Error: Line 30, The data type in the type group is invalid. (LBDB-82)

LBDB-83 (warning) The width value in the type group is invalid.

It is corrected.

DESCRIPTION

This message indicates that the specified **bit_width** value in the type group is invalid. This might be caused by a typo in the value. The Library Compiler ignores the invalid value and computes the real value from the bit_from and bit_to fields.

WHAT NEXT

Change the library file, and fix the value of the bit_width.

EXAMPLES

```
type(bus2) {  
    base_type : array;  
    data_type : bit;  
    bit_width : 3;  
    bit_from : 0;  
    bit_to : 1;  
    downto : false;  
}
```

In this case, the bit_width value is 3. To fix the problem, change it to 2 (bit_to - bit_from + 1).

EXAMPLE MESSAGE

Error: Line 30, The width value in the type group is invalid.
It is corrected. (LBDB-82)

LBDB-86 (warning) The downto value in the type group is invalid.

It is corrected.

DESCRIPTION

This message indicates that the specified **downto** value in the type group is invalid. This might be caused by a typo in the value. The Library Compiler ignores the invalid value and computes the real value from the bit_from and bit_to fields.

WHAT NEXT

Change the library file, and fix the value of the downto field.

EXAMPLES

```
type(bus2) {  
    base_type : array;  
    data_type : bit;  
    bit_width : 2;  
    bit_from : 0;  
    bit_to : 1;  
    downto : ffalses;  
}
```

In this case, the `downto` value has a typo, `ffalses`. To fix the problem, change `ffalses` to `false`. The Library Compiler corrects the value by setting to `false` `bit_from` value is less than the `bit_to` value. Otherwise, it is set to `true`.

EXAMPLE MESSAGE

Warning: Line 35, The `downto` value in the type group is invalid.
It is corrected. (LBDB-86)

LBDB-87 (error) The type group is missing its 'data_type' field.

DESCRIPTION

This message indicates that the `data_type` field is missing in the type group.

WHAT NEXT

Change the library file, and add the `data_type` field to the type group.

EXAMPLES

```
type(bus2) {  
    base_type : array;  
    bit_width : 2;  
    bit_from : 0;  
    bit_to : 1;  
    downto : false;  
}
```

To fix the problem, add the `data_type` statement to the type group.

```
    data_type : bit;
```

EXAMPLE MESSAGE

Error: Line 28, The type group is missing its 'data_type' field. (LBDB-87)

LBDB-88 (error) The type group is missing its 'base_type' field.

DESCRIPTION

This message indicates that the base_type field is missing in the type group.

WHAT NEXT

Change the library file, and add the base_type field to the type group.

EXAMPLES

```
type(bus2) {  
    data_type : bit;  
    bit_width : 2;  
    bit_from : 0;  
    bit_to : 1;  
    downto : false;  
}
```

To fix the problem, add the base_type statement to the type group.

```
base_type : array;
```

EXAMPLE MESSAGE

Error: Line 28, The type group is missing its 'base_type' field. (LBDB-88)

LBDB-89 (error) The '%s' library attribute must be defined to specify a %s value.

DESCRIPTION

This message indicates that an attribute needed by another group is missing in the library. Examples of attributes are

- * The input_voltage value needs the voltage_unit attribute defined.
- * The slew_control value needs the time_unit attribute defined.
- * The drive_current value needs the current_unit attribute defined.

WHAT NEXT

Add the missing attribute to the library.

EXAMPLES

```
input_voltage(CMOS) {
    vil      : 0.8 ;
    vih      : 2.0 ;
    vimin    : -0.3 ;
    vimax    : VDD + 0.3 ;
}
cell(lbdb89) {
    area : 0.0;
    dont_touch : false;
    dont_use   : false;
    pad_cell   : true;
    pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        direction   : input;
        capacitance : 3.0;
        fanout_load : 0.0;
    }
    pin(Y ) {
        direction : output;
        function   : "PAD";
        max_fanout : 16.0;
    }
    timing() {
        intrinsic_fall  : 4.0;
        intrinsic_rise  : 4.0;
        fall_resistance : 0.0;
        rise_resistance : 0.0;
        related_pin    :"PAD ";
    }
}
}
```

In this case, add the voltage_unit to the library as follows:

```
voltage_unit : "1V";
```

EXAMPLE MESSAGE

```
Error: Line 14, The 'voltage_unit' library attribute must be defined
       to specify a input_voltage value. (LBDB-89)
```

LBDB-90 (error) The type group is defined multiple times.

DESCRIPTION

This message indicates that the type group is defined multiple times in the technology library. This might be caused by a typo.

WHAT NEXT

Change the library file by either removing the multiple definitions but one or renaming the type groups.

EXAMPLES

```
type(bus2) {  
    base_type : array;  
    data_type : bit;  
    bit_width : 2;  
    bit_from : 0;  
    bit_to : 1;  
    downto : false;  
}  
type(bus2) {  
    base_type : array;  
    data_type : bit;  
    bit_width : 2;  
    bit_from : 1;  
    bit_to : 0;  
    downto : true;  
}
```

In this case, rename the second type group to bus2_down.

EXAMPLE MESSAGE

Error: Line 36, The type group is defined multiple times. (LBDB-90)

LBDB-91 (warning) The bus naming style format is invalid. Using the default format.

DESCRIPTION

This message indicates that you specified an invalid bus_naming_style format. The value must include %s and %d. Library Compiler ignores the invalid value and uses the default style "%s[%d]".

WHAT NEXT

Check the "Library Compiler User Guide" for the correct format of the bus_naming_style and fix the value.

EXAMPLES

```
bus_naming_style : "%s$%s";
```

EXAMPLE MESSAGE

Warning: Line 28, The bus naming style format is invalid.
Using the default format. (LBDB-91)

LBDB-92 (error) The bus subscript is out of bounds.

DESCRIPTION

This message indicates that you specified a bus element whose index value falls outside the declared index range of the bus type.

The accessed bus element with an index outside the bus bounds is specified in function, three_state, ff, or latch statements.

WHAT NEXT

Either change the bounds of the bus definition so that all subelements that are accessed fall within the range, or correct any bus indexing errors in the source library.

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
}
cell (lbdb92) {
    area : 31.0;
    bus (D) {
        bus_type : bus2;
        direction : input ;
        capacitance : 1.0 ;
    }
    pin (CK) {
        direction : input ;
        capacitance : 1.0 ;
    }
    ff_bank (IQ,IQN,2) {
        next_state : "D[3]" ;
        clocked_on : "CK" ;
    }
    bus (SO) {
        bus_type : bus2;
        direction : output ;
        function : "IQ" ;
    }
}
```

In this case, the 'D[3]' value assigned to next_state falls outside the bus2 range.

EXAMPLE MESSAGE

Error: Line 186, The bus subscript is out of bounds. (LBDB-92)

LBDB-93 (error) The bus type is invalid.

DESCRIPTION

This message indicates that you specified a bus name whose bus_type is invalid. This might be caused by an invalid base_type in the type group or a typo in the name. Library Compiler only supports the **array** base_type for bus groups.

WHAT NEXT

Check the "Library Compiler User Guide" and fix the name of the base_type in the type group, or change the bus type name.

EXAMPLES

```
type(bus2) {
    base_type : list;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
}
cell (lbdb93) {
    area : 31.0;
    bus (D) {
        bus_type : bus2;
        direction : input ;
        capacitance : 1.0 ;
    }
    pin (CK) {
        direction : input ;
        capacitance : 1.0 ;
    }
}
```

In this case, the 'list' base_type of the 'bus2' type is invalid. Fix the problem by changing the 'list' to 'array'.

EXAMPLE MESSAGE

Error: Line 177, The bus type is invalid. (LBDB-93)

LBDB-94 (warning) The ':' character is used in this bus naming style;
this makes it impossible to specify ranges of buses using ':'.

DESCRIPTION

This message indicates that you specified a ':' in the string of the bus_naming_style. Library Compiler gets confused because the ':' is used to specify ranges of buses.

WHAT NEXT

Change the value of the bus_naming_style attribute in the technology library.

EXAMPLES

```
bus_naming_style : "%s:%d";
```

EXAMPLE MESSAGE

Warning: Line 28, The ':' character is used in this bus naming style;
this makes it impossible to specify ranges of buses using ':'. (LBDB-94)

LBDB-95 (error) Buses have incompatible widths.

DESCRIPTION

This message indicates that you specified a function or a three_state attribute of a group of buses with a different width.

WHAT NEXT

Change the library source file to make sure that all buses have the same width.

EXAMPLES

```
cell (lbdb95) {  
    area : 3.0;  
    bus (D) {  
        bus_type : bus2;  
        direction : input;  
        capacitance : 1.0;  
    }  
    pin (CK) {  
        direction : input;
```

```
    capacitance : 1.0;
}
ff_bank (IQ,IQN,4) {
    next_state : "D";
    clocked_on : "CK";
}
pin (SO) {
    direction : output;
    function : "D[0] CK";
}
}
```

In this case, the number of bits in the ff_bank, which is 4, is different from the width of the 'D' bus, which is 2. Make sure that both values are the same.

EXAMPLE MESSAGE

Error: Line 186, Buses have incompatible widths. (LBDB-95)

LBDB-96 (error) The bus type name is missing.

DESCRIPTION

This message indicates that you specified a bus with an invalid a bus_type.

WHAT NEXT

Check the library source file, and correct the bus_type to the bus in the library.

LBDB-97 (error) The bus type of a subelement is missing.

DESCRIPTION

This message indicates that you specified a subelement whose parent is missing a bus type.

WHAT NEXT

Change the library, and fix the bus type.

LBDB-98 (error) The type group name is not defined.

DESCRIPTION

This message indicates that you specified a bus group with an undefined bus_type name in the technology library. This might be caused by a typo.

WHAT NEXT

Change the library file by adding the named type group.

EXAMPLES

```
cell (lbdb98) {  
    area : 3.0;  
    bus (D) {  
        bus_type : bus2;  
        direction : input;  
        capacitance : 1.0;  
    }  
}
```

In this case, the 'bus2' is not defined in the library. To fix the problem, add the following type group:

```
type(bus2) {  
    base_type : array;  
    data_type : bit;  
    bit_width : 2;  
    bit_from : 0;  
    bit_to : 1;  
    downto : false;  
}
```

EXAMPLE MESSAGE

Error: Line 177, The type group name is not defined. (LBDB-98)

LBDB-99 (error) The pin direction is inconsistent with the bus or the bundle parent direction.

DESCRIPTION

This message indicates that you specified a member of a bus or a bundle whose direction is different from its parent's direction.

WHAT NEXT

Change the library to fix the direction of the element, the bus, or the bundle.

EXAMPLES

```
bundle(nets) {
    members(n0, n1, n2, n3);
    direction : inout;
    pin (n0) {
        direction : output;
    }
}
```

In this case, the 'nets' direction is 'inout', but the 'n0' direction is 'output'.

EXAMPLE MESSAGE

Error: Line 199, The pin direction is inconsistent with the bus or the bundle parent direction. (LBDB-99)

LBDB-101 (error) The piece number in piecewise linear mode is negative.

DESCRIPTION

This message indicates that you specified a negative piece number in either delay intercept attributes or pin resistance attributes in CMOS piecewise linear delay model library.

WHAT NEXT

Modify the piece number to match the number of ranges in the piece_define attribute.

EXAMPLES

```
piece_define("0 8 15");
...
rise_delay_intercept(-11, "2.2");
```

In this case, the -11 piece number is invalid. To fix the problem, make the piece number 0, 1, or 2 as defined by the piece_define attribute.

EXAMPLE MESSAGE

Error: Line 172, The piece number in piecewise linear mode is negative. (LBDB-101)

LBDB-102 (warning) The '%s' piece is multiply defined. Using the first one encountered.

DESCRIPTION

This message indicates that you specified either delay intercept attributes or pin resistance attributes for the same piece number multiple times in a CMOS piecewise linear delay model library. Library Compiler ignores the later definitions.

WHAT NEXT

Modify the piece number if it is a typo, or remove the second definition.

EXAMPLES

```
rise_delay_intercept(1, "2.2");
rise_delay_intercept(1, "2.2");
```

EXAMPLE MESSAGE

Warning: Line 173, The 'rise_delay_intercept(1)' piece is multiply defined. Using the first one encountered. (LBDB-102)

LBDB-103 (warning) The piece number is greater than the number defined with piece_define.

DESCRIPTION

This message indicates that in a CMOS piecewise-linear delay model library you specified a piece number in either delay intercept attributes or pin resistance attributes greater than the number defined in the piece_define attribute.

WHAT NEXT

Modify the piece number to match the number of ranges in the piece_define attribute.

EXAMPLES

```
piece_define("0 8 15");
...
rise_delay_intercept(3, "2.2");
```

In this case, the 3 piece number is invalid. To fix the problem, make the piece

number 0, 1, or 2 as defined by the piece_define attribute.

EXAMPLE MESSAGE

Warning: Line 174, The piece number is greater than the number defined with piece_define. (LBDB-103)

LBDB-104 (warning) The piecewise linear model is multiply defined.

Using the first one encountered.

DESCRIPTION

This message indicates that you specified the **piece_define** attribute multiple times in a CMOS piecewise linear delay model library. Library Compiler ignores the later definitions.

WHAT NEXT

Remove the second definition of the attribute.

EXAMPLES

```
piece_define("0 8 15");
piece_define("0 8 15 25");
```

EXAMPLE MESSAGE

Warning: Line 13, The piecewise linear model is multiply defined.
Using the first one encountered. (LBDB-104)

LBDB-105 (warning) The timing arc has a negative %s specified. Using the default value.

DESCRIPTION

This message indicates that you specified a negative drive resistance value of pin resistance attributes in a CMOS piecewise linear delay model library. Library Compiler assigns the **default_rise_pin_resistance** or the **default_fall_pin_resistance** value to the timing arc or the value 0.0 if no default value exists.

WHAT NEXT

Make the drive resistance value positive in the pin resistance attribute.

WHAT NEXT

EXAMPLES

```
rise_pin_resistance(0, "-11.1");
```

EXAMPLE MESSAGE

Warning: Line 183, The timing arc has a negative rise_pin_resistance(0) specified. Using the default value. (LBDB-105)

LBDB-107 (warning) The %s '%s' is defined multiple times in the library. Using the last one encountered.

DESCRIPTION

This message indicates that the same name has been used for more than one object (for example, cells in a library or pins in a cell). Each object must have a unique name within its scope. In the case of a name conflict, Library Compiler ignores all except the last name encountered during the compilation. The compiled database contains the last object only.

WHAT NEXT

Update the library to give each object a unique name within its scope. Quite often, a typo is responsible for the name conflict.

EXAMPLES

```
statetable ( "D GN", "Q QB") {  
table : "L/H L : - - : L/H H/L,\n      - H : - - : N N";  
}  
  
statetable ( "D GN", "Q QB") {  
table : "L/H L : - - : L/H H/L,\n      - H : - - : N N";  
}
```

EXAMPLE MESSAGE

Warning: Line 987, The group 'statetable' is defined multiple times
in the library. Using the last one encountered. (LBDB-107)

LBDB-110 (warning) In the piecewise linear model, the first piece must have 0 length.

DESCRIPTION

This message indicates that you specified the first piece range, in the piece_define attribute, not starting from zero. Library Compiler ignores the value, and resets it to zero.

WHAT NEXT

Change the first piece range to zero.

EXAMPLES

```
piece_define("1 8 15");
```

EXAMPLE MESSAGE

Warning: Line 12, In the piecewise linear model, the first piece must have 0 length. (LBDB-110)

LBDB-111 (warning) In the piecewise linear model, a piece length smaller than that of the previous piece has been found.

DESCRIPTION

This message indicates that in the piece_define attribute you specified a piece length smaller than the previous one. The Library Compiler ignores the value and resets it to the previous value.

WHAT NEXT

Change the piece ranges to be in ascending order.

EXAMPLES

```
piece_define("0 18 15");
```

EXAMPLE MESSAGE

Warning: Line 12, In the piecewise linear model, a piece length smaller than that of the previous piece has been found. (LBDB-111)

LBDB-112 (error) The timing arc has only one segment of '%s'. It must have at least two if piece_define has more than one piece.

DESCRIPTION

This message indicates that in a CMOS piecewise linear delay model library you specified only one segment in either delay intercept attributes or pin resistance attributes. However, the **piece_define** defines more than one piece.

WHAT NEXT

Modify the piece number to match the number of ranges in the **piece_define** attribute.

EXAMPLES

```
piece_define("0 8 15");
...
rise_delay_intercept(0, "2.2");
```

In this case, only one **rise_delay_intercept** attribute is defined. To fix the problem, add two more **rise_delay_intercept** for piece 1 and 2.

```
rise_delay_intercept(1, "3.3");
rise_delay_intercept(2, "4.4");
```

WHAT NEXT

EXAMPLE MESSAGE

Error: Line 169, The timing arc has only one segment of 'rise_delay_intercept'. It must have at least two if piece_define has more than one piece. (LBDB-112)

LBDB-117 (error) A list does not belong here.

DESCRIPTION

This message indicates that you specified a list to an attribute whose type is not a list.

WHAT NEXT

Correct the value of the specified attribute.

EXAMPLES

```
library(lbdb117) {
    cell(c) {
        area : 1.0;
        pin( a ) {
            direction : input;
            capacitance : 1.0;
        }
        pin( b ) {
            direction : output;
            timing() {
                intrinsic_rise : 0.48;
                intrinsic_fall : 0.77;
                rise_resistance : 0.1443;
                fall_resistance : {0.0523,0.0523};
                slope_rise : 0.0;
                slope_fall : 0.0;
                related_pin : "a";
            }
        }
    }
}
```

In this case, the 'fall_resistance' attribute has a value of type list. Fix the problem by assigning a single value to the attribute.

EXAMPLE MESSAGE

Error: Line 14, A list does not belong here. (LBDB-117)

LBDB-119 (error) The '%s' pin on the %s could not be found on

the %s. There must be a one-to-one match.

DESCRIPTION

Each pin in the regular cell needs a matched pin in the scaled_cell group. This message indicates that a pin could not be matched in the library source.

WHAT NEXT

Add the missing pin in the regular cell, or remove the extra pin in the scaled_cell.

EXAMPLES

```
library(lbdb119) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }
    cell(AND) {
        area : 1;
        pin(A B) {
direction : input;
capacitance : 1;
        }
        pin(Z) {
direction : output;
function : "A B";
timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
        }
    }

    scaled_cell(AND,WCCOM) {
        area : 1;
        pin(A B C) {
direction : input;
capacitance : 1;
        }
        pin(Z) {
direction : output;
function : "A B";
timing() {
            intrinsic_rise : 0.1;
```

```

intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
slope_rise : 0.0;
slope_fall : 0.0;
related_pin : "A B";
}
}
}
}

```

In this case, the 'C' pin exists in the scaled_cell but not in the parent cell.

EXAMPLE MESSAGE

Error: Line 100, The 'C' pin on the scaled_cell could not be found on the parent cell. There must be a one-to-one match. (LBDB-119)

LBDB-120 (warning) Layers are ignored inside symbols.

DESCRIPTION

For a symbol library, Library Compiler ignores layer information within a symbol.

WHAT NEXT

Remove the layer information from the symbol.

EXAMPLES

```

symbol(lbdb-120) {
    line( - flag_width / 2, - flag_height / 2, \
        - flag_width / 2, flag_height / 2) ;
    line( - flag_width / 2, flag_height / 2, \
        flag_width / 2, flag_height / 2) ;
    line( flag_width / 2, flag_height / 2, \
        flag_width / 2, - flag_height / 2) ;
    line( flag_width / 2, - flag_height / 2, \
        - flag_width / 2, - flag_height / 2) ;
    text( "Area", - string_length / 2 - char_width / 3, \
        - 0.75 / 2, "constraint_layer") ;
}

```

In this case, the constraint_layer is used in the symbol.

EXAMPLE MESSAGE

Warning: Line 3453, Layers are ignored inside symbols. (LBDB-120)

LBDB-126 (error) The '%s' construct is not valid in '%s' libraries.

DESCRIPTION

This message indicates that the specified construct is not valid in the specified library. In Library Compiler, certain constructs are valid only in certain types of libraries. For example, pin resistances are not valid when specified on timing arcs in nonlinear (table_lookup) libraries.

WHAT NEXT

Remove the invalid construct from the library source file

EXAMPLES

```
library(lbdb126) {
    delay_model : "generic_cmos";
    piece_define("0 8 15");

    cell(INVERTER) {
        area : 5.0;
        cell_power : 1.0;
        pin(A) {
            direction : input;
            capacitance : 1.0;
        }
    }
}
```

In this case, the 'cell_power' construct is not valid in piecewise_cmos libraries.

EXAMPLE MESSAGE

Error: Line 155, The 'cell_power' construct is not valid
in 'piecewise_cmos' libraries. (LBDB-126)

LBDB-132 (error) In the '%s' cell, the %s pin '%s' cannot have

a '%s' attribute.

DESCRIPTION

This message indicates that you specified a **clock** or a **prefer_tied** attribute on a inout pin.

WHAT NEXT

Remove the specified attribute, or change the direction of the pin to input.

EXAMPLES

```
cell(lbdb132) {
    area : 1;
    pin(A B C) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : inout;
        function : "A B";
        three_state : "C";
        clock : true;
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A B C";
        }
        timing() {
            timing_type : three_state_disable;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "C";
        }
    }
}
```

In this case, the 'Z' pin whose direction is inout has a clok attribute set.

EXAMPLE MESSAGE

Error: Line 219, In the 'lbdb132' cell, the inout pin 'Z' cannot have a 'clock' attribute. (LBDB-132)

LBDB-136 (warning) The '%s' attribute on the '%s' pin in the '%s' cell is not valid on %s pins.
The attribute is ignored.

DESCRIPTION

This message indicates that the attribute on the specified pin is invalid. The attribute is ignored.

WHAT NEXT

Refer to the "Library Compiler User Guide" to determine the reason why the attribute is not valid. Make the correction.

EXAMPLES

```
cell(lbdb136) {  
    area : 9;  
    pin(D) {  
direction : input;  
capacitance : 1;  
    }  
    pin(CP) {  
direction : input;  
capacitance : 1;  
    }  
    pin(CD) {  
direction : input;  
capacitance : 2;  
    }  
    ff("IQ", "IQN") {  
next_state : "D";  
clocked_on : "CP";  
clear : "CD'";  
    }  
    pin(Q) {  
direction : output;  
function : "IQ";  
min_period : 0;  
    }
```

In this case, the min_period attribute is defined for an output pin.

EXAMPLE MESSAGE

Warning: Line 1848, The 'min_period' attribute on the 'Q' pin in the 'lbdb136' cell is not valid on output pins.
The attribute is ignored. (LBDB-136)

LBDB-138 (warning) The timing arc is missing the piecewise data value

for '%s'. The value is interpolated if possible.

Otherwise, the default value is used if it exists.

DESCRIPTION

This message indicates that you did not specify the definition of either delay intercept attributes or pin resistance attributes of piece number in a CMOS piecewise linear delay model library.

WHAT NEXT

Add the missing attribute to the specified piece number.

EXAMPLES

```
library(test) {
    delay_model : "generic_cmos";
    piece_define("0 8 15");

    cell(lbdb138) {
        area : 5.0;
        pin(A) {
            direction : input;
            capacitance : 1.0;
        }
        pin(Z) {
            direction : output;
            function : "A'";
        }

        timing() {
            intrinsic_rise : 5.0;
            intrinsic_fall : 2.0;
            slope_rise : 1.0;
            slope_fall : 2.0;

            rise_delay_intercept(0, "1.1");
            rise_delay_intercept(1, "2.2");
            rise_delay_intercept(2, "3.3");

            fall_delay_intercept(0, "1.1");
            fall_delay_intercept(1, "2.2");
            fall_delay_intercept(2, "3.3");

            rise_pin_resistance(0, "1.1");
            rise_pin_resistance(1, "2.2");

            fall_pin_resistance(0, "4.4");
            fall_pin_resistance(1, "4.4");
        }
    }
}
```

```
related_pin : "A";
    }
}
}
}
```

In this case, the value of the rise_pin_resistance attribute is missing for index 2.

EXAMPLE MESSAGE

Warning: Line 165, The timing arc is missing the piecewise data value for 'rise_pin_resistance(2)'. The value is interpolated if possible Otherwise, the default value is used if it exists. (LBDB-138)

LBDB-139 (error) Invalid delay model for the given technology.

DESCRIPTION

This message indicates that you specified an invalid value in the delay_model attribute.

WHAT NEXT

Refer to the "Library Compiler User Guide" for supported delay models. Change the value of the delay_model attribute to a valid one.

EXAMPLES

```
delay_model : "lbdb139";
```

EXAMPLE MESSAGE

Error: Line 3, Invalid delay model for the given technology. (LBDB-139)

LBDB-140 (warning) The '%s' cell contains circular timing arcs. The '%s' pin is in one of the cycles.

DESCRIPTION

The pin in the library cell has circular timing arcs. A circular timing arc occurs when an inout or output pin is related to itself through other inout or output pins. A change in one pin belonging to a circular timing arc continually loops around.

Circular timing arcs do not make sense and are probably mistakes. Therefore, the

Library Compiler flags them with warnings.

WHAT NEXT

Check the library source file, and verify the questionable circular timing arcs.

EXAMPLES

```
cell(lbdb140) {
    area : 9;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(CP) {
direction : input;
capacitance : 1;
    }

    ff("IQ", "IQN") {
next_state : "D";
clocked_on : "CP";
    }
    pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
    }
    pin(Q2) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q3";
}
    }
    pin(Q3) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
}
```

```
    related_pin : "Q2";
}
}
}
```

EXAMPLE MESSAGE

Warning: Line 263, The 'lbdb140' cell contains circular timing arcs.
The 'Q2' pin is in one of the cycles. (LBDB-140)

LBDB-141 (warning) The timing arc is missing the piecewise data value for '%s'. The default value is used if it exists.

DESCRIPTION

This message indicates that you did not specify the definition of either delay intercept attributes or pin resistance attributes of the piece number defined in the piece_define in a CMOS piecewise linear delay model library.

WHAT NEXT

Add the missing attribute to the specified piece number.

EXAMPLES

```
library(test) {
    delay_model : "generic_cmos";
    piece_define("0");

    cell(lbdb138) {
        area : 5.0;
        pin(A) {
            direction : input;
            capacitance : 1.0;
        }
        pin(Z) {
            direction : output;
            function : "A'";
            timing() {
                intrinsic_rise : 5.0;
                intrinsic_fall : 2.0;
                slope_rise : 1.0;
                slope_fall : 2.0;
                rise_delay_intercept(0, "1.1");
            }
        }
    }
}
```

```
rise_pin_resistance(0, "1.1");
fall_pin_resistance(0, "4.4");

related_pin : "A";
}
}
}
```

In this case, the value of the fall_delay_intercept attribute is missing for index 2.

EXAMPLE MESSAGE

Warning: Line 170, The timing arc is missing the piece wise data value for 'fall_delay_intercept(0)'. The default value is used if it exists. (LBDB-141)

LBDB-142 (error) '%s' is an invalid value for the '%s' enumerated type attribute.

DESCRIPTION

This message indicated that you specified a value that is not part of the enumerated literals for the specified attribute.

WHAT NEXT

Refer to the "Library Compiler User Guide", and fix the invalid value.

EXAMPLES

```
voltage_unit : "1";
```

EXAMPLE MESSAGE

Error: Line 19, '1' is an invalid value for the 'voltage_unit' enumerated type attribute. (LBDB-142)

LBDB-143 (error) An invalid string is provided. The invalid string is

either a blank string or a string that begins with a digit

that is unquoted.

DESCRIPTION

A string begining with a digit must be enclosed in double quotes (""). In addition, blank strings are not valid in Library Compiler.

WHAT NEXT

Check the library and correct the string. If the string begins with a digit, enclose the string in quotes. Remove any blank strings. For details on Library Compiler string rules, refer to the "Library Compiler Reference Manual".

EXAMPLES

```
type(111) {  
    base_type : array;  
    data_type : bit;  
    bit_width : 2;  
    bit_from : 1;  
    bit_to : 0;  
    downto : true;  
}
```

In this case, the 111 type name starts with a digit. To fix the problem, add quotes.

EXAMPLE MESSAGE

Error: Line 29, An invalid string is provided. The invalid string is either a blank string or a string that begins with a digit that is unquoted. (LBDB-143)

LBDB-144 (error) The '%s' pin name does not match the '%s' bus name.

DESCRIPTION

This message indicates that you specified a bus element name different from the bus name given in the bus_naming_style. Library Compiler cannot extract the element name properly.

WHAT NEXT

Make sure that the bus_naming_style string matches the specified bus name.

LBDB-145 (warning) The 'direction' attribute is missing in the %S '%S'.

DESCRIPTION

This message indicates that the direction attribute is missing in the bus or bundle group.

WHAT NEXT

Add the direction attribute to the bus or bundle port in the technology library.

EXAMPLES

```
bundle(Q) {  
    members(XQ, Q1);  
/*     direction : output; */  
    function : "1";  
}
```

EXAMPLE MESSAGE

Warning: Line 53, The 'direction' attribute is missing in the 'Q' bundle. (LBDB-145)

LBDB-146 (error) The value for the update attribute must be "true" or "false".

DESCRIPTION

This message indicates that, in a symbol library, you specified an invalid value to the **update** attribute in either an **annotate_symbol** or an **annotate** group. This might be caused by a typo because the Library Compiler expects a quoted string.

WHAT NEXT

Check your symbol library file, and correct the value of the update attribute.

EXAMPLES

```
annotate_symbol() {  
    value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;  
    format : "sheet: %s of %s" ;  
    x : RIGHT_X ;  
    y : LOW_Y ;  
    layer_name : "template_text_layer" ;
```

```
        update : true;  
    }
```

EXAMPLE MESSAGE

Error: Line 95, The value for the update attribute must be "true" or "false". (LBDB-146)

LBDB-147 (error) A value must be specified for the annotate or the annotate_symbol group.

DESCRIPTION

This message indicates that, in a symbol library, you did not specify a value to either the **annotate** or the **annotate_symbol** group.

WHAT NEXT

Check your symbol library file, and add the value attribute.

EXAMPLES

```
annotate_symbol() {  
    format : "sheet: %s of %s" ;  
    x : RIGHT_X ;  
    y : LOW_Y ;  
    layer_name : "template_text_layer" ;  
}
```

In this case, the value attribute is missing. To fix the problem, add the attribute,

```
    value( "ANN_PAGE_NUM" , "ANN_NUM_PAGES" ) ;
```

EXAMPLE MESSAGE

Error: Line 89, A value must be specified for the annotate or the annotate_symbol group. (LBDB-147)

LBDB-148 (error) The '%s' pin is not found in the annotate_symbol group.

DESCRIPTION

This message indicates that, in a symbol library, you specified an invalid pin_name

value for the **pin_name** attribute in an **annotate_symbol**. This might be caused by a typo.

WHAT NEXT

Check your symbol library file, and correct the value of the pin_name attribute.

EXAMPLES

```
symbol("lbdb148") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    annotate_symbol() {
        value( "ANN_PAGE_NUM", "ANN_NUM_PAGES") ;
        pin_name : "P2";
        format : "sheet: %s of %s" ;
        x : RIGHT_X ;
        y : LOW_Y ;
        layer_name : "template_text_layer" ;
    }
}
```

In this case, the 'P2' name does not exist in the 'lbdb148' symbol. Change the name to P0.

EXAMPLE MESSAGE

Error: Line 89, The 'P2' pin is not found in the annotate_symbol group. (LBDB-148)

LBDB-149 (error) The X value is invalid in the annotate or the annotate_symbol group.

DESCRIPTION

This message indicates that, in a symbol library, you specified an invalid value to the **x** attribute in either an **annotate** or **annotate_symbol** group. This might be caused by a typo.

WHAT NEXT

Check your symbol library file, and correct the value of the X attribute.

EXAMPLES

```
symbol("lbdb148") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    annotate_symbol() {
        value( "ANN_PAGE_NUM", "ANN_NUM_PAGES" ) ;
        format : "sheet: %s of %s" ;
        x : "";
        y : LOW_Y ;
        layer_name : "template_text_layer" ;
    }
}
```

EXAMPLE MESSAGE

Error: Line 89, The X value is invalid in the annotate or the annotate_symbol group. (LBDB-149)

LBDB-150 (error) The format specification cannot have more than %d %%s specifications.

DESCRIPTION

This message indicates that, in a symbol library, the format attribute has more than 10 string specifications. Library Compiler accepts only 10.

WHAT NEXT

Check your symbol library file, and reduce the number of specification in the format attribute.

EXAMPLES

```
annotate_symbol() {
    value( "A1", "A2", "A3", "A4", "A5", "A6", "A7", "A8", "A9", "A10" ) ;
    format : "sheet: %s of %s " ;
    x : RIGHT_X ;
    y : LOW_Y ;
    layer_name : "template_text_layer" ;
}
```

EXAMPLE MESSAGE

Error: Line 101, The format specification cannot have more than 10 %s specification s. (LBDB-150)

LBDB-151 (error) The format specification has %d %%s specification(s), but only %d value(s) is/are specified.

DESCRIPTION

This message indicates that, in a symbol library, the format specification does not match the number of values provided to either the **annotate** or the **annotate_symbol** group. This might be caused by a typo.

WHAT NEXT

Check your symbol library file, and correct the value of either the value attribute or the format attribute.

EXAMPLES

```
annotate_symbol() {  
    value( "ANN_PAGE_NUM" ) ;  
    format : "sheet: %s of %s" ;  
    x : RIGHT_X ;  
    y : LOW_Y ;  
    layer_name : "template_text_layer" ;  
}
```

In this case, the value attribute has only the string value, but the format refers to two %s. To fix the problem, either add the second string value in the value attribute or remove the second %s in the format attribute.

EXAMPLE MESSAGE

Error: Line 89, The format specification has 2 %s specification(s), but only 1 value(s) is/are specified. (LBDB-151)

LBDB-152 (error) The '%s' object type is invalid in the annotate

or the `annotate_symbol` group.

DESCRIPTION

This message indicates that, in a symbol library, you specified an invalid object type for the `object_type` attribute in either an `annotate` or `annotate_symbol` group. This might be caused by a typo. Library Compiler accepts the following object types:

- * pin
- * design
- * port
- * cell
- * net

WHAT NEXT

Check your symbol library file, and correct the value of the `object_type` attribute.

EXAMPLES

```
symbol("lbdb152") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    annotate_symbol() {
        value( "ANN_PAGE_NUM" , "ANN_NUM_PAGES" ) ;
        format : "sheet: %s of %s" ;
        x : "RIGHT_X";
        y : LOW_Y ;
        layer_name : "template_text_layer" ;
        object_type : "library";
    }
}
```

EXAMPLE MESSAGE

Error: Line 89, The 'library' object type is invalid in the `annotate` or the `annotate_symbol` group. (LBDB-152)

LBDB-153 (error) A syntax error is found before the `library` or `phys_library` group.

The compilation is terminated.

DESCRIPTION

This message follows lexical and syntax error messages issued when reading a library.

WHAT NEXT

Fix all lexical and syntax errors.

EXAMPLES

```
related_bus_pins : { ADDR";
```

In this case, a lexical error is encountered in the related_bus_pins value. Substitute the '{' for a "'".

EXAMPLE MESSAGE

```
Error: A syntax error is found before the library or phys_library group.  
The compilation is terminated. (LBDB-153)
```

LBDB-155 (warning) The %s_cell for the '%s' cell with '%s' operating_conditions is defined multiple times in the library. Using the last one encountered.

DESCRIPTION

This message indicates that a scaled_cell with the same operating_conditions is defined multiple times in the library. This might be caused by a typo in the name of the operating_conditions. Library Compiler uses the last cell encountered.

WHAT NEXT

Delete all the redundant scaled_cell groups, or fix the library if it is a typo.

EXAMPLES

```
library(lbdb155) {  
    operating_conditions(WCCOM) {  
process : 1.5 ;  
        temperature : 70 ;  
voltage : 4.75 ;  
tree_type : "worst_case_tree" ;
```

```

        }
    cell(IVV) {
        area : 1;
        pin(A) {
direction : input;
capacitance : 1;
        }
        pin(Z) {
direction : output;
function : "A'";
timing() {
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A";
}
    }
}

scaled_cell(IVV,WCCOM) {
    area : 1;
    pin(A) {
direction : input;
capacitance : 1;
    }
    pin(Z) {
direction : output;
function : "A'";
timing() {
    intrinsic_rise : 0.3;
    intrinsic_fall : 0.3;
    rise_resistance : 0.3;
    fall_resistance : 0.3;
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A";
}
    }
}

scaled_cell(IVV,WCCOM) {
    area : 1;
    pin(A) {
direction : input;
capacitance : 1;
    }
    pin(Z) {
direction : output;
function : "A'";
timing() {
    intrinsic_rise : 0.3;
    intrinsic_fall : 0.3;
    rise_resistance : 0.3;
    fall_resistance : 0.3;
}
}
}

```

```
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A";
}
}
}
}
```

EXAMPLE MESSAGE

Warning: Line 327, The scaled_cell for the 'AND' cell with 'WCCOM' operating_conditions is defined multiple times in the library. Using the last one encountered. (LBDB-155)

LBDB-156 (error) The LSI rounding digit and cutoff attributes have incompatible values.

DESCRIPTION

This message indicates that you specified invalid values for either the **lsi_rounding_digit** or the **lsi_rounding_cutoff** attribute. Library Compiler issues this error when the **lsi_rounding_digit** value is greater than the **lsi_rounding_cutoff** value multiplied by 10.01 or the **lsi_rounding_cutoff** value is greater than the **lsi_rounding_digit** value.

WHAT NEXT

Check the library, and fix either the value of the **lsi_rounding_digit** or the **lsi_rounding_cutoff** attribute.

EXAMPLES

```
lsi_rounding_digit : 0.1;
lsi_rounding_cutoff : 0.003;
```

In this case, the **lsi_rounding_digit** 0.1 is greater than $(0.003 * 10.01)$. To fix the problem, assign the value 0.01 to **lsi_rounding_digit**.

```
lsi_rounding_digit : 0.01;
```

EXAMPLE MESSAGE

Error: Line 10, The LSI rounding digit and cutoff attributes have incompatible values. (LBDB-156)

LBDB-157 (error) The '%s' cell name defined in the scaled_cell

is not found.

DESCRIPTION

This message indicates that the technology library has a scaled_cell defined without a parent cell defined. Library Compiler uses the scaled_cell group to supply an alternate set of values for an existing cell. The choice is based on the set of operating conditions used.

WHAT NEXT

Add the parent cell for the scaled_cell, or fix the scaled_cell name if it is a typo.

EXAMPLES

```
library(lbdb157) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }

cell(IV) {
    area : 1;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A'";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
}
scaled_cell(IVV,WCCOM) /* Typo in the cell name. */
area : 1;
pin(A) {
    direction : input;
    capacitance : 1;
}
pin(Z) {
    direction : output;
```

```

        function : "A'";
        timing() {
            intrinsic_rise : 0.3;
            intrinsic_fall : 0.3;
            rise_resistance : 0.3;
            fall_resistance : 0.3;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 101, The 'IVV' cell name defined in the scaled_cell is not found. (LBDB-157)

LBDB-158 (error) The '%s' operating conditions is not found.

DESCRIPTION

This message indicates that the technology library has a scaled_cell with an undefined operating conditions.

WHAT NEXT

Add the operating_conditions group if it is missing, or fix the operating_conditions name if it has a typo.

EXAMPLES

```

library(lbdb158) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }

cell(IV) {
    area : 1;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
    }
}

```

```

        function : "A'";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
}

scaled_cell(IV,WCCOM1) { /* Typo in the operating_conditions name. */
    area : 1;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A'";
        timing() {
            intrinsic_rise : 0.3;
            intrinsic_fall : 0.3;
            rise_resistance : 0.3;
            fall_resistance : 0.3;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 305, The 'WCCOM1' operating conditions is not found. (LBDB-158)

LBDB-159 (error) Incomplete EDIF properties are specified in the '%s' symbol.

Specify 'edif_cell_name', 'edif_view_name', and 'edif_name_property'.

DESCRIPTION

This message indicates that, in a symbol library, you specified incomplete attributes of the view identifier properties of the symbol for a cell. These attributes are **edif_cell_name**, **edif_view_name**, and **edif_name_property**. If Library

Compiler encounters a symbol with any of these attributes, it must have all three of them declared.

WHAT NEXT

Change the symbol definition for the cell in the source text file of the symbol library. Either delete the view identifier property attributes that are there so that the symbol has none of those attributes or add appropriate view identifier property attributes, so that the symbol has all three of those attributes.

EXAMPLES

```
symbol("lbdb159") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 10000, 1000, DOWN);

    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
    edif_cell_name : "edifcell";
    edif_name_property : " edifproperty";
}
```

In this case, the edif_view_name attribute is missing. To fix the problem, add

```
    edif_view_name : "edifview";
```

EXAMPLE MESSAGE

```
Error: Incomplete EDIF properties are specified in the 'lbdb159' symbol.
      Specify 'edif_cell_name', 'edif_view_name', and 'edif_name_property'. (LBDB-
159)
```

LBDB-160 (error) It is not acceptable to set the technology to '%s' after it has been set to '%s'. The two technologies are incompatible.

DESCRIPTION

This message indicates that you specified incompatible values for the technology attribute and the delay_model attribute.

WHAT NEXT

Check The Library Compiler User Guide Manual for compatible combinations, and fix either the value of the technology or the delay_model attribute.

EXAMPLES

```
library(lbdb160) {
    /* wrong technology and delay model combination */
    technology("cmos");
    delay_model : generic_ecl;
}
```

EXAMPLE MESSAGE

Error: Line 4, It is not acceptable to set the technology to 'generic_ecl' after it has been set to 'cmos'. The two technologies are incompatible. (LBDB-160)

LBDB-161 (error) The '%s' bus needs to have its bus_type specified first.

The %s '%s' was found before the bus_type.

DESCRIPTION

This message indicates that you specified a bus without its bus_type attribute, or Library Compiler rejected the bus_type value and considered it as not defined.

WHAT NEXT

Add the bus_type attribute to the library, or fix the value of the attribute.

EXAMPLES

```
bus (D) {
/*    bus_type : bus2; /* remove the comment to fix the problem */
    direction : input;
    capacitance : 1.0;
}
```

EXAMPLE MESSAGE

Error: Line 179, The 'D' bus needs to have its bus_type specified first.
The attribute 'direction' was found before the bus_type. (LBDB-161)

LBDB-162 (error) An invalid area range is found in the

wire_load_from_area attribute.

DESCRIPTION

This message indicates that you specified an invalid area range. The problem is caused by any of these reasons:

- * The min_area value is greater than the max_area value.
- * The min_area value is less than zero.
- * The max_area value is less or equal to zero.

WHAT NEXT

Check the area values, and fix the problem.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
wire_load_selection(test) {  
    wire_load_from_area(27,10,"10x10");/* problem */  
    wire_load_from_area(27,100,"10x10");  
    wire_load_from_area(0,28,"05x05");  
    wire_load_from_area(2,10,"15x10");  
}
```

In this case, the minimum area value 27 is greater than the maximum area value 10.

EXAMPLE MESSAGE

Error: Line 51, An invalid area range is found in the wire_load_from_area attribute . (LBDB-162)

LBDB-163 (warning) The '%s' attribute value is %s (%3.1f). Using %3.1f instead.

DESCRIPTION

This message indicates that you specified an attribute value that is out of the accepted range. The value is either less than the minimum value or greater than the maximum value.

WHAT NEXT

Change the attribute value to satisfy the value range.

EXAMPLES

```
k_volt_internal_power : -111.0;
```

In this case, the `k_volt_internal` attribute's value `-111.0` is less than the minimum accepted value `-100.0`.

EXAMPLE MESSAGE

Warning: Line 9, The '`k_volt_internal_power`' attribute value is less than the minimum allowed (-100.0). Using 0.0 instead. (LBDB-163)

LBDB-164 (error) The '`wire_load_from_area`' range overlaps the range in line %d.

DESCRIPTION

This message indicates that you specified an overlapping area range in two `wire_load_from_area` attributes.

WHAT NEXT

Change the area range in the second `wire_load_from_area` attribute.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
  
wire_load_selection(test) {  
    wire_load_from_area(0,20,"05x05");  
    wire_load_from_area(10,25,"05x05");  
}
```

In this case, the area range `[0,20]` overlaps the area range `[10,25]`.

EXAMPLE MESSAGE

```
Error: Line 12, The 'wire_load_from_area' range overlaps  
the range in line 13. (LBDB-164)
```

LBDB-165 (warning) A range gap is found in the 'wire_load_selection'.

The 'min_area' is extended from %f to %f.

DESCRIPTION

The wire_load_selection specified in this library has a gap. It means that two adjacent selector items are not overlapped. Library Compiler uses its built-in algorithm to fill the gap. It extends the lower bound of the selector that covers the bigger area toward the upper bound of the other selector item.

WHAT NEXT

Ignore the warning if the Library Compiler's algorithm satisfies your modeling requirement. Otherwise, fix the library source code to match your wire_load_selection model.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
  
wire_load_selection(test) {  
    wire_load_from_area(0,20,"05x05");  
    wire_load_from_area(25,50,"05x05");  
}
```

In this case, there is a gap in area range from 20 to 25. Library Compiler corrects the problem as if you had the declaration

```
wire_load_from_area(20,50,"05x05");
```

EXAMPLE MESSAGE

```
Warning: Line 13, A range gap is found in the 'wire_load_selection'.  
The 'min_area' is extended from 25.000000 to 20.000000. (LBDB-165)
```

LBDB-166 (warning) A range does not start with 0.0 in the 'wire_load_selection'.

The 'min_area' is extended from %f to 0.0.

DESCRIPTION

The min_area value in the specified wire_load_selection attribute in this library does not start with 0.0. Library Compiler extends the lower bound of the selector to 0.0.

WHAT NEXT

Fix the library source code to set the min_area to 0.0.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
  
wire_load_selection(test) {  
    wire_load_from_area(10,25,"05x05") ;  
}
```

EXAMPLE MESSAGE

Warning: Line 48, A range does not start with 0.0 in the 'wire_load_selection'.
The 'min_area' is extended from 10.000000 to 0.0. (LBDB-166)

LBDB-167 (error) The '%s' scaling factors group is not found.

DESCRIPTION

The message indicates that you specified an invalid name for the scaling_factors group. This might be caused either by a typo in the name or by the group not being defined.

WHAT NEXT

Add the scaling_factors group to the library, or correct the value of the scaling_factors if it is a typo.

EXAMPLES

```
scaling_factors("IO_PAD_SCALING") {
    k_volt_intrinsic_rise : 0.846 ;
}
cell (lbdb167) {
    area : 0 ;
    scaling_factors : IO_PAD_SCALE ;
}
```

In this case, there is a typo in the name.

EXAMPLE MESSAGE

Error: Line 20, The 'IO_PAD_SCALE' scaling factors group is not found. (LBDB-167)

LBDB-168 (error) The %s timing constraint has only one value.
Only one 'intrinsic_rise' or 'intrinsic_fall' can be specified.

DESCRIPTION

You specified invalid values for intrinsic_rise and intrinsic_fall in a timing group that describes a **recovery** or **removal** timing constraint. Library Compiler complains if each of these two constraints has

- * Both intrinsic_rise and intrinsic_fall values are assigned to zero.
- * Both intrinsic_rise and intrinsic_fall values are not specified.
- * Both intrinsic_rise and intrinsic_fall values are not zero.

WHAT NEXT

Inspect the datasheet of the cell in question. If the asynchronous control signal is high-active, define the recovery and the removal constraints as the intrinsic_fall. If the asynchronous control signal is low-active, define the recovery and the removal constraints as the intrinsic_rise. Remove the other field (intrinsic_rise or intrinsic_fall) from the library source file.

EXAMPLES

```
pin(CD) {
    direction : input;
    capacitance : 2;
    timing() {
        timing_type : recovery_rising;
        /* both values are 0.0 */
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "CP";
```

```

        }
    timing() {
timing_type : removal_rising;
/* both values not specified */
related_pin : "CP";
    }
}

```

EXAMPLE MESSAGE

Error: Line 56, The Recovery timing constraint has only one value.
 Only one 'intrinsic_rise' or 'intrinsic_fall' can be specified. (LBDB-168)

LBDB-169 (error) An invalid 'three_state_disable' timing type appears on the timing arc. Its parent output pin has no 'three_state' attribute.

DESCRIPTION

This message indicates that you specified a **three_state_disable** timing_arc on a port that has no **three_state** attribute.

WHAT NEXT

Either delete the timing arc or correct the port group definition to add the three_state attribute.

EXAMPLES

```

cell(AND) {
    area : 1;
    pin(A B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "A B" ;
        }
        timing() {

```

```
timing_type : three_state_disable;
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "A";
}
}
}
```

EXAMPLE MESSAGE

Error: Line 44, An invalid 'three_state_disable' timing type appears on the timing arc. Its parent output pin has no 'three_state' attribute. (LBDB-169)

LBDB-170 (warning) The '%s' attribute's value is %s (%3.1f). Removing it.

DESCRIPTION

This message indicates that you specified an attribute value that is out of the accepted range. The value is either less than the minimum value or greater than the maximum value. Library Compiler ignores the value because it does not find a default value to replace it.

WHAT NEXT

Change the attribute value to satisfy the value range.

EXAMPLES

```
pin(A) {
    direction : input;
    capacitance : 1;
    min_fanout : -1;
}
```

In this case, the min_fanout attribute's value -1 is less than the minimum accepted value 0.0.

EXAMPLE MESSAGE

Warning: Line 283, The 'min_fanout' attribute value is less than the minimum allowed (0.0). Removing it. (LBDB-170)

LBDB-171 (error) The '%s' wire load model is not defined, or it is defined after this line.

DESCRIPTION

This message indicates that you specified a "wire_load_from_area" that refers to a "wire_load" group that is not defined or has been defined in the library after the current line.

WHAT NEXT

Check your library to see if you have defined the group. If you have done that, also check its position within the library to make sure it is defined before it is used.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
  
wire_load_selection(test) {  
    wire_load_from_area(27,100,"10x10");  
    wire_load_from_area(10,25,"05x05");  
}
```

EXAMPLE MESSAGE

Error: Line 47, The '10x10' wire load model is not defined, or it is defined after this line. (LBDB-171)

LBDB-172 (warning) The '%s' attribute is not specified. Using %4.2f.

DESCRIPTION

This message indicates that an attribute is missing, and Library Compiler is reporting the default floating point or integer value it is setting. This message affects attributes with default values.

WHAT NEXT

Either add the missing attribute to the technology library or ignore the message.

EXAMPLES

```
pin(D) {  
    direction : input;  
}
```

EXAMPLE MESSAGE

Warning: Line 52, The 'capacitance' attribute is not specified. Using 0.00. (LBDB-172)

LBDB-173 (error) The '%s' group requires one or more names.

DESCRIPTION

This message indicates you specified no name for a group that requires at least one name.

WHAT NEXT

Change your library to add the group name.

EXAMPLES

```
pin() {  
    direction : input;  
    capacitance : 1.0;  
}
```

In this case, a pin name is required.

EXAMPLE MESSAGE

Error: Line 286, The 'pin' group requires one or more names. (LBDB-173)

LBDB-174 (error) The '%s' group requires %d names.

DESCRIPTION

This message indicates that you specified a group without its required number of names. This might be caused by a typo.

WHAT NEXT

Refer to the "Library Compiler User Guide" for the correct syntax of the specified group, and match the number of group names.

EXAMPLES

```
ff(IQ,IQN, 2)
```

In this case, the 'ff' group requires 2 names. To fix the problem, either remove the last element 2 or if it is a typo change ff to ff_bank.

EXAMPLE MESSAGE

Error: Line 87, The 'ff' group requires 2 names. (LBDB-174)

LBDB-175 (warning) The `bus_naming_style` contains characters that are also used as delimiters in function, `three_state`, and `related_pin` attributes. Be sure to put spaces around the characters in the `[%s]` set when supplying values for attributes of the types mentioned. Also, surround subscripted pin names with double quotes in pin groups.

DESCRIPTION

This message indicates that you specified delimiter characters in the `bus_naming_style` attribute such as "/ \

WHAT NEXT

Change the delimiter character, or follow the rules specified in the message.

EXAMPLES

```
bus_naming_style : %s&%d;
```

EXAMPLE MESSAGE

Warning: Line 28, The bus_naming_style contains characters that are also used as delimiters in function, three_state, and related_pin attributes. Be sure to put spaces around the characters in the [&] set when supplying values for attributes of the types mentioned. Also, surround subscripted pin names with double quotes in pin groups. (LBD
B-175)

LBDB-176 (error) Invalid bus syntax is detected in '%s'.

DESCRIPTION

This message indicates that you specified an invalid bus element. Library Compiler fails to extract the bus element information using the bus_naming_style attribute value.

WHAT NEXT

Change the library by either fixing the bus_naming_style value or fixing the bus element representation.

LBDB-177 (warning) The attribute '%s' is not specified Using '%S'.

DESCRIPTION

This message indicates that an attribute is missing, and Library Compiler is reporting the default string value it is setting. This message affects attributes with default values.

WHAT NEXT

Either add the missing attribute to the technology library or ignore the message.

LBDB-179 (error) The '%s' group requires the '%s' attribute. Either the attribute is missing or the attribute has an invalid

value.

DESCRIPTION

This message indicates you specified a group without one of its required attributes. Library Compiler rejects the attribute definition if the attribute exists and has an invalid value.

WHAT NEXT

Change the library file by adding the missing attribute to the group.

EXAMPLES

```
memory() {  
    type : random;  
    address_width : 10;  
    word_width : 8;  
}
```

In this case, the 'type' has an invalid value. To fix the problem, assign 'rom' or 'ram' to the type.

EXAMPLE MESSAGE

```
Error: Line 27, The 'memory' group requires the 'type' attribute.  
Either the attribute is missing or the attribute has an invalid value. (LBDB-179)
```

LBDB-180 (error) The '%s' attribute requires both 'clear' and 'preset' attributes.

DESCRIPTION

This message indicates that you specified the 'clear_preset_var1' or the 'clear_preset_var2' attribute or both in a sequential model group without specifying both the 'clear' and the 'preset' attributes.

WHAT NEXT

Add the missing attribute to the group.

EXAMPLES

```
ff("IQ", "IQN") {  
next_state : "D";
```

```
clocked_on : "CP";
clear : "CD'";
clear_preset_var1: "L";
}
```

In this case, the 'preset' attribute is missing in the ff group.

EXAMPLE MESSAGE

Error: Line 98, The 'clear_preset_var1' attribute requires both 'clear' and 'preset' attributes. (LBDB-180)

LBDB-181 (error) The '%s' group, with both 'clear' and 'preset' attributes, requires 'clear_preset_var1' and/or 'clear_preset_var2' attributes.

DESCRIPTION

This message indicates that you specified both the 'clear' and the 'preset' attribute in a sequential model group without specifying both the 'clear_preset_var1' or the 'clear_preset_var2' attributes.

WHAT NEXT

Add either 'clear_preset_var1' or 'clear_preset_var2' to the sequential group.

EXAMPLES

```
ff("IQ", "IQN") {
next_state : "D";
clocked_on : "CP";
preset : "SD'";
clear : "CD";
```

In this case, the 'clear_preset_var1' and or 'clear_preset_var2' attributes are missing.

EXAMPLE MESSAGE

Error: Line 93, The 'ff' group, with both 'clear' and 'preset' attributes, requires 'clear_preset_var1' and/or 'clear_preset_var2' attributes. (LBDB-181)

LBDB-182 (error) Invalid %s name '%s' is detected. This name must be unique among all pin names, bus names, bundle names, and rail connection names.

DESCRIPTION

This message indicates a duplicate pin, bus, bundle, or a rail_connection name in the library.

WHAT NEXT

Change the name of the pin, bus, bundle, rail_connection in the technology library.

EXAMPLES

```
pin(D) {  
    direction : input;  
    capacitance : 1.0;  
}  
pin(D) {  
    direction : input;  
    capacitance : 1.0;  
}
```

EXAMPLE MESSAGE

Error: Line 56, Invalid pin name 'D' is detected. This name must be unique among all pin names, bus names, and bundle names. (LBDB-182)

LBDB-186 (error) Invalid '%s' pin name is detected in the '%s' bundle.

DESCRIPTION

This message indicates that you specified an invalid pin name in a bundle group.

WHAT NEXT

Change the library source file by correcting the pin name.

LBDB-187 (error) The '%s' bundle needs to have its 'members' specified first.

The '%s' %s is found before a 'members'.

DESCRIPTION

This message indicates that you specified the members attribute in a bundle group after another attribute. The **members** attribute has to be first in the bundle group.

WHAT NEXT

Change the library source file by specifying the members attribute first in the bundle group.

EXAMPLES

```
bundle (DD) {  
direction : input;  
members(D1, D2);  
capacitance : 1;  
}
```

EXAMPLE MESSAGE

Error: Line 94, The 'DD' bundle needs to have its 'members' specified first.
The 'direction' attribute is found before a 'members'. (LBDB-187)

LBDB-188 (error) The 'members' attribute is defined multiple times.

DESCRIPTION

This message indicates that you specified the **members** attribute in a bundle group more than once. Library Compiler expects only one **members** attribute in the bundle group.

WHAT NEXT

Change the library source file by specifying only one members attribute in a bundle group.

EXAMPLES

```
bundle (DD) {
```

```
direction : input;
members(D1, D2);
members(D3, D4);
capacitance : 1;
}
```

EXAMPLE MESSAGE

Error: Line 95, The 'members' is defined multiple times. (LBDB-188)

LBDB-189 (warning) Level shifters are required for this library.
A level shifter is a buffer or inverter with differing connection_class values specified between input and output pins. Design Compiler cannot produce valid designs using this library if a level shifter component is not provided.

DESCRIPTION

This warning message occurs when your library contains connection classes that cannot be used without level shifters. Design Compiler uses these components to shift a net from one connection class to another and does so to remove connection class violations from your design. Multi-input or multi-output cells with differing connection classes on inputs and outputs are not considered level shifters. Following this warning message, a list appears of those connection classes that do not have valid shifters between them.

This warning alerts you to situations where Design Compiler might not be able to validate your design for connection class. For example, suppose that Library Compiler warns that you are missing a level shifter with an input connection class of "a" and an output connection class of "b". If there is a pin or port in your design with a connection class of "b" connected to a driver with a connection class of "a", Design Compiler might be unable to validate this connection without a level shifting component that converts voltage levels from an input connection class of "a" to an output connection class of "b".

There are cases where this message can be too restrictive. For example, consider the case where you, the designer, know that all inputs to your design will only have connection class "a" and that all outputs will only have connection class "c". Meanwhile, for the purposes of our example, assume that all "internal" logic in the design will have connection class "b". If you defined a library with two level shifters (one with "a" on the input and "b" on the output, and the other with "b" on the input and "c" on the output), Design Compiler can validate the design because it can convert voltage levels from the inputs at level "a" to internal logic at level "b", and from internal logic at level "b" to the outputs at level "c". In this case, the warnings that you receive about missing level shifters would be too restrictive. However, you have an output that is at level "a", and is driven by internal logic at level "b", Design Compiler is not be able to validate the design unless it can replace the component driving the output port with a component that has level "a" on

its output pin.

Be aware of the current limitations in the connection class validation and be advised that you can construct a library with connection rule restrictions that are too difficult for Design Compiler to solve. Future versions of the software might remove these restrictions, but Library Compiler currently informs you of the limitations on validating a design for connection class violations.

WHAT NEXT

If this message appeared because you omitted some level shifting components from your library, add the components.

EXAMPLES

```
cell(lbdb189) {
    /* Should only be connected to IO Cells only */
    area : 0.0;
    dont_touch : false;
    dont_use : false;
    pad_cell : true;
    pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        direction : input;
        capacitance : 1.0;
        fanout_load : 0.0;
    }
    pin(Y ) {
        connection_class : "iopcl";
        direction : output;
        function : "PAD";
        max_fanout : 1.0;
        timing() {
            intrinsic_fall : 1.0;
            intrinsic_rise : 1.0;
            fall_resistance : 0.0;
            rise_resistance : 0.0;
            related_pin : "PAD ";
        }
    }
}
```

EXAMPLE MESSAGE

Warning: Line 1, Level shifters are required for this library.
A level shifter is a buffer or inverter with differing
connection_class values specified between input and output
pins. Design Compiler cannot produce valid designs using this
library if a level shifter component is not provided. (LBDB-189)

LBDB-190 (warning) %s level shifter with input connection class '%s'
and output connection class '%s' is needed.

DESCRIPTION

This message indicates that a (noninverting or inverting) level shifter is needed between the two connection classes. See the man page for error LBDB-189 for more information on how this message can occur.

WHAT NEXT

If you obtained this message because you omitted a level shifting component from your library, add the level shifting component.

EXAMPLES

```
cell(IOPCLBUF) {
    /* Should only be connected to IO Cells only */
    area : 0.000000;
    dont_touch : false;
    dont_use : false;
    pad_cell : true;
    pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        direction : input;
        capacitance : 35.000000;
        fanout_load : 0.000000;
    }
    pin(Y ) {
        connection_class : "iopcl";
        direction : output;
        function : "PAD";
        max_fanout : 16.000000;
        timing() {
            intrinsic_fall : 3.925000;
            intrinsic_rise : 3.925000;
            fall_resistance : 0.000000; /* delay included in intrinsic */
            rise_resistance : 0.000000; /* delay included in intrinsic */
            related_pin : "PAD ";
        }
    }
}
```

EXAMPLE MESSAGE

Warning: Line 1, Noninverting level shifter with input connection class 'iopcl'
and output connection class 'default' is needed. (LBDB-190)

LBDB-191 (error) The inout '%s' pin, bus, or bundle has no 'three_state' function.

DESCRIPTION

The pin whose direction is specified as 'inout' has only a 'function' statement. The 'three_state' statement is also required by an "inout" pin.

WHAT NEXT

If the pin is actually an output pin, change the direction attribute to 'output'. Otherwise, add the 'three_state' statement to the pin.

EXAMPLES

```
pin(Z) {  
    direction : inout;  
    function : "A B";  
}
```

EXAMPLE MESSAGE

Error: Line 356, The inout 'Z' pin, bus, or bundle has no 'three_state' function. (LBDB-191)

LBDB-192 (error) Illegal interdependence data specified in pin "%S".

DESCRIPTION

timing arc with "interdependence_id" attribute is treated as interdependence data in pin. they are used for setup/hold pessimism reduction. There are some rules to specified the id for interdependence data (These rules applies to timing arcs with same condition) :

1. Interdependece data can not be the first timing arc in this pin. This it to prevent potential backward compatibility issue.
2. Interdependece data should be in pair. That is, if there is a setup_rising interdependence data with id = 1 in the pin, a hold_rising interdependence data with same id = 1 is needed. Same case for timing type = setup_falling / hold_falling.
3. For one timing_type arcs, the interdependence id should be unique. E.g. If there are two setup_rising interdependence data with same id = 1, this error is issued.
4. The interdependence id starts from 1, and if multiple interdependence data

defined for the pin, the id should be consecutive. E.g. id = 1,2,3 is okay, but 1, 2, 4 is not.

WHAT NEXT

Check the id value for interdependence data in the pin group, make sure all above requirements are satisfied.

EXAMPLES

```
pin(D) {
    direction : input;
timing() {
    timing_type : setup_rising;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
timing() {
    timing_type : setup_rising;
    interdependence_id : 1;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
timing() {
    timing_type : hold_rising;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
timing() {
    timing_type : hold_rising;
    interdependence_id : 2;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
```

```
}
```

EXAMPLE MESSAGE

Error: Line 356, Illegal interdependence data specified in pin "D".(LBDB-192)

LBDB-193 (error) Interdependence data is defined for wrong timing type arc in pin "%s".

DESCRIPTION

Timing group with "interdependence_id" attribute is treated as interdependence data in pin. they are used to for setup/hold pessimism reduction. For now, It's only supported for these timing types: setup_rising, hold_rising, setup_falling, hold_falling.

WHAT NEXT

Check the interdependence data in the pin group, make sure they are defined for constraint arcs with right timing type.

EXAMPLES

```
pin(D) {
    direction : input;
timing() {
    timing_type : setup_rising;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
timing() {
    timing_type : skew_rising; // not support type
    interdependence_id : 1;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
timing() {
    timing_type : hold_rising;
    fall_constraint("template") {
```

```

    ...
}
rise_constraint("template") {
    ...
}
related_in: "CLK";
}
timing() {
    timing_type : hold_rising;
    interdependence_id : 2;
    fall_constraint("template") {
        ...
    }
    rise_constraint("template") {
        ...
    }
    related_in: "CLK";
}
}

```

EXAMPLE MESSAGE

Error: Line 356, Interdependence data is defined for wrong timing type arc in pin "D". (LBDB-193)

LBDB-200 (error) The cell has both the 'pad_cell' and the 'auxiliary_pad_cell' attributes.

DESCRIPTION

This message indicates that you specified both the **pad_cell** and the **auxiliary_pad_cell** attributes in the same cell.

WHAT NEXT

Remove either the **pad_cell** attribute or the **auxiliary_pad_cell** attribute.

EXAMPLES

```

cell(lbdb200){
    area : 0.000000;
    pad_cell : true;
    auxiliary_pad_cell : true;
}

```

EXAMPLE MESSAGE

Error: Line 3577, The cell has both the 'pad_cell' and the 'auxiliary_pad_cell' attributes. (LBDB-200)

LBDB-201 (error) A nonpad '%s' cell has a '%s' attribute.

DESCRIPTION

This message indicates that you specified a pad_type attribute in a nonpad cell.

WHAT NEXT

Check the "Library Compiler User Guide" for information on pad cells. Either remove the invalid attribute or add the pad_type, the pad_cell, or the auxiliary_pad_cell attribute.

EXAMPLES

```
cell(lbdb201){  
    area : 0.0;  
    pad_type : clock;  
    pin(Z) {  
        direction : output  
        function : "A"  
    }  
    pin(A) {  
        direction : input;  
        capacitance : 1.0;  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 3577, A nonpad 'lbdb201' cell has a 'pad_type' attribute. (LBDB-201)

LBDB-202 (error) A nonpad '%s' cell has a '%s' pin with a '%s' attribute.

DESCRIPTION

This message indicates that you specified a pad pin attribute in a nonpad cell.

WHAT NEXT

refer to the "Library Compiler User Guide" for information on pad cells. Either remove the invalid attribute or add the pad_cell attribute.

EXAMPLES

```
cell(lbdb202){  
    area : 0.0;  
    pin(Z) {  
        is_pad : true;  
        direction : output  
        drive_current : 2.0;  
        function : "A"  
    }  
    pin(A) {  
        direction : input;  
        capacitance : 1.0;  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 3581, A nonpad 'lbldb202' cell has a 'Z' pin
with a 'is_pad' attribute. (LBDB-202)

LBDB-203 (error) The nonpad '%s' pin has a '%s' attribute.

DESCRIPTION

This message indicates that you specified a pad cell with pad_type and pad_cell attributes defined and a nonpad pin with a hysteresis attribute.

WHAT NEXT

Refer to the "Library Compiler User Guide" for information on pad cells. Either remove the pad cell attributes or add the pad pin attributes.

EXAMPLES

```
cell(lbdb203){  
    area : 0.0;  
    pad_type : clock;  
    pad_cell : true;  
    pin(Z) {  
        direction : output;  
        hysteresis : true;  
        function : "A";  
    }  
}
```

```
pin(A) {
    direction : input;
    capacitance : 1.0;
}
}
```

EXAMPLE MESSAGE

Error: Line 3584, The nonpad 'Z' pin has a 'hysteresis' attribute. (LBDB-203)

LBDB-204 (error) The '%s' %s pin cannot have a '%s' attribute.

DESCRIPTION

This message indicates that you specified a pad pin attribute on a pin with an invalid direction.

WHAT NEXT

Refer to the "Library Compiler User Guide" for information on pad cells. Either change the pin's direction or move the attribute to the correct pin.

EXAMPLES

```
cell(lbdb204) {
    area : 0.0;
    pad_cell : true;
    pin(Z) {
        direction : output;
        is_pad : true;
        hysteresis : true;
        function : "A";
    }
    pin(A) {
        direction : input;
        capacitance : 1.0;
    }
}
```

EXAMPLE MESSAGE

Error: Line 3584, The 'Z' output pin cannot have a 'hysteresis' attribute. (LBDB-204)

LBDB-205 (warning) The '%s' pad pin is missing a '%s' attribute.

DESCRIPTION

This message indicates that you specified an output or inout pad pin without a **drive_current** attribute.

WHAT NEXT

Refer to the "Library Compiler User Guide" for information on pad cells and pins. Add the missing attribute to the pin.

EXAMPLES

```
cell(lbdb205){  
    area : 0.0;  
    pad_cell : true;  
    pin(Z) {  
        direction : output;  
        is_pad : true;  
        hysteresis : true;  
        function : "A";  
    }  
    pin(A) {  
        direction : input;  
        capacitance : 1.0;  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 3596, The 'Z' pad pin is missing a 'drive_current' attribute. (LBDB-205)

LBDB-206 (error) The '%s' pad cell has no pad pins.

DESCRIPTION

This message indicates that you specified a pad cell with **pad_type** and **pad_cell** attributes defined but you did not specify pad pin attributes associated with any pin in the cell.

WHAT NEXT

Refer to the "Library Compiler User Guide" for information on pad cells. Remove either the pad cell attributes or add the pad pin attributes.

EXAMPLES

```
cell(lbdb206) {
    area : 0.0;
    pad_type : clock;
    pad_cell : true;
    pin(Z)  {
        direction : output
        function : "A"
    }
    pin(A) {
        direction : input;
        capacitance : 1.0;
    }
}
```

EXAMPLE MESSAGE

Error: Line 3575, The 'lbdb206' pad cell has no pad pins. (LBDB-206)

LBDB-207 (warning) The '%s' pad cell has more than one pad pin.

DESCRIPTION

This message indicates that you specified more than one pad pin in a pad cell.

WHAT NEXT

Refer to the "Library Compiler User Guide" for information on pad cells.

EXAMPLES

```
cell(lbdb207) {
    area : 0.0;
    pad_cell : true;
    bond_pads : 1;
    driver_sites : 1;
    pin(PAD ) {
        direction : input;
        is_pad : true;
        input_voltage : CMOS;
        capacitance : 1.0;
    }
    pin(PAD1 ) {
        direction : input;
        is_pad : true;
```

```

        input_voltage : CMOS;
        capacitance : 1.0;
    }
    pin(Y) {
        direction : output;
        function : "PAD PAD1";
        timing() {
intrinsic_fall : 1.0;
intrinsic_rise : 1.0;
fall_resistance : 0.50;
rise_resistance : 0.50;
related_pin :"PAD PAD1";
        }
    }
}

```

In this case, there are two pad pins: 'PAD' and 'PAD1'.

EXAMPLE MESSAGE

Warning: Line 33, The 'lbdb207' pad cell has more than one pad pin. (LBDB-207)

LBDB-208 (error) The %s '%s' pad cell cannot be a 'clock' pad.

DESCRIPTION

This message indicates you specified an output pad pin with the `is_pad` attribute on a clock pad. Library Compiler accepts clock pads only on input pins.

WHAT NEXT

Refer to the "Library Compiler User Guide" for information on pad cells. Check the library source file, and specify the `is_pad` attribute to an input pin.

EXAMPLES

```

cell(lbdb208) {
    area : 0.0;
    pad_cell : true;
    pad_type : clock;
    pin(PAD) {
        direction : input;
        capacitance : 1.0;
    }
    pin(Y) {
        direction : output;
        is_pad : true;
        function : "PAD";
        output_voltage : CMOS_OUT;
        timing() {

```

```
intrinsic_fall : 1.0;
intrinsic_rise : 1.0;
fall_resistance : 0.0;
rise_resistance : 0.0;
related_pin :"PAD";
}
}
}
```

EXAMPLE MESSAGE

Error: Line 65, The output 'lbdb208' pad cell cannot be a 'clock' pad. (LBDB-208)

LBDB-209 (error) A '%s' attribute cannot be specified on a pin unless a pull_up or pull_down driver_type is specified.

DESCRIPTION

This message indicates that you specified a **pulling_resistance** or a **pulling_current** attribute on a pin without specifying the pullup or pulldown driver type.

WHAT NEXT

Change the library file by either adding the **driver_type** attribute to the specified pin or removing the **pulling_resistance** or **pulling_current** attribute.

EXAMPLES

```
pin(A) {
    direction : output;
    pulling_resistance : 100;
    ...
}
```

In this case, the **driver_type** is missing. To fix the problem, add the statement,

```
    driver_type : pull_up;
```

EXAMPLE MESSAGE

Error: Line 355, A 'pulling_resistance' attribute cannot be specified on a pin unless a pull_up or pull_down driver_type is specified. (LBDB-209)

LBDB-210 (error) The pulling_current value cannot be 0.0.

DESCRIPTION

This message indicates that you specified a zero value for the **pulling_current** attribute.

WHAT NEXT

Change the value of the attribute to a nonzero value.

EXAMPLES

```
pulling_current : 0.0;
```

EXAMPLE MESSAGE

Error: Line 357, The pulling_current value cannot be 0.0. (LBDB-210)

LBDB-211 (error) The '%s' driver_type cannot be specified on a pin that already has a %s driver_type specified.

DESCRIPTION

This message indicates that you specified an incompatible set of driver types on a pin. Library Compiler fails if the driver_type value includes the following combinations:

- * pull_up and pull_down
- * pull_up and bus_hold
- * pull_down and bus_hold
- * open_drain and open_source
- * open_drain and bus_hold
- * open_source and bus_hold

WHAT NEXT

Refer to the "Library Compiler User Guide" for driver_type information. Remove the incompatible values of the driver_type attribute.

EXAMPLES

```
cell(lbdb211) {
    area : 2;
    pin(A) {
        direction : input;
```

```

        capacitance : 1.0;
    }
pin(Z2) {
    direction : output;
    function : "A";
    driver_type : "pull_up pull_down";
    timing() {
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
related_pin : "A";
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 84, The 'pull_down' driver_type cannot be specified on a pin that already has a 'pull_up' driver_type specified. (LBDB-211)

LBDB-212 (error) The 'open_%s' driver_type cannot be specified on an input pin.

DESCRIPTION

This message indicates that you specified an invalid **open_source** or **open_drain** driver_type value on an input_pin.

WHAT NEXT

Refer to the "Library Compiler User Guide" for driver_type information. Remove the invalid value of the driver_type attribute.

EXAMPLES

```

cell(lbdb212) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1.0;
        driver_type : "open_drain";
    }
    pin(Z2) {
        direction : output;
        function : "A";
        timing() {
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;

```

```
related_pin : "A";
}
}
}
```

EXAMPLE MESSAGE

Error: Line 78, The 'open_drain' driver_type cannot be specified on an input pin. (LBDB-212)

LBDB-213 (error) The '%s' area attribute cannot be specified on a pin of a cell that is not a pad cell.

DESCRIPTION

This message indicates that you specified a user-defined cell area value for pad cells and applied it to a nonpad cell.

WHAT NEXT

Change the library file, and either make the cell a pad cell or remove the pad information from the cell.

EXAMPLES

```
define_cell_area(my_area,pad_slots);

cell(NON_PAD_CELL) {
    area : 1;
    my_area : 10;
}
```

EXAMPLE MESSAGE

Error: Line 29, The 'my_area' area attribute cannot be specified on a pin of a cell that is not a pad cell. (LBDB-213)

LBDB-214 (error) The '%s' area attribute of '%s' type cannot be specified on a pin of a cell that is not a pad cell

or an auxiliary pad cell.

DESCRIPTION

This message indicates that you specified a user-defined cell area value for pad cells or auxiliary pad cells and applied it to a nonpad cell.

WHAT NEXT

Change the library file and either make the cell a pad cell or remove the pad information from the cell.

EXAMPLES

```
define_cell_area(your_area,pad_driver_sites);  
  
cell(NON_PAD_CELL) {  
    area : 1;  
    your_area : 10;  
}
```

EXAMPLE MESSAGE

Error: Line 29, The 'your_area' area attribute of 'pad_driver_sites' type cannot be specified on a pin of a cell that is not a pad cell or an auxiliary pad cell. (LBDB-214)

LBDB-215 (error) The '%s' attribute cannot be specified on the '%s' input pin.

DESCRIPTION

This message indicates that you specified an invalid attribute on an input pin. Library Compiler fails if the following attributes are associated with an input pin.

- * A driver_type attribute whose value is bus_hold
- * A slew_control attribute
- * An edge_rate_rise attribute
- * An edge_rate_fall attribute
- * An edge_rate_rise_load attribute
- * An edge_rate_fall_load attribute
- * A reference_resistance attribute

WHAT NEXT

Check the library source file, and delete the invalid attribute from the input pin.

EXAMPLES

```
pin(B) {
    direction : input;
    capacitance : 1.0;
    fanout_load : 1.0;

    edge_rate_breakpoint_r0 : 0.000;
    edge_rate_breakpoint_f0 : 0.000;
    edge_rate_breakpoint_r1 : 0.010;
    edge_rate_breakpoint_f1 : 0.010;

    edge_rate_rise : 1.0;
    edge_rate_load_rise : 1.0;
    edge_rate_fall : 1.0;
    edge_rate_load_fall : 1.0;
}
```

EXAMPLE MESSAGE

Error: Line 110, The 'edge_rate_rise' attribute cannot be specified
on the 'B' input pin. (LBDB-215)

LBDB-216 (error) The '%s' scaled_cell's '%s' pin has a different number of timing arcs than the corresponding pin on the '%s' cell.

DESCRIPTION

This message indicates that a timing group is missing in one of the output pins of either the specified cell or the scaled_cell.

WHAT NEXT

Add the missing timing group to the specified output pin in either the cell or the scaled_cell.

EXAMPLES

```
library(lbdb216) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }
    cell(IVV) {
        area : 1;
```

```

        pin(A) {
direction : input;
capacitance : 1;
}
pin(Z) {
direction : output;
function : "A'";
timing() {
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A";
}
}
}

scaled_cell(IVV,WCCOM) {
    area : 1;
    pin(A) {
direction : input;
capacitance : 1;
}
    pin(Z) {
direction : output;
function : "A'";
}
}
}

```

In this case, add the following timing group to the 'Z' pin in the scaled_cell to fix the problem.

```

timing() {
    intrinsic_rise : 0.3;
    intrinsic_fall : 0.3;
    rise_resistance : 0.3;
    fall_resistance : 0.3;
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A";
}

```

EXAMPLE MESSAGE

Error: Line 40, The 'WCCOM' scaled_cell's 'Z' pin has a different number of timing arcs than the corresponding pin on the 'IVV' cell. (LBDB-216)

LBDB-217 (error) The '%s' cell's '%s' pin has a timing arc

**without
a counterpart on the scaled_cell(%s,%s).**

DESCRIPTION

Each timing arc in the regular cell needs a matched timing arc on the same pin in the scaled_cell group. This message indicates that a matching timing arc is not found in the library source file.

WHAT NEXT

Find the missing timing group in the scaled_cell and add it, or remove one of the extra timing groups in the cell.

EXAMPLES

```
library(lbdb217) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }
    cell(AND) {
        area : 1;
        pin(A B) {
direction : input;
capacitance : 1;
        }
        pin(Z) {
direction : output;
function : "A B";
timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
}

scaled_cell(AND,WCCOM) {
    area : 1;
    pin(A B) {
direction : input;
capacitance : 1;
    }
    pin(Z) {
```

```

direction : output;
function : "A B";
timing() {
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A";
}
timing() {
    intrinsic_rise : 0.3;
    intrinsic_fall : 0.3;
    rise_resistance : 0.3;
    fall_resistance : 0.3;
    slope_rise : 0.0;
    slope_fall : 0.0;
    related_pin : "A ";
}
}
}

```

In this case, The timing arc between 'Z' and 'A' is defined once in the 'AND' cell and twice in the 'AND' scaled_cell. To fix the problem, remove one of the timing arcs.

EXAMPLE MESSAGE

Error: Line 42, The 'AND' cell's 'Z' pin has a timing arc without a counterpart on the scaled_cell(AND,WCCOM). (LBDB-217)

LBDB-218 (warning) The 'direction' of the '%s' scaled_cell pin does not match that of the same pin name on the '%s' cell. Resetting the scaled_cell pin's direction to match both directions.

DESCRIPTION

This message indicates that a direction attribute of a scaled_cell pin is different from the same pin on the primary cell. Library Compiler matches the direction of the scaled_cell pin to the direction of the primary pin.

WHAT NEXT

Check the library source file, and make sure the directions are the same.

EXAMPLES

```
cell(AND) {
    area : 1;
    pin(A B C) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : inout;
        function : "A B";
        three_state : "C";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A B C";
        }
        timing() {
            timing_type : three_state_disable;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "C";
        }
    }
}
scaled_cell(AND,WCCOM) {
    area : 1;
    pin(A B C) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
}
```

EXAMPLE MESSAGE

Warning: Line 313, The 'direction' of the 'Z' scaled_cell pin
does not match that of the same pin name on the 'AND' cell.
Resetting the scaled_cell pin's direction to match both directions. (LBDB-

LBDB-219 (error) The '%s,%s' scaled_cell has duplicate timing arcs for the '%s' pin. It is unclear which arc corresponds to the arcs in the '%s' cell.

DESCRIPTION

This message indicates that a scaled_cell has duplicate timing arcs between two pins. Library Compiler fails to recognize the equivalent timing arc in the primary cell.

WHAT NEXT

Check the library source file, and remove the second timing arc.

LBDB-220 (error) The '%s' %s_voltage group has no '%s' attribute specified. This attribute is essential in defining valid voltages.

DESCRIPTION

This message indicates that an input_voltage or an output_voltage group has one of its attributes missing. For an input_voltage group, Library Compiler fails if any of the vil, vih, vimin, or vimax attributes is missing. For an output_voltage group, Library Compiler fails if any of the vol, voh, vomin, or vomax attributes is missing.

WHAT NEXT

Check the library source file, and add the missing attribute to the voltage group.

EXAMPLES

```
output_voltage(CMOS_OUT) {
    vil : 1.5;
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
}
```

In this case, either there is a typo where the output_voltage is specified instead of input_voltage, or the vol, voh, vomin, and vomax are not specified for the

```
output_voltage.
```

EXAMPLE MESSAGE

```
Error: Line 31, The 'CMOS_OUT' output_voltage group has no 'vol' attribute specified. This attribute is essential in defining valid voltages. (LBDB-220)
```

**LBDB-221 (warning) The '%s' %s_voltage group has a %s value,
which is %s %s.**

DESCRIPTION

This message indicates that an **input_voltage** or an **output_voltage** has inconsistent values for its attributes. Library Compiler issues warnings in these cases:

- * vil value is less than vimin value.
- * vih value is greater than vimax value.
- * vol value is less than vomin value.
- * voh value is greater than vomax value.

WHAT NEXT

Change the specified attribute value to be consistent with the minimum or the maximum values.

EXAMPLES

```
input_voltage(CMOS) {  
    vil : -1.5;  
    vih : 3.5;  
    vimin : -0.3;  
    vimax : VDD + 0.3;  
}
```

In this case, the vil value is less than the vimin value.

EXAMPLE MESSAGE

```
Warning: Line 25, The 'CMOS' input_voltage group has a vil value,  
which is less than vimin. (LBDB-221)
```

LBDB-222 (error) The fpga_family attribute is required when

the fpga_cell_type attribute is specified.

DESCRIPTION

This message indicates that in an fpga cell you specified an **fpga_cell_type** attribute without the **fpga_family** attribute.

WHAT NEXT

Add the missing fpga_family attribute to the cell.

EXAMPLES

```
cell( lbdb222 ) {  
area : 1;  
fpga_cell_type : CLB;  
  
pin( K ) {  
    direction : input;  
    capacitance : 0.0;  
}  
...  
}
```

In this case, to fix the problem, add the statement to the cell.

```
fpga_family : "x4000";
```

EXAMPLE MESSAGE

Error: Line 28, The fpga_family attribute is required when
the fpga_cell_type attribute is specified. (LBDB-222)

**LBDB-223 (error) The fpga_cell_type attribute is required when
the fpga_family attribute is specified.**

DESCRIPTION

This message indicates that in an fpga cell you specified an **fpga_family** attribute without the **fpga_cell_type** attribute.

WHAT NEXT

Add the missing fpga_cell_type attribute to the cell.

EXAMPLES

```
cell(1bdb223) {  
area : 1;  
fpga_family : "x4000";  
  
pin( K ) {  
    direction : input;  
    capacitance : 0.0;  
}  
...  
}
```

In this case, to fix the problem, add the statement to the cell.

```
fpga_cell_type : CLB;
```

EXAMPLE MESSAGE

Error: Line 28, The `fpga_cell_type` attribute is required when the `fpga_family` attribute is specified. (LBDB-222)

LBDB-224 (error) The `fpga_timing_type` is required on all arcs when `fpga_cell_type` and `fpga_family` are specified.

DESCRIPTION

This message indicates that you did not specify `fpga_timing_type` groups in a cell with the `fpga_family` and the `fpga_cell_type` attributes.

WHAT NEXT

Add the missing `fpga_timing_type` groups to all the pins of the cell.

EXAMPLES

```
cell(INV) {  
    fpga_family : "x4000";  
    fpga_cell_type : CLB;  
    area : 1;  
    pin(X) {  
        function : "A'";  
        direction : output;  
        timing() {  
            intrinsic_rise : 0.1;  
            intrinsic_fall : 0.1;  
            rise_resistance : 1.0;  
            fall_resistance : 1.0;  
            related_pin : "A";  
        }  
    }  
}
```

```

        }
    }
    pin(A) {
direction : input;
capacitance : 0.1;
fanout_load : 0.1;
}
}

```

To fix the problem, add the attribute to the timing group.

```

timing() {
    fpga_timing_type : ICK;
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 1.0;
    fall_resistance : 1.0;
    related_pin : "A";
}

```

EXAMPLE MESSAGE

Error: Line 208, The fpga_timing_type is required on all arcs when fpga_cell_type and fpga_family are specified. (LBDB-224)

LBDB-225 (error) The fpga_timing_type is invalid when the fpga_cell_type and the fpga_family attributes are not defined on a cell.

DESCRIPTION

This message indicates that you specified fpga_timing_type in a timing group of a pin without defining the fpga_family and the fpga_cell_type attributes at the cell level.

WHAT NEXT

Add the missing attribute to the library file.

EXAMPLES

```

cell(lbdb225) {
    area : 1;
    pin(X) {
function : "A'";
direction : output;
timing() {
    fpga_timing_type : ICK;
}
}
}

```

```

intrinsic_rise  : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 1.0;
fall_resistance : 1.0;
related_pin : "A";
}
}
pin(A) {
direction : input;
capacitance : 0.1;
fanout_load : 0.1;
}
}

```

To fix the problem, add the sample statements at the cell level.

```

fpga_family : "x4000";
fpga_cell_type : CLB;

```

EXAMPLE MESSAGE

Error: Line 30, The fpga_timing_type is invalid when the fpga_cell_type and the fpga_family attributes are not defined on a cell. (LBDB-225)

LBDB-226 (error) The FPGA CLB cell type from the x2000 family requires A, B, C, D, K, X, and Y pins.

DESCRIPTION

This message indicates that you specified an incomplete CLB FPGA cell with missing pins from the x2000 family.

WHAT NEXT

Add the missing pins to the cell.

EXAMPLES

```

cell(lbdb226) {
    fpga_family : "x2000";
    fpga_cell_type : CLB;
    area : 1;
    pin(X) {
function : "A'";
direction : output;
timing() {
    fpga_timing_type : ICK;
}
}
}

```

```

intrinsic_rise  : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 1.0;
fall_resistance : 1.0;
related_pin : "A";
}
}
pin(A) {
direction : input;
capacitance : 0.1;
fanout_load : 0.1;
}
}

```

EXAMPLE MESSAGE

Error: Line 22, The FPGA CLB cell type from the x2000 family requires A, B, C, D, K, X, and Y pins. (LBDB-226)

LBDB-227 (error) The FPGA IOB cell type from the x2000 family requires O, T, K, I, and PAD pins.

DESCRIPTION

This message indicates that you specified an incomplete IOB FPGA cell with missing pins from the x2000 family.

WHAT NEXT

Add the missing pins to the cell.

EXAMPLES

```

cell(lbdb227) {
    fpga_family : "x2000";
    fpga_cell_type : IOB;
    area : 1;
    pin(X) {
function : "A'";
direction : output;
timing() {
    fpga_timing_type : ICK;
    intrinsic_rise  : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 1.0;
    fall_resistance : 1.0;
    related_pin : "A";
}
}

```

```
        }
    }
    pin(A) {
direction : input;
capacitance : 0.1;
fanout_load : 0.1;
}
}
```

EXAMPLE MESSAGE

Error: Line 22, The FPGA IOB cell type from the x2000 family requires O, T, K, I, and PAD pins. (LBDB-227)

LBDB-228 (error) The FPGA CLB cell type from the x3000 family requires A, B, C, D, E, K, EC, DI, RD, X, Y, and GSR pins.

DESCRIPTION

This message indicates that you specified an incomplete CLB FPGA cell with missing pins from the x3000 family.

WHAT NEXT

Add the missing pins to the cell.

EXAMPLES

```
cell(lbdb228) {
    fpga_family : "x3000";
    fpga_cell_type : CLB;
    area : 1;
    pin(X) {
function : "A'";
direction : output;
timing() {
    fpga_timing_type : ICK;
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 1.0;
    fall_resistance : 1.0;
    related_pin : "A";
}
}
pin(A) {
direction : input;
capacitance : 0.1;
```

```
fanout_load : 0.1;
}
}
```

EXAMPLE MESSAGE

Error: Line 22, The FPGA CLB cell type from the x3000 family requires A, B, C, D, E, K, EC, DI, RD, X, Y, and GSR pins. (LBDB-228)

LBDB-229 (error) The FPGA IOB cell type from the x3000 family requires O, T, IK, OK, I, Q, PAD, and GSR pins.

DESCRIPTION

This message indicates that you specified an incomplete IOB FPGA cell with missing pins from the x3000 family.

WHAT NEXT

Add the missing pins to the cell.

EXAMPLES

```
cell(lbdb229) {
    fpga_family : "x3000";
    fpga_cell_type : IOB;
    area : 1;
    pin(X) {
        function : "A'";
        direction : output;
        timing() {
            fpga_timing_type : ICK;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "A";
        }
    }
    pin(A) {
        direction : input;
        capacitance : 0.1;
        fanout_load : 0.1;
    }
}
```

EXAMPLE MESSAGE

Error: Line 22, The FPGA IOB cell type from the x3000 family requires O, T, IK, OK, I, Q, PAD, and GSR pins. (LBDB-229)

LBDB-230 (error) The FPGA CLB cell type from the x4000 family requires

F1-F4, G1-G4, C1-C4, K, X, Y, XQ, YQ, GSR, CIN, and COUT pins.

DESCRIPTION

This message indicates that you specified an incomplete CLB FPGA cell with missing pins from the x4000 family.

WHAT NEXT

Add the missing pins to the cell.

EXAMPLES

```
cell(lbdb230) {
    fpga_family : "x4000";
    fpga_cell_type : CLB;
    area : 1;
    pin(X) {
        function : "A'";
        direction : output;
        timing() {
            fpga_timing_type : ICK;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "A";
        }
        pin(A) {
            direction : input;
            capacitance : 0.1;
            fanout_load : 0.1;
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 22, The FPGA CLB cell type from the x4000 family requires F1-F4, G1-G4, C1-C4, K, X, Y, XQ, YQ, GSR, CIN, and COUT pins. (LBDB-230)

LBDB-231 (error) The FPGA IOB cell type from the x4000 family requires O, T, IK, OK, I1, I2, PAD, and GSR pins.

DESCRIPTION

This message indicates that you specified an incomplete IOB FPGA cell with missing pins from the x4000 family.

WHAT NEXT

Add the missing pins to the cell.

EXAMPLES

```
cell(lbdb231) {
    fpga_family : "x4000";
    fpga_cell_type : IOB;
    area : 1;
    pin(X) {
        function : "A'";
        direction : output;
        timing() {
            fpga_timing_type : ICK;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "A";
        }
    }
    pin(A) {
        direction : input;
        capacitance : 0.1;
        fanout_load : 0.1;
    }
}
```

EXAMPLE MESSAGE

Error: Line 22, The FPGA IOB cell type from the x4000 family requires O, T, IK, OK, I1, I2, PAD, and GSR pins. (LBDB-231)

LBDB-235 (error) This %s voltage or power supply group is not

defined.

DESCRIPTION

This message indicates the specified voltage or the power supply associated with the signal level is not defined in the library source file. The voltage can either be input or output.

WHAT NEXT

Add the missing voltage or the power supply to the library file.

EXAMPLES

```
pin(PAD) {
is_pad : true;
input_voltage : lbdb235;
direction : input;
capacitance : 35.000000;
fanout_load : 0.000000;
}
pin(PAD1) {
is_pad : true;
input_signal_level : VDD1;
direction : input;
capacitance : 35.000000;
fanout_load : 0.000000;
}
```

In this case, the 'lbdb235' input_voltage is not defined. To fix the problem, add the following input_voltage:

```
input_voltage(lbdb235) {
vil : 0.8 ;
vih : 2.0 ;
vimin : -0.3 ;
vimax : VDD + 0.3 ;
}
```

In addition, the 'VDD1' input_signal_level is not defined. To fix the problem, add the following power_supply group:

```
power_supply() {
default_power_rail : VDD0;
power_rail (VDD1, 5.0);
}
```

EXAMPLE MESSAGE

Error: Line 23, This input voltage or power supply group is not defined. (LBDB-235)
Error: Line 30, This input voltage or power supply group is not defined. (LBDB-235)

LBDB-236 (error) An %s pin cannot specify an %s attribute.

DESCRIPTION

This message indicates that there is a mismatch between the direction of a pin and the voltage attribute. Library Compiler fails if you specify an input_voltage to an output pin and an output_voltage to an input pin.

WHAT NEXT

Check the library source file, and fix the invalid attribute, either the direction of the pin or the voltage attribute.

EXAMPLES

```
cell(lbdb236) {  
    area : 0.0;  
    pad_cell : true;  
    pad_type : clock;  
    pin(PAD) {  
        direction : input;  
        is_pad : true;  
        input_voltage : CMOS;  
        capacitance : 1.0;  
    }  
    pin(Y) {  
        direction : output;  
        is_pad : true;  
        function : "PAD";  
        input_voltage : CMOS;  
        timing() {  
            intrinsic_fall : 1.0;  
            intrinsic_rise : 1.0;  
            fall_resistance : 0.1;  
            rise_resistance : 0.1;  
            related_pin : "PAD";  
        }  
    }  
}
```

In this case, the 'Y' pin has an input_voltage specified. To fix the problem, change the voltage to an output_voltage attribute.

EXAMPLE MESSAGE

Error: Line 71, An output pin cannot specify an input_voltage attribute. (LBDB-236)

LBDB-238 (warning) No '%s' attribute has been specified for the

library. This attribute is needed in %s libraries.

DESCRIPTION

This message indicates that you did not specify any of the following attributes in the technology library.

```
* time_unit  
* capacitance_load_unit  
* pulling_resistance_unit  
* voltage_unit  
* current_unit
```

WHAT NEXT

Add the missing attribute to the library source file.

EXAMPLES

Add any of the following examples of attributes to the library:

```
capacitive_load_unit(0.042000,pf) ;  
voltage_unit : "1V";  
current_unit : "1mA";  
pulling_resistance_unit : "1kohm";  
time_unit : "1ns";
```

EXAMPLE MESSAGE

Warning: No 'capacitive_load_unit' attribute has been specified for the library. This attribute is needed in technology libraries. (LBDB-238)

LBDB-239 (error) The '%s' driver_type cannot coexist with the '%s' attribute on the '%s' pin.

DESCRIPTION

The **driver_type** specified in the pin cannot coexist with the attribute on the same pin. For example, a pin with a **bus_hold driver_type** is tied to a DC source. A function attribute or **three_state** attribute cannot be specified on a **bus_hold** pin.

WHAT NEXT

Check the specification of the cell, and make the appropriate change to the **driver_type** attribute or other attributes in the faulty pin group.

EXAMPLES

```
cell(lbdb239) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1.0;
    }
    pin(Z2) {
        direction : output;
        function : "A";
        driver_type : "bus_hold";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "A";
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 84, The 'bus_hold' driver_type cannot coexist
with the 'function' attribute on the 'Z2' pin. (LBDB-239)

LBDB-240 (error) The '%s' cell area attribute has already been defined.

DESCRIPTION

This message indicates that the user-defined cell area is specified twice.

WHAT NEXT

Remove the second definition of the cell area attribute.

EXAMPLES

```
define_cell_area(my_area,pad_slots);
define_cell_area(my_area,pad_slots);
```

EXAMPLE MESSAGE

Error: Line 24, The 'my_area' cell area attribute has already been defined. (LBDB-240)

LBDB-241 (warning) Multiple cell area definitions (%s, %s) map onto the same '%s' area. Using the last one encountered.

DESCRIPTION

This message indicates that you specified multiple defined_cell_area attributes with the same area kind. Library Compiler uses the last one encountered.

WHAT NEXT

Delete the redundant define_cell_area definitions.

EXAMPLES

```
define_cell_area(my_area,pad_slots);  
define_cell_area(your_area,pad_slots);
```

EXAMPLE MESSAGE

Warning: Line 24, Multiple cell area definitions (your_area, my_area) map onto the same 'pad_slots' area. Using the last one encountered. (LBDB-241)

LBDB-242 (warning) This '%s' timing arc has the same timing_type and related_pin attributes as the timing arc on the line %d.

DESCRIPTION

This message indicates that on the same pin you defined two timing groups with the same timing_type and related_pin attributes. Design Compiler considers the timing arcs as two separate arcs.

WHAT NEXT

If it is a typo, change the library file, and delete the redundant timing groups.

EXAMPLES

```
pin(QN) {  
    direction : output;  
    function : "IQN";  
    timing() {  
        timing_type : rising_edge;  
        intrinsic_rise : 1.0;
```

```

        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 2.0;
        intrinsic_fall : 2.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP P";
    }
    timing() {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

```

In this case, the 'QN' pin has the 'CP' related_pin and the 'rising_edge' timing_type multiply defined.

EXAMPLE MESSAGE

Warning: Line 591, This 'QN' timing arc has the same timing_type and related_pin attributes as the timing arc on the line 583. (LBDB-242)

LBDB-243 (warning) The '%s' combinational cell has a '%s' pin with a sequential timing arc containing the '%s' timing_type.

DESCRIPTION

This message indicates that you specified one of the cell's timing arcs as sequential, while the function of this cell is combinational. Library Compiler warns you if any of the following timing types is defined on a combinational cell:

- * rising_edge
- * falling_edge
- * preset
- * clear
- * setup_rising
- * setup_falling
- * hold_rising
- * hold_falling
- * recovery_rising

```
* recovery_falling
* skew_rising
* skew_falling
* removal_rising
* removal_falling
```

WHAT NEXT

Change the library source file, and fix the timing_type of the specified pin.

EXAMPLES

```
cell(lbdb243) {
    area : 1;
    pin(A B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A B";
        }
    }
}
```

In this case, the 'Z' pin has an invalid 'rising_edge' timing_type.

EXAMPLE MESSAGE

```
Warning: Line 84, The 'lbdb243' combinational cell has a 'Z' pin with
         a sequential timing arc containing the 'rising_edge' timing_type. (LBDB-
243)
```

LBDB-246 (warning) The default_wire_load_selection is not defined.

By default, the '%s' wire_load_selection group is used.

DESCRIPTION

The **default_wire_load_selection** attribute is undefined in this library. The **default_wire_load_selection** attribute is required when multiple wire_load_selection

groups are specified in a library. If there is only one wire_load_selection group defined in a library, Library Compiler automatically sets the **default_wire_load_selection** attribute to the only available wire_load_selection group.

WHAT NEXT

Set the **default_wire_load_selection** attribute to avoid this warning message, or ignore this message.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
wire_load_selection(test) {  
    wire_load_from_area(27,10,"10x10");  
    wire_load_from_area(27,100,"10x10");  
    wire_load_from_area(0,28,"05x05");  
    wire_load_from_area(2,10,"15x10");  
}
```

EXAMPLE MESSAGE

Warning: Line 50, The default_wire_load_selection is not defined.
By default, the 'test' wire_load_selection group is used. (LBDB-246)

LBDB-247 (error) The default_wire_load_selection is not defined.

The default_wire_load_selection attribute is required when more than one wire_load_selection group is specified.

DESCRIPTION

The **default_wire_load_selection** attribute is undefined in this library. Library Compiler requires this attribute because there is more than one wire_load_selection group specified.

WHAT NEXT

Set the **default_wire_load_selection** attribute to be one of the wire_load_selection

groups.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}  
  
wire_load_selection(test) {  
    wire_load_from_area(0,25,"05x05");  
}  
wire_load_selection(test1) {  
    wire_load_from_area(0,27,"05x05");  
}
```

To fix the problem, add this statement to the library:

```
default_wire_load_selection : test;
```

EXAMPLE MESSAGE

```
Error: Line 0, The default_wire_load_selection is not defined.  
The default_wire_load_selection attribute is required when more than one  
wire_load_selection group is specified. (LBDB-247)
```

LBDB-250 (warning) The '%s' pin already has a 'pulling_resistance' value.

The 'pulling_current' causes the 'pulling_resistance' value to be overwritten.

DESCRIPTION

This message indicates you specified both the **pulling_resistance** and the **pulling_current** attributes on the same pin. Library Compiler uses the pulling_current value and the nominal voltage to overwrite the pulling_resistance value.

WHAT NEXT

If you do not want the pulling_resistance value overwritten, delete the pulling_current attribute.

EXAMPLES

```
pin(Y) {  
direction : output;  
capacitance : 1.0;  
driver_type : pull_up;  
is_pad : true;  
slew_control : low;  
drive_current : 1.0;  
output_voltage : CMOS_OUT;  
function : "A";  
three_state : "GZ";  
pulling_resistance : 1000;  
pulling_current : 10;  
}
```

EXAMPLE MESSAGE

Warning: Line 93, The 'Y' pin already has a 'pulling_resistance' value.
The 'pulling_current' causes the 'pulling_resistance' value to be overwritten. (LBD
B-250)

LBDB-251 (warning) The '%s' pin has a 'hysteresis' attribute but no 'input_voltage' attribute. Both attributes are needed.

DESCRIPTION

This message indicates that you specified the hysteresis attribute, but you did not specify the input_voltage attribute in a pad cell.

WHAT NEXT

Add the input_voltage attribute to the pin in the pad cell.

EXAMPLES

```
pin(PAD ) {  
direction : input;  
is_pad : true;  
hysteresis : true;  
capacitance : 1.0;  
}
```

To fix the problem, add this statement to the 'PAD' pin:

```
input_voltage : CMOS; /* CMOS is defined in the library */
```

EXAMPLE MESSAGE

Warning: Line 53, The 'PAD' pin has a 'hysteresis' attribute but no 'input_voltage' attribute. Both attributes are required. (LBDB-251)

LBDB-252 (error) The '%s' %s group already exists and cannot be overwritten.

DESCRIPTION

This message indicates that you multiply defined either an input_voltage or an output_voltage group. Library Compiler does not allow the overwriting of existing voltage groups.

WHAT NEXT

Delete the second specification of the voltage group.

EXAMPLES

```
input_voltage(CMOS) {  
    vil : 1.5;  
    vih : 3.5;  
    vimin : -0.3;  
    vimax : VDD + 0.3;  
}  
  
input_voltage(CMOS) {  
    vil : 2.5;  
    vih : 4.5;  
    vimin : -0.3;  
    vimax : VDD + 0.3;  
}
```

EXAMPLE MESSAGE

Error: Line 31, The 'CMOS' input_voltage group already exists and cannot be overwritten. (LBDB-252)

LBDB-253 (error) The '%s' pin does not have all the %s slew rate attributes defined. The '%s' attribute is missing. All %s slew-rate attributes must be specified together as a

group.

DESCRIPTION

This message indicates that not all slew rate attributes are specified in a pin. Library Compiler expects the following rise slew rate attributes defined together:

- * rise_current_slope_before_threshold
- * rise_time_before_threshold
- * rise_current_slope_after_threshold
- * rise_time_after_threshold

and the following fall slew rate defined together:

- * fall_current_slope_before_threshold
- * fall_time_before_threshold
- * fall_current_slope_after_threshold
- * fall_time_after_threshold

WHAT NEXT

Check the library source file, and add the missing slew rate attribute.

EXAMPLES

```
cell(lbdb253) {  
    area : 0.0;  
    pad_cell : true;  
    bond_pads : 1;  
    driver_sites : 1;  
    pin(PAD) {  
        is_pad : true;  
        direction : output;  
        output_voltage : CMOS_OUT;  
        function : "Y";  
        drive_current : 1.0;  
        slew_control : high;  
        rise_time_before_threshold : 1.0;  
        rise_current_slope_after_threshold : -0.1;  
        rise_time_after_threshold : 1.0;  
        fall_current_slope_before_threshold : -0.1;  
        fall_time_before_threshold : 1.0;  
        fall_current_slope_after_threshold : 0.1;  
        fall_time_after_threshold : 1.0;  
        timing() {  
            intrinsic_fall : 1.0;  
            intrinsic_rise : 1.0;  
            fall_resistance : 0.1;  
            rise_resistance : 0.1;  
            related_pin : "Y";  
        }  
    }  
}
```

```
pin(Y) {
    direction : input;
    capacitance : 1.0;
}
}
```

In this case, the 'rise_current_slope_before_threshold' attribute is not specified for the 'PAD' pin.

EXAMPLE MESSAGE

Error: Line 88, The 'PAD' pin does not have all the rise slew rate attributes defined. The 'rise_current_slope_before_threshold' attribute is missing.
All rise slew-rate attributes must be specified together as a group. (LBDB-253)

LBDB-254 (error) The '%s' edge rate related attribute cannot be specified on the '%s' output pin.

DESCRIPTION

This message indicates that you specified an edge rate attribute on an output pin.

WHAT NEXT

Delete the attribute from the output pin group.

EXAMPLES

```
pin(Z) {
    direction : output;
    function : "(A & B)";
    max_fanout : 25;

    edge_rate_breakpoint_r0 : 0.0;
    edge_rate_breakpoint_f0 : 0.0;
    edge_rate_breakpoint_r1 : 0.1;
    edge_rate_breakpoint_f1 : 0.1;

    edge_rate_rise : 1.0;
    edge_rate_load_rise : 1.0;
    edge_rate_fall : 0.1;
    edge_rate_load_fall : 1.0;
}
```

EXAMPLE MESSAGE

Error: Line 120, The 'edge_rate_breakpoint_r0' edge rate related attribute

cannot be specified on the 'Z' output pin. (LBDB-254)

LBDB-255 (error) The 'vhdl_name' attribute of '%s' is invalid VHDL or conflicts with another 'vhdl_name' attribute.

DESCRIPTION

This message indicates that the cell or port **vhdl_name** attribute is either invalid VHDL (reserved VHDL name) or another cell or port has already been set to the same name.

WHAT NEXT

If the attribute is invalid VHDL, change the library by fixing the value of the **vhdl_name** attribute. If the value of the attribute is redundant, either delete the second attribute or change its value.

EXAMPLES

```
cell(lbdb255) {
    area : 2;
    pin(A) {
        vhdl_name : "pinvhdl";
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        vhdl_name : "pinvhdl" ;
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A^B";
        timing() {
            timing_sense : positive_unate;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
        timing() {
            timing_sense : non_unate;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
        }
    }
}
```

```

related_pin : "A B";
}
}
}

```

In this case, both the 'A' and 'B' pin have the same value in the vhdl_name attribute.

EXAMPLE MESSAGE

Error: Line 93, The 'vhdl_name' attribute of 'pinvhdl' is invalid VHDL or conflicts with another 'vhdl_name' attribute. (LBDB-255)

LBDB-256 (warning) The 'vhdl_name' attribute of '%s' is invalid VHDL or conflicts with another 'vhdl_name' attribute. Renamed to '%s'.

DESCRIPTION

This message indicates that the cell or port 'vhdl_name' attribute is either invalid VHDL or another cell or port has already been set to the same name.

Because this is an update_lib cell, the name is automatically renamed to a valid one.

WHAT NEXT

Change the file to update by changing the value of the vhdl_name attribute if you are not satisfied with the renamed value.

EXAMPLES

```

cell (lbdb256) {
    area : 1;
    pin(IN) {
        vhdl_name : "port_X";
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        vhdl_name : "port_X";/* rename after warning */
        direction : output;
        function : "IN'";
        timing () {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
        }
    }
}

```

```

        fall_resistance : 0.1;
        related_pin : "IN";
    }
}
}
```

EXAMPLE MESSAGE

Warning: Line 9, The 'vhdl_name' attribute of 'port_X' is invalid VHDL or conflicts with another 'vhdl_name' attribute. Renamed to 'port_Xb'. (LBDB-256)

LBDB-257 (warning) The '%s' wire_load_selection group has been specified

while the default_wire_load_mode is %s 'top'. This causes the 'wire_load_selection' group to work only for the top-level design.

DESCRIPTION

The 'default_wire_load_mode' is defined as, or defaults to, 'top', which causes the 'wire_load_selection' group to only work for the top-level design.

WHAT NEXT

Set the default_wire_load_mode to 'segmented' or 'enclosed' modes to work with wire_load_selection group.

EXAMPLES

```

default_wire_load_mode : 'top';
wire_load_selection(test) {
    wire_load_from_area(27,100,"10x10");
    wire_load_from_area(10,25,"05x05");
}
```

EXAMPLE MESSAGE

Warning: The 'test' wire_load_selection group has been specified while the default_wire_load_mode is default to 'top'. This causes the 'wire_load_selection' group to work only for the top-level design. (LBDB-257)

LBDB-258 (error) The '%s' driver_type cannot be specified

on a inout pin without a three_state attribute.

DESCRIPTION

This message indicates that you specified a pull_up or a pull_down driver_type on an inout pin lacking a three_state attribute.

WHAT NEXT

Either delete the driver_type or add the three_state attribute.

EXAMPLES

```
pin(A) {
    direction : inout;
    driver_type : pull_up;
    capacitance : 1;
    pulling_resistance : 100;
}
```

EXAMPLE MESSAGE

Error: Line 354, The 'pull_up' driver_type cannot be specified
on a inout pin without a three_state attribute. (LBDB-258)

LBDB-259 (error) The '%s' refers to a nonexistent or empty '%s'.

DESCRIPTION

This message indicates that you specified a nonexistent or empty template group on a propagation delay in a nonlinear delay library.

WHAT NEXT

Check the library source file, and either add the lu_table_template group if it is missing or correct the template name if it is a typo.

EXAMPLES

```
fall_propagation(lbdb259_template) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
}
```

To fix the problem, add the following group to the library file,

```
lu_table_template(lbdb259_template) {
    variable_1 : input_net_transition;
    variable_2 : output_net_length;
    index_1 ("0.1, 1.2, 2.3, 3.4");
    index_2 ("0.1, 1.2, 2.3, 3.4");
}
```

EXAMPLE MESSAGE

Error: Line 111, The 'lbdb259_template' refers to a nonexistent or empty 'lu_table_template'. (LBDB-259)

LBDB-260 (error) The '%s' in '%s' and '%s' in '%s' of the '%s' lu_table_template represent the same unallowable meaning.

DESCRIPTION

This message indicates that the two variables in the lu_table_template represent the same unallowable meaning. Library Compiler fails if both the values of variable_1 and variable_2 are from the following set:

- * total_output_net_capacitance
- * output_net_length
- * output_net_wire_cap
- * output_net_pin_cap

WHAT NEXT

Check the lu_table_template, and make the correction to either variable_1 or variable_2.

EXAMPLES

```
lu_table_template(lbdb260) {
    variable_1 : output_net_length;
    variable_2 : total_output_net_capacitance;
    index_2 ("0.1, 1.2, 2.3, 3.4");
}
```

EXAMPLE MESSAGE

Error: Line 57, The 'output_net_length' in variable_1 and 'total_output_net_capacitance' in variable_2 of the 'lbdb260' lu_table_template represent the same unallowable meaning. (LBDB-260)

LBDB-261 (error) The '%s' has already been specified for '%s'.

DESCRIPTION

This message indicates that routing track or look-up table information is specified multiple times. Library Compiler does not allow duplicate information.

WHAT NEXT

Check the library source file, and, if there is a duplicate, change the name of either group or delete one group.

EXAMPLES

```
lu_table_template(lbdb261_template) {  
    variable_1 : constrained_pin_transition;  
    variable_2 : related_pin_transition;  
    index_1 ("0.1, 1.2, 2.3, 3.4");  
    index_2 ("0.1, 1.2, 2.3, 3.4");  
    index_2 ("0.1, 1.2, 2.3, 3.4");  
}
```

EXAMPLE MESSAGE

Error: Line 43, The 'index_2' has already been specified for 'lbdb261_template'. (LBDB-261)

LBDB-262 (error) The '%s' attribute has an invalid sequence of data '%f , %f'. The values must be in monotonically increasing order.

DESCRIPTION

This message indicates that the set of data is not specified in monotonically increasing order.

WHAT NEXT

Check your library and correct the order of the values.

EXAMPLES

```
lu_table_template(one_dimension) {  
    variable_1 : input_net_transition;  
    variable_2 : output_net_length;
```

```
    index_1 ("0.1");
/* index does not in monotonically increasing order */
    index_2 ("0.1, 4.2, 2.3, 3.4");
}
```

EXAMPLE MESSAGE

Error: Line 22, The 'index_2' attribute has an invalid sequence of data '4.200000 , 2.300000'. The values must be in monotonically increasing order. (LBDB-262)

LBDB-263 (error) The '%s' attribute has a value '%f', which is less than '%f', the minimum required value of this attribute.

DESCRIPTION

The value specified is less than the required minimum value for this attribute.

WHAT NEXT

Check the library source file and correct the problem. Find the minimum value for this attribute in the error message or in the Library Compiler reference manual.

EXAMPLES

```
lu_table_template(invalid_template) {
    variable_1 : constrained_pin_transition;
    variable_2 : output_net_length;
/* index value can not be less than zero */
    index_1 ("-0.1, 1.2, 2.3, 3.4");
    index_2 ("0.1, 1.2, 2.3, 3.4");
}
```

EXAMPLE MESSAGE

Error: Line 35, The 'index_1' attribute has a value '-0.100000', which is less than '0.000000', the minimum required value of this attribute. (LBDB-263)

LBDB-264 (error) The '%s' is invalid in this look-up table.

DESCRIPTION

This message indicates that the specified index is not allowed in the current table because the current table is one dimensional.

WHAT NEXT

Check the library source file to determine whether you have the **variable_2** attribute specified before **index_2** or whether you are specifying **index_2** in a one-dimensional table or template.

EXAMPLES

```
lu_table_template(lbdb264) {  
    variable_1 : constrained_pin_transition;  
    index_2 ("0.1, 1.2, 2.3, 3.4");  
}
```

To fix the problem, change **index_2** to **index_1**.

EXAMPLE MESSAGE

Error: Line 46, The 'index_2' is invalid in this delay look-up table. (LBDB-264)

LBDB-265 (error) You cannot mix a cell delay table with a propagation delay table in the same timing group.

DESCRIPTION

You can define cell delay table or propagation delay table within a timing group, but you cannot mix them together. For example, **cell_rise** and **propagation_fall** cannot be defined in a timing group. The same applies to **cell_fall** and **propagation_rise**.

WHAT NEXT

Make your selection, and use either a cell delay table or a propagation delay table.

EXAMPLES

```
cell (INVB) {  
    area : 0.1;  
    pin(Q) {  
        direction : output;  
        function : "!A";
```

```

        timing() {
related_pin : "A";
rise_transition(fivebyfive) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    index_2("0.100,0.200,0.300,0.400,0.500");
    values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
}
cell_rise(fivebyfive_prime) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    values("-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
}
rise_propagation(fivebyfive_prime) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    values("-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
}
fall_transition(fivebyfive) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    index_2("0.100,0.200,0.300,0.400,0.500");
    values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
}
cell_fall(fivebyfive) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    index_2("0.100,0.200,0.300,0.400,0.500");
    values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
}
        }
max_transition : 1.0;
}
pin(A) {
    direction : input;
    capacitance : 1.0;
}

```

```
    }
}
```

EXAMPLE MESSAGE

Error: Line 1110, You cannot mix a cell delay table with a propagation delay table in the same timing group. (LBDB-265)

LBDB-266 (error) The '%s' attribute is needed in the specification.

No default can be applied to this attribute.

DESCRIPTION

This error message occurs when the identified attribute is missing in the specification.

WHAT NEXT

Check your library, add the missing attribute, and run the command again.

For example, the **index_1** attribute is missing from the following specification:

```
lu_table_template(lbdb266_template) {
    variable_1 : constrained_pin_transition;
    index_2 ("0.1, 1.2, 2.3, 3.4");
}
```

In the following example, since the **va_rise_constraint** is referring to a template that contains the **related_out_total_output_net_capacitance** related output loading variable, the **related_output_pin** attribute is required under the timing group.

```
lu_table_template(va_sup_hld_1) {
    variable_1 : related_out_total_output_net_capacitance;
    index_1("2.0, 3.0");
    variable_2 : constrained_pin_transition;
    index_2("3.0, 4.0");
}
timing () {
    timing_based_variation() {
        va_parameters(var1, var2);
        nominal_va_values(10.0, 20.0);
        va_rise_constraint(va_sup_hld_1) {
            va_values(10.0, 19.0);
            ...
        }
    ...
}
```

LBDB-267 (error) The '%s' is missing for this timing arc.

DESCRIPTION

All four delay look-up tables

```
* rise_propagation/cell_rise
* fall_propagation/cell_fall
* rise_transition
* fall_transition
```

are required in the timing arc if the **delay_model** is **table_lookup**. If the **timing_type** is 'clear', define both fall tables. Defining the rise tables is optional. If the **timing_type** is 'preset', define both rise tables. Defining the fall tables is optional.

WHAT NEXT

Check the library source file to see if you missed the look-up table or put it in the wrong place.

EXAMPLES

```
pin ( Y )      {
    direction : output;
    function : " (A+B)' ";
    timing ()      {
        related_pin : A ;
        rise_propagation(prop) {
            values("0.100000, 0.100000, 0.100000", \
                  "0.100000, 0.100000, 0.100000", \
                  "0.100000, 0.100000, 0.100000", \
                  "0.100000, 0.100000, 0.100000");
        }
        rise_transition(tran) {
            values("0.000000, 0.100000");
        }
        fall_transition(tran) {
            values("0.000000, 0.100000");
        }
    }
}
```

To fix the problem, add the attribute to the timing group,

```
fall_propagation(prop) {
    values("0.100000, 0.100000, 0.100000", \
```

```
"0.100000, 0.100000, 0.100000", \
    "0.100000, 0.100000, 0.100000", \
    "0.100000, 0.100000, 0.100000", \
    "0.100000, 0.100000, 0.100000");
}
```

EXAMPLE MESSAGE

Error: Line 144, The 'fall_propagation' is missing for this timing arc. (LBDB-267)

LBDB-268 (error) The '%s' cannot be specified in a timing arc with the '%s' timing_type.

DESCRIPTION

This message indicates that the timing arc with the indicated timing_type is not compatible with a **table_lookup** delay model.

EXAMPLES

```
rise_constraint(basic_template) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
}
```

EXAMPLE MESSAGE

Error: The 'rise_constraint' cannot be specified in a timing arc with the 'combinational' timing_type. (LBDB-268)

LBDB-269 (error) You have both '%s' and '%s' specified in this timing group.

DESCRIPTION

You cannot specify both cell delay and propagation delay information in a timing group as indicated in the error message. For example, **cell_rise** and **propagation_fall** cannot be defined in a timing group. The same applies to **cell_fall** and

propagation_fall.

You can use **intrinsic_rise** and **intrinsic_fall** to define default delay values when the delay model is a table_lookup.

WHAT NEXT

Make your selection to use either a cell delay table or a propagation delay table.

EXAMPLES

```
cell (INVNB) {
    area : 0.1;
    pin(Q) {
        direction : output;
        function : "!A";
        timing() {
related_pin : "A";
rise_transition(fivebyfive) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    index_2("0.100,0.200,0.300,0.400,0.500");
    values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
}
cell_rise(fivebyfive_prime) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    values(
        "-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
}
rise_propagation(fivebyfive_prime) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    values(
        "-0.100000, -0.200000, 0.300000, 0.400000, 0.500000");
}
fall_transition(fivebyfive) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    index_2("0.100,0.200,0.300,0.400,0.500");
    values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
}
```

```

cell_fall(fivebyfive) {
    index_1("0.000,0.200,0.400,0.600,0.800");
    index_2("0.100,0.200,0.300,0.400,0.500");
    values("0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000, 0.100000, 0.100000");
}
    max_transition : 1.0;
}
pin(A) {
    direction : input;
    capacitance : 1.0;
}
}

```

EXAMPLE MESSAGE

Error: Line 1110, You have both 'rise_propagation' and 'cell_rise' specified in this timing group. (LBDB-269)

LBDB-270 (error) The '%s' has a count of %d, which does not match the size %d specified.

DESCRIPTION

The specification of the index implied the size of each axis of the look-up table. The syntax of **values** complex attribute should be organized in groups of floating-point values equal to the size of index_2. The total number of groups should be equal to the size of index_1. For a one-dimensional table, the size of index_2 is **1**.

WHAT NEXT

Check the library source file, and correct the problem by grouping the values together in the required format.

EXAMPLES

```

lu_table_template(basic_template) {
    variable_1 : input_net_transition;
    variable_2 : output_net_length;
}

```

```
    index_1 ("0.1, 1.2, 2.3, 3.4");
    index_2 ("0.1, 1.2, 2.3, 3.4");
}

rise_propagation(basic_template) {
    values ("1, 2, 3, 4", "5, 6, 7, 8", \
            "9, 10, 11", "13, 14, 15, 16");
}
```

EXAMPLE MESSAGE

Error: Line 160, The 'values' have a count of 3, which does not match the size 4 specified. (LBDB-270)

LBDB-271 (error) The '%s' has zero elements.

DESCRIPTION

This message indicates that one of the lu_table_template index complex attributes contains no value.

WHAT NEXT

Check the library source file, and either add the missing value to the index attribute or delete the attribute if it is not used.

EXAMPLES

```
lu_table_template(missing_index) {
variable_1 : output_net_length;
index_1("");
}
```

EXAMPLE MESSAGE

Error: Line 64, The 'index_1' has zero elements. (LBDB-271)

LBDB-272 (warning) The '%s' attribute has a '%f' value, which is less than '%f' the minimum recommended value of this

attribute.

DESCRIPTION

This message indicates that the value assigned for the specified attribute is lower than the recommended minimum value. However, Library Compiler will maintain the values as is.

WHAT NEXT

Check the library source file, and make sure the value is correct. Refer to the "Library Compiler Reference Manual" for the attribute value requirements.

EXAMPLES

```
lu_table_template(basic_template) {
    variable_1 : input_net_transition;
    variable_2 : output_net_length;
    index_1 ("0.1, 1.2, 2.3, 3.4");
    index_2 ("0.1, 1.2, 2.3, 3.4");
}
...
fall_transition(basic_template) {
values ("-1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
}
```

EXAMPLE MESSAGE

Warning: Line 123, The 'values' attribute has a '-1.000000' value, which is less than '0.000000' the minimum recommended value of this attribute. (LBDB-272)

LBDB-273 (error) The fanout_length complex attribute allows only 2 or 5 arguments, and you specified %d arguments.

DESCRIPTION

This message indicates that the **fanout_length** complex attribute has an invalid number of arguments. The attribute can have either the two standard arguments,

```
* fanout
* length
```

or five arguments created automatically from the back-annotation information,

```
* fanout
* length
* average capacitance
* standard deviation
* number of nets
```

WHAT NEXT

Refer to the "Library Compiler User Guide" manual for more information about the fanout_length attribute. Check the library source file, and correct the format of the attribute.

EXAMPLES

```
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39, 0.1) ;
}
```

EXAMPLE MESSAGE

```
Error: Line 43, The fanout_length complex attribute allows only 2
      or 5 arguments, and you specified 3 arguments. (LBDB-273)
```

LBDB-274 (warning) The '%s' attribute has a '%f' value,
which is less than '%f' the minimum required value of this
attribute.

The value is changed to the minimum value.

DESCRIPTION

This message indicates that the value assigned for the specified attribute is lower than the required minimum value. Therefore, Library Compiler uses the minimum value for the attribute.

WHAT NEXT

Check the library source file, and correct the value if the minimum value is not acceptable. Refer to the "Library Compiler Reference Manual" for the attribute value requirements.

EXAMPLES

```
lu_table_template(basic_template) {  
    variable_1 : output_pin_transition;  
    variable_2 : connect_delay;  
    index_1 ("0, 1");  
    index_2 ("0, 1");  
}  
...  
fall_transition_degradation(basic_template) {  
values ("-1, 2", "5, 8");  
}
```

EXAMPLE MESSAGE

Warning: Line 123, The 'values' attribute has a '-1.000000' value, which is less than '0.000000' the minimum required value of this attribute. The value is changed to the minimum value. (LBDB-274)

LBDB-275 (warning) The '%s' attribute has size 1, which is not used for any purpose with its associated variable.

DESCRIPTION

This message indicates that the size of one of the **lu_table_template** attributes has size 1. Library Compiler expects the size of each dimension to be larger than **1**.

WHAT NEXT

Check the library source file, and delete this dimension if it is not needed.

EXAMPLES

```
lu_table_template(lbdb275) {  
    variable_1 : input_net_transition;  
    variable_2 : output_net_length;  
    index_1 ("0.1");  
    index_2 ("0.1, 0.2, 0.3, 0.4");  
}
```

EXAMPLE MESSAGE

Warning: Line 20, The 'index_1' attribute has size 1, which is not used for any purpose with its associated variable. (LBDB-275)

LBDB-276 (error) The '%s' refers to an invalid '%s'.

DESCRIPTION

This message indicates that the specified name refers to an invalid **lu_table_template** group. First, Library Compiler issues all the errors that make the group invalid and issues this message when the template is used.

WHAT NEXT

Check the library source file, and correct the errors in the look-up table template to which this table refers.

EXAMPLES

```
lu_table_template(lbdb276_template) {
    variable_1 : constrained_pin_transition;
    variable_2 : output_net_length;
    index_1 ("‐0.1, 1.2, 2.3, 3.4");
    index_2 ("0.1, 1.2, 2.3, 3.4");
}

rise_transition(invalid_template) {
    values ("1, 2, 3, 4", "5, 6, 7, 8", \
            "9, 10, 11, 12");
}
```

In this case, the index_1 value is less than zero, so the look-up table becomes invalid. The rise_transition timing information refers to an invalid table.

EXAMPLE MESSAGE

```
Error: Line 165, The 'lbdb276_template' refers to an invalid 'lu_table_template'. (LBDB-276)
```

LBDB-278 (error) The 'timing' group with '%s' timing_type needs at least one look-up table.

DESCRIPTION

This message indicates that in a nonlinear delay library, you did not specify a look-up table (rise_constraint or fall_constraint) for timing checks in a timing group. To be complete, Library Compiler expects at least one look-up table for the timing check groups.

WHAT NEXT

Check the library source file, and correct the timing group. Add either a rise_constraint or fall_constraint table to the group.

EXAMPLES

```
pin ( D )      {
    direction : input;
    capacitance : 1;
    timing ()      {
        related_pin : CK ;
        timing_type : setup_rising ;
    }
}
```

To fix the problem, define the template group and the rise_constraint group to the timing group,

```
lu_table_template(constraint) {
    variable_1 : constrained_pin_transition;
    index_1("0, 1, 2, 3, 4");
    variable_2 : related_pin_transition;
    index_2("0, 1, 2, 3, 4");
}
pin ( D )      {
    direction : input;
    capacitance : 1;
    timing () {
        related_pin : CK ;
        timing_type : setup_rising ;
    }
    rise_constraint(constraint) {
        values("1.0000, 1.0000, 1.0000, 1.0000, 1.0000", \
"1.0000, 1.0000, 1.0000, 1.0000, 1.0000", \
"1.0000, 1.0000, 1.0000, 1.0000, 1.0000", \
"1.0000, 1.0000, 1.0000, 1.0000, 1.0000", \
"1.0000, 1.0000, 1.0000, 1.0000, 1.0000");
    }
}
```

EXAMPLE MESSAGE

Error: Line 63, The 'timing' group with 'setup_rising' timing_type needs at least one look-up table. (LBDB-278)

LBDB-279 (error) The 'timing' group with '%s' timing_type

needs one look-up table.

DESCRIPTION

This message indicates that you specified more than one table for the specified timing group. This group needs only one table, either **constraint_rise** or **constraint_fall**.

WHAT NEXT

Check the library source file, and correct the timing group. Delete from the group either the **constraint_rise** table or the **constraint_fall** table.

EXAMPLES

```
pin(cd) {
    direction : input;
    capacitance : 0.065
    timing() {
related_pin : "cp";
timing_type : recovery_rising;
rise_constraint(constraint_template) {
    values("1, 2", "3, 4");
}
fall_constraint(scalar) {
    values("1");
}
}
```

In this case, the 'cd' pin has both the `rise_constraint` and `fall_constraint` attribute. To fix the problem, delete the `fall_constraint` table.

EXAMPLE MESSAGE

Error: Line 61, The 'timing' group with 'recovery_rising' timing_type
needs one look-up table. (LBDB-279)

LBDB-280 (error) The '%s' look-up table cannot use
'%s' as its template. The look-up table is not
compatible with the template.

DESCRIPTION

This message indicates that the specified look-up table is not compatible with the specified template. Variable types described in a look-up table template must be

compatible with the usage of that template. For example, a template references variable types used for constraint checking ('related_pin_transition' and 'constrained_pin_transition') cannot be referenced in a cell delay description ('cell_rise' or 'cell_fall').

WHAT NEXT

Refer to the "Library Compiler User Guide" for more information about look-up tables. Change the library source file by referencing a different template in the look-up table description.

EXAMPLES

```
lu_table_template(basic_template) {
    variable_1 : input_net_transition;
    index_1("0, 1, 2, 3, 4");
    variable_2 : output_net_length;
    index_2("0, 1, 2");
}
lu_table_template(constraint) {
    variable_1 : constrained_pin_transition;
    index_1("0, 1, 2, 3, 4");
    variable_2 : related_pin_transition;
    index_2("0, 1, 2, 3, 4");
}

rise_constraint(basic_template) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
}
```

To fix the problem, change the template value of the rise_constraint group from basic_template to constraint.

EXAMPLE MESSAGE

```
Error: Line 126, The 'rise_constraint' look-up table cannot use
'basic_template' as its template. The look-up table is not
compatible with the template. (LBDB-280)
```

LBDB-281 (error) The '%s' template has variables which should not be used together.

DESCRIPTION

This message indicates that you specified two incompatible variables in the same template.

WHAT NEXT

Refer to the "Library Compiler User Guide" for more information on defining CMOS nonlinear timing model templates. Check the library source file to see if you made a mistake when you entered the variables strings.

EXAMPLES

```
lu_table_template(invalid_template) {
    variable_1 : constrained_pin_transition;
    variable_2 : output_net_length;
    index_1 ("0.1, 0.2, 0.3, 0.4");
    index_2 ("0.1, 0.2, 0.3, 0.4");
}
```

EXAMPLE MESSAGE

Error: Line 32, The 'invalid_template' template has variables which should not be used together. (LBDB-281)

LBDB-282 (error) The '%s' attribute has a '%f' value that is larger than the maximum allowed value of '%f'.

DESCRIPTION

This message indicates that for the specified attribute, you defined a value that is larger than the maximum allowed value. The error message includes the maximum value for this attribute.

WHAT NEXT

Refer to the "Library Compiler User Guide" for the maximum value required for the attribute, and correct the value in the library source file.

EXAMPLES

```
default_min_porosity : 91.0;
```

EXAMPLE MESSAGE

Error: Line 53, The 'default_min_porosity' attribute has a '91.000000' value that is larger than the maximum allowed value of '90.000000'. (LBDB-282)

LBDB-283 (error) The '%s' layer name is invalid.

DESCRIPTION

This message indicates that you specified an invalid name for the current attribute or function. The name should match a name previously defined in the resource group.

If the value is in the related_layer attribute and the layer is not valid. It may be because it is not one of the neighboring contact layer.

WHAT NEXT

Check your library to see if you have an error in either previous layer definition or the current attribute / function.

EXAMPLES

```
same_net_min_spacing(dummy, metal1, 0.1, TRUE);
```

EXAMPLE MESSAGE

Error: Line 104, The 'dummy' layer name is invalid. (LBDB-283)

LBDB-284 (error) Missing 'routing_layers' attribute for this library

which is needed for specifying 'routing_track'.

DESCRIPTION

This message indicates that you specified a **routing_track** group without specifying the **routing_layers** attribute. Library Compiler expects the **routing_layers** complex attribute to be defined before you can specify the **routing_track** group. The **routing_track** group has a name to refer to a specific routing layer in the **routing_layers** complex attribute.

WHAT NEXT

Check the library source file to see if you are missing the **routing_layers** attribute, which should be placed in the library before the **routing_track** group can be identified.

EXAMPLES

```
routing_track(metal2) {
    tracks : 2;
```

```
        total_track_area : 0.2;  
    }
```

To fix the problem, add the attribute to the library,

```
routing_layers(metal1,metal2);
```

EXAMPLE MESSAGE

Error: Line 65, Missing 'routing_layers' attribute for this library, which is needed for specifying 'routing_track'. (LBDB-284)

LBDB-285 (error) In this 'routing_track' group, 'tracks' is 0 and 'total_track_area' is %f, which is inconsistent.

DESCRIPTION

This message indicates that for a **routing_track** group, you specified the **total_track_area** attribute without specifying the **tracks** attribute. If you do not have tracks in a routing layer, you cannot have **total_track_area** for that layer either.

WHAT NEXT

Check your library to see if it is missing the **tracks** attribute in this group. Do not have the **total_track_area** other than '0', or this group is not needed.

EXAMPLES

```
routing_layers(metal1,metal2);  
  
routing_track(metal2) {  
/* missing tracks */  
    total_track_area : 1.5;  
}
```

To fix the problem, add the **tracks** attribute to the **routing_track** group,

```
    tracks : 1;
```

EXAMPLE MESSAGE

Error: Line 266, In this 'routing_track' group, 'tracks' is 0 and 'total_track_area' is 1.500000, which is inconsistent. (LBDB-285)

LBDB-286 (error) No 'routing_track' information in the '%s'

library.

DESCRIPTION

This message indicates that, in the library, you specified the **default_min_porosity** attribute without specifying the **routing_track** group in any of the cells.

WHAT NEXT

Remove the **default_min_porosity** attribute or add **routing_track** information into the library.

EXAMPLE MESSAGE

Error: Line 1, No 'routing_track' information in the 'lbdb286' library. (LBDB-286)

LBDB-287 (warning) No routability information in the '%s' %s.

DESCRIPTION

This message indicates that one of the two cases occurred:

- * You have the **routing_layers** attribute in a library and do not have **routing_track** group in the cell.
- * You have the **default_min_porosity** attribute in a library and do not have the **routing_track** information in a cell.

WHAT NEXT

Check the library source file to remove the **routing_layers** attribute if the warning fits the first case. For the second case, check the cell to make sure it does not have any **routing_track** information on all routing layers (all of them are completely obstructed in this cell) when you have the **default_min_porosity** attribute.

EXAMPLES

```
default_min_porosity : 0.0;  
routing_layers(metal1,metal2);  
  
cell(AN2) {  
    area : 2;  
    pin(A) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(B) {
```

```

        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "B";
        }
    }
}

```

In this case, The library has the **default_min_porosity** attribute, but the 'AN2' cell has no **routing_track** information.

EXAMPLE MESSAGE

Warning: Line 63, No routability information in the 'AN2' cell. (LBDB-287)

LBDB-288 (error) The '%f' 'total_track_area' value is larger than the '%f' cell area value.

DESCRIPTION

This message indicates that you specified a larger value for the **total_track_area** than the **cell area** value. The **total_track_area** value of a particular routing layer cannot be larger than the **cell area** value.

WHAT NEXT

Check to see if you have entered the wrong information for either of these two attributes.

EXAMPLES

```
cell(IPV) {
    area : 1;
```

```

routing_track(metal2) {
tracks : 1;
    total_track_area : 1.5;
}
pin(A) {
    direction : input;
    capacitance : 1;
}
pin(Z) {
    direction : output;
    function : "A'";
    timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
    }
}
}
}

```

EXAMPLE MESSAGE

Error: Line 242, The 1.500000 'total_track_area' value is larger than the '1.000000' cell area value. (LBDB-288)

LBDB-289 (error) '%s' has been used more than one time in the specification.

DESCRIPTION

This message indicates that you specified the same routing layer name more than once in the routing_layers attribute. Library Compiler expects unique names.

WHAT NEXT

Check to see if you entered the wrong information for this attribute.

EXAMPLES

```
routing_layers(metal2,metal2);
```

EXAMPLE MESSAGE

Error: Line 55, 'metal2' has been used more than one time in the specification. (LBDB-289)

LBDB-290 (error) '%s' should have at least one entry in it.

DESCRIPTION

This message indicates that you specified an attribute without any entries. This complex attribute must contain at least one entry.

WHAT NEXT

Check to see if you have entered the required information for this complex attribute.

EXAMPLES

```
routing_layers();
```

EXAMPLE MESSAGE

Error: Line 18, 'routing_layers' should have at least one entry in it. (LBDB-290)

LBDB-291 (warning) No routability information for the '%s' layer. It is assumed to be completely obstructed.

DESCRIPTION

The **routing_track** group of the indicated layer is not in the cell. It is assumed to be completely obstructed.

WHAT NEXT

If the previous statement is not true, enter the **routing_track** information for the indicated layer. Otherwise, it is all right.

EXAMPLES

```
library(small_cmos1) {
    default_min_porosity : 0.0;
    routing_layers(metal1,metal2);

    cell(AN2) {
        area : 2;
        routing_track(metal2) {
            tracks : 2;
            total_track_area : 0.2;
        }
        pin(A) {
```

```

        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "B";
        }
    }
}

```

In this case, 'metall1' is not used in any routing_track group.

EXAMPLE MESSAGE

Warning: Line 240, No routability information for the 'metall1' layer.
It is assumed to be completely obstructed. (LBDB-291)

LBDB-292 (error) The '%s' should be the %d%s attribute in the library.

DESCRIPTION

This message indicates that you specified the technology and delay_model in unacceptable order. For the Library Compiler to work correctly, the defined attribute must appear in this library at the indicated place in the error message.

WHAT NEXT

Modify the library source file to move the defined attribute to the correct place, as indicated in the error message.

EXAMPLES

```
library(lib) {  
    technology : "cmos";  
    delay_model : "generic_cmos";  
}
```

In this case, the `delay_model` attribute comes after the `technology` attribute. To fix the problem, switch the order of definition of the two attributes.

EXAMPLE MESSAGE

Error: Line 5, The '`delay_model`' should be the 1st attribute in the library. (LBDB-292)

LBDB-293 (error) In this '`routing_track`' group, the '`tracks`' value is `%d` and the '`total_track_area`' value is '`0.0`'. This is inconsistent.

DESCRIPTION

This message indicates that you specified the `tracks` attribute without specifying the `total_track_area` attribute in a `routing_track` group. If you have tracks in a routing layer, you need to have the `total_track_area` for that layer too.

WHAT NEXT

Check the library source file to see if it is missing the `total_track_area` attribute in this group, and add it. Otherwise, set the `tracks` value to 0 or remove the `routing_track` group.

EXAMPLES

```
routing_track(metal2) {  
    tracks : 2;  
/* missing total_track_area */  
}
```

EXAMPLE MESSAGE

Error: Line 205, In this '`routing_track`' group, the '`tracks`' value is 2 and the '`total_track_area`' value is '`0.0`'. This is inconsistent. (LBDB-293)

LBDB-294 (warning) The UP or DOWN X pin coordinate does not lay on a grid.

DESCRIPTION

This warning message appears when the library symbol has a pin that is not on a grid and is off by 0.01.

WHAT NEXT

Check the symbol library file, and correct the X coordinate.

EXAMPLES

```
library(lbdb294) {
    SCALE = 1.0 / 8.0;

    symbol("gndsym") {
        set_minimum_boundary(0 * SCALE, 0 * SCALE, 40 * SCALE, 40 * SCALE);
        line(5 * SCALE, 10 * SCALE, 35 * SCALE, 10 * SCALE);
        line(0 * SCALE, 20 * SCALE, 40 * SCALE, 20 * SCALE);
        line(15 * SCALE, 2 * SCALE, 25 * SCALE, 2 * SCALE);
        line(20 * SCALE, 20 * SCALE, 20 * SCALE, 40 * SCALE);
        pin("gnd", 20 * SCALE, 40 * SCALE, ANY_ROTATION);
    }
}
```

In this case, the "gnd" pin has the Y coordinate off the grid.

EXAMPLE MESSAGE

Warning: Line 24, The UP or DOWN X pin coordinate does not lay on a grid. (LBDB-294)

LBDB-295 (warning) The LEFT or RIGHT Y pin coordinate does not lay on a grid.

DESCRIPTION

This warning message appears when the library symbol has a pin that is not on a grid and is off by 0.01.

WHAT NEXT

Check the symbol library file, and correct the Y coordinate.

EXAMPLES

```
library(lbdb295) {
    SCALE = 1.0 / 8.0;

    symbol("gnd") {
        set_minimum_boundary(0 * SCALE, 0 * SCALE, 40 * SCALE, 40 * SCALE);
        line(5 * SCALE, 10 * SCALE, 35 * SCALE, 10 * SCALE);
        line(0 * SCALE, 20 * SCALE, 40 * SCALE, 20 * SCALE);
        line(15 * SCALE, 2 * SCALE, 25 * SCALE, 2 * SCALE);
        line(20 * SCALE, 20 * SCALE, 20 * SCALE, 40 * SCALE);
        pin("Z", 128 * SCALE, 4 * SCALE, ANY_ROTATION);
        pin("gnd", 20 * SCALE, 40 * SCALE, ANY_ROTATION);
    }
}
```

In this case, the "Z" pin has the Y coordinate off the grid.

EXAMPLE MESSAGE

Warning: Line 24, The LEFT or RIGHT Y pin coordinate does not lay on a grid. (LBDB-295)

LBDB-296 (warning) The '%s' pin of the '%s' auxiliary pad cell should not have a function attribute.

DESCRIPTION

This message indicates that you specified a function attribute on a auxiliary pad cell.

Cells with a 'auxiliary_pad_cell' attribute are used together with other cells with a 'pad_cell' attribute to build a logical pad. They can also provide the pull-up, pull-down, buffer, or inverter functionality. They should not have real 'logic'. Design Compiler will not work correctly if you decompose your pad cell this way.

WHAT NEXT

Check the technology source library. Either

1. remove the 'function' attribute from the cell under the following conditions:
 - * If the cell is a buffer, no action is required.
 - * If the cell is an inverter, invert the functionality of your 'pad_cell', which is to be connected to this cell to form a pad cell, accordingly.
- or
2. remove the 'auxiliary_pad_cell' attribute, and model this cell as a regular cell but with the right 'connection_class' on the pin so it can be connected to the 'pad_cell' to form a pad as

intended.

EXAMPLES

```
cell(lbdb296) {
    auxiliary_pad_cell : true;
    area : 1;
    general_drivers : 0;
    input_drivers : 8;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A'";
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
    }
}
```

EXAMPLE MESSAGE

Warning: Line 64, The 'Z' pin of the 'lbdb296' auxiliary pad cell should not have a function attribute. (LBDB-296)

LBDB-297 (error) The '%s' pin is reserved and should not be used as a pin name.

DESCRIPTION

Library Compiler uses several keywords internally for a sequential cell. The keywords are

- * next_state
- * clocked_on
- * clocked_on_also
- * data_in
- * enable
- * enable_also
- * preset
- * clear
- * force_00
- * force_01
- * force_10

```
* force_11
* the variable1 and variable2 used in ff/latch/ff_bank/latch_bank
```

WHAT NEXT

Modify your library to change the name of the pin.

EXAMPLES

```
pin(preset) {
    direction : input;
    capacitance : 1;
}
```

EXAMPLE MESSAGE

Error: Line 182, The 'preset' pin is reserved and should not be used as a pin name. (LBDB-297)

LBDB-298 (error) The '%s' attribute has a value %d, which is less than the minimum required value of this attribute %d.

DESCRIPTION

This message indicates that the value specified is less than the required minimum value for this attribute.

WHAT NEXT

Check the library source file, and correct the value of the attribute. If the minimum value for this attribute is not displayed in the error message, refer to the **Library Compiler User Guide Manual** for minimum attribute values.

EXAMPLES

```
wire_load_table("40x40") {
    fanout_area(-11, 0.1);
}
```

EXAMPLE MESSAGE

Error: Line 84, The 'fanout_area' attribute has a value -11, which is less than the minimum required value of this attribute 1. (LBDB-298)

LBDB-300 (error) The '%s' related_outputs for the internal_power group has been specified. A duplicate is not allowed.

DESCRIPTION

This message indicates that you include the same output pin in more than one internal_power group.

WHAT NEXT

Check the library source file, and delete the duplicate information from one of the internal_power groups.

EXAMPLES

```
internal_power(test_input) {  
    values("0.1, 1.2, 2.3, 3.4");  
    related_outputs : "Z";  
}  
internal_power(test_input) {  
    values("0.1, 1.2, 2.3, 3.4");  
    related_outputs : "Z";  
}
```

EXAMPLE MESSAGE

Error: Line 41, The 'Z' related_outputs for the internal_power group has been specified. A duplicate is not allowed. (LBDB-300)

LBDB-301 (information) No internal_power information for the '%s' cell.

DESCRIPTION

This message indicates that you did not define an internal_power group for the specified cell. Library Compiler expects at least one internal_power group so the internal power of the cell can be calculated.

WHAT NEXT

If you want to include the internal power of this cell in your design, add the required information into the library.

EXAMPLES

```
cell(lbdb301) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
    cell_leakage_power : 1;
}
```

In this case, the 'lbdb301' cell is missing the internal_power group. To fix the problem, add this statement:

```
internal_power(output_by_cap_and_trans) {
    values(" 5.000000 , 15.000000 , 0.300000 ", \
           " 1.000000 , 5.000000 , 0.000000 ", \
           " 0.000000 , 0.000000 , 0.000000 ");
    related_outputs : "Z";
    related_inputs : "A B";
}
```

EXAMPLE MESSAGE

Information: Line 191, No internal_power information for the 'lbdb301' cell. (LBDB-301)

LBDB-302 (error) The '%s' specified in the '%s' is an

%s pin.

DESCRIPTION

This message indicates that you specified either an input pin in a **related_outputs** attribute or an output pin in a **related_inputs** attribute.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb302) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
    cell_leakage_power : 1;
    internal_power(output_by_cap_and_trans) {
        values(" 5.000000 , 15.000000 , 0.300000 ", \
               " 1.000000 , 5.000000 , 0.000000 ", \
               " 0.000000 , 0.000000 , 0.000000 ");
        /* bad related port */
        related_outputs : "A";
        related_inputs : "Z B";
    }
}
```

In this case, both the `related_outputs` and the `related_inputs` attributes have a wrong pin name. To fix the problem, change the name from '`A`' to '`Z`' in the `related_outputs` attribute and '`Z`' to '`A`' in the `related_inputs` attribute.

EXAMPLE MESSAGE

```
Error: Line 272, The 'A' specified in the 'related_outputs' is an  
input pin. (LBDB-302)  
Error: Line 273, The 'Z' specified in the 'related_inputs' is an  
output pin. (LBDB-302)
```

LBDB-303 (error) You cannot specify more than one input pin or one bit of a bus or bundle input pin in the 'related_input'.

DESCRIPTION

This message indicates that you specified more than one input pin or one bit of an input pin, in the case of bus and bundle groups, in the **related_input** attribute. Library Compiler allows only one input pin or one bit of a bus or bundle in the attribute.

WHAT NEXT

Check the "Library Compiler User Guide" for more information on power analysis, and correct the problem. Make sure that the related_input attribute has only one input pin or one bit of an bus or bundle input pin and the related_inputs attribute has more than one pin.

EXAMPLES

```
cell(lbdb303) {  
    area : 2;  
    pin(A) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(B) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(Z) {  
        direction : output;  
        function : "A+B";  
        timing() {  
            intrinsic_rise : 1.0;  
            intrinsic_fall : 1.0;  
            rise_resistance : 0.1;  
            fall_resistance : 0.1;  
            slope_rise : 0.0;  
            slope_fall : 0.0;  
            related_pin : "A B";  
        }  
    }  
}
```

```

        }
    }
cell_leakage_power : 1;
internal_power(output_by_cap_and_trans) {
    values(" 5.000000 , 15.000000 , 0.300000 ", \
           " 1.000000 , 5.000000 , 0.000000 ", \
           " 0.000000 , 0.000000 , 0.000000 ");
related_outputs : "Z";
/* more than one related input */
related_input : "A B";
}
}

```

In this case, the related_input attribute has two 'A' and 'B' input pins.

EXAMPLE MESSAGE

Error: Line 315, You cannot specify more than one input pin or one bit of a bus or a bundle input pin in the 'related_input'. (LBDB-303)

LBDB-304 (error) You can specify '%s' but not both, because they are mutually exclusive.

DESCRIPTION

This message indicates that you specified a **related_input** attribute with a **related_outputs** attribute in an internal_power group. Library Compiler allows either a **related_input** attribute or the pair **related_outputs**, **related_inputs** attributes, but not both, since the information provided is mutually exclusive. Library Compiler supports the related_input, related_inputs, and the related_outputs attributes in the table as follows:

- * A one dimensional table uses only related_outputs.
- * A one dimensional table uses only related_input.
- * A one dimensional table uses both related_inputs and related_outputs.
- * A two dimensional table uses both related_inputs and related_outputs.

WHAT NEXT

Check the library and correct the related_inputs attribute if it is a typo or delete the unnecessary information from the library.

EXAMPLES

```
cell(lbdb304) {
```

```

area : 2;
pin(A) {
    direction : input;
    capacitance : 1;
}
pin(B) {
    direction : input;
    capacitance : 1;
}
pin(Z) {
    direction : output;
    function : "A+B";
    timing() {
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A B";
    }
}
cell_leakage_power : 1;
internal_power(output_by_cap_and_trans) {
    values(" 5.000000 , 15.000000 , 0.300000 ", \
           " 1.000000 , 5.000000 , 0.000000 ", \
           " 0.000000 , 0.000000 , 0.000000 ");
    related_outputs : "Z";
    related_input : "A B";
}
}

```

In this case, there is a typo. To fix the problem, add the character s to the related_input attribute name.

EXAMPLE MESSAGE

Error: Line 309, You can specify 'related_outputs/related_inputs or related_input' but not both, because they are mutually exclusive. (LBDB-304)

**LBDB-305 (error) In the context, the '%s' valid value of the '%s' template is '%s'.
You specified '%s'.**

DESCRIPTION

This message indicates that you specified an invalid value for the variable_1 in the power_lut_template given the specified information in the internal_power group.

Library Compiler expects

- * A related_input attribute in an internal_power group for a input_transition_time value in variable_1 of the corresponding power_lut_template
- * A related_outputs attribute in an internal_power group for a total_output_net_capacitance value in variable_1 of the corresponding power_lut_template

WHAT NEXT

Refer to the "Library Compiler Reference Manual Volume 1" for more information on power modeling and analysis. Correct the attribute's value or its reference in the library.

EXAMPLES

```
power_lut_template(lbdb305_input) {  
    variable_1 : input_transition_time;  
    index_1 ("1.0, 2.0");  
}  
  
cell(lbdb305) {  
    internal_power(lbdb305_input) {  
        index_1("1.0, 2.0");  
        values("1.0, 2.0");  
        related_outputs : "Z";  
    }  
}
```

EXAMPLE MESSAGE

```
Error: Line 27, In the context, the 'variable_1' valid value of the  
'lbdb305_input' template is 'total_output_net_capacitance'.  
You specified 'input_transition_time'. (LBDB-305)
```

LBDB-306 (warning) The '%s' preferred input voltage does not exist in this library.

DESCRIPTION

This message indicates that you specified a input_voltage name to the **preferred_input_pad_voltage** attribute that is not described in the library or is defined after this attribute.

WHAT NEXT

Check the preferred input pad voltage to be sure it is correct. If the input_voltage

exists, make sure that the attribute is defined before the preferred_input_pad_voltage attribute. Otherwise, add the preferred input pad voltage to the library description.

EXAMPLES

```
preferred_input_pad_voltage : "lbdb306";
input_voltage(lbdb306) {
    vil : 1.5;
    vih : 3.5;
    vimin : -0.3;
    vimax : VDD + 0.3;
}
```

in this case, the 'lbdb306' input_voltage is defined after the preferred_input_pad_voltage attribute.

EXAMPLE MESSAGE

Warning: Line 25, The 'lbdb306' preferred input voltage does not exist in this library. (LBDB-306)

LBDB-307 (warning) The '%s' preferred output voltage does not exist in this library.

DESCRIPTION

This message indicates that you specified an output_voltage name to the **preferred_output_pad_voltage** attribute that is not described in the library or is defined after this attribute.

WHAT NEXT

Check the preferred output pad voltage to be sure it is correct. If the output_voltage exists, make sure that the attribute is defined before the preferred_output_pad_voltage attribute. Otherwise, add the preferred output pad voltage to the library description.

EXAMPLES

```
preferred_output_pad_voltage : "lbdb307" ;
output_voltage(lbdb307) {
    vol : 1.5;
    voh : 3.5;
    vomin : -0.3;
    vomax : VDD + 0.3;
}
```

in this case, the 'lbdb307' output_voltage is defined after the preferred_output_pad_voltage attribute.

EXAMPLE MESSAGE

Warning: Line 24, The 'lbdb307' preferred output voltage does not exist in this library. (LBDB-307)

LBDB-308 (warning) Incomplete set of pads to support the '%s' preferred output pad slew rate control.

DESCRIPTION

This message indicates that in the library you specified the **preferred_output_pad_slew_rate_control** attribute but you did not define a complete set of pads to support it. Library Compiler expects at least one of the following set of pad cells in the library with the given slew rate control value:

- * One output pad
- * One bidirectional pad
- * One three state pad

WHAT NEXT

Check the preferred output pad slew rate control to be sure it is correct, and add pads to the library containing the preferred output pad slew rate control value.

EXAMPLES

```
library (lbdb308) {
    preferred_output_pad_slew_rate_control : high;
    output_voltage(GENERAL) {
        vol          : 0.33 ;
        voh          : 3.7 ;
        vomin        : -0.3 ;
        vomax        : VDD + 0.3 ;
    }
    cell(OUTBUF) {
        area : 0.000000;
        dont_touch : false;
        dont_use   : false;
        pad_cell   : true;
        pin(D ) {
            direction   : input;
            capacitance : 1.0;
        }
        pin(PAD ) {
            is_pad : true;
            output_voltage : GENERAL;
        }
    }
}
```

```

        drive_current : 4.0;
        slew_control : high;
        direction    : output;
        function     : "D";
        timing() {
            intrinsic_fall  : 1.0;
            intrinsic_rise   : 1.0;
            fall_resistance : 0.1;
            rise_resistance : 0.1;
            related_pin    :"D";
        }
    }
}
cell(BBHS) {
    area : 0.000000;
    dont_touch : false;
    dont_use   : false;
    pad_cell : true;
    pin(E D ) {
        direction  : input;
        capacitance : 1.0;
    }
    pin(Y ) {
        direction  : output;
        timing() {
            intrinsic_fall  : 1.0;
            intrinsic_rise   : 1.0;
            fall_resistance : 0.1;
            rise_resistance : 0.1;
            related_pin    :"PAD ";
        }
    }
    pin(PAD ) {
        is_pad : true;
        input_voltage : CMOS;
        output_voltage : GENERAL;
        drive_current : 4.0;
        slew_control : high;
        direction    : inout;
        function     : "D";
        three_state : "E'";
        timing() {
            intrinsic_fall  : 1.0;
            intrinsic_rise   : 1.0;
            fall_resistance : 0.1;
            rise_resistance : 0.1;
            related_pin    :"E D";
        }
    }
}
}

```

In this case, the 'lbdb308' library has an output pad cell and a bidirectional pad cell, but it is missing a three_state pad cell.

EXAMPLE MESSAGE

Warning: Line 2, Incomplete set of pads to support the 'high' preferred output pad slew rate control. (LBDB-308)

LBDB-309 (warning) In the '%s' gate, cannot degenerate the '%s' output due to excessive function size.

DESCRIPTION

This message appears when the Library Compiler has determined that degenerating the given output is potentially too difficult. This determination is based on an evaluation of the function complexity at this output port.

WHAT NEXT

Either remove the **fpga_complex_degenerate** attribute from the library cell in question, or set the **fpga_degenerate_output** attribute to FALSE on this particular output. In either case, these actions delete the warning; they do not cause the degeneration software to attempt to degenerate the gate.

LBDB-310 (information) Degenerating %d-input gates from '%s' component of the '%s' output.

DESCRIPTION

This message indicates that the Library Compiler is starting to create degenerate functions based on the component named.

WHAT NEXT

No action is required.

EXAMPLES

```
cell(lbdb310) {  
    area : 1.0;  
    fpga_complex_degenerate : true ;  
    pin(D0 D1 D2 D3 S00 S01 S10 S11) {  
        direction : input;  
        capacitance : 1.0;  
    }  
    pin(Y) {
```

```

        direction : output;
        function : "(D0!(S00&S01)+D1(S00&S01))!(S10+S11)+(D2!(S00&S01)+D3(S00&S01))(S
10+S11)";
        timing() {
rise_resistance : 0.5;
fall_resistance : 0.5;
        related_pin : "D0 D1 D2 D3 S00 S01 S10 S11" ;
    }
}
}

```

EXAMPLE MESSAGE

Information: Degenerating 2-input gates from the 'lbdb310' component of the 'Y' output. (LBDB-310)

LBDB-311 (information) Degenerated %d %d-input gates from the '%s' component.

A total of %d components have been degenerated from the '%s' output.

DESCRIPTION

This message indicates that the Library Compiler has finished creating n-input degenerate functions based on the component and output named. The message tells you how the library size is growing and how long the degeneration process is taking.

WHAT NEXT

No action is required.

EXAMPLES

```

cell(lbdb311) {
    area : 1.0;
    fpga_complex_degenerate : true ;
    pin(D0 D1 D2 D3 S00 S01 S10 S11) {
        direction : input;
        capacitance : 1.0;
    }
    pin(Y) {
        direction : output;
        function : "(D0!(S00&S01)+D1(S00&S01))!(S10+S11)+(D2!(S00&S01)+D3(S00&S01))(S
10+S11)";
        timing() {
rise_resistance : 0.5;
fall_resistance : 0.5;
    }
}
}

```

```
        related_pin : "D0 D1 D2 D3 S00 S01 S10 S11" ;
    }
}
}
```

EXAMPLE MESSAGE

Information: Degenerated 2 1-input gates from the 'lbdb311' component.
A total of 2 components have been degenerated from the 'Y' output. (LBDB-311)

LBDB-312 (warning) Unable to do fpga complex degeneration on the '%s' gate because it %s.

DESCRIPTION

This message occurs when you have defined **fpga_complex_degenerate** on a component for which this feature is not currently supported. Library Compiler issues this message for the following cells:

- * Sequential devices: latches and flip flops
- * I/O pads
- * Cells with dont_use attribute
- * Cells with three_state attribute

WHAT NEXT

Remove the **fpga_complex_degenerate** attribute for this component, or set the attribute to FALSE.

LBDB-315 (error) The '%s' attribute is incorrectly specified in the context.

DESCRIPTION

The attribute indicated in the error message is not valid, because it is not compatible with the template to which this internal_power group refers. For example, the **related_input** attribute cannot be specified in a two-dimensional table.

WHAT NEXT

Refer to the Library Compiler manuals and the Design Power Reference manual for power modeling and analysis. Modify the library to correct the problem.

EXAMPLES

```
power_lut_template(output_by_cap_and_trans) {
    variable_1 : total_output_net_capacitance;
    variable_2 : input_transition_time;
    index_1 ("0.0, 5.0, 20.0");
    index_2 ("0.1, 1.00, 5.00");
}

cell(lbdb315) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A+B";
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
    cell_leakage_power : 1;
    internal_power(output_by_cap_and_trans) {
        values(" 5.000000 , 15.000000 , 0.300000 ", \
               " 1.000000 , 5.000000 , 0.000000 ", \
               " 0.000000 , 0.000000 , 0.000000 ");
        related_outputs : "Z";
        related_input : "A";
    }
}
```

EXAMPLE MESSAGE

Error: Line 315, The 'related_input' attribute is incorrectly specified in the cont ext. (LBDB-315)

LBDB-316 (error) Arithmetic overflow or exception is encountered

on the '%s' attribute with the '%s' value.

DESCRIPTION

This message indicates that you specified an attribute's value that causes an arithmetic overflow or an exception. Library Compiler cannot handle the value.

WHAT NEXT

Check the library source file, and correct the problem.

EXAMPLES

```
fall_propagation ( table4x6 ) {  
    index_1 ("2.00e+02 2.50e+02 3.50e+02 4.00e+02 " ) ;  
    index_2 ("4.48e-02 8.96e-02 1.34e-01 1.79e-01 2.24e-01 2.69e-01 ");  
    values ("7.45e+01 9.56e+01 1.15e+02 1.34e+02 1.52e+02 1.71e+02 ", \  
            "9.38e+01 1.20e+02 1.45e+02 1.67e+02 1.89e+02 2.10e+02 ", \  
            "1.01e+02 1.32e+02 1.58e+02 1.83e+02 2.07e+02 2.29e+02 ", \  
            "1.04e+02 1.43e-93 1.43e-93 1.43e-93 2.75e+226 9.30e+254 " ) ;  
}
```

EXAMPLE MESSAGE

Error: Line 85, Arithmetic overflow or exception is encountered
on the 'values' attribute with the '2.75e+226' value. (LBDB-316)

**LBDB-317 (error) It is invalid to specify the '%s' attribute
on a pin within the bus or bundle group.**

DESCRIPTION

This message indicates that you specified a function attribute on a pin within a bus or a bundle group.

WHAT NEXT

Check the library source file, and correct the problem.

EXAMPLES

```
bundle (qn) {  
    members(qn2);
```

```

direction : output;
function : "iq";
pin (qn2) {
    function : "q2";
    timing() {
        related_pin : "q2";
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 1.0;
        fall_resistance : 1.0;
    }
}

```

EXAMPLE MESSAGE

Error: Line 67, It is invalid to specify the 'function' attribute on a pin within the bus or bundle group. (LBDB-317)

**LBDB-350 (error) The '%s' cell has the interface_timing attribute,
but is not a black box.**

DESCRIPTION

This library cell has the **interface_timing** attribute set to TRUE. The interface timing specification ITS policy requires that no pin on this cell has the function attribute defined for it. In addition, the ff group cannot be defined for such cells.

WHAT NEXT

Remove the function attribute defined for any output pin of the cell. Also remove the ff group from the cell description if it is specified.

EXAMPLES

```

cell (lbdb350) {
    area : 0.0;
    interface_timing : TRUE;
    pin (I1) {
        direction : input;
        capacitance : 1.0;
        fanout_load : 1.0;
    }
    pin(Q){
        direction : output;
        function : "I1'";
        timing () {

```

```

intrinsic_rise    : 1.0;
rise_resistance  : 0.1;
intrinsic_fall   : 1.0;
fall_resistance  : 0.1;
related_pin       : "I1";
}
}
}

```

EXAMPLE MESSAGE

Error: Line 6, The 'lbdb350' cell has the interface_timing attribute, but is not a black box. (LBDB-350)

LBDB-353 (warning) A nonsequential timing arc is specified with respect to the '%s' clock pin.

DESCRIPTION

The cell has the **interface_timing** attribute set to TRUE. The interface timing policy requires that all timing arcs defined with respect to a clock pin be sequential (noncombinational) in nature.

WHAT NEXT

Make sure that all arcs with a clock pin as a related_pin are sequential.

EXAMPLES

```

cell (lbdb353) {
  area      : 0.0;
  interface_timing : TRUE;
  pin (I1)  {
    direction   : input;
    capacitance : 1.0;
    fanout_load : 1.0;
    timing () {
      timing_type : setup_rising;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
      related_pin : "CLK";
    }
    timing () {
      timing_type : hold_rising;
      intrinsic_rise : 1.0;
      intrinsic_fall : 1.0;
    }
  }
}

```

```

related_pin : "CLK";
}
}
pin (CLK) {
    direction : input;
    capacitance : 1.0;
    fanout_load : 1.0;
    clock : true;
    timing () {
timing_type : skew_rising;
intrinsic_rise : 1.0;
related_pin : "CLK1";
    }
}

pin (CLK1) {
    direction : input;
    capacitance : 1.0;
    fanout_load : 1.0;
    timing () {
timing_type : skew_falling;
intrinsic_rise : 1;
related_pin : "CLK";
    }
}
pin(Q){
    direction : output;
    timing () {
intrinsic_rise : 1.0;
rise_resistance : 0.1;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "CLK";
    }
}
}

```

In this case, the 'Q' pin is missing the timing_type attribute in its timing group.

EXAMPLE MESSAGE

Warning: Line 62, A nonsequential timing arc is specified with respect to the 'CLK' clock pin. (LBDB-353)

LBDB-354 (warning) A sequential timing arc is specified with respect

to the '%s' nonclock pin.

DESCRIPTION

The cell has the **interface_timing** attribute set to TRUE. The interface timing policy requires that all sequential timing arcs (except for clear and preset) be defined with respect to a pin that is labeled as a clock.

WHAT NEXT

Make sure that all sequential arcs are defined with respect to a clock pin.

EXAMPLES

```
cell (lbdb354) {
    area      : 0.0;
    interface_timing : TRUE;
    pin (I1)  {
        direction   : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        timing () {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CLK";
        }
        timing () {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CLK";
        }
    }
    pin (CLK)  {
        direction   : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        clock : true;
        timing () {
            timing_type : skew_rising;
            intrinsic_rise : 1.0;
            related_pin : "CLK1";
        }
    }

    pin (CLK1)  {
        direction   : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        timing () {
            timing_type : skew_falling;
```

```

intrinsic_rise : 1;
related_pin : "CLK";
}
}
pin(Q){
    direction : output;
    timing () {
intrinsic_rise : 1.0;
rise_resistance : 0.1;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "CLK";
}
}
}
}

```

In this case, the 'CLK' pin has a timing group with a timing_group value skew_rising related to the 'CLK1' pin.

EXAMPLE MESSAGE

Warning: Line 40, A sequential timing arc is specified with respect to the 'CLK1' nonclock pin. (LBDB-354)

LBDB-355 (warning) A skew constraint is specified for the nonclock '%s' pin.

DESCRIPTION

A skew constraint is specified for a pin that is not a clock. All clock pins must have the **clock** attribute set to TRUE.

WHAT NEXT

Make sure that skew constraints are defined for clock pins only. Check the library source file, and either set the **clock** attribute to TRUE on the pin, or remove the skew constraint.

EXAMPLES

```

cell (lbdb355) {
    area : 0.0;
    interface_timing : TRUE;
    pin (I1) {
        direction : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        timing () {
    timing_type : setup_rising;

```

```

intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
related_pin : "CLK";
}
timing () {
timing_type : hold_rising;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
related_pin : "CLK";
}
pin (CLK) {
direction : input;
capacitance : 1.0;
fanout_load : 1.0;
clock : true;
timing () {
timing_type : skew_rising;
intrinsic_rise : 1.0;
related_pin : "CLK1";
}
}

pin (CLK1) {
direction : input;
capacitance : 1.0;
fanout_load : 1.0;
timing () {
timing_type : skew_falling;
intrinsic_rise : 1;
related_pin : "CLK";
}
}
pin(Q){
direction : output;
timing () {
intrinsic_rise : 1.0;
rise_resistance : 0.1;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "CLK";
}
}
}
}

```

In this case, the 'CLK1' pin has skew constraint timing group on the nonclock 'CLK' pin. Because Library Compiler failed to recognize the 'CLK' pin.

EXAMPLE MESSAGE

Warning: Line 52, A skew constraint is specified for the nonclock 'CLK1' pin. (LBDB-355)

LBDB-356 (warning) Multiple %s constraints are specified between the '%s' pin and the '%s' clock pin.

DESCRIPTION

Design Compiler takes the worst case constraint when multiple constraints are specified.

WHAT NEXT

PrimeTime supports multiple setup/hold constraints.

EXAMPLES

```
cell (lbdb356) {
    area      : 0.0;
    interface_timing : TRUE;
    pin (I1) {
        direction   : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        timing () {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CLK";
        }
        timing () {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CLK";
        }
        timing () {
            timing_type : hold_falling;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CLK";
        }
    }
    pin (CLK) {
        direction   : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        clock : true;
    }
    pin(Q){
        direction   : output;
        timing () {

```

```

timing_type      : rising_edge;
intrinsic_rise  : 1.0;
rise_resistance : 0.1;
intrinsic_fall  : 1.0;
fall_resistance : 0.1;
related_pin     : "CLK";
}
}
}

```

In this case, the 'I1' pin has two hold constraints.

EXAMPLE MESSAGE

Warning: Line 31, Multiple setup or hold constraints are specified between the 'I1' pin and the 'CLK' clock pin. (LBDB-356)

**LBDB-357 (warning) The '%s' cell has the interface_timing attribute,
but has no clock pin.**

DESCRIPTION

According to interface timing specification policy, a library cell with the interface timing attribute set to TRUE must have at least one pin labeled as a clock.

WHAT NEXT

If the cell is combinational, remove the **interface_timing** attribute set on the cell. If the cell is sequential in nature, add the **clock** attribute to all clock pins of the cell. If the cell does not have a clock pin (like a RAM), choose the control pin with respect to which setups and holds are measured, and label it as a clock.

EXAMPLES

```

cell (lbdb357) {
    area      : 0.0;
    interface_timing : TRUE;
    pin (I1)   {
        direction  : input;
        capacitance : 1.0;
        fanout_load : 1.0;
    }
    pin(Q){
        direction  : output;
        function : "I1'";
        timing () {

```

```
intrinsic_rise    : 1.0;
rise_resistance  : 0.1;
intrinsic_fall   : 1.0;
fall_resistance  : 0.1;
related_pin      : "I1";
}
}
}
```

EXAMPLE MESSAGE

Warning: Line 6, The 'combo' cell has the interface_timing attribute, but has no clock pin. (LBDB-357)

LBDB-358 (error) It is not legal to specify the attribute '%s' in the '%s' group in this context.

DESCRIPTION

The indicated attribute cannot be specified in the indicated group because of the context. This situation can arise if the group can have several types and the attribute can only appear when the group is of specific type.

WHAT NEXT

Check your library to see if you have specified the wrong information for the group or if the attribute should be deleted from the group.

LBDB-370 (error) The library contains a '%s' group, but has no contain '%s' group.

DESCRIPTION

This message indicates that you specified only one transition degradation table in the library. Libraries that contain transition degradation tables must have tables for both rise and fall transitions.

WHAT NEXT

Add the missing table group to the library description.

EXAMPLES

```
rise_transition_degradation(trans_deg) {
```

```
values("0.0, 0.6",
      "1.0, 1.6");
}
```

In this case, the 'fall_transition_degradation' group is missing. To fix the problem, add this group to the library,

```
fall_transition_degradation(trans_deg) {
values("0.0, 0.8",
      "1.0, 1.8");
}
```

EXAMPLE MESSAGE

Error: Line 46, The library contains a 'rise_transition_degradation' group, but has no 'fall_transition_degradation' group. (LBDB-370)

LBDB-371 (error) The '%s' lut group is missing the mandatory '%s' attribute.

DESCRIPTION

This message indicates that you specified a lut group without the input_pins attribute in a FPGA library.

WHAT NEXT

Check the library source file, and add the missing attribute.

EXAMPLES

```
cell(lut5) {
  area : 1.0;
  lut(lbdb371) {
    /*      input_pins : "a b c d e"; */
  }
  pin(a b c d e) {
    direction : input;
    capacitance : 0.0;
  }
  pin(o) {
    direction : output;
    function : "lbdb371";
    timing() {
related_pin : "a b c d e";
    }
  }
}
```

EXAMPLE MESSAGE

Error: Line 98, The 'lbdb371' lut group is missing the mandatory 'input_pins' attribute. (LBDB-371)

LBDB-372 (error) The '%s' lut group attribute has an invalid '%s' value.

DESCRIPTION

This message indicates that you specified a lut group with an invalid value for the input_pins attribute in a FPGA library.

WHAT NEXT

Check the library source file, and correct the value of the input_pins attribute.

EXAMPLES

```
cell(lut5) {  
    area : 1.0;  
    lut(R) {  
        input_pins : "";  
    }  
    pin(a b c d e) {  
        direction : input;  
        capacitance : 0.0;  
    }  
    pin(o) {  
        direction : output;  
        function : "R";  
        timing() {  
            related_pin : "a b c d e";  
        }  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 98, The 'input_pins' lut group attribute has an invalid '' value. (LBDB-372)

LBDB-373 (error) The '%s' cell has more than one lut group

defined.

DESCRIPTION

This message indicates that you specified more than one lut group in the FPGA library.

WHAT NEXT

Check the library source file, and delete the extra lut groups.

EXAMPLES

```
cell(lbdb373) {  
    area : 1.0;  
    lut(R) {  
        input_pins : "a b c d e";  
    }  
    lut(R1) {  
        input_pins : "a b c d e";  
    }  
    pin(a b c d e) {  
        direction : input;  
        capacitance : 0.0;  
    }  
    pin(o) {  
        direction : output;  
        function : "R";  
        timing() {  
            related_pin : "a b c d e";  
        }  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 96, The 'lbdb373' cell has more than one lut group defined. (LBDB-373)

LBDB-374 (error) The '%s' input port is not in the '%s' lut.

DESCRIPTION

This message indicates that you did not specify an input port in lut group.

WHAT NEXT

Check the library source file, and either add the input port to the lut group or

delete the port.

EXAMPLES

```
cell(lbdb374) {
    area : 1.0;
    lut(R) {
        input_pins : "a b c d e";
    }
    pin(a b c d e f) {
        direction : input;
        capacitance : 0.0;
    }
    pin(o) {
        direction : output;
        function : "R";
        timing() {
            related_pin : "a b c d e";
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 101, The 'f' input port is not in the 'lbdb374' lut. (LBDB-374)

LBDB-375 (error) The '%s' port is incorrectly listed as an input in the '%s' lut.

DESCRIPTION

This message indicates that you specified a noninput port in the lut group.

WHAT NEXT

Check the library source file, and delete the noninput port from the lut group.

EXAMPLES

```
cell(lbdb375) {
    area : 1.0;
    lut(R) {
        input_pins : "a b c d e o";
    }
    pin(a b c d e) {
        direction : input;
        capacitance : 0.0;
    }
}
```

```

    }
    pin(o) {
        direction : output;
        function : "R";
        timing() {
related_pin : "a b c d e";
        }
    }
}

```

EXAMPLE MESSAGE

Error: Line 98, The 'o' port is incorrectly listed as an input in the 'lbdb375' lut. (LBDB-375)

LBDB-376 (error) The '%s' port is invalid in a cell containing a lut group.

DESCRIPTION

This message indicates that you specified an invalid port in a cell containing a lut group. Ports in a cell with a lut are either input or output.

WHAT NEXT

Check the library source file, and correct the direction of the port.

EXAMPLES

```

cell(lbdb376) {
    area : 1.0;
    lut(R) {
        input_pins : "a b c d e ";
    }
    pin(a b c d e) {
        direction : input;
        capacitance : 0.0;
    }
    pin(f) {
        direction : inout;
        capacitance : 0.0;
    }
    pin(o) {
        direction : output;
        function : "R";
        timing() {
related_pin : "a b c d e";
        }
    }
}

```

```
}
```

EXAMPLE MESSAGE

Error: Line 105, The 'f' port is invalid in a cell containing a lut group. (LBDB-376)

LBDB-377 (error) The '%s' lut group is invalid in a multiple output cell.

DESCRIPTION

This message indicates that you specified more than one output port in a cell containing a lut group.

WHAT NEXT

Check the library source file, and delete the extra output ports.

EXAMPLES

```
cell(lbdb377) {
    area : 1.0;
    lut(R) {
        input_pins : "a b c d e ";
    }
    pin(a b c d e) {
        direction : input;
        capacitance : 0.0;
    }
    pin(f) {
        direction : output;
        function : "R";
        timing() {
            related_pin : "a b c d e";
        }
    }
    pin(o) {
        direction : output;
        function : "R";
        timing() {
            related_pin : "a b c d e";
        }
    }
}
```

In this case, both 'f' and 'o' are output ports.

EXAMPLE MESSAGE

Error: Line 98, The 'R' lut group is invalid in a multiple output cell. (LBDB-377)

LBDB-378 (error) The '%s' lut group is invalid in a cell with no outputs.

DESCRIPTION

This message indicates that you did not specify any output port in a cell containing a lut group.

WHAT NEXT

Check the library source file, and either add the output port or delete the lut group.

EXAMPLES

```
cell(lbdb378) {
    area : 1.0;
    lut(R) {
        input_pins : "a b c d e ";
    }
    pin(a b c d e) {
        direction : input;
        capacitance : 0.0;
    }
}
```

In this case, the 'lbdb378' has no output port.

EXAMPLE MESSAGE

Error: Line 98, The 'R' lut group is invalid in a cell with no outputs. (LBDB-378)

LBDB-379 (error) The '%s' output port on the '%s' cell has no function attribute, or the function attribute is invalid with the lut group on this cell.

DESCRIPTION

This message indicates that either you specified an invalid function attribute on

the output port a cell containing a lut group, or you did not define the function attribute.

WHAT NEXT

Check the library source file, and either add or correct the function attribute.

EXAMPLES

```
cell(lbdb379) {  
    area : 1.0;  
    lut(R) {  
        input_pins : "a b c d e";  
    }  
    pin(a b c d e) {  
        direction : input;  
        capacitance : 0.0;  
    }  
    pin(o) {  
        direction : output;  
        timing() {  
related_pin : "a b c d e";  
        }  
    }  
}
```

In this case, The function attribute is missing in the 'o' port. To fix the problem, add the statement

```
function : "R";
```

EXAMPLE MESSAGE

```
Error: Line 113, The 'o' output port on the 'lbdb379' cell has no  
function attribute, or the function attribute is invalid with  
the lut group on this cell. (LBDB-379)
```

LBDB-380 (error) The '%s' name is invalid for a lut group in the
'%s'
cell because a port on the design has the same name.

DESCRIPTION

This message indicates that there is a name conflict between the specified lut group name and a port name. The names of the lut groups must be unique and must not conflict with existing port names.

WHAT NEXT

Change the name of the lut group so that it is unique.

EXAMPLES

```
cell(lbdb380) {  
    area : 1.0;  
    lut(R) {  
        input_pins : "a b c d e";  
    }  
    pin(a b c d e) {  
        direction : input;  
        capacitance : 0.0;  
    }  
    pin(R) {  
        direction : output;  
        function : "R";  
        timing() {  
related_pin : "a b c d e";  
        }  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 98, The 'R' name is invalid for a lut group in the 'lbdb380' cell because a port on the design has the same name. (LBDB-380)

LBDB-381 (error) The '%s' lut cell has %d input port(s). A lut cell must have at least 1 but no more than 9 input ports.

DESCRIPTION

This message indicates that the specified lut cell has either too many or too few input ports. lut cells must have at least 1 but not more than 9 input ports.

WHAT NEXT

Edit the lut cell description in your library so that the cell has at least 1 but not more than 9 input ports.

EXAMPLES

```
cell(lbdb381) {  
    area : 1.0;  
    lut(R) {  
        input_pins : "a b c d e f g h i j";  
    }
```

```

    }
    pin(a b c d e f g h i j) {
        direction : input;
        capacitance : 0.0;
    }
    pin(o) {
        direction : output;
        function : "R";
        timing() {
related_pin : "a b c d e f g h i j";
        }
    }
}

```

EXAMPLE MESSAGE

Error: Line 98, The 'lbdb381' lut cell has 10 input port(s). A lut cell must have at least 1 but no more than 9 input ports. (LBDB-381)

LBDB-382 (error) The '%s' cell is an invalid lut cell. Only simple combinational cells are valid.

DESCRIPTION

This message indicates that the specified cell is not a simple combinational cell, which is the only valid type of lut cell.

WHAT NEXT

Remove the lut construct from this cell description, or modify the cell so that it is a simple combinational cell.

EXAMPLES

```

cell(lbdb382) {
    area : 1.0;
    lut(R) {
        input_pins : "D CP";
    }
    pin(D CP ) {
        direction : input;
        capacitance : 0.0;
    }
    ff("IQ", "IQN") {
        next_state : "D";
        clocked_on : "CP";
    }
    pin(o) {

```

```
    direction : output;
    function : "R";
    timing() {
related_pin : "D CP";
    }
}
}
```

EXAMPLE MESSAGE

Error: Line 96, The 'lbdb382' cell is an invalid lut cell. Only simple combinational cells are valid. (LBDB-382)

LBDB-383 (error) The '%s' attribute is invalid on the '%s' lut cell.

DESCRIPTION

This message indicates that the specified attribute is not valid on the specified lut cell.

WHAT NEXT

Remove the offending attribute from the lut cell.

EXAMPLES

```
cell(lbdb383) {
    area : 1.0;
    fpga_lut_output : true;
    lut(R) {
        input_pins : "A B C D";
    }
    pin(A B C D) {
direction : input;
capacitance : 0.0;
    }
    pin(Z) {
direction : output;
function : "R";
timing() {
    intrinsic_rise : 5.0;
    intrinsic_fall : 5.0;
    related_pin : "A B C D";
}
}
}
```

EXAMPLE MESSAGE

```
Error: Line 25, The 'fpga_lut_output' attribute is invalid on  
the 'lbdb383' lut cell. (LBDB-383)
```

LBDB-384 (error) The lut marker cell attribute '%s' is invalid on the '%s' cell.

DESCRIPTION

This message indicates that a lut marker cell attribute has been found on the specified cell, identifying it as a lut marker cell. However, the cell is not a valid candidate for a lut marker cell because it is not a single output buffer cell with 0 area.

Lut marker cells delimit the boundaries of luts and must be single-output buffer cells with 0 area.

WHAT NEXT

Either remove the lut marker cell attribute from the cell, or edit the cell description to make it a valid marker cell; that is, a single output buffer cell with 0 area.

EXAMPLES

```
cell(lbdb384) {  
    area : 0.0;  
    fpga_lut_insert_before_sequential : true;  
    pin(A) {  
        direction : input;  
        capacitance : 0.0;  
    }  
    pin(Z) {  
        direction : output;  
        function : "A";  
        timing() {  
            intrinsic_rise : 0.0;  
            intrinsic_fall : 0.0;  
            related_pin : "A";  
        }  
    }  
}
```

EXAMPLE MESSAGE

```
Error: Line 126, The lut marker cell attribute  
'fpga_lut_insert_before_sequential' is invalid on the 'lbdb384' cell. (LBDB-384)
```

LBDB-385 (error) The lut marker '%s' cell is functionally invalid. Lut marker cells must be single output buffers.

DESCRIPTION

This message indicates that the specified marker cell is not a single output buffer, which is the only valid lut marker cell type.

WHAT NEXT

Remove the marker cell attribute from the cell, or change the cell's functionality so that it is a single output buffer.

EXAMPLES

```
cell(lbdb385) {  
    area : 0.0;  
    fpga_lut_output : true;  
    pin(A) {  
        direction : input;  
        capacitance : 0.0;  
    }  
    pin(Z1) {  
        direction : output;  
        function : "A";  
        timing() {  
            intrinsic_rise : 0.0;  
            intrinsic_fall : 0.0;  
            related_pin : "A";  
        }  
    }  
    pin(Z2) {  
        direction : output;  
        function : "A";  
        timing() {  
            intrinsic_rise : 0.0;  
            intrinsic_fall : 0.0;  
            related_pin : "A";  
        }  
    }  
}
```

In this case, there are two output ports in the cell.

EXAMPLE MESSAGE

```
Error: Line 143, The lut marker 'lbdb385' cell is functionally invalid.  
Lut marker cells must be single output buffers. (LBDB-385)
```

LBDB-386 (warning) The lut marker '%s' cell has a nonzero '%s' attribute. Marker cells must have zero area and zero delay.

DESCRIPTION

This message indicates that the specified area or delay value in the library is nonzero, which is invalid for lut marker cells.

WHAT NEXT

Change the offending nonzero value (area or delay, as appropriate) to zero.

EXAMPLES

```
cell(lbdb386) {
    area : 0.0;
    fpga_lut_output : true;
    pin(A) {
        direction : input;
        capacitance : 0.0;
    }
    pin(Z) {
        direction : output;
        function : "A";
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 0.0;
            related_pin : "A";
        }
    }
}
```

In this case, the 'intrinsic_rise' value is 1.0. Change the value to zero to fix the problem.

EXAMPLE MESSAGE

```
Warning: Line 169, The lut marker 'lbdb386' cell has a nonzero
'intrinsic rise delay' attribute. Marker cells must have
zero area and zero delay. (LBDB-386)
```

LBDB-387 (warning) The '%s' library has more than one lut

output marker cell.

DESCRIPTION

This message indicates that the specified library has too many lut output marker cells. Each library can have only one lut output marker cell.

WHAT NEXT

Check the library source file, and remove the duplicate output marker cells.

EXAMPLES

```
library(lbdb387) {
    ...
    cell(marker1) {
        area : 0.0;
        fpga_lut_output : true;
        pin(A) {
            direction : input;
            capacitance : 0.0;
        }
        pin(Z) {
            direction : output;
            function : "A";
            timing() {
                intrinsic_rise : 0.0;
                intrinsic_fall : 0.0;
                related_pin : "A";
            }
        }
    }

    cell(marker2) {
        area : 0.0;
        fpga_lut_output : true;
        pin(A) {
            direction : input;
            capacitance : 0.0;
        }
        pin(Z) {
            direction : output;
            function : "A";
            timing() {
                intrinsic_rise : 0.0;
                intrinsic_fall : 0.0;
                related_pin : "A";
            }
        }
    }
}
```

EXAMPLE MESSAGE

Warning: Line 56, The 'lbdb387' library has more than one lut output marker cell. (LBDB-387)

LBDB-388 (error) The '%s' attribute cannot be specified in a timing arc that is not a timing constraint.

DESCRIPTION

This message indicates that an attribute has been incorrectly specified. The specified attribute is allowed only on timing arcs that are timing constraints (for example, setup and hold).

WHAT NEXT

Check the library source file, and make the appropriate correction. For example, change the timing type to be a timing constraint.

EXAMPLES

```
pin(Q) {
    direction : output;
    function : "IQ";
    timing() {
        timing_type : falling_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
    when_end : "D0";
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CK2";
    }
}
```

In this case, the 'falling_edge' timing_type value is not a constraint.

EXAMPLE MESSAGE

Error: Line 94, The 'when_end' attribute cannot be specified in a timing arc that is not a timing constraint. (LBDB-388)

LBDB-389 (error) This timing arc has either '%s' or '%s'

attribute but not both.

DESCRIPTION

This message indicates that in a timing group, you defined only one attribute from the following sets:

- * when attribute and sdf_cond attribute
- * when_start attribute and sdf_cond_start attribute
- * when_end attribute and sdf_cond_end attribute

To define a state dependent timing arc, Library Compiler expects both attributes defined.

WHAT NEXT

Complete your specification by adding appropriate attributes to the timing group.

EXAMPLES

```
pin(Z) {  
direction : output;  
function : "A^B";  
timing() {  
    when : "B'";  
    timing_sense : positive_unate;  
    intrinsic_rise : 0.1;  
    intrinsic_fall : 0.1;  
    rise_resistance : 0.1;  
    fall_resistance : 0.1;  
    related_pin : "A";  
}  
}
```

In this case, only the 'when' attribute is specified. To fix the problem, add the statement,

```
sdf_cond : "!B";
```

EXAMPLE MESSAGE

```
Error: Line 88, This timing arc has either 'when' or 'sdf_cond'  
attribute but not both. (LBDB-389)
```

LBDB-390 (warning) The when and/or sdf_cond attributes in this

timing arc are ignored.

DESCRIPTION

This message indicates that you specified, in addition to the **when_start**, **when_end**, **sdf_cond_start**, or **sdf_cond_end** attributes in the timing (constraint) group, the **when** and **sdf_cond** attributes. Library Compiler ignores the **when** and **sdf_cond** attributes.

WHAT NEXT

Remove the redundant **when** and/or **sdf_cond** attributes from the timing group.

EXAMPLES

```
timing() {  
    timing_type : setup_rising;  
    intrinsic_rise : 1.0;  
    intrinsic_fall : 1.0;  
    sdf_edges : start_edge;  
    when : " CD * SD ";  
    sdf_cond : " SIG_2 == 1'b1 ";  
    when_end : " CD * SD * Q' ";  
    sdf_cond_end : " SIG_0 == 1'b1";  
    related_pin : "CP";  
}
```

In this case, both the **when** and **sdf_cond** pair and the **when_end** and **sdf_cond_end** are specified.

EXAMPLE MESSAGE

Warning: Line 836, The **when** and/or **sdf_cond** attributes in this timing arc are ignored. (LBDB-390)

LBDB-391 (warning) The '%s' attribute on pin '%s' is not valid. The attribute is ignored.

DESCRIPTION

This message indicates that the attribute on the specified pin is invalid. The attribute is ignored. This situation occurs when other information specified on the same pin is incompatible with the attribute. For example, the **min_period** attribute is ignored if the **minimum_period** group is also specified on the same pin.

WHAT NEXT

Refer to the **Library Compiler Reference Manual** to determine the reason why the attribute is not valid. Change the library source file and make the correction.

EXAMPLES

```
pin (CLK) {  
    direction : input ;  
    capacitance : 0 ;  
    min_pulse_width_low : 3 ;  
    min_pulse_width_high : 3 ;  
    min_period : 5.0;  
    minimum_period() {  
        constraint : 1.0;  
        when : "D PRE";  
        sdf_cond : "cond_1 == 1'b1";  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 183, The 'min_period' attribute on the 'CLK' pin is not valid.
The attribute is ignored. (LBDB-391)

LBDB-392 (error) The ECL Technology is obsolete with v3.4b.
Compilation terminated abnormally.

DESCRIPTION

This error occurs when the ECL Technology is used. This technology is supported up to v3.4a but not for subsequent releases.

WHAT NEXT

Use the supported technologies.

EXAMPLES

```
library(lbdb392) {  
    technology(ecl);  
    delay_model : "generic_ecl" ;  
}
```

EXAMPLE MESSAGE

Error: The ECL Technology is obsolete with v3.4b. Compilation terminated abnormally
. (LBDB-392)

LBDB-393 (error) Too many values entered for the driver_type attribute.

DESCRIPTION

This error occurs when more than two values entered for a driver_type attribute in defining a simple attribute.

WHAT NEXT

Only inout pin allows for two driver_type values. Other pins can have only one value. During passing, we first catch the case where more than two are entered.

EXAMPLES

```
pin(y) {
    direction : inout;
    function : 1;
    three_state : "a";
    driver_type : "open_source pull_down resistive";
    timing() {
        timing_type : three_state_disable;
        related_pin : "a";
    }
    timing() {
        related_pin : "a";
    }
}
```

In the driver_type line, three driver_types are specified for this pin.

EXAMPLE MESSAGE

Error: Line 458, Too many values entered for the driver_type attribute. (LBDB-393)

LBDB-394 (error) The driver type %s is incompatible with the %s pin %s.

DESCRIPTION

Valid driver-type (programmable or non-programmable) and pin combinations (Y means valid) :

```
non-programmable input output inout programmable
===== ===== ===== ===== ===== pull_up Y Y Y
pull_up_function pull_down Y Y Y pull_down_function open_drain N Y Y
```

```
open_drain_function open_source N Y Y open_source_function bus_hold N N Y  
bus_hold_function resistive N Y Y resistive_function resistive_0 N Y Y  
resistive_0_function resistive_1 N Y Y resistive_1_function open_drain_with_pull_up  
N N Y open_drain_with_pull_down N N Y open_source_with_pull_up N N Y  
open_source_with_pull_down N N Y  
=====
```

WHAT NEXT

When single pull_up/down applys to an inout pin, it is for the input behavior; other single types applying to an inout pin are for the output behavior. Always comply with the above rules.

EXAMPLES

```
pin(a) {  
    direction : input;  
    capacitance : "1";  
    driver_type : "open_source pull_up";  
}
```

EXAMPLE MESSAGE

Error: Line 177, The driver type open_source_with_pull_up is incompatible with the input pin a. (LBDB-394)

EXAMPLES

```
pin(A3) {  
    direction : input;  
    pull_up_function : "!A1 * !A2 * !A3";  
    pull_down_function : "A1 * A2 * !A3";  
    bus_hold_function : "A1 * !A2 * !A3";  
    open_drain_function : "!A1 * A2 * !A3";  
    open_source_function : "!A1 * !A2 * A3";  
    resistive_function : "A1 * A2 * A3";  
    resistive_0_function : "A1 * !A2 * A3";  
    resistive_1_function : "!A1 * A2 * A3";  
    ...  
}
```

In this case, only pull_up_function and pull_down_function can be specified under an input pin. To avoid the error, please remove the rest of 6 programmable driver types.

EXAMPLE MESSAGE

Error: Line 217, The driver type open_drain_function is incompatible with the input pin A3. (LBDB-394)

LBDB-395 (warning) The timing arc with timing_type '%s' can only be specified on a pin with 'input' or 'inout' direction.

DESCRIPTION

The timing_type non_seq_setup_rising, non_seq_setup_falling, non_seq_hold_rising and non_seq_hold_falling can only be specified on a timing arc on the input or the inout pins.

WHAT NEXT

Check the timing arc and make the correction to either the direction of the pin or delete the timing arc or move it to the appropriate place.

EXAMPLES

```
pin(Z) {  
    direction : output;  
    timing() {  
        timing_type : non_seq_setup_rising;  
        ...  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 144, The timing arc with timing_type 'non_seq_setup_rising' can only be specified on a pin with 'input' or 'inout' direction. (LBDB-395)

LBDB-396 (warning) The 'related_output_pin' attribute is only needed when the delay table refers to a template which uses the output loading of the related_output_pin in one of its dimension.

DESCRIPTION

This can happen when the 'related_output_pin' is not needed in this timing arc or the template name used by this table is wrong or the template itself should use the output loading of the related_output_pin in one of its dimension.

WHAT NEXT

Check the table or the template to see if the related_output_pin attribute is actually needed here. If not, just delete the attribute.

EXAMPLES

```
lu_table_template(prop) {
    variable_1 : output_net_length;
    index_1 ("1, 5, 10");
}

cell(A) {

    pin(0) {
        timing() {
            related_output_pin : "Z";
            rise_propagation(prop) {
                ...
            }
        }
    }
}
```

EXAMPLE MESSAGE

Warning: Line 144, The 'related_output_pin' attribute is only needed when the delay table refers to a template which uses the output loading of the related_output_pin in one of its dimension. (LBDB-396)

The timing arc is a rise_propagation table which refers to the template 'prop'. In the template, the only variable it depends on is the loading of the output pin. There is no dependency on the loading of pin 'Z' and there is no need to put the 'related_output_pin' in the timing group.

LBDB-397 (error) There can only be one pin in the 'related_output_pin' attribute and the pin should be single bit.

DESCRIPTION

The "related_output_pin" attribute is used for figuring out the output loading to index into the table. It is not possible to determine which output pin to use for this purpose if there is more than one pin specified in the attribute. Multiple bits specification also have the same problem.

WHAT NEXT

Check the 'related_output_pin' attribute and make the correction according to the real electrical characteristics.

EXAMPLES

```
timing() {
    related_output_pin : "Z1 Z2";
...
}
```

EXAMPLE MESSAGE

Error: Line 144, There can only be one pin in the 'related_output_pin' attribute and the pin should be single bit. (LBDB-397)

There are two pins, Z1 and Z2, in the related_output_pin attribute. It is not possible to figure out which pin should be used to figuring out the loading to index into the timing table.

LBDB-398 (error) The pin '%s' specified in the 'related_output_pin' attribute is not an output or inout pin.

DESCRIPTION

The pin specified in the 'related_output_pin' attribute should have the direction 'output' or 'inout'.

WHAT NEXT

Check the 'related_output_pin' attribute to see if you have put the wrong pin in it or you forgot to put the correct pin direction on the pin specified in the 'related_output_pin' attribute.

EXAMPLES

```
pin(A) {
    direction : input;
...
}
pin(B) {
    timing() {
        related_output_pin : "A";
...
}
```

```
    }  
}
```

EXAMPLE MESSAGE

Error: Line 144, The pin 'A' specified in the 'related_output_pin' attribute is not an output or inout pin. (LBDB-398)

Pin 'A' is an input pin and cannot be put into the 'related_output_pin' attribute.

LBDB-399 (error) The timing_type '%s' is not supported with the 'related_output_pin' attribute.

DESCRIPTION

The timing_type supported with the 'related_output_pin' attribute are:
'setup_rising', 'setup_falling', 'hold_rising', 'hold_falling',
'non_seq_setup_rising', 'non_seq_setup_falling', 'non_seq_hold_rising',
'non_seq_hold_falling', 'skew_rising', 'skew_falling', 'removal_rising',
'removal_falling', 'recovery_rising' and 'recovery_falling'.

WHAT NEXT

You may either put the wrong timing_type for the timing group or delete the timing group if it is not supported or the 'related_output_pin' attribute is not needed.

EXAMPLES

```
timing() {  
    timing_type : rising_edge;  
    related_output_pin : "A";  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 144, The timing_type 'rising_edge' is not supported with the 'related_output_pin' attribute.. (LBDB-399)

LBDB-400 (warning) The '%s' operating condition has been

**defined
multiple times in the '%s' library.
Design Compiler will use the first definition only.**

DESCRIPTION

The library contains more than one definition of an operating condition. Library Compiler issues this error message, records all definitions, but Design Compiler will only use the first definition encountered.

WHAT NEXT

Change the operating condition name if it is wrong, or delete all extra definitions.

EXAMPLES

```
operating_condition(P1V1) {  
    ...  
}  
operating_condition(P1V1) {  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 50, The 'P1V1' operating condition has been defined multiple times in the 'sample-library' library.
Design compiler will use the first one only. (LBDB-400)

LBDB-401 (error) The '%s' is missing for this timing check.

DESCRIPTION

Both rise and fall constraint values are required in the nochange timing check.

WHAT NEXT

Check the library source file to see if you missed the rise or fall constraint value. Otherwise, use setup or hold check instead.

EXAMPLES

```
pin ( EN ) {  
    direction : input;  
    timing () {
```

```

timing_type : nochange_high_high;
    related_pin : CP ;
    rise_constraint(cons) {
        values("0.100000, 0.100000, 0.100000", \
               "0.100000, 0.100000, 0.100000", \
               "0.100000, 0.100000, 0.100000", \
               "0.100000, 0.100000, 0.100000");
    }
}
}

```

To fix the problem, add the attribute to the timing group,

```

fall_constraint(cons) {
    values("0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000", \
           "0.100000, 0.100000, 0.100000");
}

```

EXAMPLE MESSAGE

Error: Line 104, The 'fall_constraint' is missing for this timing check. (LBDB-401)

LBDB-402 (error) The '%s' is missing for this internal_power group.

DESCRIPTION

Internal_power groups require specification of either (1) both the rise_power and fall_power attributes; or (2) the power attribute.

WHAT NEXT

Check the library source file to see if you missed the rise_power, fall_power, or power attribute.

EXAMPLES

```
pin ( EN )      {
    direction : input;
    internal_power ()      {
        rise_power(power_1d_temp) {
            values("0.100000, 0.100000, 0.100000");
        }
    }
}
```

To fix the problem, add the attribute to the internal_power group.

```
fall_power(power_1d_temp) {
    values("0.100000, 0.100000, 0.100000");
}
```

EXAMPLE MESSAGE

Error: Line 104, The 'fall_power' is missing for this internal_power group. (LBDB-402)

LBDB-403 (error) The '%s' and '%s' attributes are both defined for this internal_power group.

DESCRIPTION

Internal_power groups require specification of either (1) both the rise_power and fall_power attributes; or (2) the power attribute.

However, it is an error to mix style (1) and (2).

WHAT NEXT

Check the library source file to make sure that the previous requirement is met.

EXAMPLES

```
pin ( EN )      {
    direction : input;
    internal_power ()      {
        power(power_1d_temp) {
            values("0.100000, 0.100000, 0.100000");
        }
        rise_power(power_1d_temp) {
            values("0.100000, 0.100000, 0.100000");
        }
    }
}
```

```
    }
}
```

To fix the problem, remove the rise_power attribute from the internal_power group, or remove power attribute and add the following fall_power attribute from the internal_power group.

```
fall_power(power_1d_temp) {
    values("0.100000, 0.100000, 0.100000");
}
```

EXAMPLE MESSAGE

XXX

Error: Line 104, The 'rise_power' and 'power' attributes are both defined for this internal_power group. (LBDB-403)

LBDB-404 (error) The '%s' lookup table in the input-associated internal_power group cannot use '%s' as its template.

DESCRIPTION

The rise_power, fall_power, or power lookup tables in a input-associated internal_power group must use 1-dimensional template with input_transition_time as its variable.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
}
power_lu_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
}

power(err_temp) {
values ("1, 2, 3, 4");
}
```

To fix the problem, change the template value of the power attribute from err_temp to ok_temp.

EXAMPLE MESSAGE

```
Error: Line 126, The 'power' lookup table in the inout-associated  
internal_power group cannot use 'err_temp' as its template. (LBDB-404)
```

LBDB-405 (error) The 1-dimensional '%s' lookup table in the inout-associated internal_power group cannot use '%s' as its template.

DESCRIPTION

The 1-dimensional rise_power, fall_power, or power lookup tables in an inout-associated internal_power group must use a template with input_transition_time or total_output_net_capacitance as its variable.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
power_lu_template(ok_temp) {  
    variable_1 : input_transition_time;  
    index_1("0, 1, 2, 3");  
}  
power_lu_template(ok2_temp) {  
    variable_1 : total_output_net_capacitance;  
    index_1("0, 1, 2, 3");  
}  
power_lu_template(err_temp) {  
    variable_1 : output_net_length;  
    index_1("0, 1, 2, 3");  
}  
  
    power(err_temp) {  
        values ("1, 2, 3, 4");  
    }
```

To fix the problem, change the template value of the power attribute from err_template to ok_temp or ok2_temp.

EXAMPLE MESSAGE

```
Error: Line 126, The 1-dimensional 'power' lookup table in the  
inout-associated internal_power group cannot use
```

```
'basic_template' as its template. (LBDB-405)
```

LBDB-406 (error) The 1-dimensional '%s' lookup table in the %s-associated internal_power group cannot use '%s' as its template.

DESCRIPTION

The 1-dimensional rise_power, fall_power, or power lookup tables in an output-associated internal_power group must use a template with total_output_net_capacitance as its variable.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
power_lu_template(err_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
}
power_lu_template(ok_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
}

power(err_temp) {
    values ("1, 2, 3, 4");
}
```

To fix the problem, change the template value of the power attribute from err_template to ok_temp.

EXAMPLE MESSAGE

Error: Line 126, The 1-dimensional 'power' lookup table in the output-associated internal_power group cannot use 'err_temp' as its template. (LBDB-406)

LBDB-407 (error) The 2-dimensional '%s' lookup table in the %s-associated internal_power group cannot use '%s' as its

template.

DESCRIPTION

The 2-dimensional `rise_power`, `fall_power`, or power lookup tables in an output-associated `internal_power` group must use a template with `input_transition_time` and `total_output_net_capacitance` as its variables.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2, 3");
}
power_lu_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
    variable_2 : constrained_pin_transition;
    index_2("0, 1, 2, 3");
}
power(err_temp) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
}
```

To fix the problem, change the template value of the `power` attribute from `err_temp` to `ok_temp`.

EXAMPLE MESSAGE

Error: Line 126, The 2-dimensional 'power' lookup table in the output-associated `internal_power` group cannot use '`err_temp`' as its template. (LBDB-407)

LBDB-408 (error) The 3-dimensional '%s' lookup table in the %s-associated `internal_power` group cannot use '%s' as its

template.

DESCRIPTION

The 3-dimensional `rise_power`, `fall_power`, or power lookup tables in an output-associated `internal_power` group must use a template with `input_transition_time`, `total_output_net_capacitance` and `equal_or_opposite_output_net_capacitance` as its variables.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
power_lu_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2");
    variable_3 : equal_or_opposite_output_net_capacitance;
    index_3("0, 1, 2");
}
power_lu_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2");
    variable_2 : constrained_pin_transition;
    index_2("0, 1, 2");
    variable_3 : equal_or_opposite_output_net_capacitance;
    index_3("0, 1, 2");
}

power(err_temp) {
    values ("1, 2, 3", "4, 5, 6", "7, 8, 9", \
            "10, 11, 12", "13, 14, 15", "16, 17, 18", \
            "19, 20, 21", "22, 23, 24", "25, 26, 27");
}
```

To fix the problem, change the template value of the `power` attribute from `err_temp` to `ok_temp`.

EXAMPLE MESSAGE

Error: Line 126, The 3-dimensional 'power' lookup table in the output-associated `internal_power` group cannot use '`err_temp`' as its template. (LBDB-408)

LBDB-409 (error) The %d-dimensional template used in '%s' lookup table is incompatible with the template used in '%s' lookup table.

DESCRIPTION

Both rise_power and fall_power lookup tables must have the same dimension. One exception is when the internal_power is an arc from a tri-state pin (that is related_pin is a tri-state pin), the dimension of rise_power and fall_power can be different.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
power_lu_template(1d_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");

    power_lu_template(2d_temp) {
        variable_1 : input_transition_time;
        index_1("0, 1, 2, 3");
        variable_2 : total_output_net_capacitance;
        index_2("0, 1, 2, 3");
    }

    rise_power(1d_temp) {
        values ("1, 2, 3, 4");
    }
    fall_power(2d_temp) {
        values ("1, 2, 3, 4", "5, 6, 7, 8", \
                "9, 10, 11, 12", "13, 14, 15, 16");
    }
}
```

To fix the problem, use 1-dimensional or 2-dimensional lookup tables on both rise_power and fall_power attributes.

EXAMPLE MESSAGE

Error: Line 126, The %d-dimensional template used in '%s' lookup table is incompatible with the template used in '%s' lookup table. (LBDB-409)

LBDB-410 (error) The '%s' attribute is missing from the internal_power group.

DESCRIPTION

The related_pin or related_bus_pins attributes are required in an internal_power group with a 2-dimensional or 3-dimensional lookup table. The equal_or_opposite_output attribute is required in an internal_power group with a 3-dimensional look-up table.

WHAT NEXT

Change the library source file by specifying related_pin, related_bus_pins, or equal_or_opposite_output attribute in the internal_power group as needed.

EXAMPLES

```
internal_power() {
    power(power_2d) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
    }
}
```

To fix the problem, add the following line into the internal_power group.

```
related_pin : "A";
```

EXAMPLE MESSAGE

Error: Line 126, The 'related_pin or related_bus_pins' attribute is missing from the internal_power group. (LBDB-410)

LBDB-411 (error) The internal_power group associated with pin '%s' cannot coexist with the cell-associated internal_power group in line %d.

DESCRIPTION

It is not allowed to use cell-associated and pin-associated internal_power group for the same pin.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about power modeling. Change the library source file by using either the cell-associated style or pin-associated style internal_power on the specified pin.

EXAMPLES

```
cell(AN2) {  
internal_power(power_1d_temp) {  
    related_input : "A";  
    values("0.100000, 0.100000, 0.100000");  
}  
    pin (A) {  
        direction : input;  
        internal_power () {  
            power(power_1d_temp) {  
                values("0.100000, 0.100000, 0.100000");  
            }  
        }  
    }  
}  
...  
}
```

To fix the problem, remove internal_power group associated with cell group or pin group.

EXAMPLE MESSAGE

```
Error: Line 126, The internal_power group associated with pin 'A'  
cannot co-exist with the cell-associated internal_power group in line 120. (LBDB-  
411)
```

LBDB-412 (error) There is a missing internal_power relation between pins '%s' and '%s' in the '%s' cell.

DESCRIPTION

This message indicates there is a missing internal_power relation from an input or inout pin to an output pin.

For a combinational cell, the Library Compiler checks that

- * An output port with a function statement has internal_power relation to all functionally related inputs
- * An output port with a three_state attribute has timing arcs to all three_state related inputs

However, Library Compiler will not check if internal_power information is completely missing in this output.

WHAT NEXT

Add the missing internal_power group between the two pins.

EXAMPLES

```
cell(AN2) {
    pin(A, B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        internal_power () {
            power (power_2d_temp) {
                values ("1, 2, 3, 4", "5, 6, 7, 8", \
                        "9, 10, 11, 12", "13, 14, 15, 16");
            }
            related_pin : "A";
        }
        timing() {
            ...
        }
    }
}
```

In this case, an internal_power group is missing between the pin 'Z' and 'B'. To fix the problem, add the following internal_power group:

```
internal_power () {
    power (power_2d_temp) {
        values ("1, 2, 3, 4", "5, 6, 7, 8", \
                "9, 10, 11, 12", "13, 14, 15, 16");
    }
    related_pin : "B";
}
```

EXAMPLE MESSAGE

Error: Line 12, There is a missing internal_power relation between pins 'B' and 'Z' in the 'AN2' cell. (LBDB-412)

LBDB-413 (error) There is an extra internal_power group

**between '%s' and
'%s' pins in the '%s' cell.**

DESCRIPTION

Internal_power groups are allowed for pins that are related to each other. To be related to each other, the input pin has to be in the **function** or **three_state** attribute of the output or input pin. This message is issued if the internal_power group identified between pins does not fall into the categories previously described.

WHAT NEXT

Check your library to see whether you have generated the internal_power group by mistake, whether the related_pin field is wrong, or the function attribute value is not recognized.

EXAMPLES

```
pin(Z) {
    direction : output;
    function : "B";
    internal_power () {
        power (power_2d_temp) {
            values ("1, 2, 3, 4", "5, 6, 7, 8", \
                    "9, 10, 11, 12", "13, 14, 15, 16");
        }
        related_pin : "A B";
    }
    timing() {
    ...
    }
}
```

In this case, you defined a internal_power group between the 'A' and 'Z' pins, even though the 'A' pin is not functionally related to the 'Z' pin. Remove the internal_power group or change the function statement of 'Z' to include 'A'.

EXAMPLE MESSAGE

Warning: Line 73, There is an extra internal_power group between 'A' and 'Z' pins in the 'AN2' cell. (LBDB-413)

LBDB-414 (error) In this internal_power group, the '%s' output pin in

the '%s' attribute is not functionally equivalent or opposite to the '%S' pin.

DESCRIPTION

If an output is specified in the related_pin, related_bus_pins, or equal_or_opposite_output attributes, this output must be functionally equivalent or opposite of the output pin which owns the internal_power.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
cell(AN2) {
    pin(A, B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        internal_power () {
            power (power_3d_temp) {
                values ("1, 2, 3", "4, 5, 6", "7, 8, 9", \
                        "10, 11, 12", "13, 14, 15", "16, 17, 18", \
                        "19, 20, 21", "22, 23, 24", "25, 26, 27");
            }
            related_pin : "A B";
        equal_or_opposite_output : "Y";
        }
        timing() {
            ...
        }
    }
    pin(Y) {
        direction : output;
        function : "A + B";
        timing() {
            ...
        }
    }
}
```

To fix the problem, remove equal_or_opposite_output attribute from the internal_power group and use 2-dimensional lookup table; or make sure 'Y' is

functionally equivalent or opposite to 'Z'.

EXAMPLE MESSAGE

Error: Line 126, In this internal_power group, the 'Y' output pin in the 'equal_or_opposite_output' attribute is not functionally equivalent or opposite to the 'Z' pin. (LBDB-414)

LBDB-415 (error) The '%s' attribute cannot be specified in this internal_power group.

DESCRIPTION

This message indicates you specified an attribute outside its context.

- (1) An internal_power group with 1-dimensional look-up tables cannot specify related_pin, related_bus_pins, or equal_or_opposite_output attributes.
- (2) An internal_power group with 2-dimensional look-up tables cannot specify an equal_or_opposite_output attribute.

One exception is when the internal_power is an arc from a tri-state pin (that is related_pin is a tri-state pin), the checker is disabled.

WHAT NEXT

Change the technology library source file to delete the specified attribute or move the attribute to its correct context.

EXAMPLES

```
internal_power() {
    power(power_1d_temp) {
        values ("1, 2, 3, 4");
    }
    related_pin : "A";
}
```

In this case, the 'related_pin' attribute is not allowed in 1-dimensional lookup table. To fix the problem, remove the related_pin attribute from internal_power group.

EXAMPLE MESSAGE

Error: Line 69, The 'related_pin or related_bus_pins' attribute cannot be specified in this internal_power group. (LBDB-415)

LBDB-416 (error) The '%s' cell is missing cell_leakage_power attribute.

DESCRIPTION

This message indicates there is one or more state-dependent leakage_power attribute, but no cell_leakage_power attribute specified as default value. When at least one state-dependent leakage power is specified in a cell, the cell must have also cell_leakage_power attribute defined.

WHAT NEXT

Add the missing timing group between the two pins.

EXAMPLES

```
cell(AN2) {  
    leakage_power () {  
when : "A";  
value : 1.0;  
    }  
    ...  
}
```

In this case, a cell_leakage_power attribute is missing. To fix the problem, add the following attribute to the cell group:

```
cell_leakage_power : 0.5;
```

EXAMPLE MESSAGE

Error: Line 12, The 'AN2' cell is missing cell_leakage_power attribute. (LBDB-416)

LBDB-417 (error) Pin '%s' has a timing arc that appears on only one of the scaled cell (%s,%s) and the cell '%s'.

DESCRIPTION

Timing arcs with the same pin pair and type must match by number between the scaled cell and the regular cell.

WHAT NEXT

Find the timing group in the scaled_cell and remove the extra timing groups or add

more timing groups in the parent cell.

EXAMPLES

```
library(alib) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }
    cell(AND) {
        area : 1;
        pin(A B) {
direction : input;
capacitance : 1;
        }
        pin(Z) {
direction : output;
function : "A B";
timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
}

scaled_cell(AND,WCCOM) {
    area : 1;
    pin(A) {
direction : input;
capacitance : 1;
    }
    pin(B) {
direction : input;
capacitance : 1;
timing() {
            intrinsic_rise : 0.3;
            intrinsic_fall : 0.3;
            rise_resistance : 0.3;
            fall_resistance : 0.3;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
    pin(Z) {
direction : output;
function : "A B";
timing() {
```

```

intrinsic_rise : 0.3;
intrinsic_fall : 0.3;
rise_resistance : 0.3;
fall_resistance : 0.3;
slope_rise : 0.0;
slope_fall : 0.0;
related_pin : "A B";
}
}
}
}

```

In this case, The timing arc between 'B' and 'A' is defined only on the 'AND' scaled cell and not on the 'AND' scaled_cell. To fix the problem, remove one of the timing arcs.

EXAMPLE MESSAGE

Error: Ling 30, Pin 'A' has a timing arc that appears on only one of the scaled cell (AND,WCCM) and the cell 'AND'. (LBDB-417)

LBDB-418 (warning) The cell_degradation constraint is missing in this timing group in cell '%s'.

DESCRIPTION

This message informs the user that Library Compiler finds the cell_degradation constraint being described in at least one, but not all, timing arcs of the cell. If the cell_degradation constraint is specified in a cell, all timing arcs of the following types should specify cell_degradation constraint: combinational rising_edge falling_edge clear preset three_state_enable However, the cell_degradation constraint should not be defined in timing groups of the following timing types: setup_rising setup_falling hold_rising hold_falling recovery_rising recovery_falling removal_rising removal_falling skew_rising skew_falling non_seq_setup_rising non_seq_setup_falling non_seq_hold_rising non_seq_hold_falling nochange_high_high nochange_high_low nochange_low_high nochange_low_low

WHAT NEXT

Do either one of the following modification to the cell description: (1) Remove all cell_degradation constraints specified in the cell. (2) Make sure all delay arcs of the above timing types specify cell_degradation constraints.

EXAMPLES

```

cell (DFF) {
    pin (D) {
        direction : input;
    }
}

```

```

...
timing () /* no warning */
  timing_type : setup_rising;
  related_pin : CP;
  rise_constraint (constr) {
    ...
  }
  rise_constraint (constr) {
    ...
  }
}
pin (CP) {
  direction : input;
  ...
}
pin (Q) {
  direction : output;
  timing () /* cell_degradation is defined */
  related_pin : CP;
  timing_type : rising_edge;
  cell_degradation (celldeg) {

  }
  cell_rise (delay) {
    ...
  }
  cell_fall (delay) {
    ...
  }
  ...
}
pin (QN) {
  direction : output;
  timing () /* cell_degradation is NOT defined --- LIBG-206 --- */
  related_pin : CP;
  timing_type : rising_edge;
  cell_rise (delay) {
    ...
  }
  cell_fall (delay) {
    ...
  }
  ...
}
...
}

```

In this case, the warning message will be issued on CP-to-QN timing arc.

EXAMPLE MESSAGE

Warning: Line 202, The cell_degradation constraint is missing
in this timing group in cell 'DFF'. (LBDB-418)

LBDB-419 (warning) Found the obsolete and unsupported
'state' group in the '%s' cell;
please use 'ff' group or 'latch' group or 'statetable' instead.

DESCRIPTION

The **state** group is not supported after v3.0. Instead, the sequential function should now be described in **ff** or **latch** group or **statetable**.

WHAT NEXT

If you have access to the technology library source file change the **state** group to **ff** or **latch** group. Otherwise contact the vendor and inform them about the problem.

EXAMPLE MESSAGE

Warning: Line 159, Found the obsolete and unsupported 'state' group in the '1bdb141
9' cell;
please use 'ff' group or 'latch' group or 'statetable' instead. (LBDB-419)

LBDB-420 (error) The index number '%d' must be less than
the address width '%d'.

DESCRIPTION

This message indicates an index in the column_address or row_address attribute is greater than the address_width value.

WHAT NEXT

Correct the index in the technology library.

EXAMPLES

```
memory() { /* Indicate this is a memory cell */  
    type : ram;  
    address_width : 4;  
    word_width : 2;
```

```
    column_address : "0 6 "; /* index 6 > addr_width 4 */
}
```

EXAMPLE MESSAGE

Error: Line 127, The index number '6' must be less than
the address width '4'. (LBDB-420)

LBDB-421 (error) The column or row address width '%d' must be less than or equal to the address width '%d'.

DESCRIPTION

This message indicates the width of the column_address or row_address attribute is greater than the address_width value.

WHAT NEXT

Reduce the number of indices in the column_address or row_address or correct the address_width value in the technology library.

EXAMPLES

```
memory() { /* Indicate this is a memory cell */
    type : ram;
    address_width : 4;
    word_width : 2;
    column_address : "0:4 "; /* col width 5 > addr_width 4 */
}
```

EXAMPLE MESSAGE

Error: Line 127, The column/row address width '5' must be less than or equal to the address width '4'. (LBDB-421)

LBDB-423 (error) Address pins are not all used by column_address and row_address attributes.

DESCRIPTION

This message indicates not all indices in the column_address and row_address attributes are used.

WHAT NEXT

Correct the index in the technology library.

EXAMPLES

```
memory() { /* Indicate this is a memory cell */
    type : ram;
    address_width : 4;
    word_width : 2;
    column_address : "0 1";
    row_address : "3";           /* missing the index 2 */
}
```

EXAMPLE MESSAGE

Error: Line 122, Address pins are not all used by column_address and row_address attributes. (LBDB-423)

LBDB-424 (warning) The number of address pins that overlap between column and row is '%d'.

DESCRIPTION

This message indicates that there are overlapping indices in the column_address and row_address attributes.

WHAT NEXT

Correct the index overlapping in the technology library.

EXAMPLES

```
memory() { /* Indicate this is a memory cell */
    type : ram;
    address_width : 4;
    word_width : 2;
    column_address : "0:2";
    row_address : "2:3";          /* the index 2 is overlapping */
}
```

EXAMPLE MESSAGE

Warning: Line 122, The number of address pins that overlap between column and row is 1. (LBDB-424)

LBDB-425 (warning) Removing duplicate indices in the attribute.

DESCRIPTION

This message indicates an index in the column_address or row_address attribute is duplicated.

WHAT NEXT

Correct the index in the technology library.

EXAMPLES

```
memory() { /* Indicate this is a memory cell */
    type : ram;
    address_width : 4;
    word_width : 2;
    column_address : "0 3 3";
}
```

EXAMPLE MESSAGE

Warning: Line 126, Removing duplicate indices in the attribute. (LBDB-425)

LBDB-426 (error) The '%s' is missing for this inout pin.

DESCRIPTION

Both input_signal_level and the output_signal_level values are required in an inout pin.

WHAT NEXT

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes. Otherwise, change the direction of the pin to input or output.

EXAMPLES

```
pin ( BIDIR ) {
    direction : inout;
    input_signal_level : VDD1;
}
}
```

To fix the problem, add the attribute to the pin group,

```
output_signal_level : VDD2;
```

EXAMPLE MESSAGE

Error: Line 104, The 'output_signal_level' is missing for this inout pin. (LBDB-426)

LBDB-427 (error) All power supplies defined in the power_supply group must exist in this operating_conditions group.

DESCRIPTION

This message indicates that one or more power_rail attributes are missing in an operating_conditions group even though they were defined in the power_supply group.

WHAT NEXT

Check the library source file to see if you missed a power_rail attribute and correct it.

EXAMPLES

```
power_supply() {
    default_power_rail : VDD0;
    power_rail(VDD1, 5.0);
    power_rail(VDD2, 3.3);
}

operating_conditions(MPSS) {
    process : 1.5 ;
    temperature : 70 ;
    voltage : 4.75 ;
    tree_type : "worst_case_tree" ;
    power_rail(VDD2, 2.9);
}
```

To fix the problem, add the attribute to the operating_conditions group,

```
power_rail(VDD1, 4.9);
```

EXAMPLE MESSAGE

Error: Line 14, All power supplies defined in the power_supply group must exist in this operating_conditions group. (LBDB-427)

LBDB-428 (error) All the pins in the '%s' cell with multiple power supplies must have signal level attributes.

DESCRIPTION

Either the input_signal_level or the output_signal_level attribute is missing in a pin within a multiple power supply cell.

WHAT NEXT

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes.

EXAMPLES

```
power_supply() {
    default_power_rail : VDD0;
    power_rail(VDD1, 5.0);
    power_rail(VDD2, 3.3);
}

cell(lbdb428) {
    area : 2;
    pad_cell : true;
    rail_connection(PV1, VDD1);
    rail_connection(PV2, VDD2);
    pin(A) {
        direction : input;           /* missing input_signal_level attribute */
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A";
        output_signal_level : VDD2;
        timing() {
            intrinsic_rise : 0.48;
            intrinsic_fall : 0.77;
            rise_resistance : 0.1443;
            fall_resistance : 0.0523;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
}
```

To fix the problem, add the attribute to the 'A' pin group,

```
    input_signal_level : VDD1;
```

EXAMPLE MESSAGE

Error: Line 96, All the pins in the 'lbdb428' cell with multiple power supplies must have signal level attributes. (LBDB-428)

LBDB-429 (warning) The timing arc from '%s' to '%s' is dormant.

DESCRIPTION

A timing arc from an input pin to an output pin is dormant if the signal change on the input pin can never cause the change on the output without simultaneous changes on any other input pins.

WHAT NEXT

This is caused by the input sharing between 'function', 'three_state', and 'x_function'. The signal transition is not physically possible and generally the timing arc should not be specified.

EXAMPLES

```
cell(a_cell) {
    pin(y) {
        function : "!a b"
        three_state : "!a !b | a b"
        timing() {
            related_pin : a;
        }
    }
}
```

In this example, if only pin 'a' is changed, pin 'y' will not have the signal transitions between '0' and '1'. The combinational timing arc between 'a' and 'y' is dormant.

EXAMPLE MESSAGE

Warning: Line 50000, The timing arc from 'a' to 'y' is dormant. (LBDB-429)

LBDB-430 (error) The '%s' rail_connection in a cell with multiple power

supplies is missing an internal_power table.

DESCRIPTION

This error message indicates that an output pin, regardless of the output_signal_level value, is missing an internal_power table for designated rail_connection.

WHAT NEXT

Check the library source file to see if you missed the power_level attribute or there is a typo in the name of the power_supply.

EXAMPLES

```
power_supply() {
    default_power_rail : VDD0;
    power_rail(VDD1, 5.0);
    power_rail(VDD2, 3.3);
}

cell(lbdb428) {
    area : 2;
    pad_cell : true;
    rail_connection(PV1, VDD1);
    rail_connection(PV2, VDD2);
    pin(A) {
        direction : input;
        capacitance : 1;
        input_signal_level : VDD1;
        internal_power () {
            power_level : VDD1;
            power(power_out1_d) {
                values (" 0.693418, 0.691911, 0.689730, 0.691771, 0.695229, 0.696524");
            }
        }
    }
    pin(Z) {
        direction : output;
        function : "A";
        output_signal_level : VDD2;
        internal_power () {
            power_level : VDD2;
            power(power_out1_d) {
                values (" 0.693418, 0.691911, 0.689730, 0.691771, 0.695229, 0.696524");
            }
        }
        timing() {
            intrinsic_rise : 0.48;
            intrinsic_fall : 0.77;
            rise_resistance : 0.1443;
            fall_resistance : 0.0523;
        }
    }
}
```

```

        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
    }
}
}
}
```

To fix the problem, add the internal_power to the 'Z' pin.

```

internal_power () {
    power_level : VDD1;
    power(power_out1_d) {
        values (" 0.693418, 0.691911, 0.689730, 0.691771, 0.695229, 0.696524");
    }
}
```

EXAMPLE MESSAGE

Error: Line 96, The 'VDD1' rail_connection in a cell with multiple power supplies is missing an internal_power table. (LBDB-430)

LBDB-431 (error) The value for attribute '%s' is empty.

DESCRIPTION

This error message indicates that an value field is null or empty.

WHAT NEXT

Check the library source file to see if you missed giving the value. If so, fill it up with appropriate value.

EXAMPLES

```

cell(GND_G_A) {
    area           : 1 ;
    cell_footprint : GND_G ;
    dont_touch    : true ;
    dont_use      : true ;
    cell_leakage_power : 0.00;

    pin(PAD) {
        direction     : output ;
        function      : "0" ;
        capacitance   : 0.000000 ;

        max_capacitance : 999.989990 ;
    }
}
```

```

internal_power(POWER_IO_A) {
    values ("0.00000 ,0.00000  ",
           "0.00000 ,0.00000  ");
    related_inputs : "";
    related_outputs : "PAD";
}
}

```

To fix the problem, fill up value for related_inputs or remove related_inputs.

```

internal_power () {
    values ("0.00000 ,0.00000  ",
           "0.00000 ,0.00000  ");
    related_inputs : "";
    related_outputs : "PAD";
}

```

EXAMPLE MESSAGE

Error: Line 722, The value for attribute 'related_outputs' is empty. (LBDB-431)

LBDB-432 (error) The non-Zero %d scalar value is not allowed in internal_power group within a cell group.

DESCRIPTION

This error message indicates that a non zero scalar value was defined in an internal_power group within a cell group.

WHAT NEXT

Check the library source file to see if it was a typo. If so, change the value to zero for no power consumption or move the internal power to a pin group.

EXAMPLES

```

cell(LBDB-432) {
    area          : 1 ;

    internal_power(scalar) {
values("2.0");
related_input : "";
    }

    ....
}

```

To fix the problem, change the values to zero or move the internal_power to a pin group.

```
internal_power (scalar) {  
    values ("0.00000");  
related_input : "";  
}
```

EXAMPLE MESSAGE

Error: Line 174, The non-Zero 2.0 scalar value is not allowed in internal_power group within a cell group. (LBDB-432)

LBDB-433 (error) The '%s' integrated gated clock cell has a '%s' pin with
a combinational timing arc containing the '%s' timing_type.

DESCRIPTION

This message indicates that you specified one of the cell's timing arcs as either combinational or sequential which should be the opposite, while the function of this cell is integrated clock gated cell.

WHAT NEXT

Change the library source file, and fix the timing_type of the specified pin.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    clock_gating_integrated_cell : "none_posedge";  
    dont_use : true;  
    pin(EN) {  
        direction : input;  
        capacitance : 0.017997;  
        clock_gate_enable_pin : true;  
        timing() {  
            intrinsic_rise : 0.48;  
            intrinsic_fall : 0.77;  
            rise_resistance : 0.1443;  
            fall_resistance : 0.0523;  
            slope_rise : 0.0;  
            slope_fall : 0.0;  
            related_pin : "EN";  
        }  
        timing() {  
            intrinsic_rise : 0.22;
```

```

        intrinsic_fall : 0.22;
        rise_resistance : 0.1443;
        fall_resistance : 0.0523;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "CP";
    }
}

                  "0.160, 0.190, 0.217");
        }
        related_pin : "CP EN" ;
    }
}

```

```
    }
}
}
```

EXAMPLE MESSAGE

Error: Line 206, The 'CGNP' integrated gated clock cell has a 'Z' pin with a combinational timing arc containing the 'combinational' timing_type. (LBD B-433)

LBDB-434 (error) The '%s' integrated gated clock cell has a '%s' pin with a sequential timing arc containing the '%s' timing_type.

DESCRIPTION

This message indicates that you specified one of the cell's timing arcs as sequential, while the function of this cell is integrated clock gated cell. Library Compiler issues an error if any of the following timing types is defined on this cell:

```
* rising_edge
* falling_edge
* preset
* clear
* setup_rising
* setup_falling
* hold_rising
* hold_falling
* recovery_rising
* recovery_falling
* skew_rising
* skew_falling
* removal_rising
* removal_falling
```

WHAT NEXT

Change the library source file, and fix the timing_type of the specified pin.

EXAMPLES

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "none_posedge";
    dont_use : true;
    pin(EN) {
```

```

direction : input;
capacitance : 0.017997;
clock_gate_enable_pin : true;
timing() {
    timing_type : nochange_high_low;
    intrinsic_rise : 0.4;
    intrinsic_fall : 0.4;
    related_pin : "CP";
}
timing() {
    timing_type : nochange_low_low;
    intrinsic_rise : 0.4;
    intrinsic_fall : 0.4;
    related_pin : "CP";
}
pin(CP) {
    direction : input;
    capacitance : 0.031419;
    clock_gate_clock_pin : true;
    min_pulse_width_low : 0.319;
}
pin(Z) {
    direction : output;
    function : "CP + EN'";
    max_capacitance : 0.500;
    clock_gate_out_pin : true;
    timing() {
        timing_type : nochange_high_low;
        intrinsic_rise : 0.4;
        intrinsic_fall : 0.4;
        related_pin : "CP";
    }
    timing() {
        timing_type : nochange_low_low;

            values("0.117, 0.144, 0.246",
                "0.133, 0.151, 0.238",
                "0.151, 0.186, 0.279",
                "0.160, 0.190, 0.217");
        }
        related_pin : "CP EN" ;
    }
}
}
}

```

EXAMPLE MESSAGE

Error: Line 206, The 'CGNP' integrated gated clock cell has a 'Z' pin with a sequential timing arc containing the 'nochange_high_low' timing_type. (LB DB-434)

LBDB-435 (error) The '%s' integrated gated clock cell has a '%s' pin without specified timing arcs.

DESCRIPTION

This message indicates that you specified one of the cell's pin without timing arcs, while the function of this cell is integrated clock gated cell.

WHAT NEXT

Change the library source file, and add the missing timing arc of the specified pin.

EXAMPLES

```
cell(CGNP) {
    area : 1;
```

```

clock_gating_integrated_cell : "none_posedge";
dont_use : true;
pin(EN) {
    direction : input;
    capacitance : 0.017997;
    clock_gate_enable_pin : true;
}
pin(CP) {
    direction : input;
    capacitance : 0.031419;
    clock_gate_clock_pin : true;
    min_pulse_width_low : 0.319;
}
pin(Z) {
    direction : output;
    function : "CP + EN'";
    max_capacitance : 0.500;
    clock_gate_out_pin : true;
    timing() {
        timing_type : nochange_high_low;
        intrinsic_rise : 0.4;
        intrinsic_fall : 0.4;
        related_pin : "CP";
    }
    timing() {
        timing_type : nochange_low_low;
        intrinsic_rise : 0.4;
        intrinsic_fall : 0.4;
        related_pin : "CP";
    }
    timing() {
        intrinsic_rise : 0.48;
        intrinsic_fall : 0.77;
        rise_resistance : 0.1443;

}
}
}
```

EXAMPLE MESSAGE

Error: Line 206, The 'CGNP' integrated gated clock cell has a 'Z' pin without specified timing arcs. (LBDB-435)

LBDB-436 (error) Illegal timing_model_type value '%s'.

DESCRIPTION

Currently the timing_model_type attribute can only take the value "stamp".

WHAT NEXT

Change or delete the attribute.

EXAMPLES

```
cell(CGNP) {
    area : 1;
    timing_type_model : stml;
    ...
}
```

EXAMPLE MESSAGE

Error: Line 206, Illegal timing_model_type value 'stml'. (LBDB-436)

LBDB-437 (warning) The generated_clock(%s) group is defined

multiple times.

DESCRIPTION

This message indicates that you specified the same generated_clock group multiple times. Only the last one is retained.

WHAT NEXT

Change the group name, or delete the duplicated group.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
  
    generated_clock(clock_A) {  
        ...  
    }  
    generated_clock(clock_A) {  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 206, The generated_clock(clock_A) group is defined multiple times. (LBDB-437)

LBDB-438 (error) The master pin is not specified in the generated_clock group.

DESCRIPTION

The master_pin attribute must be specified for a generated clock.

WHAT NEXT

Add the master_pin attribute.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    generated_clock(clockA) {  
        clock_pin : CK;  
        divided_by : 2;  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The master pin is not specified in the generated_clock group. (LBDB-438)

LBDB-439 (error) The clock pin is not specified in the generated_clock group.

DESCRIPTION

The `clock_pin` attribute must be specified for a generated clock.

WHAT NEXT

Add the `clock_pin` attribute.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    generated_clock(clockA) {  
        master_pin : CK;  
        divided_by : 2;  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The clock pin is not specified in the generated_clock group. (LBDB-439)

LBDB-440 (error) The generated_clock divisor is less than 1.

DESCRIPTION

The divisor in the generated_clock group must be an integer greater than or equal to 1.

WHAT NEXT

Change the divisor value.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    generated_clock(clockA) {  
        clock_pin : CLK1;  
        master_pin : CLK;  
        divided_by : 0;  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The generated_clock divisor is less than 1. (LBDB-440)

LBDB-441 (error) The generated_clock multiplier is less than 1.

DESCRIPTION

The multiplier in the generated_clock group must be an integer greater than or equal to 1.

WHAT NEXT

Change the multiplier value.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    generated_clock(clockA) {  
        clock_pin : CLK1;  
        master_pin : CLK;  
        multiplied_by : 0;
```

```
 }  
 ...  
 }
```

EXAMPLE MESSAGE

Error: Line 206, The generated_clock multiplier is less than 1. (LBDB-441)

LBDB-442 (error) The generated_clock edge is less than 0.

DESCRIPTION

The edge1, edge2, and edge3 parameter in the edges complex attribute in the generated_clock group must be non-negative integers.

WHAT NEXT

Change the violating edge value.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    generated_clock(clockA) {  
        clock_pin : CLK1;  
        master_pin : CLK;  
        edges(-1, 2, 3);  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The generated_clock edge is less than 0. (LBDB-442)

LBDB-443 (warning) The mode_definition(%s) group is defined multiple times.

DESCRIPTION

This message indicates that you specified the same mode_definition group multiple times. Only the last one is retained.

WHAT NEXT

Change the group name, or delete the duplicated group.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
  
    mode_definition(rw) {  
        ...  
    }  
    mode_definition(rw) {  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 206, The mode_definition(rw) group is defined multiple times. (LBDB-443)

LBDB-444 (error) The mode definition '%s' has no values defined.

DESCRIPTION

A mode_definition group must have at least one mode value defined.

WHAT NEXT

Define the mode values.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    mode_definition(read) {  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The mode definition 'read' has no values defined. (LBDB-444)

LBDB-445 (warning) The mode_value(%s) group is defined multiple times.

DESCRIPTION

This message indicates that you specified the same mode_value group multiple times. Only the last one is retained.

WHAT NEXT

Change the group name, or delete the duplicated group.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
  
    mode_definition(rw) {  
        mode_value(read) {  
            when : R;  
            sdf_cond : "R == 1";  
        }  
        mode_value(read) {  
            when : !R;  
            sdf_cond : "R == 0";  
        }  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 206, The mode_value(read) group is defined multiple times. (LBDB-445)

LBDB-446 (error) The sdf_cond attribute is not specified for the mode condition.

DESCRIPTION

This message indicates that you specified the when condition for the mode value, but did not specify the sdf_cond attribute.

WHAT NEXT

Add the missing sdf_cond attribute.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    mode_definition(rw) {  
        mode_value(read) {  
            when : R;  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The sdf_cond attribute is not specified for the mode condition. (LBDB-446)

LBDB-447 (information) The mode instance is defined multiple times
for the same timing arc.

DESCRIPTION

This message indicates that you specified multiple mode instances for a timing arc.

WHAT NEXT

Please make sure that it is your real intention to have multiple modes that apply to the timing arc.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
  
    pin (y) {  
        timing() {  
            mode(rw, read);  
            mode(rw, write);  
        }  
    }  
}
```

EXAMPLE MESSAGE

Information: Line 206, The mode instance is defined multiple times
for the same timing arc. (LBDB-447)

**LBDB-448 (error) The Boolean condition overlaps with the
condition
specified at line %d.**

DESCRIPTION

The two Boolean conditions must be mutually exclusive.

WHAT NEXT

Check the conditions and make them mutually exclusive.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    mode_definition(rw) {  
        mode_value(read) {  
            when : R;  
            sdf_cond : "R == 1";  
        }  
        mode_value(write) {  
            when : R;  
            sdf_cond : "R == 1";  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The Boolean condition overlaps with the condition
specified at line 202. (LBDB-448)

LBDB-449 (error) The mode instance mode(%s, %s) is invalid.

DESCRIPTION

The mode instance declaration must be referring to a mode_definition and one of its mode_value

WHAT NEXT

Check for consistency between mode group and mode value definitions, and mode instance declarations.

EXAMPLES

```
cell(CGNP) {
    area : 1;
    mode_definition(rw) {
        mode_value(read) {
            ...
        }
        mode_value(werite) {
            ...
        }
    }
    pin (y) {
        timing () {
            mode(rw, latching);
            ...
        }
    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 206, The mode instance mode(rw, latching) is invalid. (LBDB-449)

LBDB-450 (error) Mismatched quotes in the sdf_cond string.

DESCRIPTION

In the sdf_cond string, a double quoting is mismatched.

WHAT NEXT

Add the missing quote or delete the extra quote.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    mode_definition(rw) {  
        mode_value(read) {  
            when : R;  
            sdf_cond : "R == 1 && C ==  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, Mismatched quotes in the sdf_cond string. (LBDB-450)

LBDB-451 (error) Undefined variable '%s'.

DESCRIPTION

The variable in the sdf_cond string must be a port or bus name.

WHAT NEXT

Eliminate undefined varibable.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    mode_definition(rw) {  
        mode_value(read) {  
            when : R;  
            sdf_cond : "read == 1";  
        }  
    }  
    pin (R) {  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, Undefined variable 'read'. (LBDB-451)

LBDB-452 (error) Fewer than two ports are specified in the short list.

DESCRIPTION

A short complex attribute must have more than one parameter.

WHAT NEXT

Add the missing port names.

EXAMPLES

```
cell (c) {  
    ...  
    short(A);  
    pin (A) {...}  
    pin (Y) {...}  
}
```

EXAMPLE MESSAGE

Error: Line 206, Fewer than two ports are specified in the short list. (LBDB-452)

LBDB-453 (error) The parameter '%s' in the short list is not a port or bus name.

DESCRIPTION

The short complex attribute must take port or bus name as parameters.

WHAT NEXT

Eliminate undefined variable.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    short(R, T);  
  
    pin(R) {...}  
    ...
```

```
}
```

EXAMPLE MESSAGE

Error: Line 206, The parameter 'T' in the short list is not a port or bus name. (LBDB-453)

LBDB-454 (error) Unequal bus widths in the short list. specified timing arcs.

DESCRIPTION

All members of a short list must be of the same width. That is, they must all be simple ports, or all be buses of the same width.

WHAT NEXT

Use the same width members.

EXAMPLES

```
cell(CGNP) {
    area : 1;
    short(A, B);
    bus(A) {
        bus_type : bus4;
    }
    bus(B) {
        bus_tyep : bus8;
    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 206, Unequal bus widths in the short list. (LBDB-454)

LBDB-455 (error) Multiple drive arcs are defined on port %s.

DESCRIPTION

A port can have at most one drive arc defined.

WHAT NEXT

Eliminate the extra ones.

EXAMPLES

```
pin(Y) {  
    timing () {  
        drive_arc : true;  
        ...  
    }  
    timing () {  
        drive_arc : true;  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, Multiple drive arcs are defined on port Y. (LBDB-455)

Lbdb-456 (error) The drive arc is not combinational.

DESCRIPTION

Drive arc must be combinational.

WHAT NEXT

Change the drive arc to combinational or delete it.

EXAMPLES

```
pin(Z) {  
    direction : output;  
    timing() {  
        timing_type : nochange_high_low;  
        drive_arc : true;  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The drive arc is not combinational. (LBDB-456)

LBDB-457 (error) Related pin is found on the drive arc.

DESCRIPTION

Drive arc cannot have related pins.

WHAT NEXT

Remove the `related_pin` attribute or unlabel the timing arc.

EXAMPLES

```
pin(Z) {  
    direction : output;  
    timing() {  
        timing_type : nochange_high_low;  
        drive_arc : true;  
        related_pin : A;  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, Related pin is found on the drive arc. (LBDB-457)

LBDB-458 (error) Cell rise or fall table is missing on the drive arc.

DESCRIPTION

Drive arc requires cell rise and fall tables.

WHAT NEXT

Add the missing tables.

EXAMPLES

```
pin(Z) {  
    direction : output;  
    timing() {  
        timing_type : nochange_high_low;  
        drive_arc : true;
```

```
    cell_rise(table1) {
        ...
    }
...
}
```

EXAMPLE MESSAGE

Error: Line 206, Cell rise or fall table is missing on the drive arc. (LBDB-458)

LBDB-459 (error) The drive arc has tables that are not 1-D function of total_output_capacitance.

DESCRIPTION

Drive arc requires delay tables to be 1-D function of total output capacitance.

WHAT NEXT

Add the missing tables.

EXAMPLES

```
pin(Z) {
    direction : output;
    timing() {
        timing_type : nochange_high_low;
        drive_arc : true;
        cell_rise(table2D) {
            values("0.1, 0.2", "0.5, 0.8");
        }
    }
...
}
```

EXAMPLE MESSAGE

Error: Line 206, The drive rc has tables that are not 1-D function of total_output_capacitance. (LBDB-459)

LBDB-460 (error) Multiple tlatch groups are defined on pin '%s'.

DESCRIPTION

This message indicates that you specified multiple tlatch groups on a pin.

WHAT NEXT

Delete the duplicated group.

EXAMPLES

```
pin(D) {  
    tlatch(EN) {  
        ...  
    }  
    tlatch(E) {  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, Muliple tlatch groups are defined on pin 'D'. (LBDB-460)

LBDB-461 (error) The edge type is not specified for the tlatch.

DESCRIPTION

A tlatch group must have the edge_type attribute specified.

WHAT NEXT

Add the missing attribute.

EXAMPLES

```
pin(D) {  
    tlatch(EN) {  
        tdisable : TRUE;  
    }
```

```
 }  
 ...  
 }
```

EXAMPLE MESSAGE

Error: Line 206, The edge type is not specified for the tlatch. (LBDB-461)

LBDB-462 (error) Pin '%s' referred to in tlatch does not exist.

DESCRIPTION

The tlatch group name must be the name of an existing enable pin.

WHAT NEXT

Add the missing attribute.

EXAMPLES

```
cell (c) {  
    pin(D) {  
        tlatch(EN) {  
            edge_type : rising;  
        }  
    }  
    ...  
    /* No such pin as EN */  
}
```

EXAMPLE MESSAGE

Error: Line 206, Pin 'EN' referred to in tlatch does not exist. (LBDB-462)

LBDB-463 (warning) The related pin '%s' for the non-sequential setup/hold timing check is labeled a clock.

DESCRIPTION

If the related pin for the non-sequential constraint arc is labeled a clock, then timing analysis will not propagate a clock signal through the cell.

WHAT NEXT

Delete the "clock : true;" declaration in the pin group.

EXAMPLES

```
cell (c) {
    pin(D) {
        timing() {
            timing_type : non_seq_setup_falling;
            related_pin : OSC;
            ...
        }
    }
    pin(OSC) {
        clock : true;
        ...
    }
}
```

EXAMPLE MESSAGE

Warning: Line 206, The related pin 'OSC' for the non-sequential setup/hold timing check is labeled a clock. (LBDB-463)

LBDB-464 (error) The '%s' cell is a non-pad cell with x_function, which is not supported by Library Compiler.

DESCRIPTION

Library Compiler only supports x_function on pad cells. Library Compiler issues this error message if a non-pad cell defines x_function on one or more ports.

WHAT NEXT

Remove the x_function attribute defined for any output pin of the cell.

EXAMPLES

```
cell (lbdb464) {
    area      : 0.0;
    pin (D, CLK) {
        direction   : input;
        capacitance : 1.0;
        fanout_load : 1.0;
    }
    pin(Q){
```

```

direction    : output;
function : "IQ";
x_function : CLK';
timing () {
  timing_type : rising_edge;
intrinsic_rise   : 1.0;
rise_resistance  : 0.1;
intrinsic_fall   : 1.0;
fall_resistance  : 0.1;
related_pin       : "CLK";
}
}
ff (IQ, IQN) {
  next_state : D;
  clocked_on : CLK;
}
}

```

EXAMPLE MESSAGE

Error: Line 6, The 'lbdb464' cell is a non-pad cell with x_function,
which is not supported by Library Compiler. (LBDB-464)

LBDB-465 (error) The '%s' attribute is missing from the electromigration group.

DESCRIPTION

The **related_pin** or **related_bus_pins** attribute is required in an electromigration group with a two-dimensional lookup table.

WHAT NEXT

Change the library source file by specifying the **related_pin** or the **related_bus_pins** attribute in the electromigration group as needed.

EXAMPLES

```

electromigration() {
  em_max_toggle_rate(em_2d) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
  }
}

```

To fix the problem, add the following line into the electromigration group:

```
related_pin : "A";
```

EXAMPLE MESSAGE

Error: Line 126, The 'related_pin or related_bus_pins' attribute is missing from the electromigration group. (LBDB-465)

LBDB-466 (error) The '%s' attribute cannot be specified in this electromigration group.

DESCRIPTION

This message indicates that you specified an attribute outside its context. An electromigration group with one-dimensional lookup tables cannot specify **related_pin** or **related_bus_pins** attributes.

WHAT NEXT

Change the technology library source file to delete the specified attribute or move the attribute to its correct context.

EXAMPLES

```
electromigration() {
    em_max_toggle_rate(em_1d_temp) {
        values ("1, 2, 3, 4");
    }
related_pin : "A";
}
```

In this case, the **related_pin** attribute is not allowed in the one-dimensional lookup table. To fix the problem, remove the **related_pin** attribute from the electromigration group.

EXAMPLE MESSAGE

Error: Line 69, The 'related_pin or related_bus_pins' attribute cannot be specified in this electromigration group. (LBDB-466)

LBDB-467 (error) The '%s' lookup table in the input-associated

electromigration group cannot use '%s' as its template.

DESCRIPTION

The `em_max_toggle_rate` lookup table in an input-associated electromigration group must use a one-dimensional template with `input_transition_time` as its variable.

WHAT NEXT

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
em_lut_template(ok_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
}
em_lut_template(err_temp) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
}

em_max_toggle_rate(err_temp) {
values ("1, 2, 3, 4");
}
```

To fix the problem, change the template value of the `em_max_toggle_rate` attribute from `err_temp` to `ok_temp`.

EXAMPLE MESSAGE

Error: Line 126, The 'em_max_toggle_rate' lookup table in the input-associated electromigration group cannot use 'err_temp' as its template. (LBDB-467)

LBDB-468 (error) The one-dimensional '%s' lookup table in the inout-associated electromigration group cannot use '%s' as its template.

DESCRIPTION

The one-dimensional `em_max_toggle_rate` lookup table in an inout-associated electromigration group must use a template with `input_transition_time` or `total_output_net_capacitance` as its variable.

WHAT NEXT

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
em_lut_template(ok_template) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
}
em_lut_template(ok2_template) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
}
em_lut_template(err_template) {
    variable_1 : output_net_length;
    index_1("0, 1, 2, 3");
}

    em_max_toggle_rate(err_template) {
        values ("1, 2, 3, 4");
    }
}
```

To fix the problem, change the template value of the **em_max_toggle_rate** attribute from err_template to ok_template or ok2_template.

EXAMPLE MESSAGE

```
Error: Line 126, The 1-dimensional 'em_max_toggle_rate' lookup table in the
      inout-associated electromigration group cannot use
      'err_template' as its template. (LBDB-468)
```

LBDB-469 (error) The one-dimensional '%s' lookup table in the %s-associated electromigration group cannot use '%s' as its template.

DESCRIPTION

The one-dimensional em_max_toggle_rate lookup table in an output-associated electromigration group must use a template with **total_output_net_capacitance** as its variable.

WHAT NEXT

For more information about lookup tables, see the *Library Compiler User Guide*.

Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
em_lut_template(err_template) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
}
em_lut_template(ok_template) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
}

em_max_toggle_rate(err_template) {
    values ("1, 2, 3, 4");
}
```

To fix the problem, change the template value of the **em_max_toggle_rate** attribute from *err_template* to *ok_template*.

EXAMPLE MESSAGE

```
Error: Line 126, The 1-dimensional 'em_max_toggle_rate' lookup table in the
output-
associated electromigration group cannot use 'err_template' as its template. (LBDB-
469)
```

LBDB-470 (error) The two-dimensional '%s' lookup table in the %s-associated electromigration group cannot use '%s' as its template.

DESCRIPTION

The two-dimensional `em_max_toggle_rate` lookup table in an output-associated electromigration group must use a template with `input_transition_time` and `total_output_net_capacitance` as its variables.

WHAT NEXT

Refer to the *Library Compiler User Guide* for more information about lookup tables. Change the library source file by referencing a different template in the lookup table description.

EXAMPLES

```
em_lut_template(ok_template) {
    variable_1 : input_transition_time;
```

```

    index_1("0, 1, 2, 3");
    variable_2 : total_output_net_capacitance;
    index_2("0, 1, 2, 3");
}
em_lut_template(err_template) {
    variable_1 : total_output_net_capacitance;
    index_1("0, 1, 2, 3");
    variable_2 : constrained_pin_transition;
    index_2("0, 1, 2, 3");
}

em_max_toggle_rate(err_template) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \
"9, 10, 11, 12", "13, 14, 15, 16");
}

```

To fix the problem, change the template value of the **em_max_toggle_rate** attribute from err_template to ok_template.

EXAMPLE MESSAGE

```
Error: Line 126, The 2-dimensional 'em_max_toggle_rate' lookup table in the
output-
associated electromigration group cannot use 'err_template' as its template. (LBDB-
470)
```

LBDB-471 (error) The '%s' port has %d electromigration tables. Only one table is allowed. Path-dependent electromigration is not supported.

DESCRIPTION

Library Compiler only supports non path-dependent electromigration. Library Compiler issues this error message if more than one electromigration is defined within a pin.

WHAT NEXT

Change the library source file by removing any extra electromigration tables within the pin group.

EXAMPLES

```

pin(Q){
    ...
    electromigration() {
        em_max_toggle_rate(em_2d) {
values ("1, 2, 3, 4", "5, 6, 7, 8", \

```

```

    "9, 10, 11, 12", "13, 14, 15, 16");
}
related_pin : "A";
}
electromigration() {
em_max_toggle_rate(em_2d) {
values ("21, 22, 23, 24", "25, 26, 27, 28", \
"29, 30, 31, 32", "33, 34, 35, 36");
}
related_pin : "B";
}
}

```

To fix the problem, remove one of the electromigration tables and include both pins 'A' and 'B' in the related_pin.

```

pin(Q) {
...
electromigration() {
em_max_toggle_rate(em_2d) {
values ("41, 42, 43, 44", "45, 46, 47, 48", \
"49, 50, 51, 52", "53, 54, 55, 56");
}
related_pin : "A B";
}
}

```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has 2 electromigration tables.
Only one table is allowed. Path dependent electromigration is not supported. (LBDB-471)

LBDB-472 (warning) The timing type of the timing arc from '%s' to '%s' is changed from '%s' to '%s'.

DESCRIPTION

The functional relationships between the pin and the related pin(s) dictate that this timing arc is non-rising or non-falling. This is due to the input sharing between function, three_state, and x_function.

WHAT NEXT

Change the library source file so that expected timing types are entered. In case of an error, change the functional description.

EXAMPLES

```
pin(io){  
    direction : output;  
    function : "!ap & !an";  
    three_state : "ap & !an";  
    x_function : "!ap & an";  
  
    timing() {  
        related_pin : "ap an";  
        timing_type : three_state_disable;  
        ...  
    }  
    ...  
}
```

To fix, change functions or change timing_types.

```
pin(io){  
    ...  
    timing() {  
        related_pin : "ap an";  
        timing_type : three_state_disable_rise;  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 9, The timing type of the timing arc from 'ap' to 'io' is changed from 'three_state_disable' to 'three_state_disable_rise'. (LBDB-472)

LBDB-473 (error) The timing label '%s' is already used for another timing arc in the same cell.

DESCRIPTION

You receive this error message when the given timing label is invalid because it was already used by another timing arc in the cell. Duplicate timing labels are not allowed within a cell.

WHAT NEXT

Edit the timing label list so that there is not a label in the list that is used in another timing group in the cell.

LBDB-474 (error) The timing group has incorrect number of labels.

DESCRIPTION

You receive this error message when the timing group at the specified line has either too many or too few specified labels.

WHAT NEXT

Edit the timing label list in your library so that the timing group has the right number of labels specified.

LBDB-475 (error) The port '%s' is missing the attribute '%s'.

DESCRIPTION

You receive this error message when the **rise_capacitance** attribute or the **fall_capacitance** attribute for a port is missing and the other attribute is specified. Both or neither of the attributes must be specified.

WHAT NEXT

Specify the missing attribute, or remove the specified attribute.

LBDB-476 (warning) The port '%s' does not have the attribute '%s' specified. The value %f will be assigned to the attribute.

DESCRIPTION

You receive this error message when the **rise_capacitance** and **fall_capacitance** attributes are specified for a port, and the **capacitance** attribute is not. The maximum value between **rise_capacitance** and **fall_capacitance** will be assigned to the attribute.

WHAT NEXT

If you accept the value assigned to the attribute referenced in the error message, no action is required on your part. If not, assign a value to the attribute.

LBDB-477 (error) The table %s has invalid intermediate_values entry.

DESCRIPTION

This message indicates that a intermediate_values table contain invalid values. The values have to be between zero and the corresponding values from the values table attribute.

WHAT NEXT

Edit the intermediate_values table so that it doesn't have invalid values any more.

LBDB-478 (error) The intermediate_values cannot be used with current setting of output delay threshold voltages.

DESCRIPTION

This message indicates that the output delay threshold voltages are not valid for intermediate_values table. intermediate_values table values are used to specify the values from first slew point to the output delay point. The assumption is that the output delay point lies between the two slew points. This error message will be issued when Library Compiler detects that the output delay point does not lie between the two slew points, and intermediate_values table was used.

WHAT NEXT

Stop using intermediate_values table, or edit the library level attributes for threshold voltages (for delay and slew).

LBDB-479 (error) when '%s' is specified '%s' has to be

given as well.

DESCRIPTION

This message indicates that a rise net delay table was given without fall net delay table (or vice versa). Both tables are expected by the wire delay estimator.

WHAT NEXT

Edit the library source file to add in the missing table or delete the incomplete table for the file to compile.

LBDB-480 (error) Missing a timing arc of timing_type 'three_state_disable' between the '%s' and '%s' pins in the '%s' cell.

DESCRIPTION

To describe the transition from 0->Z or 1->Z, use the timing arc with a timing_type of **three_state_disable** for the pin with a **three_state** attribute.

WHAT NEXT

Add the missing timing group between the two pins. To change the message to a warning, set the environment variable **timing_check_all_errors** to 0.

EXAMPLES

```
cell(BTS4)  {
    area : 3.0;
    pin(Z)  {
        direction : output;
        function : "A";
        three_state : "E";
        timing()  {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
        timing()  {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
        }
    }
}
```

```
        related_pin : "E";
    }
}
pin(A)  {
    direction : input;
    capacitance : 1.0;
}
pin(E)  {
    direction : input;
    capacitance : 1.0;
}
}
```

EXAMPLE MESSAGE

Error: Line 110, Missing a timing arc of timing_type 'three_state_disable' between 'E' and 'Z' pins in the 'lbf35' cell. (LBDB-480)

LBDB-481 (warning) Port %s has multiple default timing arcs. Only one arc is used as the default arc.

DESCRIPTION

You receive this message because a port has multiple default timing arcs in the case of State Dependent Timing. This is probably due to two conditions: First, a timing arc with no WHEN statement has been given as a default arc. Second, one timing arc with a condition has been specified as a default timing arc by having its **default_timing** attribute set for the arc.

WHAT NEXT

Examine the library source file, and remove all but one default timing arc.

LBDB-482 (error) Port %s has multiple timing arcs with default_timing attribute set.

DESCRIPTION

You receive this message because a port has multiple timing arcs with the **default_timing** attribute set. A port with State Dependent Timing should have only one timing arc. A library with this error does not compile.

WHAT NEXT

Examine the library source file, and reset all but one timing arc of the `default_timing` attribute for the port.

LBDB-483 (error) Cannot find include file '%s'.

DESCRIPTION

You receive this message because the `include()` attribute has been used to include a file but the file could not be located in the search path.

WHAT NEXT

Add the missing include file.

LBDB-484 (error) No variables statement is specified in the '%s' poly_template.

DESCRIPTION

You receive this message because you did not define a variables statement in the specified poly_template group. Library Compiler expects you to define one variables statement there.

WHAT NEXT

Define a variables statement for the specified poly_template.

EXAMPLES

The following example shows a poly_template named *p1* that is missing a variables statement:

```
poly_template(p1) {
    variable_1_range("1,2");
    variable_2_range("3,4");
}
```

To correct the problem in the example above, insert the following statement in the *p1* poly_template group:

```
variables("temperature, total_output_net_capacitance");
```

EXAMPLE MESSAGE

Error: Line 191, No variables statement is specified in the 'p1' poly_template. (LBDB-484)

LBDB-485 (error) Incompatible variable '%s' is used in the '%s' poly_template.

DESCRIPTION

You receive this message because you defined an invalid variable in the variables statement in the poly_template group.

WHAT NEXT

Define a variable name for the specified poly_template.

EXAMPLES

In the following example, the *whatever* variable value is not valid in the *p1* poly_template.

```
poly_template(p1) {  
    variables("whatever, total_output_net_capacitance");  
    variable_1_range("1,2");  
    variable_2_range("3,4");  
}
```

To correct the problem in the example above, insert the following statement in the *p1* poly_template group:

```
variables("temperature, total_output_net_capacitance");
```

EXAMPLE MESSAGE

Error: Line 191, Incompatible variable 'whatever' is used in the 'p1' poly_template. (LBDB-485)

LBDB-486 (warning) Variable range outside variable dimension is defined in '%s' poly_template.

DESCRIPTION

You receive this message because you have defined a variable range outside the

dimension of the poly_template.

WHAT NEXT

Remove the statement for the variable range that is not in use.

EXAMPLES

The following example shows a **variable_2_range** variable value that cannot be used in the *p1* poly_template.

```
poly_template(p1) {  
    variables("total_output_net_capacitance");  
    variable_1_range("1,2");  
    variable_2_range("3,4");  
}
```

Correct it by removing the **variable_2_range** statement.

EXAMPLE MESSAGE

```
Warning: Line 191, Variable range outside variable  
dimension is defined in 'p1' poly_template. (LBDB-486)
```

**LBDB-487 (error) No range information defined for variable_%d
in
'%s' poly_template.**

DESCRIPTION

You receive this message because you have not defined the range for one of the variables used in the poly_template.

WHAT NEXT

Add the **variable_n_range** statement for the specified variable.

EXAMPLES

The following example shows a *p1* poly_template that is missing the **variable_1_range** statement.

```
poly_template(p1) {  
    variables("temperature, total_output_net_capacitance");  
    variable_2_range("3,4");
```

```
}
```

Correct it by adding the following statement in the poly_template group:

```
variable_1_range("1,2");
```

EXAMPLE MESSAGE

```
Error: Line 191, No range information defined for variable_1 in  
'p1' poly_template. (LBDB-487)
```

LBDB-488 (error) No variables statement specified in '%s' domain of '%s' poly_template.

DESCRIPTION

You receive this message because you have not defined a variables statement in this domain of the poly_template group.

WHAT NEXT

Define a variables statement for this domain in the poly_template.

EXAMPLES

The following example shows a domain named *d1* in a poly_template named *p1* that is missing the variables statement:

```
poly_template(p1) {  
    ....  
    domain (d1) {  
        variable_1_range("1,2");  
        variable_2_range("3,4");  
    }  
}
```

Correct it by adding the following statement in the poly_template group:

```
variables("temperature, total_output_net_capacitance");
```

EXAMPLE MESSAGE

```
Error: Line 191, No variables statement specified in 'd1'  
domain of 'p1' poly_template. (LBDB-488)
```

LBDB-489 (error) Incompatible variable '%s' used '%s' domain of '%s' poly_template.

DESCRIPTION

You receive this message because you defined an invalid variable in the variables statement of this domain in the poly_template.

WHAT NEXT

Examine the name of the specified variable to determine the cause.

EXAMPLES

The following example shows an invalid variable named *whatever* in the *p1* poly_template.

```
poly_template(p1) {  
    ....  
    domain(d1) {  
        variables("whatever, total_output_net_capacitance");  
        variable_1_range("1,2");  
        variable_2_range("3,4");  
    }  
}
```

Correct it by adding the following statement in the domain group:

```
variables("temperature, total_output_net_capacitance");
```

EXAMPLE MESSAGE

```
Error: Line 191, Incompatible variable 'whatever' used in 'd1' domain of 'p1' poly_template. (LBDB-489)
```

LBDB-490 (warning) Variable range outside variable dimension is defined in '%s' domain of '%s' poly_template.

DESCRIPTION

You receive this message because you have defined a variable range outside the dimension of the specified domain of the poly_template.

WHAT NEXT

Remove the variable range statement not in use.

EXAMPLES

The following example shows a **variable_2_range** statement that is useless in the *d1* domain of the *p1* poly_template.

```
poly_template(p1) {
    .....
    domain(d1) {
        variables("total_output_net_capacitance");
        variable_1_range("1,2");
        variable_2_range("3,4");
    }
}
```

Correct it by removing the **variable_2_range** statement.

EXAMPLE MESSAGE

Warning: Line 191, Variable range outside variable dimension is defined in 'd1' domain of 'p1' poly_template. (LBDB-490)

LBDB-491 (error) No range information defined for variable_%d in

'%s' domain of '%s' poly_template.

DESCRIPTION

You receive this message because you have not defined a range for the specified variable used in this domain of the poly_template.

WHAT NEXT

Add a **variable_n_range** statement (substituting the specified variable number for **n**).

EXAMPLES

The following example shows the *d1* domain of the *p1* poly_template with the **variable_1_range** statement missing.

```
poly_template(p1) {
    .....
    domain(d1) {
```

```
variables("temperature, total_output_net_capacitance");
variable_2_range("3,4");
}
}
```

Correct it by adding the following statement:

```
variable_1_range("1,2");
```

EXAMPLE MESSAGE

Error: Line 191, No range information defined for variable_1 in 'd1' domain of 'p1' poly_template. (LBDB-491)

LBDB-492 (error) Power rail mapping information missing in '%s' poly_template.

DESCRIPTION

You receive this message because you have not defined the power rail mapping information for the **voltage2** variable in the poly_template.

WHAT NEXT

Add the mapping statement in the poly_template.

EXAMPLES

The following example shows the *p1* poly_template with the mapping statement missing.

```
poly_template(p1) {
    variables("temperature, voltage2, total_output_net_capacitance");
    .....
}
```

Correct it by adding the following statement:

```
mapping("voltage2, VDD");
```

EXAMPLE MESSAGE

Error: Line 191, Power rail mapping information missing in 'p1' poly_template. (LBDB-492)

LBDB-493 (error) Power rail mapping information missing in

'%s' domain of '%s' poly_template.

DESCRIPTION

You receive this message because you have not defined the power rail mapping information for the voltage2 variable in the specified domain of the specified poly_template.

WHAT NEXT

Add the mapping statement in this domain of the poly_template.

EXAMPLES

The following example shows the d1 domain of the p1 poly_template with the mapping statement missing.

```
poly_template(p1) {
    .....
    domain(d1) {
        variables("temperature, voltage2, total_output_net_capacitance");
        .....
    }
}
```

Correct it by adding the following statement:

```
mapping("voltage2, VDD");
```

EXAMPLE MESSAGE

Error: Line 191, Power rail mapping information missing in 'd1' domain of 'p1' poly_template. (LBDB-493)

LBDB-495 (error) Invalid number of dimensions in '%s' poly_template.

DESCRIPTION

You receive this message because the number of variables you have defined in the poly_template is invalid.

WHAT NEXT

Examine the variables statement to determine why the number of variables is invalid.

EXAMPLES

The following example shows a variables statement that defines the wrong number of variables in the *p1* poly_template.

```
poly_template(p1) {  
    variables("");  
    .....  
}
```

Correct it by changing the variables statement in the poly_template group to the following:

```
variables("temperature, total_output_net_capacitance");
```

EXAMPLE MESSAGE

Error: Line 191, Invalid number of dimensions in 'p1' poly_template. (LBDB-495)

LBDB-496 (error) Invalid number of dimensions in '%s' domain of '%s' poly_template.

DESCRIPTION

You receive this message because the number of variables you have defined in the specified domain of the specified poly_template is invalid.

WHAT NEXT

Examine the variables statement to determine why the number of variables is invalid.

EXAMPLES

The following example shows a variables statement that defines the wrong number of variables in the *d1* domain of the *p1* poly_template.

```
poly_template(p1) {  
    .....  
    domain (d1) {  
        variables("");  
        .....  
    }  
}
```

Correct it by changing the variables statement in this domain of the poly_template group to the following:

```
variables("temperature, total_output_net_capacitance");
```

EXAMPLE MESSAGE

```
Error: Line 191, Invalid number of dimensions in 'd1' domain of 'p1' poly_template.  
(LBDB-496)
```

LBDB-497 (error) Incomplete range of variable in '%s' poly_template.

DESCRIPTION

You receive this message because the variable statement of the specified poly_template has an incomplete range.

WHAT NEXT

Examine all **variable_n_range** statements (substituting each existing variable number for **n**) of the specified poly_template to determine those that have an incomplete range.

EXAMPLES

The following example shows the *p1* poly_template with an incomplete **variable_1_range** statement.

```
poly_template(p1) {  
    variables("temperature, total_output_net_capacitance");  
    variable_1_range("1");  
    .....  
}
```

Correct it by changing the **variable_1_range** statement in the poly_template group to the following:

```
variable_1_range("1,2");
```

EXAMPLE MESSAGE

```
Error: Line 191, Incomplete range of variable in 'p1' poly_template. (LBDB-497)
```

LBDB-498 (error) Incomplete range of variable in '%s'

domain of '%s' poly_template.

DESCRIPTION

You receive this message because the variable statement in the specified domain of the specified poly_template has an incomplete range.

WHAT NEXT

Examine all **variable_n_range** statements (substituting each existing variable number for **n**) in the specified domain of the specified poly_template to determine those that have an incomplete range.

EXAMPLES

The following example shows *d1* domain of the *p1* poly_template with an incomplete **variable_1_range** statement.

```
poly_template(p1) {  
    ....  
    domain (d1) {  
        variables("temperature, total_output_net_capacitance");  
        variable_1_range("1");  
        ....  
    }  
}
```

Correct it by changing the **variable_1_range** statement in the *d1* domain of the poly_template group to the following:

```
variable_1_range("1,2");
```

EXAMPLE MESSAGE

```
Error: Line 191, Incomplete range of variable in 'd1' domain of 'p1' poly_template.  
(LBDB-498)
```

LBDB-499 (error) No orders information defined for the polynomial.

DESCRIPTION

You receive this message because you have not defined the **orders** statement for the polynomial.

WHAT NEXT

Add the **orders** statement before the **coefs** statement.

EXAMPLES

The following example shows a poly timing group with a missing **orders** statement.

```
rise_constraint(constraint) {  
    coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000, 0.0000");  
}
```

Correct it by adding the following statement before the **coefs** statement:

```
orders("1,1,1");
```

EXAMPLE MESSAGE

Error: Line 191, No orders information defined for the polynomial. (LBDB-499)

LBDB-500 (error) No orders information defined for '%s' domain of the polynomial.

DESCRIPTION

You receive this message because you have not defined the **orders** statement for this domain of the polynomial.

WHAT NEXT

Add the **orders** statement before the **coefs** statement.

EXAMPLES

The following example shows the *d1* domain of a poly timing group with a missing **orders** statement.

```
rise_constraint(constraint) {  
    .....  
    domain (d1) {  
        coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000, 0.0000");  
    }  
}
```

Correct it by adding the following statement before the **coefs** statement:

```
orders("1,1,1");
```

EXAMPLE MESSAGE

Error: Line 191, No orders information defined for 'd1' domain of the polynomial.
(LBDB-500)

LBDB-501 (error) No coefs information defined for the polynomial.

DESCRIPTION

You receive this message because you have not defined the **coefs** statement for the polynomial.

WHAT NEXT

Add the **coefs** statement after the **orders** statement.

EXAMPLES

The following example shows a poly timing group with a missing **coefs** statement.

```
rise_constraint(constraint) {  
    orders("1,1,1");  
}
```

Correct it by adding the following statement after the **orders** statement:

```
coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000, 0.0000");
```

EXAMPLE MESSAGE

Error: Line 191, No coefs information defined for the polynomial. (LBDB-500)

LBDB-502 (error) No coefs information defined for '%s' domain of the polynomial.

DESCRIPTION

You receive this message because you have not defined the **coefs** statement for the specified domain of the polynomial.

WHAT NEXT

Add the **coefs** statement for the specified domain after the **orders** statement.

EXAMPLES

The following example shows the *d1* domain of a poly timing group with a missing **coefs** statement.

```
rise_constraint(constraint) {
    .....
    domain (d1) {
        orders("1,1,1");
    }
}
```

Correct it by adding the following after the **orders** statement:

```
coefs("1.2095, 0.2281, 0.0225, -0.0001, 0.0678, -0.0002, 0.0000, 0.0000");
```

EXAMPLE MESSAGE

```
Error: Line 191, No coefs information defined for 'd1' domain of the polynomial.
(LBDB-502)
```

LBDB-503 (Error) The low range setting is equal to or greater than the high range setting in %s.

DESCRIPTION

This warning message tells you that the values specified for the variable range setting statement are incorrect. Only temperature, voltages, and generic parameters can have the same low range and high range.

EXAMPLES

The following example shows the *p1* poly_template with an incomplete variable_1_range statement.

```
poly_template(p1) {
    variables("temperature, total_output_net_capacitance");
    variable_1_range("100,1");
    .....
}
```

Correct it by changing the variable_1_range statement in the poly_template group to the following:

```
variable_1_range("1,100");
```

EXAMPLE MESSAGE

Error: Line 191, The low range setting is equal to or greater than the high range setting in variable_1_range. (LBDB-503)

LBDB-504 (warning) Range setting in domain at variable_%d_range conflicts with template setting. Use the template setting instead.

DESCRIPTION

This warning tells you that the variable range setting statement has a range that conflicts with the range set previously in the template.

WHAT NEXT

Examine all variable_n_range statements. Substitute each existing variable number for n in the specified poly_template to determine the statements that conflict with each other.

EXAMPLES

The following example shows the p1 poly_template with an incorrect variable_1_range statement in the domain.

```
poly_template(p1) {
    variables("temperature, total_output_net_capacitance");
    variable_1_range("1,50");
    domain (d1) {
        variable_1_range("2,100");
    }
    .....
}
```

Correct it by changing the variable_1_range statement in the domain to the following:

```
variable_1_range("2,40");
```

The value 40 can be any number less than or equal to 50.

EXAMPLE MESSAGE

Warning: Line 191, Range setting conflicts with template setting. (LBDB-504)

LBDB-505 (error) Variable %s is not a voltage. Can only map voltages to a power rail.

DESCRIPTION

This error message tells you that the first variable in mapping is not a voltage. Only voltages can be mapped to a power rail.

WHAT NEXT

Check the variables in the mapping and replace the first variable with a voltage.

EXAMPLES

The following example shows the p1 poly template with an incorrect mapping statement.

```
poly_template(p1) {  
    variables("temperature, voltage, total_output_net_capacitance");  
    variable_1_range("20,150");  
    variable_2_range("1.2,3.2");  
    variable_3_range("10,30");  
    mapping(temperature,VDD1);  
    .....  
}
```

Fix the mapping statement by changing the variable_1_range statement in the domain to the following:

```
mapping(voltage,VDD1);
```

EXAMPLE MESSAGE

Error: Line 191, Variable temperature is not a voltage (LBDB-505).

LBDB-506 (error) Variable %s is not defined in the %s.

DESCRIPTION

This error message tells you that the first variable in mapping is not defined in the template.

WHAT NEXT

Define the variable in the template, or change the variable_1_range statement in the

domain.

EXAMPLES

The following example shows the p1 poly_template with an incorrect mapping statement.

```
poly_template(p1) {
    variables("temperature, voltage, total_output_net_capacitance");
    variable_1_range("20,150");
    variable_2_range("1.2,3.2");
    variable_3_range("10,30");
    mapping(voltage1,VDD1);
    .....
}
```

Correct it by changing the variable_1_range statement in the domain to the following:

```
mapping(voltage,VDD1);
```

EXAMPLE MESSAGE

Error: Line 191, Variable voltage1 is not defined in the template (LBDB-506).

LBDB-507 (error) Attempting to map to %s, which is defined in power_supply group. However, power_supply group is missing.

DESCRIPTION

This error message tells you that you have not defined a power_supply group before using its information.

WHAT NEXT

Add a power_supply group before the templates.

EXAMPLES

The following example shows the p1 poly_template with the mapping statement missing.

```
poly_template(p1) {
    variables("temperature, voltage2, total_output_net_capacitance");
    mapping("voltage2, VDD");
    .....
}
```

Correct it by adding the following statement before the template:

```
power_supply() {
    default_power_rail : VDD ;
}
```

EXAMPLE MESSAGE

Error: Line 191, Power_supply group missing but trying to map to %s, which is supposed to be defined in a power_supply group. (LBDB-507)

LBDB-508 (error) The '%s' port has hyperbolic low groups. Only input pin or bidirectional pin can have hyperbolic low groups.

DESCRIPTION

Library Compiler issues this error message if one hyperbolic low group is defined within an output pin.

WHAT NEXT

Change the library source file by removing the hyperbolic low groups within the output pin group.

EXAMPLES

```
pin(Q) {
    direction : output;
    ...
    hyperbolic_noise_low() {
        ...
    }
}
```

To correct the problem, remove one of the hyperbolic low groups.

```
pin(Q) {
    direction : output;
    ...
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has hyperbolic groups.
Only input pin or bidirectional pin can have hyperbolic low groups. (LBDB-508)

LBDB-509 (error) The '%s' port has hyperbolic high groups.
Only input pin or bi-directional pin can have hyperbolic high groups.

DESCRIPTION

Library Compiler issues this error message if one hyperbolic high group is defined within a output pin.

WHAT NEXT

Change the library source file by removing the hyperbolic high groups within the output pin group.

EXAMPLES

```
pin(Q){  
    direction : output;  
    ...  
    hyperbolic_noise_high() {  
    }  
}
```

To fix the problem, remove one of the hyperbolic high groups.

```
pin(Q){  
    direction : output;  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has hyperbolic groups.
Only input pin or bi-directional pin can have hyperbolic high groups. (LBDB-509)

LBDB-510 (error) The '%s' port has hyperbolic above_high
groups.
Only input pin or bi-directional pin can have hyperbolic

above_high groups.

DESCRIPTION

Library Compiler issues this error message if one hyperbolic above_high group is defined within a output pin.

WHAT NEXT

Change the library source file by removing the hyperbolic above_high groups within the output pin group.

EXAMPLES

```
pin(Q){  
    direction : output;  
    ...  
    hyperbolic_noise_above_high() {  
    }  
}
```

To fix the problem, remove one of the hyperbolic above_high groups.

```
pin(Q){  
    direction : output;  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has hyperbolic groups.
Only input pin or bi-directional pin can have hyperbolic above_high groups. (LBDB-510)

LBDB-511 (error) The '%s' port has hyperbolic below_low groups.

Only input pin or bi-directional pin can have hyperbolic below_low groups.

DESCRIPTION

Library Compiler issues this error message if one hyperbolic below_low group is defined within a output pin.

WHAT NEXT

Change the library source file by removing the hyperbolic below_low groups within the output pin group.

EXAMPLES

```
pin(Q){  
    direction : output;  
    ...  
    hyperbolic_noise_below_low() {  
    }  
}
```

To fix the problem, remove one of the hyperbolic below_low groups.

```
pin(Q){  
    direction : output;  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has hyperbolic groups.

Only input pin or bi-directional pin can have hyperbolic below_low groups. (LBDB-511)

LBDB-512 (error) The '%s' port has noise hyperbolic groups.
Only one input/bi-directional port can have noise hyperbolic groups.

DESCRIPTION

Library Compiler issues this error message if more than one noise hyperbolic is defined within a timing.

WHAT NEXT

Change the library source file by removing any extra noise hyperbolic groups within the pin group.

EXAMPLES

```
pin(Q){
```

```
direction : output;  
...  
noise_hyperbolic_low() {  
    ...  
}  
}
```

To fix the problem, remove one of the noise hyperbolic groups.

```
pin(Q){  
    direction : output;  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has noise hyperbolic groups.
Only input/bi-directional ports can have noise hyperbolic groups. (LBDB-512)

LBDB-513 (error) The '%s' port has repeated noise hyperbolic groups. Only one such group is allowed.

DESCRIPTION

Library Compiler issues this error message if more than one of the same noise hyperbolic group is defined within a timing.

WHAT NEXT

Change the library source file by removing any extra noise hyperbolic groups within the timing group.

EXAMPLES

```
pin(Q){  
    ...  
    noise hyperbolic_low() {  
        ...  
    }  
    noise hyperbolic_low() {  
        ...  
    }  
}
```

To correct the problem, remove extra noise hyperbolic groups.

```
pin(Q){  
    ...  
    noise hyperbolic_low() {  
        ...  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has repeated noise hyperbolic groups.
Only one such group is allowed. (LBDB-513)

LBDB-514 (error) The constraint timing arc has noise immunity groups.

Only non-constraint timing arc can specify such info.

DESCRIPTION

Library Compiler issues this error message if noise immunity info is defined within a constraint timing arc.

WHAT NEXT

Remove the noise immunity tables/polys.

EXAMPLES

```
pin(Q){  
    direction : output;  
    ...  
    timing() {  
        timing_type: setup_rising;  
        ...  
        noise_immunity_low() {  
            ...  
        }  
    }  
}
```

To fix the problem, remove the noise immunity tables/polys.

```
pin(Q){  
    direction : output;  
    ...  
    timing() {
```

```
timing_type: setup_rising;
...
}
}
```

EXAMPLE MESSAGE

Error: Line 6, The timing arc has noise immunity groups.
Only non-constraint timing arc can specify such info. (LBDB-514)

LBDB-515 (error) The '%s' port has repeated noise immunity groups inside timing group. Only one such group is allowed.

DESCRIPTION

Library Compiler issues this error message if more than one noise immunity is defined within a timing group.

WHAT NEXT

Change the library source file by removing any extra noise immunity tables or polys within the timing group.

EXAMPLES

```
pin(Q) {
...
timing() {
...
noise_immunity_low() {
...
}
noise_immunity_low() {
...
}
}
```

To correct the problem, remove extra noise immunity groups.

```
pin(Q) {
...
timing() {
...
noise_immunity_low() {
...
}}
```

```
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 6, The 'Q' port has repeated noise immunity groups inside timing group. Only one such group is allowed. (LBDB-515)

LBDB-516 (error) The '%s' group uses template '%s' which does not contain 'iv_output_voltage' as its variable.

DESCRIPTION

The iv characteristics group must use a 1-d iv characteristics template with **iv_output_voltage** as its variable.

WHAT NEXT

Change the library source file by including 'iv_output_voltage' in the template.

EXAMPLES

```
iv_lut_template(ok_temp) {
    variable_1 : iv_output_voltage;
    index_1("0.5,1.0,1.5,2.0,2.5");
}
iv_lut_template(err_temp) {
    variable_1 : input_transition_time;
    index_1("0.5,1.0,1.5,2.0,2.5");
}
...
steady_state_current_high(err_temp) {
values("1.385,2.554,3.722,4.891,6.059");
}
```

To fix the problem, change the template value of the **steady_state_current_high** attribute from *err_temp* to *ok_temp*.

EXAMPLE MESSAGE

Error: Line 126, The 'steady_state_current_high' group in the timing group cannot use 'err_temp' as its template. (LBDB-516)

LBDB-517 (error) The '%s' lookup table in the timing group cannot use '%s' as its template.

DESCRIPTION

The noise characteristics group must use a 2-d noise characteristics template with **input_noise_width**, **total_output_net_capacitance** as its variables.

WHAT NEXT

Change the library source file by including 'input_noise_width' and 'total_output_net_capacitance' in the template.

EXAMPLES

```
noise_lut_template(ok_temp){  
    variable_1 : input_noise_width;  
    variable_2 : total_output_net_capacitance;  
    index_2("1.0,2.0,4.0,6.0,10.0");  
    index_2("0.5,1.0,1.5,2.0,2.5");  
}  
noise_lut_template(err_temp){  
    variable_1 : input_net_transition;  
    variable_2 : total_output_net_capacitance;  
    index_2("1.0,2.0,4.0,6.0,10.0");  
    index_2("0.5,1.0,1.5,2.0,2.5");  
}  
...  
noise_immunity_high(err_temp) {  
    values("0.733,1.073,1.412,1.752,2.092",  
          "0.873,1.214,1.554,1.894,2.234",  
          "1.095,1.442,1.787,2.132,2.477",  
          "1.298,1.648,1.996,2.343,2.691",  
          "1.703,2.060,2.414,2.766,3.119");  
}
```

To fix the problem, change the template value of the **noise_immunity_high** attribute from *err_temp* to *ok_temp*.

EXAMPLE MESSAGE

Error: Line 126, The 'noise_immunity_high' lookup table in the timing group cannot use 'err_temp' as its template. (LBDB-517)

LBDB-519 (error) The timing arc has steady_state_resistance_low/high/above_high/below_low attribute specified.

Only combo, enable, disable, rising_edge, falling_edge, clear and preset timing arc can specify such attributes.

DESCRIPTION

Library Compiler issues this error message if any steady_state_resistance_low/high/above_high/below_low attribute is defined within a timing arc which is not combo, disable or enable.

WHAT NEXT

Change the library source file by removing such attributes inside the timing() group.

EXAMPLES

```
pin(Q){  
    ...  
    timing() {  
        timing_type : setup_rising;  
        ...  
        steady_state_resistance_high() {  
            ...  
        }  
    }  
}
```

To fix the problem, remove the steady_state_resistance attributes.

```
pin(Q){  
    ...  
    timing() {  
        timing_type : setup_rising;  
        ...  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 6, The timing arc has steady_state_resistance_low/high/above_high/below_low attribute specified.

Only combo, enable, disable, rising_edge, falling_edge, clear and preset timing arc can specify such attributes. (LBDB-519)

LBDB-520 (error) The timing arc has

`steady_state_current_high/low` specified.

Only `combo`, `rising_edge`, `falling_edge`, `preset` and `clear` timing arcs can specify such info.

DESCRIPTION

Library Compiler issues this error message if any `steady_state_current_high/low` group is defined within a timing group which is not `combo`, `enable` or `disable`.

WHAT NEXT

Change the library source file by removing such groups inside the `timing()` group.

EXAMPLES

```
pin(Q){  
    ...  
    timing() {  
        timing_type : setup_rising;  
        ...  
        steady_state_current_high(iv1x5) {  
            ...  
        }  
    }  
}
```

To fix the problem, remove the `steady_state_current_high` group.

```
pin(Q){  
    ...  
    timing() {  
        timing_type : setup_rising;  
        ...  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 6, The timing arc has `steady_state_current_high/low` specified.
Only `combo`, `rising_edge`, `falling_edge`, `preset` and `clear` timing arcs can specify such info. (LBDB-520)

LBDB-521 (error) The timing arc has
`steady_state_current_tristate` specified.

Only enable or disable timing arc can specify such info.

DESCRIPTION

Library Compiler issues this error message if any steady_state_current_tristate group is defined within a timing group which is not disable or enable.

WHAT NEXT

Change the library source file by removing such groups inside the timing() group.

EXAMPLES

```
pin(Q){  
    ...  
    timing(){  
        ...  
        steady_state_current_tristate(iv1x5) {  
            ...  
        }  
    }  
}
```

To fix the problem, remove the steady_state_current_tristate group.

```
pin(Q){  
    ...  
    timing(){  
        ...  
        steady_state_current_tristate(iv1x5) {  
            ...  
        }  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 6, The timing arc has steady_state_current_tristate specified.
Only enable or disable timing arc can specify such info. (LBDB-521)

LBDB-522 (error) The '%s' group in the

timing arc cannot use '%s' as its template.

DESCRIPTION

The noise characteristics group must use a 3-d noise characteristics template with **input_noise_width**, **input_noise_height**, **total_output_net_capacitance** as its variables.

WHAT NEXT

Change the library source file by including 'input_noise_width', 'input_noise_height' and 'total_output_net_capacitance' in the template.

EXAMPLES

```
...
propagation_lut_template(ok_temp) {
    variable_1 : input_noise_width;
    variable_2 : input_noise_height;
    variable_3 : total_output_net_capacitance;
    index_1("1.0,2.0,4.0,6.0,10.0");
    index_2("0.5,1.0,1.5,2.0,2.5");
    index_3("0.5,1.0,1.5,2.0,2.5");
}
noise_lut_template(err_temp) {
    variable_1 : input_net_transition;
    variable_2 : input_noise_height;
    variable_3 : total_output_net_capacitance;
    index_1("1.0,2.0,4.0,6.0,10.0");
    index_2("0.5,1.0,1.5,2.0,2.5");
    index_3("0.5,1.0,1.5,2.0,2.5");
}
...
propagation_noise_width_high(err_temp) {
    values("0.733,1.073,1.412,1.752,2.092",
          "0.873,1.214,1.554,1.894,2.234",
          "1.095,1.442,1.787,2.132,2.477",
          "1.298,1.648,1.996,2.343,2.691",
          ...
          "1.703,2.060,2.414,2.766,3.119");
}
```

To fix the problem, change the template value of the **propagation_noise_width_high** attribute from *err_temp* to *ok_temp*.

EXAMPLE MESSAGE

Error: Line 126, The 'propagation_noise_width_high' group in the timing arc cannot use 'err_temp' as its template. (LBDB-522)

LBDB-523 (error) The related '%s' group is not specified for the %s' group in the timing arc.

DESCRIPTION

The noise propagation width and height group must coexist for the same region(low, high, below_low, above_high).

WHAT NEXT

Add the missiong propagation group in the timing group.

EXAMPLES

```
...
timing() {
    propagation_noise_width_high(ok_temp) {
        values("0.733,1.073,1.412,1.752,2.092",
              "0.873,1.214,1.554,1.894,2.234",
              "1.095,1.442,1.787,2.132,2.477",
              "1.298,1.648,1.996,2.343,2.691",
        ...
        "1.703,2.060,2.414,2.766,3.119");
    }
    propagation_noise_width_low(ok_temp) {
        values("0.733,1.073,1.412,1.752,2.092",
              "0.873,1.214,1.554,1.894,2.234",
              "1.095,1.442,1.787,2.132,2.477",
              "1.298,1.648,1.996,2.343,2.691",
        ...
        "1.703,2.060,2.414,2.766,3.119");
    }
    propagation_noise_height_low(ok_temp) {
        values("0.733,1.073,1.412,1.752,2.092",
              "0.873,1.214,1.554,1.894,2.234",
              "1.095,1.442,1.787,2.132,2.477",
              "1.298,1.648,1.996,2.343,2.691",
        ...
        "1.703,2.060,2.414,2.766,3.119");
    }
}
...
```

To fix the problem, add the *propagation_noise_width_high* group in the timing group.

EXAMPLE MESSAGE

Error: Line 126, The related 'propagation_noise_height_high' group is not specified for the 'propagation_noise_width_high' group in the timing arc. (LBDB-523)

LBDB-524 (error) Invalid variable '%s' is used in the '%s' poly_template refered by %s group.

DESCRIPTION

You receive this message because you defined an invalid variable in the variables statement in the poly_template group refered by leakage_power or pin_capacitance group. The valid variables can only be temperature voltage, and power_rails.

WHAT NEXT

Define a variable name for the specified poly_template.

EXAMPLES

In the following example, the *whatever* variable value is not valid in the *p1* poly_template.

```
poly_template(p1) {  
    variables("temperature, total_output_net_capacitance");  
    variable_1_range("1,2");  
    variable_2_range("3,4");  
}
```

To correct the problem in the example above, insert the following statement in the *p1* poly_template group:

```
variables("temperature, voltage");
```

EXAMPLE MESSAGE

Error: Line 191, Invalid variable 'total_output_net_capacitance' is used in the 'p1' poly_template refered by leakage_power group. (LBDB-524)

LBDB-525 (error) Only polynomial format is supported for '%s' group.

DESCRIPTION

You receive this message because you defined an non-polynomial group, such as pin_capacitance() group, leakagage_power() group.

WHAT NEXT

Please redefine these groups using polynomials.

LBDB-600 (error) The '%s' direction cannot be specified on a pin.

DESCRIPTION

This message indicates that you specified an incompatible direction value on a pin. Library Compiler fails if the direction value includes the following combinations:

- * tristate

WHAT NEXT

Refer to the "Library Compiler User Guide" for direction information. Remove the incompatible values of the direction attribute.

EXAMPLES

```
cell(lbdb600) {  
    area : 2;  
    pin(A) {  
        direction : tristate;  
        capacitance : 1.0;  
    }  
    ...  
}
```

EXAMPLE MESSAGE

```
Error: Line 84, The 'tristate' direction cannot be specified on a  
pin. (LBDB-600)
```

LBDB-601 (error) related_pin is illegal in the timing group. Timing arc info is missing.

DESCRIPTION

This message indicates that you specified an illegal related_pin in a timing group.

WHAT NEXT

Refer to the "Library Compiler User Guide" for related_pin information.

EXAMPLES

```
timing() {
```

```

/* noise immunity */
noise_immunity_high(noise5x5) {
    index_2("0.362,0.725,1.087,1.449,1.812");
    values("0.733,1.073,1.412,1.752,2.092",
           "0.873,1.214,1.554,1.894,2.234",
           "1.095,1.442,1.787,2.132,2.477",
           "1.298,1.648,1.996,2.343,2.691",
           "1.703,2.060,2.414,2.766,3.119");
}
related_pin: "a";
}

```

EXAMPLE MESSAGE

Error: Line 120, related_pin is illegal in the timing group.
Timing arc info is missing. (LBDB-601)

LBDB-602 (warning) The units of time, capacitance, voltage and current are not consistent.

DESCRIPTION

This message indicates that you specified an inconsistent units in the library.

WHAT NEXT

Refer to the "Library Compiler User Guide" for unit information. Modify the realted unit values to make them consistent.

EXAMPLES

```

library (mi333) {
    ...
    time_unit          : "1ns";
    voltage_unit       : "1mV";
    current_unit       : "1mA";
    pulling_resistance_unit : "1kohm";
    capacitive_load_unit (1, pf);
    ...
}

```

EXAMPLE MESSAGE

Warning: Line 120, The units of time, capacitance, voltage and current are not consistent. (LBDB-602)

LBDB-603 (error) The '%s' attribute cannot be supplied a nonpositive value (%d).

DESCRIPTION

This message indicates that the specified attribute cannot have a nonpositive value.

WHAT NEXT

Change the value of the attribute to positive in the technology library file.

EXAMPLES

```
orders ( 0, 2, 3 );
```

EXAMPLE MESSAGE

Error: Line 18, The 'orders' attribute cannot be supplied a nonpositive value (0) (LBDB-603)

LBDB-604 (error) '%s' attribute should be less than '%s' attribute.

DESCRIPTION

This message indicates that the specified attributes are not consistent.

WHAT NEXT

Change the value of the attributes to be consistent in the technology library file.

EXAMPLES

```
slew_lower_threshold_pct_rise: 80.0
slew_upper_threshold_pct_rise: 20.0
```

EXAMPLE MESSAGE

Error: Attribute 'slew_lower_threshold_pct_rise' should be less than 'slew_upper_threshold_pct_rise'. (LBDB-604)

LBDB-605 (warning) The attribute '%s' is not specified.

DESCRIPTION

This message indicates that an attribute is missing.

WHAT NEXT

Either add the missing attribute to the technology library or ignore the message.

EXAMPLES

```
slew_lower_threshold_pct_rise: 20.0
```

EXAMPLE MESSAGE

Warning: Line 18, The attribute 'slew_lower_threshold_pct_rise' is not specified. (LBDB-605)

LBDB-606 (error) The invalid '%s' value is encountered on the '%s' attribute.

DESCRIPTION

This message indicates that you specified an invalid attribute's value . Library Compiler cannot handle the value.

WHAT NEXT

Check the library source file, and correct the problem.

EXAMPLES

```
fall_propagation ( table4x6 ) {
    index_1 ("2.00e+02 2.50e+02 3.50e+02 4.00e+02 " ) ;
    index_2 ("4.48e-02 8.96e-02 1.34e-01 1.79e-01 2.24e-01 2.69e-01 ");
    values ("Look.here 9.56e+01 1.15e+02 1.34e+02 1.52e+02 1.71e+02 ", \
            "9.38e+01 1.20e+02 1.45e+02 1.67e+02 1.89e+02 2.10e+02 ", \
            "1.01e+02 1.32e+02 1.58e+02 1.83e+02 2.07e+02 2.29e+02 ", \
            "1.04e+02 1.43e-93 1.43e-93 1.43e-93 2.75e+226 9.30e+254 " ) ;
}
```

EXAMPLE MESSAGE

Error: Line 85, The invalid 'Look.here' value is encountered
on the 'values' attribute. (LBDB-606)

LBDB-607 (warning) The pin '%s' does not have a internal_power group.

DESCRIPTION

For an input pin, we must have one internal_power table matching the input_signal_level value. The rest of the rail connections are optional.

WHAT NEXT

Add the relative internal_power table matching the input_signal_level value.

EXAMPLES

```
cell ( cell1 ) {
    rail_connection(PV1, VDD1);
    rail_connection(PV2, VDD2);

    pin(A) {
    ...
    }
    pin(B) {
    ...
    }
    pin ( CP ) {
        direction : input ;
        input_signal_level : VDD1;
    ...
    }
    ...
}
```

To fix the problem, add the relative internal_power group matching the input_signal_level value to pin(CP). internal_power() { power_level : VDD1 ; when : "A !B"; power (power_ramp) { values ("1.934150, 2.148130, 2.449420, 3.345050, 4.305690"); } }

EXAMPLE MESSAGE

Warning: Line 126, The pin 'CP' does not have a internal_power group. (LBDB-607)

LBDB-608 (Warning) Library cell '%s' has a valid function-id,

but it has also been annotated with the `user_function_class` attribute. Resolving this conflict by ignoring the `user_function_class` attribute for this library cell.

DESCRIPTION

The specified cell has been annotated with the `user_function_class` attribute even though it has a valid function-id. Library Compiler can generate a function-id for most cells in a technology library. However, there may be a few complex sequential or combinational cells that Library Compiler cannot successfully generate a function-id for. In addition, some black-box cells in the library do not have any function information. The `user_function_class` attribute is intended for such cells that otherwise would not have a function-id. The `user_function_class` attribute is not intended for library cells that already have a valid function-id.

WHAT NEXT

This warning message indicates that the `user_function_class` attribute for this library cell will be ignored. No further action is required. To turn off this warning message in the future, make sure that a `user_function_class` attribute is not set on this library cell.

LBDB-609 (Warning) Library cells '%s' and '%s' have different pin information, but they have been assigned the same `user_function_class`. Resolving this conflict by ignoring the `user_function_class` attribute on the latter library cell.

DESCRIPTION

Two library cells that are assigned the same `user_function_class` attribute should have the exact same pin information. That is, they must have the same number of pins and the same pin names. This requirement is necessary so that Design Compiler can establish pin-to-pin correspondence between two cells in the same `user_function_class` when it replaces a reference to one library cell by a reference to the other library cell.

This warning message indicates that an inconsistency was found between the pin information of two library cells in the same `user_function_class`. To resolve this conflict, the `user_function_class` attribute for the second library cell will be ignored.

WHAT NEXT

This warning message indicates that the `user_function_class` attribute for the second

library cell will be ignored. No further action is required. To turn off this warning message in the future, make sure that all library cells in a given **user_function_class** attribute have the same pin information.

LBDB-610 (warning) The units of %s are not consistent.

DESCRIPTION

This message indicates that you specified an inconsistent units in the library.

WHAT NEXT

Refer to the "Library Compiler User Guide" for unit information. Modify the realted unit values to make them consistent.

EXAMPLES

```
library (mi333) {  
    ...  
    time_unit           : "1ns";  
    voltage_unit        : "1V";  
    current_unit        : "1mA";  
    resistance_unit     : "1kohm";  
    capacitive_load_unit (1, pf);  
    ...
```

EXAMPLE MESSAGE

Warning: Line 120, The units of time, capacitance, resistance are not consistent. (LBDB-610)

LBDB-611 (warning) The '%s' %s group is not used by any %s pin in the library.

DESCRIPTION

This message indicates that the library pins does not use the defined input/output voltage groups.

WHAT NEXT

For input_voltage group, add "input_voltage" attrribute to input library pins. For output_voltage group, add "output_voltage" attrtribue to output library pins.

EXAMPLES

```
input_voltage(CMOS) {  
    vil : 1.5;  
    vih : 3.5;  
    vimin : -0.3;  
    vimax : VDD + 0.3;  
}  
  
input_voltage(CMOS) {  
    vil : 2.5;  
    vih : 4.5;  
    vimin : -0.3;  
    vimax : VDD + 0.3;  
}
```

EXAMPLE MESSAGE

Error: Line 31, The 'CMOS' input_voltage group is not used by any input pin in the library. (LBDB-611)

LBDB-612 (information) The '%s' attribute value is %s (%3.1f).

DESCRIPTION

This message indicates that you specified an attribute value that maybe out of the accepted range. The value is either less than the minimum value or greater than the maximum value. Unlike LBDB-163, it does not reset the value.

WHAT NEXT

EXAMPLES

```
height_coefficient : -0.01;
```

In this case, the height_coefficient's value -0.01 is less than the minimum accepted value 0.0. However, it is not reset.

EXAMPLE MESSAGE

Warning: Line 109, The 'height_coefficient' attribute value is less than 0.0. (LBDB-612)

LBDB-613 (error) The '%s' group requires the '%s' %s.

Either the attribute(or group) is missing or the attribute(or group) has an invalid value.

DESCRIPTION

This message indicates you specified a group without one of its required attributes(or groups). Library Compiler rejects the attribute(group) definition if the attribute(group) exists and has an invalid value.

WHAT NEXT

Change the library file by adding the missing attribute(or group) to the group.

EXAMPLES

```
memory() {  
    type : random;  
    address_width : 10;  
    word_width : 8;  
}
```

In this case, the 'type' has an invalid value. To fix the problem, assign 'rom' or 'ram' to the type.

EXAMPLE MESSAGE

Error: Line 27, The 'memory' group requires the 'type' attribute.
Either the attribute is missing or the attribute has an invalid value. (LBDB-179)

**LBDB-614 (error) The '%s' has a count of %d, which does not match
the number of "%s" specified.**

DESCRIPTION

The specification of the variables implied the number of indices of a template (or template domain).

WHAT NEXT

Check the library source file, and make the number of variables and indices to the same.

EXAMPLES

```
lu_table_template(basic_template) {
    variable_1 : input_net_transition;
    index_1 ("0.1, 1.2, 2.3, 3.4");
    index_2 ("0.1, 1.2, 2.3, 3.4");
}
```

EXAMPLE MESSAGE

Error: Line 160, The 'index_*' have a count of 2, which does not match the number of 'variable_*' specified. (LBDB-614)

LBDB-615 (warning) Connect pin '%s' to the default_power_supply '%s' defined in the power_supply() group in library.

DESCRIPTION

Either the input_signal_level or the output_signal_level attribute is missing in a pin within a multiple power supply cell. By default, LC connect this pin to the default_power_supply defined in the power_supply() group in library.

WHAT NEXT

Check the library source file to see if you missed the input_signal_level or the output_signal_level attributes.

EXAMPLES

```
power_supply() {
    default_power_rail : VDD0;
    power_rail(VDD1, 5.0);
    power_rail(VDD2, 3.3);
}

cell(lbdb428) {
    area : 2;
    pad_cell : true;
    rail_connection(PV1, VDD1);
    rail_connection(PV2, VDD2);
    pin(A) {
        direction : input;           /
        * missing input_signal_level attribute, will use default VDD0 */
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
```

```

        function : "A";
        output_signal_level : VDD2;
        timing() {
            intrinsic_rise : 0.48;
            intrinsic_fall : 0.77;
            rise_resistance : 0.1443;
            fall_resistance : 0.0523;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A";
        }
    }
}
}
}

```

EXAMPLE MESSAGE

Warning: Line 96, Connect pin 'A' to the default_power_supply 'VDD0' defined in the power_supply() group in library. (LBDB-615)

LBDB-616 (error) Found the timing arc '%s' has lookup table or poly template which is more than %s dimensional in a '%s' timing group in the library

DESCRIPTION

In the timing group reported, since the related_pin and constraint_pin are the same, there can not be a two-dimension or more lookup table/poly template based on related_pin_transition and constraint_pin_transition because they are the same pin and one pin can not have two different values at the same time.

Specially, for min_pulse_width timing group, since the arc can be indexed by the output load, thus it can be 1D or 2D.

WHAT NEXT

Modify the timing arc based on a one-dimensional lookup table or poly template.

EXAMPLES

```

lu_table_template (table_2)  {
    variable_1 : constrained_pin_transition ;

```

```

variable_2 : related_pin_transition ;
index_1 ("0.00, 0.25, 0.50") ;
index_2 ("0.00, 0.50, 2.00") ;
}

timing() {
    related_pin : CP ;
    timing_type : min_pulse_width ;
    rise_constraint(table_2) {
        index_1 ("0.00, 1.00, 2.50") ;
        index_2 ("0.00, 1.00, 2.50") ;
        values (\n
            "4.0, 5.0, 6.0"\n
            "4.2, 5.2, 6.2"\n
            "4.4, 5.4, 6.4"\n
        );
    }
    fall_constraint(table_2) {
        index_1 ("0.00, 1.00, 2.50") ;
        index_2 ("0.00, 1.00, 2.50") ;
        values (\n
            "4.0, 5.0, 6.0"\n
            "4.2, 5.2, 6.2"\n
            "4.4, 5.4, 6.4"\n
        );
    }
}

```

EXAMPLE MESSAGE

Error: Line 160, Found the timing arc 'rise_constraint' has lookup table or poly template

which is more than one dimensional in a min_pulse_width timing group in the library
(LBDB-616)

LBDB-617 (warning) The related pin in a '%s' timing group is specified as '%s', not the pin '%s' itself. It is reset to pin '%s'.

DESCRIPTION

In the timing group reported, since the related_pin and constraint_pin are the same, the related_pin attribute is optional and has to be set to the pin itself.

WHAT NEXT

Either delete the related_pin attribute or set the attribute to the pin's name.

EXAMPLES

```
pin(CP) {  
    ...  
    timing() {  
        related_pin : D ;  
        timing_type : min_pulse_width ;  
        rise_constraint(table_2) {  
            index_1 ("0.00, 1.00, 2.50") ;  
            index_2 ("0.00, 1.00, 2.50") ;  
            values (\n                "4.0, 5.0, 6.0"\n                "4.2, 5.2, 6.2"\n                "4.4, 5.4, 6.4"\n            );  
        }  
    }  
    fall_constraint(table_2) {  
        index_1 ("0.00, 1.00, 2.50") ;  
        index_2 ("0.00, 1.00, 2.50") ;  
        values (\n                "4.0, 5.0, 6.0"\n                "4.2, 5.2, 6.2"\n                "4.4, 5.4, 6.4"\n            );  
    }  
}  
  
need to delete related_pin attribute or set it as  
related_pin : CP ;
```

EXAMPLE MESSAGE

Warning: Line 160, The related pin in a min_pulse_width timing group is specified as 'D', not

the pin 'CP' itself. It is reset to pin 'CP'. (LBDB-617)

LBDB-618 (error) The min/max_clock_tree_path timing arc contains illegal rise/fall_propagation group.

DESCRIPTION

In a min/max_clock_tree_path timing arc, only cell_rise group or cell_fall group or both are allowed

WHAT NEXT

Delete the illegal rise/fall_propagation group

EXAMPLES

```
pin(CP) {  
    ...  
    timing() {  
        related_pin : CLK ;  
        timing_type : min_clock_tree_path ;  
        rise_propagation(table_2) {  
            index_1 ("0.00, 1.00, 2.50") ;  
            values (\n                "4.0, 5.0, 6.0"\n            );  
        }  
        fall_propagation(table_2) {  
            index_1 ("0.00, 1.00, 2.50") ;  
            index_2 ("0.00, 1.00, 2.50") ;  
            values (\n                "4.0, 5.0, 6.0"\n            );  
        };  
    };  
}
```

need to delete both rise_propagation and fall_propagation lookup table and replace with
cell_rise and cell_fall lookup tables

EXAMPLE MESSAGE

Warning: Line 160, the min/max_clock_tree_path timing arc contains illegal rise/
fall_progagation group (LBDB-618)

LBDB-619 (error) The '%s' attribute cannot be specified on the
%S %S.

DESCRIPTION

This error message occurs when you specify an invalid attribute for an object. As shown in the following example, the **output_signal_level_high** attribute is invalid for a pin object, causing the error message:

```
cell(lbdb600) {  
    area : 2;  
    pin(A) {  
        direction : input;
```

```

    capacitance : 1.0;
    output_signal_level_high : 1.2;
    ...
}
...
}

Error: Line 84, The 'output_signal_level_high' attribute cannot be specified on
the
pin 'A'. (LBDB-619)

```

WHAT NEXT

Remove the attribute from the pin and rerun the command.

LBDB-620 (warning) The lookup table domain '%s' is defined multiple times within '%s'. Using the last one encountered.

DESCRIPTION

This message indicates that the same lookup table domain has been defined for multiple times within one timing/power arc. In the case of a domain conflict, Library Compiler ignores all except the last domain encountered during the compilation. The compiled database contains the last domain only.

WHAT NEXT

Make sure that only define one lookup table for each domain for each timing/power arc.

EXAMPLES

```

cell_rise(li7X7){
    domain(D1) { ... }
    domain(D1) { ... }
    domain(D2) { ... }
}

```

EXAMPLE MESSAGE

Warning: Line 987, The lookup table domain 'D1' is defined multiple times within 'cell_rise'. Using the last one encountered. (LBDB-620)

LBDB-621 (error) Invalid calc_mode '%s' is detected. This

name must be
unique among domains within one lu_table_template.

DESCRIPTION

This message indicates a duplicate calc_mode defined among domains within one lu_table_template.

WHAT NEXT

Change the name of the pin, bus, bundle, rail_connection in the technology library.

EXAMPLES

```
lu_table_template(li7X7){  
    domain(D1) {  
        calc_mode : "CM1";  
        . . .  
    }  
    domain(D2) {  
        calc_mode : "CM1";  
        . . .  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 56, Invalid calc_mode 'CM1' is detected. This name must be unique among domains within one lu_table_template. (LBDB-621)

LBDB-622 (error) The '%s' attribute is missing for the %s %s.

DESCRIPTION

This error message occurs because either the **max_input_noise_width** or the **min_input_noise_width** attribute is missing when both attributes are required.

This message also occurs when **input_signal_level** and **output_signal_level** are not defined in the input/output pin of a level shifter or isolation cell.

WHAT NEXT

Check the library source file, and add the missing attribute.

LBDB-623 (error) The '%s' attribute is larger than the %s '%s' %sfor the %s %s.

DESCRIPTION

This error message occurs when the **min_input_noise_width** attributed value is larger than the **max_input_noise_width** attribute value. Library Compiler requires that the **min_input_noise_width** value be no larger than the **max_input_noise_width** value.

The following example shows **min_input_noise_width** set at a higher value than **max_input_noise_width** and the resulting error message.

```
pin(S) {
    min_input_noise_width : 2.0;
    max_input_noise_width : 1.0;
    ...
}
```

Error: Line 18, The 'min_input_noise_width' attribute is larger than the 'min_input_noise_width' attribute for the pin '%s'. (LBDB-623)

This error message also occurs when any of the following are true:

- The value of **output_signal_level_high** is greater than **output_signal_level_low**.
- The value of **output_signal_level_high** is greater than **output_signal_level**.
- The value of **input_signal_level_high** is greater than **input_signal_level_low**.
- The value of **input_signal_level_high** is greater than **input_signal_level**.

WHAT NEXT

Change all related values to conform to the requirement and rerun the command.

LBDB-624 (error) The output/inout pin '%s' has illegal 'tied-off' timing arcs.

DESCRIPTION

If a output pin is not tied to "high" (the function attribute is set to "1") or "low" (the function attribute is set to "0"), its time arcs should not set the 'tied-off' attribute to true.

WHAT NEXT

Delete the 'tied-off' attribute.

EXAMPLES

```
pin(S) {
    function : "A B";
    ...
    timing() {
        tied_off : true;
        steady_state_current_high(table_1) {
            index_1 ("0.00, 1.00, 2.50") ;
            values (\n
                "4.0, 5.0, 6.0"\n
            ...
        );
    }
    ...
}
```

need to delete the 'tied-off' attribute.

EXAMPLE MESSAGE

Warning: Line 160, The output pin 'S' has illegal 'tied-off' timing arcs. (LBDB-624)

LBDB-625 (error) The output/inout pin '%s' has a 'tied-off' timing arc containing illegal '%s' %s.

DESCRIPTION

If a output pin is tied to "high"(the function attribute is set to "1"), only steady_state_current_high group is allowed in its timing arc whose 'tied_off' attribute is set to true.

WHAT NEXT

Delete the illegal noise_immunity/noise_propagation groups.

EXAMPLES

```
pin(S) {
    function : "1";
    ...
    timing() {
```

```

    tied_off : true;
    steady_state_current_high(table_1) {
        index_1 ("0.00, 1.00, 2.50") ;
        values (\n
            "4.0, 5.0, 6.0"\n
        ...
    );
}
...
}
```

need to delete the 'steady_state_current_high' table.

EXAMPLE MESSAGE

Warning: Line 160, The output pin 'S' has a 'tied-off' timing arc containing illegal 'steady_state_current_high' group. (LBDB-625)

LBDB-626 (error) The 'tied-off' timing arc contains illegal noise_immunity/noise_propagation group.

DESCRIPTION

In a timing arc whose tied_off attribute is set to true, for noise information, only steady_state_current_low group or steady_state_current_high group is allowed

WHAT NEXT

Delete the illegal noise_immunity/noise_propagation groups.

EXAMPLES

```

pin(CP) {
...
    timing() {
        tied_off : true;
        noise_immunity_high(table_1) {
            index_1 ("0.00, 1.00, 2.50") ;
            index_2 ("0.00, 1.00, 2.50") ;
            values (\n
                "4.0, 5.0, 6.0"\n
            ...
        );
    }
...
}
```

need to delete the 'noise_immunity_high' table.

EXAMPLE MESSAGE

Warning: Line 160, the 'tied-off' timing arc contains illegal noise_immunity/noise_propagation group (LBDB-626)

LBDB-627 (error) The '%s' group of the '%s' timing arc is not referencing the compatible template.

DESCRIPTION

In the min_pulse_width timing arc reported, the only valid templates are as follows:
1. "constrained_pin_transition" (1-dimentional) 2. "related_pin_transition" (1-dimentional)
3. "constrained_pin_transition" + "related_out_total_output_net_capacitance" 4. "related_pin_transition" + "related_out_total_output_net_capacitance"

WHAT NEXT

Change the variable in the template accordingly.

EXAMPLES

```
lu_table_template (table_1) {
    variable_1 : related_pin_transition ;
    index_1 ("0.10, 0.25, 0.50") ;
}

lu_table_template (table_2) {
    variable_1 : related_out_total_output_net_capacitance;
    index_1 ("0.10, 0.25, 0.50") ;
}

timing() {
    related_pin : CP ;
    timing_type : min_pulse_width ;
    rise_constraint(table_2) {
        index_1 ("0.50, 1.00, 2.50") ;
        values (\n
            "4.0, 5.0, 6.0"\n
        );
    }
    fall_constraint(table_1) {
        index_1 ("0.50, 1.00, 2.50") ;
    }
}
```

```
    values (\n        "4.0, 5.0, 6.0"\n    );\n}
```

change the template table_2 to

```
lu_table_template (table_2) { variable_1 : constrained_pin_transition ; index_1\n("0.10, 0.25, 0.50") ; }
```

EXAMPLE MESSAGE

```
Error: Line 160, The 'rise_constraint' group of the 'min_pulse_width' timing arc\nis not referencing the compatible template. (LBDB-627)
```

LBDB-628 (error) The value of timing_sense attribute is invalid for the timing arc whose timing_sense should be '%s' instead.

DESCRIPTION

The timing arc with feed_through_type attribute must have 'positive_unate' timing_sense.

WHAT NEXT

Check the timing arc and make the correction accordingly.

EXAMPLES

```
...
pin(Z) {
    direction : inout;
    timing() {
        feed_through_type : short;
        timing_sense : negative_unate;
        ...
    }
}
...
```

In this case, the timing sense should be "positive_unate".

EXAMPLE MESSAGE

Error: Line 256, The value of timing_sense attribute is invalid for the timing arc whose timing_sense should be 'positive_unate' instead. (LBDB-628)

LBDB-629 (error) The parent '%s' of the user-defined attribute is not defined.

DESCRIPTION

For define(name, parent, type), parent must be the name of a user-defined group or a predefined library group.

WHAT NEXT

Either change the parent name or define a new user-defined group with the parent name.

EXAMPLES

```
library(test) {  
    define(a, test, string);  
...  
}
```

Since "test" is not defined, we can define a new user-defined group call "test" by adding the following statement: define_group(test, library);

EXAMPLE MESSAGE

Error: Line 256, The parent 'test' of the user-defined attribute is not defined. (LBDB-629)

LBDB-630 (error) The 'user_parameters' group is not specified.

DESCRIPTION

This message indicates that the 'user_parameters' group is not specified. Library Compiler errors out because some generic parameters(parameter1..5) are used in either poly_template or power_poly_template, and the 'user_parameters' must be defined to contain the definition of those generic parameters.

WHAT NEXT

Add the missing attribute to the 'user_parameters' group. the message.

EXAMPLES

```
user_parameters() {  
    parameter1 : 0.80;  
}
```

EXAMPLE MESSAGE

Error: Line 52, The 'user_parameters' group is not specified. (LBDB-630)

LBDB-631 (error) The '%s' attribute in the 'user_parameters' group is not specified.

DESCRIPTION

This message indicates that an attribute is missing, and Library Compiler errors out because this attribute is used in either poly_template or power_poly_template.

WHAT NEXT

Add the missing attribute to the 'user_parameters' group. the message.

EXAMPLES

```
user_parameters() {  
    parameter1 : 0.80;  
}
```

EXAMPLE MESSAGE

Error: Line 52, The 'parameter2' attribute in the 'user_parameters' group is not specified. (LBDB-631)

LBDB-632 (error) The power rail name '%s' is invalid.

DESCRIPTION

This message indicates that you specified an invalid name for the current power rail. The name should not conflict with the generic parameters (parameter1..paramter5).

WHAT NEXT

User a different name that is not conflicting with parameter1..paramter5.

EXAMPLES

```
power_supply() {
    default_power_rail : VDD0;
    power_rail(parameter1, 4.95);
}
```

EXAMPLE MESSAGE

Error: Line 104, The power rail name 'parameter1' layer name is invalid. (LBDB-632)

LBDB-633 (error) The %s value, '%s', has not been defined in the %s.

DESCRIPTION

This message indicates that the referred value is undefined in the library.

WHAT NEXT

Add the referred value in the library.

EXAMPLES

```
part(a) {
    valid_speed_grades ("A", "B", "C");
    valid_step_levels ("step0", "step1", "step3");
    default_step_level : "step0";
    speed_grade("D") {
        step_level("step0");
    }
}
```

In this case, the "D" valid_speed_grade is not defined.

EXAMPLE MESSAGE

Error: Line 57, The valid_speed_grade value, 'D', has not been defined in the part. (LBDB-74)

LBDB-634 (error) The "variables" definition is conflicting with the

main template.

DESCRIPTION

This message indicates that you specified an invalid 'variables' for the current poly template domain. It's required that a poly template define the same 'variables' as that of its main poly template.

WHAT NEXT

User the same 'variables' definition as that of its main poly template.

EXAMPLES

```
poy_template(T3) {  
    variables (input_net_transition, voltage, temperature);  
    . . .  
    domain(D1) {  
        variables (input_net_transition, voltage);  
        . . .  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 124, The "variables" definition is conflicting with its main template.
(LBDB-634)

LBDB-635 (error) The 'tied-off' timing arc contains illegal related_pin attribute.

DESCRIPTION

In a timing arc whose tied_off attribute is set to true, related_pin attribute is not allowed.

WHAT NEXT

Delete the related_pin attribute.

EXAMPLES

```
pin(CP) {  
    ...  
    timing() {  
        tied_off : true;
```

```
...
related_pin : A;
}
...
}

need to delete the 'related_pin' attribute.
```

EXAMPLE MESSAGE

Warning: Line 160, the 'tied-off' timing arc contains illegal related_pin attribute. (LBDB-635)

LBDB-636 (error) The '%s' attribute value is invalid for the timing arc.

DESCRIPTION

This message indicates for a timing arc that the attribute value is invalid. For example, clock_gate_check attribute can only be defined to "true" for the setup/hold/nochange timing arcs.

WHAT NEXT

Remove the attribute from the timing arc.

LBDB-637 (error) The %s-associated '%s' lookup table cannot use '%s' as its template.

DESCRIPTION

This message can be used as generic error message template. For frequency-base max_cap, it means that: 1. the max_cap lookup table in an input-associated max_cap group must use a one-dimensional template with **frequency** as its variable. 2. the max_cap lookup table in an output-associated max_cap group must use a one-dimensional template with **frequency** as its variable, or a two-dimensional template with **frequency** and **total_output_net_capacitance** as its variables with **frequency** being the first variable.

WHAT NEXT

For more information about lookup tables, see the *Library Compiler User Guide*. Change the library source file by referencing a different template in the lookup

table description.

EXAMPLES

```
maxcap_lut_template(ok_temp) {
    variable_1 : frequency;
    index_1("0, 1, 2, 3");
}
maxcap_lut_template(err_temp) {
    variable_1 : input_transition_time;
    index_1("0, 1, 2, 3");
}

max_cap(err_temp) {
values ("1, 2, 3, 4");
}
```

To fix the problem, change the template value of the **max_cap** attribute from *err_temp* to *ok_temp*.

EXAMPLE MESSAGE

```
Error: Line 126, The input-associated 'max_cap' lookup table
cannot use 'err_temp' as its template. (LBDB-637)
```

LBDB-638 (error) It is invalid to specify the '%s' %s on an %s pin.

DESCRIPTION

This message indicates that you specified an invalid group on a pin.

WHAT NEXT

Check the library source file, and correct the problem.

EXAMPLES

```
pin (p) {
    direction : input;
    ...
    max_cap (test) {
        ...
    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 67, It is invalid to specify the 'max_cap' group on an input pin. (LBDB-638)

LBDB-639 (warning) The '%s' %s in this timing arc are ignored.

DESCRIPTION

This message indicates that you specified a redundant attribute or group for the sequential half-nate timing arcs.

In the following example, both the cell_fall group and the fall_transition group are redundant for the sequential half-unate timing arc.

```
timing() {
    timing_type : rising_edge;
    timing_sense : positive_unate;
    cell_rise( f_ocap ){
        index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990, 31999.9980, 63999.
9961");
        values ( "25.0000, 35.0000, 5145.0000, 80024.9922, 160024.9844, 320024.9688, 6
40024.9375");
    }
    rise_transition( f_ocap ){
        index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990, 31999.9980, 63999.
9961");
        values ( "15.0000, 25.0000, 5135.0000, 80014.9922, 160014.9844, 320014.9688, 6
40014.9375");
    }
    cell_fall( f_ocap ){
        index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990, 31999.9980, 63999.
9961");
        values ( "25.0000, 35.0000, 5145.0000, 80024.9922, 160024.9844, 320024.9688, 6
40024.9375");
    }
    fall_transition( f_ocap ){
        index_1 ( "0.0000, 1.0000, 512.0000, 7999.9995, 15999.9990, 31999.9980, 63999.
9961");
        values ( "15.0000, 25.0000, 5135.0000, 80014.9922, 160014.9844, 320014.9688, 6
40014.9375");
    }
}
```

Warning: Line 639, The cell_fall group in this
timing arc are ignored. (LBDB-390)

Warning: Line 639, The fall_transition group in this
timing arc are ignored. (LBDB-390)

WHAT NEXT

Remove the redundant groups from the timing arc and rerun the command.

LBDB-640 (error) The '%s' attribute %s in this %s group.

DESCRIPTION

This message indicates you need to specify or remove an attribute from the group according to the template it references as follows: 1. 1-dimentional template does not allow the 'related_pin' attribute. 2. 2-dimentional template requires the 'related_pin' attribute.

WHAT NEXT

Change the technology library source file to add or delete the specified attribute.

EXAMPLES

```
max_cap(maxcap_1d_template) {  
    values ("1, 2, 3, 4");  
    related_pin : "A";  
}
```

In this case, the 'related_pin' attribute is not allowed in 1-dimensional lookup table. To fix the problem, remove the related_pin attribute from the max_cap group.

EXAMPLE MESSAGE

Error: Line 69, The 'related_pin' attribute cannot be specified
in this max_cap group. (LBDB-640)

LBDB-641 (error) The '%s' %s has some %s groups missing the %s attribute.

DESCRIPTION

This message indicates there is one or more leakage_power(internal) groups without the power_level attribute. When at least one leakage_power(internal_power) is specified with the power_level attribute in a cell(pin), all the leakage_power(internal_power) in the cell must also have the power_level attribute defined.

It can also be used to notify a user that the related_pg_pin attribute is missing in the leakage_power/internal_power groups.

WHAT NEXT

Add the missing attribute for the leakage_power group.

EXAMPLES

```
cell(AN2) {  
    leakage_power () {  
power_level : VDD1;  
value : 1.0;  
    }  
    leakage_power () {  
/* power_level : VDD2; */  
value : 2.0;  
    }  
    ...  
}
```

In this case, the power_level attribute is missing for the 2nd leakage_power. To fix the problem, add the attribute to the leakage_power group:

```
cell(AN2) {  
    leakage_power () {  
        power_level : VDD1;  
        value : 1.0;  
    }  
    leakage_power () {  
        power_level : VDD2;  
        value : 2.0;  
    }  
    ...  
}
```

EXAMPLE MESSAGE

```
Error: Line 12, The 'AN2' cell has some leakage_power groups  
missing the power_level attribute. (LBDB-641)
```

LBDB-642 (warning) The group '%s' is defined multiple times
in group '%s'. Using the last one encountered.

DESCRIPTION

Some groups require that no more than one same group be defined in their scope.

Some groups require when statement, and only one of them can be defined without when

statement in their scope.

WHAT NEXT

Remove the extra objects.

EXAMPLES

```
pin_capacitance () {
    rise_capacitance_range() { ... }
    rise_capacitance_range() { ... }
}
```

EXAMPLE MESSAGE

Warning: Line 987, The group 'rise_capacitance_range' is defined multiple times
in group 'pin_capacitance'. Using the last one encountered. (LBDB-642)

EXAMPLES

```
cell(test) {
...
leakage_current () {
    when : A;
    pg_current(VDD) {
        value : 5.3;
    }
}
leakage_current () {
    when : A1;
    pg_current(VDD) {
        value : 15.3;
    }
}
...
leakage_current () {
    pg_current(VDD) {
        value : 0.3;
    }
}
leakage_current () {
    pg_current(VDD) {
        value : 8.3;
    }
}
...
```

Only one of leakage_current groups with no 'when' statement can be defined under a cell. If there are more than one group with no 'when' statement defined, then they are duplicated groups.

The rule is applied to intrinsic_parasitic and va_leakage_current groups as well. q

For va_leakage_current, if two of va_leakage_current groups are under the same cell_based_variation and both have same va_value and with no state condition, then they are duplicated groups.

```
cell(test) {
...
power_cell_type : macro;
intrinsic_parasitic() {
    when : "!A1 & !A2 & !ZN";
    total_capacitance(V2) {
        value : 9.0;
    }
    total_capacitance(G1) {
        value : 62.2;
    }
    total_capacitance(G2) {
        value : 31.47;
    }
}
intrinsic_parasitic() {
    when : "!A1 & A2 & !ZN";
    total_capacitance(V2) {
        value : 9.0;
    }
    total_capacitance(G1) {
        value : 62.2;
    }
    total_capacitance(G2) {
        value : 31.47;
    }
}
}

...

```

If power_cell_type is macro, then only one intrinsic_parasitic can be specified under a cell. In this case, there are two intrinsic_parasitic groups under cell "test", which is wrong. The first intrinsic_parasitic will be removed, and only the second one will be kept.

EXAMPLE MESSAGE

```
Warning: Line 138, The group 'leakage_current' is defined multiple times
       in group 'cell'. Using the last one encountered. (LBDB-642)
```

LBDB-643 (error) '%s' is used more than once inside cell '%s'.

DESCRIPTION

This error message occurs when unique **power_gating_pin** attribute value is specified more than once within a cell.

The following example shows power_pin_1 specified twice within a cell and the resulting error message:

```
cell (BUF) {  
    pin(A) {  
        power_gating_pin (power_pin_1, "0") ;  
        direction : input;  
    }  
    pin(B) {  
        power_gating_pin (power_pin_1, "0") ;  
        direction : output;  
    }  
}
```

```
Error: Line 56, 'power_pin_1' is used more than once inside cell 'BUF'.  
(LBDB-643)
```

WHAT NEXT

Make sure that each unique **power_gating_pin** value is specified only once.

LBDB-644 (warning) The **cell_leakage_power** attribute of the '%s' cell is redundant
and not used in the **leakage_power** modeling.

DESCRIPTION

This message indicates one of the following two cases are true: 1. there is power_level specific leakage_power groups in the cell 2. the cell has no power_level specific leakage_power groups, and it has default leakage_power group(leakage_power group without 'when' statement).

WHAT NEXT

Remove the 'cell_leakage_power' from the cell.

EXAMPLES

```
cell(AN2) {  
    cell_leakage_power : 0.5;  
    leakage_power () {  
power_level : VDD1;  
when : "A";  
value : 1.0;  
    }  
    ...
```

```
}
```

In this case, the cell has power_level specific leakage_power groups, thus the cell_leakage_power attribute is redundant. To fix the problem, remove the attribute from the cell group.

EXAMPLES

```
cell(AN2) {
    cell_leakage_power : 0.5;
    leakage_power () {
        when : "A";
        power(LKP_T) {
            orders ("1, 1");
            coefs  ("1, 1, 1, 1");
            domain (D1) {
                orders ("1, 1");
                coefs  ("1, 1, 1, 1");
            }
        }
    }
    ...
}
```

In this case, a cell_leakage_power attribute is redundant. To fix the problem, remove the attribute from the cell group:

Warning: Line 12, The cell_leakage_power attribute of the 'AN2' cell is redundant and not used in the leakage_power modeling. (LBDB-644)

LBDB-645 (error) Cannot find the '%s' %s in the %s.

DESCRIPTION

This error message occurs when a power_rail name attached to a **related_power_rail** or **rail_value** attribute does not exist in the power_supply.

This error message also occurs when the **default_power_rail** attribute is not defined in the power_supply group.

The following code does not contain VDD4 in the power_supply, which results in the error message.

```
library(libg5) {
    ...
    power_supply(pw) {
        default_power_rail : VDD;
        power_rail (VDD1, 2.0);
        power_rail (VDD2, 2.5);
        power_rail (VDD3, 3.0);
```

```

        power_rail (VSS1, 3.0);
        power_rail (VSS2, 3.0);

        mapping(VSS1) {
            related_power_rail : "VDD1 VDD2";
        }
        mapping(VSS2) {
            related_power_rail : "    VDD4 VDD3      ";
        }
    }

Error: Line 403, Cannot find the 'VDD4' power_rail in the power_supply.
(LBDB-645)

```

WHAT NEXT

Check your library for an incorrect power_rail name, correct the name, and run the command again.

LBDB-646 (error) No %s information is defined before the %s '%S'.

DESCRIPTION

This error message occurs when you have not defined the power_supply statement for the power_level.

This message also occurs when the power_supply group is missing for a cell rail_connections because some pins of the cell do not define the **input_signal_level** (for an input pin) or the **output_signal_level** (for an output pin).

The following example shows a library with a missing power_supply statement before the cell containing the power_level attribute and the resulting error message.

```

library(lib) {
    ...
    cell (A)
    ...
    leakage_power() {
        power_level : "VDD";
        ...
    }
    ...
}

Error: Line 191, No power_supply information is defined before the
power_level 'VDD'. (LBDB-646)

```

WHAT NEXT

Add the power_supply statement before the cell statement that contains the power_level, as shown in the following example:

```
power_supply() {
    default_power_rail : VDD;
    power_rail (VDD, 2.0);
    ...
}
```

LBDB-647 (warning) Found the obsolete and unsupported '%s' %s in the '%s' cell; use '%s' instead.

DESCRIPTION

The **rail_connection** attribute is not supported after 2004.12 Beta version. Instead, the information should now be described in the power_pin group.

The following is an example of the error message:

```
Warning: Line 159, Found the obsolete and unsupported 'rail_connection'
attribute in the 'sample' cell; use 'power_pin' group instead. (LBDB-647)
```

WHAT NEXT

If you have access to the technology library source file, change the **rail_connection** attribute to power_pin group. Otherwise, contact the vendor and inform them of the problem.

LBDB-648 (error) The power_pin definitions of cell '%s' do not follow the mapping rules specified in the power_supply group.

DESCRIPTION

This error message occurs when the definitions of the power_pins do not follow the mapping rules in the power_supply group. The following is an example of this error message:

```
Warning: Line 159, The power_pin definitions of cell '%s' do not follow
the mapping rules in the power_supply group. (LBDB-648)
```

WHAT NEXT

Either change the mapping rules in the power_supply group or redefine the power_pins and run the command again.

LBDB-649 (error) The '%s' domain's power rail mapping information conflicts with its main template.

DESCRIPTION

This error message occurs when the power rail mapping information is incorrectly defined in the domain of the poly_template. The information in poly_template domain must be exactly the same as the poly_template.

The following example shows the *d1* domain of the *p1* poly_template with the incorrect mapping statement and the resulting error message:

```
poly_template(p1) {
    ...
    mapping(voltage1, VDD1);
    mapping(voltage, VDD0);
    ...
    domain(d1) {
        ...
        mapping(voltage1, VDD2);
        mapping(voltage, VDD0);
        ...
    }
}
```

Error: Line 191, The 'd1' domain's power rail mapping information conflicts with its main template. (LBDB-649)

WHAT NEXT

Modify the mapping statements in this domain of the poly_template to match those of the poly_template.

The following example shows the correct *d1* domain mapping statements:

```
mapping(voltage1, VDD1);
mapping(voltage, VDD0);
```

LBDB-650 (error) The '%s' cell is not a valid %s.

DESCRIPTION

This error message occurs when the level shifter or isolation cell is incorrectly modeled. A level shifter or an isolation cell must satisfy one of the following sets of conditions:

- It has 3 pins, including 1 input pin, 1 level_shifter_enable_pin/isolation_cell_enable_pin, 1 output pin.
- It has 2 pins, including 1 input pin and 1 output pin.

The following example shows the level shifter with the incorrect modeling and the resulting error message:

```
cell(LS) {  
is_level_shifter : true;  
...  
pin(a) {  
    ...  
}  
pin(b) {  
    ...  
}  
pin(c) {  
    ...  
}  
pin(d) {  
    ...  
}  
}  
Error: Line 191, The 'LS' cell is not a valid level shifter. (LBDB-650)
```

WHAT NEXT

Correct the modeling information of the level shifter or isolation cell to satisfy the requirements.

You could correct the modeling in the previous example by removing one of the pins specified in the cell.

LBDB-651 (error) The %s%s '%s' contains the

conflicting '%s'/'%s' values.

DESCRIPTION

This error message occurs when the **input_signal_level** and **output_signal_level** values are modeled incorrectly for the level shifter or isolation cell.

For a level shifter, **input_signal_level** in input pin can't be the same as **output_signal_level** in output pin. Meaning that the rail names can't be the same in a level shifter.

For an isolation cell, the value of **input_signal_level** in input pin can't be different from the value of **output_signal_level** in output pin. Meaning that the rail values can't be difference in an isolation cell.

EXAMPLES

The following example shows the level shifter with the incorrect modeling and the resulting error message:

```
cell(LS) {  
    is_level_shifter : true;  
    ...  
    pin(in) {  
        ...  
        input_signal_level : VDD2  
    }  
    pin(out) {  
        ...  
        output_signal_level : VDD2  
    }  
}
```

Error: Line 191, The pins of level shifter 'LS' contain the conflicting 'input_signal_level'/'output_signal_level' values. (LBDB-651)

WHAT NEXT

Modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the example above, make the **input_signal_level** string "VDD1" of the input pin different from the **output_signal_level** string "VDD2" of the output pin as follows:

```
cell(LS) {  
    is_level_shifter : true;  
    ...  
    pin(in) {  
        ...  
        input_signal_level : VDD1
```

```

    }
    pin(out) {
        ...
        output_signal_level : VDD2
    }
}

```

EXAMPLES

The following example shows the isolation cell with the incorrect modeling and the resulting error message:

```

library(libdb651) {

    ...
    /* operation conditions */
    operating_conditions(5v_1v) {
        ...
        power_rail (VDDH, 5);      /* high power */
        power_rail (VDDL, 1);      /* low power */
        ...
    }
    ...
    default_operating_conditions : 5v_1v;

    ...
    cell(ISO) {
        is_isolation_cell : true;
        ...
        pin(in) {
            ...
            input_signal_level : VDDH
        }
        pin(out) {
            ...
            output_signal_level : VDDL
        }
    }
}

```

Error: Line 191, The pins of isolation cell 'ISO' contain the conflicting 'input_signal_level'/'output_signal_level' values. (LBDB-651)

WHAT NEXT

Modify the modeling information of the isolation cell to meet the requirements.

To correct the modeling of the example above, make the **input_signal_level** value "5" of the input pin same as the **output_signal_level** value "1" of the output pin. You can assiged both to the same pin like "VDDH", so that both will refer to same value "5" in **operating_conditions** as follows.

```

library(lbdb651) {
    ...
    /* operation conditions */
    operating_conditions(5v_1v) {
        ...
        power_rail (VDDH, 5);      /* high power */
        power_rail (VDDL, 1);      /* low power */
        ...
    }
    ...
    default_operating_conditions : 5v_1v;

    ...
cell(ISO) {
    is_isolation_cell : true;
    ...
    pin(in) {
        ...
        input_signal_level : VDDH
    }
    pin(out) {
        ...
        output_signal_level : VDDH
    }
}

```

SEE ALSO

LBDB-747

LBDB-652 (error) The %s '%s' has incompatible '%s' and '%s'.

DESCRIPTION

This error message occurs when the user specified attributes are incompatible. For example, specifying both **pulse_clock** and **generated_clock** inside a cell.

```
Error: Line 159, The cell 'A' has incompatible 'pulse_clock'
and 'generated_clock'. (LBDB-652)
```

WHAT NEXT

Either remove the **pulse_clock** attribute or the **generated_clock** group for the cell.

LBDB-653 (error) The index of '%s' can define only one value.

DESCRIPTION

This error message occurs because the specified index cannot contain more than one value. This restriction applies to the dimension input_net_transition, and total_output_net_capacitance in the vector group.

The following example shows an index with more than one value and the resulting error message.

```
output_current_template(CCS_T) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
}
vector(CCS_T) {
    reference_time : 0.5;
    index_1 ("0.12");
    index_2 ("0.1, 1.2");
    index_3 ("0.01, 0.02, 0.03");
    values (" ... ");
}
```

Error: Line 46, The index of 'total_output_net_capacitance' can only define one value. (LBDB-653)

To correct the error, change index_2 to ("0.1");

WHAT NEXT

Check the library source file and remove the extra values in the index definition.

LBDB-654 (error) The values of '%s' and '%s' are not consistent in %s %s'.

DESCRIPTION

This error message occurs when the values of the **reference_time** and **input_net_transition** attributes are inconsistent inside the output_current_rise or output_current_fall group. Inside each output_current_rise or output_current_fall group, only the same pair of **reference_time** and **inout_net_transition** values is allowed.

Note: In 2007.03 release, the message is enhanced to also report inconsistent input_voltage_range and output_voltage_range values in a level shifter. Assuming that a level shifter defines the following information: level_shifter_type :

```
<lst_val>; input_voltage_range(<<ivrl_val>, <ivrh_val>);  
output_voltage_range(<ovrl_val>, <ovrh_val>); then it must satisfy the following  
requirements: - if <lst_val> = HL, then <ivrh_val> > <ovrl_val>. - if <lst_val> =  
LH, then <ivrl_val> < <ovrh_val>. Otherwise, LC will issue LBDB-654 error.
```

The following is an example of inconsistent **reference_time** and **input_net_transition** values and the resulting error message:

```
output_current_template(CCT) {  
    variable_1 : input_net_transition;  
    variable_2 : total_output_net_capacitance;  
    variable_3 : time;  
}  
. . .  
output_current_rise() {  
    vector(CCT) {  
        reference_time : 0.11; <== reference_time = 0.11 with input_net_transition  
= 0.1  
        index_1 ("0.1");  
        index_2 ("1");  
        index_3 ("1, 2, 3");  
        values ("1, 2, 3");  
    }  
    vector(CCT) {  
        reference_time : 0.12; <== reference_time = 0.12 with input_net_transition  
= 0.1  
        index_1 ("0.1");  
        index_2 ("2");  
        index_3 ("1, 2, 3");  
        values ("1, 2, 3");  
    }  
}
```

Error: Line 98, The values of 'reference_time' are not consistent in
group 'output_current_rise'. (LBDB-654)

WHAT NEXT

Check the library source file, and correct the values of the **reference_time** attribute.

LBDB-655 (error) The vectors are not dense in group '%s'.

DESCRIPTION

This error message occurs because Library Compiler requires a vector for each **input_net_transition** and **total_output_net_capacitance** pair inside each **output_current_rise** or **output_current_fall** group.

The following example shows an **output_current_rise** group without a dense vector and

resulting error message.

```
output_current_template(CCT) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
}
. . .
output_current_rise() {
    vector(CCT) {
        reference_time : 0.11;
        index_1 ("0.1");
        index_2 ("1");
        index_3 ("1, 2, 3");
        values ("1, 2, 3");
    }
    vector(CCT) {
        reference_time : 0.11;
        index_1 ("0.2");
        index_2 ("2");
        index_3 ("1, 2, 3");
        values ("1, 2, 3");
    }
    /* need vectors for (0.1, 2) and (0.2, 1) */
}
```

Error: Line 198, The vectors are not dense in group 'output_current_rise'.
(LBDB-655)

WHAT NEXT

Check the library source file and add a vector for each `input_net_transition` and `total_output_net_capacitance` pair.

LBDB-656 (error) The lu_table_template '%s' referred by '%s' in line %d is invalid.

DESCRIPTION

This error message occurs because the variable of the referred lu_table_template can only include the `input_net_transition` variable for the pin based receiver model. For the timing arc based receiver model, the variable of the referred lu_table_template can include `input_net_transiton` and `total_output_net_capacitance`.

The following example shows an invalid lu_table_template reference and the resulting error message:

```
lu_table_template(T1) {
```

```

variable_1 : input_net_transition;
variable_2 : total_output_net_capacitance;
. . .
}
. . .
pin(A) {

receiver_capacitance() {
    receiver_capacitance1_rise(T1) {
        index_1 ("0.1, 0.1");
        index_2 ("1, 2");
        values ("1, 2", "2.5, 3");
    }
. . .
}

```

Error: Line 298, The lu_table_template 'T1' referred by
 'receiver_capacitance1_rise' in line 1239 is invalid. (LBDB-656)

WHAT NEXT

Check the library source file, and correct the variable(s) of the corresponding lu_table_template.

LBDB-657 (error) Conflicting receiver model found in pin '%s' (pin-based) and in timing arc '%s-%s' (arc-based).

DESCRIPTION

This error message occurs because when an input (or inout) pin A defines a receiver_capacitance() group, then no timing arc whose from pin is A, can define receiver_capacitance1_rise/receiver_capacitance1_fall/ receiver_capacitance2_rise/ receiver_capacitance2_fall.

The following is an example of an incorrect definition and the resulting error message:

```

pin(A) {
    direction : input;
    receiver_capacitance() { . . . }
    . . .
}
pin(Y) {
    direction : output;
    timing() {
        receiver_capacitance1_rise(T1) { . . . }
        receiver_capacitance1_fall(T1) { . . . }
        receiver_capacitance2_rise(T1) { . . . }
        receiver_capacitance2_fall(T1) { . . . }
    }
}

```

```
    . . .
}
```

Error: Line 398, Conflicting receiver model found in pin 'A' (pin-based) and in timing arc 'A-Y' (arc-based). (LBDB-657)

WHAT NEXT

Check the library source file and remove the duplicated receiver model. Usually it is best practice to use the timing arc based receiver model.

LBDB-658 (error) Both variable and range of poly_template '%s' should be defined before domain '%s' is defined.

DESCRIPTION

You receive this message a domain can't be defined because either the variable or range statement of the main poly_template is missing.

WHAT NEXT

Make sure that **variables** and all **variable_n_range** statements exist before defining domains.

EXAMPLES

The following example shows the *p1* poly_template is missing both variable and range information.

```
poly_template(p1) {
    poly_template(PT)  {
        domain(D1)  {
            variables("temperature, total_output_net_capacitance");
            variable_1_range(0, 40);
            variable_2_range(1, 2);
        }
        .....
    }
}
```

Correct it by add **variablesfp**, **variable_1_range** and **variable_2_range** statement in the poly_template group.

EXAMPLE MESSAGE

Error: Line 191, Both variable and range of poly_template 'PT' should be defined

before domain 'D1' is defined. (LBDB-658)

LBDB-659 (error) The %s %s cannot coexist with the '%s' %s on the '%s' pin.

DESCRIPTION

The first specified attribute/group in the pin cannot coexist with the second specified attribute/group on the same pin. For example, the **is_three_state** attribute cannot be specified on a pin with **three_state** attribute.

WHAT NEXT

Check the specification of the cell, and make the appropriate change to the **driver_type** attribute or other attributes in the faulty pin group.

EXAMPLES

```
cell(lbdb239) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1.0;
    }
    ...

    pin(Z) {
        direction : output;
        function : "A";
        three_state : "B"

        is_three_state : false; /* error */
        ...
    }
}
```

EXAMPLE MESSAGE

Error: Line 84, The "false" 'is_three_state' attribute cannot coexist with the 'three_state' attribute on the 'Z' pin. (LBDB-659)

LBDB-660 (error) It is invalid to specify the '%s' %s

on the '%s' %s%s.

DESCRIPTION

This message indicates that you specified an invalid attribute/group on a cell.

WHAT NEXT

Check the library source file, and correct the problem. For example, in order to specify the "clocked_cell" attribute, the cell needs to satisfy the following 2 conditions: - has only 1 clock pin whose "clock" attribute is set to "true". - has at least 1 timing arc between the clock pin and an output pin.

EXAMPLES

```
cell (p) {
    clocked_cell : rising_edge;
    pin(clk) {
        clock : true;
    }

    pin(out) {
        function : "clk";
    }
}
```

To solve this issue, we need to add "combinational" timing arcs between "clk" pin and "out" pin.

EXAMPLE MESSAGE

```
Error: Line 67, It is invalid to specify the 'clocked_cell' attribute
on the 'p' cell. (LBDB-660)
```

LBDB-661 (error) The 'generic' integrated clock gating cell should not define the 'statetable' group.

It should use 'ff' group or 'latch' group instead.

DESCRIPTION

This message indicates that you specified the 'generic' integrated gating clock cell with 'statetable' definition, You should define 'ff/latch' group instead.

WHAT NEXT

Change the library source file, and replace the statetable group with the ff/latch group of the specified cell.

EXAMPLES

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "generic";

    statetable(" CP EN ", "IQ ") {
        table : " L  L  : - : L ,
                  L  H  : - : H ,
                  H  -  : - : N ";
    }
    ...
}
```

The modified cell description should be :

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "generic";

    latch("IQ","IQN") {
        enable : "CP'";
        data_in : "EN";
    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 206, The 'generic' integrated clock gating cell should not define the 'statetable' group.
It should use 'ff' group or 'latch' group instead. (LBDB-661)

LBDB-662 (warning) The %s is not defined.
operating_conditions "nom_pvt" is created
and set as the default_operating_conditions.

DESCRIPTION

This warning message occurs when the **default_operating_conditions** is undefined and there is either no operating_conditions groups defined or multiple operating_conditions defined.

WHAT NEXT

If you do not want Library Compiler to create the default operating_conditions for you, please check your library to define the relative operating_condition group and set it as the default_operating_conditions with the library-level attribute "default_operating_conditions".

LBDB-663 (warning) The %s is not defined.
operating_conditions '%s' is set
as the default_operating_conditions.

DESCRIPTION

This warning message occurs when the **default_operating_conditions** is undefined and there is exactly 1 operating_conditions group defined in the library.

WHAT NEXT

If you do not want Library Compiler to automatically set the default operating_conditions for you, please check your library to define the relative operating_condition group and set it as the default_operating_conditions with the library-level attribute "default_operating_conditions".

LBDB-664 (error) The '%s' attribute of the '%s' has a value '%g', which should be %s for the %s.

DESCRIPTION

The value specified is less than/larger than/equal to a threshold value 0.0 for the attribute.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```
output_current_rise(current_template_8x7) {
    vector<current_template_8x7> {
        reference_time : 0.0140609;
        index_1("0");
        index_2("0.019368");
        index_3("0.1462, 0.175, 0.19, 0.205, 0.235, 0.25, 0.265, 0.275, 0.29, 0.
```

```

305, 0.32, 0.35, 0.406591");
    values("-
0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1, 1.2, 1.3");
}
}

```

EXAMPLE MESSAGE

Error: Line 35, The 'values' attribute of the 'vector' has a value '-0.100000', which should be positive for the output_current_rise vector. (LBDB-664)

LBDB-665 (error) The %s value of the '%s' attribute of the '%s' is the peak value.

DESCRIPTION

The first value specified in the specified attribute is a peak value, i.e., the maximum value for the values attribute of the vector of an output_current_rise group, or the minimum value for the values attribute of the vector of an output_current_fall group.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```

output_current_rise(current_template_8x7) {
    vector(current_template_8x7) {
        reference_time : 0.0140609;
        index_1("0");
        index_2("0.019368");
        index_3("0.1462, 0.175, 0.19, 0.205, 0.235, 0.25, 0.265, 0.275, 0.29, 0.
305, 0.32, 0.35, 0.406591");
        values("1.8, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1, 1.2, 1.3"
);
    }
}

```

EXAMPLE MESSAGE

Error: Line 35, The first value of the 'values' attribute of the 'vector' is the peak value. (LBDB-665)

LBDB-666 (warning) The '%s' has the same %s %g as the '%s'

at line %d,
but the %s does not increase(from %g to %g)
with increasing %s (from %g to %g).

DESCRIPTION

For a timing arc, within each output_current_rise/fall group. for a given total_output_net_capacitance(load), teh reference_times should increase with the increasing input_transition_time(slew). This check is only useful for the signoff timing analysis with the 2004.12 and the relative sevice pack releases of PrimeTime.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```
output_current_rise(current_template) {
...
    vector(current_template) {
        reference_time : 0.0140609;
        index_1("0.1"); /* load */
        index_2("0.019368"); /* slew */
        index_3("0.1462, 0.175, 0.19, 0.205, 0.235, 0.25, 0.265, 0.275, 0
.29, 0.305, 0.32, 0.35, 0.406591");
        /* LBDB-664 */
        values("0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1, 1.
2, 1.3");
    }
    vector(current_template) {
        reference_time : 0.0319875;
        index_1("0.1"); /* load */
        index_2("0.049573"); /* slew */
        index_3("0.160795, 0.185, 0.2, 0.23, 0.24, 0.255, 0.27, 0.285, 0.
295, 0.31, 0.325, 0.34, 0.355, 0.37, 0.4
175");
        values("0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.1, 1.
2, 1.3");
    }
...
}
```

EXAMPLE MESSAGE

Warning : Line 357, The 'vector' has the same total_output_net_capacitance 0.000000
as the 'vector' at line 364,
but the reference_time does not increase(from 0.031987 to 0.026168)
with increasing input_net_transition (from 0.049573 to 0.094881). (LBDB-666)

LBDB-667 (error) The '%s' of the '%s' is %g, which should be positive.

DESCRIPTION

The reference_times in the vectors of output_current_rise/fall groups should NOT be zero or negative.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```
output_current_rise(current_template) {
...
    vector(current_template) {
        /* reference_time : 0.0961844; */
        reference_time : 0.0; /* LBDB-667 */
        index_1("0");
        index_2("0.170393");
        index_3("0.254379, 0.295, 0.31, 0.325, 0.34, 0.355, 0.385, 0.4, 0.415, 0
.43, 0.445, 0.475, 0.543056");
        values("0.1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0");
    }
...
}
```

EXAMPLE MESSAGE

Error : Line 373, The 'reference_time' of the 'vector' is 0.000000, which should be positive. (LBDB-667)

LBDB-668 (warning) The final signal voltage of the %s is %g, which does not reach within the 5 percent of the rail voltage %g.

DESCRIPTION

For each output_current_rise/fall vector, the final signal voltage must be within the 5% of the final rail voltage. This can be described with the following formulas:

If output_signal_level_low and output_signal_level_high are specified, volt_low = output_signal_level_low; volt_high = output_signal_level_high; Else volt_low = VSS; volt_high = VDD;

1. For the output_current_rise vector, $V_{final} = volt_low + (0.5/Cout)*(I2+I1)*(T2-T1) + \dots + (0.5/Cout)*(In+In-1)*(Tn-Tn-1)$ and $\text{fabs}(V_{final} - volt_high)$ must NOT be greater than 0.02 ($volt_high - volt_low$)
2. For the output_current_fall vector, $V_{final} = volt_high + (0.5/Cout)*(I2+I1)*(T2-T1) + \dots + (0.5/Cout)*(In+In-1)*(Tn-Tn-1)$ and $\text{fabs}(V_{final} - volt_low)$ must NOT be greater than 0.02 ($volt_high - volt_low$)

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLE MESSAGE

Error : Line 373, The final signal voltage of the vector is 1.200000, which does not reach within the 5 percent of the rail voltage 1.000000. (LBDB-668)

LBDB-669 (error) The final signal voltage of the %s is %g and it does not reach beyond the 2nd slew threshold voltage, which is %g for the %s.

DESCRIPTION

For each output_current_rise/fall vector, the final signal voltage must reach the 2nd slew threshold(i.e., the maximum of the slew thresholds for the output_current_rise vectors, and the minimum of the slew thresholds for the output_current_fall vectors) This can be described with the following formulas:

If output_signal_level_low and output_signal_level_high are specified, $volt_low = output_signal_level_low$; $volt_high = output_signal_level_high$; Else $volt_low = VSS$; $volt_high = VDD$;

1. For the output_current_rise vector, $V_{final} = volt_low + (0.5/Cout)*(I2+I1)*(T2-T1) + \dots + (0.5/Cout)*(In+In-1)*(Tn-Tn-1)$ $V_{err} = volt_low + \text{MAX}(\text{slew_lower_threshold_pct_rise}, \text{slew_upper_threshold_pct_rise}, \text{output_threshold_pct_rise}) * (volt_high-volt_low) * 0.01$

V_{final} must NOT be less than V_{err} . 2. For the output_current_fall vector, $V_{final} = volt_high + (0.5/Cout)*(I2+I1)*(T2-T1) + \dots + (0.5/Cout)*(In+In-1)*(Tn-Tn-1)$ $V_{err} = volt_low + \text{MAX}(\text{slew_lower_threshold_pct_fall}, \text{slew_upper_threshold_pct_fall}, \text{output_threshold_pct_fall}) * (volt_high-volt_low) * 0.01$

V_{final} must NOT be greater than V_{err} .

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLE MESSAGE

Error : Line 373, The final signal voltage of the vector is 0.800000 and it does not reach beyond the 2nd slew threshold voltage, which is 1.000000 for the output_current_fall vector. (LBDB-669)

LBDB-670 (information) The '%s' has '%s' %s, which has less than %d significant digits.

DESCRIPTION

The values in the current/receiver_capacitance tables should have at least 4 significant digits. The value of intrinsic_resistance and intrinsic_capacitance should have at least 2 significant digits if there is no off channel resistance (i.e. greater than 1Mohm) in the library.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```
output_current_rise(current_template) {  
...  
    vector(current_template) {  
        reference_time : 0.0961844;  
        index_1("0");  
        index_2("0.170393");  
        index_3("0.254379, 0.295, 0.31, 0.325, 0.34, 0.355, 0.385, 0.4, 0.415, 0  
.43, 0.445, 0.475, 0.543056");  
        values("0.1234, 0.2345, 0.3456, 0.4567, 0.5678, 0.6789, 0.7890, 0.7891,  
0.0001, 0.7892, 0.7893, 0.7894, 0.7895");  
    }  
...  
}
```

EXAMPLE MESSAGE

Information : Line 373, The 'vector' has 'values' 0.4, which has less than 4 significant digits. (LBDB-670)

LBDB-671 (warning) The '%s' has %s adjacent '%s' (%.8g,

`%.8g).`

DESCRIPTION

The adjacent 'values' in the vectors fo the output_current_rise/fall tables are identical.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```
output_current_rise(current_template) {  
...  
    vector<current_template> {  
        reference_time : 0.0961844;  
        index_1("0");  
        index_2("0.170393");  
        index_3("0.254379, 0.295, 0.31, 0.325, 0.34, 0.355, 0.385, 0.4, 0.415, 0  
.43, 0.445, 0.475, 0.543056");  
        values("0.1234, 0.2345, 0.2345, 0.4567, 0.5678, 0.6789, 0.7890, 0.7891,  
0.0001, 0.7892, 0.7893, 0.7894, 0.7895");  
    }  
...  
}
```

EXAMPLE MESSAGE

Error : Line 373, The 'vector' has identical adjacent 'values' (0.2345, 0.2345). (L
BDB-671)

LBDB-672 (information) There are more than 1 operating_conditions defined in the library.

DESCRIPTION

The message is to notify users that there are more than 1 operating_conditions defined in the library. For each library, only 1 operating_conditions group is necessary since it defined the pvt used for characterizing the library, and this operating_condition is also the "default_operating_conditions" of the library.

LBDB-673 (warning) The timing arc does not have full receiver

modeling information.

DESCRIPTION

This message indicates that the timing arc does not have all the following receiver modeling information: receiver_capacitance1_rise, receiver_capacitance1_fall, receiver_capacitance2_rise, receiver_capacitance2_fall

Although it is usually valid to specify only half of the receiver modeling information for the half-nate timing arcs. However, in some corner cases, we may need the full receiver modeling information.

In the following example, the receiver_capacitance1_fall group and the receiver_capacitance2_fall group are not specified for the half-unate timing arc.

```
timing() {
    timing_type : rising_edge;
    timing_sense : positive_unate;
    ...
    receiver_capacitance1_rise(basic_template_8x7) {
        index_1 ("0, 0.00081298, 0.0188997, 0.0460298, 0.0912466, 0.18168,
0.452981, 0.905149");
        index_2 ("0.019368, 0.049573, 0.0948806, 0.170393, 0.321418, 0.7744
94, 1.52962");
        values ("0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211
, 0.00166425, 0.00167038",
                 "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0
0166425, 0.00167038",
                 "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0
0166425, 0.00167038",
                 "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0
0166425, 0.00167038",
                 "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0
0166425, 0.00167038",
                 "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0
0166425, 0.00167038",
                 "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0

0166425, 0.00167038",
        "0.00165664, 0.00165664, 0.00165936, 0.00166126, 0.00166211, 0.0
0166425, 0.00167038");
    }
    ...
}

```

Warning: Line 673, The timing arc does not have full receiver modeling information
. (LBDB-390)

WHAT NEXT

If possible, add the missing receiver modeling information in the library.

**LBDB-674 (information) The 1st %s/%s index of timing arc
' %s' are %g, %g which are larger than recommended %g, %g.**

DESCRIPTION

This information occurs when the 1st index values of the timing arc are larger than the recommended values.

WHAT NEXT

Make sure the 1st index values are not larger than the recommended.

EXAMPLES

```

cell_rise(template) {
    index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance */
    index_2("0.362,0.725,1.087,1.449,1.812"); /* input_transition_time */
    ...
}

```

EXAMPLE MESSAGE

Information: Line 20068, The 1st total_output_net_capacitance/
input_transition_time index of timing arc
'cell_rise' are 1.0, 0.362 which are larger than recommended 0, 0. (LBDB-

LBDB-675 (information) The 1st %s index of timing arc '%s' is %g, which is larger than recommended %g.

DESCRIPTION

This information occurs when the 1st index value of the timing arc is larger than the recommended value.

WHAT NEXT

Make sure the 1st index value is not larger than the recommended.

EXAMPLES

```
cell_rise(template) {
    index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance */
    ...
}
```

EXAMPLE MESSAGE

Information: Line 20068, The 1st total_output_net_capacitance index of timing arc 'cell_rise' is 1.0, which is larger than recommended 0. (LBDB-675)

LBDB-676 (information) The significant digits of values in timing arc '%s' is %d, which is less than recommended %d.

DESCRIPTION

This information occurs when the significant digits of values in the specified table is less than the recommended number.

WHAT NEXT

Make sure the significant digits is not less than the recommended.

EXAMPLES

```
cell_rise(template) {
```

```
...
values("0.459,0.651,0.843,1.034,1.225",
      ...);
}
```

EXAMPLE MESSAGE

Information: Line 454, The significant digits of values in timing arc 'cell_rise' is 4,
which is less than recommended 5. (LBDB-676)

LBDB-677 (warning) The table size of timing arc '%s' is %dx%d, which is less than recommended %dx%d.

DESCRIPTION

This information occurs when the table size is less than the recommended number.

WHAT NEXT

Make sure the table size is not less than the recommended.

EXAMPLES

```
cell_rise(template) {
    index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance */
    index_2("0.362,0.725,1.087,1.449,1.812"); /* input_transition_time */
    ...
}
```

EXAMPLE MESSAGE

Warning: Line 446, The table size of timing arc 'cell_rise' is 5x5,
which is less than recommended 7x7. (LBDB-677)

LBDB-678 (warning) The table size of timing arc '%s' is %d, which is less than recommended %d.

DESCRIPTION

This information occurs when the table size is less than the recommended number.

WHAT NEXT

Make sure the table size is not less than the recommended.

EXAMPLES

```
cell_rise(template) {
    index_1("1.0 ,2.0,4.0,6.0,10.0"); /* total_output_net_capacitance */
    ...
}
```

EXAMPLE MESSAGE

Warning: Line 446, The table size of timing arc 'cell_rise' is 5,
which is less than recommended 7. (LBDB-678)

LBDB-679 (error) Can not find the %s of the %s pin '%s'.

DESCRIPTION

This information occurs when pin's max_capacitance/min_capacitance or the related_pin's max_transition information can not be found.

WHAT NEXT

Make sure the max_transition/max_capacitance/min_capacitance information are defined in the source .lib file.

EXAMPLES

```
cell ( INV ) {
    area : 1 ;
    pin ( A ) {
        direction : input ;
        capacitance : 1 ;
        fanout_load : 1 ;
        ...
    }
    pin ( Z ) {
        related_pin : A ;
        direction : output ;
        capacitance : 1 ;
        fanout_load : 1 ;
        ...
    }
}
```

EXAMPLE MESSAGE

```
Error: Line 446, Can not find the max_transition of the input pin 'A'. (LBDB-679)
Error: Line 446, Can not find the min_capacitance of the pin 'Z'. (LBDB-679)
Error: Line 446, Can not find the max_capacitance of the pin 'Z'. (LBDB-679)
```

**LBDB-680 (warning) The max value of %s index of timing arc '%s' is %g,
which is less than max %s of pin '%s', %g.**

DESCRIPTION

This information occurs when the max value of the specified index is less than the max constraint for the pin.

WHAT NEXT

Make sure the max index value is not less than the constraint.

EXAMPLES

```
pin(y) {
    direction : input;
    min_capacitance : 0.361;
    max_capacitance : 1.813;
    max_transition : 0.5;
    cell_rise(template) {
        index_2("0.362,0.725,1.087,1.449,1.812"); /* total_out_net_cap */
        ...
    }
    ...
}
```

EXAMPLE MESSAGE

```
Warning: Line 762, The max value of total_out_net_cap index of timing arc 'cell_rise' is 1.812,
        which is less than max total_out_net_cap of pin 'y', 1.813. (LBDB-680)
```

LBDB-681 (warning) The min value of %s index of timing arc '%s' is %g,

which is bigger than min %s of pin '%s', %g.

DESCRIPTION

This information occurs when the min value of the specified index is larger than the min constraint for the pin.

WHAT NEXT

Make sure the min index value is not larger than the constraint.

EXAMPLES

```
pin(y) {
    direction : input;
    min_capacitance : 0.361;
    max_capacitance : 1.813;
    max_transition : 0.5;
    cell_rise(template) {
        index_2("0.362,0.725,1.087,1.449,1.812"); /* total_out_net_cap */
        ...
    }
    ...
}
```

EXAMPLE MESSAGE

```
Warning: Line 762, The min value of total_out_net_cap index of timing arc 'cell_rise' is 0.362,
          which is larger than min total_out_net_cap of pin 'y', 0.361. (LBDB-681)
```

LBDB-682 (warning) The values in timing arc '%s' are non monotonous %g, %g,
when %s = %g.

DESCRIPTION

This information occurs when the delay values in specified table do not increase monotonously with increasing capacitance.

WHAT NEXT

Make sure the delay values increase monotonously with increasing capacitance.

EXAMPLES

```
cell_rise(template) {
    index_1("1.0 ,2.0,4.0,6.0,10.0"); /* input_transition_time */
    index_2("0.362,0.725,1.087,1.449,1.812"); /* total_output_net_capacitance */
    values ("1.405, 1.116...")
}
```

EXAMPLE MESSAGE

Warning: Line 762, The values in timing arc 'cell_rise' are non monotonous 1.405, 1
.116,
when input_net_transition = 1. (LBDB-682)

LBDB-683 (warning) The table is a load independent table.

DESCRIPTION

This information occurs when the template of one table do not have the total_output_net_capacitance index where it is needed.

WHAT NEXT

Make sure the table use the correct template which is with total_output_net_capacitance index.

EXAMPLES

```
lu_table_template(transition1x5){
    variable_1 : input_net_transition;
    index_1("0.5,1.0,1.5,2.0,2.5");
}
...
cell (AND) {
    pin(y) {
        ...
        cell_rise(transition1x5) {
            index_1("0.362,0.725,1.087,1.449,1.812"); /* input_net_transition */
            ...
        }
        ...
    }
    ...
}
```

EXAMPLE MESSAGE

Warning: Line 762, The table is a load independent table. (LBDB-683)

LBDB-684 (warning) The table is a scalar table.

DESCRIPTION

This information occurs when the template of one table do not have any index where it is needed.

WHAT NEXT

Make sure the table use the correct template which is with index.

EXAMPLES

```
lu_table_template(scalar_template) {  
}  
...  
cell (AND) {  
    pin(y) {  
        ...  
        cell_rise(scalar_template) {  
            values ("...");  
        }  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 762, The table is a scalar table. (LBDB-684)

LBDB-685 (warning) The voltage range of %s is %g->%g, which is less than recommended %g->%g.

DESCRIPTION

This information occurs when the range of voltage index for IV curves is less than the recommended.

WHAT NEXT

Make sure the voltage range is not less than the recommended.

EXAMPLES

...

```

iv_lut_template ("LUT_TEMPLATE_13570_t") {
variable_1 : "iv_output_voltage";
index_1("-1.500000, -0.611850, -
0.019800, 0.009900, 0.246750, 0.868350, 1.016400, 1.578900, 2.526300, 3.000000");
}
...
timing () {
    steady_state_current_low ("LUT_TEMPLATE_13570_t") {
        values("-1.500000, -0.611850, -
0.019800, 0.009900, 0.246750, 0.868350, 1.016400, 1.578900, 2.526300, 3.000000");
    }
}

```

EXAMPLE MESSAGE

Warning: Line 780, The voltage range of steady_state_current_low is -1.5->3,
which is less than recommended -5->10. (LBDB-685)

**LBDB-686 (warning) There is potential extrapolation problem
%S[%g, %g, %g]=%g (> %g).**

DESCRIPTION

This information occurs when the noise value extrapolated with the boundary values is larger than the recommended zero value.

WHAT NEXT

Make sure the boundary values in the table correct.

EXAMPLES

```

propagated_noise_width_below_low(my_noise_propagation) {
    index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500, 0.03750, 0.05000"); /
*total_output_net_capacitance*
    index_2("0.400,1.000,1.500,2.000"); /*input_noise_width*/
    index_3("0.36000,0.54000,0.72000,0.90000");
    values("0.025, 0.024, 0.010, 0.013",
           "1.071, 0.342, 0.121, 0.222",
           "0.489, 0.565, 0.789, 0.750",
           "0.282, 0.021, 0.279, 0.118",
           "0.034, 0.042, 0.009, 0.015",
           "1.068, 0.346, 0.121,...");
}

```

EXAMPLE MESSAGE

```
Warning: Line 215, There is potential extrapolation problem
Width[0.05, 1, 0]=0.376 (> 0.1). (LBDB-686)
```

**LBDB-687 (warning) There is potential extrapolation problem
%S[%g, %g]=%g (> %g).**

DESCRIPTION

This information occurs when the noise value extrapolated with the boundary values is larger than the recommended zero value.

WHAT NEXT

Make sure the boundary values in the table correct.

EXAMPLES

```
propagated_noise_width_below_low(my_noise_propagation) {
    index_1("0.400,1.000,1.500,2.000"); /*input_noise_width*/
    index_2("0.36000,0.54000,0.72000,0.90000");
    values("0.025, 0.024, 0.010, 0.013",
           "1.071, 0.342, 0.121, 0.222",
           "0.489, 0.565, 0.789, 0.750",
           "0.282, 0.021, 0.279, 0.118");
}
```

EXAMPLE MESSAGE

```
Warning: Line 215, There is potential extrapolation problem
Width[1, 0]=2.529 (> 0.1). (LBDB-687)
```

**LBDB-688 (warning) The curve is curling upwards at the end.
when total_output_net_capacitance=%g.**

DESCRIPTION

This information occurs when the immunity curve curls upwards at the end of the curve.

WHAT NEXT

Make sure each last 2 values with the same total_output_net_capacitance index are almost identical.

EXAMPLES

```
noise_immune_high (my_noise_reject) {  
    values ("1.3, 0.8, 0.7, 0.6, 0.55",  
            "1.5, 0.9, 0.8, 0.65, 0.6",  
            "1.5, 0.9, 0.8, 0.65, 0.6",  
            "1.5, 0.9, 0.8, 0.65, 0.6",  
            "-1.5, 1.9, 0.8, 0.65, 0.6") ;  
}
```

EXAMPLE MESSAGE

Warning: Line 178, The curve is curling upwards at the end.
when total_output_net_capacitance=0.1. (LBDB-688)

**LBDB-689 (warning) The curve is not leveling off at the end.
when total_output_net_capacitance=%g.**

DESCRIPTION

This information occurs when the immunity curve is not leveling off at the end.

WHAT NEXT

Make sure each last 2 values with the same total_output_net_capacitance index are almost identical.

EXAMPLES

```
noise_immune_high (my_noise_reject) {  
    values ("1.3, 0.8, 0.7, 0.6, 0.55",  
            "1.5, 0.9, 0.8, 0.65, 0.6",  
            "1.5, 0.9, 0.8, 0.65, 0.6",  
            "1.5, 0.9, 0.8, 0.65, 0.6",  
            "-1.5, 1.9, 0.8, 0.65, 0.6") ;  
}
```

EXAMPLE MESSAGE

Warning: Line 178, The curve is not leveling off at the end.
when total_output_net_capacitance=0. (LBDB-689)

LBDB-690 (error) The current polarity is reversed.

DESCRIPTION

This information occurs when the current polarity is reversed.

WHAT NEXT

Make sure the skew of the current at middle point is correct.

EXAMPLES

```
steady_state_current_low(my_current_low) {  
    values("0.1, 0.05, 0, -0.1, -0.25, -1, -1.8");  
}
```

EXAMPLE MESSAGE

Error: Line 198, The current polarity is reversed. (LBDB-690)

LBDB-691 (error) There is negative values in the table.

DESCRIPTION

This information occurs when the value in the table is negative where it should be positive.

WHAT NEXT

Make sure the values in the table are positive.

EXAMPLES

```
propagated_noise_height_below_low(my_noise_propagation) {  
    ...  
    values (" -1.4 .. ");
```

EXAMPLE MESSAGE

Error: Line 198, There is negative values in the table. (LBDB-691)

LBDB-692 (warning) The max height of the noise table %s is %g,

which is less than recommended %g.

DESCRIPTION

This information occurs when the max height of the noise table is less than the recommended.

WHAT NEXT

Make sure the max height is not less than the recommended.

EXAMPLES

```
propagated_noise_height_below_low(my_noise_propagation){  
    index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500, 0.03750, 0.05  
000");  
    index_2("0.400,1.000,1.500,2.000");  
    index_3("0.36000,0.54000,0.72000,0.90000"); /*input_noise_height*/
```

EXAMPLE MESSAGE

Warning: Line 248, The max height of the noise table propagated_noise_height_below_low is 0.9,
which is less than recommended 5. (LBDB-692)

LBDB-693 (warning) The max width of the noise table %s is %g, which is less than recommended %g.

DESCRIPTION

This information occurs when the max width of the noise table is less than the recommended.

WHAT NEXT

Make sure the max width is not less than the recommended.

EXAMPLES

```
propagated_noise_height_below_low(my_noise_propagation){  
    index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500, 0.03750, 0.05  
000");  
    index_2("0.400,1.000,1.500,2.000"); /*input_noise_width*/  
    index_3("0.36000,0.54000,0.72000,0.90000");
```

EXAMPLE MESSAGE

Warning: Line 281, The max width of the noise table propagated_noise_width_low is 2, which is less than recommended 4. (LBDB-693)

LBDB-694 (warning) The width range of %s is %g->%g, which is less than recommended %g->%g.

DESCRIPTION

This information occurs when the width index does not have enough range.

WHAT NEXT

Make sure the width index have the enough range.

EXAMPLES

```
noise_immune_above_high (my_noise_reject_outside_rail) {  
    index_1("0, 0.1, 2"); /*input_noise_width*/  
    values ("1, 0.8, 0.5",  
            "1, 0.8, 0.5",  
            "1, 0.8, 0.5");  
}
```

EXAMPLE MESSAGE

Warning: Line 192, The width range of noise_immune_above_high is 0->2, which is less than recommended 2->4. (LBDB-694)

LBDB-695 (error) The pin '%s' misses DC noise margin.

DESCRIPTION

This information occurs when one pin does not DC noise margin information.

WHAT NEXT

Make sure there is DC noise margin information defined in one pin if no other noise information.

EXAMPLES

```
pin(a) {
```

```
    direction : input;
    capacitance : 1.000;
}
```

EXAMPLE MESSAGE

Error: Line 794, The pin 'a' misses DC noise margin. (LBDB-695)

LBDB-696 (warning) The timing arc misses noise %s information.

DESCRIPTION

This information occurs when the timing arc does not have specified noise information.

WHAT NEXT

Make sure there is complete noise information defined in the timing arc.

EXAMPLE MESSAGE

Warning: Line 137, The timing arc misses noise propagated_noise_width_high information. (LBDB-696)

LBDB-697 (warning) The timing arc %s->%s misses noise %s_%s information.

DESCRIPTION

This information occurs when the timing arc does not have specified noise information.

WHAT NEXT

Make sure there is complete noise information defined in the timing arc.

EXAMPLE MESSAGE

Warning: Line 137, The timing arc DA[0]->QB[0] misses noise propagated_noise_width_above_high information. (LBDB-697)

LBDB-698 (warning) The values in noise table '%s' are non monotonous

%g, %g, when %s = %g, %s = %g.

DESCRIPTION

This information occurs when the delay values in specified table do not decrease monotonously with increasing capacitance.

WHAT NEXT

Make sure the delay values decrease monotonously with increasing capacitance.

EXAMPLES

```
propagated_noise_width_below_low(my_noise_propagation) {
    index_1("0.00250, 0.00500, 0.01000, 0.01500, 0.02500, 0.03750, 0.05
000");
    index_2("0.400,1.000,1.500,2.000");
    index_3("0.36000,0.54000,0.72000,0.90000");
    values("0.000, 0.024, 0.010, 0.013",
           "1.071, 0.342, 0.121, 0.222",
           "0.489, 0.565, 0.789, 0.750",
           "0.282, 0.021, 0.279, 0.118",
           "1.000, 0.042, 0.009, 0.015",
           "1.068, 0.346, 0.121, 0.248",
           "0.497, 0.584, 0.786, 0.777",
           "0.271, 0.029, 0.281, 0.120",
           "0.055, 0.074, 0.008, 0.017",
           "1.076, 0.356, 0.121, 0.306",
           "0.481, 0.612, 0.783, 0.778",
           "0.257, 0.045, 0.288, 0.103",
           "0.072, 0.102, 0.006, 0.018",
           "1.098, 0.367, 0.121, 0.359",
           "0.506, 0.646, 0.779, 0.770",
           "0.248, 0.057, 0.295, 0.105",
           "0.102, 0.161, 0.002, 0.018",
           "1.162, 0.392, 0.118, 0.437",
           "0.571, 0.707, 0.775, 0.763",
           "0.238, 0.076, 0.311, 0.107",
           "0.142, 0.202, 0.002, 0.059",
           "0.389, 0.426, 0.102, 0.541",
           "0.673, 0.775, 0.772, 0.768",
           "0.235, 0.094, 0.329, 0.109",
           "0.180, 0.246, 0.005, 0.071",
           "0.434, 0.463, 0.090, 0.644",
           "0.705, 0.835, 0.758, 0.783",
           "0.235, 0.108, 0.345, 0.111");
}
```

EXAMPLE MESSAGE

```
Warning: Line 248, The values in noise table 'propagated_noise_height_below_low' are non monotonous
          0.025, 1.000, when input_noise_width = 0.4, input_noise_height = 0.36. (LBD
B-698)
```

Lbdb-699 (error) The 'generic' integrated clock gating cell '%s' should only have at most 1 inout/output pin with attribute 'clock_gate_out_pin' set to true.

DESCRIPTION

This message indicates that you specified the 'generic' integrated gating clock cell can only have 1 inout/output pin with 'clock_gate_out_pin : true'.

WHAT NEXT

Change the library source file.

EXAMPLES

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "generic";
    ...
    pin(01) {
        direction : output;
        clock_gate_out_pin : true;
    ...
    }
    pin(02) {
        direction : output;
        clock_gate_out_pin : true;
    ...
    }
    ...
}
```

The modified cell description can be :

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "generic";
    ...
    pin(01) {
        direction : output;
        clock_gate_out_pin : true;
    ...
}
```

```
 }
...
}
```

EXAMPLE MESSAGE

Error: Line 206, The 'generic' integrated clock gating cell 'CGNP' should only have at most 1 inout/output pin with
attribute 'clock_gate_out_pin' set to true. (LBDB-699)

LBDB-700 (error) The pin '%s' of the 'generic' integrated clock gating cell '%s' can not define

attribute 'state_function'. It should use attribute 'function' instead.

DESCRIPTION

This message indicates that you specified attribute 'state_function' in the 'generic' integrated gating clock cell. It should be changed as 'function'.

WHAT NEXT

Change the library source file by replacing "state_function" to "function".

EXAMPLES

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "generic";
    ...
    pin(01) {
        direction : output;
    state_function : "!(IQ + SE) * CP_IN"
    ...
}
...
}
```

The modified cell description can be :

```
cell(CGNP) {
    area : 1;
    clock_gating_integrated_cell : "generic";
    ...
    pin(01) {
```

```

        direction : output;
function : "!(IQ + SE) * CP_IN"
...
}
...
}

```

EXAMPLE MESSAGE

Error: Line 206, The pin '01' of the 'generic' integrated clock gating cell 'CGNP' can not define

attribute 'state_function'. It should use attribute 'function' instead. (LBDB-700)

LBDB-701 (error) The %scell '%s' can not define pin functions of both '%s' and '%s'.

DESCRIPTION

Assume the integrated clock gating cell is modeled as :

```
... clock_gating_integrated_cell : "generic"; latch("IQ", "IQN") { data_in : "EN1 * EN2" ; enable : "CLK'" ; } ...
```

This message indicates that you specified pin functions for either one of the following 2 cases, which is invalid: 1. the same pin function with both IQ and IQN. for example, pin(Y1) { function : "IQ * (A + IQN)"; ... }

2. the different pin functions involved with IQ and IQN. for example, pin(Y1) { function : "IQ * A"; ... } pin(Y2) { function : "IQN * A"; ... }

WHAT NEXT

Change the library source file by replacing "IQN" to "IQ'" .

EXAMPLE MESSAGE

Error: Line 206, The integrated clock gating cell '%s' can not define pin functions of both '%s' and '%s'. (LBDB-701)

LBDB-702 (error) The cell should not define the 'statetable' group.

It should use 'ff' group or 'latch' group instead.

DESCRIPTION

This message indicates that you specified statetable and the pin function of "...IQ..." or "...IQN..." (excluding "IQ" and IQN", where IQ and IQN are the output of sequential element. You should define 'ff/latch' group instead.

WHAT NEXT

Change the library source file, and replace the statetable group with the ff/latch group of the specified cell.

EXAMPLES

```
cell(A) {
    area : 1;
    ...
    statetable(" CP EN ", "IQ ") {
        table : " L  L  : - : L ,
                  L  H  : - : H ,
                  H  -  : - : N ";
    }
    pin(Y) {
        function : "IQ * CP";
    ...
    }
    ...
}
```

The modified cell description should be :

```
cell(A) {
    area : 1;
    latch("IQ", "IQN") {
        enable : "CP";
        data_in : "EN";
    }
    ...
    pin(Y) {
        function : "IQ * CP";
    ...
    }
}
```

EXAMPLE MESSAGE

Error: Line 206, The cell should not define the 'statetable' group.
It should use 'ff' group or 'latch' group instead. (LBDB-702)

LBDB-703 (error) An invalid %s '%s' is found in the '%s' group.

DESCRIPTION

The message is to notify users that either the attribute/group should not be defined in the relative parent group, or the value of the attribute/group need to be corrected.

WHAT NEXT

Remove the attribute/group or correct the value of the attribute/group and rerun the command.

LBDB-704 (error) The standard cells '%s' and '%s' does not have the same pg_pin configuration.

DESCRIPTION

The message is to notify users that all the standard cells(cells having 1 primary_power pg_pin and 1 primary_ground pg_pin) should have exactly the same pg_pin configuration: - all the primary_power pg_pins of these cells have the same "voltage_name" - all the primary_ground pg_pins of these cells have the same "voltage_name"

WHAT NEXT

Correct the "voltage_name" attribute values of the pg_pins of the standard cells and rerun the command.

LBDB-705 (warning) The '%s' %s group has been defined multiple times in the '%s' %s group. Using the last definition encountered.

DESCRIPTION

The library contains more than one definition of a group. The Library Compiler issues this error message, ignores the previous definitions, and takes into consideration the last definition encountered.

WHAT NEXT

Change the group name if it is wrong, or delete the second definition.

EXAMPLES

```
cell(sample) {  
...  
pg_pin(A) {  
...  
}  
pg_pin(A) {  
...  
}  
...  
}
```

EXAMPLE MESSAGE

Warning: Line 50, The 'A' pg_pin group has been defined multiple times in the 'sample' cell group. Using the last definition encountered. (LBDB-705)

LBDB-706 (error) Cell '%s', pin '%s', the CCS Noise data cannot be compiled successfully.

DESCRIPTION

The Library Compiler issues this error message to indicate that the CCS Noise data defined is not ok, since it cannot be compiled successfully for the Synopsys Timing tools to do the CCS Noise computation.

WHAT NEXT

Change the CCS Noise data accordingly.

EXAMPLE MESSAGE

Error: Line 50, Cell 'bad', pin 'Y', the CCS Noise data cannot be compiled successfully. (LBDB-706)

:w

LBDB-707 (information) Compiling CCS Noise data --- %%d...

DESCRIPTION

This message is for information purposes only and it is to show the process of compiling CCS Noise data.

EXAMPLE MESSAGE

```
Information: Compiling CCS Noise data --- 10%... (LBDB-707)
Information: Compiling CCS Noise data --- 20%... (LBDB-707)
Information: Compiling CCS Noise data --- 100%... (LBDB-707)
```

LBDB-708 (error) The timing arc has '%s' timing_sense, which is not consistent with the "is_inverting" attribute value(s) of its ccsn_first_stage/ccsn_last_stage group(s).

DESCRIPTION

This message is to indicate that the "is_inverting" attribute value of the ccsn_first_stage/ccsn_last_stage group(s) defined in the timing arc is not consistent with the timing_sense of the arc.

The correct configuration should be: 1. If the timing sense is "positive_unate", then it can only contain either 1 ccsn_first_stage with "FALSE" "is_inverting" attribute, or 1 ccsn_first_stage with "TRUE" "is_inverting" attribute and 1 ccsn_last_stage with "TRUE" "is_inverting" attribute, or 1 ccsn_first_stage with "FALSE" "is_inverting" attribute and 1 ccsn_last_stage with "FALSE" "is_inverting" attribute. 2. If the timing sense is "negative_unate", then it can only contain either 1 ccsn_first_stage with "TRUE" "is_inverting" attribute, or 1 ccsn_first_stage with "TRUE" "is_inverting" attribute and 1 ccsn_last_stage with "FALSE" "is_inverting" attribute, or 1 ccsn_first_stage with "FALSE" "is_inverting" attribute and 1 ccsn_last_stage with "TRUE" "is_inverting" attribute.

EXAMPLE MESSAGE

```
Error: Line 50, The timing arc has 'negative_unate' timing_sense, which is not consistent with the "is_inverting" attribute values of its ccsn_first_stage/ccsn_last_stage group(s). (LBDB-708)
```

LBDB-709 (error) The sequential timing arc cannot define the

'%s' group.

DESCRIPTION

This message is to indicate that a sequential timing arc cannot have ccsn_first_stage/ccsn_last_stage group.

EXAMPLE MESSAGE

Error: Line 50, The sequential timing arc cannot define the 'ccsn_first_stage' group. (LBDB-709)

LBDB-710 (error) The table size of '%s' is %dx%d, which is less than the required %dx%d.

DESCRIPTION

This information occurs when the table size is less than the required number.

WHAT NEXT

Make sure the table size is not less than the recommended.

EXAMPLES

```
dc_current(template) {  
    index_1("1.0") ; /* input_voltage */  
    index_2("0.362"); /* output_voltage */  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 446, The table size of 'dc_current' is 5x5, which is less than the required 6x6. (LBDB-710)

LBDB-711 (error) Cell '%s', pin '%s', an %s pin cannot specify the '%s' %s.

DESCRIPTION

This message indicates that there is a mismatch between the direction of a pin and

the CCS Noise data. Library Compiler fails if the following rules are not satisfied:
1. an input pin can only specify at least 1 ccsn_first_stage group. 2. an inout pin can specify both ccsn_first_stage group and ccsn_last_stage group. 3. an output pin can only specify ccsn_last_stage group.

WHAT NEXT

Check the library source file, and fix the invalid CCS Noise data, either the direction of the pin.

EXAMPLES

```
cell(lbdb711) {  
    ...  
    pin(Y) {  
        direction : output;  
        ...  
        ccsn_first_stage() {  
            ...  
        }  
    }  
}
```

In this case, the 'Y' pin has the 'ccsn_first_stage' group specified. To fix the problem, rename 'ccsn_first_stage' with 'ccsn_last_stage'.

EXAMPLE MESSAGE

```
Error: Line 71, Cell 'lbdb711', pin 'Y', an output pin cannot specify the 'ccsn_first_stage' group. (LBDB-711)
```

LBDB-712 (warning) Cell '%s', pin '%s', an %s pin should specify at least 1 non-static '%s' %s in either the pin group or one of its timing groups.

DESCRIPTION

This message indicates that an inout/output pin should have at least 1 non-static ccsn_last_stage group in either the pin group.

A static CCS noise model captures the behaviors of a static CCB (channel connected block). A static CCB refers to a CCB that does not have any input terminal or the voltage level at the input terminal does not affect the output current of the CCB. For example, a static CCS noise model can be characterized for a CMOS NAND gate when both inputs are tied to ground. Such static CCS noise models can be used in noise analysis with case analysis, but they cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. Please refer to "CCS Noise Library Characterization Guide" for detailed information.

Warning message LBDB-712 can be safely ignored if following three categories of cells are identified in a library: 1) inverters -> always one input pin and one output pin with function as "!input" or "input'". 2) NAND -> always 2 input or more and one output pin with function as "!(input1 * input2 * ... input(n))" or "(input1 * input2 * ... input(n))'". 3) NOR -> always 2 input or more and one output pin with function as "!(input1 + input2 + ... input(n))" or "(input1 + input2 + ... input(n))'".

WHAT NEXT

Check the library source file, and fix either the invalid CCS Noise data, or the direction of the pin. Just ignore the warning if current cell is belong to above three categories of cells.

EXAMPLES

```
cell(good) {  
    ...  
    pin(Y ) {  
        direction : output;  
        ...  
        ccsn_last_stage() {  
            ...  
            }  
            }  
    }  
    cell(lbdb712) {  
        ...  
        pin(Y ) {  
            /* no ccs noise information inside the pin group */  
            direction : output;  
            ...  
            }  
        }  
    }  
}
```

In this case, the 'Y' pin does not have the 'ccsn_last_stage' group specified. To fix the problem, add the 'ccsn_last_stage' group into the pin group.

EXAMPLE MESSAGE

Error: Line 71,Cell 'good', pin 'Y', an output pin should specify at least 1 non-static 'ccsn_last_stage' group. (LBDB-712)

LBDB-713 (error) The '%s' group wth %s '%s' attribute

cannot specify '%s' %s.

DESCRIPTION

This message can be used to indicate that if a ccsn_first_stage/ccsn_last_stage group has 'is_needed' attribute set to FALSE, then it is not valid to specify the following CCS Noise data: stage_type, is_inverting, miller_cap_rise, miller_cap_fall, dc_current, output_voltage_rise, output_voltage_fall, propagated_noise_low, propagated_noise_high.

WHAT NEXT

Check the library source file, and remove the redundant CCS Noise data.

EXAMPLES

```
cell(bad) {  
    ...  
    pin(Y ) {  
        direction : output;  
        ...  
        ccsn_last_stage() {  
            is_needed : FALSE;  
            stage_type : both  
            ...  
        }  
    }  
}
```

In this case, the 'Y' pin does not have the 'ccsn_last_stage' group specified. To fix the problem, add the 'ccsn_first_stage' group into the pin group.

EXAMPLE MESSAGE

Error: Line 71, The 'ccsn_last_stage' group with FALSE 'is_needed' attribute cannot specify 'stage_type' attribute. (LBDB-713)

LBDB-714 (error) The '%s' group cannot specify the '%s' attribute with value '%s'.

DESCRIPTION

This message can be used to indicate that the output pin of a tie-off cell(pin function= "1" | "0", or driver_type = "pull_up" | "pull_down") specify incorrect value for the stage_type attribute of the ccsn_first_stage/ccsn_last_stage groups defined on the pin, which must satisfy the following rules: 1. If the driver pin

with driver_type = pull_up or function = "1", then its ccsn_first_stage/ccsn_last_stage group must have the stage_type attribute with value "PULL_UP". 2. If the driver pin with driver_type = pull_down or function = "0", then its ccsn_first_stage/ccsn_last_stage group must have the stage_type attribute with value "PULL_DOWN".

WHAT NEXT

Check the library source file, and correct the incorrect 'stage_type' value.

EXAMPLES

```
cell(bad) {  
    ...  
    pin(Y) {  
        direction : output;  
        function : 1;  
        driver_type : "pull_up";  
        ...  
        ccsn_last_stage() {  
            is_needed : FALSE;  
            stage_type : "pull_down";  
            ...  
        }  
    }  
}
```

In this case, the 'Y' pin specify 'pull_down' stage_type attribute in its 'ccsn_last_stage' group. To fix the problem, change the 'pull_down' to 'pull_up'.

EXAMPLE MESSAGE

Error: Line 71, The 'ccsn_last_stage' group cannot specify the 'stage_type' attribute with value 'PULL_DOWN'. (LBDB-714)

LBDB-715 (error) The '%s' attribute has an invalid sequence of data '%g , %g'. The values must be in %s increasing order.

DESCRIPTION

This message indicates that the set of data is not specified in increasing order.

WHAT NEXT

Check your library and correct the order of the values.

EXAMPLES

```
dc_current(template) {  
/* index does not in monotonically increasing order */  
    index_1 ("0.1, 4.2, 2.3, 3.4");  
    index_2 ("0.1, ...");  
...  
}
```

EXAMPLE MESSAGE

Error: Line 22, The 'index_1' attribute has an invalid sequence of data '4.200000 , 2.300000'. The values must be in monotonically increasing order. (LBDB-715)

LBDB-716 (error) The %s %g of '%s' attribute is %s %s = %g.

DESCRIPTION

This message indicates that the first/last/some value of the specific attribute is greater than the upper bound value, or lower than the lower bound value.

WHAT NEXT

Check your library and correct the value.

LBDB-717 (error) The value %g of '%s' attribute is %s %g.

DESCRIPTION

This message indicates that the value of the specific attribute is greater than the upper bound value, or less than the lower bound value.

WHAT NEXT

Check your library and correct the value.

LBDB-718 (warning) The %s %g of '%s' attribute is %s %s =

%g.

DESCRIPTION

This message indicates that the first/last/some value of the specific attribute is greater than the upper bound value, or lower than the lower bound value. Note that this is just a warning, not an error.

WHAT NEXT

Check your library and correct the value.

LBDB-719 (error) The cells '%s' must have at least 1 'primary_ground' pg_pin and at least 1 'primary_power' pg_pin.

DESCRIPTION

The message is to notify users that in the new libraries based on pg_pin, all the cells must have at least 1 'primary_ground' pg_pin and at least 1 'primary_power' pg_pin.

WHAT NEXT

Add the missing 'primary_ground' pg_pin or 'primary_power' pg_pin.

LBDB-720 (error) The '%s' %s cannot be specified in the library based on pg_pin.

DESCRIPTION

This message indicates that you specified the syntax(power_supply, rail_connection, input/output_signal_level, power_level, etc.) which is incompatible with the syntax based on pg_pin such as voltage_map, pg_pin, related_power/ground_pin, related_pg_pin).

WHAT NEXT

Refer to the "Library Compiler User Guide" for related information and remove the incompatible values,

EXAMPLES

```
cell(lbdb720) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1.0;

        input_signal_level : VDD;

        related_power_pin : VDD;
        related_ground_pin : VSS;

    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 84, The 'input_signal_level' attribute cannot be specified in the library
based on pg_pin. (LBDB-720)

LBDB-721 (warning) The value %f of 'nom_voltage' is not the same as the value %f of 'voltage' of the default operating_conditions '%s'.

DESCRIPTION

This message indicates that the nom_voltage value is not equal to the value of "voltage" attribute of the default operating_conditions group of the library.

WHAT NEXT

Correct the nominal_voltage value to make it the same as the value of the voltage attribute of the default operating_conditions group.

EXAMPLES

```
nom_voltage      : 1.09;

operating_conditions(sample) {
    process      : 1;
    temperature : 85;
    voltage     : 1.08;
    tree_type   : balanced_tree
}
```

EXAMPLE MESSAGE

Warning: Line 52, The value 1.09 of 'nom_voltage' is not the same as the value 1.08 of 'voltage' of the default operating_conditions '%s'. (LBDB-721)

LBDB-722 (error) The voltage value %f of the 1st voltage_map '%s' is not the same as the value of 'voltage' of the default operating_conditions '%s'.

DESCRIPTION

This message indicates the 1st specified voltage_map attribute specify the different voltage value from that of the 'voltage' of the default operating_consitions group. They should be equal.

WHAT NEXT

Correct the voltage value of the 1st voltage_map.

EXAMPLES

```
voltage_map(VDD, 1.2);
voltage_map(VSS, 0);
operating_conditions(sample) {
    process      : 1;
    temperature : 85;
    voltage     : 1.08;
    tree_type   : balanced_tree
}
default_operating_conditions : sample;
```

In this case, the voltage value of the 1st voltage_map 'VDD1' voltage_map is 1.2, while the voltage valye of default operating_conditions 'sample' is 1.08. To Fix the problem, update the voltage_map 'VDD' as follows:

```
voltage_map(VDD, 1.08);
voltage_map(VSS, 0);
operating_conditions(sample) {
    process      : 1;
    temperature : 85;
    voltage     : 1.08;
    tree_type   : balanced_tree
}
default_operating_conditions : sample;
```

EXAMPLE MESSAGE

Error: Line 23, The voltage value 1.2 of the 1st voltage_map 'VDD' is not the same as

the value of 'voltage' of the default operating_conditions 'sample'. (LBDB-722)

LBDB-723 (error) The last variable '%s' is '%s', which is wrong. The value must be "time".

DESCRIPTION

This message indicates that the value of the last variable can only be "time" in pg_current_template. pg_current_template can have one variable up to 4 variables, and input_net_transition, time, and total_output_net_capacitance are 3 available values can be assigned. No matter what size of template is, the last variable must be "time".

WHAT NEXT

If the last variable is not "time", change the variable, which is assigned to "time", to the last.

EXAMPLES

```
pg_current_template(basic_template) {  
    variable_1 : input_net_transition;  
    variable_2 : time;  
    variable_3 : total_output_net_capacitance;  
    variable_4 : total_output_net_capacitance;  
}
```

To fix the problem, exchange the values between variable_2 and variable_4.

EXAMPLE MESSAGE

Error: Line 388, The last variable variable_4 is total_output_net_capacitance, which is wrong. The value must be "time". (LBDB-723)

LBDB-724 (error) There is no voltage_map defined for ground

voltage value 0.

DESCRIPTION

This message indicates the library does not define the voltage_map for the ground voltage value 0. In the libraries based on the new power modeling syntax (voltage_map, pg_pin, ..., etc.), this condition must be satisfied.

WHAT NEXT

Add the voltage_map for the ground voltage value 0.

EXAMPLES

```
voltage_map(VDD, 1.08);
voltage_map(VDD1, 1.1);

operating_conditions(sample) {
process      : 1;
temperature : 85;
voltage     : 1.08;
tree_type   : balanced_tree
}
default_operating_conditions : sample;
```

In this case, there is no voltage_map defined for ground voltage value 0. To fix the problem, add the following voltage_map attribute at the library level:

```
voltage_map(VDD, 1.08);
voltage_map(VDD1, 1.1);
voltage_map(VSS, 0);

operating_conditions(sample) {
process      : 1;
temperature : 85;
voltage     : 1.08;
tree_type   : balanced_tree
}
default_operating_conditions : sample;
```

EXAMPLE MESSAGE

Error: Line 23, There is no voltage_map defined for ground voltage value 0. (LBDB-724)

LBDB-725 (warning) Connect pin '%s' to the default %s pg_pin

'%S'.

DESCRIPTION

Either the related_power_pin or the related_ground_pin attribute is missing in a pin within a multiple power supply cell. By default, LC connect this pin to the default related_power_pin/related_ground_pin.

WHAT NEXT

Check the library source file to see if you missed the related_power_pin or the related_ground_pin attributes.

EXAMPLES

```
voltage_map(VDD0, 1.8);
voltage_map(VDD1, 1.9);
voltage_map(VDD2, 23);
voltage_map(VSS, 0);

cell(lbdb428) {
    area : 2;
    pad_cell : true;
    pg_pin(PV1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(PV2) {
        voltage_name : VDD2;
        pg_type : primary_power;
    }
    pg_pin(VSS) {
        voltage_name : VSS;
        pg_type : primary_ground;
    }
    pin(A) {
        direction : input;
        capacitance : 1;
        /* missing related_power_pin attribute, will use default PV1 */
        related_ground_pin : VSS;
    }
    pin(Z) {
        direction : output;
        function : "A";
        related_power_pin : PV1;
        related_ground_pin : VSS;
        timing() {
            intrinsic_rise : 0.48;
            intrinsic_fall : 0.77;
            rise_resistance : 0.1443;
            fall_resistance : 0.0523;
            slope_rise : 0.0;
        }
    }
}
```

```
        slope_fall : 0.0;
        related_pin : "A";
    }
}
}
```

EXAMPLE MESSAGE

Warning: Line 96, Connect pin 'A' to the default power pg_pin 'PV1'. (LBDB-725)

LBDB-726 (error) All the pins in the '%s' cell with more than 2 %s pg_pins must have '%s' attribute.

DESCRIPTION

The related_power_pin (or the related_ground_pin) attribute is missing in a pin within a cell with more than 2 power pg_pins (or ground pg_pins) respectively.

WHAT NEXT

Check the library source file to see if you missed the related_power_pin or the related_ground_pin attributes.

EXAMPLES

```
voltage_map(VDD0, 1.8);
voltage_map(VDD1, 1.9);
voltage_map(VDD2, 23);
voltage_map(VSS, 0);

cell(lbdb428) {
    area : 2;
    pad_cell : true;
    pg_pin(PV1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(PV2) {
        voltage_name : VDD2;
        pg_type : primary_power;
    }
    pg_pin(VSS) {
        voltage_name : VSS;
        pg_type : primary_ground;
    }
    pin(A) {
        direction : input;
```

```

    capacitance : 1;
    /* missing related_power_pin attribute, will use default PV1 */
    related_ground_pin : VSS;
}
pin(Z) {
    direction : output;
    function : "A";
    related_power_pin : PV1;
    related_ground_pin : VSS;
    timing() {
        intrinsic_rise : 0.48;
        intrinsic_fall : 0.77;
        rise_resistance : 0.1443;
        fall_resistance : 0.0523;
        slope_rise : 0.0;
        slope_fall : 0.0;
        related_pin : "A";
    }
}
}

```

To fix the problem, add the attribute to the 'A' pin group,

```
related_power_pin : VDD1;
```

EXAMPLE MESSAGE

Error: Line 96, All the pins in the 'lbdb726' cell with more than 2 power pg_pins must have 'related_power_pin' attribute. (LBDB-726)

LBDB-727 (error) The %s%s '%s' contains the conflicting %s '%s' for pin '%s' and %s '%s' for pin '%s'.

DESCRIPTION

This error message occurs when the **input_signal_level**, **output_signal_level**, or **related_power_pin** values is modeled incorrectly for the level shifter or isolation cell. See detail checking as described below.

In Liberty, we support two kinds (old and new) of pg syntax.

Rule for a level shifter in old syntax : The rail name of **input_signal_level** in input pin can't be the same as rail name of **output_signal_level** in output pin.

Rule for a level shifter in new syntax : If **input_signal_level** and **related_power_pin** both present in input pin, then Library Compiler will choose the value of **input_signal_level** for comparison. Either **input_signal_level** or **related_power_pin** in input pin can't refer to the same voltage name as what **related_power_pin** refers to in output pin.

Rule for an isolation cell in old syntax : The rail value of **input_signal_level** in input pin shall be the same as the rail value of **output_signal_level** in output pin.

Rule for an isolation cell in new syntax : The value of either **input_signal_level** or **related_power_pin** in input pin shall refer to the same voltage value as what **related_power_pin** refers to in output pin.

EXAMPLES

The following example shows the level shifter with the incorrect modeling and the resulting error message in new pg syntax:

```
library (test) {
voltage_map( VSS, 0.0);
voltage_map( VDDH, 0.9);
voltage_map( VDDL, 0.7);
cell(LS) {
pg_pin(GND) {
voltage_name : VSS;
pg_type : primary_ground;
}
pg_pin(VDD2) {
voltage_name : VDDH;
pg_type : primary_power;
}
pg_pin(VDD1) {
voltage_name : VDDL;
pg_type : primary_power;
}

is_level_shifter : true;
...
pin(in) {
    ...
        input_signal_level : VDDL;
related_power_pin : VDD1; /* discard */
related_ground_pin : GND;
}
pin(out) {
    ...
related_power_pin: VDD1;
related_ground_pin : GND;
}
}
```

In this case, `input_signal_level "VDDL"`, which is the same voltage name as what `related_power_pin "VDD1"` is referring to.

Error: Line 191, The level shifter 'LS' contain the conflicting `input_signal_level 'VDDL'` for pin 'in' and `related_power_pin 'VDD1'` for pin 'out'. (LBDB-727)

WHAT NEXT

Modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the example above, make the **input_signal_level** value of the input pin different from the **related_power_pin** value of the output pin as follows:

```
cell(LS) {
    is_level_shifter : true;
    ...
    pin(in) {
        ...
        input_signal_level : VDDL;
        related_power_pin: VDD1;
        related_ground_pin : GND;
    }
    pin(out) {
        ...
        related_power_pin: VDD2;
        related_ground_pin : GND;
    }
}
```

EXAMPLES

The following example shows the isolation cell with the incorrect modeling and the resulting error message in new pg syntax:

```
library (libdb727) {
voltage_map( VDD, 0.7);
voltage_map(VDDH, 0.80); /* high power */
voltage_map(VDDL, 0.4); /* low power */
voltage_map(VSS, 0.0);   /* primary ground */
cell(ISO) {
pg_pin(VDD1) {
voltage_name : VDDH;
pg_type : primary_power;
}
pg_pin(VDD2) {
voltage_name : VDDL;
pg_type : primary_power;
}

is_isolation_cell : true;
...
pin(in) {
    ...
    related_power_pin : VDD1;
    related_ground_pin : GND;
}
```

```

pin(out) {
    ...
    related_power_pin: VDD2;
    related_ground_pin : GND;
}
}

```

In this case, `related_power_pin` 'VDD1' is referred to voltage value 0.8 and `related_power_pin` 'VDD2' is referred to voltage value 0.4. So, the valtage value 0.8 in input pin is different from valtage value 0.4 in output pin, which is wrong.

Error: Line 191, The isolation cell 'ISO' contain the conflicting `related_power_pin` 'VDD1' for pin 'in' and `related_power_pin` 'VDD2' for pin 'out'. (LBDB-727)

WHAT NEXT

Modify the modeling information of the isolation cell to meet the requirements.

To correct the modeling of the example above, make the `related_power_pin` value of the input pin same as the `related_power_pin` value of the output pin as follows:

```

library (libdb727) {
voltage_map( VDD, 0.7);
voltage_map(VDDH, 0.80); /* high power */
voltage_map(VDDL, 0.4); /* low power */
voltage_map(VSS, 0.0); /* primary ground */
cell(ISO) {
pg_pin(VDD1) {
voltage_name : VDDH;
pg_type : primary_power;
}
pg_pin(VDD2) {
voltage_name : VDDL;
pg_type : primary_power;
}

is_isolation_cell : true;
...
pin(in) {
    ...
    related_power_pin : VDD1;
    related_ground_pin : GND;
}
pin(out) {
    ...
    related_power_pin: VDD1;
    related_ground_pin : GND;
}
}

```

EXAMPLES

The following example shows the level shifter with the incorrect modeling and the resulting error message in old pg syntax:

```
cell(LS) {  
    is_level_shifter : true;  
    ...  
    pin(in) {  
        ...  
        input_signal_level : VDD2  
    }  
    pin(out) {  
        ...  
        output_signal_level : VDD2  
    }  
}
```

Error: Line 191, The level shifter 'LS' contain the conflicting input_signal_level 'VDD2' for pin 'in' and output_signal_level 'VDD2' for pin 'out'. (LBDB-727)

WHAT NEXT

Modify the modeling information of the level shifter to meet the requirements.

To correct the modeling of the example above, make the **input_signal_level** string of the input pin different from the **output_signal_level** string "VDD2" of the output pin as follows:

```
cell(LS) {  
    is_level_shifter : true;  
    ...  
    pin(in) {  
        ...  
        input_signal_level : VDD1  
    }  
    pin(out) {  
        ...  
        output_signal_level : VDD2  
    }  
}
```

EXAMPLES

The following example shows the isolation cell with the incorrect modeling and the resulting error message in old pg syntax:

```

library(libdb727) {
    ...
    /* operation conditions */
    operating_conditions(5v_1v) {
        ...
        power_rail (VDDH, 5);      /* high power */
        power_rail (VDDL, 1);      /* low power */
        ...
    }
    ...
    default_operating_conditions : 5v_1v;

    ...
    cell(ISO) {
        is_isolation_cell : true;
        ...
        pin(in) {
            ...
            input_signal_level : VDDH
        }
        pin(out) {
            ...
            output_signal_level : VDDL
        }
    }
}

```

Error: Line 191, The isolation cell 'ISO' contain the conflicting input_signal_level 'VDDH' for pin 'in' and output_signal_level 'VDDL' for pin 'out'. (LBDB-727)

WHAT NEXT

Modify the modeling information of the isolation cell to meet the requirements.

input_signal_level 'VDDH' is referred to voltage value '5' and output_signal_level 'VDDL' is referred to voltage value '1'. The voltage value is '5' in input pin and the voltage value is '1' in output pin, which is wrong.

To correct it, you can assiged both to the same voltage like "VDDH", so that both will refer to same value "5" in operating_conditions as follows.

```

library(libdb727) {
    ...
    /* operation conditions */
    operating_conditions(5v_1v) {
        ...
        power_rail (VDDH, 5);      /* high power */
        power_rail (VDDL, 1);      /* low power */
        ...
    }
}

```

```

...
default_operating_conditions : 5v_1v;

...
cell(ISO) {
    is_isolation_cell : true;
    ...
    pin(in) {
        ...
        input_signal_level : VDDH
    }
    pin(out) {
        ...
        output_signal_level : VDDH
    }
}

```

SEE ALSO

LBDB-747

LBDB-728 (error) You can not specify the same pin '%s' twice in '%s'.

DESCRIPTION

This message indicates that you specified the same pin more than one in either **related_inputs** or **related_outputs**. Each pin can be only specified once.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell(lbdb728) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {

```

```

direction : output;
function : "A B";
timing() {
    ...
}
dynamic_current() {
    when : "A";
    related_inputs : "B B";
    related_outputs : "Z Z"
    typical_capacitances(0.3 0.4);
    switching_group() {
        ...
    }
}
...
}

```

In this case, both `related_outputs` and `related_inputs`, have specified the same pin name twice. To fix the problems, change the name from 'Z Z' to 'Z' in the `related_outputs`, change the name from 'B B' to 'B' in the `related_inputs`.

EXAMPLE MESSAGE

```

Error: Line 272, You can not specify the same pin 'Z' twice
in 'related_outputs'. (LBDB-728)
Error: Line 572, You can not specify the same pin 'B' twice
in 'related_inputs'. (LBDB-728)

```

**LBDB-729 (error) You can't specify the same pin '%s' in different
related_output attributes which are under the same
intrinsic_parasitic group.**

DESCRIPTION

If there are more than one `intrinsic_resistance` group under a `intrinsic_parasitic` group, then no `related_output` can have the same pin. However, the rule does not apply to closed channel, where the value specified in `intrinsic_resistance` group is greater than 1M Ohm.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
library(my) {
    /* unit attributes */
    time_unit : "1ns";
    capacitive_load_unit (1.0,pf);
    ...
cell(lbdb729) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }
    intrinsic_parasitic() {
        /* default state */
        intrinsic_resistance(<pg_name>) {
            related_output : "ZN";
            value : 9.0;
        }
        intrinsic_resistance(<pg_name>) {
            related_output : "ZN";
            value : 920.0;
        }
        intrinsic_resistance(<pg_name>) {
            related_output : "ZN";
            value : 1001.0;
        }
        intrinsic_capacitance(<pg_name>) {
            value : 8.2;
        }
    }
    ...
}
}
```

Based on timing and capacitance unit, we know the resistance unit is kilo. In this case, all intrinsic_resistance groups under a intrinsic_parasitic have same related_output 'ZN'. To fix the problem, change the name 'ZN' to 'Z' in either the group which has value '9.0' or the group which has value '920.0' because both are opened channel. No need to change the name in the group which has value '1001.0' because it is greater than 1M ohm, which is closed channel.

EXAMPLE MESSAGE

Error Line 272, You can't specify the same pin 'ZN' in different related_output attributes which are under the same intrinsic_parasitic group. (LBDB-729)

LBDB-730 (error) The pin '%s' specified in the '%s' is neither an %s pin nor an inout pin.

DESCRIPTION

This message indicates that direction of the pin you specified in a **related_inputs**, **related_outputs**, **related_output**, **index_output** or **gate_leakage** is wrong.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb730) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        function : "A B";
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            slope_rise : 0.0;
            slope_fall : 0.0;
            related_pin : "A B";
        }
    }
    leakage_current() {
        when : "A & !B & Z";
        pg_current(V1) {
            ...
        }
        ...
    }
    gate_leakage(Z) { /* must be input or inout pin */
}
```

```

        input_high_value : 2.1;
        input_low_value : -1.7;
    }
}
dynamic_current() {
    when : "A";
    related_inputs : "Z";
    related_outputs : "B"
    typical_capacitances(0.3);
    switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise);
        pg_current(<pg_name>) {
            vector(<lu_template_name>) {
                reference_time : 93.2;
                index_output : "A";
                index_1("5.1");
                index_2("0.3");
                index_3("8.2 9.4 9.8");
                values("1.78 12.4 110.1");
            }
        }
    ...
}
intrinsic_parasitic() {
    /* default state */
    intrinsic_resistance(<pg_name>) {
        related_output : "B";
        value : 9.0;
    }
    intrinsic_capacitance(<pg_name>) {
        value : 8.2;
    }
}
...
}
...
}

```

In this case, all related_output, related_outputs, related_inputs, index_output and gate_leakage have a wrong pin name. To fix the problems, change the name from 'Z' to either 'A' or 'B' in the related_inputs, change the name from 'B' to 'Z' in the related_outputs, change the name from 'A' to 'Z' in the index_output, change the name from 'B' to 'Z' in the related_output and change the name from 'Z' to either 'A' or 'B' in the gate_leakage.

EXAMPLE MESSAGE

```

Error: Line 272, The pin 'Z' specified in the 'related_inputs' is neither
      an input pin nor an inout pin. (LBDB-730)
Error: Line 471, The pin 'B' specified in the 'related_outputs' is neither
      an output pin nor an inout pin. (LBDB-730)
Error: Line 526, The pin 'A' specified in the 'index_output' is neither
      an output pin nor an inout pin. (LBDB-730)
Error: Line 890, The pin 'B' specified in the 'related_output' is neither

```

```
an output pin nor an inout pin. (LBDB-730)
Error: Line 749, The pin 'Z' specified in the 'gate_leakage' is neither
      an input pin nor an inout pin. (LBDB-730)
```

LBDB-731 (error) The pin '%s' specified in the '%s' can not be found in '%s'.

DESCRIPTION

Whatever the pin you specified in **index_output** must be matched to one of pins that you specified in **related_outputs**.

This message indicates that the pin you specified in a **index_output** is wrong because it can not be found in **related_outputs** which is defined under the same dynamic_current group as where **index_output** is defined.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb731) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }
    dynamic_current() {
        when : "A";
        related_inputs : "B";
        related_outputs : "Z"
        typical_capacitances(0.3);
        switching_group() {
            input_switching_condition(fall);
            output_switching_condition(rise);
            pg_current(<pg_name>) {
```

```

        vector<lu_template_name> {
            reference_time : 93.2;
            index_output : "ZN";
            index_1("5.1");
            index_2("0.3");
            index_3("8.2 9.4 9.8");
            values("1.78 12.4 110.1");
        }
    }
    ...
}
}
...
}

```

In this case, `index_output` have a wrong pin '`ZN`' because it does not match the pin '`Z`', which is specified in `related_outputs`. To fix the problem, change the name from '`ZN`' to '`Z`' in `index_output`.

EXAMPLE MESSAGE

Error: Line 272, The pin '`ZN`' specified in the '`index_output`' can not be found in '`related_outputs`'. (LBDB-731)

LBDB-732 (error) You cannot specify more than one output pin or one bit of a bus or bundle output pin in the '%s'.

DESCRIPTION

Only single output pin is allowed to be specified in a `index_output` and a `related_output`.

This message indicates that you specified multiple pins either in a `index_output` or in a `related_output`.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell(lbdb732) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
}

```

```

pin(B) {
    direction : input;
    capacitance : 1;
}
pin(Z) {
    direction : output;
    ...
}
pin(ZN) {
    direction : output;
    ...
}

dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z ZN"
    typical_capacitances(0.3 0.4);
    switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall);
        pg_current(<pg_name>) {
            vector(<lu_template_name>) {
                reference_time : 93.2;
                index_output : "Z ZN";
                index_1("5.1");
                index_2("0.3");
                index_3("8.2 9.4 9.8");
                values("1.78 12.4 110.1");
            }
        }
        ...
    }
}
...
intrinsic_parasitic() {
    /* default state */
    intrinsic_resistance(<pg_name>) {
        related_output : "Z ZN";
        value : 9.0;
    }
    intrinsic_capacitance(<pg_name>) {
        value : 8.2;
    }
}
}
}

```

In this case, index_output and related_output have specified "Z ZN" which is wrong. To fix the problem, remove either 'Z' or 'ZN' from "Z ZN".

EXAMPLE MESSAGE

Error: Line 272, You cannot specify more than one output pin or one bit

of a bus or bundle output pin in the 'index_output'. (LBDB-732)
Error: Line 262, You cannot specify more than one output pin or one bit
of a bus or bundle output pin in the 'related_output'. (LBDB-732)

LBDB-733 (warning) An %s pin '%s' should specify at least 1 non-static '%s' %s.

DESCRIPTION

This message indicates that the following rule is not satisfied: an input/inout pin should have at least 1 non-static ccsn_first_stage group in the pin group if it is referred as the related_pin in a timing arc and the timing arc does not have non-static ccsn_first_stage group.

A static CCS noise model captures the behaviors of a static CCB (channel connected block). A static CCB refers to a CCB that does not have any input terminal or the voltage level at the input terminal does not affect the output current of the CCB. For example, a static CCS noise model can be characterized for a CMOS NAND gate when both inputs are tied to ground. Such static CCS noise models can be used in noise analysis with case analysis, but they cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. Please refer to "CCS Noise Library Characterization Guide" for detailed information.

WHAT NEXT

Check the library source file, and fix either the invalid CCS Noise data, or the direction of the pin.

EXAMPLES

```
cell(good) {  
    ...  
    pin (A) {  
        direction : input;  
    }  
  
    pin(Y ) {  
        direction : output;  
        ...  
        ccsn_last_stage() {  
            ...  
        }  
  
        timing () {  
            related_pin : A;  
            cell_rise() {  
                ...  
            }  
            rise_transition() {  
                ...  
            }  
        }  
    }  
}
```

```

...
}
cell_fall() {
...
}
fall_transition() {
...
}
}
}
}
}

```

In this case, the timing arc A->Y does not have 'ccsn_first_stage' group specified, and the 'A' pin does not have the 'ccsn_first_stage' group specified. To fix the problem, add the non-static 'ccsn_first_stage' group into the pin 'A'.

EXAMPLE MESSAGE

Warning: Line 71, An input/inout pin 'A' should specify at least 1 non-static 'ccsn_first_stage' group. (LBDB-733)

LBDB-734 (warning) Cell '%s', pin '%s', an %s pin should specify at least 1 non-static '%s' %s.

DESCRIPTION

This message indicates that an input/inout pin does not have non-static ccsn_first_stage group in the pin group and there are no related timing arcs referring this pin as the related_pin.

A static CCS noise model captures the behaviors of a static CCB (channel connected block). A static CCB refers to a CCB that does not have any input terminal or the voltage level at the input terminal does not affect the output current of the CCB. For example, a static CCS noise model can be characterized for a CMOS NAND gate when both inputs are tied to ground. Such static CCS noise models can be used in noise analysis with case analysis, but they cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. Please refer to "CCS Noise Library Characterization Guide" for detailed information.

WHAT NEXT

Check the library source file, and fix either the invalid CCS Noise data, or the direction of the pin.

EXAMPLES

```

cell(sample) {
...
pin (A) {

```

```

direction : input;
}

pin(Y) {
    direction : output;
    ...
    ccsn_last_stage() {
...
    }
}

```

In this case, the 'A' pin does not have the 'ccsn_first_stage' group specified, and there are no associated timing arcs specifying 'ccs_first_stage' groups. To fix the problem, add the non-static 'ccsn_first_stage' group into the pin 'A'.

EXAMPLE MESSAGE

Warning : Line 71, Cell 'sample', pin 'A', an input/inout pin should specify at least 1 non-static 'ccsn_first_stage' group. (LBDB-734)

LBDB-735 (error) '%s' can't be specified in '%s' if power cell type is macro.

DESCRIPTION

Currently in Liberty syntax, we support two power cell types for CCS power model. One is 'stdcell' and another is 'macro'. For a 'macro' cell type, there is one restriction. You can not specify **related_outputs** in **dynamic_current** group and **output_switching_condition** in **switching_group** group if cell type in CCS power is 'macro'.

This message indicates that you either specified **related_outputs** or **output_switching_condition** when cell type is 'macro'.

WHAT NEXT

Check the library source file, and make the necessary correction. You can remove **output_switching_condition** or **related_outputs** attribute to avoid the error if you specify any of them.

EXAMPLES

```

cell(lbdb735) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
}

```

```

}

...
power_cell_type : macro;
dynamic_current() {
    ...
    related_outputs : "Z ZN";           /* remove this */
    typical_capacitances(0.3 0.4);
    switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall); /* remove this */
        pg_current(<pg_name>) {
            vector(<lu_template_name>) {
                ...
            }
            ...
        }
    }
}
...
}
}

```

In the case above, `related_outputs` and `output_switching_condition` are specified when cell type is 'macro', which is wrong. To fix the problem, we shall remove both attributes.

EXAMPLE MESSAGE

```

Error: Line 272, 'related_outputs' can't be specified in 'dynamic_current' if power
      cell type is macro. (LBDB-735)
Error: Line 292, 'output_switching_condition' can't be specified in 'switching_grou
      p' if power cell type is macro. (LBDB-735)

```

LBDB-736 (error) Size of '%s' must be the same as size of related_outputs.

DESCRIPTION

Size of `output_switching_condition` specified in `switching_group` and size of `related_outputs` specified in `dynamic_current`, they must be identical, which is the same for `typical_capacitances`. Meaning that size of `typical_capacitances` specified in `dynamic_current` must be the same size as what `related_outputs` has.

This message indicates that either size is different between `related_outputs` and `typical_capacitances` or size is different between `related_outputs` and `output_switching_condition`.

WHAT NEXT

Check the library source file, and make the necessary correction. Size of **output_switching_condition**, **related_outputs** and **typical_capacitances** must be identical.

EXAMPLES

```
cell(lldb736) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }

    dynamic_current() {
        when : "A";
        related_inputs : "B";
        related_outputs : "Z";
        typical_capacitances(0.3 0.4);
        switching_group() {
            input_switching_condition(fall);
            output_switching_condition(rise fall);
            pg_current(<pg_name>) {
                vector(<lu_template_name>) {
                    ...
                }
            ...
        }
    ...
}
...
}
```

In this case, size of related_outputs is 1 ("Z"), but size of typical_capacitances is 2 (0.3 and 0.4) and size of output_switching_condition is 2 (rise and fall) as well. To fix the problem, you can increase size of related_outputs to 2. You can change "Z" to "Z ZN".

EXAMPLE MESSAGE

Error: Line 272, Size of 'typical_capacitances' must be the same as size of related

```
_outputs. (LBDB-736)
Error: Line 282, Size of 'output_switching_condition' must be the same as size of r
elated_outputs. (LBDB-736)
```

LBDB-737 (error) '%s' is required in '%s' if index_output is specified in one of pg_current groups.

DESCRIPTION

For expanded ccs power, if **index_output** is specified in one of **vector** groups, then all of the **vector** groups under the same **pg_current** group must define an **index_output**.

For compact ccs power, if **index_output** is specified in one of **compact_ccs_power** groups, then all of the **compact_ccs_power** groups under the same **pg_current** group must define an **index_output**.

In the case like this, **typical_capacitances** attribute is required in **dynamic_current** group.

This message indicates that there no **typical_capacitances** attribute can be found in **dynamic_current** when **index_output** is defined.

WHAT NEXT

Check the library source file, and make the necessary correction. Add **typical_capacitances** attribute to avoid the error.

EXAMPLES

```
cell(lbdb737) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }
}
```

```

dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z ZN"
    switching_group() {
        ...
        pg_current(<pg_name>) {
            vector(<lu_template_name>) {
                reference_time : 93.2;
                index_output : "Z";
                index_1("5.1");
                index_2("0.3");
                index_3("8.2 9.4 9.8");
                values("1.78 12.4 110.1");
            }
        ...
    }
    ...
}
...
}

```

In this case, `index_output` is specified, but no `typical_capacitances` attribute is specified. To fix the problem, add the line like this `typical_capacitances(0.1);` in the `dynamic_current` group.

EXAMPLE MESSAGE

```
Error: Line 272, 'typical_capacitances' is required in 'dynamic_current' if index_o
utput is specified
    in one of pg_current groups. (LBDB-737)
```

LBDB-738 (error) In '%s' group, size of '%s' must be larger than one

if `index_output` is defined in one of `pg_current` groups.

DESCRIPTION

For expanded ccs power, if `index_output` is specified in one of `vector` groups, then all of the `vector` groups under the same `pg_current` group must define an `index_output` attribute.

For compact ccs power, if `index_output` is specified in one of `compact_ccs_power` groups, then all of the `compact_ccs_power` groups under the same `pg_current` group must define an `index_output` attribute.

In the case like this, the size of `related_outputs` must be larger than 1.

This message indicates that the size of **related_outputs** is less than 2, when **index_output** is defined.

WHAT NEXT

Check the library source file, and make the necessary correction. Increase the size of **related_outputs** up to at least 2 to avoid the error.

EXAMPLES

```
cell(lbdb738) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }

    dynamic_current() {
        related_outputs : "Z"
        ...
        switching_group() {
            ...
            pg_current(<pg_name>) {
                vector(<lu_template_name>) {
                    reference_time : 93.2;
                    index_output : "Z";
                    index_1("5.1");
                    index_2("0.3");
                    index_3("8.2 9.4 9.8");
                    values("1.78 12.4 110.1");
                }
                ...
            }
            ...
        }
        ...
    }
}
```

In this case, size of related_outputs is 1 ("Z"), when index_output is defined, which is wrong. To fix problem, we shall increase size of related_outputs. We can change "Z" to "Z ZN".

EXAMPLE MESSAGE

```
Error: Line 272, In 'dynamic_current' group, size of 'related_outputs' must be larger than one
      if index_output is defined in one of pg_current groups. (LBDB-738)
```

LBDB-739 (error) '%s' attribute is required for this '%s' group.

DESCRIPTION

For expanded ccs power, all **vector** groups under the same **pg_current** group must specify the same template. If there is no any **index_output** attribute specified in these **vector** groups and template used for these **vector** groups contains only one total_output_net_capacitance, then **related_outputs** attribute is required in **dynamic_current**.

For expanded ccs power, all **compact_ccs_power** groups under the same **pg_current** group must specify the same template. If there is no any **index_output** attribute specified in these **compact_ccs_power** groups and template used for these **compact_ccs_power** groups contains only one total_output_net_capacitance, then **related_outputs** attribute is required in **dynamic_current**.

This message indicates that you must specify **related_outputs** attribute in **dynamic_current** because the above rule is applied.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pg_current_template(test_2) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
}
cell(lbdb739) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
```

```

    ...
}

pin(ZN) {
    direction : output;
    ...
}

dynamic_current() {
    when : "A";
    related_inputs : "B";
    ...
    switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall);
        pg_current(<pg_name>) {
            vector(test_2) {
                reference_time : 93.2;
                index_1("5.1");
                index_2("0.3");
                index_3("8.2 9.4 9.8");
                values("1.78 12.4 110.1");
            }
            ...
        }
        ...
    }
}
...
}

```

In this case, there is no `index_output` specified in any vector under a `pg_current` group. Also, the template (`test_2`) that vector referred to contains only one `total_output_net_capacitance` (`variable_2`). In the case like this a `related_outputs` attribute is required to be defined in `dynamic_current` group. To fix the problem, we need to add a `related_outputs` attribute within a `dynamic_current` group.

EXAMPLE MESSAGE

Error: Line 272, 'related_outputs' attribute is required for this 'dynamic_current' group. (LBDB-739)

LBDB-740 (error) Size of '%s' in this '%s' group must be two.

DESCRIPTION

For expanded ccs power, all `vector` groups under the same `pg_current` group refer to the same `pg_current_template`.

For compact ccs power, a `compact_ccs_power` group refers to a `compact_lut_template`.

In the `pg_current_template` or `compact_lut_template`, if there are two

`total_output_net_capacitance`, then size of `related_outputs` in `dynamic_current` must be two.

This message indicates that the size of `related_outputs` is not two.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pg_current_template(test_1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : total_output_net_capacitance;
    variable_4 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
    index_4("4.5 6.7 7.2");
}
cell(lbdb740) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }
}

dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z"
    switching_group() {
        ...
        pg_current(<pg_name>) {
            vector(test_1) {
                reference_time : 93.2;
                index_1("5.1");
                index_2("0.3");
                index_3("0.3");
                index_4("8.2 9.4 9.8");
                values("1.78 12.4 110.1");
            }
        }
    }
}
```

```
 }
...
}
...
```

In this case, template 'test_1' contains two total_output_net_capacitance values, but size of related_outputs is 1 ("Z"), which is wrong. To fix the problem, you might want to increase size of related_outputs to two. You can change "Z" to "Z ZN".

EXAMPLE MESSAGE

Error: Line 262, Size of 'related_outputs' in this 'dynamic_current' group must be two. (LBDB-740)

LBDB-741 (error) Two switching_group groups in line %d and %d are overlapping.

DESCRIPTION

If either min_input_switching_count or max_input_switching_count specified in switching groups, and the switching count number they covered are overlapping, then these **switching_group** groups are considered overlapped.

If there is no min_input_switching_count or max_input_switching_count, then two **switching_group** groups are considered overlapped if both **input_switching_condition** and **output_switching_condition** are overlapped.

If one of followings are true, then **output_switching_condition** is considered to be overlapping condition : + **output_switching_condition** is undefined on both **switching_group** groups. + **output_switching_condition** is defined on both **switching_group** groups and values of them are indentical.

If one of followings are true, then **input_switching_condition** is considered to be overlapping condition : + **input_switching_condition** is undefined on both **switching_group** groups. + **input_switching_condition** is defined on both **switching_group** groups and values of them are indentical. + values of them are difference, but one **input_switching_condition** is undefined, and another has value either "rise" or "fall".

This message indicates that two **switching_group** groups are overlapped because **input_switching_condition** and **output_switching_condition** both are in overlapping condition.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb741) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }
    power_cell_type : stdcell;
    dynamic_current() {
        when : "A";
        related_inputs : "B";
        related_outputs : "Z ZN"
        typical_capacitances(0.3 0.4);
        switching_group() {
            input_switching_condition(fall);
            output_switching_condition(rise fall);
            ...
        }
        switching_group() {
            output_switching_condition(rise fall);
            ...
        }
    }
    ...
}
```

In this case, both switching_group have same output_switching_condition, and one input_switching_condition has value "fall" and another is undefined. input_switching_condition is overlapping and which is same as output_switching_condition, so two switching_group groups are overlapped. To fix the problem, you might want to change the value to "fall fall" in one of output_switching_condition groups.

```
type(bus6) {
    base_type : array ;
    data_type : bit ;
    bit_width : 6 ;
    bit_from : 5 ;
    bit_to : 0 ;
    downto : true ;
}
```

```

cell(lbdb741) {
    bus(sel) {
        bus_type : bus6 ;
        direction : input ;
        capacitance : 2 ;
        related_power_pin : V1;
        related_ground_pin : G1;
    }

    bundle(C) {
        members(Cx, Cy, Cz);
        direction : input;
        capacitance : 2 ;
        related_power_pin : V1;
        related_ground_pin : G1;

    }
    area : 2;
    pg_pin(V1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(V2) {
        voltage_name : VDD2;
        pg_type : backup_power;
    }
    pg_pin(G1) {
        voltage_name : GND1;
        pg_type : primary_ground;
    }
    pg_pin(G2) {
        voltage_name : GND2;
        pg_type : backup_ground;
    }
    power_cell_type : macro;
    dynamic_current() {
        related_inputs : "C sel";
        switching_group() {
            min_input_switching_count : 1;
            max_input_switching_count : 6;
            ...
        }
        switching_group() {
            min_input_switching_count : 5;
            max_input_switching_count : 9;
            ...
        }
        ...
    }
}
}

```

In this case, the `min_input_switching_count` and `max_input_switching_count` are specified in "macro" cell type. If that is the case, we need to check if the number they covered are overlapping. We don't worry about `input_switching_condition` or `output_switching_condition` here because these attributes can't be specified.

if either min_input_switching_count or max_input_switching_count is specified.

'C' is 6 bits bus and 'sel' is 3 bits bundle. The total bits are 9.

For the first switching_group, the switching count is from 1 to 6, and for the second switching_group, the switching count is from 5 to 9. The number 5 and 6 are covered in both groups, which means the two groups are overlapping. To fix the problem, please change number 5 to 7 in the second switching_group or change number 6 to 4 in the first switching_group.

SH EXAMPLE MESSAGE

Error: Line 100, Two switching_group groups in line 170 and 189 are overlapping. (LBDB-741)

LBDB-742 (error) Only one total_output_net_capacitance is allowed for the template specified in this %s.

DESCRIPTION

For expanded ccs power, if **index_output** is specified in one of **vector** groups, then all of the **vector** groups under the same **pg_current** group must define an **index_output** attribute.

For compact ccs power, if **index_output** is specified in one of **compact_ccs_power** groups, then all of the **compact_ccs_power** groups under the same **pg_current** group must define an **index_output** attribute.

In the case like this, the template , which these **vector/compact_ccs_power** groups referred to, must contains only one total_output_net_capacitance.

This message indicates that the template contains either more than one or less than one total_output_net_capacitance.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pg_current_template(test_1) {  
    variable_1 : input_net_transition;  
    variable_2 : total_output_net_capacitance;  
    variable_3 : total_output_net_capacitance;  
    variable_4 : time;  
    index_1("0.6 0.9");  
    index_2("0.6 0.9");  
    index_3("0.3 4.7");
```

```

    index_4("4.5 6.7 7.2");
}

pg_current_template(test_2) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
}
cell(lbdb742) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }
}

dynamic_current() {
    when : "A";
    related_inputs : "B";
    related_outputs : "Z ZN";
    typical_capacitances(0.3 0.4);
    switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall);
        pg_current(<pg_name>) {
            vector(test_1) {
                reference_time : 93.2;
                index_output : "Z";
                index_1("5.1");
                index_2("0.3");
                index_3("0.3");
                index_4("8.2 9.4 9.8");
                values("1.78 12.4 110.1");
            }
        }
        ...
    }
}

```

In this case, `index_output` is specified in `vector`, and the `vector` is referred to template '`test_1`', which contains two `total_output_net_capacitance` values. That is wrong. To fix the problem, we can change referred template to '`test_2`'.

EXAMPLE MESSAGE

```
Error: Line 272, Only one total_output_net_capacitance is allowed for the
template specified in this vector. (LBDB-742)
```

LBDB-743 (error) All %s under a pg_current group must specify same template.

DESCRIPTION

All **vector** or **compact_ccs_power** groups under the same **pg_current** group must specify the same template.

This message indicates that you specified different templates in /fBvector or **compact_ccs_power** groups, which are all under same **pg_current**.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pg_current_template(test_1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : total_output_net_capacitance;
    variable_4 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
    index_4("4.5 6.7 7.2");
}

pg_current_template(test_2) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
}

cell(lbdb743) {
    area : 2;
    ...
    dynamic_current() {
        ...
        switching_group() {
            ...
            pg_current(<pg_name>) {
                vector(test_2) {
```

```

        reference_time : 93.2;
        index_1("5.1");
        index_2("0.3");
        index_3("8.2 9.4 9.8");
        values("1.78 12.4 110.1");
    }
    vector(test_1) {
        reference_time : 93.2;
        index_1("5.1");
        index_2("0.3");
        index_3("0.3");
        index_4("8.2 9.4 9.8");
        values("1.78 12.4 110.1");
    }
    ...
}
...

```

In this case, two vectors refer to different templates, one is 'test_1', and another is 'test_2'. This is wrong. To fix the problem, change 'test_1' to 'test_2' in second vector.

EXAMPLE MESSAGE

Error: Line 272, All vectors under a pg_current group must specify same template. (LBDB-743)

LBDB-744 (error) index_output is required for all %s in this pg_current group.

DESCRIPTION

For expanded ccs power, if **index_output** is specified in one of **vector** groups, then all of the **vector** groups under the same **pg_current** group must define an **index_output** attribute.

For compact ccs power, if **index_output** is specified in one of **compact_ccs_power** groups, then all of the **compact_ccs_power** groups under the same **pg_current** group must define an **index_output** attribute.

This message indicates that **index_output** attribute is not defined in all **vector/compact_ccs_power** groups under a **pg_current**.

Also to see, LBDB-737, LBDB-738, and LBDB-742.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb744) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
        ...
    }

    dynamic_current() {
        when : "A";
        related_inputs : "B";
        related_outputs : "Z ZN"
        typical_capacitances(0.3 0.4);
        switching_group() {
            input_switching_condition(fall);
            output_switching_condition(rise fall);
            pg_current(VDD) {
                vector(<lu_template_name>) {
                    reference_time : 93.2;
                    index_output : "ZN";
                    index_1("5.1");
                    index_2("0.3");
                    index_3("8.2 9.4 9.8");
                    values("1.78 12.4 110.1");
                }
                vector(<lu_template_name>) {
                    reference_time : 93.2;
                    index_output : "Z";
                    index_1("5.1");
                    index_2("0.3");
                    index_3("8.2 9.4 9.8");
                    values("1.78 12.4 110.1");
                }
                vector(<lu_template_name>) {
                    reference_time : 93.2;
                    index_1("5.1");
                    index_2("0.3");
                    index_3("8.2 9.4 9.8");
                    values("1.78 12.4 110.1");
                }
            }
        }
        ...
    }
}
```

```
    }
}
...
```

In this case, index_output is not specified in third vector, which is wrong. All vectors under pg_current(VDD) must specify index_output, because index_output has been defined in one of vectors. To fix the problem, add index_output attribute to the third vector.

EXAMPLE MESSAGE

Error: Line 272, index_output is required for all vectors in this pg_current group. (LBDB-744)

LBDB-745 (error) Under this dynamic_current, pin '%s' is specified in '%s' and '%s'.

DESCRIPTION

/fbwhen, **related_outputs**, and **related_inputs** can't specify the same pin if they are under the same **dynamic_current** group.

This message indicates that you specified the same pin for two of following attributes : /fbwhen, **related_outputs**, and **related_inputs**

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb745) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(B) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
        ...
    }
    pin(ZN) {
        direction : output;
```

```

    ...
}

pin(ZN1) {
    direction : output;
    ...
}
dynamic_current() {
    when : "B + ZN'";
    related_inputs : "B";
    related_outputs : "Z ZN"
    typical_capacitances(0.3 0.4);
    switching_group() {
        ...
    }
}

```

In this case, pin B is specified in both when and related_inputs, which is wrong. Same for pin ZN, which is specified in both when and related_outputs. To fix the problem, change "B" to "A" in related_inputs, and change "Z ZN" to "Z ZN1" in related_outputs.

EXAMPLE MESSAGE

```

Error: Line 272, Under this dynamic_current, pin 'B' is specified in
      'related_inputs' and 'when'. (LBDB-745)
Error: Line 272, Under this dynamic_current, pin 'ZN' is specified in
      'related_outputs' and 'when'. (LBDB-745)

```

LBDB-746 (error) The %s of cell '%s'
should be specified before the %s '%s' is defined.

DESCRIPTION

You receive this message because the switch_cell_type is not defined before specifying the attributes related to switch cells.

WHAT NEXT

Make sure that **switch_cell_type** attribute exists before defining other attributes related switch cells.

EXAMPLES

The following example shows the switch_cell_type is missing.

```

cell(sample) {
    pin(Y) {
        switch_function : "sp";

```

```
...
}
.....
}
```

Correct it by add **fBswitch_cell_typefp** attribute in the cell group.

EXAMPLE MESSAGE

Error: Line 191, The switch_cell_type attribute of cell 'sample' should be specified before the switch_function 'sp' is defined. (LBDB-746)

LBDB-747 (warning) %s on input pin and %s on output pin have same power rail value but different rail name.

DESCRIPTION

This message will only be applied for an isolation cell.

In Liberty, we support two kinds (old and new) of pg syntax. If **input_signal_level** and **related_power_pin** both presented in new syntax, then **input_signal_level** will be chosen, and **related_power_pin** will be discarded.

If you are in new pg syntax, the message indicates that voltage name of either **input_signal_level** or **related_power_pin** in input pin is different from voltage name of **related_power_pin** in ouput pin, but both are referring to the same voltage value.

If you are in old pg syntax, the message indicates that rail name of **input_signal_level** in input pin is different from rail name of **foutput_signal_level** in ouput pin, but both rail names are referring to the same voltage value.

WHAT NEXT

Check the library source file, and make the necessary correctiorn if it is needed.

EXAMPLES

```
/* This is an example of old pg syntax. */
library(libdb747) {
...
power_supply() {
    default_power_rail : VDD;
    power_rail (VDDH, 3); /* high power */
    power_rail (VDDL, 3); /* low power */
    power_rail (VSS, 0.0); /* primary ground */
}
...
/* operation conditions */
nom_process : 1;
```

```

nom_temperature      : 25;
nom_voltage     : 1.0;
operating_conditions(3v_3v) {
    process      : 1;
    temperature  : 25;
    voltage      : 1.0;
    tree_type    : balanced_tree
    power_rail (VDDH, 3); /* high power */
    power_rail (VDDL, 3); /* low power */
    power_rail (VSS, 0.0); /* primary ground */
}
default_operating_conditions : 3v_3v;

...
cell (LVLHLEHX2M) {
    ...
    rail_connection (VDD, VDDL);
    area : 2.600000;
    is_isolation_cell : true;
    pin(A) {
        direction : input;
        input_signal_level : VDDH;
        capacitance : 0.1859;
        internal_power() {
            ...
        }
    }
    pin(Y) {
        direction : output;
        output_signal_level : VDDL;
        capacitance : 0.0;
        function : "(A & EN)";
        internal_power() {
            power_level : VDDL;
        }
    }
}

```

In this case, `input_signal_level` in input pin "A" is specified "VDDH" as power rail, which is different from "VDDL" specified in `output_signal_level` in output pin "Y". However, both "VDDH" and "VDDL" are referring to same voltage value "3" as defined in `operating_conditions` group.

EXAMPLE MESSAGE

Warning: Line 100, `input_signal_level` on input pin and `output_signal_level` on output pin have same power rail value but different rail name. (LBDB-747)

EXAMPLES

```
/* This is an example of new pg syntax */
library (libdb747) {
```

```

voltage_map( VDD, 0.7);
voltage_map(VDDH, 0.8); /* high power */
voltage_map(VDDL, 0.8); /* low power */
voltage_map(VSS, 0.0); /* primary ground */
cell(ISO) {
pg_pin(VDD1) {
voltage_name : VDDH;
pg_type : primary_power;
}
pg_pin(VDD2) {
voltage_name : VDDL;
pg_type : primary_power;
}

is_isolation_cell : true;
...
pin(in) {
...
    input_signal_level : VDDH;
    related_power_pin : VDD1; /* discard */
    related_ground_pin : GND;
}
pin(out) {
...
    related_power_pin: VDD2;
    related_ground_pin : GND;
}
}

```

In this case, `input_signal_level` 'VDDH' is referred to voltage value 0.8 and `related_power_pin` 'VDD2' is referred to voltage value 0.8, too. The voltage value 0.8 in input pin is same as voltage value in output pin, but their voltage names are different, one is VDDH, and the other is VDDL.

EXAMPLE MESSAGE

```

Warning: Line 100, input_signal_level on input pin and related_power_pin on output
pin
        have same power rail value but different rail name. (LBDB-747)

```

SEE ALSO

LBDB-727

LBDB-748 (error) There are less than 4 vectors specified in

group '%s'.

DESCRIPTION

This error message occurs because Library Compiler requires at least 4 vectors inside each output_current_rise or output_current_fall group.

The following example shows an output_current_rise group without a dense vector and resulting error message.

```
output_current_template(CCT) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
}
. . .
output_current_rise() {
    vector(CCT) {
        reference_time : 0.11;
        index_1 ("0.1");
        index_2 ("1");
        index_3 ("1, 2, 3");
        values ("1, 2, 3");
    }
    /* need at least additional 3 vectors to compile */
}
```

Error: Line 198, There are less than 4 vectors specified in group 'output_current_rise'. (LBDB-748)

WHAT NEXT

Check the library source file and add additional vectors.

LBDB-749 (error) The size of %s should be at least %d.

DESCRIPTION

The specification of the size of the index is less than the minim index size.

WHAT NEXT

Check the library source file, and correct the problem by inceasing the size of the specified index.

EXAMPLES

```
lu_table_template(basic_template) {  
variable_1 : input_net_transition;  
index_1 ("1");  
}  
  
receiver_capacitance1_rise(basic_template) {  
index_1 ("500");  
values ("1.3401");  
}
```

EXAMPLE MESSAGE

Error: Line 160, The size of index_1 should be at least 2. (LBDB-749)

LBDB-750 (warning) Overwrite '%s' by default '%s' value %f defined in 'operating_conditions'.

DESCRIPTION

There are two pg pin syntaxes in liberty: one is old syntax such as power_rail or rail_connection, another is new syntax such as voltage_map or pg_pin.

If new pg_pin syntax has been defined in .lib file , all PVT (process, voltage and temperature) defined in default_operating_conditions will be copied over to nom PVT.

The warning message indicates that whatever default nom PVT values you defined have been overwritten by values of default_operating_conditions.

EXAMPLES

```
library(libdbb750) {  
...  
nom_process : 1.3  
nom_temperature : 20.0;  
nom_voltage : 4.0;  
  
operating_conditions ( TYPICAL ) {  
    process : 1.0 ;  
    temperature : 22.0 ;  
    voltage : 3.0 ;  
    tree_type : balanced_tree ;  
}  
default_operating_conditions : TYPICAL;  
...  
voltage_map(VDD1, 4.0); /* new pg pin syntax */  
voltage_map(VDD2, 4.5);
```

```

...
cell (and2) {
...
pg_pin(V1) { /* new pg pin syntax */
    voltage_name : VDD1;
    pg_type : primary_power;
}
pg_pin(V2) {
    voltage_name : VDD2;
    pg_type : backup_power;
}
...

```

In this case, nom_process will be overwritten by "process" value 1.0, which is defined in default operating_conditions group. nom_temperature will be overwritten by "temperature" value 22.0, which is defined in default operating_conditions group. nom_voltage will be overwritten by "voltage" value 3.0, which is defined in default operating_conditions group.

EXAMPLE MESSAGE

```

Warning: Line 100, Overwrite 'nom_process' by default 'process' value 1.0 defined
in 'operating_conditions'. (LBDB-750)
Warning: Line 100, Overwrite 'nom_temperature' by default 'temperature' value 22.0
defined
in 'operating_conditions'. (LBDB-750)
Warning: Line 100, Overwrite 'nom_voltage' by default 'voltage' value 3.0 defined
in 'operating_conditions'. (LBDB-750)

```

LBDB-751 (error) The %s group with name '%s', has not been defined in the %s.

DESCRIPTION

This message indicates that the referred group name is undefined in the library.

WHAT NEXT

Add the referred group in the library. Or remove the reference

EXAMPLE MESSAGE

```
Error: Line 57, The base_curves group with name 'AND2",
has not been defined in the library.(LBDB-751)
```

LBDB-752 (error) The '%s' attribute is missing in compressed_lut_template '%s'.

DESCRIPTION

This message indicates that the attribute is not defined in the compressed_lut_template group.

WHAT NEXT

Add the attribute in compressed_lut_template.

EXAMPLE MESSAGE

Error: Line 58, The 'base_curves_group' attribute is missing in compressed_lut_template 'LTT3'.(LBDB-752)

LBDB-753 (error) The '%s' base curve parameter is missing in compressed_lut_template '%s' index_3.

DESCRIPTION

For ccs timing base curves, these six elementary curve parameters are must needed: init_current, peak_current, peak_voltage, peak_time, left_id, right_id. Additional parameters are also allowed, the index_3 value list can contains more than six parameters.

WHAT NEXT

Add the missing elementary curve parameter in compressed_lut_template index_3.

EXAMPLES

```
compressed_lut_template(LTT3) {  
variable_1 : input_net_transition;  
variable_2 : total_output_net_capacitance;  
variable_3 : curve_parameters;  
index_1 ("0.1, 0.2");  
index_2 ("1.0, 1.2");  
index_3 ("init_current, peak_current, peak_voltage, left_id, right_id");  
}
```

EXAMPLE MESSAGE

Error: Line 60, The 'peak_time' base curve parameter is missing in compressed_lut_t

```
emplate 'LTT3' index_3.(LBDB-753)
```

LBDB-754 (error) Redudant curve_x defined in base_curves '%S'.

DESCRIPTION

In a base_curves group, only one curve_x definition is allowed, otherwise it brings confusing to users.

WHAT NEXT

Remove redundant curve_x definition in base curves group, left one curve_x is enough.

EXAMPLES

```
base_curves(AND2_BC) {  
    base_curve_type : ccs_timing_half_curve;  
    curve_x ("0.1, 0.5, 0.9");  
    curve_x ("0.2, 0.5, 0.8");  
    curve_y (1, "0.8, 0.5, 0.2");  
    curve_y (2, "0.85, 0.5, 0.15");  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 62, Redudant curve_x defined in base_curves 'AND2_BC'.(LBDB-754)

LBDB-755 (error) Illegal base curve data is specified in '%s'.

DESCRIPTION

The syntax of base_curves group: base_curves("name") { base_curve_type : ccs_half_curve; curve_x ("float..., float"); curve_y (curve_id, "float..., float"; ... }

Following are rules for base curve data: For curve data specified in curve_x: 1. At least 3 points are specified; 2. The value should between 0 and 1; 3. The values should be monotonic increasing;

For curve_data specified in curve_y: 1. number of points should be same as that in curve_x; 2. curve_y should be defined after curve_x; 3. valid boundary is [-inf, 1] for both compact CCS timing and compact CCS power.

WHAT NEXT

Check base curve data according these rules, fix error.

EXAMPLES

```
base_curves(AND2_BC) {  
    base_curve_type : ccs_timing_half_curve;  
    curve_x ("0.1, 0.5, 1.1");  
    curve_y (1, "0.8, 0.5, 0.2, 0.1");  
    curve_y (2, "0.85, 0.5, 0.15");  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 63, Illegal base curve data is specified in 'curve_x'.(LBDB-755)
Error: Line 64, Illegal base curve data is specified in 'curve_y'.(LBDB-755)

LBDB-756 (error) No curve_x definition found before curve_y in the base_curves '%s'.

DESCRIPTION

In a base_curves group, Only and Must have one curve_x defined before curve_y.

WHAT NEXT

Add the curve_x definition before the curve_y, otherwise, the base curve data is incomplete.

EXAMPLES

```
base_curves(AND2_BC) {  
    base_curve_type : ccs_timing_half_curve;  
    curve_y (1, "0.8, 0.5, 0.2");  
    curve_y (2, "0.85, 0.5, 0.15");  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 65, No curve_x definition found before curve_y in the base_curves 'AND2_BC'.(LBDB-756)

LBDB-757 (error) No curve_y definition found in the base_curves '%s'.

DESCRIPTION

In a base_curves group, base curves are demonstrated by curve_x and curve_y together. curve_y can't be absent.

WHAT NEXT

Add the curve_y definition after the curve_x, in the base curves group.

EXAMPLES

```
base_curves(AND2_BC) {  
    base_curve_type : ccs_timing_half_curve;  
    curve_x ("0.1, 0.5, 0.9");  
}
```

EXAMPLE MESSAGE

Error: Line 63, No curve_y definition found in the base_curves 'AND2_BC'. (LBDB-757)

LBDB-758 (error) Duplicate or negative curve_id '%d' is specified.

DESCRIPTION

In a base_curves group, the curve_id in curve_y should satisfy following rules: 1. curve_id should be an integer that greater than 0; 2. curve_id should be unique in the base_curves group;

WHAT NEXT

Check rules above, correct the curve_id data in curve_y.

EXAMPLES

```
base_curves(AND2_BC) {  
    base_curve_type : ccs_timing_half_curve;  
    curve_x ("0.1, 0.5, 1.1");  
    curve_y (-1, "0.8, 0.5, 0.2, 0.1");  
    curve_y (2, "0.85, 0.5, 0.15");  
    curve_y (4, "0.8, 0.5, 0.2, 0.1");  
    curve_y (4, "0.85, 0.5, 0.15");
```

```
...  
}
```

EXAMPLE MESSAGE

```
Error: Line 63, Duplicate or negative curve_id '-1' is specified.(LBDB-758)  
Error: Line 60, Duplicate or negative curve_id '4' is specified.(LBDB-758)
```

LBDB-759 (error) Bad init_current value '%g' is specified in '%s'.

DESCRIPTION

Init_current is one of six parameters to model compressed ccs timing base curve. In compressed_ccs_rise group, the init_current values should ≥ 0 ; And in compressed_ccs_fall group, the init_current values should ≤ 0 ;

WHAT NEXT

According the rule above, correct the init_current value.

EXAMPLES

```
library(name) {  
    ...  
    base_curves (ctbct1){  
        base_curve_type : ccs_timing_half_curve;  
        curve_x("0.2, 0.5, 0.8");  
        curve_y(1, "0.8, 0.5, 0.2");  
        curve_y(2, "0.75, 0.5, 0.35");  
        curve_y(3, "0.85, 0.5, 0.15");  
        curve_y(4, "0.85, 0.5, 0.15");  
    }  
    compressed_lut_template(LTT3) {  
        variable_1 : input_net_transition;  
        variable_2 : total_output_net_capacitance;  
        variable_3 : curve_parameters;  
        index_1 ("0.1, 0.2");  
        index_2 ("1.0, 2.0");  
        index_3 ("init_current, peak_current, peak_voltage, peak_time, left_id, right_id");  
        base_curves_group: "ctbct1";  
    }  
  
    cell(cell_name) {  
        pin(pin_name) {  
            timing() {  
                compressed_ccs_rise("LTT3") {  
                    values("0, 0.5, 0.6, 0.8, 1, 3",  
                          "-0.15, 0.55, 0.65, 0.85, 2, 4",  
                          "0.2, 0.6, 0.7, 0.9, 3, 2", <HardSpace
```

```

        "0.25, 0.65, 0.75, 0.95, 4, 1");
} /* end of compressed_ccs_rise */
}
}
}
...
}
```

EXAMPLE MESSAGE

Error: Line 1163, Bad init_current value '-0.15' is specified in 'compressed_ccs_rise'. (LBDB-759)

SEE ALSO

LBDB-753

LBDB-760 (error) Bad peak_current value '%g' is specified in '%s'.

DESCRIPTION

peak_current is one of six parameters to model compressed ccs timing base curve. In compressed_ccs_rise group, the peak_current values should > 0; And in compressed_ccs_fall group, the peak_current values should < 0;

WHAT NEXT

According the rule above, correct the peak_current value.

EXAMPLES

```
library(name) {
...
base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
}
compressed_lut_template(LTT3) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
```

```

    index_2 ("1.0, 2.0");
    index_3 ("init_current, peak_current, peak_voltage, peak_time, left_id, right_id");
    base_curves_group: "ctbct1";
}

cell(cell_name) {
    pin(pin_name) {
timing() {
    compressed_ccs_rise("LTT3") {
        values("0.1, 0, 0.6, 0.8, 1, 3",
        "0.15, -0.55, 0.65, 0.85, 2, 4",
        "0.2, 0.6, 0.7, 0.9, 3, 2", <HardSpace
            "0.25, 0.65, 0.75, 0.95, 4, 1");
    } /* end of compressed_ccs_rise */
}
}
}
...
}

```

EXAMPLE MESSAGE

Error: Line 1163, Bad peak_current value '0' is specified in 'compressed_ccs_rise'.
(LBDB-760)
Error: Line 1163, Bad peak_current value '
0.55' is specified in 'compressed_ccs_rise'. (LBDB-760)

SEE ALSO

LBDB-753

LBDB-761 (error) Non-integer base curve id '%s' is specified in '%S'.

DESCRIPTION

Curve_id should be integers because it is defined with integer data type.

For compact ccs timing, curve_id is the data corresponding to left_id or right_id in compressed_ccs_rise/compressed_ccs_fall group.

For compact ccs power, curve_id is the data corresponding to bc_id* in compact_ccs_power group.

WHAT NEXT

According the rule above, correct the left_id/right_id value in compressed_ccs_rise/

compressed_ccs_fall group, or the bc_id* value in compact_ccs_power group.

EXAMPLES

```
library(name) {
    ...
    base_curves (ctbct1){
        base_curve_type : ccs_timing_half_curve;
        curve_x("0.2, 0.5, 0.8");
        curve_y(1, "0.8, 0.5, 0.2");
        curve_y(2, "0.75, 0.5, 0.35");
        curve_y(3, "0.85, 0.5, 0.15");
        curve_y(4, "0.85, 0.5, 0.15");
    }
    compressed_lut_template(LTT3) {
        variable_1 : input_net_transition;
        variable_2 : total_output_net_capacitance;
        variable_3 : curve_parameters;
        index_1 ("0.1, 0.2");
        index_2 ("1.0, 2.0");
        index_3 ("init_current, peak_current, peak_voltage, peak_time, left_id, right_id");
        base_curves_group: "ctbct1";
    }
}

cell(cell_name) {
    pin(pin_name) {
    timing() {
        compressed_ccs_rise("LTT3") {
            values("0.1, 0, 0.6, 0.8, 1, 3",
                  "0.15, -0.55, 0.65, 0.85, 2, 4",
                  "0.2, 0.6, 0.7, 0.9, 3, 2", <HardSpace
                  "0.25, 0.65, 0.75, 0.95, 4, 1");
        } /* end of compressed_ccs_rise */
    }
    }
}
...
}
```

EXAMPLE MESSAGE

```
Error: Line 1163, Non-integer curve_id(left_id/
right_id) '3.5' is specified in 'compressed_ccs_rise'. (LBDB-761)
Error: Line 1163, Non-integer curve_id(left_id/
right_id) '2.0' is specified in 'compressed_ccs_rise'. (LBDB-761)
```

SEE ALSO

LBDB-753

LBDB-762 (error) Undefined base curve id '%d' is referenced in '%S'.

DESCRIPTION

Curve_id must be predefined in previous base_curve group.

For compact ccs timing, curve_id is the data corresponding to left_id or right_id in compressed_ccs_rise/compressed_ccs_fall group.

For compact ccs power, curve_id is the data corresponding to bc_id* in compact_ccs_power group.

WHAT NEXT

According the rule above, correct the left_id/right_id value in compressed_ccs_rise/compressed_ccs_fall group, or the bc_id* value in compact_ccs_power group.

EXAMPLES

```
library(name) {  
    ...  
    base_curves (ctbct1){  
        base_curve_type : ccs_timing_half_curve;  
        curve_x("0.2, 0.5, 0.8");  
        curve_y(1, "0.8, 0.5, 0.2");  
        curve_y(2, "0.75, 0.5, 0.35");  
        curve_y(3, "0.85, 0.5, 0.15");  
        curve_y(4, "0.85, 0.5, 0.15");  
    }  
    compressed_lut_template(LTT3) {  
        variable_1 : input_net_transition;  
        variable_2 : total_output_net_capacitance;  
        variable_3 : curve_parameters;  
        index_1 ("0.1, 0.2");  
        index_2 ("1.0, 2.0");  
        index_3 ("init_current, peak_current, peak_voltage, peak_time, left_id, right_id");  
        base_curves_group: "ctbct1";  
    }  
  
    cell(cell_name) {  
        pin(pin_name) {  
            timing() {  
                compressed_ccs_rise("LTT3") {  
                    values("0.1, 0, 0.6, 0.8, 1, 31",  
                        "0.15, -0.55, 0.65, 0.85, 7, 4",  
                        "0.2, 0.6, 0.7, 0.9, 3, 2", <HardSpace  
                            "0.25, 0.65, 0.75, 0.95, 4, 1");  
                } /* end of compressed_ccs_rise */  
            }  
        }  
    }  
}
```

```
    }
}
...
}
```

EXAMPLE MESSAGE

```
Error: Line 1163, Undefined curve_id(lef_id/
right_id) '31' is referenced in 'compressed_ccs_rise'. (LBDB-762)
Error: Line 1163, Undefined curve_id(lef_id/
right_id) '7' is referenced in 'compressed_ccs_rise'. (LBDB-762)
```

SEE ALSO

LBDB-753

LBDB-763 (error) Incompatible %s data specified in %s.

DESCRIPTION

For ccs timing and power data, there are two models that can be used. One is expanded model, the other is compact model.

Expanded ccs timing model is specified by output_current_{rise|fall}. Compact ccs timing model is specified by compact_ccs_{rise|fall}. Expanded ccs power model is specified by vector under pg_current group. Compact ccs power model is specified by compact_ccs_power under pg_current group.

Currently, only one model is supported in one library. If both of them are used in the library, the error is issued.

Users can't specify expanded ccs timing/power model for some cells in the library, while compact ccs timing/power model for other cells.

WHAT NEXT

Keep only one ccs timing/power model in the library.

EXAMPLES

```
library(name) {
...
cell(cell_name1) {
    pin(pin_name) {
timing() {
    output_current_rise() {
        vector("CT3") {
```

```

...
}

...
}

output_current_fall() {
    vector("CT3") {
...
}
...
}
}

cell(cell_name2) {
    pin(pin_name) {
timing() {
    compact_ccs_rise("LTT3") {
        values("......., ....");
    }
    compact_ccs_fall("LTT3") {
        values("......., ....");
    }
}
}
}
}

...
}

```

EXAMPLE MESSAGE

Error: Line 1, Un-Compatible CCS timing data specified in timing arc. (LBDB-763)

LBDB-764 (error) Redundant base_curves group '%s' with '%s' type defined in library.

DESCRIPTION

Since the compressed ccs data (for the time being, it only support compressed ccs timing) is consumed by PT, to ensure the performance of PT, guarantee the ccs accuracy and ease the implementation of PT support and implementation, we only support one base curve group with specific base curve type.

WHAT NEXT

Remove the base_curves group or combine same base curve type groups into one base_curves group if possible. Leave only one base_curves group with the base curve type.

EXAMPLES

```
library(name) {  
    ...  
  
    base_curves(bct1) {  
        base_curve_type : ccs_timing_half_curve;  
        curve_x ("0.1, 0.5, 0.9");  
        curve_y (1, "0.2, 0.5, 0.8");  
        ...  
    }  
    base_curves(bct2) {  
        base_curve_type : ccs_timing_half_curve;  
        curve_x ("0.1, 0.5, 0.9");  
        curve_y (1, "0.33, 0.55, 0.88");  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 165, Redundant base_curves group 'bct2' with 'ccs_timing_half_curve' type defined in library. (LBDB-764)

LBDB-765 (error) Bad peak_voltage value '%g' is specified in '%s',

Legal vale should be in range of [%g, %g].

DESCRIPTION

peak_voltage is one of six parameters to model compact ccs timing base curve. In [va_]compact_ccs_rise/fall group, the peak_voltage values should less than Vdd of this port.

Note that the ways to define VDD are different between pg pin library, power-rail library, non-pg pin library. details may need to refer to application notes for pg pin supporting.

WHAT NEXT

According the rule above, correct the peak_voltage value.

EXAMPLES

```
library(name) {  
    ...
```

```

operating_conditions(typical) {
    process: 1;
    temperature: 25;
    voltage: 1.0;
    tree_type: balanced_tree
}
default_operating_conditions : typical;

base_curves (ctbct1){
    base_curve_type : ccs_timing_half_curve;
    curve_x("0.2, 0.5, 0.8");
    curve_y(1, "0.8, 0.5, 0.2");
    curve_y(2, "0.75, 0.5, 0.35");
    curve_y(3, "0.85, 0.5, 0.15");
    curve_y(4, "0.85, 0.5, 0.15");
}
compressed_lut_template(LTT3) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
    index_1 ("0.1, 0.2");
    index_2 ("1.0, 2.0");
    index_3 ("init_current, peak_current, peak_voltage, peak_time, left_id, right_id");
    base_curves_group: "ctbct1";
}

cell(cell_name) {
    pin(pin_name) {
timing() {
    compact_ccs_rise("LTT3") {
        values("0.1, 0, 0.6, 0.8, 1, 3",
              "0.15, 1.55, 0.65, 0.85, 2, 4",
              "0.2, 0.6, 0.7, 0.9, 3, 2", <HardSpace
                  "0.25, 0.65, 0.75, 0.95, 4, 1");
    } /* end of compressed_ccs_rise */
}
    }
}
...
}

```

EXAMPLE MESSAGE

Error: Line 1163, Bad peak_voltage value '1.55' is specified in 'compact_ccs_rise',
Legal value should be in range of [0, 1.0].(LBDB-765)

SEE ALSO

LBDB-753

LBDB-766 (warning) The '%s' attribute of %s '%s' overwrites the value specified in the '%s' attrbiute.

DESCRIPTION

This message indicates that the latest value overwrites the previous value defined for the same attribute.

WHAT NEXT

Make sure that it is what have been expected.

EXAMPLE MESSAGE

```
Error: Line 100, The 'retention_pin' attribute of pin 'A' overwrites the value specified  
in the 'map_to_logic' attrbiute. (LBDB-766)
```

LBDB-767 (error) No mandatory attribute '%s' defined in sensitization group '%s'.

DESCRIPTION

sensitization group is to describe the complete state patterns (by vector attributes) for a specific list of pins (by pin_names attribute). vector and pin_names are mandatory attributes in the group.

WHAT NEXT

According to message, add pin_names or vector to make the sensitization group complete.

EXAMPLES

```
library(name) {  
    ...  
    sensitization (my_sensitization){  
        pin_names("A, B, Y");  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 11, No mandatory attribute 'vector' defined in sensitization group 'my_sensitization'.(LBDB-767)

LBDB-768 (error) Duplicate pin name '%s' specified in '%s'.

DESCRIPTION

This error is issued when duplicate pin name specified in sensitization group pin_names, or cell/timing group pin_name_map attribute. Pin names in the attribute are used to generate stimuli from sensitization group for timing arc.

WHAT NEXT

Correct the duplicate pin name definition, if the number of pin is changed because of the fix, other sensitization related attributes may also need to be updated.

EXAMPLES

```
library(name) {  
    ...  
    sensitization (my_sensitization){  
        pin_names("A, B, B, Y");  
        vector (0, "0 0 0 0");  
        vector (1, "0 0 0 1");  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 12, Duplicate pin name 'B' specified in 'pin_names'.(LBDB-768)

LBDB-769 (error) %s id (%d) specified sensitization vector.

DESCRIPTION

This error is issued when duplicate or negative vector id specified in vector attribute. The vector attribute is composed by: vector(vector_id, vector_string); The vector id should greater than or equal to zero, and unique in current sensitization group.

WHAT NEXT

Correct the vector id in the vector attribute, according to the rule above.

EXAMPLES

```
library(name) {  
    ...  
    sensitization (my_sensitization){  
        pin_names("A, B, C, Y");  
        vector (0, "0 0 0 0");  
        vector (1, "0 0 0 1");  
        vector (1, "0 0 1 1");  
        vector (-1, "0 0 1 0");  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

```
Error: Line 14, Duplicate id (1) specified in sensitization vector.(LBDB-769)  
Error: Line 15, Negative id (-1) specified in sensitization vector.(LBDB-769)
```

LBDB-770 (error) No pin_names attribute defined before the vector.

DESCRIPTION

In sensitization group, pin_names attribute should be declared before all vectors. The error is issued when processing vector but find no pin_names attribute defined before in the sensitization group.

WHAT NEXT

Add pin_names attribute if it's missing, or reorder the pin_names attribute to the first declaration in the sensitization group.

EXAMPLES

```
library(name) {  
    ...  
    sensitization (my_sensitization){  
        vector (0, "0 0 0 0");  
        pin_names("A, B, C, Y");  
        vector (1, "0 0 0 1");
```

```
    vector (2, "0 0 1 0");
    vector (3, "0 0 1 1");
    ...
}

...
}
```

EXAMPLE MESSAGE

Error: Line 13, No pin_names attribute defined before the vector.(LBDB-770)

LBDB-771 (error) Number of elements in the vector string (%d) is different from number of pin (%d).

DESCRIPTION

This error is issued when the number of elements in vector string is different the number of pins defined in pin_names attribute. The vector attribute is composed by:
vector(vector_id, vector_string);

WHAT NEXT

Correct the vector string in the vector attribute, make it's elements number equal to number of pin in pin_names.

EXAMPLES

```
library(name) {
    ...
    sensitization (my_sensitization) {
        pin_names("A, B, C, Y");
        vector (0, "0 0 0 0");
        vector (1, "0 0 0 1");
        vector (2, "0 0 1 0");
        vector (3, "0 1 1");
        ...
    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 17, Number of elements in the vector string (3) is different from number of pins (4).(LBDB-771)

LBDB-772 (error) Number of pins (%d) in the %s pin_name_map is different from that (%d) in sensitization master '%s'.

DESCRIPTION

This error is issued when run into following situations: 1. Number of pin in cell->pin_name_map is different from that in cell->sensitization_master->pin_names. 2. Number of pin in timing->pin_name_map is different from that in timing->sensitization_master->pin_names. 3. When there is timing->pin_name_map defined, but there is only cell->sensitization_master attribute, Number of pin in timing->pin_name_map is different from that in cell->sensitization_master->pin_names.

When there is pin_name_map defined in cell or timing, pins in the attribute is used to generate stimuli for characterization, instead of pin_names in sensitization master. but the number of pins should be the same, otherwise vectors in the sensitization_master can not be mapped to these pins properly.

WHAT NEXT

Correct the vector string in the vector attribute, make it's elements number equal to number of pin in pin_names.

EXAMPLES

```
library(name) {
    ...
    sensitization (my_sensitization) {
        pin_names("A, B, C, Y");
        vector (0, "0 0 0 0");
        vector (1, "0 0 0 1");
        vector (2, "0 0 1 0");
        vector (3, "0 0 1 1");
        ...
    }

    cell (my_cell) {
        sensitization_master : my_sensitization;
        pin_name_map("A, B, Z");
        pin (A) {
            ...
        }
        ...
    }
    ...
}
```

EXAMPLE MESSAGE

```
Error: Line 1170, Number of pins (3) in the cell pin_name_map  
is different from that (4) in sensitization master 'my_sensitization'. (LBDB-772)
```

LBDB-773 (error) Illegal pin name '%s' specified in %s level sensitization attribute.

DESCRIPTION

This error is issued when pin name specified in cell/timing level sensitization attribute is an illegal(undefined) pin in the cell: This screener rule checks following pin names: 1. pin names specified in cell->pin_name_map attribute. 2. when there is no cell->pin_name_map, pin_names in cell->sensitization_master. 3. pin names in timing->pin_name_map attribute. 4. when there is no timing->pin_name_map, pin_names in timing->sensitization_master.

WHAT NEXT

Check pin names in the sensitization attributes(pin_name_map, or pin_names in sensitization_master), make sure all pin names are real pin in the cell.

EXAMPLES

```
library(name) {  
    ...  
    sensitization (my_sensitization){  
        pin_names("A, B, C");  
        vector (0, "0 0 0");  
        vector (1, "0 0 1");  
        vector (2, "0 1 0");  
        vector (3, "0 1 1");  
        ...  
    }  
  
    cell (my_cell) {  
        sensitization_master : my_sensitization;  
        pin_name_map("A, B, Z");  
        pin (A) {  
            ...  
        }  
        pin (B) {  
            ...  
        }  
        pin (Y) {  
            ...  
        }  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 1170, Illegal pin name 'Z' specified in cell level sensitization attribute.(LBDB-773)

LBDB-774 (error) Incomplete sensitization info in the timing arc.

DESCRIPTION

This error is issued when there is wave_rise/wave_fall attribute defined in the timing group, but none of following attributes found: 1. pin_name_map attribute in current timing group. 2. sensitization_master attribute in current timing group. 3. pin_name_map attribute in current cell. 2. sensitization_master attribute in current cell.

Since there is no way to get the pin names for the wave_rise/wave_fall, the sensitization information for the timing is incomplete.

WHAT NEXT

Define pin_name_map or sensitization_master attribute either in the timing arc or in the cell, make sure the sensitization information in this timing group is complete.

EXAMPLES

```
library(name) {  
    ...  
    sensitization (my_sensitization) {  
        pin_names("A, B, C");  
        vector (0, "0 0 0");  
        vector (1, "0 0 1");  
        vector (2, "0 1 0");  
        vector (3, "0 1 1");  
        ...  
    }  
  
    cell (my_cell) {  
        ...  
        pin (A) {  
            timing() {  
                wave_rise (1, 3);  
                wave_fall (2, 0);  
                /* other timing arc data */  
            }  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 1170, Incomplete sensitization info in the timing arc.(LBDB-774)

LBDB-775 (warning) No sensitization_master defined, sensitization vector is derived from vector id in the timing arc.

DESCRIPTION

This warning is issued when there is wave_rise/wave_fall attribute defined in the timing group, But no sensitization_master attribute defined either in the timing group or current cell.

This is a simplified usage model of sensitization, that sensitization vector used to get from sensitization group by vector id, but is derived from vector id and number of pin in pin_name_map by binary scale directly in such cases.

Example: timing() { pin_name_map("A, B, C, Z"); wave_rise (5, 8, 15); }

Here '5' implies vector string of "0 1 0 1", '8' implies vector string of "1 0 0 0", and so on.

WHAT NEXT

If this is what the users wanted, just ignore this warning. otherwise, specify valid sensitization_master attribute in the timing group or current cell.

EXAMPLES

```
library(name) {
    ...
    cell (my_cell) {
        ...
        pin (A) {
            timing() {
                pin_name_map("A, B, Y");
                wave_rise (1, 3);
                wave_fall (2, 0);
                /* other timing arc data */
            }
        }
    }
    ...
}
```

EXAMPLE MESSAGE

Warning: Line 1170, No sensitization_master defined, sensitization vector is derived from vector id in the timing arc.(LBDB-775)

LBDB-776 (error) Vector id (%d) in '%s' is undefined in sensitization group '%s'.

DESCRIPTION

When there is sensitization master defined for the timing arc, Vector id specified in wave_rise and wave_fall should be predefined in the sensitization group, otherwise, this error is issued.

WHAT NEXT

Modify vector id in the wave_rise/wave_fall, make sure every vector id is predefined in sensitization master group.

EXAMPLES

```
library(name) {
    sensitization (my_sensitization) {
        pin_names("A, B, C");
        vector (0, "1 0 0");
        vector (1, "0 0 1");
        vector (2, "1 1 0");
        vector (3, "0 1 1");
    }
    ...

    cell (my_cell) {
        ...
        pin (A) {
            timing() {
                sensitization_master : my_sensitization;
                pin_name_map ("A, B, Y");
                wave_rise (1, 3);
                wave_fall (2, 4);
                /* other timing arc data */
            }
        }
    }
}
...
```

EXAMPLE MESSAGE

```
Error: Line 1181, Vector id (4) in 'wave_fall' is undefined in sensitization group  
'my_sensitization' (LBDB-776)
```

LBDB-777 (error) Vector id (%d) for implied vector string in '%s' is out of range (0~%d).

DESCRIPTION

When there is no sensitization master defined either in the timing group or current cell, Vector string is implied by vector id and number of pin in pin_name_map. So the vector id should greater than or equal to zero, and less than $2^{(\text{number of pin in pin_name_map})}$.

For example: `timing() { pin_name_map("A, B, C, Z"); wave_rise (5, 8, 17); }` Here number of pin in pin_name_map is 4, the vector id should < $(2^4 = 16)$, so the vector id = 17 is out of range, and is not allowed.

WHAT NEXT

Modify vector id in the wave_rise/wave_fall, make sure every vector id is in the legal range.

EXAMPLES

```
library(name) {  
    ...  
    cell (my_cell) {  
        ...  
        pin (A) {  
            timing() {  
                sensitization_master : my_sensitization;  
                pin_name_map ("A, B, Y");  
                wave_rise (1, 7);  
                wave_fall (2, 8);  
                /* other timing arc data */  
            }  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

```
Error: Line 1181, Vector id (8) for implied vector string in 'wave_fall' is out of range (0~7) (LBDB-777)
```

LBDB-778 (error) index (%d) specified in '%s' is out of range (1~%d).

DESCRIPTION

The wave_rise_sampling_index/wave_fall_sampling_index is to define from which transition, (instead of default last transition) to the transition of the output pin, the delay is measured.

If the number of elements in wave_rise/wave_fall is N, then The index value should between (1 ~ N-1).

WHAT NEXT

Modify sampling index accordingly, make sure it's in the legal range.

EXAMPLES

```
library(name) {  
    ...  
    cell (my_cell) {  
        ...  
        pin (A) {  
            timing() {  
                sensitization_master : my_sensitization;  
                pin_name_map ("A, B, Y");  
                wave_rise (1, 4, 7);  
                wave_fall (2, 5, 8);  
                wave_rise_sampling_index : 3;  
                /* other timing arc data */  
            }  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 1181, index (3) specified in 'wave_rise_sampling_index' is out of range (1~2) (LBDB-778)

LBDB-779 (error) Number of elements (%d) specified in '%s' is

out of range (1~%d).

DESCRIPTION

The wave_rise_timing_interval/wave_fall_timing_interval attributes are for special cases that customers want to control the time interval between transitions. which is used to characterize some special-purpose cells and pessimistic timing characterization.

If the number of elements in wave_rise/wave_fall is N, then Number of elements in these two attributes should between (1 ~ N-1);

WHAT NEXT

Modify the wave_rise_timing_interval/wave_fall_timing_interval attribute values, accordingly to the rule above.

EXAMPLES

```
library(name) {  
    ...  
    cell (my_cell) {  
        ...  
        pin (A) {  
            timing() {  
                sensitization_master : my_sensitization;  
                pin_name_map ("A, B, Y");  
                wave_rise (1, 4, 7);  
                wave_fall (2, 5, 8);  
                wave_rise_timing_interval(0.0, 0.5, 1.0);  
                /* other timing arc data */  
            }  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 1181, Number of elements (3) specified in 'wave_rise_sampling_index' is out of range (1~2) (LBDB-779)

LBDB-780 (error) The '%s' %s is not %s '%s' %s.

DESCRIPTION

This error message occurs when you specify an invalid 'std_cell_main_rail' pg_pin in

a level shifter not satisfying one of the following constraints: - the pg_pin must be a 'primary_power' or 'primary_ground' pg_pin. - if the pg_pin is 'primary_power', the pg_pin must be specified as the "related_power_pin" of one of the signal pins of the level shifter. - if the pg_pin is 'primary_ground', the pg_pin must be specified as the "related_ground_pin" of one of the signal pins of the level shifter.

As shown in the following example, the 'VDD' pg_pin is invalid because it is not a 'primary power' pg_pin.

```
cell(ls) {
    is_level_shifter : true;

    pg_pin(VDD) {
        voltage_name : VDDL;
        pg_type : backup_power;

        std_cell_main_rail : true;
    }
    ...
}
```

Error: Line 84, The 'VDD' pg_pin is not a 'primary_power' pg_pin. (LBDB-780)

WHAT NEXT

Modify the cell accordingly to satisfy the constraints.

LBDB-781 (error) The timing arc with feed_through_type '%s' %s specify the CCS Timing Current waveform vectors.

DESCRIPTION

The timing arc with feed_through_type attribute must satisfy the following requirements: 1. if the feed_through_type attribute is "short", then the timing arc must not have CCS Timing current waveform vectors. 2. if the feed_through_type attribute is "wire" or "gate", then the timing arc must have CCS Timing current waveform vectors.

WHAT NEXT

Check the timing arc and make the correction accordingly.

EXAMPLES

```
pin(Z) {
    direction : output;
    timing() {
        /* no ccs information defined in the timing arc */
```

```
    feed_through_type : wire;  
    ...  
}  
}
```

EXAMPLE MESSAGE

Error: Line 144, The timing arc with feed_through_type 'short' cannot specify the CCS Timing Current waveform vectors. (LBDB-781)

LBDB-782 (error) The pin '%s' should be an 'inout' pin because of the associated timing arc with feed_through_type attribute.

DESCRIPTION

The timing arc with feed_through_type attribute can only be specified between inout pins.

WHAT NEXT

Check the timing arc and make the correction accordingly.

EXAMPLES

```
pin (A) {  
    direction : output;  
    ...  
}  
pin(Z) {  
    direction : output;  
    timing() {  
        feed_through_type : short;  
        ...  
        related_pin : "A";  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 144, The pin 'A' should be an 'inout' pin because of the associated timing arc with feed_through_type attribute. (LBDB-782) Error: Line 148, The pin 'Z' should be an 'inout' pin because of the associated timing arc with feed_through_type attribute. (LBDB-782)

LBDB-783 (error) In cell '%s', the %s timing arc from pin '%s' to '%s' with feed_through_type '%s'
does not have the required timing arc from pin '%s' to '%s' of the same timing_type
, timing_sense and feed_though_type.

DESCRIPTION

The timing arc with feed_through_type attribute 'short' or 'wire' must have the relative backward timing arc with the same timing_type and feed_through_type for the same cell.

WHAT NEXT

Check the timing arcs and make the correction accordingly.

EXAMPLES

```
cell(T) {  
...  
pin(Z) {  
    direction : output;  
    /* no timing arc Z-  
>A with timing_type = combinational and feed_through_type= wire exists in the cell  
T */  
    timing() {  
        timing_type : combinational;  
        feed_through_type : wire;  
        ...  
        related_pin "A";  
    }  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 144, In cell 'T', the combinational timing arc from pin 'A' to 'Z' with feed_through_type '%s'
does not have the required timing arc from pin 'Z' to 'A' of the same timing_type , timing_sense and feed_though_type. (LBDB-783)

LBDB-784 (error) The %s value of the '%s' attribute is %g,

which is %s the required value %g.

DESCRIPTION

The minimum/maximum value of the attribute is less/greater than the required value.

WHAT NEXT

Check the library source file and correct the problem.

EXAMPLES

```
...
current_unit : "1mA" ;
...
dc_current (ccsn_dc_29x29) {
index_1 ("...");
index_2 ("...");
/* current unit = 1mA, and the max value = 0.005 */
values ("0.0005, ...., 0.00091);
}
```

EXAMPLE MESSAGE

Error: Line 35, The maximum value of the 'values' attribute is 0.0005, which is less than required value 0.001. (LBDB-784)

LBDB-785 (warning) The '%s' attribute is not defined in the library.

Using %f as the default value.

DESCRIPTION

You receive this message because the relative attribute is not defined in the library, so LC will create the attribute with the predefined default value.

WHAT NEXT

Examine the library source file, and add the correct value for the attribute.

EXAMPLE MESSAGE

Warning: Line 85, The 'nom_voltage' attribute is not defined in the library. Using 5

as the default value. (LBDB-785)

LBDB-786 (error) The attribute value is not a switch pin.

DESCRIPTION

The value of related_switch_pin must be referring to either a switch pin or an internal pin as defined below.

switch pin : switch_pin attribute is set to "true" within a pin. internal pin : related_pin attribute is referred to a switch pin.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
dc_current (ccsn_dc_29x29) {
    related_switch_pin : D;
    ...
}
pin(CTL) { /* this is a switch pin as switch_pin is set to "true" */
    capacitance : 0.5;
    direction : input;
    switch_pin : true;
    ...
}
pin(int_1) { /* this is an internal pin, which refers to a switch pin by
               related_pin attribute */
    direction : internal;
    timing () {
        related_pin : CTL;
        ...
    }
    ...
}
pin(D) {
    capacitance : 0.5;
    direction : input;
    ...
}
```

In this case, related_switch_pin is pointing to pin "D", which is not either an internal pin or a switch pin. The way to correct it is to specify related_switch_pin to either pin "CTL" or pin "int_1".

EXAMPLE MESSAGE

Error Line 272, The attribute value is not a switch pin. (LBDB-786)

LBDB-787 (error) Cell(%s): The 'internal_node' in the '%s' port can't be specified because no statetable is allowed in generic type of clock gating integrated cell.

DESCRIPTION

If attribute 'clock_gating_integrated_cell' is generic, then no statetable is allowed. 'internal_node' attribute must match one of the internal node names in statetable. Since there is no statetable is allowed, there is no 'internal_node' attribute can be specified in a port, either.

WHAT NEXT

Remove the internal_node attribute to fix the problem.

EXAMPLES

```
cell(lldb-787) {  
    ...  
    cell_leakage_power : 0.023529479 ;  
    clock_gating_integrated_cell : "generic" ;  
    ...  
  
    pin(Q) {  
        direction : internal;  
        internal_node : "Q1";  
        timing() {  
            timing_type : rising_edge;  
            intrinsic_rise : 1.34;  
            intrinsic_fall : 1.54;  
            rise_resistance : 0.0718;  
            fall_resistance : 0.0347;  
            related_pin : "CP";  
        }  
    }  
}
```

In this case, Q1 in internal_node attribute shall not be specified because there is no statetable in the cell.

EXAMPLE MESSAGE

Error: Line 139, Cell(lldb-787): The 'internal_node' in the 'Q' port

can't be specified because no statetable is allowed in generic type of clock gating integrated cell. (LBDB-787)

LBDB-788 (warning) No default '%s" group defined in '%s'.

DESCRIPTION

This warning is issued when there is some default group is missing in library, but no default can be assumed to it.

For example, if there is no default driver waveform specified, This warning will be reported.

WHAT NEXT

Check the library source file, add default group.

EXAMPLE MESSAGE

Warning Line 10, No default 'normalized_driver_waveform" group defined in 'library' .(LBDB-788)

LBDB-789 (warning) The '%s' attribute in the '%s' table has less than %d '%s" points,that is point between %g to %g.

DESCRIPTION

The values of the corresponding attribute has no enough type of points.

For example, the normalized voltage points for driver waveform need at lease 1 start points(0~0.05) and end points(0.95~1.0) for accuracy.

WHAT NEXT

Check the library source file, add some example points for the attribute.

EXAMPLES

```
normalized_driver_waveform (dw01) {  
    index_1 ("1.0");/* input net transition */  
    index_2 ("0.1, 0.3, 0.5, 0.7, 0.9"); /* normalized voltage*/  
    ...  
}
```

In this case, the index_2 of normalized_driver-waveform is normalized_voltage, It would be better to supply at least one start points and end points for accuracy purpose.

EXAMPLE MESSAGE

Warning Line 27, The 'index_2' attribute in the 'normalized_driver_waveform' table has less than 1 'start" points, that is between '0' to '0.05'. (LBDB-789)
Warning Line 27, The 'index_2' attribute in the 'normalized_driver_waveform' table has less than 1 'end" points, that is between '0.95' to '1.0'. (LBDB-789)

LBDB-790 (error) '%s' only allows single %s pin name.

DESCRIPTION

Only one single pg pin name can be specified in intrinsic_resistance, intrinsic_capacitance and pg_current or only one single pin name can be specified in gate_leakage.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pg_pin(V1) {
    voltage_name : VDD1;
    pg_type : primary_power;
}
pg_pin(V2) {
    voltage_name : VDD2;
    pg_type : backup_power;
}
pg_pin(G1) {
    voltage_name : GND1;
    pg_type : primary_ground;
}
pg_pin(G2) {
    voltage_name : GND2;
    pg_type : backup_ground;
}

pin(A1) {
    direction : input;
    ...
}
pin(A2) {
    direction : input;
    ...
}
```

```

        }
pin(A3) {
    direction : input;
    ...
}
pin(ZN1) {
    direction : output;
    ...
}
pin(ZN) {
    direction : output;
    ...
}
...
dynamic_current() {
    when : "A1";
    related_inputs : "A2 A3";
    related_outputs : "ZN ZN1";
    typical_capacitances(0.3 0.4);
    switching_group() {
        input_switching_condition(fall);
        output_switching_condition(rise fall);
        pg_current(V2 G1) {
            vector(test_2) {
                reference_time : 193.2;
                index_output : "ZN1";
                index_1("15.1");
                ...
            }
        ...
    }
    ...
}
leakage_current() {
    pg_current(V1) {
        value : 4.5;
    }
    pg_current(G1 G2) {
        value : -4.5;
    }
    ...
    gate_leakage(A2 A3) {
        input_high_value : 1.0;
        input_low_value : -10.0;
    }
    gate_leakage() {
        input_high_value : 3.0;
        input_low_value : -40.0;
    }
}

intrinsic_parasitic() {
    when : "A1 & A2 & ZN";
}

```

```

intrinsic_resistance(G1 G1) {
    related_output : "ZN";
    value : 9.0;
}
intrinsic_resistance(G1) {
    related_output : "ZN1";
    value : 62.2;
}
intrinsic_capacitance(G2 G2) {
    value : 31.47;
}
}

```

In this case, the pg_current within switching_group has two pg pins, V2 and G1, which is wrong. The pg_current within leakage_current has two pg pins, G1 and G2, which is wrong. The intrinsic_resistance has two pg names, G1 and G1, which is wrong. The intrinsic_capacitance has two pg names, G2 and G2, which is wrong. The first gate_leakage has two pin names A3 and A2, which is wrong, and the second gate_leakage has no name there, which is wrong, too. You might want to change all of them to one PG or pin name to avoid the error.

EXAMPLE MESSAGE

Error Line 272, 'pg_current' only allows single pg pin name. (LBDB-790)
Error Line 222, 'gate_leakage' only allows single pin name. (LBDB-790)

LBDB-791 (error) pg_pin group is required for ccs power cell.

DESCRIPTION

If the cell is a ccs power cell, which contains dynamic_current, leakage_current or intrinsic_parasitic, then pg_pin group is required.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell (AND3) {
    ...
    power_cell_type : stdcell;
    dynamic_current() {
        when : "A1";
        related_inputs : "A2 A3";
        related_outputs : "ZN ZN1";
        typical_capacitances(0.3 0.4);
        switching_group() {

```

```

    ...
}
...
} ...
}

In this case, cell, AND3, is a ccs power cell. The pg_pin must be specified within
cell to fix the error as shown below : cell (AND3) { pg_pin(V1) { voltage_name :
VDD1; pg_type : primary_power; } pg_pin(V2) { voltage_name : VDD2; pg_type :
backup_power; } pg_pin(G1) { voltage_name : GND1; pg_type : primary_ground; }
pg_pin(G2) { voltage_name : GND2; pg_type : backup_ground; }

power_cell_type : stdcell; dynamic_current() { ...

```

EXAMPLE MESSAGE

Error Line 272, pg_pin group is required for ccs power cell. (LBDB-791)

LBDB-792 (error) leakage current in simplified format must be >= 0.

DESCRIPTION

If there is no pg_current within leakage_current group, we defined that as simplified format. Please refer to users guide for details.

If leakage_current is in simplified format, then the value of leakage current must be zero or positive floating number.

The same rule is applied to va_leakage_current.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell (OR2) {
    pg_pin(V1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(G1) {
        voltage_name : GND1;
        pg_type : primary_ground;
    }
    leakage_current() {
        when : "A1 & !A2 & ZN";
    }
}

```

```

        value : 3.1;
    }
leakage_current() {
    when : "A1 & !A2 & !ZN";
    value : 0.0;
}
leakage_current() {
    /* default state */
    value : -8.1;
}
...
}

```

In this case, leakage current -8.1 is not allowed. The value must be ≥ 0 in simplified format.

EXAMPLE MESSAGE

Error Line 272, leakage current in simplified format must be ≥ 0 . (LBDB-792)

LBDB-793 (error) Name specified in '%s' is not a valid %s pin.

DESCRIPTION

You got this message because an invalid PG or signal pin is used.

The pin name specified in intrinsic_capacitance, intrinsic_resistance, or pg_current group must be referred to a valid PG pin defined in cell, and a pg name is required for these groups.

The pin name specified in gate_leakage group must be referred to a valid signal pin defined in cell, and a pin name is required for gate_leakage.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell (AND3) {
    ...
    pg_pin(V1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(V2) {
        voltage_name : VDD2;
        pg_type : backup_power;
    }
    pg_pin(G1) {

```

```

voltage_name : GND1;
pg_type : primary_ground;
}
pg_pin(G2) {
    voltage_name : GND2;
    pg_type : backup_ground;
}
...
dynamic_current() {
    when : "A1";
    related_inputs : "A2 A3";
    related_outputs : "ZN ZN1";
    typical_capacitances(0.3 0.4);
    switching_group() {

        input_switching_condition(fall);
        output_switching_condition(rise fall);

        pg_current(V5) { /* error */
            vector(test_2) {
                ...
            }
            pg_current() { /* error */
                ...
            }
            ...
        }
    }
    ...
leakage_current() {
    when : "A1 & !A2 | ZN";
    pg_current(V5) { /* error */
        value : 4.5;
    }
    pg_current(V2) {
        value : 4.5;
    }
    pg_current(G2) {
        value : -3.5;
    }
    pg_current() { /* error */
        value : 4.5;
    }
}
...
intrinsic_parasitic() {
    when : "A1 & A2 & ZN";
    intrinsic_resistance() { /* error */
        related_output : "ZN";
        value : 9.0;
    }
    intrinsic_resistance(V5) { /* error */
        related_output : "ZN1";
        value : 62.2;
    }
    intrinsic_capacitance(G2) {
        value : 31.47;
    }
}

```

```

}
intrinsic_capacitance() {      /* error */
    value : 31.47;
}
intrinsic_capacitance(V5) {    /* error */
    value : 31.47;
}
...
}
}

```

Please check the lines marked as 'error'. For these lines, they are either refers to an empty pg name, or refers to a invalid pg pin name, V5. Both are wrong. To fix the problems, please change V5 to a valid pg pin like V1, and also give a valid pg name for the empty ones.

EXAMPLE MESSAGE

Error Line 272, Name specified in 'pg_current' is not a valid PG pin. (LBDB-793)

LBDB-794 (error) The value of pg_current must be '%s'.

DESCRIPTION

This is rule for leakage_current groups. If the PG pin is a power or internal ground pin, then the value of leakage current must be either zero or positive floating number. If the PG pin is a ground or internal power pin, then the value of leakage current must be either zero or negative floating number.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell (AND3_1) {
    pg_pin(V1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(V2) {
        voltage_name : VDD2;
        pg_type : backup_power;
    }
    pg_pin(V3) {
        voltage_name : VDD3;
        pg_type : internal_ground;
    }
    pg_pin(G1) {
        voltage_name : GND1;
    }
}

```

```

    pg_type : primary_ground;
}
pg_pin(G2) {
    voltage_name : GND2;
    pg_type : backup_ground;
}
pg_pin(G3) {
    voltage_name : GND3;
    pg_type : internal_power;
}
leakage_current() {
    when : "A1 & !A2 & ZN";
    pg_current(V1) {
        value : -4.5;
    }
    pg_current(V2) {
        value : -4.5;
    }
    pg_current(G2) {
        value : 4.5;
    }
    pg_current(V3) {
        value : -4.5;
    }
    pg_current(G1) {
        value : 4.5;
    }
    pg_current(G3) {
        value : 4.5;
    }
}
}
}

```

In this case, V1, V2 and V3 must be positive or zero, and G1, G2 and G3 must be negative or zero based on the pg_type.

EXAMPLE MESSAGE

Error Line 272, The value of pg_current must be '>=0'. (LBDB-794)

LBDB-795 (error) Only one PG pin can be omitted in %s group.

DESCRIPTION

All the PG pins except one shall be specified in leakage_current. This rule is also applied to va leakage current group.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell (AND3) {  
  
    pg_pin(V1) {  
        voltage_name : VDD1;  
        pg_type : primary_power;  
    }  
    pg_pin(V2) {  
        voltage_name : VDD2;  
        pg_type : backup_power;  
    }  
    pg_pin(G1) {  
        voltage_name : GND1;  
        pg_type : primary_ground;  
    }  
    pg_pin(G2) {  
        voltage_name : GND2;  
        pg_type : backup_ground;  
    }  
    leakage_current() {  
        when : "A1 & A2 & !ZN";  
        pg_current(V1) {  
            value : 4.5;  
        }  
        pg_current(V2) {  
            value : 4.5;  
        }  
    }  
}
```

There are 4 pg pins in the cell AND3, and based on rule only one pg pin can be omitted in leakage_current group. Meaning you have to specify at least three pg pins for this case. However, there are only two pg pins (V1 and V2) specified in leakage_current. To fix the problem, please specify at least one of ground pins for leakage_current as shown below.

```
leakage_current() { when : "!A1 & A2 & ZN"; pg_current(V1) { value : 4.5; }  
pg_current(V2) { value : 4.5; } pg_current(G2) { value : -4.5; } }
```

EXAMPLE MESSAGE

Error Line 272, Only one PG pin can be omitted in leakage_current group. (LBDB-795)

LBDB-796 (error) The leakage current of all PG pins and gate leakage current of all input/inout pins must be summed up to

zero.

DESCRIPTION

This rule applies to leakage_current and va_leakage_current groups if leakage current of all PG pins are specified.

If no gate_leakage are specified, the leakage current of all PG pins should add up to zero. If gate_leakage of all input/inout pins are specified, the leakage current of all PG pins and gate leakage current of all input/inout pins should add up to zero.

The absolute total of leakage current must add up to zero with a tolerance of $1.0e-6 * (\text{total of absolute values of leakage current})$. The tolerance is calculated as follows:

$$0 \leq \frac{|\text{total of leakage current}|}{\text{total of } |\text{leakage current}|} \leq 1.0e-06$$

If $|\text{total of leakage current}| * (\text{current_unit / Amp}) < 1.0e-10$, this message won't be issued because the absolute current value is too small.

WHAT NEXT

Check the library source file and make the necessary correction.

EXAMPLES

In the example below, the total of leakage current is -0.000028. Based on the rule above, it will be like $|-0.000028| / 27.000028 = 1.03 * 1.0e-6$. The result is greater than $1.0e-6$. To fix the problem, we can change the G3 current to -4.500020.

```
cell (AND3_1) {
    pg_pin(V1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(V2) {
        voltage_name : VDD2;
        pg_type : backup_power;
    }
    pg_pin(V3) {
        voltage_name : VDD3;
        pg_type : internal_ground;
    }
    pg_pin(G1) {
        voltage_name : GND1;
        pg_type : primary_ground;
    }
    pg_pin(G2) {
        voltage_name : GND2;
    }
}
```

```

        pg_type : backup_ground;
    }
    pg_pin(G3) {
        voltage_name : GND3;
        pg_type : internal_power;
    }
    leakage_current() {
        when : "A1 & A2 & ZN";
        pg_current(V1) {
            value : 4.5;
        }
        pg_current(V2) {
            value : 4.5;
        }
        pg_current(G2) {
            value : -4.5;
        }
        pg_current(V3) {
            value : 4.5;
        }
        pg_current(G1) {
            value : -4.5;
        }
        pg_current(G3) {
            value : -4.500028;
        }
    }
}

```

EXAMPLE MESSAGE

Error: Line 246, The leakage current of all PG pins and gate leakage current of all input/inout pins must be summed up to zero. (LBDB-796)

LBDB-797 (warning) The leakage_current is in wrong format.

DESCRIPTION

Please also refer to LBDB-798.

The leakage_cuurent only allow either regular or simplified format. The regular format shall contain pg_current group, and the simplified format shall contain value attribute.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
leakage_current() {
```

```
    when : "A1 & !A2 & !ZN";  
}
```

In this case, leakage_current is neither in regular nor in simplified format. To avoid the warning, please change it to either of followings :

```
simplified format : leakage_current() { when : "A1 & !A2 & !ZN"; value : 0.0; }
```

```
regular format : leakage_current() { when : "A1 & !A2 & !ZN"; pg_current(V1) { value : 0.0; } }
```

EXAMPLE MESSAGE

Warning Line 272, The leakage_current is in wrong format. (LBDB-797)

LBDB-798 (error) The leakage current groups have mix format.

DESCRIPTION

Please also refer to LBDB-797.

The leakage_cuurent only allow either regular or simplified format. The regular format shall contain pg_current group, and the simplified format shall contain value attribute. And, two formats can not be mixed.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell (test) { ... leakage_current() { pg_current(V1) { value : 4.5; } pg_current(G1)  
{ value : -4.5; } pg_current(G2) { value : -14.5; } pg_current(V2) { value : 14.5; }  
} leakage_current() { when : "!A1 & !A2 & ZN"; value : 0.0; } ... }
```

In this case, first leakage_current is in regular format and second leakage_current is in simplified format, which is wrong. Two formats can not be mixed under the same cell.

EXAMPLE MESSAGE

Error Line 272, The leakage current groups have mix format. (LBDB-798)

LBDB-799 (error) The multiple PG pins can not be simplified format

in %s.

DESCRIPTION

The simplified format in leakage_current means no pg_current group specified under this leakage_current. If a cell have more than one power or ground pin, then we can not use simplified format for leakage_current.

The rule is also applied to va_leakage_current.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell (test) {
    pg_pin(V1) {
        voltage_name : VDD1;
        pg_type : primary_power;
    }
    pg_pin(G1) {
        voltage_name : GND1;
        pg_type : primary_ground;
    }
    pg_pin(V2) {
        voltage_name : VDD2;
        pg_type : backup_ground;
    }
    leakage_current() {
        when : "A1 & !A2 | ZN";
        value : 3.1;
    }
    ...
}
```

In this case, the cell 'test' have more than one power pin, and leakage_current is in simplified format, which is wrong. To fix the problem, please change the simplified format to regular format as shown below.

```
leakage_current() { when : "A1 & !A2 | ZN"; pg_current(V1) { value : 1.1; }
pg_current(G1) { value : -3.1; } pg_current(V2) { value : 2.0; } }
```

EXAMPLE MESSAGE

Error Line 272, The multiple PG pins can not be simplified format in leakage_current group. (LBDB-799)

LBDB-800 (error) In group '%s', the number of differnt

'%s' values in the vectors is %d, which should be at least %d.

DESCRIPTION

This error message occurs because Library Compiler requires the vectors should contain at least 2 different slew values and 2 different load values.

The following example shows an output_current_rise group with vectors containing only 1 slew value, which is 1.

```
output_current_template(CCT) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
}
. .
output_current_rise() {
    vector(CCT) {
        reference_time : 0.11;
        index_1 ("0.1");
        index_2 ("1");
        index_3 ("1, 2, 3");
        values ("1, 2, 3");
    }
    vector(CCT) {
        reference_time : 0.11;
        index_1 ("0.2");
        index_2 ("1");
        index_3 ("1, 2, 3");
        values ("1, 2, 3");
    }
}
}

Error: Line 198, In group 'output_current_rise', the number of differnt
'total_output_net_capacitance' values in the vectors is 1, which should
be at least %d. (LBDB-800)
```

WHAT NEXT

Check the library source file and add a vector for each input_net_transition and total_output_net_capacitance pair.

LBDB-801 (error) %s and %s attributes must be specified in

pair.

DESCRIPTION

The `max_input_switching_count` and `min_input_switching_count` attributes must be defined in pair within a `switching_group`. Meaning that if `max_input_switching_count` is defined, then `min_input_switching_count` must be defined under the same `switching_group` and vice versa.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
power_cell_type : macro;
dynamic_current() {
    ...
    switching_group() {
        min_input_switching_count : 1;
        ...
    }
    ...
}
```

In this case, `min_input_switching_count` is defined, but there is no `max_input_switching_count`, which is wrong. To fix the problem, you can either remove `min_input_switching_count` from the `switching_group` or specify `max_input_switching_count` within `switching_group`.

EXAMPLE MESSAGE

Error Line 272, `min_input_switching_count` and `max_input_switching_count` attributes must be specified in pair. (LBDB-801)

LBDB-802 (error) %s can not be defined within a %s group where %s is defined.

DESCRIPTION

You can only specify either `max_input_switching_count` and `min_input_switching_count` or `input_switching_condition` within a `switching_group` group. Meaning `max_input_switching_count/ min_input_switching_count` and `input_switching_condition` shall not present under the same `switching_group` group.

ALSO SEE LBDB-801

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
switching_group() {
    min_input_switching_count : 1;
    max_input_switching_count : 9;
    input_switching_condition(rise);
    ...
}
```

In this case, `min_input_switching_count` and `max_input_switching_count` are defined, and also `input_switching_condition` is defined under the same `switching_group` where `min_input_switching_count` and `max_input_switching_count` are defined. This is wrong. To fix the problem, please remove either `input_switching_condition` or `min_input_switching_count` and `max_input_switching_count`.

EXAMPLE MESSAGE

```
Error Line 272, input_switching_condition can not be defined within a switching_group where min_input_switching_count or max_input_switching_count is defined. (LBD B-802)
```

LBDB-803 (error) %s and %s are required for all %s groups within this %s group.

DESCRIPTION

If `min_input_switching_count` and `max_input_switching_count` are specified in one of `switching_group` groups within a `dynamic_current` group, then they must be defined in the rest of `switching_group` groups.

This message indicates that `min_input_switching_count` and `max_input_switching_count` are not defined in all `switching_group` groups within a `dynamic_current`.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(lbdb803) {
    ...
    dynamic_current() {
        ...
    }
}
```

```

switching_group() {
    pg_current(V1) {
        vector(test_3) {
            reference_time : 193.2;
            index_1("1.1");
            index_2("18.2 18.3 19.0");
            values("13.78 192.4 1100.1");
        }
        vector(test_3) {
            reference_time : 193.2;
            index_1("1.8");
            index_2("18.2 19.4 19.8");
            values("11.78 112.4 1110.1");
        }
        vector(test_3) {
            reference_time : 193.2;
            index_1("2.1");
            index_2("18.2 19.4 19.8");
            values("12.78 122.4 1120.1");
        }
        ...
    }
    switching_group() {
        min_input_switching_count : 1;
        max_input_switching_count : 9;
        pg_current(V2) {
            vector(test_3) {
                ...
            }
            vector(test_3) {
                ...
            }
            ...
        }
    }
}
...

```

In this case, `min_input_switching_count` and `max_input_switching_count` are defined in second `switching_group`, but not in first `switching_group`. This is wrong.
`min_input_switching_count` and `max_input_switching_count` are required for all `switching_group` groups if they are defined in one of `switching_group` under the same `dynamic_current`. To fix the problem, please define `min_input_switching_count` and `max_input_switching_count` in first `switching_group`.

EXAMPLE MESSAGE

Errorr Line 272, `min_input_switching_count` and `max_input_switching_count` are required for all `switching_group` groups within this `dynamic_current` group. (LBDB-803)

LBDB-804 (error) The switching count shall cover all bits in related_inputs.

DESCRIPTION

The max_input_switching_count and min_input_switching_count attributes defined in a dynamic_current shall cover all bits specified in related_inputs.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
type(bus6) {
    base_type : array ;
    data_type : bit ;
    bit_width : 6 ;
    bit_from : 5 ;
    bit_to : 0 ;
    downto : true ;
}
cell (libdb804) {
    bus(sel) {
        bus_type : bus6 ;
        direction : input ;
        ...
    }
    bundle(C) {
        members(Cx, Cy, Cz) ;
        direction : input;
        ...
    }
    pin(A1) {
        direction : input;
        ...
    }
    pin(A2) {
        direction : input;
        ...
    }
    pin(A3) {
        direction : input;
        ...
    }
    ...
    power_cell_type : macro;
    dynamic_current() {
        when : "A1";
        related_inputs : "Cx A3 Cy sel[0:3] A2";
        switching_group() {

```

```

        min_input_switching_count : 1;
        max_input_switching_count : 3;
        ...
    }
    switching_group() {
        min_input_switching_count : 5;
        max_input_switching_count : 8;
        ...
    }
}

```

In this case, total number of bits in related_inputs is 8, so the switching count we specified in min_input_switching_count and max_input_switching_count shall cover number from 1 up to 8. The first switching group covers number from 1 to 3 and second switching group covers number from 5 to 8. The number 4 is not covered by any switching count within the dynamic_current. This is wrong. To fix the problem, we need the third switching_group as following :

```

switching_group() { min_input_switching_count : 4; max_input_switching_count : 4;
... }

```

EXAMPLE MESSAGE

Error Line 272, The switching count shall cover all bits in related_inputs. (LBDB-804)

LBDB-805 (error) The value of %s is invalid.

DESCRIPTION

The message indicates that you are breaking one of following rules :

1> The value of min_input_switching_count must be greater than 0. 2> The value of max_input_switching_count must be greater than or equal to min_input_switching_count. 3> The value of max_input_switching_count must be less than or equal to total number of bits in related_inputs

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

type(bus6) {
    base_type : array ;
    data_type : bit ;
    bit_width : 6 ;
    bit_from : 5 ;
    bit_to : 0 ;
}

```

```

    downto : true ;
}
cell (libdb804) {
  bus(sel) {
    bus_type : bus6 ;
    direction : input ;
    ...
  }
  bundle(C) {
    members(Cx, Cy, Cz);
    direction : input;
    ...
  }
  pin(A1) {
    direction : input;
    ...
  }
  pin(A2) {
    direction : input;
    ...
  }
  pin(A3) {
    direction : input;
    ...
  }
  ...
  power_cell_type : macro;
  dynamic_current() {
    when : "A1";
    related_inputs : "Cx A3 Cy sel[0:3] A2";
    switching_group() {
      min_input_switching_count : 0;
      max_input_switching_count : 9;
      ...
    }
    switching_group() {
      min_input_switching_count : 8;
      max_input_switching_count : 6;
      ...
    }
  }
}

```

In this case, total number of bits in related_inputs is 8, so the switching count we specified in min_input_switching_count and max_input_switching_count shall cover only from 1 up to 8. 0 in min_input_switching_count is not a valid number, and 9 in max_input_switching_count is not a valid number, either. In the second switching_group, min_input_switching_count is greater than max_input_switching_count, which is wrong.

EXAMPLE MESSAGE

Error Line 272, The value of min_input_switching_count is invalid. (LBDB-805)
Error Line 272, The value of max_input_switching_count is invalid. (LBDB-805)

LBDB-806 (error) table_lookup is required model in ccs.

DESCRIPTION

The table_lookup is required delay_model for following ccs syntaxes :

ccs timing (driver and receiver), compact ccs timing, ccs noise, and ccs power

The message indicates that either there is no delay_model in your library or the delay_model you defined is not "table_lookup".

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
library(libdb806) {  
    ...  
    cell(test_1) {  
        pin(Z) {  
            direction : output;  
            timing() {  
                compact_ccs_rise(template) {  
                    ....  
                }  
                compact_ccs_fall(template) {  
                    ....  
                }  
            }  
        }  
    }  
}
```

In this case, ccs compact is defined but there is no delay_model specified, which is wrong. This is the fix to avoid the error message.

```
library(libdb806) { delay_model : table_lookup; ... cell(test_1) { ... }
```

EXAMPLE MESSAGE

Error Line 272, table_lookup is required model in ccs. (LBDB-806)

LBDB-807 (error) The power_down_function is not allowed in

test_cell.

DESCRIPTION

The power_down_function attribute can not be specified under test_cell group.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell(libdb807) {  
    ...  
    test_cell() {  
        pin(QN) {  
            direction : output;  
            power_down_function : "!VDD + VSS";  
            function : "IQN";  
            signal_type : test_scan_out_inverted;  
        }  
    }  
    ...  
}
```

In this case, power_down_function attribute is defined under a test_cell, which is wrong. You can avoid the message by comment out power_down_function attribute.

EXAMPLE MESSAGE

Error Line 272, The power_down_function is not allowed in test_cell. (LBDB-807)

LBDB-808 (error) The %s can't be specified if %s is not defined.

DESCRIPTION

The nominal tables must be specified if variation-aware tables are there. Meaning the following variation-aware tables can be specified only if the corresponding nominal tables are defined.

```
va_tables : va_compact_ccs_rise , va_compact_ccs_fall va_receiver_capacitance1_rise  
, va_receiver_capacitance2_rise va_receiver_capacitance1_fall ,  
va_receiver_capacitance2_fall va_rise_constraint, va_fall_constraint and  
va_leakage_current
```

```
corresponding nominal tables : compact_ccs_rise , compact_ccs_fall  
receiver_capacitance1_rise , receiver_capacitance2_rise receiver_capacitance1_fall ,  
receiver_capacitance2_fall rise_constraint, fall_constraint and leakage_current
```

For the leakage_current, we need to consider when statement. Meaning that va_leakage_current can be defined only if leakage_current with the same state condition as what va_leakage_current has and it is defined within the same cell as where va_leakage_current is defined.

The same rule is applied to gate_leakage. The gate_leakage in va_leakage_current can't be specified if gate_leakage with same pin name is not defined in leakage_current, and both va_leakage_current and leakage_current are under the same state condition.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pin(QN) {  
    ...  
    pin_based_variation() {  
        va_parameters(var1, var2);  
        nominal_va_values(10.0, 20.0);  
        va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {  
            va_values(10.0, 21.0);  
            values (  
                "1.100, 1.100, 1.100");  
        }  
        ...  
    }  
}
```

In this case, there is no receiver_capacitance specified within QN pin, so it is wrong to define va_receiver_capacitance1_rise table.

EXAMPLE MESSAGE

Error: Line 341, The va receiver cap can't be specified if nominal receiver cap is not defined. (LBDB-808)

EXAMPLES

```
leakage_current() {  
    when : "B1";  
    ...  
}  
leakage_current() {  
    when : "C1";  
    ...  
}  
leakage_current() {  
    when : "D1";  
    ...  
}  
leakage_current() /* default */
```

```

    ...
}

cell_based_variation() {
    va_parameters(var1, var2);
    nominal_va_values(10.0, 20.0);
    va_leakage_current() {
        when : "A1";
        va_values(10.0, 21.0);
        ...
    }
    ...
}
}

```

In this case, there is no "when statement" A1 in leakage_current, but "when : A1" is defined in va_leakage_current, which is wrong.

EXAMPLE MESSAGE

Error: Line 246, The va_leakage_current can't be specified if leakage_current with the same state condition is not defined. (LBDB-808)

EXAMPLES

```

leakage_current() {
    when : "A2";
    pg_current(V1) {
        value : 4.5;
    }
    pg_current(G1) {
        value : -4.5;
    }
    gate_leakage(A2) {
        input_high_value : 7.1;
    }
}
cell_based_variation() {
    va_parameters(var1);
    nominal_va_values(10.0);
    va_leakage_current() {
        when : "A2";
        va_values(11.0);
        pg_current(V1) {
            value : 4.5;
        }
        pg_current(G1) {
            value : -4.5;
        }
        gate_leakage(A1) {
            input_high_value : 9.3;
            input_low_value : -8.7;
        }
    }
}
...

```

```
    }
}
```

The gate_leakage "A1" is defined under va_leakage_current, but it is not defined under leakage_current, where va_leakage_current and leakage_current have same state condition (when : "A2"). This violate the rule.

EXAMPLE MESSAGE

Error: Line 161, The gate_leakage in va_leakage_current can't be specified if gate_leakage in leakage_current is not defined. (LBDB-808)

LBDB-809 (error) The left_id and right_id must be either defined in pairs or non-defined.

DESCRIPTION

The left_id and right_id are optional attributes for variation-aware compact table. If they are defined, then they must be defined in pairs.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
library(libdbb809) {
    compact_lut_template(va_test) {
        variable_1 : input_net_transition ;
        variable_2 : total_output_net_capacitance ;
        variable_3 : curve_parameters;
        index_1 ( "5.236700e-02, 6.042500e-02, 8.710600e-02" ) ;
        index_2 ( "1.000000e-03, 1.511000e-03" ) ;
        index_3 ("init_current, peak_current, peak_voltage, peak_time, left_id");
        base_curves_group : "tt";
    }
    timing () {
        ...
        timing_based_variation() {
            va_parameters(var1, var2);
            nominal_va_values(10.0, 20.0);
            va_compact_ccs_rise(va_test) {
                va_values(10.0, 21.0);
                values (
                    "0.01, 3.45, 3.20, 1.3, 1", "1.01, 2.45, 4.20, 2.3, 1", "2.01, 3.35, 5.
20, 3.3, 1", "3.01, 4.45, 6.20, 4.3, 1", "4.01, 5.45, 7.20, 5.3, 1", "6.01, 7.45, 8.2
```

```
0, 6.3, 1");
    }
}
...
}
```

In this case, `va_compact_ccs_rise` is referring to a template, `va_test`, which has only `left_id` without `right_id`. This is wrong. To avoid the error message, you shall either remove `left_id` from the template or define `right_id` in the template.

EXAMPLE MESSAGE

Error: Line 813, The `left_id` and `right_id` must be either defined in pairs or non-defined. (LBDB-809)

LBDB-810 (error) The %s can't be empty.

DESCRIPTION

There must be at least one variable specified in `va_parameters` attribute.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pin_based_variation() {
    va_parameters();
    ...
}
```

In this case, there is no value inside `va_parameters`, which is wrong. You can specified a list of variables in `va_parameters()`, and the list can't be empty.

EXAMPLE MESSAGE

Error: Line 1029, The `va_parameters` can't be empty. (LBDB-810)

LBDB-811 (error) The %s must be defined before %s is defined.

DESCRIPTION

The `va_parameters` can be defined within `library()`, `timing_based_variation()`, `pin_based_variation()` or `cell_based_variation()` group.

The `va_parameters` is referred by `nominal_va_values` and `va_values`, and it shall be defined before `nominal_va_values` and `va_values` are defined.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
library(libdb811) {  
    ...  
    pin_based_variation() {  
        nominal_va_values(10.0, 20.0);  
        ...  
        va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {  
            va_values(10.0, 21.0);  
            values (  
                "1.100, 1.100, 1.100");  
        }  
    }  
    ...  
    va_parameters(var1, var2);  
}
```

In this case, there is no `va_parameters` attribute defined inside either `library()` or `pin_based_variation()` before `nominal_va_values` and `va_values`. To fix the problem, please move `va_parameters(var1, var2)` to the line above `pin_based_variation()`.

```
library(libdb811) { va_parameters(var1, var2); ... pin_based_variation() {  
nominal_va_values(10.0, 20.0); ... va_receiver_capacitance1_rise (  
pinTB2INVXC_rise_1 ) { va_values(10.0, 21.0); values ( "1.100, 1.100, 1.100"); } }  
... }
```

Or, you can move the `va_parameters(var1, var2)` to the line above `nominal_va_values(10.0, 20.0)`.

```
library(libdb811) { ... pin_based_variation() { va_parameters(var1, var2);  
nominal_va_values(10.0, 20.0); ... va_receiver_capacitance1_rise (  
pinTB2INVXC_rise_1 ) { va_values(10.0, 21.0); values ( "1.100, 1.100, 1.100"); } }  
... }
```

EXAMPLE MESSAGE

```
Error: Line 626, The va_parameters must be defined before nominal_va_values is defined. (LBDB-811)  
Error: Line 638, The va_parameters must be defined before va_values is defined. (LB  
DB-811)
```

LBDB-812 (error) The size of %s and %s must be identical.

DESCRIPTION

You can specified a list of values in these attributes : va_parameters, nominal_va_values and va_values.

The size of list in nominal_va_values must be the same as the size of corresponding va_parameters. The same rule is applied to va_values.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
library(libdb821) {  
    ...  
    va_parameters(var1);  
    ...  
    pin(a) {  
        pin_based_variation() {  
            nominal_va_values(10.0, 20.0);  
            va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {  
                va_values(10.0, 21.0);  
                values (  
                    "1.100, 1.100, 1.100");  
            }  
        }  
        ...  
    }  
}
```

In this case, the size of va_parameters is 1, but the size of va_values is 2. They are shall be identical. And, the size of nominal_va_values is 2, which is not the same as the size of va_parameters neither. To fix the problem, please specify two values in va_parameters such as va_parameters(var1, var2).

EXAMPLE MESSAGE

```
Error: Line 761, The size of va_parameters and nominal_va_values must be identical.  
(LBDB-812)  
Error: Line 763, The size of va_parameters and va_values must be identical. (LBDB-  
812)
```

LBDB-813 (error) The values in %s must be unique.

DESCRIPTION

The variables that you specified in `va_parameters` must be unique. They can't have the same name.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
va_parameters(var1, var2, var2, var4);
```

In this case, there are two `var2` in `va_parameters`, which is wrong.

EXAMPLE MESSAGE

Error: Line 363, The values in `va_parameters` must be unique. (LBDB-813)

LBDB-814 (error) The values in %s must be the same as defined values.

DESCRIPTION

The following predefined parameters can be specified in `va_parameters`:

- The parameters defined in `default_operating_conditions`, such as `process`, `temperature`, and `voltage`
- The voltage names defined in `voltage_map`

If these predefined parameters are specified in `va_parameters`, then the values defined in `nominal_va_values` must match the values of the predefined parameters.

If both `default_operating_conditions` and `voltage_map` are defined, and `voltage` is defined in `va_parameters`, then Library Compiler considers `voltage` as a user-defined parameter, an exception to the rule.

WHAT NEXT

Check the library source file, and make sure the values are correct.

In the following example, the predefined parameter `voltage` is specified in `va_parameters`, and the corresponding value in `nominal_va_values` is defined as 15.1.

This value is incorrect because it will be the same value of 9.0 as defined in **default_operating_conditions**, WCCOM. For the **process** predefined parameter, 35.0 in **nominal_va_values** is incorrect, because it is not the same value of 1.5 as defined in **default_operating_conditions**.

```
library(libdb814) {
    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 45 ;
        voltage : 9.0 ;
        tree_type : "worst_case_tree" ;
    }
    default_operating_conditions : WCCOM;
    ...
    timing_based_variation() {
        va_parameters(voltage, var2, process, temperature);
        nominal_va_values(15.1, 25.0, 35.0, 45.0);
        ...
    }
}
```

In the example below, both **default_operating_conditions** and **voltage_map** are defined. The **voltage** is user-defined parameter, (not a predefined parameter), which means you can specify any voltage value in **nominal_va_values**. However, VDD is a predefined parameter in **voltage_map**. If you specified it in **va_parameters**, then the corresponding value of 10.0 in **nominal_va_values** will be the same as the value of 9.0 defined in **voltage_map**. The values are not the same, so the error message is generated.

```
library(libdb814) {
    ...
    voltage_map( VDD, 9.0);
    voltage_map(VDDH, 4.91);
    voltage_map(VDDL, 4.80);
    voltage_map(VSS, 0.0);

    operating_conditions(WCCOM) {
        process : 1.5 ;
        temperature : 45 ;
        voltage : 9.0 ;
        tree_type : "worst_case_tree" ;
    }
    default_operating_conditions : WCCOM;
    ...
    timing_based_variation() {
        va_parameters(voltage, var2, VDD, temperature);
        nominal_va_values(15.1, 25.0, 10.0, 45.0);
        ...
    }
}
```

LBDB-815 (error) The number of %s in %s must be exactly

twice the number of the values in **va_parameters**.

DESCRIPTION

This error message occurs when the number of variation tables does not equal twice the number of the values in **va_parameters**.

The following are the possible variation tables that you can specify under **pin_based_variation**:

```
va_receiver_capacitance1_rise  
va_receiver_capacitance2_rise  
va_receiver_capacitance1_fall  
va_receiver_capacitance2_fall
```

in -25i

The following are the possible variation tables that you can specify under **timing_based_variation**:

```
va_receiver_capacitance1_rise  
va_receiver_capacitance2_rise  
va_receiver_capacitance1_fall  
va_receiver_capacitance2_fall  
va_rise_constraint  
va_fall_constraint  
va_compact_ccs_rise  
va_compact_ccs_fall
```

The total number of these tables must be exactly twice number of values in **va_parameters**.

WHAT NEXT

Check the library source file, make the necessary corrections, and run the command again.

EXAMPLES

In the following example, there are 5 **va_receiver_capacitance1_rise** groups under **timing_based_variation**. Since the size of **va_parameters** is 2, var1 and var2, the total number of **va_receiver_capacitance1_rise** groups will be 4 instead of 5.

```
timing_based_variation() {  
    va_parameters(var1, var2);  
    nominal_va_values(15.0, 25.0);  
    va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {  
        va_values(16.0, 25.0);  
        values (  
            "1.100, 1.100", "1.100, 1.100", "1.100, 1.100");  
    }  
    va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
```

```

va_values(14.0, 25.0);
values (
    "1.200, 1.200", "1.200, 1.200", "1.200, 1.200");
}
va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(15.0, 26.0);
    values (
        "1.300, 1.300", "1.300, 1.300", "1.300, 1.300");
}
va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(15.0, 24.0);
    values (
        "1.400, 1.400", "1.400, 1.400", "1.400, 1.400");
}
va_receiver_capacitance1_rise ( va_TB2INVXC_rise_1 ) {
    va_values(15.0, 23.0);
    values (
        "1.400, 1.400", "1.400, 1.400", "1.400, 1.400");
}
...

```

LBDB-816 (error) %s in this group and %s defined in %s shall have identical values on all but one.

DESCRIPTION

The values you specified in `va_values` and `nominal_va_values` must be identical except for one value.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

pin_based_variation() {
    va_parameters(var1, var2, var3, var4);
    nominal_va_values(15.0, 25.0, 35.0, 45.0);
    va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
        va_values(15.0, 25.0, 35.0, 45.0);
        values (
            "1.100, 1.100, 1.100");
    }
    va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
        va_values(14.0, 25.0, 35.0, 45.0);
        values (
            "1.200, 1.200, 1.200");
    }
}

```

```

va_receiver_capacitance1_rise ( pinTB2INVXC_rise_1 ) {
    va_values(15.0, 26.0, 36.0, 45.0);
    values (
        "1.300, 1.300, 1.300");
}
...

```

In the first va_receiver_capacitance1_rise, all values in nominal_va_values and va_values are the same, which is wrong. There must be one value difference.

In the second va_receiver_capacitance1_rise, var1 has different value between va_values and nominal_va_values, which is okay.

In the third va_receiver_capacitance1_rise, var2 and var3 have different values between va_values and nominal_va_values, which is wrong. Only one value is allowed to be different.

EXAMPLE MESSAGE

```
Error: Line 381, va_values in this group and nominal_va_values defined in pin_based_variation
shall have identical values on all but one. (LBDB-816)
```

LBDB-817 (error) For %s groups in %s, one characterization point is required and up to two points are allowed for each parameter.

DESCRIPTION

At least one characterization point is required for each parameter, and only up to two points are allowed. The value of characterization point must be different from the nominal value. If there are two points, then one must be greater than nominal value, and the other must be less than nominal value.

This rule also applies for all va_leakage_current groups under the same state condition.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

timing_based_variation() {
    va_parameters(var1, var2);
    nominal_va_values(15.0, 25.0);
    va_compact_ccs_rise(va_lut) {

```

```

    va_values(16.0, 25.0);
    values ( ... );
}
va_compact_ccs_rise(va_lut) {
    va_values(19.0, 25.0);
    values ( ... );
}
va_compact_ccs_rise(va_lut) {
    va_values(15.0, 26.0);
    values ( ... );
}
va_compact_ccs_rise(va_lut) {
    va_values(15.0, 24.0);
    values ( ... );
}
...
}

```

For the parameter var1, there are two variations (19.0 and 16.0), and both of them are greater than nominal value 15.0, which is wrong.

EXAMPLES

```

timing_based_variation() {
    va_parameters(var1, var2);
    nominal_va_values(15.0, 25.0);
    va_rise_constraint(va_sup_hld) {
        va_values(16.0, 25.0);
        index_1(" 0.006, 0.04, 0.1, 0.2, 1");
        index_2(" 0.006, 0.04, 0.1, 0.2, 1");
        values( ... );
    }
    va_rise_constraint(va_sup_hld) {
        va_values(14.0, 25.0);
        index_1(" 0.006, 0.04, 0.1, 0.2, 1");
        index_2(" 0.006, 0.04, 0.1, 0.2, 1");
        values( ... );
    }
    va_rise_constraint(va_sup_hld) {
        va_values(16.0, 25.0);
        index_1(" 0.006, 0.04, 0.1, 0.2, 1");
        index_2(" 0.006, 0.04, 0.1, 0.2, 1");
        values( ... );
    }
    va_rise_constraint(va_sup_hld) {
        va_values(15.0, 24.0);
        index_1(" 0.006, 0.04, 0.1, 0.2, 1");
        index_2(" 0.006, 0.04, 0.1, 0.2, 1");
        values( ... );
    }
}
...

```

For parameter var1, there are three variation values (16.0, 14.0 and 16.0 again). This is wrong because only up to 2 points are allowed. For parameter var2, there is only one variation value (24.0), which is okay.

EXAMPLES

```
cell_based_variation() {
    va_parameters(var1, var2);
    nominal_va_values(15.0, 25.0);
    va_leakage_current() {
        when : "A1";
        va_values(17.0, 25.0);
        ...
    }
    va_leakage_current() {
        when : "A1";
        va_values(13.0, 25.0);
        ...
    }
    va_leakage_current() {
        when : "!A1";
        va_values(17.0, 25.0);
        ...
    }
    va_leakage_current() {
        when : "!A1";
        va_values(15.0, 29.0);
        ...
    }
    va_leakage_current() { /* default state */
        va_values(16.0, 25.0);
        ...
    }
    va_leakage_current() { /* default state */
        va_values(15.0, 26.0);
        ...
    }
} /* end of cell_based_variation */
...
```

Under the when statement "A1", there is no characterization point for var2, which is wrong, and var1 have two points (17.0 and 13.0), which are okay. For the cases with state condition "!A1" and without any state condition (default state), both are okay.

EXAMPLE MESSAGE

Error: Line 552, For va_rise_constraint groups in timing_based_variation, one characterization point is required and up to two points are allowed for each parameter. (LBDB-817)

LBDB-818 (error) At least, one of the variation-aware groups is

absent.

DESCRIPTION

This message indicates that at least you are missing one of the variation-aware tables. Here is the rule : if both of nominal tables are defined, then either no variation-aware table is required or all variation-aware tablea are required. Meaning that if all nominal tables are defined, then you can't not just define partial of correspoding variation-aware tables.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
timing() {
    ...
    fall_constraint(sup_hld) {
        index_1(" 0.006      , 0.04      , 0.1      , 0.2      , 1      ");
        index_2(" 0.006      , 0.04      , 0.1      , 0.2      , 1      ");
        values( ...
    }
    rise_constraint(sup_hld) {
        index_1(" 0.006      , 0.04      , 0.1      , 0.2      , 1      ");
        index_2(" 0.006      , 0.04      , 0.1      , 0.2      , 1      ");
        values( ...
    }
    timing_based_variation() {
        ...
        va_rise_constraint(va_sup_hld) {
            ...
            values( ...
        ...
    ...
}
...
}
```

In this case, both nominal tables (`fall_constraint` and `rise_constraint`) are defined and only one of variation-aware tables (`va_rise_constraint`) is defined, which is wrong. To fix the problem, please either add `va_fall_constraint` :

```
timing() { ... fall_constraint(sup_hld) { index_1(" 0.006 , 0.04 , 0.1 , 0.2 , 1 ");
index_2(" 0.006 , 0.04 , 0.1 , 0.2 , 1 "); values( ... ) rise_constraint(sup_hld) {
index_1(" 0.006 , 0.04 , 0.1 , 0.2 , 1 "); index_2(" 0.006 , 0.04 , 0.1 , 0.2 , 1 ");
values( ... ) timing_based_variation() { ... va_rise_constraint(va_sup_hld) {
... values( ... ...) va_fall_constraint(va_sup_hld) { ... values( ... ...)
...
} ...
}
```

or remove `va_rise_constraint` from the timing arc :

```
timing() { ... fall_constraint(sup_hld) { index_1(" 0.006 , 0.04 , 0.1 , 0.2 , 1 ");
```

```
index_2(" 0.006 , 0.04 , 0.1 , 0.2 , 1 "); values( ... } rise_constraint(sup_hld) {  
index_1(" 0.006 , 0.04 , 0.1 , 0.2 , 1 "); index_2(" 0.006 , 0.04 , 0.1 , 0.2 , 1  
"); values( ... } timing_based_variation() { ... ...} ...}
```

EXAMPLE MESSAGE

Error: Line 552 At least, one of the variation-aware groups is absent. (LBDB-818)

LBDB-819 (warning) The %s %s is not present, so accuracy can be deteriorated.

DESCRIPTION

You will get the warning due to the following reason : - If CCS timing driver model is defined, then CCS timing receiver model is expected to be there, too.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
...  
pin(I) {  
    direction : input ;  
    capacitance : 0.0014397 ;  
    rise_capacitance : 0.0013000 ;  
    fall_capacitance : 0.0012000 ;  
}  
pin(Z) {  
    direction : output ;  
    max_capacitance : 0.17890 ;  
    function : "I" ;  
  
    timing() {  
        related_pin : "I" ;  
        timing_sense : positive_unate ;  
        cell_rise(delay_template_7x7) {  
            ...  
        }  
        rise_transition(delay_template_7x7) {  
            ...  
        }  
        cell_fall(delay_template_7x7) {  
            ...  
        }  
        fall_transition(delay_template_7x7) {  
            ...  
        }  
    }
```

```

        output_current_fall() {
            ...
        }
        output_current_rise() {
            ...
        }
        ...
    }
...

```

In this case, ccs receiver data for pin 'I' is expected because ccs driver model is defined.

EXAMPLE MESSAGE

Warning: Line 3186, The CCS receiver data is not present, so accuracy can be deteriorated. (LBDB-819)

LBDB-820 (error) The %s is preferred pg type.

DESCRIPTION

If the cell is an always_on cell, then for all signal pins, the backup_power is preferred pg_type that related_power_pin shall refer to, and backup_ground is preferred pg_type that related_ground_pin shall refer to.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell(test) {
    always_on : TRUE;
    pg_pin(PWR) {
        voltage_name : VDD;
        pg_type : primary_power;
    }
    pg_pin(GND) {
        voltage_name : VSS;
        pg_type : primary_ground;
    }
    pg_pin(GND1) {
        voltage_name : VSS1;
        pg_type : backup_ground;
    }
    pg_pin(VDDI) {
        voltage_name : VDDH;
        pg_type : backup_power;
    }
}

```

```

...
pin(A1) {
    always_on : TRUE;
    direction : input;
    related_power_pin : PWR;
    related_ground_pin : GND1;
    ...
}
pin(A2) {
    direction : input;
    related_power_pin : VDDI;
    related_ground_pin : GND;
    ...
}
...
}

```

For the always_on pin, A1 , the related_power_pin is pointing to PWR, which is not backup_power. For the non always_on pin, A2, the related_ground_pin is pointing to GND, which is not backup_ground either. Both of them shall connect to backup PG.

EXAMPLE MESSAGE

Error: Line 335, The backup_power is preferred pg type. (LBDB-820)
Error: Line 385, The backup_ground is preferred pg type. (LBDB-820)

LBDB-821 (error) The always_on pin is required for always_on cells.

DESCRIPTION

An always_on cell requires at least one or more always_on pin under it.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```

cell(test) {
    always_on : TRUE;
    ...
pin(sp) {
    direction : input;
    related_power_pin : PWR;
    related_ground_pin : GND;
    ...
}
pin(a) {

```

```
    ...
}
...
}
```

Since 'test' cell is an always_on cell, the always_on attribute is required to be specified at least in one of pins under 'test' cell.

EXAMPLE MESSAGE

Error: Line 1548, The always_on pin is required for always_on cells. (LBDB-821)

LBDB-822 (error) A pin can only has either non-programmable or programmable driver types.

DESCRIPTION

Under a pin, there can only be either non-programmable driver type or programmable driver types, but not both.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
pin(ZN) {
    direction : inout;
    pull_up_function : "!A1 * !A2 * !A3";
    pull_down_function : "A1 * A2 * !A3";
    bus_hold_function : "A1 * !A2 * !A3";
    driver_type : pull_up;
    ...
}
```

In pin ZN, there are three programmable driver types, pull_up_function, bus_hold_function, and pull_down_function. Also, the non-programmable driver type, "driver_type : pull_up", is defined under the same pin, which is wrong. Please remove either programmable driver types or non-programmable driver type from the pin.

EXAMPLE MESSAGE

Error: Line 104, A pin can only has either non-programmable or programmable driver types. (LBDB-822)

LBDB-823 (information) The %s %s is not present, so accuracy can be deteriorated.

DESCRIPTION

You will get the message due to one of following reasons : - ccs model is expected to be defined to improve the data accuracy.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
...
timing() {
    related_pin : "I" ;
    timing_sense : positive_unate ;
    cell_rise(delay_template_7x7) {
        ...
    }
    rise_transition(delay_template_7x7) {
        ...
    }
    cell_fall(delay_template_7x7) {
        ...
    }
    fall_transition(delay_template_7x7) {
        ...
    }
}
...
}
```

In this case, there is no ccs timing model but NLDM, and we expected ccs timing models for better accuracy.

EXAMPLE MESSAGE

Information: Line 582, The CCS data output_current_rise is not present, so accuracy can be deteriorated. (LBDB-823)

Information: Line 582, The CCS data output_current_fall is not present, so accuracy can be deteriorated. (LBDB-823)

LBDB-824 (error) The %s'%s' group cannot specify the static

'%S' %S.

DESCRIPTION

This message indicates you specified a static ccsn_*_stage group in a timing arc or input/internal pin, which is not allowed.

A static CCS noise model captures the behaviors of a static CCB (channel connected block). A static CCB refers to a CCB that does not have any input terminal or the voltage level at the input terminal does not affect the output current of the CCB. For example, a static CCS noise model can be characterized for a CMOS NAND gate when both inputs are tied to ground. Such static CCS noise models can be used in noise analysis with case analysis, but they cannot be used for propagating crosstalk delay or noise waveforms through the cell under study. Please refer to "CCS Noise Library Characterization Guide" for detailed information.

WHAT NEXT

Change the library file by adding the missing non-static ccsn_*_stage group.

EXAMPLE MESSAGE

Error: Line 27, The 'timing' group cannot specify the static 'ccsn_first_stage' group. (LBDB-824)

LBDB-825 (error) The '%s' pin with 'true' has_pass_gate attribute

**does not have any timing-level/pin-level ccsn_first_stage/
ccsn_last_stage
group with 'true' is_pass_gate attribute.**

DESCRIPTION

This message indicates you specified a pin with 'true' has_pass_gate, but does not specify 'true' is_pass_gate attribute in its timing-level/pin-level ccsn_*_stage groups, which causes conflict.

WHAT NEXT

Change the library file by either remove the has_pass_gate attribute from eh pin or specify 'true' is_pass_gate attribute for the relative pin-level/timing-level ccsn_first_stage/ccsn_last_stage group inside the pin.

EXAMPLE MESSAGE

Error: Line 27, The The 'Z' pin with 'true' has_pass_gate attribute does not have any timing-level/pin-level ccsn_first_stage/ccsn_last_stage group with 'true' is_pass_gate attribute. (LBDB-825)

LBDB-826 (error) The %s entry cannot be found for %s(%s) of cell(%s).

DESCRIPTION

This message indicates that you do not specify the relative entry in the map file required by add_pg_pin_to_db command.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The pg_to_voltage_map entry cannot be found for pg_pin(VDD) of cell(sample). (LBDB-826)

LBDB-827 (error) The input library '%s' has not been read in.

DESCRIPTION

This message indicates that the input library has not been read in.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The input library 'a.db' has not been read in. (LBDB-827)

LBDB-828 (error) The input library '%s' is pg_pin-based library.

DESCRIPTION

This message indicates that the input library is pg_pin-based.

WHAT NEXT

The input library is already pg_pin based, and no need to be converted by the utility

EXAMPLES

EXAMPLE MESSAGE

Error: The input library 'a.db' is pg_pin-based library. (LBDB-828)

LBDB-829 (error) The input library '%s' does not have default operating_conditions.

DESCRIPTION

This message indicates that the input library does not have default operating_conditions.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The input library 'A.db' does not have default operating_conditions. (LBDB-829)

LBDB-830 (error) The input library '%s' does not have 'voltage' attribute in the default operating_conditions '%s'.

DESCRIPTION

This message indicates that the input library does not have default

operating_conditions.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The input library 'A.db' does not have 'voltage' attribute in trhe default operating_conditions 'nom_pvt'. (LBDB-830)

LBDB-831 (error) The converted voltage_map table is empty.

DESCRIPTION

This message indicates that converted voltage_map table is empty.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The converted voltage_map table is empty. (LBDB-831)

LBDB-832 (error) The number of pg_pin's generated for cell(%s) is %d, which is less than 2.

DESCRIPTION

This message indicates that the number of generated pg_pin's for the cell is less than the required minimum value (2).

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The number of pg_pin's generated for cell(A) is 1, which is less than 2. (L

BDB-832)

LBDB-833 (error) The related_pg_pin for %s %s power_level(%s) of cell(%s) cannot be found.

DESCRIPTION

This message indicates that the related_pg_pin entry cannot be found for internal_power/leakage_power group.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The related_pg_pin for cell-level internal_power power_level(VDD) of cell(A). (LBDB-833)

LBDB-834 (error) The related_pg_pin for %s %s of cell(%s) cannot be found.

DESCRIPTION

This message indicates that the related_pg_pin entry cannot be found for internal_power/leakage_power group.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The related_pg_pin for cell-level internal_power of cell(A). (LBDB-834)

LBDB-835 (error) For cell(%s), the %s(%s) which is the %s of

pin(%s) cannot be found.

DESCRIPTION

This message indicates that you do not specify the power/ground pg_pin of a cell in the map file required by add_pg_pin_to_db command.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: For cell(sample), the pg_pin(VDD) which is the related_power_pin of pin(A) cannot be found. (LBDB-835)

LBDB-836 (error) Failed to generate %s for pin(%s) of cell(%s).

DESCRIPTION

This message indicates that add_pg_pin_to_db command cannot generate related_power_pin/related_ground_pin for the specified signal pin. Please check input map file to make sure that it is specified correctly.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: Failed to generate related_ground_pin for pin(A) of cell(sample). (LBDB-836)

LBDB-837 (error) The %s for pin(%s) of cell(%s) cannot be found.

DESCRIPTION

This message indicates that the related_power_pin/related_ground_pin cannot be found for the specified pin.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: The related_power_pin for pin(A) of cell(sample) cannot be found. (LBDB-837)

LBDB-838 (error) Failed to find the file name for %s option.

DESCRIPTION

In add_pg_pin_to_db command, some options have dependency and requirement. (1) An output db file name must be specified in -output option and must be different from the input db file. (2) If -mw_library_name is not specified, -pg_map_file must be specified, and vice versa. (3) If the Milkyway library does not cover all cells in db, -pg_map_file must be specified. (4) the map file name must be valid and exists in disk.

WHAT NEXT

Check the options to this command, and specify all the necessary ones.

EXAMPLES

```
add_pg_pin_to_db input.db -output pg_pin.db
```

In this case, neither -pg_map_file nor -mw_library_name is specified. You will get the second error message in the following example.

EXAMPLE MESSAGE

Error: Failed to find the file name for -output option. (LBDB-838)

Error: Failed to find the file name for either -pg_map_file or -mw_library_name. (LBDB-838)

Error: Failed to find the file name for -pg_map_file option. (LBDB-838)

LBDB-839 (warning) Partial Milkyway library for the input library file.

DESCRIPTION

In add_pg_pin_to_db command, when you specify -mw_library_name and the Milkyway

library does not cover all cells in the input db, this warning will occur. This includes missing cells, as well as missing and mismatched pins. This is shown after check_library command is invoked under the hood, and you will also see Logic vs. physical library check summary: Number of cells missing in logic library: <number of missing cells>

WHAT NEXT

You should specify mapping in the map file for those cells that do not exist or exist but have missing or mismatched pins in the Milkyway library. Otherwise, later checking in the flow will find such cells are not specified in the map file and pg_pin based db will not be generated. If you want to get a list of the missing cells and/or missing and mismatched pins, run check_library command for logic vs. physical library cross checking with default options. You do not need to use set_check_library_options command to set options. You only need to specify logic and Milkyway library names in check_library command.

EXAMPLES

```
add_pg_pin_to_db input.db -mw_library_name mwlib -pg_map_file pg.map -  
output pg_pin.db
```

In this case, Milkyway library mwlib does not cover all cells in input.db. You will get the second error message in the following example.

EXAMPLE MESSAGE

```
Logic vs. physical library check summary:  
Number of cells missing in logic library: 23  
Logic library is INCONSISTENT with physical library.  
Warning: Partial Milkyway library for the input library file. (LBDB-839)
```

LBDB-840 (warning) No %s found in map file.

DESCRIPTION

In the map file, if any of the following occurs: (1) No BEGIN <section_name> or END <section_name> (2) incorrect <section_name> (3) incorrect key words in title line this message will be printed out. Valid section names include: PG_PIN_MAP PG_TO_VOLTAGE_MAP VOLTAGE_MAP POWER_DOWN_FUNCTION_MAP

Key words in title line include: (1) PG_TO_VOLTAGE_MAP section cell, pg_pin, voltage_name, pg_type and direction where key word direction is optional. (2) PG_PIN_MAP section cell, pin, rail_connection and pg_pin (3) VOLTAGE_MAP section voltage_name and voltage_value (4) POWER_DOWN_FUNCTION_MAP cell, pin and power_down_function

The key words in each title line should be in the above order and delimited by Tab or space(s). Invalid record will be ignored. If BEGIN or END section line or title line is missing, the whole section will be ignored. In the map file, the following

lines are legal but will be ignored: (1) a comment line starting with # is a comment line and (2) a blank line

WHAT NEXT

You should correct the syntax errors in the map file.

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell      pg_pin      voltage_name pg_type
ADDFHX1   VDD         VDD         power
ADDFHX1   VSS         VSS         primary_ground
END PG_TO_VOLTAGE_MAP
```

EXAMPLE MESSAGE

Warning: Line 14, No END section found in map file. (LBDB-840)
Warning: Line 20, No BEGIN section found in map file. (LBDB-840)
Warning: Line 44, No title line found in map file. (LBDB-840)

LBDB-841 (error) Failed to read input library '%s'.

DESCRIPTION

When the input library file does not exist or cannot open for read or the library is not a valid technology library, this message occurs.

WHAT NEXT

Check for the input library file name and location to make sure it exists with read permission. If it does, check if the input library is a valid technology library.

EXAMPLES

EXAMPLE MESSAGE

Error: Failed to read input library 'rail.db'. (LBDB-841)

LBDB-842 (warning) Number of rail_connections %d for cell

'%s' is not equivalent to number of power pins %d in %s.

DESCRIPTION

In cell group in db, rail_connection is used to specify power rails, not ground or internal pins. Therefore, if a rail_connection is for ground, such as VSS in the following example, the rail_connection is not valid.

WHAT NEXT

If you have more rail_connections in db than power pins in Milkyway or map file, check if the extra rail is proper or not. If not, you should remove it from db. Otherwise, there is mismatch between db and Milkyway (or map file if the cell is from map file) and the command will stop conversion for a new pg_pin db.

EXAMPLES

```
cell (test) {  
    rail_connection(VDD, VDD);  
    rail_connection(VDD_AUX, VDD1);  
    rail_connection(VSS, VSS);  
    ...  
}
```

In Milkyway library, cell test has VDD and VSS, but no VDD1.

EXAMPLE MESSAGE

Warning: Number of rail_connections 3 for cell 'test' is not equivalent to number of power pins 1 in Milkyway. (LBDB-842)

LBDB-843 (error) %s cell '%s' does not have %s pg_pins.

DESCRIPTION

Each cell with NLDM, CCS-T and CCS-N has at least 2 pg_pins (1 power and 1 ground) while a load or pull_up (tieoff high) or pull_down (tieoff low) cell has at least one pg_pin as documented in LC manual. Further, a pull_up cell should have a power pg_pin while a pull_down cell should have a ground pg_pin.

WHAT NEXT

Check and specify the correct pg_pin in the map file: 1) for a cell with NLDM, CCS-T and CCS-N, check if there are at least 1 power and 1 ground pg_pin's, and 1 power and 1 ground pg_pin's for each signal pin. 2) for a load cell, check if there are at least 1 pg_pin 3) for a pull_up cell, check if there is 1 power pg_pin 4) for a pull_down cell, check if there is 1 ground pg_pin

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell      pg_pin      voltage_name pg_type
tieoff_pullup VDD VDD      primary_power
tieoff_pulldownVSSVSS      primary_power
END PG_TO_VOLTAGE_MAP
where tieoff_pulldown cell does not have a ground pg_pin.
```

EXAMPLE MESSAGE

Error: Tieoff cell 'tieoff_pulldown' does not have ground pg_pins. (LBDB-843)
Error: cell 'ADDFHX4' pin 'A' does not have related_power pg_pins. (LBDB-843)

LBDB-844 (warning) %s '%s' does not exist in input db. Remove it from map.

DESCRIPTION

When a cell and/or pin specified in the map file does not exist in the input db, it will be ignored and removed from the map. The cell may come from the map file or Milkyway. If it comes from Milkyway, no line number is printed out.

WHAT NEXT

Check if the cell and/or pin is what you want. If so, you need to check the input db for the missing cell. Otherwise, ignore it or remove it from the map file.

EXAMPLES

EXAMPLE MESSAGE

Warning: Line 24, Cell 'test' does not exist in input db. Remove it from map. (LBDB-844)

LBDB-845 (error) %s '%s' is missing in %s.

DESCRIPTION

If a db cell and/or pin is missing in the map file or its Milkyway library, this message will be printed out. You need to add its mapping in the map file to generate

a complete pg_pin based db file.

WHAT NEXT

You need to add the mapping in the map file or specify the correct Milkyway library for the missing cells to generate a complete pg_pin based db file. You can use wild card "*" for all the cells that are not explicitly specified in the map file.

EXAMPLES

EXAMPLE MESSAGE

Error: Cell 'test' is missing in map file. (LBDB-845)

LBDB-846 (warning) Cell '%s' has %d %s pins in Milkyway library.

DESCRIPTION

If a cell has multiple power or ground pins in Milkyway and db, you should specify related_power_pin and related_ground_pin for its signal pins.

WHAT NEXT

Check PG_PIN_MAP section in the map file to see if related_power_pin and related_ground_pin's are specified for these cells that have multiple P/G pins. This is only a warning message. In the flow that follows this message, there are other checkings that will catch error if you did not specify related_power_pin and related_ground_pin for these cells.

EXAMPLES

```
BEGIN PG_PIN_MAP
cell      pin rail_connection pg_pin
test      LSI VDD           VDD
test      LSO VDD_AUX       VDD_AUX
test      LSI -             VSS
test      LSO -             VSS
END PG_PIN_MAP
where cell test has 2 power pins: VDD and VDD_AUX.
```

EXAMPLE MESSAGE

Warning: Cell 'test' has 2 power pins in Milkyway library. (LBDB-846)

LBDB-847 (error) Too many values (%d) specified in the table.

DESCRIPTION

This message indicates that there are too many values specified in the table. (number = index1_size * index2_size [* index3_size] [*index4_size]). The number exceed the limit (32767) that Library Compiler current handles.

WHAT NEXT

Split the table, to make each table's size less than the limit.

EXAMPLE MESSAGE

Error: Line 307, Too many values (45000) specified in the table. (LBDB-847)

LBDB-848 (error) There is no '%s' %s defined for '%s' %s.

DESCRIPTION

This message indicates the library does not define the voltage_map for the voltage_name specified in a pg_pin, or input_signal_level/output_signal_level defined in a pin.

WHAT NEXT

Add the missing voltage_map.

EXAMPLES

```
voltage_map(VDD, 1.08);
voltage_map(VDD1, 1.1);
voltage_map(VSS, 0.0);

...
cell(sample) {
    pg_pin(VDD) {
        voltage_name : VDD2;
    }
}
```

...
In this case, there is no voltage_map defined for voltage_name VDD2. To fix the problem, add the voltage_map attribute for VDD2 at the library level:

```
voltage_map(VDD, 1.08);  
voltage_map(VDD1, 1.1);  
voltage_map(VDD2, 1.2);  
voltage_map(VSS, 0);  
  
...  
cell(sample) {  
    pg_pin(VDD) {  
        voltage_name : VDD2;  
    ...  
}  
...  
}  
...  
...  
...
```

EXAMPLE MESSAGE

Error: Line 23, There is no 'VDD2' voltage_map defined for 'VDD2' voltage_name. (LB DB-848)

LBDB-849 (warning) The '%s' group is overwritten by the '%s' group on line %d.

DESCRIPTION

The same group has been defined multiple times and only the last one will be recoded in the library db.

WHAT NEXT

Check the dc_current groups for wrong information and fix.

EXAMPLES

EXAMPLE MESSAGE

Warning: The 'dc_current' group is overwritten by the 'dc_current' group on line 12 0. (LBDB-849)

LBDB-850 (warning) Missing %s value under section %s in map

file.

DESCRIPTION

If data entered in map file is incomplete, this message will be printed out. In PG_TO_VOLTAGE_MAP section, there are four fields: cell, pg_pin, pg_type and voltage_name. If one or more fields are left blank, you will see missing data in this section. The same is true for other sections. In VOLTAGE_MAP, for multi-rail library you should specify voltage_map entry with voltage_value = 0. Invalid record will be ignored. In POWER_DOWN_FUNCTION_MAP, if power_down_function values are missing for some cell/pins, the default values !VDD1+!VDD2+...+VSS1+VSS2 will be used where VDDi and VSSI are pg_pins of the cell.

WHAT NEXT

You should enter values for each field in the map file. Do not leave blank in any field except optional direction field in PG_TO_VOLTAGE_MAP section.

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell      pg_pin      voltage_name pg_type
ADDFHX1   VDD         VDD
ADDFHX1   VSS         VSS      primary_ground
END PG_TO_VOLTAGE_MAP
```

EXAMPLE MESSAGE

```
Warning: Line 14, Missing pg_type value under section PG_TO_VOLTAGE_MAP in map file
. (LBDB-850)
Warning: Line 20, Missing voltage value under section VOLTAGE_MAP in map file. (LBD
B-850)
```

LBDB-851 (error) %s section %s in map file.

DESCRIPTION

If the whole map section is missing (neither in map file nor derivable), this message will be printed out. For single-rail library, only PG_TO_VOLTAGE_MAP is required if no Milkyway library. If there is complete Milkyway library to cover all the cells in the input db, no map file is required. In this case, VOLTAGE_MAP will be derived from the input db that includes one voltage_map for nominal voltage and the other one for ground (voltage value = 0). For multi-rail library, PG_PIN_MAP, PG_TO_VOLTAGE_MAP, VOLTAGE_MAP and POWER_DOWN_FUNCTION_MAP sections are all required. If there are rail_connection's, PG_PIN_MAP is required in any case. Please note that invalid entries in the map section are ignored and removed. So even though these entries exist in the map section, the final map table may not include such entries.

WHAT NEXT

Enter the missing section. For multi-rail library, specify all the four map sections with complete data. You can use "*" in cell and/or pin fields for all the others that are not listed in the map section. For single-rail library, specify at least PG_TO_VOLTAGE_MAP section with complete pg_pin, voltage_name and pg_type for each cell.

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell    pg_pin   voltage_name    pg_type
*      VDD      VDD primary_power
*      VSS      VSS primary_ground
*      VSS1     VSS1 backup_ground
END PG_TO_VOLTAGE_MAP
BEGIN POWER_DOWN_FUNCTION_MAP
cell    pin power_down_function
test   test   VSS
*      *       !VDD+VSS+VSS1
END POWER_DOWN_FUNCTION_MAP
```

EXAMPLE MESSAGE

```
Error: Missing section PG_PIN_MAP in map file. (LBDB-851)
Error: Missing section VOLTAGE_MAP in map file. (LBDB-851)
```

LBDB-852 (error) %s found in %s is missing in %s.

DESCRIPTION

This message occurs during cross checking of map sections. (1) PG_PIN_MAP and PG_TO_VOLTAGE_MAP It is two-way checking. It is to check consistency of pg_pin associated with a cell between the two map sections. If a pg_pin for a cell exists in one map section but either the pg_pin or cell is missing in the other section, you will see this message. (2) PG_PIN_MAP and POWER_DOWN_FUNCTION_MAP It is to check signal pin consistency between the two sections. If a pin for a cell exists in POWER_DOWN_FUNCTION_MAP but is missing in PG_PIN_MAP, you will see this message. This checking is for multi-rail library. (3) PG_TO_VOLTAGE_MAP and VOLTAGE_MAP It is to check voltage_name consistency between the two sections. If the voltage_name for the nominal voltage is specified in VOLTAGE_MAP but is missing in PG_TO_VOLTAGE_MAP, you will see a message saying so. Please also refer to LBDB-854. In VOLTAGE_MAP, you can have more entries than necessary.

WHAT NEXT

Check if the missing data (cell, pg_pin or pin) is what is required in the map section or extra data in the section where it exists. In the following example, if it is a multi-rail library and pg_pin VDD1 is what you should need in the library, you should list its entry in PG_TO_VOLTAGE_MAP, in the form of ADDFHX1 VDD1 VDD1

```
backup_power Otherwise, if it is a single-rail library, you should remove the entry  
for VDD1 from PG_PIN_MAP.
```

EXAMPLES

```
BEGIN PG_PIN_MAP  
cell      pin rail_connection pg_pin  
ADDFHX1 A      -      VSS  
ADDFHX1 A      -      VDD  
ADDFHX1 A      -      VDD1  
END PG_PIN_MAP  
BEGIN PG_TO_VOLTAGE_MAP  
cell      pg_pin  voltage_name    pg_type  
ADDFHX1 VDD      VDD primary_power  
ADDFHX1 VSS      VSS primary_ground  
END PG_TO_VOLTAGE_MAP
```

EXAMPLE MESSAGE

```
Error: Line 14, Cell 'test' pg_pin 'VDD1' found in PG_PIN_MAP is missing in PG_TO_VOLTAGE_MAP. (LBDB-852)
```

LBDB-853 (warning) Voltage value %g for voltage_name '%s' is replaced by %g from input library.

DESCRIPTION

In add_pg_pin_to_db, it takes the data in the input db as higher priority. Therefore, if you defined a voltage_map in the map file while there is a different voltage value in the db for this voltage_name, the user defined value will be replaced by the value from the db, e.g. power_rail. The voltage value from the input db is taken in the following order: 1. If the library db has defined default_operating_conditions, then the specified voltage value in operating_condition will be used as the nominal voltage. 2. Otherwise, nom_voltage value defined at the library level will be used as the nominal voltage.

EXAMPLES

```
BEGIN VOLTAGE_MAP  
voltage_name      voltage_value  
VDD              1.1  
VSS              0.0  
END VOLTAGE_MAP  
in default_operating_conditions,  
  power_rail (VDD, 1.2)
```

EXAMPLE MESSAGE

```
Warning: Voltage value 1.1 for voltage_name 'VDD' is replaced by 1.2 from input lib
```

rary. (LBDB-853)

LBDB-854 (warning) voltage_map for nominal voltage %g not referenced in PG_TO_VOLTAGE_MAP.

DESCRIPTION

If you have specified a voltage_map with the nominal voltage (or in the case of a single-rail or 1P1G library, a default voltage_map for the nominal voltage is automatically derived from the input db), but this voltage_name is not referenced in PG_TO_VOLTAGE_MAP table, you will receive this message.

WHAT NEXT

Check if this nominal voltage and voltage name are correct. If so, add its mapping entry with the nominal voltage in PG_TO_VOLTAGE_MAP. If you have not specified the correct voltage_name for the nominal voltage in VOLTAGE_MAP, please correct the voltage_name. If you have not specified the voltage_map in the map file for the nominal voltage and it is derived by the utility, please specify the voltage_map for the nominal voltage by using the correct voltage_name from PG_TO_VOLTAGE_MAP.

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell    pg_pin    voltage_name    pg_type
test    VDD1      VDD1          primary_power
test    VSS       VSS           primary_ground
END PG_TO_VOLTAGE_MAP

BEGIN VOLTAGE_MAP
voltage_name    voltage_value
VDD            1.2
VDD1           1.08
VSS            0.0
END VOLTAGE_MAP
where 1.2 is nominal voltage.
```

EXAMPLE MESSAGE

Warning: voltage_map for nominal voltage 1.2 not referenced in PG_TO_VOLTAGE_MAP. (LBDB-854)

LBDB-855 (warning) Invalid %s found under section %s in map

file.

DESCRIPTION

In the map file, if any of the following is incorrect, (1) pg_type (2) pg_pin direction (3) voltage value (4) wild card or - in wrong field (5) incorrect section name or keywords in title line (6) pin direction in POWER_DOWN_FUNCTION_MAP (7) duplicate data specified on the same cell/pin (8) incorrect rail_connection this message will occur.

Valid pg_type values include: primary_power primary_ground backup_power backup_ground internal_power internal_ground Valid pg_pin direction values include input output inout internal nwell pwell deepnwell deepppwell

Valid voltage values are non-negative floating point numbers. Valid pin directions in POWER_DOWN_FUNCTION_MAP are output or inout. Valid power_down_functions are double quoted strings or unquoted strings if no space within the strings and the strings must contain only the power and ground pin names. rail_connection value should be derived from input .lib/db for the cell. If no rail_connection, please enter -.

Wild cards "*" and "-" can only be entered in some specific fields: (1) PG_PIN_MAP section "*" can be entered in cell and pin fields, and "-" can be entered in pin and rail_connection fields. (2) POWER_DOWN_FUNCTION_MAP section "*" can be entered in cell and pin fields. (3) PG_TO_VOLTAGE_MAP section "*" can be entered in cell field only, and "--" can be entered in optional direction field. (4) VOLTAGE_MAP section No "*" or "--" can be entered in any field in this section. Caret "^" cannot be entered in the first entry of each map section. In checking title lines, the key words and their order should be exactly the same as mentioned in the spec. If an invalid value is entered or the value is entered in the wrong field in the map file, the whole record will be ignored for all fields except optional field in which only optional value is ignored. For example, if the pg_pin direction value is invalid, only the invalid value in this field is ignored. However, if the value is invalid in other fields, the whole line of record will be ignored. (5) POWER_MANAGEMENT_ATTRIBUTE_MAP section If you specify duplicate entries on the same cell/pin/attribute, the last one will be ignored. For example, if you specify retention_2 sv retention_pin (save, "1") retention_2 sv retention_pin (restore, "0") you will receive this message and the second entry will be ignored. If you want to specify pin SAVE as both save and restore, specify it in this way, retention_2 sv retention_pin (save_restore, "0")

WHAT NEXT

You should correct the invalid values in the map file. For example, in pg_type field, if you enter power, you will receive this message. The correct pg_type should be primary_power.

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell      pg_pin      voltage_name pg_type
ADDFHX1   VDD        VDD      power
ADDFHX1   VSS        VSS      primary_ground
```

```
GEND PG_TO_VOLTAGE_MAP
```

EXAMPLE MESSAGE

Warning: Line 14, Invalid pg_type found under section PG_TO_VOLTAGE_MAP in map file . (LBDB-855)

Warning: Line 20, Invalid wild card found under section PG_PIN_MAP in map file. (LB DB-855)

LBDB-856 (error) For pin(%s) of cell(%s), the %s entry for %s of pin(%s) cannot be found.

DESCRIPTION

This message indicates that you do not specify the relative_power_pin/related_ground_pin of the signal pin in the PG_PIN_MAP section of the map file used by add_pg_pin_to_db command.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: For pin(A) of cell(sample), the pg_pin_map entry for related_power_pin of pi n(A) cannot be found. (LBDB-856)

LBDB-857 (error) Missing %s under section %s.

DESCRIPTION

You will receive this Error if the following occurs: (1) VOLTAGE_MAP for multi-rail library if you do not specify voltage_map entry with voltage_value = 0 (2) POWER_MANAGEMENT_ATTRIBUTE_MAP if you do not specify a complete set of power management attributes in the map file, or the input .lib has partial power management attributes but you do not specify the ones that are missing in the library

WHAT NEXT

You should enter values for each field in the map file. Do not leave blank in any field except optional direction field in PG_TO_VOLTAGE_MAP section. In VOLTAGE_MAP, for multi-rail library you should specify voltage_map entry with voltage_value = 0. In POWER_MANAGEMENT_ATTRIBUTE_MAP, specify the missing power attributes. In

converting power_gating_pin, it uses power_pin_class and map_to_logic attributes in DB, and change power_pin_class = 6, 7, 8 to pin class "save", "restore" and "save_restore", respectively, and take the value of map_to_logic as <disable_value>. If the input .lib does not have power_pin_class = 6, 7 or 8, you should specify retention_pin_class as in the example RET_1svretention_pin (save, "0")

EXAMPLES

```
BEGIN VOLTAGE_MAP
voltage_name      voltage_value
VDDlow           1.6
VDDhigh          2.0
VSS              0.1
END VOLTAGE_MAP
```

EXAMPLE MESSAGE

```
Error: Missing voltage value 0 under section VOLTAGE_MAP. (LBDB-857)
Error: Missing power_pin_class for cell 'retention' pin 'sv' under section POWER_MA
NAGEMENT_ATTRIBUTE_MAP. (LBDB-857)
```

LBDB-858 (error) The timing arc %s->%s with when condition "%s" doesn't have ccs noise model.

DESCRIPTION

For every timing arc, there must be one of the followings: (1) arc-based ccs noise model(s) with the same "when" condition as the "when" of the timing arc, (2) pin-based ccs noise models with the same "when" condition as the "when" of the timing arc, or (3) pin-based ccs noise models with default (i.e., no "when") "when" condition.

```
For example, pin(CO) { timing() { when : "!B&A"; ... ccsn_first_stage() { /* no when
condition */ ... } /* qualified model 1 */ }

ccsn_last_stage() { when : "!B&A"; ... } /* qualified model 2 */

ccsn_last_stage() { /* no when condition */ ... } /* qualified model 3 */

... }
```

when condition "default" means that this timing arc has no "when" attribute.

WHAT NEXT

Add ccs noise model with the qualified "when" condition.

EXAMPLE MESSAGE

```
Error: The timing arc CI->CO with when condition "!B&A" doesn't have ccs noise model. (LBDB-858)
```

LBDB-859 (error) There is no cross point in this %s group with input_net_transition %s.

DESCRIPTION

For expanded ccs power, if **pg_current** is represented as a sparse cross table, if there is no *input_net_transition*, then there must be one and only one cross point in one of the vectors. if *input_net_transition* is specified, then one and only one cross point is required for each *input_net_transition*.

For compact ccs power, if **pg_current** is represented as a sparse cross table, then the typical capacitance of the pin specified in "index_output" must be one of the values in index with variable "total_output_net_capacitance".

WHAT NEXT

Add cross point for each *input_net_transition*.

EXAMPLES

```
dynamic_current() {
    ...
    related_outputs : "Q QN QN1 QN2";
    typical_capacitances(10.0, 12.0, 14.0, 16.0);
    switching_group() {
        ...
        pg_current(VDD) {
            vector(CCS_power_1) {
                index_output : "QN1";
                index_1 ("0.01");
                index_2 ("14.0"); /* cross point */
            ...
        }
        vector(CCS_power_1) {
            index_output : "QN2";
            index_1 ("0.02");
            index_2 ("11.0"); /* non cross point */
        ...
    }
    ...
}
}
```

In this case, **pg_current** has only two vectors. There is no cross point with

input_net_transition 0.02. So error message LBDB-859 will be issued.

EXAMPLE MESSAGE

Error: There is no cross point in this pg_current group with input_net_transition 0 .02. (LBDB-859)

LBDB-860 (error) This cross point vector is inconsistent with a previous one with the same input_net_transition.

DESCRIPTION

If two cross point **vector** groups have the same **index** value of *input_net_transition*, then waveform of the I-t curve and **reference_time** must be the same for both vectors.

Two I-t curve waveforms are "equal" means,

Step1. Use the 1st waveform as a reference. For each time point in the reference waveform, get the current from the 2nd waveform. (may involve linear interpolation).

Step2. Take the sum of absolute difference on currents for each time point at the reference waveform. Assume total num of points in the reference waveform is N.

Step3. Calculate relative waveform difference as `Sum_of_difference_on_current / (peak_from_reference * N)`, which should <= 2%.

Step4. Calculate relative peak difference as `ABS (peak_from_2nd - peak_from_reference) / peak_from_reference`, which should <= 2%.

WHAT NEXT

Correct one of the cross points to make them consistent.

EXAMPLES

```
dynamic_current() {
    ...
    related_outputs : "Q QN";
    typical_capacitances(10.0, 12.0);
    switching_group() {
        ...
        pg_current(VDD) {
            vector(CCS_power_1) {
                index_output : "Q";
                reference_time : 0.01;
                index_1 ("0.02"); /* input_net_transition */
                index_2 ("10.0"); /* total_output_net_capacitance */
                index_3 ("0.000, 0.0873, 0.135, 0.764"); /* time */
                values ("0.002, 0.009, 0.134, 0.546");
            }
        }
    }
}
```

```

}
vector(CCS_power_1) {
    index_output : "QN";
    reference_time : 0.04;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("12.0"); /* total_output_net_capacitance */
    index_3 ("0.000, 0.0873, 0.135, 0.764"); /* time */
    values ("0.002, 0.009, 0.134, 0.546");
}
}
...
}
}

```

In this case, pg_current is a sparse cross table, two vectors are represented as cross points, and both have the same input_net_transition 0.02. In such a case, I-t curve waveform and reference_time (0.01 and 0.04, not identical. Error out) must be the same.

EXAMPLE MESSAGE

Error: This cross point vector is inconsistent with a previous one with the same input_net_transition. (LBDB-860)

LBDB-861 (error) This vector is repeated with a previous one under the same pg_current group.

DESCRIPTION

Under the same **pg_current** group, no two vectors can have the same **index_output** and values of all **index** attributes except for the last **index** (time). Otherwise, this vector will be regarded as repeated.

WHAT NEXT

Correct one of the vectors to make them different.

EXAMPLES

```

pg_current(VDD) {
    vector(CCS_power_1) {
        index_output : "QN1";
        reference_time : 0.01;
        index_1 ("0.01"); /* input_net_transition */
        index_2 ("14.0"); /* total_output_net_capacitance */
        index_3 ("0.001, 0.003, 0.006"); /* time */
        ...
    }
    vector(CCS_power_1) {

```

```

index_output : "QN1";
reference_time : 0.01;
index_1 ("0.01"); /* input_net_transition */
index_2 ("14.0"); /* total_output_net_capacitance */
index_3 ("0.004, 0.007, 0.009"); /* time */
...
}
}

```

In this case, `index_output` (QN1), `input_net_transition` (0.01), and `total_output_net_capacitance`(14.0) are all the same between two vectors. So error message LBDB-861 will be issued.

EXAMPLE MESSAGE

Error: This vector is repeated with a previous one under the same pg_current group.
(LBDB-861)

LBDB-862 (error) The dense table under the pg_current group is incomplete with `input_net_transition` %s.

DESCRIPTION

If a <template> with two `total_output_net_capacitance` variables is applied to all vectors under a **pg_current** group, then all possible combination of capacitances between two output pins must be specified if all of them have the same `input_net_transition`.

WHAT NEXT

Add vectors to make the dense table complete.

EXAMPLES

```

pg_current(VDD) {
    vector(CCS_power_dense) {
reference_time : 0.01;
index_1 ("0.01"); /* input_net_transition */
index_2 ("1.0"); /* total_output_net_capacitance */
index_3 ("2.0"); /* total_output_net_capacitance */
index_4 ("0.000, 0.0873, 0.135, 0.764"); /* time */
values ("0.002, 0.009, 0.134, 0.546");
}
    vector(CCS_power_dense) {
reference_time : 0.01;
index_1 ("0.01"); /* input_net_transition */
index_2 ("1.5"); /* total_output_net_capacitance */
index_3 ("2.5"); /* total_output_net_capacitance */
index_4 ("0.100, 0.0873, 0.135, 0.764"); /* time */

```

```

    values ("0.113, 0.110, 0.243, 0.657");
}
vector<CCS_power_dense> {
reference_time : 0.01;
index_1 ("0.01"); /* input_net_transition */
index_2 ("1.5"); /* total_output_net_capacitance */
index_3 ("2.0"); /* total_output_net_capacitance */
index_4 ("0.000, 0.0873, 0.135, 0.764"); /* time */
values ("0.224, 0.221, 0.358, 0.769");
}
}

```

In this case, all possible combinations of (c1, c2) with input_net_transition 0.01 are (1.0, 2.0), (1.5, 2.5), (1.0, 2.5) and (1.5, 2.0). But (1.0, 2.5) is missing. So error message LBDB-862 will be issued.

EXAMPLE MESSAGE

Error: The dense table under the pg_current group is incomplete with input_net_transition 0.01. (LBDB-862)

LBDB-863 (error) Size or values of total_output_net_capacitance are not identical for output pin %s.

DESCRIPTION

The size and values of *total_output_net_capacitance* for the same output pin or **index_output** (cross type) shall be identical for all vectors which have different *input_net_transition* index values.

In other words, every fixed (without tolerance) *input_net_transition* needs the same set of *total_output_net_capacitance*.

In the message, "output pin" means *index_output* (cross type) or all pins in "related_outputs" (dense type and diagonal type).

WHAT NEXT

Change the size or values of *total_output_net_capacitance* with a *input_net_transition* value to make the size and values consistent.

EXAMPLES

```

dynamic_current() {
...
related_outputs : "Q QN";
typical_capacitances(10.0, 12.0);
switching_group() {
...

```

```

    pg_current(VDD) {
        vector(CCS_power_1) {
            index_output : "Q";
            reference_time : 0.01;
            index_1 ("0.01"); /* input_net_transition */
            index_2 ("5.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "Q";
            reference_time : 0.01;
            index_1 ("0.01"); /* input_net_transition */
            index_2 ("10.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "Q";
            reference_time : 0.01;
            index_1 ("0.01"); /* input_net_transition */
            index_2 ("15.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "QN";
            reference_time : 0.01;
            index_1 ("0.01"); /* input_net_transition */
            index_2 ("6.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "QN";
            reference_time : 0.01;
            index_1 ("0.01"); /* input_net_transition */
            index_2 ("12.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "QN";
            reference_time : 0.01;
            index_1 ("0.01"); /* input_net_transition */
            index_2 ("18.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "Q";
            reference_time : 0.01;
            index_1 ("0.02"); /* input_net_transition */
            index_2 ("5.0"); /* total_output_net_capacitance */
            ...
        }
        vector(CCS_power_1) {
            index_output : "Q";
            reference_time : 0.01;
            index_1 ("0.02"); /* input_net_transition */
            index_2 ("11.0"); /* total_output_net_capacitance */

```

```

    ...
}

vector {
    index_output : "Q";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("15.0"); /* total_output_net_capacitance */
    ...
}
vector {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("6.0"); /* total_output_net_capacitance */
    ...
}
vector {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("12.0"); /* total_output_net_capacitance */
    ...
}
vector {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("18.0"); /* total_output_net_capacitance */
    ...
}
vector {
    index_output : "QN";
    reference_time : 0.01;
    index_1 ("0.02"); /* input_net_transition */
    index_2 ("24.0"); /* total_output_net_capacitance */
    ...
}
}
...
}
}
}

```

When input_net_transition is 0.01 and output pin is Q, total_output_net_capacitance size=3, values = (5.0, 10.0, 15.0). /*group1*/ When input_net_transition is 0.01 and output pin is QN, total_output_net_capacitance size=3, values = (6.0, 12.0, 18.0). /*group2*/ When input_net_transition is 0.02 and output pin is Q, total_output_net_capacitance size=3, values = (5.0, 11.0, 15.0). /*group3*/ When input_net_transition is 0.02 and output pin is QN, total_output_net_capacitance size=4, values = (6.0, 12.0, 18.0, 24.0). /*group4*/ group1 and group3 have different values. group2 and group4 have different sizes. So error message LBDB-863 will be issued.

EXAMPLE MESSAGE

Error: Size or values of total_output_net_capacitance are not identical for output

```
pin Q. (LBDB-863)
Error: Size or values of total_output_net_capacitance are not identical for output
pin QN. (LBDB-863)
```

LBDB-864 (error) The design '%s' has separate intrinsic_parasitic groups.

DESCRIPTION

This error occurs when there are two intrinsic_parasitic groups in the same cell, where the only difference is that one group has only intrinsic_resistance, and the other group has only intrinsic_capacitance.

However, it is allowed that only intrinsic_resistance or intrinsic_capacitance is defined for the intrinsic_parasitic group.

WHAT NEXT

Combine the separate intrinsic_parasitic groups into one group.

EXAMPLES

```
cell (AND3) {
    ...
    intrinsic_parasitic() {
        /* default state */
        intrinsic_resistance(G1) {
            related_output : "ZN";
            value : 9.0;
        }
    }
}

intrinsic_parasitic() {
    /* default state */
    intrinsic_capacitance(G2) {
        value : 8.2;
    }
}
```

In this case, cell 'AND3' has both an intrinsic_parasitic group with only intrinsic_resistance and an intrinsic_parasitic group with only intrinsic_capacitance. So error message LBDB-864 will be issued.

EXAMPLE MESSAGE

```
Error: The design 'AND3' has separate intrinsic_parasitic groups. (LBDB-864)
```

LBDB-865 (warning) Conductance is negative at input voltage level %g.

DESCRIPTION

The conductance at any index point (input_voltage, output_voltage) is calculated as: at a given input voltage level, $G = di/dv$, where dv is the voltage difference between two adjacent index points of output voltage, and di is the corresponding current difference.

Conductance calculated from IV curve should be non-negative.

WHAT NEXT

Change output_voltage or current data in dc_current table.

EXAMPLES

```
lu_table_template (c_grain) {
    variable_1 : input_voltage;
    variable_2 : output_voltage;
    index_1("0.0, 0.2, 0.5, 1.08, 4.07");
    index_2("0.0, 0.5, 1.08, 4.0, 5.0");
}
cell (AND3) {
    ...
    dc_current (c_grain) {
        ...
        values ("0.01, 0.02, 0.03, 0.05, 0.06",
                "0.02, 0.03, 0.04, 0.05, 0.06",
                "0.03, 0.04, 0.05, 0.06, 0.07",
                "0.04, 0.05, 0.06, 1.07, 0.08",
                "0.05, 0.06, 0.07, 0.08, 0.09");
    }
}
```

In this case, at input_voltage level 1.08, the conductance is negative when using the current data "1.07" and "0.08". Cond = (0.08-1.07) / (5.0-4.0) < 0. So warning message LBDB-865 will be issued.

EXAMPLE MESSAGE

Warning: Conductance is negative at input voltage level 1.08. (LBDB-865)

SEE ALSO

LBDB-866.n LBDB-867.n

LBDB-866 (warning) The maximum conductance is non-positive.

DESCRIPTION

The conductance at any index point (input_voltage, output_voltage) is calculated as: at a given input voltage level, $G = di/dv$, where dv is the voltage difference between two adjacent index points of output voltage, and di is the corresponding current difference.

For conductance calculated cross all input voltage and output voltage indices, the largest conductance value should be positive (can't be zero).

WHAT NEXT

Change output_voltage or current data in dc_current table.

EXAMPLES

```
lu_table_template (c_grain) {
    variable_1 : input_voltage;
    variable_2 : output_voltage;
    index_1("0.0, 0.2, 0.5, 1.08, 4.07");
    index_2("0.0, 0.5, 1.08, 4.0, 5.0");
}
cell (AND3) {
    ...
    dc_current (c_grain) {
        ...
        values ("0.01, 0.01, 0.01, 0.01, 0.01",
                "0.02, 0.02, 0.02, 0.02, 0.02",
                "0.03, 0.03, 0.03, 0.03, 0.03",
                "0.04, 0.04, 0.04, 0.04, 0.04",
                "0.05, 0.05, 0.05, 0.05, 0.05");
    }
}
```

In this case, all conductance is 0.0. So warning message LBDB-866 will be issued.

EXAMPLE MESSAGE

Warning: The maximum conductance is non-positive. (LBDB-866)

SEE ALSO

LBDB-865.n LBDB-867.n

LBDB-867 (warning) Conductance is not monotonically

decreasing at input voltage level %g.

DESCRIPTION

The conductance at any index point (input_voltage, output_voltage) is calculated as: at a given input voltage level, $G = di/dv$, where dv is the voltage difference between two adjacent index points of output voltage, and di is the corresponding current difference.

At any input voltage level, as output voltage increases, the conductance should monotonically decrease.

WHAT NEXT

Change output_voltage or current data in dc_current table.

EXAMPLES

```
lu_table_template (c_grain) {
    variable_1 : input_voltage;
    variable_2 : output_voltage;
    index_1("0.0, 0.2, 0.5, 1.08, 4.07");
    index_2("0.0, 0.5, 1.08, 4.0, 5.0");
}
cell (AND3) {
    ...
    dc_current (c_grain) {
        ...
        values ("0.01, 0.02, 0.03, 0.04, 0.05",
                "0.02, 0.03, 0.04, 0.05, 0.06",
                "0.03, 0.04, 0.05, 0.06, 0.07",
                "0.04, 0.05, 0.06, 1.07, 0.08",
                "0.05, 0.06, 0.07, 0.08, 0.09");
    }
}
```

In this case, at input_voltage level 0.0, the conductance are c1 = (0.02-0.01) / (0.5-0.0) = 0.02 c2 = (0.03-0.02) / (1.08-0.5) = 0.017 c3 = (0.04-0.03) / (4.0-1.08) = 0.0034 c4 = (0.05-0.04) / (5.0-4.0) = 0.1 The values are not monotonically decreasing. So warning message LBDB-867 will be issued.

EXAMPLE MESSAGE

Warning: Conductance is not monotonically decreasing at input voltage level 0.0. (LBDB-867)

SEE ALSO

LBDB-865.n LBDB-866.n

LBDB-868 (warning) The estimated time when output signal reaches VDD level is out of range [%g, %g].

DESCRIPTION

The time when output signal reaches VDD level is estimated as $T = \text{reference time} + \text{NLDM delay}$. Reference time means the time when input signal reaches VDD level. T has to be within the range of the current waveform (min and max of time in current waveform).

The way to evaluate NLDM delay is to lookup the cell_rise/cell_fall table in the corresponding timing arc with the given input_net_transition and total_output_net_capacitance in the vector.

If the given input_net_transition and total_output_net_capacitance can not be found in the cell_rise/cell_fall table, use the nearest index to get the delay value.

WHAT NEXT

Extend current waveform, or change reference time and delay.

EXAMPLES

```
lu_table_template (table_dodelaycell_rise_0k0aa01m1) {
    variable_1 : total_output_net_capacitance
    variable_2 : input_net_transition
    index_1 (" 0.006404, 0.055194, 0.147118 ");
    index_2 (" 0.060000, 0.400000, 0.800000 ");
}
pg_current_template(t1) {
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : time;
    index_1("0.6 0.9");
    index_2("0.6 0.9");
    index_3("0.3 4.7");
}

cell (AND3) {
    dynamic_current() {
        ...
        related_inputs : "A2 A3";
        related_outputs : "ZN ZN1";
        typical_capacitances(0.3 0.4);
        switching_group() {
            ...
            pg_current(V2) {
                vector(t1) {
                    reference_time : 15.6;

```

```

        index_output : "ZN1";
        index_1("0.5");
        index_2("0.043");
        index_3("18.2 18.3 19.0");
        values("13.78 192.4 1100.1");
    }
}
}

pin(ZN1) {
    ...
    timing() {
        related_pin : "A1 A2"
        cell_rise( scalar ) {
            values("0.28");
        }
        cell_fall( scalar ) {
            values("0.0");
        }
        ...
    }
    timing() {
        related_pin : "A3"
        cell_rise ("table_dodelaycell_rise_0k0aa01m1") {
            values (
                "0.1729, 0.2200, 0.2397 ",
                "0.3494, 0.4012, 0.4273 ",
                "0.6499, 0.7018, 0.7281 "
            );
        }
        cell_fall( scalar ) {
            values("0.0");
        }
    }
}
}
}

```

In this case, the information on the given current waveform is, (1) the time range is [18.2, 19.0]; (2) reference time is 15.6; (3) input pins are "A2 A3", output pin is ZN1; (4) input_net_transition is 0.5; (5) total_output_net_capacitance is 0.043.

In the section of pin(ZN1), (1) the first timing arc is specified with input pin "A1 A2", overlaped with "A2 A3" in the current waveform. So the delay is needed. delay1 = MAX(0.28, 0.0) = 0.28.

(2) the second timing arc is specified with input pin "A3", overlaped with "A2 A3" in the current waveform. So the delay is needed.

Look up cell_rise table with (input_net_transition=0.5, total_output_net_capacitance=0.043). The nearest index is values[1][1] = 0.4012. delay2 = MAX(0.4012, 0.0) = 0.4012.

max_delay = MAX(delay1, delay2) = 0.4012.

reference_time + max_delay = 15.6+0.4012 = 16.0012. It isn't within the range [18.2, 19.0]. So warning message LBDB-868 will be issued.

EXAMPLE MESSAGE

Warning: The estimated time when output signal reaches VDD level is out of range [1 8.2, 19.0]. (LBDB-868)

LBDB-869 (information) Failure rate of the library cells will be overwritten.

DESCRIPTION

Failure rate is a Design-For-Yield concept, it is a integer number, value from 0 ~ 1e9, means the number of failures per billion.

In Liberty syntax, there are two models can describe the cell yield, under the same cell level group, `functional_yield_metric()`.

```
cell (my_cell) { ... functional_yield_metric() { /* 1st method */
average_number_of_faults(<template>) { values("float...float"); } /* 2nd method */
critical_area_table(<template>) { defect_type:enum(short, open, short_and_open);
related_layer:<layer_name>; index_1("float...float"); /*particle diameter array*/
values("float...float"); /*critical area values */ } } ... }
```

Using the 1st method can defined the average failure rate and derive a cell failure rate directly by Library Compiler.

The 2nd method, besides the critical area table in .lib, user need particle distribution function file, using command `calculate_caa_based_yield2db` to calculate out the failure rate.

This message is reported when the command `calculate_caa_based_yield2db` is called to calculate the CAA based yield (failure rate), while the failure rate attribute is already exist in the library(db file), regardless the failure rate is calculated by 1st or 2nd method before.

WHAT NEXT

This is just an information to update the status, you can just ignore it.

EXAMPLE MESSAGE

Information: Failure rate of the library cells will be overwritten. (LBDB-869)

LBDB-870 (information) Redundant cross point vector with

input_net_transition %s is removed.

DESCRIPTION

If there are more than one cross point vectors with the same input_net_transition under a pg_current group, read_lib will only keep the first one. Others will be removed.

WHAT NEXT

It's just an information. Change in .lib is not required. However, in order to remove this message, keep only one cross point vector with the specified input_net_transition.

EXAMPLES

```
dynamic_current() {
    ...
    related_outputs : "Q QN QN1 QN2";
    typical_capacitances(10.0, 12.0, 14.0, 16.0);
    switching_group() {
        ...
        pg_current(VDD) {
            vector(CCS_power_1) {
                index_output : "QN1";
                index_1 ("0.01");
                index_2 ("14.0"); /* cross point */
            ...
        }
        vector(CCS_power_1) {
            index_output : "QN2";
            index_1 ("0.01");
            index_2 ("16.0"); /* cross point */
        ...
    }
    ...
}
```

In this case, there are two cross points with input_net_transition 0.01. So the second one will be removed.

EXAMPLE MESSAGE

Info: Redundant cross point vectors with input_net_transition 0.01 are removed. (LB DB-870)

LBDB-871 (error) The first point current value(%f) is almost

the same as peak point current value(%f).

DESCRIPTION

This error is issued when init current value is numerically identical to the peak current in CCS Timing or Compact CCS Timing data. The tolerance is set to 0.001%, that is: if $\text{fabs}((\text{I(first_point)} - \text{I(peak_point)}) / \text{I(peak_point)}) < 0.001\%$,

This could potentially cause larger errors in the calculation if data is truncated during reading, when these two values are too close.

WHAT NEXT

Check the library source file and correct the data, most likely, you may need to re-characterize the library cells for CCS timing data.

EXAMPLES

```
    output_current_rise() {
vector(ccs) {
reference_time : 1.493117e+00;
index_1(2.986235e+00);
index_2(2.500000e+01);
index_3("8.216709e+00, 8.391117e+00, 1.775112e+01, 3.249112e+01, 4.366012e+01, 6.03
3512e+01, 7.932612e+01, 9.818012e+01, 1.184101e+02, 1.420501e+02, 1.728901e+02, 1.8
51275e+02");
values( "4.299772e-01, 4.299781e-01, 4.117592e-01, 3.890655e-01, 3.539464e-
01, 2.690953e-01, 1.685153e-01, 9.581405e-02, 4.934546e-02, 2.188565e-02, 7.340714e-
03, 5.989923e-03");
}
}
```

EXAMPLE MESSAGE

Error: Line 3383, The first point current value(0.429977) is almost
the same as peak point current value(0.429978). (LBDB-871)

SEE ALSO

LBDB-665 LBDB-671

LBDB-872 (warning) Curve parameters in %s are not exact for

compact CCS power.

DESCRIPTION

This warning message occurs because the curve parameters are not exact for compact CCS power. If a `compact_lut_template` is for compact CCS power, the value of `curve_parameters` index (the last index) must be the following

```
init_time, init_current, bc_id1, point_time1, point_current1, bc_id2,  
[point_time2, point_current2, bc_id3, ...], end_time, end_current
```

This is a pattern instead of a specified series because the compact CCS power table varies in size.

WHAT NEXT

Change the values in the `curve_parameters` index and run the command again.

EXAMPLES

```
compact_lut_template(t1) {  
    variable_1 : input_net_transition;  
    variable_2 : total_output_net_capacitance;  
    variable_3 : curve_parameters;  
    index_1 : (...);  
    index_2 : (...);  
    index_3 : ("init_time, init_current, bc_id1");  
}
```

The values in `index_3` are not exact for compact CCS power.

SEE ALSO

[LBDB-873 \(n\)](#)
[LBDB-876 \(n\)](#)
[LBDB-877 \(n\)](#)

LBDB-873 (error) Invalid size of data for I-t curve #%

"values".

DESCRIPTION

In compact ccs power, an I-t curve is always described with the pattern init_time, init_current, bc_id1, point_time1, point_current1, bc_id2, [point_time2, point_current2, bc_id3, ...], end_time, end_current

So the size of data within a pair of quotation (e.g., data for an I-t curve) should be able to reprented as 8+3i ($i \geq 0$).

"I-t curve #?" means the order of this curve in "values". For example, "I-t curve #2" means the 2nd curve in "values".

WHAT NEXT

Change size and data in "values".

EXAMPLES

```
compact_ccs_power(t1) {
    ...
    values("0.0, 1, 0.32, 1.08, 2, 0.87, -
0.33, 3, 1.03, 0.0, 4, 1.50, 0.67", <HardSpace/* size = 13 */
    "0.0, 0.0, 1, 0.28, 0.93, 2, 0.45, 0.28", <HardSpace/* size = 8 */
    "0.0, 0.0, 1, 0.36, 1.05, 2, 0.52, -0.49, 3, 0.88, 0.22", <HardSpace/
* size = 11 */
    "0.0, 0.0, 1, 0.33, 1.31, 2, 0.61, -0.83, 3, 0.96, 0.66" /* size = 11 */);
}
```

In this example, size of the first line in "values" is 13, which is invalid. Sizes of other lines are valid.

EXAMPLE MESSAGE

Error: Line 388, Invalid size of data for I-t curve #1 in "values". (LBDB-873)

LBDB-874 (error) Time values in I-t curve #*%d* in "values" should be monotonically increasing.

DESCRIPTION

In compact ccs power, an I-t curve is always described with the pattern init_time, init_current, bc_id1, point_time1, point_current1, bc_id2, [point_time2, point_current2, bc_id3, ...], end_time, end_current

Time values with corresponding parameter "init_time", "point_time*" and "end_time"

in an I-t curve should be monotonically increasing.

"I-t curve #?" means the order of this curve in "values". For example, "I-t curve #2" means the 2nd curve in "values".

WHAT NEXT

Change values of time-related data in "values".

EXAMPLES

```
compact_ccs_power(t1) {  
    ...  
    values("0.0, 0.0, 1, 1.32, 1.08, 2, 0.87, -  
0.33, 3, 1.03, 0.0, 4, 1.50, 0.67", ...  
}
```

In this example, time-related data are {0.0, 1.32, 0.87, 1.03, 1.50}, which are not monotonically increasing.

EXAMPLE MESSAGE

Error: Line 388, Time values for I-t curve #1 in "values" should be monotonically increasing. (LBDB-874)

LBDB-875 (warning) %s value %f in I-t curve #%d is too small and may be reset 0.

DESCRIPTION

In a I-t curve, all time values with corresponding parameter "init_time", "point_time*" and "end_time" can't be too diverse. Otherwise, small values will be reset 0. Similarly, all current values with corresponding parameter "init_current", "point_current*" and "end_current" can't be too diverse, either. "I-t curve #?" means the order of this curve in "values". For example, "I-t curve #2" means the 2nd curve in "values".

WHAT NEXT

Change time or current values.

EXAMPLES

```
compact_ccs_power(t1) {  
    ...  
    values("0.0, 0.0, 1, 1.32, 1.08, 2, 0.87, -  
0.33, 3, 1.03, 0.0, 4, 1e+100, 0.67", ...  
}
```

In this example, "end_time" is 1e+100, which will make other non-zero time values 1.32, 0.87 and 1.03 reset 0.

EXAMPLE MESSAGE

Warning: Line 388, Time value 1.32 in I-t curve 1 is too small and may be reset 0. (LBDB-875)

LBDB-876 (error) Variables are specified behind indexes in compact_lut_template.

DESCRIPTION

compact_lut_template requires variables are specified before indexes. Other templates don't have this requirement.

WHAT NEXT

Put all variables in front of indexes.

EXAMPLES

```
compact_lut_template (t1) {
    index_1 ("0, 1");
    index_2 ("0, 1");
    index_3 ("init_time, init_current, bc_id1, point_time1, point_current1,
              bc_id2, [point_time2, point_current2, bc_id3, ...],
              end_time, end_current");
    variable_1 : input_net_transition;
    variable_2 : total_output_net_capacitance;
    variable_3 : curve_parameters;
}
```

EXAMPLE MESSAGE

Error: Line 388, Variables are specified behind indexes in compact_lut_template. (LBDB-876)

LBDB-877 (error) Variables in compact_lut_template are invalid.

DESCRIPTION

Variables in compact_lut_template must satisfy, (1) The last variable is

"curve_parameters"; (2) The variables before the last one are "input_net_transition" and "total_output_net_capacitance".

If this template is applied in compact ccs timing or va compact ccs timing, (3) There should be exactly one "input_net_transition" and one "total_output_net_capacitance".

If this template is applied in compact ccs power, (3) There should be at most one "input_net_transition" and at most two "total_output_net_capacitance".

WHAT NEXT

Make necessary change in variable and index.

EXAMPLES

```
compact_lut_template(t1) {  
    variable_1 : input_net_transition;  
    variable_2 : curve_parameters;  
    variable_3 : total_output_net_capacitance;  
}
```

To fix the problem, exchange the values between variable_2 and variable_3.

EXAMPLE MESSAGE

Error: Line 388, Variables in compact_lut_template are invalid. (LBDB-877)

LBDB-878 (error) One point current value(%f) is almost the same as the adjacent point current value(%f).

DESCRIPTION

This error is issued when current value in one point is numerically identical to that in the adjacent point in Compact CCS Power data. The tolerance is set to 0.001%, that is: if $\text{fabs}((\text{I(first_point)} - \text{I(second_point)})/\text{I(second_point)}) < 0.001\%$,

This could potentially cause larger errors in the calculation if data is truncated during reading, when these two values are too close.

WHAT NEXT

Check the library source file and correct the data, most likely, you may need to re-characterize the library cells for CCS power data.

EXAMPLES

```
compact_ccs_power(t1) {  
    ...  
    values("0.0, 0.0, 1, 0.28, 0.93, 2, 0.45, 0.929999", ...  
}
```

EXAMPLE MESSAGE

Error: Line 388, One point current value(0.93) is almost the same as the adjacent point current value(0.929999). (LBDB-878)

LBDB-879 (error) Pin '%s' can't be a pll %s pin.

DESCRIPTION

This message is issued because pin direction doesn't match the required direction of pll reference/feedback/output pin. If a pin is set "is_pll_reference_pin" or "is_pll_feedback_pin" true, it should be an input pin. If a pin is set "is_pll_output_pin" true, it should be an output pin.

WHAT NEXT

Specify the attribute "is_pll_reference_pin", "is_pll_feedback_pin" or "is_pll_output_pin" under another pin with consistent direciton.

EXAMPLES

```
cell (AND2) { is_pll_cell : true; pin (A1) { direction : input; is_pll_output_pin : true; } ... }
```

EXAMPLE MESSAGE

Error: Pin 'A1' can't be a pll output pin. (LBDB-879)

LBDB-880 (error) More than one exclusive pll pin attributes are specified in pin '%s'.

DESCRIPTION

In a cell, pll reference pin, pll feedback pin and pll output pin must be different pins. Therefore in a pin group, at most one of the three attributes "is_pll_reference_pin", "is_pll_feedback_pin" and "is_pll_output_pin" can be set true.

WHAT NEXT

Move all pll pin specifications except one to other pins.

EXAMPLES

```
cell (AND2) { is_pll_cell : true; pin (ZN1) { direction : input;
is_pll_reference_pin : true; is_pll_feedback_pin : true; } ... }
```

EXAMPLE MESSAGE

Error: More than one exclusive pll pin attributes are specified in pin 'ZN1'. (LBDB-880)

LBDB-881 (error) PII cell '%s' has wrong pll %s pin defined.

DESCRIPTION

If a cell is specified as a pll cell, then the cell group should contain one and only one pll reference pin, one and only one pll feedback pin, and one or more pll output pins.

WHAT NEXT

Correct pins under the pll cell.

EXAMPLES

```
cell (AND2) { is_pll_cell : true; pin (ZN1) { direction : input;
is_pll_reference_pin : true; } }
```

EXAMPLE MESSAGE

Error: Pll cell 'AND2' has wrong pll feedback pin defined. (LBDB-881)
Error: Pll cell 'AND2' has wrong pll output pin defined. (LBDB-881)

LBDB-882 (warning) PII pin tags in non-pll cell '%s' will be ignored.

DESCRIPTION

If a cell is not set "is_pll_cell" true, then pin level attributes "is_pll_reference_pin", "is_pll_feedback_pin" and "is_pll_output_pin" will be

ignored.

WHAT NEXT

Remove pll pin tags from the non-pll cell.

EXAMPLES

```
cell (AND2) { pin (ZN1) { direction : input; is_pll_reference_pin : true; } }
```

EXAMPLE MESSAGE

Warning: Pll pin tags in non-pll cell 'AND2' will be ignored. (LBDB-882)

LBDB-883 (error) More than one physical only cell types are specified in design '%s'.

DESCRIPTION

In a pin group, at most one of the three attributes "is_decap_cell", "is_filler_cell" and "is_tap_cell" can be set true.

WHAT NEXT

Remove all physical only cell type specifications except one.

EXAMPLES

```
cell (S1CAP1) { is_filler_cell : true; is_decap_cell : true; ... }
```

EXAMPLE MESSAGE

Error: More than one physical only cell types are specified in design 'S1CAP1'. (LB DB-883)

LBDB-884 (error) Physical only cell '%s' can't contain I/O pins.

DESCRIPTION

If one of the three attributes "is_decap_cell", "is_filler_cell" and "is_tap_cell" is set true, this cell is a physical only cell. It should contain pg-pin only and has no signal pins in it.

WHAT NEXT

Remove I/O pins in this cell.

EXAMPLES

```
cell (S1CAP1) { is_decap_cell : true; pin(A1) { ... } ... }
```

EXAMPLE MESSAGE

Error: Physical only cell 'S1CAP1' can't contain I/O pins. (LBDB-884)

LBDB-885 (error) There is no bias pin named '%s' related to this signal pin's related power or ground pin.

DESCRIPTION

This error message is reported when the association of power/ground pin and bias pin in signal is incorrect.

A signal pin's related bias pin must one of the related bias pins of this signal pin's related power/ground pin.

WHAT NEXT

Check if this related bias pin is related to this signal pin's power pin or ground pin.

EXAMPLE MESSAGE

Error: Line 546, There is no bias pin named vpw related to this signal pin's related power/ground pin. (LBDB-885)

LBDB-886 (error) Bias pg_pin '%s' can not be properly associated to the pg_pin.

DESCRIPTION

This error message is reported when bias pin %s can not be properly associated to a pg_pin.

Power type pg_ppin should be associated with a nwell type bias pg pin; ground type

pg_pin should be associated with a pwell type bias pg pin.

WHAT NEXT

Check the pg_type of the pg_pin to be associated and the pg_type of the bias pg_pin.

EXAMPLES

```
pg_pin(PWR) {  
    voltage_name : VDD;  
    pg_type : primary_power;  
    related_bias_pin : "vpw"  
}  
pg_pin(vpw) {  
    voltage_name : VDDL;  
    pg_type : pwell;  
    bias_connection : routing_pin;  
}
```

EXAMPLE MESSAGE

Error: Line 546, Bias pg_pin vpw can not be properly associated to the pg_pin. (LBDB-886)

LBDB-887 (warning) Only one (P or N)well bias pin exists.

DESCRIPTION

This message indicates that only one bias pin with pg_type P or N well is exists. Generally, pwell and nwell bias pins should be exist as a pair.

WHAT NEXT

Delete the odd bias pin or add a new bias pin to be couple with the odd one.

EXAMPLE MESSAGE

Warning: Line 546, Only one (P or N)well bias pin vpw exists. (LBDB-887)

LBDB-888 (error) Bias_connection is associated with a invalid

pg_type.

DESCRIPTION

This error message is reported when bias_connection is associated with an invalid pg_type. pg_type of a bias pg pin should be one of the predefined bias types: pwell|nwell|deppwell|deepnwell.

WHAT NEXT

Check the pg_type of the bias pg pin.

EXAMPLE MESSAGE

Error: Line 546, The pg_type of bias pg pin vpw is incorrect. (LBDB-888)

LBDB-889 (error) The pg_type of bias pg pin '%s' to be related is invalid.

DESCRIPTION

This error message is reported when a bias pg pin is related to a pg_pin or a signal pin, its type_type is not one of the predefined bias types: pwell|nwell|deppwell|deepnwell.

WHAT NEXT

Check the pg_type of the bias pg pin.

EXAMPLE MESSAGE

Error: Line 546, The pg_type of bias pg pin vpw to be related is invalid. (LBDB-889)

LBDB-890 (warning) Isolation cell '%s' contains more than two

input pins.

DESCRIPTION

WHAT NEXT

Delete unwanted input pins to keep the input pin number is no less than 2.

EXAMPLES

EXAMPLE MESSAGE

Warning: Line 202, Isolation cell 'acell' contains more than two input pins. (LBDB-890)

LBDB-891 (error) Retention cell '%s' has no retention pin.

DESCRIPTION

In a retention cell (identified by retention_cell or power_gating_cell attribute), there should be at least one control pin (identified by retention_pin or power_gating_pin function).

WHAT NEXT

Add retention pins into the given cell.

EXAMPLES

```
cell(retention_dff) {
    ...
    retention_cell : "my_retention_dff" ;
    clock_gating_integrated_cell : "generic";

    pin(SAVE) {
        ...
        direction : input;
    /*    retention_pin (save, "0") ;*/
    }
}

pin(RESTORE) {
    ...
    direction : input;
/*    retention_pin (restore, "0") ;*/
}
}
```

EXAMPLE MESSAGE

Error: Retention cell 'retention_dff' has no retention pin. (LBDB-891)

LBDB-892 (error) Pin name '%s' is duplicated with pg pin name.

DESCRIPTION

Names of Signal pins should be different with pg pin names and vice-versa.

WHAT NEXT

Change the duplicated signal pin name or pg pin name.

EXAMPLE MESSAGE

Error: Pin name 'VSS' is duplicated with pg pin name. (LBDB-892)

LBDB-893 (warning) Bad usage to turn on scaling feature.

DESCRIPTION

In order to turn on scaling feature, two environment variables should be set. One is "lc_allow_process_kfactor_scaling" as a switch. Default value is 0 (turn off). Set it as 1 to turn on. The other is "lc_new_process_value" to set the new process value with a float. For example, to load scaled design.db with new process 1.8,

```
lc_shell> set lc_allow_process_kfactor_scaling 1 lc_shell> set lc_new_process_value  
1.8 lc_shell> read_db design.db
```

This message is issued because only one of the two environment variables is set.

WHAT NEXT

If scaling feature is intended to turn on, set the other variable. Else, ignore this warning.

EXAMPLES

EXAMPLE MESSAGE

Warning: Bad usage to turn on scaling feature. (LBDB-893)

LBDB-894 (warning) No scaling is done in '%s' because nominal process can not be found.

DESCRIPTION

This message is issued because scaling feature is turned on and there is no nominal process defined in the library.

Nominal process is selected in this order of precedence:

(1) if "default_operating_conditions" is specified, nominal process is taken from attribute "process" in the default "operating_conditions" group; (2) nominal process is taken from library-level attribute "nom_process".

WHAT NEXT

Define nominal process in library to continue scaling.

EXAMPLES

EXAMPLE MESSAGE

Warning: No scaling is done because nominal process can not be found. (LBDB-894)

LBDB-895 (warning) "values" in "%s" group won't be scaled because "%s" is not found.

DESCRIPTION

This message is issued because scaling feature is turned on and there is no corresponding k-factor defined for the specified attribute.

Here is the mapping table of supported k-factors and db attributes.

Nominal process is selected in this order of precedence:

```
k-factor name db_attribute_name k_process_cell_risetiming -> cell_rise -> values  
k_process_cell_falltiming -> cell_fall -> values k_process_rise_propagationontiming ->  
rise_propagation -> values k_process_fall_propagationontiming -> fall_propagation ->  
values k_process_rise_transitionontiming -> rise_transition -> values  
k_process_fall_transitionontiming -> fall_transition -> values k_process_setup_rise  
timing -> rise_constraint -> values (when "timing_type" is "setup_rising" or  
"setup_falling") k_process_setup_falltiming -> fall_constraint -> values (when  
"timing_type" is "setup_rising" or "setup_falling") k_process_hold_risetiming ->  
rise_constraint -> values (when "timing_type" is "hold_rising" or "hold_falling")  
k_process_hold_falltiming -> fall_constraint -> values (when "timing_type" is
```

```
"hold_rising"          or "hold_falling") k_process_recovery_risetiming ->
rise_constraint ->values (when "timing_type" is "recovery_rising" or
"recovery_falling") k_process_recovery_falltiming -> fall_constraint ->values (when
"timing_type" is "recovery_rising" or "recovery_falling") k_process_removal_rise
timing -> rise_constraint ->values (when "timing_type" is "removal_rising" or
"removal_falling") k_process_removal_falltiming -> fall_constraint ->values (when
"timing_type" is "removal_rising" or "removal_falling")
```

WHAT NEXT

Add corresponding k-factor.

EXAMPLES

EXAMPLE MESSAGE

Warning: "values" in "cell_rise" group won't be scaled because "k_process_cell_rise" is not found. (LBDB-895)

LBDB-896 (error) Invalid %s found under section %s in map file.

DESCRIPTION

This error message occurs if any the following are incorrect in the map file:

- voltage_name
- voltage value
- power management attributes

A valid voltage_name must be a valid string that starts with either an uppercase character A-Z or a lowercase character a-z.

The voltage_name in the PG_TO_VOLTAGE_MAP section must be the name used in VOLTAGE_MAP. The name could be a rail name, and can be the same as the pg_pin name. You cannot use an invalid value such as "-" or "*" in the voltage_name field in PG_TO_VOLTAGE_MAP or VOLTAGE_MAP section.

Valid voltage values are non-negative floating point numbers, for example, 0.9, that are valid voltage values in the input library.

For valid power management attributes see the *Library Compiler Modeling Timing, Signal Integrity, and Power in Technology Libraries User Guide*. The following are some examples of power management attributes:

- valid switch_cell_type is coarse_grain and fine_grain

- valid level_shifter_type is HL, LH and HL_LH
- always_on pins are related to backup power
- a switch cell has VVDD+VDD or VVSS+VSS and VVDD has pg_function where VVDD is virtual VDD;
- a valid retention_cell must be a sequential cell with retention_cell and retention_pin attributes

WHAT NEXT

Correct the invalid values or voltage_name in the map file. For example, if there is a "-" in the voltage_name field, this message occurs. You must input a valid voltage_name; for example, VDD.

EXAMPLES

The following example shows a "-" in the voltage name field, resulting in the error message:

```
BEGIN PG_TO_VOLTAGE_MAP
cell          pg_pin      voltage_name    pg_type
ADDFHX1      VDD          -              power
ADDFHX1      VSS          VSS            primary_ground
END PG_TO_VOLTAGE_MAP
```

SEE ALSO

`add_pg_pin_to_db(2)`
`add_pg_pin_to_lib(2)`

LBDB-897 (error) The input library '%s' has pg_pin's defined as signal pins.

DESCRIPTION

When pg_pin's are as signal pins in the library, this message occurs.
`add_pg_pin_to_db` and `add_pg_pin_to_lib` have limitation. In the above case, the utility will stop generation of map template and pg_pin based .lib/db.

WHAT NEXT

Check the contents of the library to see if there are pg_pin's or rail names or in/output_signal_level as signal pins. If so, remove these pin groups in your .lib and try to rerun the utility `add_pg_pin_to_lib`.

EXAMPLES

EXAMPLE MESSAGE

Error: The input library 'test.lib' has pg_pin's defined as signal pins. (LBDB-897)

LBDB-898 (error) Cell '%s', pin '%s', both "stage_type : pull_up" and "stage_type : pull_down" '%s' groups are specified with identical or overlapping when condition.

DESCRIPTION

This message can be used to indicate that if both "stage_type : pull-up" and "stage_type : pull_down" ccsn_first_stage/ccsn_last_stage groups are specified with identical or overlapping when condition.

Basically, if a first (last) CCB can physically make both rising and falling output transition under the same side-pin condition, then the stage_type of the CCB should be marked as both. The CCSN data should not be split into two stage_type, pull_up/pull_down. Otherwise, the characterized result will not be correct.

WHAT NEXT

Check the library source file, and correct the incorrect 'stage_type' attribute.

EXAMPLES

```
cell(bad) {
    ...
Pin (A) {
    ...
ccsn_first_stage() {
    stage_type : PULL_UP;
    when : "B";
}
ccsn_first_stage() {
    stage_type : PULL_DOWN;
    when : "B";
}
}
```

In this case, the pin 'A' has both "stage_type : pull-up" and "stage_type : pull_down" ccs_first_stage groups specified with identical or overlapping when condition.

EXAMPLE MESSAGE

Error: Cell 'bad', pin 'A', both "stage_type : pull_up" and "stage_type : pull_down" 'ccsn_first_stage' groups are specified with identical or overlapping when condition.

LBDB-899 (warning) Cell '%s', there is no ccs noise information.

DESCRIPTION

This information occurs during checking cells for ccs noise information, when there are some cells has ccs noise data, but no ccs noise information defined for this cell.

WHAT NEXT

If ccs noise information is not needed for the cell, ignore this warning, otherwise, add ccs noise data for the cell.

LBDB-900 (error) The %f value of the power distribution table is not between 0 and 1.

DESCRIPTION

This error message occurs when the values of the power distribution tables are not between 0 and 1.

WHAT NEXT

Modify the values of the power distribution tables to meet the requirements. Make sure the values are between 0 and 1.

SEE ALSO

LBDB-901 (error) Missing power distribution tables in %s.

DESCRIPTION

This error message occurs when a cell contains one leakage power group with power distribution tables, but not all leakage power groups have power distribution tables, or when a pin contains one internal power group with power distribution tables, but not all internal power groups have power distribution tables.

WHAT NEXT

Make sure that all leakage power groups have power distribution tables in a cell, or that all internal power groups have power distribution tables in a pin. Add the missing distribution tables in the .lib file before reading it in.

SEE ALSO

LBDB-902 (error) The sum of the values in all the distribution tables attached to %s table is not equal to 1.

DESCRIPTION

This error message occurs when the sum of all values in the distribution tables are not equal to 1. Each value in the distribution table must be between 0 and 1, and the sum of them should be 1.

WHAT NEXT

Check all the values in all distribution tables attached to the specified leakage power or internal power to make sure that each value is between 0 and 1, and the sum of them is 1. Update the values as needed to meet the requirements.

LBDB-903 (error) In an internal power group, the number of values for power and power distribution tables are not the same.

DESCRIPTION

This error message occurs when the number of values in the paired power and power distribution tables are not the same in the internal power group. For example, there are 5 values in the rise power table, but there are 6 values in the paired rise power distribution table.

WHAT NEXT

Check the internal power group for the number of values between the power group and paired power distribution table, rise power group and paired rise power distribution table, or fall power group and paired fall power distribution table. Make sure the number is the same.

LBDB-904 (error) The %s distribution tables are not paired with the %s tables in the internal power group.

DESCRIPTION

This error message occurs when power, rise, or fall power distribution tables are not paired with the related power group. For example, when the rise power distribution table is found in the internal power group but no rise power table is

found, the tool issues this error message.

WHAT NEXT

Check the power distribution tables in the internal power group. When the power, rise power, or fall power distribution tables are found, there must be paired power, rise power, fall power groups. If this is not the case, remove the unpaired power distribution tables or add paired power, rise power, fall power groups before reading in the .lib file.

LBDB-905 (error) Indices for the distribution tables are not matched with the paired rise power, fall power, or power groups.

DESCRIPTION

This error message occurs when the indices for the distribution tables are not matched with the paired rise power, fall power, or power groups.

WHAT NEXT

In the internal power group, check the power template and indices for distribution tables and its paired rise power, fall power, or power groups. If the power template is used, they should be the same for distribution tables and its paired rise power, fall_power, or power groups. Index_1 and index_2 for distribution tables and its paired rise power, fall power, or power groups should also be the same. If necessary, update the power template and indices to meet the requirements.

LBDB-907 (error) Invalid ground_pin %s with incorrect pg_type.

DESCRIPTION

This error message occurs when the ground_pin is not a valid PG pin defined for the cell with pg_type of primary_ground, backup_ground, or internal_ground.

WHAT NEXT

Check the pg_type of the related_ground_pin in the power distribution table to see if it is primary_ground, backup_ground, or internal_ground. If the related_ground_pin is not specified as one of the 3 types, it is not a valid ground pin in the power distribution table. Re-specify a valid ground pin for power distribution.

LBDB-996 (error) The timing arc's fpga_arc_condition attribute contains invalid format '%s.%s'.

DESCRIPTION

This message indicates that you specified invalid <pin_name>.<pin_status> or <fpga_cond_name>.<fpga_cond_value_name> in the fpga_arc_condition attribute of the timing arc.

WHAT NEXT

Modify <A>. to make it as a valid <pin_name>.<pin_status> or <fpga_cond_name>.<fpga_cond_value_name>.

EXAMPLES

```
cell(test) {  
  
    ...  
    pin(A) {  
        ...  
    }  
    pin(B) {  
        ...  
    }  
    timing() {  
        ...  
        fpga_arc_condition: "wrong_pin.CONNECTED";  
        ...  
    }  
    ...  
}  
...  
}
```

We can correct it by replace "wrong_pin" with "A".

EXAMPLE MESSAGE

Error: Line 206, The timing arc's fpga_arc_condition attribute contains invalid format 'wrong_pin.CONNECTED'. (LBDB-996)

LBDB-997 (warning) The fpga_condition(%s) group is defined multiple times.

DESCRIPTION

This message indicates that you specified the same fpga_condition group multiple times. Only the last one is retained.

WHAT NEXT

Change the group name, or delete the duplicated group.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
  
    fpga_condition(cond1) {  
        ...  
    }  
    fpga_condition(cond1) {  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 206, The fpga_conditino(cond1) group is defined multiple times. (LBDB-997)

LBDB-998 (error) The fpga condition '%s' has no values defined.

DESCRIPTION

A fpga_condition group must have at least one fpga condition value defined.

WHAT NEXT

Define the fpga condition values.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    fpga_condition(cond1) {  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The fpga condition 'cond1' has no values defined. (LBDB-998)

LBDB-999 (warning) The fpga_condition_value(%s) group is defined multiple times.

DESCRIPTION

This message indicates that you specified the same fpga_condition_value group multiple times. Only the last one is retained.

WHAT NEXT

Change the group name, or delete the duplicated group.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
  
    fpga_condition(cond1) {  
        fpga_condition_value(normal) {  
            fpga_arc_condition : "operation_mode=normal";  
        }  
        fpga_condition_value(normal) {  
            fpga_arc_condition : "operation_mode=arithmetic";  
        }  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 206, The fpga_condition_value(normal) group is defined multiple times. (LBDB-999)

LBDB-1000 (error) The fpga_arc_condition attribute is not specified for the fpga_condition_value.

DESCRIPTION

This message indicates that you have not specified fpga_arc_condition attribute within fpga_condition_value.

WHAT NEXT

Add the missing fpga_arc_condition attribute.

EXAMPLES

```
cell(CGNP) {  
    area : 1;  
    fpga_condition(cond1) {  
        fpga_condition_value(normal) {  
            fpga_arc_condition : "operation_mode=normal";  
        }  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 206, The fpga_arc_condition attribute is not specified for the fpga_condition_value. (LBDB-1000)

LBDB-1001 (error) Found one or more cells defined before '%s' group.

DESCRIPTION

This message indicates the named group in phys_library is not defined before all cell groups.

WHAT NEXT

Move this group inside the physical library so that it is defined in front of all cell groups.

EXAMPLES

```
phy_library(test) {  
...  
macro (cell1) {  
...  
}  
resource ( std_cell ) {  
...  
}  
}
```

EXAMPLE MESSAGE

Error: Line 59, Found one or more cells defined before 'resource' group. (LBDB-1001)

LBDB-1002 (error) The resource name is not supported.

DESCRIPTION

Library Compiler accepts resource with the following names: - std_cell - array

This message indicates the resource group is using a name other than mentioned above.

WHAT NEXT

Change the resource group name to either "std_cell" or "array".

EXAMPLES

```
phys_library(test) {  
...  
resource ( wrong_name ) /* ERROR */  
...  
}
```

EXAMPLE MESSAGE

Error: Line 5, The resource name is not supported. (LBDB-1002)

LBDB-1003 (error) The resource group does not contain any

layer definition.

DESCRIPTION

Library Compiler requires that one or more layer definition be defined in the resource group. A layer definition can be one of the following functions / groups: - device_layer - contact_layer - overlap_layer - routing_layer

This message indicates there is none of the above defined in the resource group.

WHAT NEXT

Add layer information into resource group.

EXAMPLES

```
phys_library(test) {  
resource ( std_cell ) /* ERROR */  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 3, The resource group does not contain any layer definition. (LBDB-1003)

LBDB-1004 (error) The resource group does not contain any site / tile definition.

DESCRIPTION

Library Compiler requires that one or more site / tile groups be defined in the resource group.

This message indicates there is neither any site nor any tile groups defined in the resource group.

WHAT NEXT

Add site information into resource group.

EXAMPLES

```
phys_library(test) {  
resource ( std_cell ) /* ERROR */  
}
```

```
...  
}
```

EXAMPLE MESSAGE

```
Error: Line 3, The resource group does not contain any site /  
tile definition. (LBDB-1004)
```

LBDB-1005 (warning) Found a duplicate %s attribute. Using the first value.

DESCRIPTION

This message indicates an attribute has been defined twice. The second definition is ignored.

WHAT NEXT

Remove the duplicate definition of the attribute.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
...  
}  
macro(and2a) {  
...  
}  
macro(and2a1) {  
...  
eq_cell : and2a;  
eq_cell : and2;  
...  
}  
}
```

EXAMPLE MESSAGE

```
Warning: Line 34, Found a duplicate eq_cell attribute. Using the first value. (LBDB-1005)
```

LBDB-1006 (error) Cannot accept the '%s' pin as the logically

equivalent pin.

DESCRIPTION

This message indicates the eq_pin attribute value is an unacceptable pin name. An unacceptable eq_pin is defined as either - a name equivalent to the current pin name; or - a pin that is not already defined.

WHAT NEXT

Check the pin name and change it. Also make sure the pin specified in the eq_pin attribute is pre-defined.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    pin(a) {  
        eq_pin : a1; /* error */  
        ...  
    }  
    pin(a1) {  
    }  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, Cannot accept the 'a1' pin as the logically equivalent pin. (LBDB-1006)

LBDB-1007 (error) The %s name '%s' is an undefined layer name.

DESCRIPTION

This message indicates the obs / geometry group name is not a legal layer name.

WHAT NEXT

Use a pre-defined layer name as the name for the obs / geometry group.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    pin(a) {  
        ...  
        obs(new_layer) /* error */  
        ...  
    }  
}  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The obs name 'new_layer' is an undefined layer name. (LBDB-1007)

LBDB-1008 (error) The %s function has inconsistent number of arguments.

DESCRIPTION

This message indicates the path / polygon / rectangle function has wrong number of arguments. In Library Compiler, - a path function requires odd number of arguments no less than 3; - a polygon function requires even number of arguments no less than 8; - a rectangle function requires 4 arguments.

WHAT NEXT

Make sure the right argument is used for each function.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    pin(a) {  
        ...  
        obs(new_layer) {  
            rectangle(0.1, 0.3); /* error */  
        }  
    }  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The rectangle function has inconsistent number of arguments. (LBDB-1008)

LBDB-1009 (error) Non-positive number found in the size function.

DESCRIPTION

This message indicates either the width or the height of the size function is a non-positive number.

WHAT NEXT

Make sure both width or height of the size function are positive numbers.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    size (-1.5, 2.0); /* error */  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, Non-positive number found in the size function. (LBDB-1009)

LBDB-1010 (error) The site '%s' is not defined in the resource group.

DESCRIPTION

This message indicates name of the site attribute is not a pre-defined site.

WHAT NEXT

Make sure the site attribute uses a pre-defined site.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    site : new_site; /* error */  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The site 'new_site' is not defined in the resource group. (LBDB-1010)

LBDB-1011 (error) Cannot accept the '%s' macro as the equivalent cell.

DESCRIPTION

This message indicates the eq_cell attribute value is an unacceptable macro name. An unacceptable macro name is defined as either - a name equivalent to the current macro name; or - a macro that is not already defined.

WHAT NEXT

Check the macro name and change it. Also make sure the macro specified in the eq_cell attribute is pre-defined.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2a1) {  
    ...  
    eq_cell : and2; /* error */  
    ...  
}  
macro(and2) {  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 34, Cannot accept the 'and2' macro as the electrically equivalent cell. (LBDB-1011)

LBDB-1012 (error) The layer name, '%s', in the '%s' group is not unique.

DESCRIPTION

Each via group can specify up to 3 geometry groups with the 'layer1', 'contact' and 'layer2' groups. The name of each group gives the name of the layer on which all geometry shapes are defined. The 3 geometry groups must be defined on different layers. This error message indicates that 2 or more geometry groups are specified on the same layer.

WHAT NEXT

Check the layer names on the 'layer1', 'contact' and 'layer2' groups and make sure they call for different layer names.

EXAMPLES

```
phys_library(test) {  
...  
resource(std_cell) {  
    ...  
    via (test) {  
        ...  
        layer1(met1) {  
...  
    }  
    contact(con1) {  
...  
    }  
    layer2(met1) /* error */  
...  
    }  
    ...  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The layer name, 'met1', in the 'layer2' group is not unique. (LBDB-1012)

LBDB-1013 (error) The %s function has inconsistent number of

arguments.

DESCRIPTION

This message indicates the via / via_iterate function has wrong number of arguments. In Library Compiler, - a via function requires 3 arguments: a name followed by x / y coordinates; - a via_iterate function requires 7 arguments: 2 integers (for x-iteration and y-iteration), 2 real numbers (for x-spacing and y-spacing), a name and another 2 real numbers for the first x / y coordinates.

WHAT NEXT

Make sure the right argument is used for each function.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    pin(a) {  
        ...  
        obs(new_layer) {  
            via(0.1, 0.3); /* error */  
        }  
    }  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The via function has inconsistent number of arguments. (LBDB-1013)

LBDB-1014 (error) The via group does not have a 'contact' group.

DESCRIPTION

Each via group is required to have a 'contact' group defined for the geometry in the contact layer. This error message indicates that the 'contact' group is missing from the current via group.

WHAT NEXT

Make sure the 'contact' group is defined in current 'via' group.

EXAMPLES

```
phys_library(test) {  
...  
resource(std_cell) {  
    ...  
    via (test) {/* error */  
        layer1(met1) {  
...  
    }  
    layer2(met2) {  
...  
    }  
    ...  
}  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The via group does not have a 'contact' group. (LBDB-1014)

LBDB-1015 (error) One or more rectangles are required in this group.

DESCRIPTION

The 'layer1', 'contact' and 'layer2' sub-groups inside a 'via' group define the geometry shapes for the via. This error message indicates that the current sub-group has no rectangle specified.

WHAT NEXT

Make sure there are at least 1 rectangle defined in the current sub-group. Otherwise, remove the sub-group altogether.

EXAMPLES

```
phys_library(test) {  
...  
resource(std_cell) {  
    ...  
    via (test) {  
        layer1(con1) { }/* error */  
        ...  
    }  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, One or more rectangles are required in this group. (LBDB-1015)

LBDB-1016 (error) The routing_grid function has inconsistent number of arguments.

DESCRIPTION

This message indicates the routing_grid function has wrong number of arguments. In Library Compiler, - a routing_grid function requires 6 arguments: x-starting-coordinate, number-of-columns, x-space, y-start-coordinate, number-of-rows, y-space.

WHAT NEXT

Make sure the right arguments are used for each function.

EXAMPLES

```
phys_library(test) {  
    ...  
    array(ABC) {  
        routing_grid(100, 200);  
    ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 34, The routing_grid function has inconsistent number of arguments. (LB DB-1016)

LBDB-1017 (error) The floorplan group contains mismatching site_array group.

DESCRIPTION

This message indicates that either: - the default floorplan (with no given name) is missing site_array with "regular" placement_rule; or - the non-default floorplan contains site_array with "regular" placement_rule.

The default floorplan should contain one or more "regular" site_array groups. The non-default floorplan should not contain any "regular" site_array group.

WHAT NEXT

Check all site_array groups under the current floorplan and make sure the above rules are followed.

EXAMPLES

```
phys_library(test) {  
    ...  
    array(ABC) {  
        floorplan() {  
            site_array(new) {  
                placement_rule : can_place;  
            ...  
        }  
    }  
    ...  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 34, The floorplan group contains mismatching site_array group. (LBDB-1017)

LBDB-1018 (warning) The floorplan group does not contain can_place/cannot_occupy site_array groups.

DESCRIPTION

This message indicates that the current floorplan group only contain site_array groups with "regular" placement_rule.

WHAT NEXT

Make sure this is the correct physical library technology data.

EXAMPLES

```
phys_library(test) {  
    ...  
    array(ABC) {  
        floorplan() {  
            site_array(new) {  
                placement_rule : regular;  
            ...  
        }  
    }  
}
```

```
    ...
}
}
...
}
...
}
```

EXAMPLE MESSAGE

Warning: Line 34, The floorplan group does not contain can_place/cannot_occupy site_array groups. (LBDB-1018)

LBDB-1019 (error) The array group does not contain base floorplan.

DESCRIPTION

This message indicates that the current array group contain no base floorplan data. An array group must have a base floorplan group - i.e. a floorplan group defined with no given name.

WHAT NEXT

Add base floorplan data into this array group.

EXAMPLES

```
phys_library(test) {
    ...
    array(ABC) {
        floorplan(NEW) {
            ...
        }
    }
    ...
}
```

EXAMPLE MESSAGE

Error: Line 34, The floorplan group does not contain base floorplan. (LBDB-1018)

LBDB-1020 (error) The '%s' function has inconsistent number of

arguments.

DESCRIPTION

This message indicates the iterate function in the current site_array has wrong number of arguments. In Library Compiler, - a iterate function requires 4 numerical arguments.

WHAT NEXT

Make sure the right arguments are used for each function.

EXAMPLES

```
phys_library(test) {  
    ...  
    array(ABC) {  
        site_array(test) {  
            iterate (100, 200);  
            ...  
        }  
        ...  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 34, The iterate function has inconsistent number of arguments. (LBDB-1020)

LBDB-1021 (error) The resource group does not contain any via definition.

DESCRIPTION

Library Compiler requires that one or more via groups be defined in the resource group.

This message indicates there is no via groups defined in the resource group.

WHAT NEXT

Add via information into resource group.

EXAMPLES

```
phys_library(test) {  
resource ( std_cell ) /* ERROR */  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 3, The via group does not contain any site definition. (LBDB-1021)

LBDB-1022 (error) The resource group must be defined before the topological_design_rules group.

DESCRIPTION

Library Compiler requires all physical library plib file to specify the resource group before specifying the topological_design_rules group.

This message indicates there is no resource group defined before the topological_design_rules group.

WHAT NEXT

Add or move the resource group to the front of the topological_design_rules group.

EXAMPLES

```
phys_library(test) {  
topological_design_rules ( ) /* ERROR */  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 2, The resource group must be defined before the topological_design_rules group. (LBDB-1022)

LBDB-1023 (warning) No '%s' group defined in the

topological_rules group.

DESCRIPTION

There is no specified group information in the current library.

WHAT NEXT

Make sure the library is correct.

EXAMPLES

```
phys_library(test) {  
    resource(std_cell) {  
        ...  
    }  
    topological_rules() {  
        ...  
    }  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 34, No via_rule group defined in the topological_rules group. (LBDB-1023)

LBDB-1024 (error) The %s function has inconsistent number of arguments.

DESCRIPTION

This message indicates the min_generate_via_size function has wrong number of arguments. In Library Compiler, it requires 2 floating numbers in the min_generated_via_size function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
phys_library(test) {  
min_generated_via_size (0.1, 0.2, 0.1);  
...  
}
```

EXAMPLE MESSAGE

Error: Line 2, The min_generated_via_size function has inconsistent number of arguments. (LBDB-1024)

LBDB-1025 (error) The '%s' function cannot be supplied a nonpositive value.

DESCRIPTION

This message indicates that the specified function cannot have a nonpositive value.

WHAT NEXT

Change all value of the function to positive in the physical library file.

EXAMPLES

```
min_generate_via_size(-1, 0.3);
```

EXAMPLE MESSAGE

Error: Line 18, The 'min_generate_via_size' function cannot be supplied a nonpositive value. (LBDB-1025)

LBDB-1026 (error) The '%s' function has inconsistent arguments.

DESCRIPTION

This message indicates the same_net_min_spacing function has wrong arguments. In Library Compiler, it requires 2 layer names followed by a floating numbers and a boolean value (TRUE or FALSE) in the same_net_min_spacing function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
phys_library(test) {  
same_net_min_spacing (metal1, metal2, 0.1);  
...}
```

```
}
```

EXAMPLE MESSAGE

Error: Line 2, The 'same_net_min_spacing" function has inconsistent arguments. (LBD
B-1026)

LBDB-1027 (error) The '%s' function has inconsistent arguments.

DESCRIPTION

This message indicates the contact_spacing function has wrong arguments. In Library Compiler, it requires 2 floating numbers in the contact_spacing function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
phys_library(test) {  
...  
contact_spacing (0.1, 0.2);  
...  
}
```

EXAMPLE MESSAGE

Error: Line 158, The 'contact_spacing" function has inconsistent arguments. (LBDB-1027)

LBDB-1028 (error) The '%s' layer name is of invalid layer type. A %s name is expected.

DESCRIPTION

This message indicates that you specified an layer name with wrong type for the current attribute or function. The name should be a routing_layer or contact_layer name as indicated in the error message.

WHAT NEXT

Check your library to see if you have an error in either previous layer definition or the current attribute / function.

EXAMPLES

```
contact_min_spacing(metall1, contact1, 0.1);
```

EXAMPLE MESSAGE

Error: Line 104, The 'metall1' layer name is of invalid layer type. A contact_layer name is expected. (LBDB-1028)

LBDB-1029 (error) There is no rectangle defined in the contact_formula group.

DESCRIPTION

There is no rectangle defined in the current contact_formula group. Library Compiler requires at least 1 rectangle being specified in each contact_formula group.

WHAT NEXT

Define the rectangle shape for the contact_formula group.

EXAMPLES

```
via_rule_generate(GEN1) {
    contact_formula(con1) { /* error */
        routing_direction : horizontal;
        resistance : 0.2;
    }
}
```

EXAMPLE MESSAGE

Warning: Line 34, There is no rectangle defined in the contact_formula group. (LB DB-1029)

LBDB-1030 (error) The '%s' attribute value is larger than the

'%s' attribute value.

DESCRIPTION

This message indicates that the 'min_wire_width' value is larger than 'max_wire_width' value. Library Compiler requires that the 'min_wire_width' is no larger than 'max_wire_width' value.

WHAT NEXT

Change all related values follow the requirement.

EXAMPLES

```
routing_layer_rule(met1) {  
    min_wire_width : 2.0;  
    max_wire_width : 1.0;  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 18, The 'min_wire_width' attribute value is larger than the 'max_wire_width' attribute value. (LBDB-1030)

LBDB-1031 (error) The wire_rule group is empty.

DESCRIPTION

This message indicates the wire_rule group does not have any layer_rule / via group or same_net_min_spacing function defined. Library Compiler requires that the wire_rule group not be empty.

WHAT NEXT

Make sure the the wire_rule group is not empty.

EXAMPLES

```
wire_rule(rule1) {  
}
```

EXAMPLE MESSAGE

Error: Line 34, The wire_rule group is empty. (LBDB-1031)

LBDB-1032 (error) Cannot accept the '%s' pin as the must_join pin.

DESCRIPTION

This message indicates the must_join pin attribute value is an unacceptable pin name. An unacceptable must_join is defined as either - a name equivalent to the current pin name; or - a pin that is not already defined.

WHAT NEXT

Check the pin name and change it. Also make sure the pin specified in the must_join attribute is pre-defined.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
    ...  
    pin(a) {  
        must_join : a1; /* error */  
        ...  
    }  
    pin(a1) {  
    }  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, Cannot accept the 'a1' pin as the must_join pin. (LBDB-1032)

LBDB-1033 (error) The '%s' function has inconsistent arguments.

DESCRIPTION

This message indicates the ranged_spacing function has wrong arguments. In Library Compiler, it requires 3 floating numbers in the ranged_spacing function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
phys_library(test) {  
ranged_spacing (0.1, 0.2);  
...  
}
```

EXAMPLE MESSAGE

Error: Line 2, The 'ranged_spacing' function has inconsistent arguments. (LBDB-1033)

LBDB-1034 (warning) The '%s' %s group already exists and cannot be overwritten. The first definition will be used.

DESCRIPTION

This message indicates that you multiply defined a site group. Library Compiler does not allow the overwriting of existing site groups.

WHAT NEXT

Delete the second specification of the site group.

EXAMPLES

```
site(IOsite) {  
...  
}  
site(IOsite) {  
...  
}
```

EXAMPLE MESSAGE

Error: Line 31, The 'IOsite' site group already exists and cannot be overwritten. The first definition will be used. (LBDB-1034)

LBDB-1035 (error) The '%s' array must have '%d' entries.

DESCRIPTION

You receive this message because the specified array has a different size from the one expected.

Where N is the number of routing layers, the following criteria are set:

```
plate_cap array must have ((N * (N-1)) / 2) entries  
overlap_wire_ratio must have (N * (N-1)) entries  
adjacent_wire_ratio must have N entries  
wire_ratio_x must have N entries  
wire_ratio_y must have N entries
```

WHAT NEXT

Correct the values in the specified array.

EXAMPLES

```
plate_cap( "0.05, 0.06, 0.03" );
```

EXAMPLE MESSAGE

```
Error: Line 127, The 'plate_cap' array must have '6' entries. (LBDB-1035)
```

LBDB-1036 (error) The sum of values in the '%s' array attribute does not meet the requirement.

DESCRIPTION

You receive this message because the sum of ratios does not match the specified criteria. The following criteria are set:

overlap_wire_ratio: the sum of value[i(N-1)] to value[i(N-1)+(N-2)] must not exceed 100.0 (100 percent); where N is the number of routing layers and i is the routing layer id in the range of $i=0..N-1$.

adjacent_wire_ratio: n/a (not applicable);

wire_ratio_x: the sum of all values must equal 100.0 (100 percent);

wire_ratio_y: the sum of all values must equal 100.0 (100 percent).

WHAT NEXT

Correct the values in the specified array.

EXAMPLES

```
wire_ratio_x( "40.1, 20.0, 20.5" );
```

EXAMPLE MESSAGE

Error: Line 127, The sum of values in the 'wire_ratio_x' array attribute does not meet requirement. (LBDB-1036)

LBDB-1037 (error) Cannot accept the '%s' as the default_routing_wire_model value.

DESCRIPTION

You receive this message because the default_routing_wire_model attribute value is an unacceptable routing_wire_model name, that is, one that is a routing_wire_model that has not already been defined.

WHAT NEXT

Change the routing_wire_model name. Ensure that the routing_wire_model specified in the default_routing_wire_model attribute is predefined.

EXAMPLES

```
phys_library(test) {  
    ...  
    resource(...) {  
        ...  
        default_routing_wire_model : model_1;           /* error */  
        ...  
        routing_wire_model(model_1) {  
            ...  
        }  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 34, Cannot accept the 'model_1' as the default_routing_wire_model value. (LBDB-1037)

LBDB-1038 (error) The plate_cap attribute is not predefined.

DESCRIPTION

You receive this message because the **plate_cap** attribute is not predefined. It has not been defined before the routing_wire_model() group is defined.

WHAT NEXT

Ensure that `plate_cap` is defined before the `routing_wire_model()` group is defined.

EXAMPLES

```
phys_library(test) {  
    ...  
    resource(...) {  
        ...  
        routing_wire_model(model_1) { /* error: LBDB-1038 */  
            ...  
        }  
        plate_cap ("0.05, 0.04, 0.06");  
    }  
}
```

EXAMPLE MESSAGE

Error: Line 34, The `plate_cap` attribute is not predefined. (LBDB-1038)

LBDB-1039 (error) The '%s' attribute has an out-of-range '%f' ratio.

DESCRIPTION

You receive this message because a percentage ratio in an array attribute is larger than 100.0 (100%) or less than 0 (0%); it has not been accepted.

WHAT NEXT

Ensure that all values are between 0.0 (0%) and 100.0 (100%).

EXAMPLES

```
phys_library(test) {  
    ...  
    resource(...) {  
        ...  
        routing_wire_model(model_1) {  
            ...  
            wire_ratio_x ("21.3, 305.4, 19.4"); /* error */  
            ...  
        }  
    }  
}
```

EXAMPLE MESSAGE

```
Error: Line 34, The 'wire_ratio_x' attribute has an out-of-range '305.4' ratio.  
(LBDB-1039)
```

LBDB-1040 (error) The %s function has an inconsistent number of arguments.

DESCRIPTION

You receive this message because the `obs_clip_box` or `keepout_clip_box` function has the wrong number of arguments. In Library Compiler, the specified command requires four floating numbers in the `obs_clip_box` or `keepout_clip_box` function.

WHAT NEXT

Ensure that the right argument is used for the specified function.

EXAMPLES

```
keepout_clip_box (0.1, 0.2, 0.1);  
...
```

EXAMPLE MESSAGE

```
Error: Line 25 The keepout_clip_box function has an inconsistent number of arguments. (LBDB-1040)
```

LBDB-1041 (error) The %s function has inconsistent arguments.

DESCRIPTION

You receive this message because the `gds2_layer_map` function has the wrong number or type of arguments. In Library Compiler, the specified function requires an integer, a string, and an integer in the `gds2_layer_map` function.

WHAT NEXT

Ensure that the right argument is used for the function.

EXAMPLES

```
gds2_layer_map (0.1, METAL1, 1);
```

EXAMPLE MESSAGE

Error: Line 30, The gds2_layer_map function has inconsistent arguments. (LBDB-1041)

LBDB-1042 (warning) The dist_conversion_factor value '%d' is not allowed. Using default value '%d'.

DESCRIPTION

You receive this message because you specified a dist_conversion_factor value that either is not a multiple of 100 or may be a nonpositive number.

WHAT NEXT

Examine the library source file, and correct the dist_conversion_factor value.

EXAMPLES

```
dist_conversion_factor : 123;
```

EXAMPLE MESSAGE

Warning: Line 85, The dist_conversion_factor value '123' is not allowed. Using default value '1000'. (LBDB-1042)

LBDB-1043 (error) The gds2_conversion_factor value '%d' is not allowed.

DESCRIPTION

You receive this message because you specified a **gds2_conversion_factor** value that is not a multiple of 100s or may be a nonpositive number.

WHAT NEXT

Examine the library source file, and correct the **gds2_conversion_factor** value.

EXAMPLES

```
gds2_conversion_factor : -100;
```

EXAMPLE MESSAGE

Warning: Line 85, The gds2_conversion_factor value '-100' is not allowed. (LBDB-1043)

LBDB-1044 (error) The process resource group must be defined after the resource group and the topological design rules group.

DESCRIPTION

This message indicates that there is no resource group and/or topological design rules group defined before the process resource group. Library Compiler requires all physical library plib files to specify the resource group and the topological_design_rules group before specifying the process_resource group.

WHAT NEXT

Add or move the resource group and the topological design rules group to the front of the process resource group.

EXAMPLES

```
phys_library(test) {  
process_resource (...) /* ERROR */  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 2, The process_resource group must be defined after the resource group and the topological_design_rules group. (LBDB-1044)

LBDB-1045 (error) The %s name '%s' is an undefined %s

name.

DESCRIPTION

This error message means that the specified process routing layer, process via, or process wire rule name was not predefined.

WHAT NEXT

Use the **read_lib** command and specify a predefined routing layer, via, or process wire rule.

EXAMPLES

```
phys_library(test) {  
resource(...) {  
    routing_layer (met1) {  
    }  
}  
process_resource(...) {  
    process_routing_layer(METAL1) { /  
* ERROR: METAL 1 is not defined.  Use met1 instead */  
    }  
...  
macro(and2) {  
    ...  
    pin(a) {  
        ...  
        obs(new_layer) /* error */  
        ...  
    }  
}  
}
```

EXAMPLE MESSAGE

Error: Line 34, The process_routing_layer name 'METAL1' is an undefined routing_layer name. (LBDB-1045)

LBDB-1046 (warning) The boundary_layer attribute is not defined in

gds2_extraction_rules.

DESCRIPTION

This warning message tells you that you used the **read_lib** command and specified the **boundary_layer** attribute, but the **boundary_layer** attribute is not defined in gds2_extraction_rules. In Library Compiler, the **boundary_layer** attribute specifies a layer ID for GDSII extraction to look for the designated macro boundary for the macro size in the PLIB file. When this attribute is missing, the macro size in the PLIB file is determined by the bounding box of all geometries.

WHAT NEXT

Make sure you did not intend to specify the boundary layer. If you did intend to specify the boundary layer, define the **boundary_layer** attribute and reexecute the command.

EXAMPLE MESSAGE

Warning: The boundary_layer attribute is not defined in gds2_extraction_rules.
(LBDB-1046)

SEE ALSO

read_lib (2).

LBDB-1047 (error) The '%s' function has inconsistent arguments.

DESCRIPTION

This message indicates the lateral_oxide function has wrong arguments. In Library Compiler, it requires 2 floating numbers in the lateral_oxide function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
lateral_oxide (0.1, 0.2, 0.3);
```

EXAMPLE MESSAGE

Error: Line 2, The 'lateral_oxide" function has inconsistent arguments. (LBDB-1047)

LBDB-1048 (error) The '%s' permittivity value is less than 1.00.

DESCRIPTION

The permittivity value must be at least 1.00. It also includes the second value in lateral_oxide() complex attribute.

WHAT NEXT

Check your library and use correct permittivity value.

EXAMPLES

```
lateral_oxide ( 3.9, 0.99 );
```

EXAMPLE MESSAGE

Error: Line 46, The 'lateral_oxide' permittivity value is less than 1.00. (LBDB-1048)

LBDB-1049 (error) The '%s' thickness value is less than zero.

DESCRIPTION

The thickness value must be positive. It also applies to the first value in lateral_oxide() complex attribute.

WHAT NEXT

Check your library and use correct thickness value.

EXAMPLES

```
lateral_oxide ( -3.9, 3.99 );
```

EXAMPLE MESSAGE

Error: Line 46, The 'lateral_oxide' thickness value is less than zero. (LBDB-1049)

LBDB-1050 (error) There is no rectangle defined in the via_contact_layer group.

DESCRIPTION

There is no rectangle defined in the current via_contact_layer group. Library Compiler requires at least 1 rectangle being specified in each via_contact_layer group.

WHAT NEXT

Define the rectangle shape for the via_contact_layer group.

EXAMPLES

```
default_via_generate(GEN1) {
    via_contact_layer(con1) { /* error */
resistance : 0.2;
    }
}
```

EXAMPLE MESSAGE

Warning: Line 34, There is no rectangle defined in the via_contact_layer group. (LBDB-1050)

LBDB-1051 (error) The %s attribute is obsolete.

DESCRIPTION

This message indicates the named attribute is obsolete and need to be changed accordingly.

WHAT NEXT

Refer to the Library Compiler User Guide for the newest attribute names.

EXAMPLES

```
lateral_oxide_thickness : 0.5 ;
```

EXAMPLE MESSAGE

Error: Line 34, The lateral_oxide_thickness attribute is obsolete. (LBDB-1051)

LBDB-1052 (error) The 'layer_antenna_factor' function has inconsistent arguments.

DESCRIPTION

This message indicates the layer_antenna_factor function has wrong arguments. In Library Compiler, it requires one layer name followed by a floating number in the layer_antenna_factor function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
phys_library(test) {  
...  
layer_antenna_factor (metall1, metall2, 0.1);  
...  
}
```

EXAMPLE MESSAGE

Error: Line 25, The 'layer_antenna_factor' function has inconsistent arguments. (LB DB-1052)

LBDB-1053 (error) The '%s' group contains conflicting layer specification styles, '%s' and '%S'.

DESCRIPTION

This message indicates the gds2 layer id definition styles are found. For example, you should either use obs_layer_map or obs_layer_id to specify geometry layer id and/or data type, but never use both functions in the same plib/pplib file.

WHAT NEXT

Make sure only one style is used in layer id definition.

EXAMPLES

```
phys_library(test) {  
...  
}
```

```
gds2_extraction_rules() {
    obs_layer_map ( "14, 16, 18, 20", "07, 08, 09, 10");
    obs_layer_id (22, 0, 11, 0);
...
}
```

EXAMPLE MESSAGE

Error: Line 25, The 'gds2_extraction_rules' group contains conflicting layer specification styles,
'obs_layer_map' and 'obs_layer_id'. (LBDB-1053)

LBDB-1054 (warning) The port '%s' does not have the attribute '%s' specified. The value (%f, %f) will be assigned to the attribute.

DESCRIPTION

You receive this error message when the **rise_capacitance** and **fall_capacitance** attributes are specified for a port, but the **_rise_capacitance_range** and **fall_capacitance_range** attribute are not. (**rise_capacitance**, **rise_capacitance**) will be assigned to attribute **_rise_capacitance_range** and (**fall_capacitance**, **fall_capacitance**) will be assigned to attribute **fall_capacitance_range** respectively.

WHAT NEXT

If you accept the value assigned to the attribute referenced in the error message, no action is required on your part. If not, assign a value to the attribute.

LBDB-1055 (error) The '%s' function has inconsistent arguments.

DESCRIPTION

This message indicates the contact_min_spacing function, min_overhang function or diff_net_min_spacing function has wrong arguments. In Library Compiler, it requires 2 layer names followed by a floating numbers in the contact_min_spacing function, min_overhang function or diff_net_min_spacing function.

WHAT NEXT

Make sure the right argument is used for the function.

EXAMPLES

```
phys_library(test) {  
...  
topological_design_rules() {  
    contact_min_spacing (contact1, 0.5);  
    min_overhang (metal1, contact1, 0.3);  
    diff_net_min_spacing (metal1, contact1, 0.6);  
    ...  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 245, The 'contact_min_spacing' function has inconsistent arguments. (LB DB-1027)

LBDB-1056 (warning) The '%s' value '%d' is not allowed. Using default value '%d'.

DESCRIPTION

You receive this message because you specified a conversion factor value that either is not a multiple of 100 or may be a nonpositive number. A conversion factor can be - capacitance_conversion_factor, or - resistance_conversion_factor, or - current_conversion_factor, or - inductance_conversion_factor.

WHAT NEXT

Examine the library source file, and correct the conversion factor value.

EXAMPLES

```
capacitance_conversion_factor : 123;
```

EXAMPLE MESSAGE

Warning: Line 85, The 'capacitance_conversion_factor' value '123' is not allowed. Using default value '1000'. (LBDB-1056)

LBDB-1057 (error) Found milkyway_layer_map group defined

before '%s' group.

DESCRIPTION

This message indicates the named group in phys_library is not defined before milkyway_layer_map group.

WHAT NEXT

Move this group inside the physical library so that it is defined in front of milkyway_layer_map group.

EXAMPLES

```
phy_library(test) {  
...  
milkyway_layer_group () {  
...  
}  
resource ( std_cell ) {  
...  
}  
}
```

EXAMPLE MESSAGE

Error: Line 59, Found milkyway_layer_group defined before 'resource' group. (LBDB-1001)

LBDB-1058 (error) The '%s' color name is invalid.

DESCRIPTION

This message indicates that you specified an invalid color name for the current attribute or function. The color name should match a color name previously defined in the color groups.

WHAT NEXT

Check your library to see if you have an error in either previous color definition or the current attribute / function.

EXAMPLES

```
color : foo ;
```

EXAMPLE MESSAGE

Error: Line 104, The 'foo' color name is invalid. (LBDB-1058)

LBDB-1059 (error) The '%s' '%s' name is invalid.

DESCRIPTION

This message indicates that you specified an invalid line_style/stipple name for the current attribute or function. The color name should match a line_style/stipple name previously defined in the line_style/stipple groups.

WHAT NEXT

Check your library to see if you have an error in either previous line_style/stipple definition or the current attribute / function.

EXAMPLES

```
stipple : foo ;
```

EXAMPLE MESSAGE

Error: Line 104, The 'foo' 'stipple' name is invalid. (LBDB-1059)

LBDB-1060 (error) The tile '%s' is not defined in the resource group.

DESCRIPTION

This message indicates name of the tile attribute is not a pre-defined tile.

WHAT NEXT

Make sure the tile attribute uses a pre-defined tile.

EXAMPLES

```
phys_library(test) {  
...  
macro(and2) {  
...  
    in_tile : new_tile; /* error */  
}}
```

```
}
```

EXAMPLE MESSAGE

Error: Line 34, The tile 'new_tile' is not defined in the resource group. (LBDB-1060)

LBDB-1061 (error) The %s shape has zero area.

DESCRIPTION

This message indicates the path / polygon / rectangle function has zero size. That is not a real geometrical shape.

WHAT NEXT

Make sure it is a real geometry.

EXAMPLES

```
phys_library(test) {
...
macro(and2) {
    ...
pin(a) {
    ...
obs(new_layer) {
    rectangle(0.1, 0.3, 0.1, 0.3); /* error */
}
}
}
```

EXAMPLE MESSAGE

Error: Line 34, The rectangle shape has zero area. (LBDB-1061)

LBDB-1062 (error) The '%s' via name is invalid.

DESCRIPTION

This message indicates that you specified an invalid name for the current attribute or function. The via name should match a name previously defined in the resource group.

WHAT NEXT

Check your library to see if you have an error in either previous layer definition or the current attribute / function.

EXAMPLES

```
reference_cut_table( my_template ) {  
values ( "via12, via12a, via12b");  
}
```

EXAMPLE MESSAGE

Error: Line 104, The 'via12a' via name is invalid. (LBDB-1062)

LBDB-1063 (warning) The argument value %d of the '%s' function is out of range. It is expected to be 0 or 1.

DESCRIPTION

This message indicates that the out-of-range value has been set to the specified function.

```
pattern( 0, 1, 0, 1 ); /* correct */
```

WHAT NEXT

Change the physical library to correct the arguments.

EXAMPLES

```
pattern( 0, 20, 0, 1 ); /* incorrect */
```

EXAMPLE MESSAGE

Warning: Line 17, The argument value 20 of the 'pattern' function is out of range. It is expected to be 0 or 1. (LBDB-1063)

LBDB-1064 (error) Invalid attribute '%s' value '%d' is detected. The value must be

unique among all '%s' objects.

DESCRIPTION

This message indicates a non-unique id is found. - All via are required to have a unique via_id value. - All mask layers (device_layer, poly_layer, routing_layer, cont_layer) must have a unique mw_map id specified in its corresponding stream_layer group.

WHAT NEXT

Make sure the specified id value is unique among all named objects.

EXAMPLES

```
via (via12) {  
    via_id : 12 ;  
    ...  
}  
via (via23) {  
    via_id : 12 ;  
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 56, Invalid attribute 'via_id' value '12' is detected. The value must be unique among all 'via' objects. (LBDB-1064)

LBDB-1065 (warning) No '%s' attribute has been specified for the

%s '%s'. It is set to default value '%d'.

DESCRIPTION

This message indicates that the library, perhaps an older PLIB file, does not contain the newly required object id's and default values are assigned to it. - All via are required to have a unique via_id value, from 1 to 255. - All mask layers (device_layer, poly_layer, routing_layer, cont_layer) must have a unique mw_map id specified in its corresponding stream_layer group. Datatype in mw_map is always default to 0.

WHAT NEXT

Enhance PLIB file to - specify a unique via_id for each via specification; - specify a corresponding stream_layer (with mw_map attribute) for each mask layer. These stream_layer should have unique mw_map layer id among them.

EXAMPLES

```
via (via12) {  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 56, No 'via_id' attribute has been specified for the via 'via12'. It is set to default value '12'. (LBDB-1065)

LBDB-1066 (warning) Cannot locate corresponding layer id and layer datatype for display_layer '%s'. It is set to layer id %d and layer datatype %d.

DESCRIPTION

This message indicates that the library, perhaps an older PLIB file, does not contain the newly required matching stream_layer object and mw_map(id, datatype) attribute values for all display_layer object. A unique mw_map(id, datatype) is automatically assigned to it.

WHAT NEXT

Enhance PLIB file to - specify a corresponding stream_layer (with mw_map attribute) for each display layer. These stream_layer should have unique mw_map(id, datatype) value pair.

EXAMPLES

```
display_layer (m1_pg) {  
    ...  
}
```

EXAMPLE MESSAGE

Warning: Line 56, Cannot locate corresponding layer id and layer datatype

```
for display_layer 'm1_pg'. It is set to layer id 23 and layer datatype '3'. (LBDB-1066)
```

LBDB-1067 (error) The '%s' attribute value(s) is out of range.

DESCRIPTION

This message indicates that the gds_map or mw_map attribute has out-of-range values.

The acceptable value ranges are:

```
id <= 255 datatype <= 255 where mw_map ( id , datatype ); gds_map ( id, datatype );
```

WHAT NEXT

Change the attribute value to satisfy the value range.

EXAMPLES

```
mw_map ( 23, 256 );
```

In this case, the datatype value 256 is out of range.

EXAMPLE MESSAGE

```
Error: Line 912, The 'mw_map' attribute' attribute value is out of range. (LBDB-1067)
```

LBDB-1068 (warning) Floating-point value %s in '%s' attribute is too precise and will be truncated to %s.

DESCRIPTION

This warning message occurs when the specified floating-point number cannot be completely stored in the database and must be rounded off.

When storing floating-point numbers in the database, the number is scaled by multiplying the floating-point number by dist_conversion_factor. Digits to the right of the decimal point are dropped. When nonzero digits are dropped, this message appears.

WHAT NEXT

This is a warning message only. No action is required.

However, if the result is not what you intended, you can increase the `dist_conversion_factor` or reduce the number of digits in the floating-point number, and then run the command again.

EXAMPLES

```
min_width : 0.1155 ;
```

EXAMPLE MESSAGE

Warning: Floating-point value 0.11550 in 'min_width' attribute is too precise and will be truncated to 0.115. (LBDB-1068)

LBDB-1069 (error) The %s object '%s' has a width %d and height %d that is inconsistent with the pattern size %d.

DESCRIPTION

This error message occurs when the pattern length of the specified section does not match the size specified by the pattern width and height. The number of elements in the pattern list must equal the product of the pattern width and height.

WHAT NEXT

Change the width and height attribute values or add or remove Boolean values to the pattern list. After making your changes, run the command again.

EXAMPLES

```
stipple ( S1 ) {  
width : 3 ;  
height : 2 ;  
pattern ( 1, 1, 0, 0 );  
}
```

EXAMPLE MESSAGE

Error: Line 67, Stipple object 'S1' has a width 3 and height 2 that is inconsistent with the pattern size 4. (LBDB-1069)

LBDB-1070 (warning) Layer '%s' has a pitch %.4f that is less than the minimum spacing and width sum %.4f.

DESCRIPTION

This warning message occurs when the specified Layer section contains an invalid pitch, minimum spacing or minimum width. The pitch must be greater than or equal to the sum of the layer's minimum spacing and minimum width.

WHAT NEXT

This is a warning message only. No action is required.

However, if the result is not what you intended, change the pitch, minimum spacing, or minimum width to meet the requirement that the pitch be greater than or equal to the sum of the layer's minimum spacing and minimum width.

EXAMPLES

```
layer ( M1 ) {  
min_width : 0.10 ;  
spacing : 0.12 ;  
pitch : 0.15 ;  
}
```

EXAMPLE MESSAGE

Warning: Line 24, Layer 'M1' has a pitch 0.1500 that is less than the minimum spacing

and width sum 0.2200. (LBDB-1069)

LBDB-1071 (warning) Routing_layer '%s' has invalid spacing_table value %.4f.

DESCRIPTION

This warning message occurs when the specified routing_layer contains an invalid spacing_table value. The spacing_table values must be equal to or greater than the routing_layer spacing value.

WHAT NEXT

This is only a warning message. No action is required.

However, it is best practice to change the spacing_table value of the specified routing_layer so the values are equal to or greater than the layer spacing value. After making your changes, run the command again.

EXAMPLES

```
layer ( M1 ) {  
spacing : 0.12 ;  
spacing_table (1d_table) {  
    values (" 0.1 , 0.15, 0.24" );  
}  
}
```

EXAMPLE MESSAGE

Warning: Line 235, Routing_layer 'M1' has invalid spacing_table value 0.100. (LBDB-1071)

LBDB-1072 (error) Routing_layer '%s' has invalid spacing_table value %.4f.

DESCRIPTION

This warning message occurs when the specified routing_layer contains an invalid spacing_table value. The spacing_table values must be equal to or greater than the routing_layer spacing value. And values[0] = spacing.

WHAT NEXT

Change the spacing_table value so the value in the list are equal to or greater than the layer spacing value. After making your changes, run the command again.

EXAMPLES

```
layer ( M1 ) {  
spacing : 0.12 ;  
spacing_table (1d_table) {  
    values (" 0.1 , 0.15, 0.24" );  
}  
}
```

EXAMPLE MESSAGE

Error: Line 235, Routing_layer 'M1' has invalid spacing_table value 0.100. (LBDB-1072)

LBDB-1073 (warning) Layer '%s' has a pitch %.4f that does not match the recommended wire-to-via pitch %.4f.

DESCRIPTION

This warning message occurs when the pitch of the specified layer does not match the recommended pitch. The wire-to-via pitch is the recommended pitch and provides the best wire track resources for routing.

The wire-to-wire pitch is more aggressive, the via-to-via is more conservative and neither are recommended. The metal layer pitch must match the wire-to-via pitch in the routing direction.

The horizontal wire-to-via pitch is calculated as follows:

$$(\text{min spacing}) + (\text{min width})/2 + (\text{via metal width})/2$$

The vertical wire-to-via pitch is calculated as follows:

$$(\text{min spacing}) + (\text{min width})/2 + (\text{via metal height})/2$$

The via metal width and height are based on the larger of the lower and upper default contact codes.

WHAT NEXT

This is only a warning message. No action is required.

You can leave the pitch of the specified layer at the current setting, or you can change the pitch of the layer to the recommended pitch.

EXAMPLES

```
layer ( metal3 ) {  
    spacing : 1.9;  
    min_width : 1.8;  
    pitch : 4.5;  
    ...  
}  
  
via (via23) {  
    ...  
}  
  
via_layer(metal3) {  
    rectangle ( -1.1, -1.1, 1.1, 1.1 );  
}  
via (via34) {
```

```
...
via_layer(metal3) {
    rectangle  ( -1.1, -1.1, 1.1, 1.1 );
}
}
```

EXAMPLE MESSAGE

Warning : Line 36, Layer 'metal3' has a pitch 4.500 that does not match the recommended wire-to-via pitch 3.900. (LBDB-1073)

LBDB-1074 (warning) Layer '%s' has a pitch %.4f that is not aligned with bottom layer pitch %.4f.

DESCRIPTION

This warning message occurs when the pitch of the specified layer is not double or triple the pitch of the lower metal layer with the same routing direction. Doubling or tripling the pitch value, maximizes routing resources and minimizes overlap with other metal layers.

WHAT NEXT

This is only a warning message. No action is required.

You can either leave the pitch of the specified layer unchanged, or change the pitch to the doubled or tripled pitch and run the command again.

EXAMPLES

```
layer ( metal1 ) {
pitch : 1.9;
...
}
...
layer ( metal3 ) {
pitch : 3.9;
...
}
```

EXAMPLE MESSAGE

Warning : Line 36, Layer 'metal3' has a pitch 3.900 that is not aligned with bottom layer pitch 1.900. (LBDB-1074)

LBDB-1075 (error) The attribute '%s' has %d entries, which exceeds the maximal allowed 8 entries.

DESCRIPTION

This error message occurs when the specified index array in routing_layer/cont_layer group that is too large. The index array size must be between 1 and 8 inclusive.

WHAT NEXT

Change the index array so that it does not exceed 8 entries. Then run the command again.

EXAMPLES

```
layer ( metal1 ) {  
spacing_table ( 1d_stable ) {  
    index_1 (0.0, 1.3, 2.4, 4.5, 6.6, 7.1, 9.3, 12.2, 25.0, 33.9);  
}  
...  
}
```

EXAMPLE MESSAGE

Warning : Line 36, The attribute 'index_1' has 10 entries, which exceeds the maximal allowed 8 entries. (LBDB-1075)

LBDB-1076 (warning) The attribute '%s' has invalid threshold values %.4f.

DESCRIPTION

This warning message occurs when the specified table index contains an invalid threshold values. The threshold list must meet the following requirements:

- The first value must be between 0 and the default_routing_width inclusively.
- The second value must be greater than the layer min_width.

WHAT NEXT

This is only a warning message. No action is required.

However, it is best practice to change the index values to meet the above

requirements. After making your changes, run the command again.

EXAMPLES

```
layer ( metall1 ) {  
min_width : 1.5 ;  
spacing_table ( 1d_stable ) {  
    index_1 (0.0, 1.3, 2.4, 4.5, 6.6, 7.1, 9.3, 12.2, 25.0, 33.9);  
    ...  
}  
...  
}
```

EXAMPLE MESSAGE

Warning : Line 36, The attribute 'index_1' has invalid index value 1.3. (LBDB-1076)

LBDB-1077 (error) The attribute '%s' has invalid threshold values %.4f.

DESCRIPTION

This warning message occurs when the specified table index contains an invalid threshold values. The threshold list must meet the following requirements:

- The first value must be between 0 and the min_width inclusively.
- The second value must be greater than the layer min_width.

WHAT NEXT

Change the index values to meet the above requirements. After making your changes, run the command again.

EXAMPLES

```
layer ( metall1 ) {  
min_width : 1.5 ;  
spacing_table ( 1d_stable ) {  
    index_1 (0.0, 1.3, 2.4, 4.5, 6.6, 7.1, 9.3, 12.2, 25.0, 33.9);  
    ...  
}  
...  
}
```

EXAMPLE MESSAGE

Error : Line 36, The attribute 'index_1' has invalid index value 1.3. (LBDB-1077)

LBDB-1078 (error) Layer '%s' has a default_routing_width value %.4f that is less than its min_width value %.4f.

DESCRIPTION

This error message occurs when the default width or minimum width of the specified Layer section is invalid. The default width (default_routing_width) of each layer must be greater than or equal to its minimum width (min_width).

WHAT NEXT

Change the default_routing_width or min_width of the specified Layer section so that the default_routing_width is greater than or equal to the min_width. After making your changes, run the command again.

EXAMPLES

```
layer ( metal1 ) {  
min_width : 1.5 ;  
default_routing_width : 1.3 ;  
...  
}  
...  
}
```

EXAMPLE MESSAGE

```
Error : Line 36, Layer 'metal1' has a default_routing_width value 1.3000 that is less than its  
min_width value 1.5000. (LBDB-1078)
```

LBDB-1079 (warning) The attribute '%s' has rounded threshold value %.4f.

DESCRIPTION

This warning message occurs when the threshold value from the index array contains rounded values. It is best practice to avoid ending threshold values with a 0 digit in the most precise position. This practice minimizes the confusion between tools that interpret the thresholds as exclusive, rather than inclusive, lower bounds.

WHAT NEXT

This is only a warning message. No action is required.

However, you can either increase the rounded threshold value by one grid resolution value and run the command again, or you can leave the threshold value at the current setting.

EXAMPLES

```
layer ( metall1 ) {  
spacing_table ( 1d_spacing ) {  
    index_1 ( "0.0, 1.500, 3.015" );  
    ...  
}  
...  
}
```

EXAMPLE MESSAGE

Warning : Line 36, The attribute 'index_1' has rounded threshold value 1.5000. (LBD B-1079)

LBDB-1080 (warning) Attribute '%s' has insignificant differences between threshold values %.4f and %.4f.

DESCRIPTION

This warning message occurs when the index threshold contains insignificant differences between the threshold values. It is best practice to have thresholds differ by more than half of the min_width and more than ten percent of the greater threshold. If they do not differ by these amounts, then the table values can contain redundant data, be unnecessarily large, and increase router run-time dramatically.

WHAT NEXT

This is only a warning message. No action is required.

However, you can check the table values for redundant data. If you find redundant data, then reduce the index dimension and the number of threshold values. After making your changes, rerun the command.

EXAMPLES

```
layer ( metall1 ) {  
min_width : 1.5;  
spacing_table ( 1d_spacing ) {  
    index_1 ( "0.0, 1.905, 1.915" );  
    ...  
}  
...  
}
```

```
}
```

EXAMPLE MESSAGE

Warning : Line 36, The attribute 'index_1' has insignificant differences between threshold values 1.9050 and 1.9150. (LBDB-1080)

LBDB-1081 (warning) Routing layer '%s' does not contain positive min_enclosed_area value.

DESCRIPTION

The value of the **minEnclosedArea** attribute for default metal layers should be greater than 0. Other values can affect the quality of the application results and can cause excessive design rule constraint violations during physical verification.

WHAT NEXT

This is only a warning message. No action is required.

However, it is best practice to check the `min_enclosed_area` or `min_enclosed_area_table` attribute value of the specified layer, and then change the value to a value greater than 0, if necessary. After making your changes, run the command again.

EXAMPLES

```
layer ( metall1 ) {  
...  
}
```

EXAMPLE MESSAGE

Warning : Line 36, Routing layer 'metall1' does not contain positive `min_enclosed_area` value. (LBDB-1081)

LBDB-1082 (error) The u_shaped_wire_spacing attribute value %.4f in routing layer '%s' is less than spacing value %.4f.

DESCRIPTION

This message indicates that the `u_shaped_wire_spacing` value is less than the spacing

value, which is not allowed. It is required that u_shaped_wire_spacing attribute value be no less than the spacing attribute value of the same routing layer.

WHAT NEXT

Change u_shaped_wire_spacing value so that it is equal or more than the spacing value. Then run the command again.

EXAMPLES

```
layer ( metall1 ) {  
    spacing : 1.4;  
    u_shaped_wire_spacing : 1.0;  
    ...  
}
```

EXAMPLE MESSAGE

Error : Line 45, The u_shaped_wire_spacing attribute value 1.0000 in routing layer 'metall1'
is less than the spacing attribute value 1.400. (LBDB-1082)

LBDB-1083 (error) The same_net_min_spacing attribute value %.4f in routing layer '%s' is more than spacing value %.4f.

DESCRIPTION

This message indicates that the same_net_min_spacing value is more than the spacing value, which is not allowed. It is required that same_net_min_spacing be no more than the spacing attribute value of the same routing layer.

WHAT NEXT

Change same_net_min_spacing value so that it is equal or less than the spacing value. Then run the command again.

EXAMPLES

```
layer ( metall1 ) {  
    spacing : 1.4;  
    same_net_min_spacing : 1.7;  
    ...  
}
```

EXAMPLE MESSAGE

```
Error : Line 45, The same_net_min_spacing attribute value 1.7000 in routing layer 'metall1' is more than the spacing attribute value 1.400. (LBDB-1083)
```

LBDB-1084 (warning) Tile '%s' has size %.4f that is not a multiple of %s routing layer pitch %.4f.

DESCRIPTION

This warning message occurs when: - in horizontal floorplan, tile width is not consistent with first vertical routing layer pitch; or - in vertical floorplan, tile height is not consistent with first horizontal routing layer pitch.

It is recommended that the tile dimension lines up with pitch to maximize utilization.

WHAT NEXT

This is a warning message only. No action is required.

However, it is best practice to either change the size value in question to the suggested pitch, or change the specified routing layer pitch to match tile dimension. After making your changes, run the command again.

EXAMPLES

```
layer ( metall2 ) {  
routing_direction : vertical ;  
pitch : 1.4;  
...  
}  
...  
tile (unit) {  
size ( 1.6, 5.5 );  
..  
}
```

EXAMPLE MESSAGE

```
Warning : Line 45, Tile 'unit' has size 1.6000 that is not a multiple of metall2 routing layer pitch 1.4000. (LBDB-1084)
```

LBDB-1085 (error) Cannot find via defined for contact layer

'%S'.

DESCRIPTION

This error message occurs when there is no via defined with a specific contact layer between 2 metal layers.

At least one via must be defined between 2 metal layers in a library.

WHAT NEXT

Define at least one via for the contact layer. Run the command again.

EXAMPLE MESSAGE

Error : Cannot find via defined for contact layer 'via12'. (LBDB-1085)

LBDB-1086 (warning) The %s attribute value in via '%s' specifies non-positive metal enclosure.

DESCRIPTION

This warning message occurs when the specified via section contains non-positive metal enclosure dimensions or non-positive enclosure metal rectangle. If the non-positive metal enclosure values are set intentionally, this warning can be ignored. Otherwise, the values may cause the router to create enclosures that violate design rule constraints, such as completely enclosed spaces or donuts.

WHAT NEXT

This is a warning message only. No action is required.

However, if the zero metal enclosure values are not intentional, you can change either the rectangle coordinates or change enclosure value in via group to avoid potential design rule violations.

EXAMPLES

```
via ( via12 ) {  
via_layer( metall1 ) {  
    enclosure ( 0, 0 );  
}  
}
```

EXAMPLE MESSAGE

Warning : Line 45, The enclosure attribute value in via 'via12' specifies non-positive metal enclosure. (LBDB-1086)

LBDB-1088 (warning) There are more than 255 layers in this library.

DESCRIPTION

This warning message occurs when more than 255 layers are found in the current library. It does not include display layers. Currently Milkyway database can accomodate up to 255 layers. Upper layers exceeding the limit will be ignore in the database.

WHAT NEXT

This is a warning message only. No action is required.

However, it is best practice to make sure that the total number of layers do not exceed the limit. After making your changes, run the command again.

EXAMPLE MESSAGE

Warning : There are more than 255 layers in this library. (LBDB-1088)

LBDB-1089 (warning) '%s' and '%s' layers in %s attribute are not adjacent layers.

DESCRIPTION

This warning message occurs when the 2 layers specified in: - same_net_min_spacing - diff_net_min_spacing - contact_min_spacing - corner_min_spacing - min_overhang - min_enclosure - end_of_line_enclosure complex attributes are not adjacent layers.

It is recommended that the 2 layers must be adjacent routing or contact layers.

WHAT NEXT

This is a warning message only. No action is required.

However, it is best practice to follow the above guideline. After making your changes, run the command again.

EXAMPLES

```
diff_net_min_spacing ( met1, met4, 1.4 );
```

EXAMPLE MESSAGE

```
Warning : Line 45, 'met1' and 'met3' layers in diff_net_min_spacing attribute are not adjacent layers. (LBDB-1089)
```

LBDB-1090 (warning) Cannot find matching stream_layer for layer '%s'.

DESCRIPTION

This warning message occurs when the layer is specified in resource layer section, but no stream_layer with identical name can be found in milkyway_layer_map group.

It is recommended that a stream_layer is defined for each layer found in resource group.

WHAT NEXT

This is a warning message only. No action is required.

However, it is best practice to add stream_layer definition for the specified layer. After making your changes, run the command again.

EXAMPLE MESSAGE

```
Warning : Cannot find matching stream_layer for layer 'metal1'. (LBDB-1090)
```

LBDB-1091 (warning) Reset density value from %4.1f to %4.1f.

DESCRIPTION

Density value defined in density_property in PLIB file should be between 0.0 and 100.0. Else, it will be reset to 0.0 or 100.0.

WHAT NEXT

Revise density value if the reset value is not expected.

EXAMPLE MESSAGE

Warning: Line 12, Reset density value from 101.6 to 100.0. (LBDB-1091)

LBDB-1092 (warning) Layer '%s' attribute '%s' has a value of %g.

DESCRIPTION

This warning message occurs when the value of the specified layer attribute may not be optimal.

The values can affect the quality of the application results and can cause excessive design rule constraint violations during physical verification.

For a set of rule, completeness of rule parameters should be maintained:

For enclosed via min edge length rule, if enclosed_via_min_edge_length is specified, min_edge_length should be specified, and enclosed_via_min_edge_length > min_edge_length > 0

For U-shape rule, if you specify u_shaped_min_length or u_shaped_wire_spacing, you should also specify u_shaped_min_depth and min_spacing. And u_shaped_wire_spacing > min_spacing.

For multiple min area rule, "min_area" attribute is needed if "min_polygon_area_rule() -> polygon_min_area" is specified and min_polygon_area_rule()->polygon_min_area > min_area. If both "min_polygon_area_rule() -> polygon_min_area" and "min_polygon_area_rule() -> max_edge_length" are specified, "min_length" should be specified. And min_polygon_area_rule() -> max_edge_length >= min_length

For non-preferred direction routing rule, if you specify non_preferred_dir_width, it will satisfy non_preferred_dir_width > default_routing_width. If you specify both non_preferred_dir_width and non_preferred_dir_max_length, it will satisfy non_preferred_dir_max_length > non_preferred_dir_width-default_routing_width.

For min_spacing rule in routing_layer, if you specify min_spacing(x_min_spacing, y_min_spacing), it will satisfy x_min_spacing >= spacing and y_min_spacing >= spacing.

For jog wire corner to corner spacing rule, if you specify aligned_jog_width and unaligned_jog_diag_width, it will satisfy aligned_jog_width >= min_width and unaligned_jog_diag_width >= min_width.

For [x|y]_min_spacing_table, [x|y]_max_spacing_table, the first value, i.e., value[0], will satisfy value[0] >= spacing.

For [x|y]_max_spacing_check_range_table, the first value, i.e., value[0], will satisfy value[0] >= spacing*2 + min_width.

WHAT NEXT

This is only a warning message. No action is required.

However, it is best practice to check the attribute value of the specified layer, and then change the value to a value greater than 0, if necessary. After making your changes, run the command again.

EXAMPLE MESSAGE

```
WARNING : Layer 'M1' attribute 'polygon_min_area' has a value of 0.03. (LBDB-1092)
```

LBDB-1093 (warning) Layer '%s' attribute '%s' is missing.

DESCRIPTION

This warning message occurs when the specified section is missing an important attribute. If the attribute is not specified in PLIB file, the default value is 0 for number attributes, or an empty string for string attributes.

For multiple min area rule, "min_area" attribute is needed if "min_polygon_area_rule() -> polygon_min_area" is specified and min_polygon_area_rule()->polygon_min_area > min_area. If both "min_polygon_area_rule() -> polygon_min_area" and "min_polygon_area_rule() -> max_edge_length" are specified, "min_length" should be specified.

For U-shape rule, if you specify u_shaped_min_length or u_shaped_wire_spacing, you should also specify u_shaped_min_depth and min_spacing.

For enclosed via min edge length rule, if enclosed_via_min_edge_length is specified, min_edge_length should be specified, and enclosed_via_min_edge_length > min_edge_length > 0. If both enclosed_via_min_edge_length and min_edge_length are specified, enclosed_via_adjacent_edge_length should be specified.

For 2-line end rule, if end_to_end_min_spacing is specified, end_of_line_metal_max_width should be specified.

For end of line rule, if end_of_line_side_keepout_length is specified, end_of_line_metal_max_width should be specified.

For line end depth rule, if end_of_line_min_length is specified, end_of_line_metal_max_width should be specified.

WHAT NEXT

This is only a warning message. No action is required.

However, if you do not want to use the default value for the attribute, add the attribute with the desired value to the specified section in PLIB file and rerun the command.

EXAMPLE MESSAGE

```
WARNING : Layer 'M1' attribute 'min_area' is missing. (LBDB-1093)
```

LBDB-1094 (error) The table '%s' can supports 'scalar' template only.

DESCRIPTION

This error message is reported for some table groups, that currently only a scalar value is supported for them by our tool. But found they are using a non-scalar template name.

Following two groups are under the restriction for now:

```
pgate_antenna_ratio(template_name) { } ngate_antenna_ratio(template_name) { }
```

WHAT NEXT

Modify the plib file accordingly, change the template name to 'scalar' and specify only one value for the table.

```
Example: antenna_rule("M1_ANTENNA_RULE") ...
pgate_antenna_ratio("antenna_tempalte1") { index_1 ("0.0 1.0 2.0 3.0") values ("200
200 400 600"); } }
```

```
Modify the group to: antenna_rule("M1_ANTENNA_RULE") ...
pgate_antenna_ratio("scalar") { values ("200"); } }
```

EXAMPLE MESSAGE

```
Error: Line 531, The table 'pgate_antenna_ratio' can supports 'scalar' template only. (LBDB-1094)
```

LBDB-1095 (error) The '%s' should coexist with '%s' in '%s' group.

DESCRIPTION

This error message is reported when there is restriction that two tables/functions/attributes should coexist the group, but only one found.

Example:

In antenna_rule group, the pgate_antenna_ratio table should coexist with ngate_antenna_ratio. If any of the other is not specified when one is present, the

error is reported.

```
antenna_rule (M1_model_d4) { antenna_ratio ("antenna_tempalte") { index_1("0, 0.05  
0.06 0.6"); values("100 100 300 500"); } pgate_antenna_ratio("scalar") {  
values("100"); } layer_antenna_factor("M1", 1.0); }
```

WHAT NEXT

Modify the plib file accordingly, specify both tables/attributes/functions in the group. or remove the existing one.

EXAMPLE MESSAGE

Error: Line 546, The 'pgate_antenna_ratio' should coexist with 'ngate_antenna_ratio' in 'antenna_rule' group. (LBDB-1095)

LBDB-1096 (error) There is unsupported antenna data in the group.

DESCRIPTION

This error message is reported when there is unsupported antenna data found in the antenna_rule group. Mainly, the error is issued for following situations:

1. usage of pgate_antenna_ratio and ngate_antenna_ratio pgate_antenna_ratio and ngate_antenna_ratio can't be supported when: antenna_accumulation_calculation_method : accumulative_ratio; with routing_layer_calculation_method : top_area|side_wall_area;

Note that when reading a plib file to Milkyway library, antenna_accumulation_calculation_method is default to accumulative_ratio and routing_layer_calculation_method is default to top_area;

So, if you want to define pgate_antenna_ratio and ngate_antenna_ratio in the antenna_rule group, you can't leave these two attributes undefined, otherwise, this error will be issued too.

2. usage of antenna area rule The antenna_rule group is defined as antenna area rule, when antenna_ratio_calculation_method == total_routing_area. And there is restrictions to antenna_accumulation_calculation_method and geometry_calculation_method, according to current tool support. Following combinations are supported now, this error will be issued for other combinations.
mode 1: calculate metal area ignore all lower layer segments.
antenna_accumulation_cm = single_layer, geometry_cm = connected_only; mode 2:
calculate metal area includes lower layer segments to input pins.
antenna_accumulation_cm = accumulative_area, geometry_cm = connected_only; mode 3:
calculate metal area includes all lower layer segments. antenna_accumulation_cm = accumulative_area, geometry_cm = all_geometries;

Besides above three calculation methods, the antenna_ratio should using scalar template and have only one value defined as max allowable antenna area, attribute max_diode_insertion_distance is used to define max allowable distance from inserted diode to gate.

other attributes and groups defined in antenna area rule are totally ignored during read_plib and not stored into database.

WHAT NEXT

Modify the plib file accordingly to rule above.

EXAMPLE MESSAGE

Error: Line 546, There is unsupported antenna data in the group. (LBDB-1096)

LBDB-1097 (error) Layer '%s' attribute '%s' and '%s' are different.

DESCRIPTION

x_min_spacing_table, y_min_spacing_table, x_max_spacing_table, y_max_spacing_table, x_max_spacing_check_range_table, y_max_spacing_check_range_table currently require the content in index_1 and index_2 are the same.

If both exist, the dimension and content in index_1[] in fat_wire_via_keepout_enclosure_table and in fat_wire_via_keepout_edge_table should be the same.

If both exist, the dimension and content in index_1[] in fat_wire_via_keepout_enclosure_table and in fat_wire_via_spacing_threshold_table should be the same.

WHAT NEXT

Unify the different elements.

EXAMPLE MESSAGE

Error : Layer 'M1' attribute 'x_min_spacing/index_1' and 'x_min_spacing/index_2' are different. (LBDB-1097)

LBDB-1098 (error) Layer '%s' has wrong '%s'.

DESCRIPTION

Values in x_legal_width and y_legal_width should satisfy, (1) the width values are in ascending order; (2) the first value \geq min_width; (3) the last value \leq max_width if max_width is specified; (4) default_routing_width is among the values.

WHAT NEXT

Re-specify x_legal_width or y_legal_width.

EXAMPLE MESSAGE

Error : Layer 'M1' has wrong 'x_legal_width'. (LBDB-1098)

LBDB-1099 (error) Layer '%s' '%s' and '%s' can't co-exist.

DESCRIPTION

fat_wire_via_keepout_edge_table and fat_wire_via_spacing_threshold_table can't co-exist in a cont_layer.

WHAT NEXT

Remove at least one of the two given attributes/functions/groups.

EXAMPLE MESSAGE

Error : Layer 'M1' 'fat_wire_via_keepout_edge_table' and 'fat_wire_via_spacing_threshold_table' can't co-exist. (LBDB-1099)

LBDB-1100 (information) Dummy cell '%s' defined in the library.

DESCRIPTION

This info message is reported when there is dummy cell defined in an incremental plib file (that is, the library attribute is_incremental_library : true;)

A dummy cell is identified by following features: 1. The cell name has wildcard '*' used, and the '*' is the last character in the cell name, for example, cell name is "*", or "AND*". 2. There is no cell geometries (macro obs, pin port) defined in the cell.

A dummy cell is expected only in an incremental plib file, and it's used to update cell/pin attributes for FRAM view cells when read plib data to Milkyway database.

WHAT NEXT

Users do not need to do anything.

LBDB-1101 (error) There is geometry data defined in dummy cell '%S'.

DESCRIPTION

This warning message is reported when there is geometry data defined in the dummy cell.

A dummy cell is identified by following features: 1. The cell name has wildcard '*' used, and the '*' is the last character in the cell name, for example, "*" or "AND*". 2. There is no cell geometries (macro obs, pin port) defined in the cell.

A dummy cell is expected only in an incremental plib file, and it's used to update cell/pin attributes for a set of FRAM view cells (pattern matched cells) when read plib data to Milkyway database.

WHAT NEXT

Remove all geometry data from the cell (macro obs, pin port) if users want to use dummy cell to update cell/pin attributes for a set of cells. Otherwise, rename the cell name to avoid it match with dummy cell naming rule.

EXAMPLE MESSAGE

Error: Line 546, There is geometry data defined in dummy cell '*'.(LBDB-1101)

LBDB-1150 (error) Invalid value in end_of_line_via_wire_rule.

DESCRIPTION

Name the five values in end_of_line_via_wire_rule as layer1, layer2, end_of_line_via_wire_min_width, end_of_line_via_wire_min_spacing, end_of_line_via_ortho_wire_max_threshold, respectively.

Suppose layer1 is routing_layer, and layer2 is cont_layer. default_via is the default via on layer2. Taking min_width and min_spacing specification from layer1, and compute cut_width by the geometry of default_via.

If there is another design rule for this layer pair

```
min_enclosure (string, string, float ); /* layer1, layer2, min_enclosure */
```

Take min_enclosure from this specification. Otherwise let min_enclosure=0.

Values should satisfy, (1) end_of_line_via_wire_min_width > min_width (2)
end_of_line_via_wire_min_width >= cut_width + 2* min_enclosure (3)
end_of_line_via_wire_min_spacing >= min_spacing + min_enclosure (4)
end_of_line_via_ortho_wire_max_threshold >= minWidth

WHAT NEXT

Change the value to satisfy all the 4 restrictions.

EXAMPLE MESSAGE

```
Error : Invalid value in end_of_line_via_wire_rule. (LBDB-1150)
```

LBDB-1151 (error) "%s" has invalid value %f.

DESCRIPTION

same_segment_center_min_spacing, same_net_center_min_spacing,
diff_segment_center_min_spacing, diff_net_center_min_spacing in cont_layer() group
or in topological_design_rules() group should satifsy,
[same|diff]_[segment|net]_center_min_spacing >= min_cut_spacing + cut_width

The value of min_cut_spacing and cut_width is explained as follows.

As for [same|diff]_[segment|net]_center_min_spacing in cont_layer() group, let "default_via" to be the default via of this cont_layer. Then min_cut_spacing is taken from contact_spacing specification. Cut_width is taken from the geometry of default_via.

As for [same|diff]_[segment|net]_center_min_spacing in topological_design_rules() group, we only check if both layer1 and layer2 are cont_layers. Let "default_via_1" to be the default via on layer1, "default_via_2" to be the default via on layer2. min_cut_spacing is taken from the function in topological_design_rule():

```
contact_min_spacing (layer1, layer2, min_cut_spacing)
```

Cut_width_1 and cut_width_2 are taken from the geometry of default_via_1 and default_via_2, respectively. Let cut_width = (cut_width_1+cut_width_2)/2.

WHAT NEXT

Change the value to satisfy the restriction.

EXAMPLE MESSAGE

Error : "diff_segment_center_min_spacing" has invalid value 0.12. (LBDB-1151)

LBDB-1152 (error) The '%s' attribute has an invalid sequence of data '%g , %g'. The values must be in decreasing order.

DESCRIPTION

This message indicates that the set of data is not specified in decreasing order. Content in "values" in min_metal_spacing_table must be in descending order.

WHAT NEXT

Check your library and correct the order of the values.

EXAMPLE MESSAGE

Error: Line 22, The 'values' attribute has an invalid sequence of data '1.200000 , 2.300000'. The values must be in decreasing order. (LBDB-1152)

LBDB-1153 (error) '%s' has 0 or more than %d arguments.

DESCRIPTION

[x|y]_legal_width requires that the argument number is greater than 0 and less than or equal to 16.

WHAT NEXT

Add or reduce arguments into the specified function.

EXAMPLE MESSAGE

Error: Line 22, 'x_legal_width' has 0 or more than 16 arguments. (LBDB-1153)

LBDB-1154 (error) There is no noise information in the library.

DESCRIPTION

This information occurs when checking library for noise information, but there is no

noise information in the library at all.

WHAT NEXT

If noise information is not needed, cancel the noise checking; If noise information is needed, add I-V characteristics, noise immunity data and noise propagation data.

LBDB-1155 (error) Invalid %s found under section %s in map file.

DESCRIPTION

In the map file, if any of the following is incorrect, (1) voltage_name (2) voltage value (3) power management attributes this message will occur.

Valid voltage_name should be a valid string that starts with a character a-z or A-Z. The voltage_name in PG_TO_VOLTAGE_MAP section should be one in VOLTAGE_MAP. It could be a rail name, and could be the same as pg_pin name. But never input an invalid value such as "--" or "*" in voltage_name field in PG_TO_VOLTAGE_MAP or VOLTAGE_MAP section. Valid voltage values are non-negative floating point numbers, for example, 0.9, that are valid voltage values in the input library. For valid power management attributes, please refer to related documents or user guide. The following are only a few examples: valid switch_cell_type is coarse_grain and fine_grain; valid level_shifter_type is HL, LH and HL_LH; always_on pins are related to backup power; a switch cell has VVDD+VDD or VVSS+VSS, and. VVDD has pg_function where VVDD is virtual VDD.

WHAT NEXT

You should correct the invalid values and/or voltage_name in the map file. For example, in voltage_name field, if you enter "--", you will receive this message. You must input a valid voltage_name, e.g. VDD.

EXAMPLES

```
BEGIN PG_TO_VOLTAGE_MAP
cell      pg_pin      voltage_name pg_type
ADDFHX1   VDD         -          power
ADDFHX1   VSS         VSS        primary_ground
GEND PG_TO_VOLTAGE_MAP
```

EXAMPLE MESSAGE

Error: Line 14, Invalid voltage_name found under section PG_TO_VOLTAGE_MAP in map file. (LBDB-1155)

LBO

LBO-1 (info) Location based optimization enabled.

DESCRIPTION

Location based optimization feature of IPO is enabled. This feature is enabled whenever location information is back-annotated using a PDEF file (revision 2.0 or later) and sufficient delay and load back-annotations are provided. Enabling of LBO does not imply automatic enabling of LBO tricks. Individual LBO tricks are enabled or disabled by setting independent variables for each LBO trick.

WHAT NEXT

For more information please see LTL users guide.

LBO-2 (info) Location based optimization enabled with obstruction capability.

DESCRIPTION

Location based optimization feature of IPO is enabled with obstruction handling. This feature will not insert cells in areas marked as obstructions in the PDEF file.

WHAT NEXT

For more information please see LTL users guide.

LBO-3 (warning) The pin '%s' has a location '%d %d' which is on an obstruction; fanout optimization will not be performed on the net.

DESCRIPTION

This net's fanout will not be optimized as its pin locations are within areas marked as obstructions.

WHAT NEXT

Please check the PDEF file to see if the locations are correct and reissue the command. Also check the bounding box of a cell marked as an obstruction via the set_obstruction command.

LBO-4 (warning) Cannot estimate load/delay

DESCRIPTION

Cell location is needed to estimate load/delay.

WHAT NEXT

Please obtain the PDEF file with cell location.

LBO-5 (information) reoptimize_design command is recommended for layout sensitive optimization

DESCRIPTION

reoptimize_design command is the new command for layout sensitive optimization. It has better performance and optimization capabilities, such as Location-Based Optimization (LBO), and shares the new flow and techniques introduced in Design Compiler 98.

WHAT NEXT

Please refer to Floorplan Manager manual

LBO-11 (Warning) Cannot mark %s as an obstruction since bounding rectangle is not defined.

DESCRIPTION

The **set_obstruction** command cannot mark cells as placement obstructions if the bounding rectangle for the cell is not defined.

WHAT NEXT

Use the **read_pdef** command to load the bounding box for the cell. For more information, see the *FloorPlan Manager User Guide* and *Synthesis Release Note Version 1999.05*.

LBO-12 (Warning) %s is already marked as an obstruction.

DESCRIPTION

You receive this warning message if the **set_obstruction** command skipped the specified cell because the cell was already marked as an obstruction.

WHAT NEXT

Verify that you are selecting the correct cell to be marked as an obstruction.

LBO-13 (Warning) Cannot mark hierarchical cell %s as an obstruction.

DESCRIPTION

You receive this warning message when the **set_obstruction** command skipped the cell because it is a hierarchical cell. Hierarchical cells cannot be marked as obstructions using the **set_obstruction** command.

WHAT NEXT

Verify that you are selecting the correct cell to be marked as an obstruction.

LBO-15 (error) No physical design information read before set_port_location; unable to set the port location.

DESCRIPTION

You receive this error message if no physical design information is available when you execute the **set_port_location** command.

WHAT NEXT

Use the **read_pdef** command to load the physical design information before using the **set_port_location** command.

SEE ALSO

For more information, see the *FloorPlan Manager User Guide* and the *Synthesis Release Note Version 1999.05*.

LBO-16 (info) Resetting location for the port %s.

DESCRIPTION

The location specified for the port by any previous **set_port_location** command will be deleted from the database. The tool will use the port location specified by the DEF file for any previous **read_def** command (in the incremental mode), if it is available.

WHAT NEXT

If you want to re-annotate the location of the port, use the **set_port_location** command with the **-coordinate** option.

LBO-17 (info) Setting location for port %s: X = %s %s Y = %s %s

DESCRIPTION

The **set_port_location** command successfully annotated the port location. If only one dimension was specified, only that dimension was changed. The location set by the **set_port_location** command will take precedence over any PDEF-based annotation.

WHAT NEXT

To reset the port location, use the **set_port_location** command without the **-x** and the **-y** options. FloorPlan Manager will then use any value on the design that was annotated using a PDEF file. For more information, see the **read_pdef** man page, and the *Floor Plan Manage User Guide*.

LBO-18 (Error) Unable to find port %s in the current design.

DESCRIPTION

The **set_port_location** command could not find the specified port in the current design.

WHAT NEXT

Check the name of the port specified by the **set_port_location** command. Use the **find** command to get a list of ports in the current design.

LBO-19 (Error) Port %s does not have location information which can be changed.

DESCRIPTION

The **set_port_location** command could not change the specified dimension since the other dimension has not been annotated. If only one dimension is specified, that dimension is changed only if the value for the other dimension is known.

WHAT NEXT

Check the name of the port specified by the **set_port_location** command. Annotate both of the dimensions on the port.

LBO-20 (Error) set_port_location cannot annotate more than one port at a time.

DESCRIPTION

The **set_port_location** command could not annotate port locations because more than one port was specified.

WHAT NEXT

Check the number of ports specified by the **set_port_location** command. Execute the **set_port_location** command for each port location you wish to specify.

LBO-21 (error) Coordinates set must consist of two floating point

values.

DESCRIPTION

The two values are for X coordinate and Y coordinate. They are expected to be in micron unit.

WHAT NEXT

provide correct number of arguments.

LBO-22 (error) Pin location cannot be set without cluster information.

DESCRIPTION

Design does not have cluster information. Cluster information is required to set the pin location on a library cell.

WHAT NEXT

Load the cluster information using the **read_pdef** or **read_clusters** command and then issue **set_port_location** command.

LBO-23 (error) The library cell %s could not be found in the target library.

DESCRIPTION

The library cell specified does not exist in the target library. The cell should exists in the target library in order to set its pin location.

WHAT NEXT

Check the cell name and make sure that this cell exists in the target library.

LBO-24 (error) Pin %s of library cell %s could not be found.

DESCRIPTION

The specified library cell exists in the target library but the specified pin could be found for this library pin.

WHAT NEXT

Specify the correct pin name.

LBO-25 (Warning) Library cell %s does not have any dimensions. The pins of cell %s will be assigned the location of the cell.

DESCRIPTION

You receive this warning message when the orientation of a cell is not North, and the dimensions of its library cell are not known. If the orientation of the cell is not North, it cannot determine the pin location without knowing the library cell dimensions.

WHAT NEXT

Set the library cell dimensions using `set_libcell_dimensions`.

LBO-30 (error) The core is entirely blocked and there is no vacant core space.

DESCRIPTION

You receive this error message when the core is entirely blocked due to fixed cells or obstructions. There is no vacant core space available for optimization.

WHAT NEXT

Review the PDEF file specified with the `read_pdef` command and the obstructions set using `create_obstruction`. Check if any obstructions that were supposed to be routing obstructions have been incorrectly specified as placement obstructions. If you are using Physical Compiler, use the Physical Compiler graphical user interface to view the floorplan.

LBO-31 (error) Port layer name and layer_area must be set together.

DESCRIPTION

To set port geometry, both layer name and layer_area must be specified.

WHAT NEXT

Use -layer and -layer_area option together for **set_port_location** command.

LBO-32 (warning) Missing pin location data in physical library for physical library pin %s on physical library cell %s.

DESCRIPTION

While attempting to calculate the location of a physical only pin, the problem was encountered where the location data for the physical library pin could not be found in the physical library. The location of the owning cell will be used for the location of the pin (for example in the GUI).

WHAT NEXT

It may be possible to obtain an improved physical library for the design which contains location data for all physical library pins.

SEE ALSO

LBO-33 (warning) Missing orientation while trying to calculate the location of pin %s on cell instance %s.

DESCRIPTION

While attempting to calculate the location of a physical only pin, the problem was encountered where the orientation data for the cell instance could not be determined. The location of the owning cell will be used for the location of the pin (for example in the GUI).

WHAT NEXT

Try setting the orientation of the cell instance.

SEE ALSO

LBR

LBR-0 (error) Can't find the %s '%s'
in the library '%s'.

DESCRIPTION

This message indicates that the design unit given is not in the library specified.

WHAT NEXT

The **report_design_lib** command can be used to determine the contents of a library. If the design unit is not present, re-analyze the design unit using the **analyze** command with the -library or -work option.

LBR-1 (warning) Can't find the %s '%s'
in the library '%s'.

DESCRIPTION

This message indicates that the design unit given is not in the library specified.

WHAT NEXT

The **report_design_lib** command can be used to determine the contents of a library. If the design unit is not present, re-analyze the design unit using the **analyze** command with the -library or -work option.

LBR-2 (error) The library '%s' is mapped to the directory
'%s' which is not %s.

DESCRIPTION

This message indicates that a command was issued which tried to read from, or write to a library mapped to a directory for which the desired permissions are not set.

WHAT NEXT

Check the permissions on the specified directory.

LBR-3 (warning) The %s '%s' is out of date with respect to its source file '%s'.

DESCRIPTION

This message indicates that the file containing the design unit has been modified since the last time the design unit was analyzed.

WHAT NEXT

To avoid this warning in the future, re-analyze the file containing the design unit with the **analyze** command.

LBR-4 (error) The %s '%s' is out of date and I can't find the source file '%s'.

DESCRIPTION

This message indicates that the file which contains the design unit given cannot be located.

WHAT NEXT

Ensure that the file in question has not been re-named or moved.

LBR-5 (error) The %s '%s' is out of date. Please re-analyze it and try again.

DESCRIPTION

This message indicates that the design unit specified depends on more recently analyzed files.

WHAT NEXT

Use the **analyze** command to re-analyze the file which contains the given design unit.

LBR-6 (error) The library '%s' is not mapped to a directory.

DESCRIPTION

This message indicates that you attempted to access a library which does not have a valid directory path associated with it.

WHAT NEXT

For information on mapping between design libraries and paths, refer to the **define_design_lib** command manual page. Mapping can also be done via the **.synopsys_vss.setup** file.

LBR-7 (error) Could not write the file '%s'.

DESCRIPTION

This message indicates that the file could not be opened for writing.

WHAT NEXT

For previously existing files, check the write permissions. When trying to create a new file, check the full directory path for existence, and ensure that the file name is not an existing directory name.

LBR-8 (warning) Library logical name '%s' is not mapped to a host directory.

DESCRIPTION

You are receiving this error message because the logical name you provided could not be mapped to a physical host directory.

WHAT NEXT

Provide an appropriate mapping to a host directory and make sure the directory exists. If this does not resolve the problem, please contact Synopsys support. For instructions for creating, packaging, and sending a test case, go to <http://www.synopsys.com/testcase>.

LBR-9 (warning) The .mra file '%s' contains invalid data. The invalid data is being ignored.

DESCRIPTION

This message indicates that the .mra file has been incorrectly modified, with extra character(s) after the architecture name, by a source other than this program. The .mra file should only contain a single architecture name per line, directly followed by a newline.

WHAT NEXT

To avoid this warning in the future, re-analyze the design. This will automatically generate a new .mra file.

LBR-10 (warning) The environment variable '%s' has no value.

DESCRIPTION

This message indicates that the given environment variable has not been set.

WHAT NEXT

Set the environment variable to a legal value.

LBR-11 (warning) Design library name '%s' is reserved, and can not be defined by the user.

DESCRIPTION

This message indicates that the specified library name has been pre-defined by Synopsys; this name cannot be re-defined.

WHAT NEXT

Use the **define_design_lib** command to define a library name that has not already been defined by Synopsys.

LBR-12 (warning) Logical library name '%s' is reserved,

and can not be mapped by the user.

DESCRIPTION

This message indicates that the specified library name has been predefined by Synopsys; this name cannot be re-mapped.

WHAT NEXT

Use the **define_design_lib** command to define a library name that has not already been defined by Synopsys.

LBR-13 (warning) Logical library name '%s' can not be mapped to '%s',
which is reserved.

DESCRIPTION

This message indicates that the specified library name has been predefined by Synopsys; this name cannot be used.

WHAT NEXT

Use the **define_design_lib** command to define a library name that has not already been defined by Synopsys. Then map the logical library name to that library name.

LBR-14 (error) '%s' in library '%s' is a %s. A %s was expected.

DESCRIPTION

This message indicates that the given design unit's type in the specified library does not match the expected type, probably because of a naming conflict between two different design unit types.

WHAT NEXT

Ensure that all primary design units in the library have unique names.

LBR-15 (information) Re-analyzing the out of date %s '%s'.

DESCRIPTION

This message indicates that the source file containing the given design unit is out of date, and will be re-analyzed.

WHAT NEXT

This is only an informational message. The design will be re-analyzed automatically.

LBR-16 (error) You cannot overwrite a library file.

DESCRIPTION

This message indicated that you attempted to write a library file to an existing file that has the same name; this is not allowed.

WHAT NEXT

Choose a unique filename for this library information.

LBR-17 (warning) The package '%s' is not able to be saved. It will be used for this read, but will not be able to be used for subsequent reads.

DESCRIPTION

This message indicates that you attempted to write to the directory that is mapped to the working library; this directory is not writable.

WHAT NEXT

For information on mapping between design libraries and paths, refer to the `write_design_lib_paths` command manual page.

LBR-18 (error) The variable '%s' is not set ...

You must use the '-filename' argument.

DESCRIPTION

This message indicates that the program could not figure out where to write the results of the `write_design_lib_paths` command.

WHAT NEXT

Set the specified environment variable, or use the -filename, or -dc_setup options when issuing the `write_design_lib_paths` command.

LBR-19 (error) The entity '%s' does not have any architectures analyzed for it.

DESCRIPTION

This message indicates that during an elaborate command, an entity was encountered which did not have any associated architecture analyzed for it.

WHAT NEXT

Analyze an architecture for this entity and then re-issue the elaborate command.

LBR-20 (error) You can't specify an architecture when elaborating a configuration.

DESCRIPTION

This message indicates the `elaborate` command was executed with the -architecture option on a configuration.

WHAT NEXT

Re-issue the `elaborate` command without the -architecture option.

LBR-21 (warning) The design '%s' has no parameters.

The parameters '%s' have been ignored.

DESCRIPTION

This message indicates that parameter(s) have been specified for a design that does not require parameters. The parameters specified will be ignored when building the design.

WHAT NEXT

Use the **dc_shell** command **report_design_lib library_name** to generate a report on the contents of the design library that contains the design. In the report table, an entry with a 'p' notation identifies a design that has parameters.

Ignore this warning message if you have a DesignWare library module that requires parameter(s) to select a specific implementation but the implementation itself does not accept parameters. An example of this is an elaborated and compiled gate-level **.db** implementation.

LBR-22 (error) The library '%s' cannot be mapped to the same directory as '%s'.

DESCRIPTION

This message indicates that you tried to map the given libraries to the same directory. This is illegal.

WHAT NEXT

Re-map one of the libraries to a different directory using the **define_design_lib** command with the -path option, or specify the mapping in the **.synopsys_vss.setup** file.

LBR-23 (error) Could not delete the file '%s'.

DESCRIPTION

The library manager tried to remove the specified file but couldn't. This should only happen if the permissions on the file are such that you do not have permission to remove it.

WHAT NEXT

Check the permissions on the specified file. If appropriate, change them to allow you to remove the file in question. Otherwise contact your system administrator for assistance.

LBR-24 (error) The file '%s' does not contain the design '%s'.

DESCRIPTION

The specified db file does not contain the entity that was expected.

WHAT NEXT

Rewrite the db file to the library, using the command "write -library". This produces a file in the format that dc expects.

LBR-25 (error) The file '%s' contains more than one entity.

DESCRIPTION

The specified db file contains multiple entities. db files stored in design libraries must contain only one entity per file.

WHAT NEXT

Rewrite the db file to the library using the command "write -library". This produces a file in the format that dc expects.

LBR-26 (error) Could not read in the file '%s'.

DESCRIPTION

An attempt was made to elaborate an entity out of a design library, and the elaboration failed.

WHAT NEXT

The db file is probably corrupt. Regenerate the db file, and overwrite the existing file in the design library.

LBR-27 (information) Overwriting the '%s' version of architecture '%s' with a '%s' version in the library '%s'.

DESCRIPTION

Each design library is only allowed to have one architecture associated with a particular entity. As a result, when you write an architecture into a library, the system overwrites existing architectures. This message simply lets you know that the overwriting is in progress.

WHAT NEXT

Do not take any further action regarding this message.

LBR-28 (error) The %s '%s' depends on the %s '%s' which has been analyzed more recently. Please re-analyze the source file for '%s' and try again.

DESCRIPTION

This message indicates that the given design unit is out of date with respect to a design unit on which it depends.

WHAT NEXT

Re-analyze the dependant design's source file.

LBR-29 (error) Design library '%s' cannot be mapped to the same directory as design library '%s'.

DESCRIPTION

It is illegal to have two design libraries mapped to the same directory. Doing so can cause library aliasing problems.

WHAT NEXT

One of the two libraries must be mapped to a different directory.

LBR-30 (error) Recursion detected in .syn files. Design unit '%s' was referenced multiple times.

DESCRIPTION

This error should never happen because it is impossible to create recursive dependencies amongst design units. This check is there simply for completeness to eliminate the chance of infinite recursion while checking design units.

WHAT NEXT

Check the dependency hierarchy of the design unit that is in question. If you can find the recursion (which would be illegal vhdl), remove one of the links in the loop to prevent the recursion.

LBR-31 (error) '%s' is being defined as a design library (using the '>' operator, but it was already defined as a logical library (using the ':' operator or the define_design_lib command). To modify the directory that '%s' is mapped to, please use ':' or the define_design_lib command.

DESCRIPTION

A logical library with the specified name has already been defined. Synthesis does not allow there to be logical and design libraries both specified with the same name.

Example 1 .synopsys_vss.setup file:

```
DW03: ./work
DW03 > DEFAULT
```

Example 2 .synopsys_vss.setup file:

```
SOME_LIB > SOME_LIB
SOME_LIB: ./work
```

In example 1 DW03 is both a logical library and a design library. In example 2 SOME_LIB is both a logical library and a design library.

WHAT NEXT

This is a limitation in the synthesis support of design libraries. As the error message states, you should be able to get the desired effect by using the ':' operator (or the define_design_lib command) to redefine the library in question. In example 1 the logical library DW03 can be renamed to something else like DW_03. In example 2 the line 'SOME_LIB > SOME_LIB' can be eliminated since it is implied by the line 'SOME_LIB: ./work'.

LBR-32 (error) Can't find file '%s'. Update failed.

DESCRIPTION

When -update is specified, a .update file must be found in the directory of your HDL source. The given .update file was not found. The analyze command has failed.

WHAT NEXT

Contact your part vendor to obtain the necessary .update file(s).

LBR-33 (error) File '%s' was not generated from '%s'. Update failed.

DESCRIPTION

When -update is specified, a .update file must be found in the directory of your HDL source. The .update file must have been generated using "analyze -create_update" on exactly the same HDL source file as you are using now.

The HDL source file you are using has been modified, so the analysis failed.

WHAT NEXT

Use the original HDL source file, or don't specify the -update flag. Contact your part vendor if you think you have been given the wrong .update or HDL source file.

LBR-50 (error) An order-based parameter:

%S

was specified after a name-based parameter.

DESCRIPTION

This error occurs when the **-parameters** option of the **elaborate** command includes a combination of order-based and name-based parameter values, and all the order-based parameters are not specified before name-based parameters. It is possible that a syntax error has caused a named-base parameter to be accidentally treated as an order-based parameter.

WHAT NEXT

Modify the **-parameters** option of the **elaborate** command so that all order-based parameters occur before name-based parameters; or, correct the syntax error.

LBR-51 (error) Parameter "%S" multiply defined.

DESCRIPTION

This message indicates that the same parameter appears more than once in the parameter list specified when executing **elaborate**. Each parameter can be specified only once.

Parameters are not case sensitive. You might have specified two names that differed only in case (upper and lower).

WHAT NEXT

Specify the parameter only once. To ensure that each parameter name is unique, refer to the parameter syntax explanation in the **elaborate** manual page.

LBSYN

LBSYN-1 (error) The parameter '%s' has been defined multiple times
in module '%s'.

DESCRIPTION

You receive this message during reading of a library, if the **read_lib** command finds that the same parameter has been defined more than once in the synthetic module. Each parameter must have a unique definition.

WHAT NEXT

Edit the .sl file to remove the duplicate parameter definition from the synthetic module. Then reexecute **read_lib**.

LBSYN-2 (error) Pin association '%s' must specify exactly one of "oper_pin" or "value".

DESCRIPTION

You receive this message if the library being read contains a pin association with multiple specifications. The pin association must have either one oper_pin or a value.

WHAT NEXT

Locate the specified pin association in the synthetic library file, and edit the file so that the pin association specifies either one oper_pin or a value. Then reexecute **read_lib**.

LBSYN-3 (error) Binding '%s' must specify "bound_operator".

DESCRIPTION

You receive this message during reading of a library, if the **read_lib** command finds a binding that does not have a bound_operator specification in the binding group in the current processed module. Each binding must have a bound_operator specification.

WHAT NEXT

Edit the file to add the missing bound_operator specification. Then reexecute **read_lib**.

LBSYN-4 (error) The module or component '%s' requires a design_library attribute.

DESCRIPTION

Each module and component in a synthetic library must have a design_library attribute that identifies the design library where its implementation source is stored. The library should correspond to a library identified in the design_design_lib command.

WHAT NEXT

Supply a design_library attribute.

LBSYN-5 (error) Operator pin '%s' must either be "input" or "output".

DESCRIPTION

Synthetic library operators can only represent combinational functions. As such, it does not make sense to have inout pins on operators. Functions with inout pins must be instantiated directly as synthetic library modules.

WHAT NEXT

Do not use operators with inout pins. Use modules if inout pins are really required.

LBSYN-6 (error) Operator '%s' data_class must either be "unsigned" or "signed".

DESCRIPTION

Synthetic library operators can only have a data_class value of "signed" or "unsigned". Other values are illegal.

WHAT NEXT

LBSYN-7 (error) Module pin '%s' must have a 'bit_width' attribute.

DESCRIPTION

'Bit_width' is a required attribute on all synthetic library module pins.

WHAT NEXT

LBSYN-8 (error) The value "%s" in group %s(%s) is not legal.

DESCRIPTION

Only a string of 1's and 0's is allowed in the attribute. The only exception is that "unbound" can occur in constraint groups.

WHAT NEXT

To fix the syntax error, use a legal value.

LBSYN-9 (error) The value attribute is missing in group %s(%s).

DESCRIPTION

A value attribute is required in this group.

WHAT NEXT

Please supply a value attribute.

LBSYN-10 (error) Parameter '%s' cannot have both a constant attribute

and a formula attribute.

DESCRIPTION

The constant attribute is used to assigned the parameter a typed constant value. The formula attribute is used to assigned the parameter a computed expression. Only one of these can be used to assign the parameter a value.

WHAT NEXT

Eliminate either the constant or the formula attribute.

LBSYN-11 (error) Parameter '%s' has a constant attribute without a type attribute.

DESCRIPTION

A parameter that sets its value using the constant attribute must have a type attribute to declare the constant's type.

WHAT NEXT

Add a type attribute.

LBSYN-12 (warning) In parameter '%s', the type attribute is ignored.

DESCRIPTION

The formula attribute ignores the type declaration in the type attribute. The formula's type is determined from the equation.

WHAT NEXT

Use the constant attribute to declare typed parameters.

LBSYN-13 (error) The string %s can not be evaluated,

therefore it can't be used for the bit_width value on pin %s.

DESCRIPTION

This message indicates that the given string contained parameter(s) that were not previously defined in the current module's scope. Therefore, the string can not be used as the value for the bit_width attribute on the given pin.

WHAT NEXT

Modify the .sl file, by creating the desired parameter group in the module that contains the given pin group. The parameter group should be defined prior to the definition of the pin group.

LBSYN-15 (error) The binding group %s in the module %s does not contain any pin_association groups.

DESCRIPTION

This message indicates that the given binding group in the stated module does not contain any pin_association groups. At least one pin_association group is required for a binding group. If this is a sequential binding group, at a minimum the clock pin must be connected to the clock input of the operator in each state.

WHAT NEXT

Modify the .sl file, by creating the necessary pin_association group(s) for the binding. The pin_association group statement defines how the module pins are associated with synthetic operator pins and constant values. See the DesignWare Developer Guide for further information on this topic.

LBSYN-16 (warning) The parameter %s does not have the hdl_parameter attribute set true, nor does it have a formula.

DESCRIPTION

This message indicates that the given parameter group does not have its hdl_parameter attribute set to "true", nor does it have a formula defined for it. A parameter must have either a formula or the hdl_parameter attribute set to "true" in order for this parameter to be referenced successfully.

WHAT NEXT

Modify the .sl file to include a formula and/or set the hdl_parameter attribute to "true". See the DesignWare Developer Guide for further information on this topic.

LBSYN-17 (warning) the parameter %s formula may not evaluate correctly during a compile operation because of: %s.

DESCRIPTION

This message indicates that the given formula potentially has an error in it which might prevent this parameter from being evaluated during run time. The reason given may provide helpful information for correcting the problem.

Certain static checks, such as syntax, are performed on formulas within parameters when a library is read in. During this process, a formula is evaluated with values that are available statically. Variables within the formula which are not known until a compile is executed can not be checked.

WHAT NEXT

Check the formula attribute within the given parameter for the problem indicated by the message. Edit the .sl file as necessary to correct the problems.

LBSYN-18 (error) Substitute Licenses are for internal use only.

DESCRIPTION

The "Substitute License" feature is for internal Synopsys use only. This feature is not available to Synopsys customers.

WHAT NEXT

Remove the "substitute_license" group from your implementation description or acquire a "Synopsys" license.

LBSYN-19 (error) The "substitute_license" group requires an

"original_license" attribute.

DESCRIPTION

The "substitute_license" group for synthetic module implementations requires at least an "original_license" and a "substitute_license" attribute. An example "substitute_license" group is:

```
substitute_license () {  
    original_license : lic_a;  
    substitute_license : lic_b;  
    valid_modules : "DW01_mult DW01_add DW01_addsub";  
}
```

WHAT NEXT

Either add the "original_license" attribute or delete the "substitute_license" group.

LBSYN-20 (error) The "substitute_license" group requires a "substitute_license" attribute.

DESCRIPTION

The "substitute_license" group for synthetic module implementations requires at least an "original_license" and a "substitute_license" attribute. An example "substitute_license" group is:

```
substitute_license () {  
    original_license : lic_a;  
    substitute_license : lic_b;  
    valid_modules : "DW01_mult DW01_add DW01_addsub";  
}
```

WHAT NEXT

Either add the "substitute_license" attribute or delete the "substitute_license" group.

LBSYN-21 (warning) The "substitute_license" group contains

no "valid_modules" attribute.

DESCRIPTION

No "valid_modules" attribute has been specified for this "substitute_license" group. This will allow any modules licensed with the "original_license" to be instantiated in this implementation without consuming the license. An example "substitute_license" group is:

```
substitute_license () {  
    original_license : lic_a;  
    substitute_license : lic_b;  
    valid_modules : "DW01_mult DW01_add DW01_addsub";  
}
```

WHAT NEXT

If improved protection is desired use the "valid_modules" attribute to restrict the modules to which this license substitution will be applied.

LBSYN-22 (error) Original license must be DesignWare-Foundation.

DESCRIPTION

The "Original License" feature must be DesignWare or DesignWare-Foundation license. We only support Foundation license substitution.

WHAT NEXT

Correct your Original license name. Or delete "susbstiute_license" group from your implementation declaration.

LBSYN-23 (error) Only one generator group can exist in a library.

DESCRIPTION

A synthetic library can have at most one generator group specifying information used during creation of library implementations.

WHAT NEXT

Remove generator groups from the synthetic library. Separate implementations requiring different generators from a single synthetic library into multiple synthetic libraries. In each new synthetic library only one generator should exist with information used to generate all implementations in the new synthetic library.

LBSYN-24 (error) The "generator" group requires the '%s' attribute.

DESCRIPTION

The "generator" group for synthetic libraries requires a minimum set of attributes. This set consists of the following attributes: "executable_os_variable", "generator_interface", and "contact_upon_failure".

WHAT NEXT

Either add the required attributes to the "generator" group or delete the "generator" group.

LBSYN-25 (error) The "generator" group requires a "generator_interface" attribute.

DESCRIPTION

The "generator" group for synthetic libraries requires at least an "executable_os_variable" attribute, a "generator_interface" attribute, and a "contact_upon_failure" attribute. An example "generator" group is:

```
generator (mult_gen) {
    generator_interface : file;
    executable_os_variable : "/usr/local/bin/mgen";
    contact_upon_failure : "MGEN Customer Support Hotline";
}
```

WHAT NEXT

Either add the "generator_interface" attribute or delete the "generator" group.

LBSYN-26 (error) The "generator" group requires a

"contact_upon_failure" attribute.

DESCRIPTION

The "generator" group for synthetic libraries requires at least an "executable_os_variable" attribute, a "generator_interface" attribute, and a "contact_upon_failure" attribute. An example "generator" group is:

```
generator (mult_gen) {
    generator_interface : file;
    executable_os_variable : "/usr/local/bin/mgen";
    contact_upon_failure : "MGEN Customer Support Hotline";
}
```

WHAT NEXT

Either add the "contact_upon_failure" attribute or delete the "generator" group.

LBSYN-27 (error) Only one "verilog" subgroup may exist in a "generator" group.

DESCRIPTION

A "generator" group may have at most one "verilog" subgroup specifying information used during processing of generator produced Verilog netlists.

WHAT NEXT

Remove "verilog" groups from the generator group leaving at most one "verilog" group.

LBSYN-28 (error) Only one "vhdl" subgroup can exist in a "generator" group.

DESCRIPTION

A "generator" group can have at most one "vhdl" subgroup specifying information used during processing of generator produced VHDL netlists.

WHAT NEXT

Remove "vhdl" groups from the generator group leaving at most one "vhdl" group.

LBSYN-29 (error) The attribute "output_format" requires either a "vhdl" or a "verilog" subgroup.

DESCRIPTION

When the "output_format" attribute specifies "soft_macro", a "vhdl" subgroup or a "verilog" subgroup is required in the "generator" group.

WHAT NEXT

Add a "verilog" or "vhdl" subgroup to the generator group. Change the value of the "output_format" to something other than "soft_macro". Removing the output_format attribute from a generator group will not solve the error because soft_macro is the default output format.

LBSYN-30 (error) Specify either a "vhdl" or "verilog" group, but not both.

DESCRIPTION

When the "output_format" attribute specifies "soft_macro", a "vhdl" subgroup or a "verilog" subgroup is required in the "generator" group.

WHAT NEXT

Add a "verilog" or "vhdl" subgroup to the generator group. Change the value of the "output_format" to something other than "soft_macro". Removing the output_format attribute from a generator group will not remove the error because soft_macro is the default output format.

LBSYN-31 (information) Generator '%s' assumed to create DB output.

DESCRIPTION

Neither a "vhdl" group nor a "verilog" group were found within the "generator" group. Thus, the netlist created by the generator is assumed to be a .db file.

WHAT NEXT

If the generator does not produce DB files, then please add either a "verilog" or

"vhdl" subgroup to the generator group. Alternatively, add the "output_format" attribute with the value "hard_macro" to the generator group to specify a hard macro. The default output format expected from the generator is a soft macro.

LBSYN-32 (error) The formula for parameter '%s' requires a string expression.

DESCRIPTION

The expression used in the formula should be a double-quoted string.

WHAT NEXT

Modify the formula attribute to the form 'formula : "expression"'.

LBSYN-33 (error) Only one "sdf" subgroup may exist in a "generator" group.

DESCRIPTION

A "generator" group may have at most one "sdf" subgroup specifying information used during processing of generator produced netlists.

WHAT NEXT

Remove "sdf" groups from the generator group leaving at most one "sdf" group.

LBSYN-34 (warning) The module group '%s' has no output pins defined.

DESCRIPTION

Synthetic library module declarations must contain at least one output pin group. Additionally, a warning is generated if no input pin groups are declared within the synthetic module.

WHAT NEXT

Add an output pin group to the synthetic module.

LBSYN-35 (warning) The module group '%s' has no input pins defined.

DESCRIPTION

Synthetic library module declarations should generally contain at least one input pin group. This message can also indicate that a synthetic module has been declared with only one port which has the direction attribute value of "inout." Additionally, a warning is generated if no output pin groups are declared within the synthetic module.

WHAT NEXT

Add an input pin group to the synthetic module.

LBSYN-36 (error) The pin '%s' in module group '%s' has an improper direction specified.

DESCRIPTION

Pin groups within synthetic library modules must specify a direction. This direction attribute can specify one of three choices: "input", "output", or "inout". For example a valid direction attribute within a pin specification might appear as:

```
pin (A) { direction : input; bit_width : "width"; }
```

WHAT NEXT

Change the value of the direction attribute to "input", "output", or "inout".

LBSYN-37 (warning) The pin associations for the module %s do not

bind to any output pins.

DESCRIPTION

One of the pin associations for a module should be bound to an output pin of the module. Note that only one pin association in all of the binding groups needs to be bound to an output pin. Furthermore, module ports of types output and inout are considered valid for pin associations.

WHAT NEXT

Specify a pin association group for the module that names a module pin with the direction of output or inout.

LBSYN-38 (warning) The pin associations for the module '%s' do not bind to any input pins.

DESCRIPTION

One of the pin associations for a module should be bound to an input pin of the module. Note that only one pin association in all of the binding groups needs to be bound to an input pin.

WHAT NEXT

Specify a pin association group for the module that names a module pin with the direction of input or inout.

LBSYN-39 (warning) The sequential bindings allow states '%s' and '%s' to simultaneously use pin '%s' on module '%s'.

DESCRIPTION

This warning indicates that non-clock pins bound to one or more nonexclusive states have been found in the synthetic library description.

WHAT NEXT

Add resources to the module and use these resources within the binding to exclude the possibility of pins being simultaneously used.

LBSYN-40 (Error) The '%s' group named '%s' is multiply defined.

DESCRIPTION

Two or more groups exist within the parent of the same type and the same name.

For example in the fragment of synthetic library code:

```
: : module (ram_wrapper) { resource(address_lines) {} resource(data_in_lines) {}  
resource(address_lines) {} resource(address_lines) {} : :
```

The resource group address_lines has been defined three times.

WHAT NEXT

Give each group of the same type a unique name or remove redundant groups.

LBSYN-41 (Warning) The resource named '%s' is used but not defined in the synthetic module '%s'.

DESCRIPTION

A use_resource group refers to a resource which has not been defined with a resource group.

In the following fragment of synthetic library code a single resource token, r_only, is defined. However, a resource token is used, undefined_resource_token, which has not been defined.

```
: : module (ram_wrapper) { resource(r_only) {} /* This is the only resource defined.  
*/ binding (b0) { : : state () { : : use_resource(undefined_resource_token) {} } } }
```

WHAT NEXT

Add a new resource group to the module, or remove the use_resource group that refers to the nonexistent resource.

LBSYN-42 (Warning) Operator '%s' has an excessive number (%d total) of bindings.

DESCRIPTION

The synthetic operator has a large number of either sequential or combinational bindings. A large number of bindings decreases performance, but does not otherwise affect functionality. A large set of bindings usually results from representing each combination of permutable pin with a binding.

Sequential bindings are considered separately from combinational bindings, and in both cases this warning is issued when more than 32 bindings exist.

WHAT NEXT

Verify the set of permutable inputs as specified through the 'permutable_inputs' attribute. Eliminate unnecessary synthetic bindings.

LBSYN-43 (Error) Unable to find the operator pin '%s' named by an unbound_oper_pin group in binding '%s' in module '%s'.

DESCRIPTION

The unbound_oper_pin group found within a binding group (or a state group within a binding group for sequential bindings) names a pin on the operator that does not exist. Note that the pin names are case-sensitive, so this error can occur if an operator has a pin named "CLK" while the unbound_oper_pin group refers to a pin named "clk". The following synthetic library fragment suffers from this error:

```
: : operator(oper_0) { data_class : "signed"; pin(CLK) { direction : input; } pin(A)
{ direction : input; } pin(Z) { direction : output; } }

module (module_0) { : : binding(binding_0) { bound_operator : "oper_0";
unbound_oper_pin(clk) { value : "1"; } /* Error: There is no pin named clk (lower
case) in oper_0. */ : : } } : :
```

WHAT NEXT

Assuming that the name of the pin in the operator group is correct, change the name of the pin in the unbound_oper_pin group. Another possibility is to remove the unbound_oper_pin group from the synthetic library if it is unnecessary.

LBSYN-44 (Error) Multiple implementation groups named '%s' found in synthetic module '%s'.

DESCRIPTION

One or more implementation groups were found to have the same name. Each implementation group used in a set of synthetic libraries must have a unique group name within the context of the implementation's associated module.

WHAT NEXT

Rename the implementation groups in the synthetic library source file (.sl) with unique names.

LBSYN-45 (Error) Input pin '%s' cannot have both the 'sreset' and the 'areset' attribute in the synthetic module '%s'.

DESCRIPTION

A synthetic library module pin can only have either the sreset attribute or the areset attribute; not both.

In the following synthetic library source fragment, the pin 'a' is an error, while all other module pins properly specify the sreset and areset attributes.

```
:  
:  
module (module_with_sequential_bindings) {  
pin(a) {  
    direction : input;  
    bit_width : "width_a";  
    sreset    : TRUE;  
    areset    : TRUE;  
}  
pin(b) {  
    direction : input;  
    bit_width : "width_b";  
    sreset    : TRUE;  
    areset    : FALSE;  
}  
pin(c) {  
    direction : input;  
    bit_width : "width_c";  
}  
:  
:
```

```
 }  
 :  
 :
```

WHAT NEXT

Remove either or both of the 'sreset' or 'areset' groups from the pin group. Another solution is to set one of the attributes' values to FALSE.

LBSYN-46 (Error) The binding '%s' in module '%s' contains a constraint specifying a nonexistent pin '%s' of the operator '%s'.

DESCRIPTION

Each synthetic library binding group is bound to an operator, and each binding group might contain a constraint group which refers to pins on the synthetic library operator. This error occurs when a constraint refers to a pin on an operator pin that does not exist.

In the following synthetic library source fragment, the binding binding_0 is bound to the synthetic operator oper_0. Furthermore, the binding group binding_0 specifies a constraint group that does not refer to any pin found in the operator oper_0.

```
: : operator(oper_0) { data_class : "signed"; pin(a) { direction : input; } pin(z) {  
direction : output; } }  
  
module (module_0) { : : binding(binding_0) { bound_operator : "oper_0";  
constraint(BogusPin) { value : "01"; } /* Error: There is no pin named BogusPin in  
oper_0. */ : : } } : :
```

WHAT NEXT

Modify the constraint to specify a valid operator pin or remove the constraint group altogether.

LBSYN-47 (Warning) The number of permutable inputs (%d) and the number of bindings (%d) do not agree for operator '%s'

in the module '%s'.

DESCRIPTION

Each possible ordering of of permutable input pins requires a unique binding. If the total number of bindings found does not equal or exceed the number of permutable inputs factorial (such as, $n!$), one or more bindings specifying various permutations have not been specified in the synthetic library.

Note that only bindings referring to the same operator within single modules are counted.

WHAT NEXT

Add binding groups to the synthetic library. One binding group is necessary to representing one pin permutation, and all possible pin permutations require a representative binding group.

Alternately, remove the `permutable_inputs` attribute from the operator group.

LBSYN-49 (Warning) The binding '%s' in module '%s' refers to an operator, '%s', which is not found in the synthetic library list.

DESCRIPTION

The binding group found within the module attempts bind to an operator which does not exist. This is only a warning as binding groups facilitate the creation of an implementation for the operator. A binding which specifies an operator that does not exist provides no useful information to the synthesis tool and is ignored.

WHAT NEXT

Check the operator spelling within the binding group for correctness. Also check the synthetic library or libraries to ensure that the operator has been declared with an operator group.

If the binding refers to an operator which has been removed from the synthetic library, then perhaps the binding group should also be removed from the synthetic library.

LBSYN-57 (Error) Multiple clock pins exist on module '%s'.

DESCRIPTION

Only one pin group within a module may specify the 'clock_pin' attribute.

WHAT NEXT

If the module only has combinational bindings, then remove all clock pin attributes from the module as they are unnecessary. If the module contains sequentail bindings or a mixture of sequential and combinational bindings, then remove all but one clock pin attributes from the module's pin groups.

LBSYN-58 (Error) Unbound operator pin value must evaluate to '1'

for operator pin '%s' in binding '%s' in module '%s'.

DESCRIPTION

You receive this message because the **check_synlib** or **compile** command has found that the specified pin's unbound operator pin value does not evaluate to 1. It must have a value of 1.

WHAT NEXT

Locate the specified binding and pin in the appropriate file, and edit the file so that the unbound operator pin value evaluates to 1. Then reexecute **check_synlib** or **compile**.

LBSYN-59 (Warning) The width function is only supported in module group parameter formulas.

DESCRIPTION

Support for the width function only exists for parameters within module groups.

WHAT NEXT

Remove width functions from formulae which are not found in module groups.

Please refer to the DesignWare Developer Guide.

LBSYN-60 (Warning) Module pin '%s' in state '%s' of binding '%s' for module '%s' is not bound to any operator pin and the module pin does not specify a stall value.

DESCRIPTION

This message only occurs for modules containing sequential bindings. One or more states in these bindings does not have all module input pins either mapped to an operator pin or defined with a stall value.

WHAT NEXT

All control pins such as write enable must be fully specified at all times. Either add a stall value to the pin's definition in the module or add a pin_association in the state group.

For data pins it is optional to force a default value. If this is the intended usage this message can be ignored.

Please refer to the DesignWare Developer Guide.

LBSYN-61 (Error) Module '%s' is of type '%s', which is not a valid type.

DESCRIPTION

The value of the module_type attribute for this module specifies an incorrect type. Incorrect types are those types which are reserved for internal use. This error message may report a module has a type other than that found in the synthetic library source file (.sl). This indicates that the type specified in the synthetic library source file was not a recognized type.

WHAT NEXT

Note that the module_type attribute is optional.

Please refer to the DesignWare Developer Guide.

LBSYN-62 (Error) Operator '%s' is of type '%s', which is not a valid type.

DESCRIPTION

The value of the operator_type attribute for this operator specifies an incorrect type. Incorrect types are those types which are reserved for internal use. This error message may report an error for an operator which has a type other than that found in the synthetic library source file (.sl). This indicates that the type specified in the synthetic library source file was not a recognized type.

WHAT NEXT

Note that the operator_type attribute is optional.

Please refer to the DesignWare Developer Guide.

LBSYN-63 (error) Invalid formula '%s' for parameter '%s'.

DESCRIPTION

You receive this error message because the formula of the specified parameter contains the parameter itself. This will cause an infinite loop during evaluation of the formula.

WHAT NEXT

Verify that you have specified the correct parameter name and that the formula is accurate.

See the *DesignWare Developer Guide* for more information.

SEE ALSO

read_lib (2).

LEFIN

LEFIN-1 (error) There is no layer definition.

DESCRIPTION

You receive this message because the .plib format requires that all layer information be defined before all cell definitions.

WHAT NEXT

Put layer-related information in input Library Exchange Format (LEF) files.

EXAMPLE MESSAGE

Error: There is no layer definition. (LEFIN-1)

LEFIN-2 (error) There is no site information.

DESCRIPTION

You receive this message because the .plib format requires that all site information be defined before all cell definitions.

WHAT NEXT

Put site-related information in input Library Exchange Format (LEF) files.

EXAMPLE MESSAGE

Error: There is no site definition. (LEFIN-2)

LEFIN-3 (warning) There is no cell information.

DESCRIPTION

You receive this message because the .plib format prefers that at least one cell be specified in the file.

WHAT NEXT

Put the cell specification in input Library Exchange Format (LEF) files.

EXAMPLE MESSAGE

Warning: There is no cell information. (LEFIN-3)

LEFIN-4 (error) There is no via information.

DESCRIPTION

You receive this message because the .plib format requires that at least one cell be specified in the file.

WHAT NEXT

Put the via specification in input Library Exchange Format (LEF) files.

EXAMPLE MESSAGE

error: There is no via information. (LEFIN-4)

LEFIN-5 (warning) The technology information is inconsistent with the command line option specified.

DESCRIPTION

You receive this message because the **lef2plib** command line option **-std_cell** or **-array** is specified, but the Library Exchange Format (LEF) file content suggests a technology inconsistent with the given option.

When the **-std_cell** option is specified, the LEF technology information should not contain an ARRAY group. When the **-array** option is specified, the LEF LAYER group should not contain a PITCH attribute.

WHAT NEXT

Examine the command line option and LEF technology information: Ensure that they are consistent.

EXAMPLE MESSAGE

Warning: The technology information is inconsistent with the command line option specified. (LEFIN-5)

SEE ALSO

lef2plib (1).

LGDS

LGDS-1 (error) Macro %s is not specified in pseudo physical library. Cannot create full macro description in physical library.

DESCRIPTION

You receive this error message because the macro you specified for the **-gdsii** option of the **read_lib** command is not in the pseudo physical library (.plib). Creation of cells failed.

WHAT NEXT

Add the missing macro to the pseudo physical library. The technology GDSII file might be different from the pseudo physical library. Check the input GDSII files.

SEE ALSO

read_lib (2).

LGDS-2 (error) Site information not found for macro %s.

DESCRIPTION

You receive this error message because the site attributes for the macro are not in the pseudo physical library. The library is therefore incomplete and cannot extract information from GDSII source files.

WHAT NEXT

Add the site attributes to the pseudo physical library. Then run the **read_lib** command again.

SEE ALSO

read_lib (2).

LGDS-3 (warning) The input gdsii filename %s does not exist.

DESCRIPTION

You see this warning because the GDSII filename you specified does not exist in the directory you gave as its location.

WHAT NEXT

Check to make sure that the file exists and is readable.

SEE ALSO

`read_lib` (2).

LGDS-4 (error) Pseudo physical library not loaded in memory.

DESCRIPTION

You receive this error message because Library Compiler cannot read the pseudo physical library (.pplib). The design cannot be created.

WHAT NEXT

Make sure to correct all errors reported during the loading of the pseudo physical library and then rerun Library Compiler.

SEE ALSO

`read_lib` (2).

LGDS-5 (error) Cannot access physical library resource information.

DESCRIPTION

You receive this error message because the pseudo physical library does not contain any resource information, which is required in case of GDSII extraction.

WHAT NEXT

Add the resource information into the pseudo library and read the library again using the **read_lib** command with the **-gdsii** option. Check to make sure that the pseudo physical library is the same library used for GDSII extraction.

SEE ALSO

read_lib (2).

LGDS-6 (error) Internal error in updating layer information.

DESCRIPTION

You receive this error message because the layer information obtained from the GDSII source file and the layer information in the pseudo physical library do not match.

WHAT NEXT

Make sure the pseudo physical library contains all of the layer information.

SEE ALSO

read_lib (2).

LGDS-7 (error) No layer map table found in library '%s'.

DESCRIPTION

You receive this error message because the pseudo physical library does not contain the layer objects you specified.

WHAT NEXT

Make sure to add all layer information to the pseudo physical library.

SEE ALSO

read_lib (2).

LGDS-8 (error) Internal error in updating

text_to_pin_layer_map.

DESCRIPTION

You receive this error message because the the text_to_pin_layer_map information you specified in the GDSII file is missing in the input pseudo physical library, or it is not correct in that library.

WHAT NEXT

Make sure that the text_to_pin_layer_map information in the input pseudo library and the input GDSII are the same.

SEE ALSO

read_lib (2).

LGDS-9 (error) Internal error in updating via information.

DESCRIPTION

You receive this error message because the via information you specified in the GDSII file is missing in the input pseudo physical library, or it is not correct in that library.

WHAT NEXT

Make sure that the Via information in the input pseudo physical library and the input GDSII file are the same.

SEE ALSO

read_lib (2).

LGDS-10 (error) Internal error in updating via_rule information.

DESCRIPTION

The via_rule information as obtained from the input pseudo physical library does not match the via_rule information in the input GDSII stream.

WHAT NEXT

Make sure the input pseudo physical library contains all via_rule names that match those in the input GDSII stream.

SEE ALSO

`read_lib` (2).

LGDS-11 (error) Internal error in updating via_rule_generate information.

DESCRIPTION

You receive this error message because the via_rule_generate information as obtained from the input pseudo physical library does not match the via_rule_generate information in the input GDSII file.

WHAT NEXT

Make sure that the via_rule_generate information in the input pseudo library and the input GDSII are the same.

SEE ALSO

`read_lib` (2).

LGDS-12 (error) Internal error in updating same_net_spacing.

DESCRIPTION

You receive this error message because the same_net_spacing layer names in the GDSII file do not match the same_net_spacing layer names in the input pseudo physical library.

WHAT NEXT

Make sure the input pseudo physical library has same_net_spacing defined and that the layer names match the layer names defined in the resource group.

SEE ALSO

`read_lib` (2).

LGDS-13 (error) Internal error in updating in_site information.

DESCRIPTION

You receive this error message because the **in_site** attribute obtained from the input pseudo physical library does not match the **site definition in the input pseudo physical library**.

WHAT NEXT

Make sure that, before it is used in the macro, the input pseudo physical library contains all of the defined sites and that the site names match exactly the site names in the **in_site** attribute.

SEE ALSO

read_lib (2).

LGDS-14 (error) Internal error in updating array information.

DESCRIPTION

You receive this error message because the site array group as obtained from the input pseudo physical library does not match the site array group in the input GDSII stream, or the information is missing.

WHAT NEXT

Make sure the input pseudo physical library contains the defined site array group.

SEE ALSO

read_lib (2).

LGDS-15 (warning) Pseudo macro cell_type not supported for design :%s

DESCRIPTION

You see this warning because the **cell_type** specified in the pseudo physical library is not supported.

WHAT NEXT

Check to make sure that you specified a valid cell_type.

SEE ALSO

`read_lib` (2).

LGDS-16 (warning) Duplicate cell name %s found.

DESCRIPTION

You see this warning to let you know that the `read_lib` command encountered more than one macro with the same name and that the command recognizes the first instance and ignores the rest.

WHAT NEXT

Check and remove duplicate macro names in the input pseudo physical library.

SEE ALSO

`read_lib` (2).

LGDS-17 (warning) Foreign attributes are not set correctly in design %s.

DESCRIPTION

You see this warning because the foreign attributes as obtained from the input pseudo physical library are not correct or are missing.

WHAT NEXT

Make sure the foreign attributes are defined for the macro and are not null.

SEE ALSO

`read_lib` (2).

LGDS-18 (error) Internal error during creation of pins.

DESCRIPTION

You receive this error message because the pins in the specified macro group are present but are null.

WHAT NEXT

Check to make sure the pins are correct and that all of the required attributes are attached to them.

SEE ALSO

`read_lib (2)`.

LGDS-19 (error) Internal error in finding routing_grid.

DESCRIPTION

You receive this error message because the routing_grid group you specified is not present in the input pseudo physical library.

WHAT NEXT

Make sure the input pseudo physical library contains the routing_grid group you specified.

SEE ALSO

`read_lib (2)`.

LGDS-20 (error) Internal error in finding floorplan.

DESCRIPTION

You receive this error message because the floorplan is absent from the site array group you specified.

WHAT NEXT

Check the input pseudo physical library to make sure the floorplan group is not null

in the site array group.

SEE ALSO

`read_lib` (2).

LGDS-21 (error) Internal error in creation of tracks.

DESCRIPTION

You receive this error message because the track group is absent from the site array group you specified.

WHAT NEXT

Check the input pseudo library to make sure it contains the tracks and that the attributes are not null.

SEE ALSO

`read_lib` (2).

LGDS-22 (warning) The layer %s attributes are null.

DESCRIPTION

You see this warning because the layer you specified in the input pseudo physical library does not have any layer attributes defined on it.

WHAT NEXT

Check the input GDSII stream to make sure that the layer you specified is there and that the layer's attributes are not null.

SEE ALSO

`read_lib` (2).

LGDS-23 (error) Shape type not supported in pseudo library.

DESCRIPTION

You see this error message because the input pseudo physical library does not support the geometry shape type you specified. The rectangle is the only geometry type supported.

WHAT NEXT

Update the input pseudo physical library so that the rectangle is the type of all of the geometries. A future release will support the other geometry types.

SEE ALSO

`read_lib` (2).

LGDS-24 (error) The layer name %s does not exist in the macro.

DESCRIPTION

You receive this error message because the layer name you specified in the via geometry is not defined in the input pseudo physical library.

WHAT NEXT

Check to make sure the layer information in the GDSII stream matches the layer information in the input pseudo physical library. Then verify that both sources contain the layer name you specified.

SEE ALSO

`read_lib` (2).

LGDS-25 (error) Internal error in extraction of macro '%s' geometries.

DESCRIPTION

You receive this error message because during execution of the `read_lib` command the extraction of rectangle geometries for macros failed.

WHAT NEXT

Make sure the `gds2_layer_map` is mapped correctly.

SEE ALSO

`read_lib` (2).

LGDS-26 (error) Internal error in creation of pins.

DESCRIPTION

You receive this error message because during the execution of the `read_lib` command the extraction of pin geometries from the input GDSII structure failed.

WHAT NEXT

Make sure the `pin_to_text_layer_map` is mapped correctly.

SEE ALSO

`read_lib` (2).

LGDS-27 (warning) You have objects outside the boundary for cell %s.

DESCRIPTION

You see this warning because the bounding box specified in the input GDSII stream is smaller than the cell.

WHAT NEXT

Check to see if it is possible to remove this warning by correcting the keepout clip box or the obstruction clip box.

SEE ALSO

`read_lib` (2).

LGDS-29 (information) The file name read is %s.

DESCRIPTION

You see this message to let you know that the file named is the input GDSII file name that will be converted to the physical library.

WHAT NEXT

This message is informational only and requires no action on your part.

LGDS-30 (warning) Structure '%s' is absent within input GDSII stream.

DESCRIPTION

You see this warning to let you know that the named macro structure is not present the input GDSII stream.

WHAT NEXT

Make sure the macro name is spelled correctly in the input pseudo physical library.

LGDS-31 (warning) There are multiple definitions of the structure '%s' within input GDSII stream.

DESCRIPTION

You receive this warning because the **read_lib** command encountered in the input GDSII file more than one definition of the named structure. Library Compiler will use the first instance for this structure and ignore the others.

WHAT NEXT

Remove the duplicate structure definitions.

. SH SEE ALSO

read_lib (2).

LGDS-40 (warning) You have no outline on layer %d for cell %s

DESCRIPTION

WHAT NEXT

EXAMPLE MESSAGE

LGDS-52 (error) Creating Via for port

DESCRIPTION

WHAT NEXT

EXAMPLE MESSAGE

LGDS-53 (error) Creating Obstruction for Macro

DESCRIPTION

WHAT NEXT

EXAMPLE MESSAGE

LGDS-54 (error) Creating Layer geometry for ports

DESCRIPTION

WHAT NEXT

EXAMPLE MESSAGE

LGDS-55 (warning) Obstruction clip box not specified for pseudo library.

DESCRIPTION

You see this warning because the obstructions you specified are not in the input pseudo physical library. If you do not specify the **obs_clip_box** attribute **gds2_extraction_rules**, the tool retains the complete cell layout and does not generate an obstruction.

WHAT NEXT

Check to make sure the pseudo physical library contains the obstruction clip box attribute values.

SEE ALSO

read_lib (2).

LGDS-60 (error) Error found in %s of input GDSii file.

DESCRIPTION

You see this error because the GDSii file is corrupted. Therefore cannot be accepted by Library Compiler.

WHAT NEXT

Make sure the input GDSii file is correct in format and data.

SEE ALSO

read_lib (2).

LIBAN

LIBAN-1 (error) Invalid switch value for '%s'.

DESCRIPTION

You specified an invalid value with the switch that is reported by the message. **Liban** stopped, because it could not process the command line with an invalid switch value.

WHAT NEXT

Invoke the **liban** command again with the correct switch value. If you don't know the valid values for a **liban** switch, consult the liban manpage. For quick reference, invoke **liban** without switches to print its correct command syntax.

```
> liban
Usage: liban [-arch VITAL] [-msgoff] \
              [-hazard transport | inertial | spike | glitch] [-xgen] [-chkoff] \
              [-nc] [-v] [-logical_name <name>] [-output name] \
              file.db
```

LIBAN-2 (error) Undefined switch '%s'.

DESCRIPTION

You specified an invalid switch that is reported by the message. **Liban** stopped because it could not process the command line with an invalid switch.

WHAT NEXT

Invoke the **liban** command again with the correct switch value. If you don't know the correct **liban** command syntax, consult the liban manpage. For quick reference, invoke **liban** without switches to print its correct command syntax.

```
> liban
Usage: liban [-arch VITAL] [-msgoff] \
              [-hazard transport | inertial | spike | glitch] [-xgen] [-chkoff] \
              [-nc] [-v] [-logical_name <name>] [-output name] \
              file.db
```

LIBAN-3 (error) Command syntax error is detected in '%s'.

DESCRIPTION

The command line **Liban** accepts only switches with or without a switch value and one db filename argument. In the command line, you specified an extra non-switch argument, which is reported by the message. This problem might also be caused by forgetting the leading '--' character of a switch or by trying to invoke **liban** with more than one db file. **liban** stopped because it could not process the command line with the specified command line syntax.

WHAT NEXT

Invoke the **liban** command again with correct switches and one db file. If you don't know the correct syntax for the **liban** command line, consult the liban manpage. For quick reference, invoke **liban** without switches to print its correct command syntax.

```
> liban
Usage: liban [-arch VITAL] [-msgoff] \
              [-hazard transport | inertial | spike | glitch] [-xgen] [-chkoff]\ \
              [-nc] [-v] [-logical_name <name>] [-output name] \
              file.db
```

LIBAN-5 (error) The '%s' DB file is not a technology library.

DESCRIPTION

The command liban requires a technology library db file. The message reports that the wrong db file has been specified and that the db file does not contain a technology library. The **liban** command aborts if a technology library is not provided. Common causes of this problem are:

- Providing a design db file with the liban command
- Making a mistake in typing the file name.

WHAT NEXT

Invoke the liban command again with a technology library db file. If you have access to Design Compiler (dc_shell) or Library Compiler (lc_shell) at your site, use the following command sequence to verify whether a db file is a technology library:

Assume the target db file is called example.db.

```
dc_shell> read example.db
```

```
dc_shell> list -lib
```

If the example.db file contains a library, the list command includes it in the execution result.

Another way to determine if a db file is a library is to issue the following command:

Assume the library object is called example.

```
dc_shell> report_lib example
```

The library report header shows that the example object is a library if the file is a technology library db file.

Otherwise, consult your local Synopsys administrator to obtain the correct Synopsys technology library db file.

LIBAN-6 (error) You do not have authorization to use the '%s' library.

DESCRIPTION

The technology db file that was invoked with this command is not authorized to be used by this site. The particular technology library is protected by a security key, and requires a license from the ASIC vendor. The **liban** command aborts because this site is not authorized to use the library.

WHAT NEXT

Consult the ASIC vendor to obtain a license of the library in question.

LIBAN-7 (error) The '%s' library cannot be used for simulation.

DESCRIPTION

The technology db file that was invoked with this command is prohibited, by the semiconductor vendor, to be used by **liban**. The **liban** command aborts because this library is unauthorized for the **liban** application.

WHAT NEXT

Consult the semiconductor vendor to obtain a version of the db file authorized for **liban**.

LIBAN-11 (error) No technology library was specified.

DESCRIPTION

The **liban** command was invoked without a technology library db file. A technology library db file is mandatory for the command **liban**. The command stops because it cannot proceed without a technology library db file.

WHAT NEXT

Invoke the **liban** command again with a technology library db file.

LIBAN-12 (error) The switch value for '%s' is required.

DESCRIPTION

You specified the switch without a switch value and it requires a value. The command **liban** fails, because it cannot process the command line without a valid switch value.

WHAT NEXT

Invoke the **liban** command again with a valid switch value. If you don't know the acceptable values for a **liban** switch, consult the liban manpage. For quick reference, invoke **liban** without switches to print its correct command syntax.

```
> liban
Usage: liban [-arch VITAL] [-msgoff] \
              [-hazard transport | inertial | spike | glitch] [-xgen] [-chkoff] \
              [-nc] [-v] [-logical_name <name>] [-output name] \
              file.db
```

LIBAN-13 (error) Cannot read the '%s' file.

DESCRIPTION

The liban command requires a technology library db file. The message reports that the wrong db file has been specified. The db file does not contain a technology library. The **liban** command fails if it cannot read in the file correctly. Common causes of this problem are

- Providing a design db file with the liban command

- Making a mistake in typing the file name
- Using a corrupted db file

WHAT NEXT

Invoke the **liban** command with a valid technology library db file. If you have access to Design Compiler (dc_shell) or Library Compiler (lc_shell) at your site, use the following command sequence to verify whether a db file is a technology library:

Assume the target db file is called example.db.

```
dc_shell> read example.db  
dc_shell> list -lib
```

If the example.db file contains a library, the list command includes it in the execution result.

Another way to determine if a db file is a library is to issue the following command:

Assume the library object is called example.

```
dc_shell> report_lib example
```

The library report header shows that the example object is a library if the file is a technology library db file.

Otherwise, consult your local Synopsys administrator to obtain the correct Synopsys technology library db file.

LIBAN-14 (error) The '%s' library is created with an older version of Synopsys software.

DESCRIPTION

The technology library db file, reported by the message, was compiled by an older version of the Synopsys Library Compiler. The **liban** command requires a technology library db compiled by the Synopsys Library Compiler v2.2a or later.

WHAT NEXT

Consult your ASIC vendor to obtain a version of the db file compiled by a newer version of the Synopsys Library Compiler.

LIBAN-15 (error) The '%s' switch cannot be defined twice.

DESCRIPTION

You specified a switch (reported by the message) more than once in the command line. Each switch that requires a switch value can be specified no more than once in the command line. The **iban** command fails because it cannot process the command line with a duplicated switch.

WHAT NEXT

Invoke the **liban** command again with valid switches. Make sure that no duplicated command switch is specified.

LIBAN-16 (error) Bad switch value '%s' for '-arch' is detected. The valid switch value is VITAL.

DESCRIPTION

You specified an invalid value (reported by the message) with the '-arch' switch. **liban** fails because it cannot process the command line with an invalid switch value.

WHAT NEXT

Invoke the **liban** command with one of the valid switch values reported in the message.

LIBAN-17 (error) The '%s' switch is obsolete.

DESCRIPTION

This switch (reported by the message) is obsolete and no longer supported by **liban**.

WHAT NEXT

Do not use this switch with the **liban** command.

LIBCHK

LIBCHK-100 (warning) %s data found. Please refer to %s.

DESCRIPTION

This message occurs when there are more serious issues that are found in the checking result listed in the table that follows. It redirects you to the message ID on next line that will give you detailed information.

WHAT NEXT

Please refer to the man page of the recommended message ID for details.

EXAMPLES

EXAMPLE MESSAGE

Warning: Mismatched data found. Please refer to LIBCHK-110. (LIBCHK-100)

LIBCHK-101 (error) %s data found. Please refer to %s.

DESCRIPTION

This message occurs when there are more serious issues are found in the checking result listed in the table that follows. It redirects you to the message ID on next line that will give you detailed information.

WHAT NEXT

Please refer to the man page of the recommended message ID for details.

EXAMPLES

EXAMPLE MESSAGE

Error: Mismatches data found. Please refer to LIBCHK-212. (LIBCHK-101)

LIBCHK-110 (information) List of cells with missing views

DESCRIPTION

This message is for reporting cells with missing views in physical library. All the physical cells with CEL/FRAM view missing will be reported in this table. In this report table, there are three columns: Cell name, CEL and FRAM. In the table, the CEL and FRAM columns list the cell name:version number. An X marks the view that is missing.

WHAT NEXT

If FRAM view is missing, it is more critical than missing CEL view. You should use extract BPV command `extract_blockage_pin_via` to generate FRAM view.

EXAMPLES

List of cells with missing views

Cell name	CEL	FRAM
dffs_1	dffs_1:2	X
tiehi_1	tiehi_1:2	X

EXAMPLE MESSAGE

Information: List of cells with missing views (LIBCHK-110)

LIBCHK-111 (warning) List of cells with mismatched views

DESCRIPTION

This message is for reporting cells with mismatched views in physical library. All the physical cells with CEL/FRAM view mismatched will be reported in this table. In this report table, there are five columns: Cell name, CEL Version, CEL Modified time, FRAM Version and FRAM Modified time. The CEL version and FRAM version columns list the version numbers, and the CEL and FRAM modified time columns list the time when the view was last modified. If a cell has an earlier FRAM view than its CEL view, it is marked as mismatched. The time checked is the internal view creation or modification time in the Milkyway database, not the UNIX time. No mismatch check is performed on the cell content.

WHAT NEXT

If a cell has an earlier FRAM view than its CEL view, please check if its FRAM view is not updated. You may need to regenerate FRAM view by extracting BPV. If you read

FRAM views from the LEF and then stream in CEL views, the views are shown as mismatched. You can ignore this report in this case.

EXAMPLES

List of cells with mismatched views

Cell name	CEL Version	CEL Modified time	FRAM Version	FRAM Modified time
FILL8	2	Oct 24 19:17:9 2000	1	Oct 24 19:14:33 2000
FILL4	2	Oct 24 19:17:9 2000	1	Oct 24 19:14:33 2000
ANTENNA	2	Oct 24 19:17:23 2000	1	Oct 24 19:14:43 2000

EXAMPLE MESSAGE

Warning: List of cells with mismatched views (LIBCHK-111)

LIBCHK-112 (information) List of cells with same names

DESCRIPTION

This message is for reporting cells with same names among the specified main or design library and all physical reference libraries linked to the specified library. All the physical cells with same name will be reported in this table. In this report table, there are two columns: Cell name and Library list in precedence order. If there are cells with the same name in multiple reference libraries, the tool uses the first cell in the reference control file and ignores the remaining cells. This option does not check naming among the logic libraries.

WHAT NEXT

This is information only. If there are cells with the same name in multiple reference libraries, the tool uses the first cell in the reference control file and ignores the remaining cells. This option does not check naming among the logic libraries.

EXAMPLES

List of cells with same names

Cell Name	Library list in precedence order
XOR3	mainlib ref ref1 ref3 ref5
DFF	ref ref1 ref3

EXAMPLE MESSAGE

Information: List of cells with same names (LIBCHK-112)

LIBCHK-113 (information) List of signal EM data

DESCRIPTION

This message is for reporting signal EM data for routing layers in physical library. All EM data will be reported in this table. In this report table, there are three columns: Layer name, Current model and Model type. If no signal EM data at all in the library, it will not print the table but print a message: The library is missing signal EM data.

WHAT NEXT

If the signal EM data is not complete, for example, it exists only in some layers but not all layers, you should check and reload the missing data.

EXAMPLES

List of signal EM data (LIBCHK-113)

Layer name	Current model	Model type
METAL1	peak	table
METAL1	rms	table
METAL1	average	table

EXAMPLE MESSAGE

Information: List of signal EM data (LIBCHK-113)

LIBCHK-114 (warning) The library is missing signal EM data.

DESCRIPTION

This message occurs when there is no signal EM data for routing layers at all in the physical library.

WHAT NEXT

For flows for and EM analysis with different temperature corners, signal EM data is required. You should check and reload the data into the physical library.

EXAMPLES

EXAMPLE MESSAGE

Warning: The library is missing signal EM data. (LIBCHK-114)

LIBCHK-115 (information) List of antenna rules

DESCRIPTION

This message is for reporting antenna rules in the layers in the specified main library. In this report table, there are six columns: Layer name, Mode, Diode mode, Default metal ratio, Default cut ratio and Max ratio.

WHAT NEXT

This is information only.

EXAMPLES

List of antenna rules

Layer Name	Mode	Diode mode	Default metal ratio	Default cut ratio	Default Max ratio
M1	1	3	500.00	20.00	500.00
M2	1	3	500.00	20.00	500.00

EXAMPLE MESSAGE

Information: List of antenna rules (LIBCHK-115)

LIBCHK-116 (warning) The library is missing antenna rules.

DESCRIPTION

This message occurs when no antenna rules exist in the physical library.

WHAT NEXT

Please check and load the antenna rule file after FRAM view is created.

EXAMPLES

EXAMPLE MESSAGE

Warning: The library is missing antenna rules. (LIBCHK-116)

LIBCHK-117 (warning) List of cells missing antenna property

DESCRIPTION

This message is for reporting missing antenna property for cells in physical library. All the cells that are missing antenna property will be reported in this table. In this table, it lists cell names and pin names missing the antenna property and the missing property type. If an input pin is missing the gate size, it is counted as missing the property. If an output pin is missing diode protection, it is counted as missing the property. If a macro is missing the hierarchical antenna property, then it is counted as missing the property. It is considered good practice to specify hierarchical antenna properties for macros.

WHAT NEXT

For antenna fix, please check and load the antenna properties (CLF) after FRAM view is created.

EXAMPLES

List of cells missing antenna property

Cell name	Cell type	Missing property	Pin name(s)
TLATNTSCAX1	StdCell	DiodeProt	ECK
TLATNTSCAX4	StdCell	DiodeProt	ECK
XOR2X4	StdCell	DiodeProt	Y
XOR2XL	StdCell	DiodeProt	Y

EXAMPLE MESSAGE

Warning: List of cells missing antenna property (LIBCHK-117)

LIBCHK-118 (information) List of cells with rectilinear

boundaries

DESCRIPTION

This message is for reporting cells with rectilinear boundaries in physical library. All cells with rectilinear boundaries will be reported in this table. In this report table, there are four columns: Cell name, Cell type, Number of points and Coordinate.

WHAT NEXT

This is information only. No further action is required.

EXAMPLES

List of cells with rectilinear boundaries

Cell Name	Cell type	Number of points	Coordinate
datapath	Macro	17	(78.750, 0.000) (78.750, 490.760) (44.435, 490.760) (44.435, 915.035) (27.440, 915.035) (27.440, 1143.605) (0.000, 1143.605) (0.000, 1313.200) (677.295, 1313.200) (677.295, 1143.605) (649.855, 1143.605) (649.855, 915.035) (632.860, 915.035) (632.860, 490.760) (598.545, 490.760) (598.545, 0.000) (0.017, 0.000)

EXAMPLE MESSAGE

Information: List of cells with rectilinear boundaries (LIBCHK-118)

LIBCHK-119 (information) List of physical only cells

DESCRIPTION

This message is for reporting physical-only cells in the physical library. In Milkyway, physical-only cells are defined as FillerCell: Filler cell IOPadCell: Pad filler (IO Pad) cell CornerCell: Corner (pad) cell ChipCell: Chip cell FlipChipPadCell: Flip chip pad (bump) cell CoverCell: Cover cell TapCell: Tap cell PGPinOnlyCell: PG-pin-only cell (containing only PG ports) In this report table, there are three columns: Cell name, Cell type and Physical library.

WHAT NEXT

Please verify that the cell types of the physical only cells are marked correctly in the physical library.

EXAMPLES

List of physical only cells

Cell name	Cell type	Physical library
FILL8	FillerCell	tsmc18_cg_LM
FILL64	FillerCell	tsmc18_cg_LM

EXAMPLE MESSAGE

Information: List of physical only cells (LIBCHK-119)

LIBCHK-120 (information) List of main and reference libraries

DESCRIPTION

This message is for reporting each libraries (main and reference physical libraries) and their full path locations, along with unit tile name and size. In this report table, there are four columns: Library name, Path, Unit tile and Tile size.

WHAT NEXT

This is information only. No further action is required. Note: if tile patterns listed in List of tile patterns are not consistent with tiles in List of main and reference libraries, it is recommended that users redo library prep to use same tile. Please refer to example 2.

EXAMPLES

Example 1:

Information: List of main and reference libraries (LIBCHK-120)

Library name	Path	Unit tile	Tile size
tsmc18_cg_LM	/remote/reg_designs/LIB_CENTER/180nm/san unit		0.660x5.040

Example 2:

Information: List of main and reference libraries (LIBCHK-120)

Library name	Path	Unit tile	Tile size

```
cb18os120_unit010 /remote/dept5532b/styao/Renesas_check_li unit010 0.560x5.600
```

List of tile patterns

Tile pattern	Unit tile	Location	Orientation	Tile size
1	unit	(0,0)	R0 R0_MX	0.560x0.560
2	unit	(-0.28,0)	R0 R0_MX	0.560x0.560

EXAMPLE MESSAGE

Information: List of main and reference libraries (LIBCHK-120)

LIBCHK-121 (information) List of placement properties

DESCRIPTION

This message is for reporting placement properties for cells in physical library. In this report table, there are seven columns: Cell name, PR boundary, Cell Height, Symmetry, Orientation, Tile pattern and Remarks. PR boundary is represented by its lower left and upper right coordinates. Cell height is relative to the unit tile height, such as 1xH for single height. Cell symmetry includes: rxy - RXYsymmetry xy - XYsymmetry y - Ysymmetry x - Xsymmetry r - Rsymmetry a - Asymmetry Cell orientation includes: R0_MX R0_MY R180 R90_MY R90 R270 R90_MX Number in Tile pattern denotes the serial number in the associated List of tile patterns table. Remarks notes that the PR boundary mismatches the tile pattern. For macros, this table reports cell boundary and height. The unit tile size is reported in the format of width x height.

WHAT NEXT

For standard cells, if mismatches are found between PR boundary and the tile pattern (Mismatch in Remarks column), please use the cmSetMultiHeightProperty command to set tile patterns for multi-height cells.

EXAMPLES

List of tile patterns

Tile pattern	Unit tile	Location	Orientation	Tile size
1	unit	(0,0)	R0 R0_MX	0.660x5.040

List of placement properties

Cell name	PR boundary	Height	Symmetry	Orientation	Tile pattern
Remarks					

```
-----
TLATNTSCAX1      (0, 0) (9.24, 5.04)      1xH  xy      R0 | R0_MX      1
NOR2X1          (0, 0) (1.98, 5.04)      1xH  xy      R90_MY      1Mismatch
-----
-----
```

EXAMPLE MESSAGE

Information: List of placement properties (LIBCHK-121)

LIBCHK-122 (information) List of routing properties

DESCRIPTION

This message is for reporting routing properties for routing layers in physical library. All routing properties for layers will be reported in this table. In this report table, there are six columns: Layer, Preferred direction, Track direction, Offset, Pitch and Remarks. Remarks column denotes if the routing property on this layer has issues. If no issues are found, you will see OK in this Remarks; otherwise, it will note what issue is found, for example, if the offset is 0.46*pitch, which is neither 0 nor half pitch, offset=0.46pitch will be noted.

WHAT NEXT

If remarks other than OK are noted, such as offset=0.46pitch, please check the issue and correct it. In the case of offset!=0.5*pitch, please reset the offset to be either 0 or half pitch. If blanks are left in Preferred direction, that denotes the preferred routing direction has not been set. Please define the preferred routing direction. If less than three routing layers are listed in this table, it is an error. Please check technology file and if some routing layers are missing, define them in the technology file and reload it.

EXAMPLES

List of routing properties

Layer	Preferred direction	Track direction	Offset	Pitch	Remarks
METAL1	H	H	0.280	0.560	OK
METAL2	V	V	0.330	0.660	OK
METAL3		H	0.280	0.560	OK
METAL4		V	0.330	0.660	OK
METAL5		H	0.280	0.610	offset=0.46pitch
METAL6		V	0.380	0.950	offset=0.40pitch

EXAMPLE MESSAGE

Information: List of routing properties (LIBCHK-122)

LIBCHK-123 (information) List of cell and pin properties

DESCRIPTION

This message is for reporting cell and pin properties for cells in physical library. In this report table, there are six columns: Cell name, Cell type, Pin name, Pin direction, Pin type and Multi PG. If a cell has either multiple power pins or multiple ground pins, multiPG will be noted in the last column. At the end of the table, it also reports the number of cells with multiple P/G pins.

WHAT NEXT

If there is not any power or ground pins for a cell, it is an error. Please check the cell and may need to rerun extract BPV.

EXAMPLES

List of cell and pin properties

Cell name	Cell type	Pin name	Pin direction	Pin type	Multi PG
XOR2XL	StdCell	Y	Output	signal	
		VSS		ground	
		B	Input	signal	
		A	Input	signal	
		VDD		power	
NAND4BBX1	StdCell	BN	Input	signal	
		Y	Output	signal	
		VSS		ground	
		C	Input	signal	
		AN	Input	signal	
		D	Input	signal	
		VDD		power	

EXAMPLE MESSAGE

Information: List of cell and pin properties (LIBCHK-123)

LIBCHK-124 (warning) List of pins without optimal routeability

DESCRIPTION

This message is for reporting pins without optimal routeability in physical library. All pins without optimal routeability will be reported in this table. Optimal routeability means pin's on-track accessibility of defined wire tracks. It also reports the total number of pins without optimal on-track routability and lists pin names, directions, layers, and tracks for each cell of this issue. In the track column, an H denotes that the pin is not accessible on a horizontal track, a V denotes the pin is not accessible on a vertical track, and H&V denotes that the pin is not accessible on both horizontal and vertical tracks.

WHAT NEXT

If a pin is reported as not accessible on track, the pin might be routed by off-track wire during detailed routing. If too many pins do not have any on-track routability, adjust the offset values of the wire track (0 or half pitch preferred) and run the the create_lib_track command to reduce the number of pins without optimal accessibility. If routability checking is not successful, the cause may be no unit tile or incorrect technology data, such as illegal fatWire threshold for some layers, illegal vias or cut layers, illegal layer Number, and rules not defined. It is possible that a track intersection is within a via region but there is still no optimal routability. The reason is that in checking the routeability, the tool considers the worst case. That is, a via is already dropped in a neighboring pin's via region, which makes the via spot from the via region of the pin being checked smaller.

EXAMPLES

List of pins without optimal routeability

Cell Name	Pin Name	Layer	Direction	Track
TLATNSRX2	D	METAL1	Input	H&V
SDFFSRHQX2	SE	METAL1	Input	H&V
NOR4BBXL	C	METAL1	Input	H&V
DFFRHQX1	D	METAL1	Input	H&V
AND4X2	C	METAL1	Input	H&V

EXAMPLE MESSAGE

Warning: List of pins without optimal routeability (LIBCHK-124)

LIBCHK-125 (warning) List of cells with DRC violation

DESCRIPTION

This message is for reporting cells with DRC violation in physical libraries. All cells with DRC violation will be reported in this table. It checks design rules such as wire minWidth, minEdgeLength, minEnclosedArea, minSpacing, cutWidth, cutSpacing, and minEnclosure. In this report table, there are three columns: Cell Name, Cell type and Error cell. Error cell contains detailed information for DRC violation of the FRAM view cell.

WHAT NEXT

Check the error cells for details of DRC violations. If a cell has DRC violation, it may not be used in the design without correction.

EXAMPLES

List of cells with DRC violation

Cell name	Cell type	Error cell
ONEPIN	Standard	ONEPIN.err

EXAMPLE MESSAGE

Warning: List of cells with DRC violation (LIBCHK-125)

LIBCHK-126 (warning) List of cells with metal density error

DESCRIPTION

This message is for reporting cells with metal density error in physical library. All cells with metal density error will be reported in this table. It checks macro metal density data for the cells, i.e. it checks if a cell has at least one of the following errors: (1) Metal density data in CEL view and FRAM view are inconsistent (2) Metal density windows do not cover the entire area on the layer In this report table, there are three columns: Cell Name, Inconsistency and the layer on which the density windows do not cover the entire area. Y denotes Yes or Inconsistency exists and N denotes No consistency.

WHAT NEXT

If the density windows do not cover the entire area, you may need to add metal fill or smooth metal wire density. If metal density data in CEL view and FRAM view are inconsistent, please check FRAM vs. CEL view.

EXAMPLES

List of cells with metal density error

Cell name	Inconsistency	Not cover entire area
ADDFX1MTR	Y	M4
OA21X1MTR	N	M1
		M2

EXAMPLE MESSAGE

Warning: List of cells with metal density error (LIBCHK-126)

LIBCHK-210 (information) List of cells missing in logic library

DESCRIPTION

This message is for reporting missing cells in logic library during logic vs. physical library checking. All the physical cells except physical only cells that are missing in logic library will be reported in this table. In this report table, there are three columns: Cell name, Cell type and Physical library. Cell type includes Core, Pad, InputPad, OutputPad, PowerPad, SpacerPad, and Unknown.

WHAT NEXT

If some cells are found missing in specified logic library (.db), please check if you have not specified all the db files since logic cells may exist in different db files while the physical cells exist in one Milkyway library.

EXAMPLES

List of cells missing in logic library

Cell name	Cell type	Physical library
AND2	Core	phys_lib
NOR1	Core	phys_lib

EXAMPLE MESSAGE

Information: List of cells missing in logic library (LIBCHK-210)

LIBCHK-211 (warning) List of cells missing in physical library

DESCRIPTION

This message is for reporting missing cells in physical library during logic vs. physical library checking. All the logic cells that are missing in physical library will be reported in this table. In this report table, there are three columns: Cell name, Cell type and Logic library. The cell type includes pad_cell, non pad_cell and unknown. If no missing cells, no table will be printed out, but Number of cells missing in logic library: 0 (out of total) will be printed out.

WHAT NEXT

If some cells are found missing in specified physical library (Milkyway library), please check if you have complete Milkyway library specified since physical cells may exist in different Milkyway library directories. If the cells are used in the design, the physical cells have to exist in the physical library that you are using. If the cells are not expected to be part of the physical library, then the incoming netlist must not have any of the missing cells. For example, by setting the dont_use attribute during synthesis.

EXAMPLES

Number of cells missing in physical library:2 (out of 498)

List of cells missing in physical library

Cell name	Cell type	Logic library
gaard21	non pad_cell	memory.lib
gaard22	non pad_cell	memory.lib

EXAMPLE MESSAGE

Warning: List of cells missing in physical library (LIBCHK-211)

LIBCHK-212 (warning) List of pins missing in %s library

DESCRIPTION

This message is for reporting missing pins in logic (or physical) cells during logic vs. physical library checking. All the physical(or logic) pins that are missing in logic (or physical) cells will be reported in this table. In this report table, there are four columns: Physical(Logic) library, Cell name, Pin name and Pin direction It also checks pg_pin's in logic library vs. PG pins in physical library if there are pg_pin's in the logic library, and reports them in the same table.

WHAT NEXT

If some signal pins are found missing in logic cells, it is a real issue and therefore an Error message LIBCHK-101 will occur to direct you to correct the cells that are missing these pins in the logic library. If pg_pins are missing in the logic library, it indicates that the logic library is not pg_pin based, and for UPF flow you need to use add_pg_pin_to_db utility to convert it into pg_pin based db.

EXAMPLES

List of pins missing in logic library

```
-----  
Physical library  Cell name  Pin name      Pin direction  
-----  
NLC13IOpllLib_3v  pnl_go       A          Output  
-----
```

EXAMPLE MESSAGE

Warning: List of pins missing in logic library (LIBCHK-212)

LIBCHK-213 (error) List of pins mismatched in logic and physical libraries

DESCRIPTION

This message is for reporting pins mismatched in either direction or pin type between the logic and physical cells during logic vs. physical library checking. All the mismatched pins will be reported in this table. In this report table, at the header of this table, the logic and physical library full path file names are listed followed by the table contents with four columns: Cell name, Pin name, Pin direction and Pin type. In Pin direction and Pin type columns, it lists values for both logic and physical libraries.

WHAT NEXT

If some pins are found mismatched in either pin direction or pin type between logic and physical cells, it is a real issue and you need to correct the cells with this issue in either the logic or physical library or both.

EXAMPLES

List of pins mismatched in logic and physical libraries

Logic library: NLC13IOpllLib_3v_fast132Vm40C

Physical library: /remote/fae99/smoot/T0_XIREN/NLC13IOpllLib_3v

```
-----  
Cell name           Pin name      Pin direction      Pin type  
                  Logic   Physical    Logic   Physical  
-----
```

pnl_go	VSSO	output	Output	signal	ground
	GND	input	Input	signal	ground
	VDDP	input	Input	signal	power

EXAMPLE MESSAGE

Error: List of pins mismatched in logic and physical libraries (LIBCHK-213)

LIBCHK-214 (information) List of bus naming styles

DESCRIPTION

This message is for reporting bus delimiters in logic and physical libraries. There are three columns in this report table: Library name, Library type and Bus naming style where Library type is either physical library or logic library. If there is no bus delimiter in the library, the field is blank in the report. To report bus naming styles, please set -bus_delimiter to set_check_library_options command. it is often true that logic libraries do not specify the bus delimiter.

WHAT NEXT

This is information only. No further action is needed.

EXAMPLES

List of bus naming styles

Library name	Library type	Bus naming style
tsmc18_xx	Physical library	_<%d>
memory.lib	Logic library	

EXAMPLE MESSAGE

Information: List of bus naming styles (LIBCHK-214)

LIBCHK-215 (warning) List of cells with cell_footprint attribute

DESCRIPTION

This message is to check that the cell PR boundary or Cell boundary for Macro in the

physical library is consistent among a class of cells with the same cell_footprint attribute specified in the logic library. This option reports cell names and their PR boundaries grouped by cell_footprint string.

WHAT NEXT

If the cells are used in the design, please check their PR boundaries or cell boundaries for inconsistency. For example, if the PR boundaries of the cells with the same cell_footprint are different, you can not use them during optimization by swapping these cells.

EXAMPLES

List of cells with cell_footprint attribute

Footprint	Logic library name	Cell name	PR boundary
add42	slow	CMPR42X1	(0,0) (22.44,5.04)
	slow	CMPR42X2	(0,0) (26.4,5.04)
addir	slow	ADDFX1	(0,0) (13.86,5.04)

EXAMPLE MESSAGE

Warning: List of cells with cell_footprint attribute (LIBCHK-215)

LIBCHK-216 (warning) List of cells with inconsistent area

DESCRIPTION

This message is to check the area attribute of cells in the logic library versus the actual area by cell PR boundary in the physical library. For comparison, the ratio of a stdCell PRBoundary in the rectangle (or Macro CellBoundary in the polygon) in the FRAM view to the cell area in the .db is used. If the ratio is the same for all the cells in the library, the cell areas are considered to be consistent. Otherwise, if the ratio for a cell deviates from the normal or average ratio for this library by a margin of 5%, it is counted as an inconsistent area. and will be included in the table. The average area ratio is calculated by first filtering out cells with the max and min area ratios and then dividing the total area ratios by the number of cells. There is no area check for pad cells. A pad cell is a special cell at the chip boundary with the pad_cell attribute in a logic cell. Pad cells are not checked because they are not used as internal gates and always have an area of 0. To check cell area, please set -cell_area to set_check_library_options command.

WHAT NEXT

If the cell areas are inconsistent between logic and physical libraries, it will

affect timing and placement accuracy. The bigger the area deviation, the worse the accuracy and correlation. If the area value is 0 or no area attribute in logic cells, it is more serious and an Error LIBCHK-101 will occur. In this case, you need to correct logic library by adding valid area values to the cells.

EXAMPLES

Average cell area ratio physical/logic in the library:0.9978

Number of cells with inconsistent area:9

List of cells with inconsistent area

Logic library name	Cell name	Area ratio Phys/logic
slow	AFCSHCONX4	0.7966
slow	AFCSHCONX2	0.8431
slow	AFHCONX2	0.9167
slow	AFHCINX4	0

EXAMPLE MESSAGE

Warning: List of cells with inconsistent area (LIBCHK-216)

LIBCHK-220 (information) Logic library is INCONSISTENT with physical library

DESCRIPTION

This message is a concluding statement after cross checking is done. When any inconsistency, for example, missing cells and mismatched pins, is found during cross checking, this message will occur.

WHAT NEXT

This is for your information. You need to go back to the check report to see inconsistent results and resolve them as directed by related man pages (LIBCHK).

EXAMPLES

EXAMPLE MESSAGE

Information: Logic library is INCONSISTENT with physical library (LIBCHK-220)

LIBCHK-300 (warning) List of inconsistent library group data

DESCRIPTION

This message is for reporting inconsistent data in logic libraries during logic vs. logic library checking. In the associated report table, it reports inconsistent values of the attributes at the library level. The attributes include. a)library version b)library type (pg_pin based or non-pg_pin based) c)units of timing, power, capacitance, etc. d)trip points e)base curve_x

WHAT NEXT

If some inconsistencies are reported at the library level, please check the libraries and correct them. Some attributes should be consistent cross the libraries. If the libraries are used for timing scaling, trip points should be consistent, and if they are used for UPF or MV flow, the libraries should be pg_pin based.

EXAMPLES

List of inconsistent library group data

```
-----  
Library name           SR60_W_SVT_UHD.db      SR60_S_SVT_UHD.db  
-----  
Voltage unit          1V      1mV  
base_curves/curve_x   "0.2, 0.5, 0.8""0.2, 0.5, 0.9"  
-----
```

EXAMPLE MESSAGE

Warning: List of inconsistent library group data (LIBCHK-300)

LIBCHK-301 (information) List of operating conditions

DESCRIPTION

This message is for reporting operating conditions of the logic libraries. In this report table, nom_voltage, nom_temperature, nom_process and default_operating_conditions of each lib are reported. If default_operating_condition is not specified, Library Compiler will add a default name nom_pvt by creating one from nominal PVTs.

WHAT NEXT

For library scaling, the operating conditions in the same scaling library group should be different in nominal voltage, temperature and/or process. For MCMM and MV/UPF, the nominal voltages should be different under different operating conditions.

For all others, this is information only. No further action is required. For voltage scaling, it is recommended that the voltages should be no more than 20% apart for good accuracy

EXAMPLES

List of operating conditions

Library name	SR60_W_SVT_UHD.db	SR60_S_SVT_UHD.db
nom P/V/T	3.0/1.0/105.0	1.0/1.4/105.0
default_opcon	"W_105_0.99"	"S_105_1.21"

EXAMPLE MESSAGE

Information: List of operating conditions (LIBCHK-301)

LIBCHK-302 (information) Voltages for library scaling are more than 20%% apart.

DESCRIPTION

This message is for voltage scaling, the voltages should be no more than 20% apart for good accuracy.

WHAT NEXT

This is information only. However, for better accuracy, it is recommended that the voltages should be no more than 20% apart for voltage scaling.

EXAMPLES

EXAMPLE MESSAGE

Information: Voltages for library scaling are more than 20% apart. (LIBCHK-302)

LIBCHK-310 (information) List of cells missing in logic libraries

DESCRIPTION

This message is for reporting cells missing in one or more logic libraries during logic vs. logic library checking. All the logic cells that are missing will be reported in this table.

WHAT NEXT

If cells are found missing in one or more of the libraries, please check why these are existing in one library but missing in the other. If such cells are used in design, these cells have to be in all the libraries.

EXAMPLES

List of cells missing in logic libraries

```
-----  
Cell name           SR60_W_SVT_UHD.dbSR60_S_SVT_UHD.db  
-----  
nsdffnqs_f4_svt    missing          existing
```

EXAMPLE MESSAGE

Warning: List of cells missing in logic libraries (LIBCHK-310)

LIBCHK-311 (information) List of cells mismatched in logic libraries

DESCRIPTION

This message is for reporting mismatched cell data in logic libraries during logic vs. logic library checking. Mismatched cells are those that have inconsistent attribute values at the cell level.

WHAT NEXT

Mismatched cells will cause issues if used in design. The same name cells existing in different libraries should have the same values for attributes such as function, dont_use and dont_touch, and same attributes should exist in all the libraries.

EXAMPLES

List of cells mismatched in logic libraries

```
-----  
                                         Attribute value  
Cell name      Attribute           SR60_W_SVT_UHD.dbSR60_S_SVT_UHD.db  
-----  
tieofflx_svt   function        "A * B"          "A * B + C"  
std_cell_inv    pin_order       "A_Y"           "VDD_A_Y"
```

EXAMPLE MESSAGE

Warning: List of cells mismatched in logic libraries (LIBCHK-311)

LIBCHK-312 (information) List of cell classification

DESCRIPTION

This message is for reporting cell classification of logic libraries. In this report table, numbers of total cells, inverters, buffers, level shifters, isolation cells, retention cells, switch cells, and always on cells in each library are reported.

WHAT NEXT

For UPF flow, special cells such as level shifters should exist in the library. In general, the library should have inverters. For all other cases, this is information only. No further action is required.

EXAMPLES

List of cell classification		
Library name	SR60_W_SVT_UHD.db	SR60_S_SVT_UHD.db
Total number	3	3
Inverter	2	1
Buffer	0	0
Level shifter	0	0
Isolation cell	0	0
Retention cell	0	0
Switch cell	0	0
Always on cell	0	0

EXAMPLE MESSAGE

Information: List of cell classification (LIBCHK-312)

LIBCHK-320 (warning) List of pins missing in logic libraries

DESCRIPTION

This message is for reporting missing signal pins and pg_pins in logic cells during logic vs. logic library checking. All the logic pins that are missing in logic cells will be reported in this table. In this report table, the following columns are listed: Cell name, Pin name and each logic library names.

WHAT NEXT

If some signal pins are found missing in logic cells, it is a real issue and therefore an Error message LIBCHK-101 will occur to direct you to correct the cells

that are missing these pins in the logic library. If pg_pins are missing in the logic library, it indicates that the logic library is not pg_pin based, and you need to use add_pg_pin_to_db utility to convert it into pg_pin based db.

EXAMPLES

List of pins missing in logic libraries

Cell name	Pin name	SR60_W_SVT_UHD.db	SR60_S_SVT_UHD.db
tieofflx_svt__VSS	missing		existing
tieofflx_svt__VDD	missing		existing

EXAMPLE MESSAGE

Warning: List of pins missing in logic libraries (LIBCHK-320)

LIBCHK-321 (information) List of pins mismatched in logic libraries.

DESCRIPTION

This information message reports mismatched pins in logic cells during logic versus logic library checking. Mismatched pins are those that have inconsistent pin attributes such as pin direction, function, related_power_pin, and so forth.

The report table has the following columns:

Cell name
Pin name
Attribute/Group name
Attribute value of each of the logic libraries.

WHAT NEXT

Mismatched pins will cause issues if the cells are used in the design. The same name pins should exist in the same name cells in different libraries with consistent values for attributes such as function, direction, related_power_pin, and related_ground_pin, and the same attributes should exist for the same pins in the same name cells. However, characterization values such as capacitance can be different.

EXAMPLES

List of pins mismatched in logic libraries

Cell name	Pin name	Attribute /Group	Attribute value	SR60_W_SVT_UHD	SR60_S_SVT_UHD
<hr/>					
tieofflx_svt	lo	pin_number	0	1	
std_cell_inv	Y	related_ground_pin	missing	VSS

LIBCHK-330 (information) List of timing arcs missing in libraries

DESCRIPTION

This message is for reporting timing arcs missing in the logic libraries.

WHAT NEXT

For timing scaling, timing arc information should exist with consistent timing data in each library. For other cases, this is information only. No further action is required.

EXAMPLES

List of timing arcs missing in libraries		
Cell name	Arc	SR60_W_SVT_UHD.db SR60_S_SVT_UHD.db
tbufl_f7_svt	gz_y	existing missing

EXAMPLE MESSAGE

Information: List of timing arcs missing in libraries (LIBCHK-330)

LIBCHK-331 (warning) List of timing arcs mismatched in logic libraries

DESCRIPTION

This message is for reporting mismatched arcs in logic libraries during logic vs. logic library checking. It also includes inconsistent output load indices. This report table has the following columns: Cell name, Arc name, Attribute/Group name

and attribute values of each logic libraries.

WHAT NEXT

For timing scaling and timing/delay calculations, consistent timing data should exist in the libraries for each timing arc.

EXAMPLES

List of timing arcs mismatched in logic libraries

Cell name	Arc	Attribute /Group	Attribute value SR60_W_SVT_UHD.db	SR60_S_SVT_UHD.db
tbufl_f7_svt	gz_y	timing_sense	positive_unate	non_unate
AND2	A_Z	output_current_rise	/total_output_net_capacitance	

EXAMPLE MESSAGE

Warning: List of timing arcs mismatched in logic libraries (LIBCHK-331)

LIBCHK-332 (warning) Library '%s' is missing CCS %s models.

DESCRIPTION

This warning message reports the existence of driver and receiver models during logic versus logic library checking. This message occurs when no driver or receiver model exists in the library.

WHAT NEXT

Receiver models and driver models (compressed or original format) must exist in the libraries for timing scaling. For all other cases, this is information only.

SEE ALSO

`check_library` (2)
`set_check_library_options` (2)

LIBCHK-340 (warning) List of inconsistent CCS noise models

DESCRIPTION

This message is for reporting inconsistent CCS noise models in logic libraries. It reports: a)inconsistent input_voltage and output_voltage indices for CCS noise models b)inconsistent conditional (when) pin models (when order). c)inconsistent CCS noise models for all pins and arcs. This report table includes the following columns: Cell name, Pin name, Group name, Attrbute name and attribute value of each library.

WHAT NEXT

For CCS noise scaling, consistent noise models are required. For other cases, it is for information only.

EXAMPLES

List of inconsistent CCS noise models

Cell name	Pin name	Group name	Attribute /variable	Attribute value SR60_W_SVT_UHD	Attribute value SR60_S_SVT_UHD
inv0d0	ZN	ccsn_first_stage	input_net_transition	"175.0"	"980.0"
inv0d0	ZN	ccsn_last_stage	total_output_net_capacitance	"0.0"	"0.0"

EXAMPLE MESSAGE

Warning: List of inconsistent CCS noise models (LIBCHK-340)

LIBCHK-341 (warning) List of inconsistent power models.

DESCRIPTION

This warning message reports inconsistent power models in the logic library. It reports the following inconsistencies:

- inconsistent dynamic_current groups for each cell
- inconsistent intrinsic_parasitic tables for each cell
- inconsistent leakage_current groups for each cell

- inconsistent power_cell_type attribute for each cell
- inconsistent internal_power tables for each pin or cell
- inconsistent leakage_power tables for each cell.

The report table includes the following columns:

Cell name
 Group name
 Attribute name
 Attribute value of all logic libraries.

WHAT NEXT

Consistent power models are required for power scaling. For other cases, the report is for information only.

EXAMPLES

List of inconsistent power models

Cell name	Group	Attribute	SR60_W_SVT_UHD	SR60_S_SVT_UHD	Attribute value
ap001_svt	leakage_power	value	0.000000	2.686740

LIBCHK-350 (warning) List of inconsistent data between different timing models

DESCRIPTION

This message is for validating library data between CCS and NLDM models. It reports:
 a) inconsistent output load indices between CCS and NLDM models, and inconsistent load indices for CCS drive/receiver b) inconsistent NLDM delay and slew indices and values with a default or user specified tolerance. c) inconsistent delays between NLDM and CCS timing with a user specified tolerance for both compact CCS and expanded CCS d) inconsistent data between two CCS driver model current waveforms including compact CCS with expanded CCS data with a tolerance e) inconsistent between CCS power data and NLPM data (not in 2008.09 releases) In this report table, including following columns: Cell name, Croup name, Attrbute name and attribute

value of all logic libraries.

WHAT NEXT

If the difference is significantly larger between the models, please rerun the simulation to correct the libraries.

EXAMPLES

```

LIBCHK-351 (information) List of inconsistent constructs and values

DESCRIPTION

This message is for reporting inconsistent liberty syntax constructs and/or values of the two logic libraries

WHAT NEXT

This is information only. No further action is required.

EXAMPLES

EXAMPLE MESSAGE

Information: List of inconsistent constructs and values (LIBCHK-351)

LIBCHK-352 (information) Table of variation-aware model analysis

DESCRIPTION

This table lists variation aware analysis results for driver, receiver and constraint models. For a set of va_values, there are normally three values: nominal, -Sigma and +Sigma. From the three values for each pair of indices, a linear model is used to find: a)monotonicity (trend) including -delays increase as slew and load increase. - delays increase/decrease as va_parameters increase. b)significance of each va_parameters

As trial and error procedure, the following statistics will be used in the study on the VA models. iThe linear model is used to roughly measure how significant each va_parameters affects on delay. 1)If slope ≈ 0 , va_parameter is insignificant (not sensitive) 2)If slope > 0 , monotonously increasing 3)If slope < 0 , monotonously decreasing 4)Alternating slopes may indicate issues 5)Trend: If Dnom > both D+/- sigma, or If Dnom < both D+/-sigma, not monotonous, where D is Delay. 6)coefficient of correlation to measure how closely the va_parameters are related to delays. Std error is used to measure how much va_parameter and delay points deviate from the linear model.

This report table includes the following columns: pin/related_pin, timing_type, when, $\neg \uparrow$ Group, $\neg \uparrow$ va_values, $\neg \uparrow$ (index_1,2), $\neg \uparrow$ nominal, -Sigma, +Sigma, $\neg \uparrow$ Slope, Std error and Trend In Trend column, / is monotonously increasing, is monotonously decreasing, ^ is non-monotonous up, V is non-monotonous down and - is flat.

WHAT NEXT

If the difference is significantly larger between the models, please rerun the simulation to correct the libraries.

EXAMPLE MESSAGE

Information: Table of variation-aware model analysis (LIBCHK-352)

LIBCHK-353 (information) Report of the statistical analysis results of characterization models.

DESCRIPTION

This information message reports the statistical analysis results of characterizations between CCS and NLDM models or between the same types of models in two libraries, using the golden NLDM or first library as the base.

The columns in the table include the following:

- Group type: Delay, Slew, Constraint, Receiver capacitance
- Mean of differences: Absolute, Relative
- Standard deviation: Absolute, Relative
- Max outlier: the maximum value of the deviations
- Number of grid points: Passed, Failed

WHAT NEXT

If the mean is far from 0, the two models or libraries have significant differences. If the standard deviation is significantly large, the differences of these two are dispersed. In any case, small numbers of mean and deviation, close to 0, should be expected if the characterizations are generated under the same operating conditions.

EXAMPLES

The following is an example report of the statistical analysis results of characterization models:

Information: List of statistical analysis (LIBCHK-353)

Group type	Mean of differences		Std deviation		Max outlier	Number of grids	
	Absolute	Relative	Absolute	Relative		Pass	Fail
Delay	0.0001	0.00%	0.0016	0.00%	0.0309	892	4
Slew	-0.0003	-0.00%	0.0044	0.01%	-0.0773	856	40
Constraint	65.6896	-69.56%	463.0871	3034.77%	3905.8228	878	42
Receiver cap	0.0000	0.00%	0.0000	0.00%	0.0000	1072	0

LIBCHK-354 (information) Table of characterization timing table trend analysis

DESCRIPTION

This table lists single characterization table trend analysis results for delay, slew, driver, receiver and constraint models. The trends include: /monotonously increasing monotonously decreasing ^non-monotonous up Vnon-monotonous down -flat M Multiple peaks WMultiple troughs N2 peaks with 2nd not turning low

WHAT NEXT

If the trend indicates that the values do not increase as slew/load indices, please check if characterizations have been done improperly.

EXAMPLES

Table of characterization timing table trend analysis (LIBCHK-354)

index_1: related_pin_transition
index_2: output_net_capacitance

EXAMPLE MESSAGE

Information: Table of characterization timing table trend analysis (LIBCHK-354)

LIBCHK-360 (information) Logic library inconsistencies found for MCMM.

DESCRIPTION

This information message occurs when consistency checking cross the libraries is completed. This message occurs when any inconsistency in MCMM is found during cross checking.

WHAT NEXT

This is an information only message. You are advised to go back to the check report to see inconsistent results and resolve them as directed by the associated man pages (LIBCHK).

If you see "inconsistencies found" in the summary report, go to the related tables with LIBCHK-300, LIBCHK-301, LIBCHK-310, LIBCHK-311, LIBCHK-312, LIBCHK-320, LIBCHK-321, LIBCHK-330, LIBCHK-331, LIBCHK-340 for details. Any of the related man pages (LIBCHK) will lead to the conclusion: inconsistencies found.

LIBCHK-361 (information) Logic library inconsistencies found

for UPF.

DESCRIPTION

This message is a concluding statement after checking cross the libraries is done. When any of inconsistency in UPF flow is found during cross checking, this message will occur.

WHAT NEXT

This is for your information. You are advised to go back to the above check report to see inconsistent results and resolve them as directed by the associated man pages (LIBCHK). If you see "inconsistencies found" in the summary report, please go back to the related tables with LIBCHK-300, LIBCHK-301, LIBCHK-302, LIBCHK-310, LIBCHK-311, LIBCHK-312, LIBCHK-320, LIBCHK-321, LIBCHK-330, LIBCHK-331, LIBCHK-332, LIBCHK-340 for details. Any of the related man pages (LIBCHK) will lead to the conclusion: inconsistencies found.

LIBCHK-362 (information) Logic library inconsistencies found for %s scaling.

DESCRIPTION

This message is a concluding statement after checking cross the libraries is done.

When any of inconsistency, for example, CCS timing scaling, CCS noise scaling, power scaling, is found during cross checking, this message will occur.

WHAT NEXT

This is for your information. You are advised to go back to the above check report to see inconsistent results and resolve them as directed by the associated man pages (LIBCHK). When you see "inconsistencies found for CCS timing scaling" in the summary report, please go back to the related tables with LIBCHK-300, LIBCHK-301, LIBCHK-302, LIBCHK-310, LIBCHK-311, LIBCHK-320, LIBCHK-321, LIBCHK-330, LIBCHK-331, LIBCHK-332, LIBCHK-340, LIBCHK-350 for details. Any of the related man pages (LIBCHK) will lead to this conclusion. When you see "inconsistencies found for CCS noise scaling" in the summary report, please go back to the related tables with LIBCHK-300, LIBCHK-301, LIBCHK-302, LIBCHK-310, LIBCHK-311, LIBCHK-320, LIBCHK-321, LIBCHK-330, LIBCHK-331, LIBCHK-340 for details. Any of the related man pages (LIBCHK) will lead to this conclusion. When you see "inconsistencies found for power scaling" in the summary report, please go back to the related tables with LIBCHK-300, LIBCHK-301, LIBCHK-302, LIBCHK-310, LIBCHK-311, LIBCHK-320, LIBCHK-321, LIBCHK-330, LIBCHK-331, LIBCHK-341 for details. LIBCHK-363 (information) Logic library inconsistencies found

for %s comparison.

DESCRIPTION

This message is a concluding statement after checking between the two libraries is done. When any of inconsistency in liberty syntax construct comparison or value comparison is found during cross checking, this message will occur. In construct comparison, the missing/existing data will be reported, while in value comparison, the characterization values will be reported.

WHAT NEXT

This is for your information. You are advised to go back to the above check report to see inconsistent results and resolve them as directed by the associated man pages (LIBCHK). When you see "inconsistencies found" for construct or value comparison in the summary report, please go back to the related tables with LIBCHK-300, LIBCHK-301, LIBCHK-310, LIBCHK-311, LIBCHK-312, LIBCHK-320, LIBCHK-321, LIBCHK-330, LIBCHK-331, LIBCHK-340, LIBCHK-341 for details. LIBG

LIBG-1 (error) The Synopsys database is corrupted. The library is not created.

DESCRIPTION

A file is read in but no library is found in the file. It is most likely that the file is empty.

WHAT NEXT

Check your library file to make sure it is a valid library.

EXAMPLE MESSAGE

Error: The Synopsys database is corrupted. The library is not created. (LIBG-1)

LIBG-2 (error) An invalid '%s' function string in the '%s' cell.

DESCRIPTION

The string given is not valid for representing a boolean logic defined in Synopsys format.

WHAT NEXT

Refer to your Library Compiler Reference Manual to find out the valid format of the string. It is described in the "function simple attribute" under the "Cell Group Description and Syntax".

EXAMPLES

```
cell(libg2) {  
    area : 1 ;  
    pin (I0) {  
        direction : input ;  
        capacitance : 0 ;  
    }  
    pin ("Y") {  
        direction : output ;  
        function : "(I0" ;  
        timing() {  
            related_pin: "I0" ;  
        }  
    }  
}
```

```
intrinsic_rise: 1.0 ;
rise_resistance : 0.0 ;
intrinsic_fall : 1.0 ;
fall_resistance : 0.0 ;
}
}
```

In this simple case, the closing parenthesis is missing in the function string.

EXAMPLE MESSAGE

Error: Line 400, An invalid '(IO' function string in the 'libg2' cell. (LIBG-2)

LIBG-3 (error) A bad '%s' pin name in the '%s' cell.

DESCRIPTION

This error gets detected during a **read_lib** and an **update_lib** commands. The pin name does not either exist or a previous error in any of the attributes of the pin group is detected. In this case the pin group is not recognized and the pin name is labeled as bad.

WHAT NEXT

Check your library for a wrong pin name in any related attribute or for an incorrect pin group.

EXAMPLES

```
cell (libg3) {
area : 4
pin(A) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
}
pin(EN) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
}
pin (Z) {
    direction : output
    function : "A"
    three_state : "E";      /* <-- This is wrong */
    max_fanout : 10
}
```

EXAMPLE MESSAGE

Error: Line 426, A bad 'E' pin name in the 'libg3' cell. (LIBG-3)

LIBG-4 (error) In the '%s' cell, the '%s' noninput pin cannot be used in the function.

DESCRIPTION

The string associated with a **function** and **three_state** attributes should include only be of **input** or **inout** directions.

WHAT NEXT

Check your library for a wrong direction of the pin in the function attribute. Another possibility is to check the use of the wrong pin name.

EXAMPLES

```
cell (libg4) {
area : 4
pin(A) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
}
pin(EN) {
    direction : input
    capacitance : 1
    fanout_load : 1.0
}
pin (Z1) {
    direction : output
    function : "A"
    max_fanout : 10
}
pin (Z) {
    direction : output
    function : "Z1"           /* <-- This is wrong */
    three_state : "Z1";      /* <-- This is wrong */
    max_fanout : 10
}
```

EXAMPLE MESSAGE

Error: Line 431, In the 'libg4' cell, the 'Z1' noninput pin cannot be used in the function. (LIBG-4)

LIBG-5 (error) Cannot find the '%s' pin in the '%s' cell.

DESCRIPTION

This error is issued when a pin name attached to a **related_pin** or a **related_bus_pins** attribute does not exist in the cell.

WHAT NEXT

Check your library for a wrong pin name.

EXAMPLES

```
cell(libg5) {
    area : 1 ;
    pin (IO) {
        direction : input ;
        capacitance : 0 ;
    }
    pin ("Y") {
        direction : output ;
        function : "IO" ;
        timing() {
            related_pin: "IO" ; /* typo zero replaced by letter O */
            intrinsic_rise: 1.0 ;
            rise_resistance : 0.0 ;
            intrinsic_fall : 1.0 ;
            fall_resistance : 0.0 ;
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 403, Cannot find the 'IO' pin in the 'libg5' cell. (LIBG-5)

LIBG-6 (error) Missing a related_pin for the '%s' pin timing group in the '%s' cell.

DESCRIPTION

This error is issued when the **related_pin** or the **related_bus_pins** attribute is missing in a timing group.

WHAT NEXT

Check your library for a typo in the attribute or add it if it is missing.

EXAMPLES

```
cell(libg6) {
    area : 1 ;
    pin (I0) {
        direction : input ;
        capacitance : 0 ;
    }
    pin ("Y") {
        direction : output ;
        function : "I0" ;
        timing() {
            frelated_pin: "I0" ; /* typo f inserted before attribute */
            intrinsic_rise: 1.0 ;
            rise_resistance : 0.0 ;
            intrinsic_fall : 1.0 ;
            fall_resistance : 0.0 ;
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 399, Missing a related_pin for the 'Y' pin timing group
in the 'libg6' cell. (LIBG-6)

LIBG-8 (error) In the '%s' cell, the '%s' input drives more than one function.

DESCRIPTION

This error is issued when both **function** and **three_state** attributes share one or more inputs pin names.

WHAT NEXT

Either delete one of the attributes or associate a unique string to each of them.

EXAMPLES

```
cell (libg8) {
    area : 4
    pin(A) {
        direction : input
        capacitance : 1
        fanout_load : 1.0
    }
    pin(EN) {
        direction : input
        capacitance : 1
    }
}
```

```

    fanout_load : 1.0
}
pin (Z1) {
    direction : output
    function : "A"
    three_state : "EN";
    max_fanout : 10
}
pin (Z) {
    direction : output
    function : "Z1"      /* ok */
    three_state : "Z1"; /* wrong, Z1 is shared. */
    max_fanout : 10
}
}

```

EXAMPLE MESSAGE

Error: Line 411, In the 'libg8' cell, the 'Z1' input drives more than one function.
 (LIBG-8)

LIBG-10 (warning) Failed to recognize the functionality of cell '%S'.

DESCRIPTION

The warning message is to notify users that Library Compiler fails to synthesize a netlist structure representing functionality of this cell. In order to other cells to recognize the cell, user can specify the "user_function_class" attribute either in the .lib file or in Design Compiler.

Note, although the function id of the cell is unknown, it may not be black-box. That is why we are saying that it may not be recognized by Design Compiler.

This message can be used to identify a cell for which pin-class conflict exists. Pin-class is defined as the set of pins which can be swapped without changing the functionality of the gate and is used for DC mapping. In the following simple example, we have $PO = \sim(PAD * PI)$ and $Y=PAD$, and it will cause pin-class conflict because: After parsing the 1st function, we have $\text{pin_class}(PAD) = \text{pin}(PI)$ because PAD and PI can be exchangable without changing the functionality of the pin PO. However it will break the functionality of the 2nd function cause $Y=PAD$ and $Y=PI$ are totally different.

When pin-class conflict happens, the function id of the cell is set to unknown.

WHAT NEXT

Check your library.

EXAMPLES

```
cell(libg28) {
    area : 1;
    ...
    pin(PAD) {
        direction : input;
        ...
    }
    pin(PI) {
        direction : input;
        ...
    }

    pin(PO) {
        direction : output;
        capacitance : 0;
        ...
        function: "!(PAD * PI)"
    }
    pin(Y) {
        direction : output;
        capacitance : 0;
        ...
        function: "PAD"
    }
}
```

EXAMPLE MESSAGE

Warning: Line 34, Failed to recognize the functionality of cell '%s'. (LIBG-10)

LIBG-16 (warning) The '%s' Pin/bus on the '%s' cell has no 'function' attribute.

The cell becomes a black box.

DESCRIPTION

This warning is issued when any output of a given cell does not have a valid function(missing or wrong information associated with the function of the pin). A function can be defined either by a **function** attribute, a **three_state** attribute, a **memory_read** group, or an **internal_node** attribute.

WHAT NEXT

Check your library for missing or wrong attributes.

EXAMPLES

```
cell(libg16) {
    area : 1 ;
    pin (I0) {
        direction : input ;
        capacitance : 0 ;
    }
    pin ("Y") {
        direction : output ;
    }
    /*      function : "I0" ; */
    timing() {
        related_pin: "I0" ;
        intrinsic_rise: 1.0 ;
        rise_resistance : 0.0 ;
        intrinsic_fall : 1.0 ;
        fall_resistance : 0.0 ;
    }
}
```

EXAMPLE MESSAGE

Warning: Line 39, The 'Y' Pin/bus on the 'libg16' cell has no 'function' attribute.
The cell becomes a black box. (LIBG-16)

LIBG-17 (error) The 'function' of the '%s' pin/bus on the '%s' cell can only be '%s' or '%s'.

DESCRIPTION

This error is issued when either the noninverted output (first variable) or the inverted output (second variable) of a sequential model, defined by a ff, a ff_bank, a latch, or a latch_bank group are not assigned to a primary output.

A function statement of each primary output must include either the first variable or the second variable.

WHAT NEXT

Make the appropriate correction in your library, as indicated in the error message. For more information on sequential models, refer to the **Library Compiler Reference** and **User Guide Manuals**.

EXAMPLES

```
cell(libg17) {
    area : 6.50;
    pin(CLK) {
        direction : input;
```

```

capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ1";/* wrong, should be IQ */
}
pin(QN) {
direction : output;
function : "IQN";
}
}

```

EXAMPLE MESSAGE

Error: Line 23, The 'function' of the 'Q' in/bus on the 'libg17' cell
can only be 'IQ' or 'IQN'. (LIBG-17)

LIBG-18 (information) The '%s' equation on the '%s' cell is not recognized.

DESCRIPTION

This information is issued when the function is not recognized. The function can be a complex **state_function**, a corrupted string in a **three_state**, a **clocked_on**, or a **clocked_on_also** attribute.

WHAT NEXT

Check your library to determine under which case the information is given. If it is due to the previous error LIBG-4, fix the library. Otherwise, ignore it.

EXAMPLES

```

cell(libg18) {
area : 6.50;
pin(CLK) {
direction : input;
capacitance : 1.5;
}
pin(SET) {

```

```

direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQN";
three_state : "Q"; /* non-input pin not used in function*/
}
}

```

EXAMPLE MESSAGE

Information: Line 218, The 'three_state' equation on the 'libg18' cell is not recognized. (LIBG-18)

LIBG-19 (warning) Failed to recognize the functionality of cell '%S'.

DESCRIPTION

Library Compiler fails to synthesize a netlist structure representing functionality of this cell. If the function of a cell is too complex for LC to recognize, the cell becomes a black box. In order to other cells to recognize the cell, user can specify the "user_function_class" attribute either in the .lib file or in Design Compiler.

WHAT NEXT

To specify "user_function_class" attribute as described above.

LIBG-20 (error) The '%s' equation on the '%s' cell evaluates to a '%s' constant.

DESCRIPTION

This message is generated when Library Compiler encounters a three-state cell whose

enable signal string is 1 or always evaluates to 1.

WHAT NEXT

Verify the cell and check the library description of the offending cell for correctness.

EXAMPLES

```
cell(libg20) {  
area : 6.50;  
pin(CLK) {  
direction : input;  
capacitance : 1.5;  
}  
pin(SET) {  
direction : input;  
capacitance : 3.0;  
}  
ff("IQ","IQN") {  
next_state : "IQ'";  
clocked_on : "CLK";  
preset : "SET'";  
}  
pin(Q) {  
direction : output;  
function : "IQ";  
}  
pin(QN) {  
direction : output;  
function : "IQN";  
three_state : "1";  
}  
}
```

EXAMPLE MESSAGE

Error: Line 218, The 'three_state' equation on the 'libg20' cell evaluates to a '1' constant. (LIBG-20)

LIBG-21 (error) The derived equality relationship between '%s' and '%s' pins conflicts with the user-specified 'pin_opposite' for the

'%s' cell.

DESCRIPTION

This error is generated if a cell is read by the library compiler with a pin_opposite attribute that conflicts with the derived equality of the pins. The function statements associated with the pins are the same.

WHAT NEXT

Check your library for a typo in the function strings of the cell or remove the pin_opposite attribute.

EXAMPLES

```
cell(libg21) {
area : 6.50;
pin(CLK) {
direction : input;
capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQ";/* typo, it should be IQN */
}
pin_opposite("Q","QN");           /* No, they're equal. */
}
```

EXAMPLE MESSAGE

Error: Line 215, The derived equality relationship between 'QN' and
'Q' pins conflicts with the user-specified 'pin_opposite' for the 'libg21' cell. (LIBG-21)

LIBG-22 (error) The derived opposite relationship between '%s'

and

'%s' pins conflicts with the user-specified 'pin_equal' for the '%s' cell.

DESCRIPTION

This error is generated if a cell is read by the library compiler with a pin_equal attribute that conflicts with the derived opposite relationship of the pins . The function statements associated with the pins are opposite.

WHAT NEXT

Check your library for a typo in the function strings of the cell or remove the pin_equal attribute.

EXAMPLES

```
cell(libg22) {
area : 6.50;
pin(CLK) {
direction : input;
capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQN";
}
pin_equal("Q QN"); /* No, they're opposite. */
}
```

EXAMPLE MESSAGE

Error: Line 215, The derived opposite relationship between 'QN' and
'Q' pins conflicts with the user-specified 'pin_equal' for the 'libg22' cell. (LIBG-22)

LIBG-24 (information) Unable to honor the 'prefer_tied' attribute on the '%s' pin of the '%s' cell.

DESCRIPTION

Library Compiler honors as many prefer_tied attributes as possible while it is still able to implement D flip flop functionality. However, it cannot honor all of them. For example, if the library developer specified **prefer_tied : 0** on all the inputs, Library Compiler honors as many as possible and the rest are ignored. If they are ignored, this message is issued during read_lib.

The prefer_tied attribute also can be used to indicate which pin(s) are tied to fixed logic during three_state degeneration for three-state pad cell.

WHAT NEXT

Check your library for the use of the prefer_tied attribute.

EXAMPLES

```
cell(libg24) {
    area : 0.0;
    pad_cell : true;
    pin(Z) {
        is_pad : true;
        direction : output;
        drive_current : 2.0;
        function : "A";
        three_state : "en tn";
        timing() {
            timing_type : three_state_disable;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "tn";
        }
        timing() {
            timing_type : three_state_disable;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "en";
        }
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "tn";
        }
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
        }
    }
}
```

```

        related_pin : "en ";
    }
    timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
    related_pin : "A";
    }
}
pin(A) {
    direction : input;
    capacitance : 0.0;
}
pin(en) {
    direction : input;
    capacitance : 0.500;
}
pin(tn) {
    prefer_tied : "0";/* in this case the value should be 1 */
    direction : input;
    capacitance : 0.500;
}
}
}

```

EXAMPLE MESSAGE

Information: Line 306, Unable to honor the 'prefer_tied' attribute on the 'tn' pin of the 'libg24' cell. (LIBG-24)

LIBG-25 (warning) Duplicated test signals of '%s' type is found on the '%s' library cell.

DESCRIPTION

The test_cell has more than one of the following valid signal_types: - test_scan_in - test_scan_in_inverted - test_scan_enable - test_scan_enable_inverted - test_scan_out - test_scan_out_inverted - test_scan_clock - test_scan_clock_a - test_scan_clock_b - test_clock

This warning informs you that the port in the test_cell pointed to has more than one signal_type that are listed previously.

WHAT NEXT

Vendors/Library developers should check the test_cell pointed to and make sure that it is the behavior they meant to have. Otherwise, delete the duplicate signal_type.

If a designer finds this problem, he should contact the vendor or library developer and explain the problem. This problem can only be fixed by the vendor/library

developer.

EXAMPLES

```
cell(libg25) {
    area : 12;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CK,CK2,IH) {
        direction : input;
        capacitance : 1;
    }
    pin(A,B) {
        direction : input
        capacitance : 2;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_falling;
            intrinsic_rise : 2.8000;
            intrinsic_fall : 2.8000;
            related_pin : "A";
        }
        timing() {
            timing_type : hold_falling;
            intrinsic_rise : 1.2000;
            intrinsic_fall : 1.2000;
            related_pin : "A";
        }
    }
    pin(Q) {
        direction : output;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 2.5500;
            intrinsic_fall : 2.4000;
            rise_resistance : 0.0700;
            fall_resistance : 0.0300;
            related_pin : "CK IH CK2";
        }
        timing() {
            timing_type : falling_edge;
            intrinsic_rise : 2.5500;
            intrinsic_fall : 2.4000;
            rise_resistance : 0.0700;
            fall_resistance : 0.0300;
            related_pin : "B";
        }
    }
    pin(XQ) {
        direction : output;
```

```

}

test_cell(){
    pin(D CK){
        direction : input;
    }
    pin(IH CK2){/* duplicate test_clock */
        direction : input;
        signal_type : "test_clock";
    }
    pin(SI){
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(A){
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    pin(B){
        direction : input;
        signal_type : "test_scan_clock_b";
    }
    state("IQ","IQN"){
        clocked_on : "CK CK2";
        next_state : "D";
    }
    pin(Q){
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
    }
    pin(XQ){
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
    }
}
}
}

```

In this case, there are two test_clock attributes for both 'IH' and 'CK2' pins.

MESSAGE EXAMPLE

Warning: Line 67, Duplicated test signals of test_clock type is found on the 'libg25' library cell. (LIBG-25)

LIBG-26 (error) The '%s' test cell pin on the '%s' cell

has no 'function' attribute. The test cell is removed.

DESCRIPTION

The specified pin has neither a test **signal_type** nor a **function** attribute. This incomplete functional description results in a black-box test cell, which is removed from the library.

WHAT NEXT

Add a proper **function** attribute or **signal_type** attribute to the faulty pin group.

EXAMPLES

```
cell(libg26) {
    area : 12;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CK IH) {
        direction : input;
        capacitance : 1;
    }
    pin(A,B) {
        direction : input
        capacitance : 2;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_falling;
            intrinsic_rise : 2.8000;
            intrinsic_fall : 2.8000;
            related_pin : "A";
        }
        timing() {
            timing_type : hold_falling;
            intrinsic_rise : 1.2000;
            intrinsic_fall : 1.2000;
            related_pin : "A";
        }
    }
    pin(Q) {
        direction : output;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 2.5500;
            intrinsic_fall : 2.4000;
            rise_resistance : 0.0700;
            fall_resistance : 0.0300;
        }
    }
}
```

```

        related_pin : "CK IH";
    }
    timing() {
        timing_type : falling_edge;
        intrinsic_rise : 2.5500;
        intrinsic_fall : 2.4000;
        rise_resistance : 0.0700;
        fall_resistance : 0.0300;
        related_pin : "B";
    }
}
pin(XQ) {
    direction : output;
}
test_cell(){
    pin(D CK){
        direction : input;
    }
    pin(IH ){
        direction : input;
        signal_type : "test_clock";
    }
    pin(SI){
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(A){
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    pin(B){
        direction : input;
        signal_type : "test_scan_clock_b";
    }
    state("IQ", "IQN"){
        clocked_on : "CK CK2";
        next_state : "D";
    }
    pin(Q){
        direction : output;
    }
    pin(XQ){
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
    }
}
}
}

```

In this case, the pin 'Q' needs to have a function : "IQ" or signal_type : "test_scan_out" statement

MESSAGE EXAMPLE

Error: Line 385, The 'Q' test cell pin on the 'libg26' cell

has no 'function' attribute. The test cell is removed. (LIBG-26)

LIBG-27 (warning) The '%s' pin is eliminated from the '%s' pin function on the '%s' cell. The cell becomes a black box.

DESCRIPTION

This message is issued to warn users about the redundant ports in a function string. Redundant ports are ports which are eliminated from the boolean function due to normal boolean simplification.

WHAT NEXT

Check the library for a possible error in the function string.

EXAMPLES

```
cell(libg27) {
area : 10;
pin(D) {
    direction : input;
    capacitance : 1;
}
pin(CP) {
    direction : input;
    capacitance : 1;
}

statetable ( "D CP", "Q QB" ) {
    table : "L/H R : - - : L/H H/L,
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
}
pin(QB) {
    direction : output;
    state_function : "D * 0";
}
}
```

EXAMPLE MESSAGE

Warning: Line 448, The 'D' pin is eliminated from the 'QB' pin function on the 'libg27' cell. The cell becomes a black box. (LIBG-27)

LIBG-28 (warning) The '%s' three state pin has no 'function' or the function is too complex to be recognized; the '%s' cell becomes a black box.

DESCRIPTION

This message identifies a cell for which one of its output pins with a three_state attribute has no valid function defined, or its function is too complex to be mapped onto. In this case the library compiler treats the cell as a black box.

WHAT NEXT

Check your library and add the functional information, in case it is absent, to the tri-statable pin. The functional model can be defined by the 'function' attribute, or ff, latch, memory, or unigen statements.

EXAMPLES

```
cell(libg28) {  
    area : 1;  
    pin(A) {  
        direction : input;  
        capacitance : 0;  
    }  
    pin(TA) {  
        direction : output;  
        three_state : "A'"; /* missing a function attribute */  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 34, The 'TA' three state pin has no 'function' or the function is too complex to be recognized; the 'libg28' cell becomes a black box. (LIBG-28)

LIBG-29 (warning) The state group needs more statements to be meaningful; cell becomes black-box.

DESCRIPTION

This message is issued when a clocked_on or a next_state statement is missing. This message also appears when a latch does not have a minimum of two force statements (force_00, force_01, force_10, and force_11). Library Compiler treats a cell without

a functional model as a black-box.

WHAT NEXT

Check the library for a wrong model and add the missing statement of the corresponding group.

EXAMPLES

```
cell(libg29) {
    area : 12;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CK) {
        direction : input;
        capacitance : 1;
    }
    pin(Q) {
        direction : output;
    }
    state("IQ", "IQN") {
        next_state : "D"; /* clocked_on : "CK"; missing */
    }
}
```

EXAMPLE MESSAGE

Warning: Line 460, The state group needs more statements to be meaningful; cell becomes black-box. (LIBG-29)

LIBG-30 (warning) The '%s' equation on the '%s' cell evaluates to a constant '%s'. Since this implies the output will never become %s, this equation is ignored.

DESCRIPTION

The sequential library cell has both a force_00 and a force_11 declared. The translation algorithm cannot handle library cells with both of these declarations. This warning message is specific to structural models.

WHAT NEXT

Declare instead either a pair of force_10 and force_01, force_10 and force_11,

force_00 and force_01, force_00 and force_10, or force_01 and force_11. The Q and QN outputs of the specified sequential cell are not complementary. Possible reasons for this are: 1. The library specifies that the outputs are not complementary; 2. The functions driving the force_00 and force_11 inputs of the degenerated sequential cell are not logical zero. For purposes of verification, every sequential cell is degenerated into a primitive sequential cell. The outputs (sourcepoints) of the primitive are Q and QN. The inputs (endpoints) of the primitive are next_state, force_00, force_01, force_10, force_11, clocked_on, and clocked_on_also (for Master-slave cells only). The functions driving the force endpoints characterize the asynchronous properties of the primitive sequential cell. The library might also contain an attribute asserting that the outputs Q and QN are complementary. The force_01 function represents the conditions under which the Q pin can be driven to zero and the QN driven to 1 simultaneously. The other force inputs have a similar interpretation. When the attribute is not present, verification tries to determine that Q and QN are effectively complementary by establishing that both force_00 and force_11 are logically zero. The exact degeneration process depends on the library characterization of the sequential cell and is not described here.

Sequential cells should be modeled using the flip-flop and latch attributes. If you model sequential cells with state attributes, use a local function to describe the asynchronous behavior of each output pin. These functions are hard-coded as async_IQ and async_IQN. The async_IQ, async_IQN, and active functions are based on the forceXX expressions. An example is this flip-flop with Preset and Clear: state (IQ,IQN) { ... force00 : "!CD & !SD" force01 : "!CD & SD" force10 : "CD & !SD" ... } When CD is low, Q is always 0, so the VHDL library generator ORs these two expressions together; instead of $(\neg CD \& SD) \mid (\neg CD \& \neg SD)$, the equation becomes $\neg CD$. The ORed expression is simplified by Boolean algorithms, which use only 1 and 0 values. If you specify an X for one of these values, the library generator might modify the results.

EXAMPLES

```
cell(libg30) {
area : 6.50;
pin(CLK) {
direction : input;
capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset      : "SET'";
}
pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQN";
three_state : "0";
}
```

```
 }  
 }
```

EXAMPLE MESSAGE

Warning: Line 218, The 'three_state' equation on the 'libg30' cell evaluates to a constant '0'. Since this implies the output will never become tri-stated, this equation is ignored. (LIBG-30)

LIBG-31 (warning) The test cell on cell '%s' does not have any function.

DESCRIPTION

This message indicates that no output port of the test cell has a function attribute.

WHAT NEXT

An output port in the test cell must have a function attribute, a signal_type attribute, or both. At least one output port must have a function attribute. The function attribute can reflect only the nontest behavior of the cell.

LIBG-32 (error) The '%s' parallel sequential cell must use bus/bundle for outputs.

DESCRIPTION

One of the requirement of parallel sequential cells, described by ff_bank or latch_bank groups, is that all outputs are busses or bundles.

This message identifies a parallel sequential cell whose outputs are not busses or bundles

WHAT NEXT

Check your library for a wrong for single bit output pins and define them as busses or bundles.

EXAMPLES

```
cell (LSFDS) {  
area : 31.000000 ;  
dont_touch : true ;
```

```

dont_use : true ;
bus (D) {
bus_type : BUS4;
direction : input ;
capacitance : 2.000000 ;
}
pin (CK) {
direction : input ;
capacitance : 1.000000 ;
}
ff_bank (IQ,IQN,4) {
next_state : "D" ;
clocked_on : "CK" ;
}
bus (Q) {
bus_type : BUS4;
direction : output ;
function : "IQ" ;
}
pin (SO) {
direction : output ;
function : "IQN" ;
}
}

```

In this case, the pin 'SO' must be defined as a bus of type BUS4.

EXAMPLE MESSAGE

Error: Line 168, The 'libg32' parallel sequential cell must use bus/bundle for outputs. (LIBG-32)

LIBG-33 (warning) In the '%s' cell, the '%s' inout pin cannot have feedback in its function. The cell becomes a black box.

DESCRIPTION

The inout pin is in its own function. Library Compiler does not support combinational functions with feedback.

WHAT NEXT

Either break the feedback or try to use a sequential definition.

LIBG-34 (error) The '%s' pin in the '%s' cell has the '%s'

direction

The direction must be '%s'.

DESCRIPTION

The pin on the programmable cell must have the direction specified.

WHAT NEXT

Replace the pin direction attribute by the correct direction.

LIBG-35 (warning) The 'nextstate_type' attribute on the '%s' pin/bus in
the '%s' cell is inconsistent with its function. The attribute is
ignored.

DESCRIPTION

In a pin group, nextstate_type defines the type of a next_state attribute to be used in an ff group, a seq group, or a ff_bank group.

Any pin with the **nextstate_type** attribute must be in the **nextstate** function. A consistency check is also made between the pin's nextstate_type attribute and the nextstate function. This message is generated when the attribute 'nextstate_type' does not match the functional information specified in the cell's sequential state description.

WHAT NEXT

Check your library for a pin with a nextstate_type attribute but not used in the next_state statement of a sequential group and correct the inconsistency.

EXAMPLES

```
cell(libg35) {  
area : 6.50;  
pin(D) {  
    direction : input;  
    capacitance : 3.0;  
}  
pin(CLK) {  
    direction : input;  
    capacitance : 1.5;  
}
```

```

pin(SET) {
    direction : input;
    nextstate_type : scan_in;
    capacitance : 3.0;
}

ff("IQ","IQN") {
    next_state : "D";
    clocked_on : "CLK";
    preset     : "SET' ";
}

pin(Q) {
    direction : output;
    function : "IQ";
}
pin(QN) {
    direction : output;
    function : "IQN";
}
}

```

EXAMPLE MESSAGE

Warning: Line 153, The 'nextstate_type' attribute on the 'SET' pin/bus in
 the 'libg35' cell is inconsistent with its function. The attribute is ignor
 ed. (LIBG-35)

LIBG-36 (warning) In the '%s' cell, the '%s' input drives more
 than one
 function. The cell might not be optimally used.

DESCRIPTION

This error is issued when more than one attribute inside ff, ff_bank, latch,
 latch_bank, or seq group share one or more inputs pin names, or when function and
 three_state on a port have common input pins.

WHAT NEXT

Check your library for shared input pins and associate a unique string to each of
 them.

EXAMPLES

```

cell(libg36) {
area : 6.50;
pin(D TE) {

```

```

        direction : input;
        capacitance : 3.0;
    }
pin(CLK) {
direction : input;
capacitance : 1.5;
}
ff("IQ","IQN") {
next_state : "D TE";
clocked_on : "CLK";
preset      : "D'";
}

pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQN";
}
}

```

In this case, the input pin 'D' is present in the next_state's string and the preset's string.

EXAMPLE MESSAGE

Warning: Line 189, In the 'libg36' cell, the 'D' input drives more than one function.

The cell might not be optimally used. (LIBG-36)

LIBG-37 (warning) The '%s' pin/bus is unused in the '%s' cell.

DESCRIPTION

This message is generated when an input pin is not used in the functionality of the cell.

WHAT NEXT

Either delete the unused input pin or add it the functionality of the cell.

EXAMPLES

```

cell(libg37) {
area : 6.50;
pin(CLK) {

```

```
direction : input;
capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
}
pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQN";
}
}
```

EXAMPLE MESSAGE

Warning: Line 202, The 'SET' pin/bus is unused in the 'libg37' cell. (LIBG-37)

LIBG-38 (warning) The '%s' enable pin with a three_state attribute in the '%s' cell should have non-unate timing arcs.

DESCRIPTION

Tri-state enable pins should have "non-unate" timing arcs because the transition depends on the data input. If incorrect timing sense is detected, a warning is issued.

WHAT NEXT

Change the timing sense to "non-unate."

LIBG-39 (warning) The '%s' asynchronous input of the '%s' cell

is inconsistent in active level.

DESCRIPTION

The asynchronous input is inconsistent in "active" level. If "active low," the clear timing arc is **positive-unate**, the preset timing arc is **negative unate**, and the intrinsic fall in recovery constraint is **zero**.

If "active high," the clear timing arc is **negative-unate**, the preset timing arc is **positive-unate**, and the intrinsic rise in recovery constraint is **zero**.

Since the active level of asynchronous input is not explicitly specified, the warning message simply states that, due to inconsistency, the active level of the asynchronous pin cannot be determined by the set of associated timing groups. An inconsistency is found at the given line number.

WHAT NEXT

Determine the asynchronous pin active level. Check the current timing group, and, if inconsistent, make the modification. Otherwise, check other timing groups associated with this asynchronous pin, and change any inconsistency.

EXAMPLES

```
cell("libg39") {
    area : 5 ;
    state("IQ", "IQN") {
        force_00 : "S*R" ;
        force_01 : "R!*S" ;
        force_10 : "S!*R" ;
    }
    pin("S") {
        direction : input ;
        capacitance : 0.145 ;
    }
    pin("R") {
        direction : input ;
        capacitance : 0.145 ;
    }
    pin("Q") {
        direction : output ;
        function : "IQ" ;
        timing() {
            timing_type      : preset ;
            timing_sense    : negative_unate ;
            rise_resistance : 1.000 ;
            related_pin     : "S" ;
        }
        timing() {
            timing_type      : clear ;
            timing_sense    : negative_unate ;
            intrinsic_fall : 1.000 ;
        }
    }
}
```

```

        fall_resistance    : 1.000 ;
        related_pin       : "R" ;
    }
}
pin("QN") {
    direction : output ;
    function  : "IQN" ;
    timing() {
        timing_type      : clear ;
        timing_sense     : negative_unate ;
        intrinsic_fall   : 1.000 ;
        fall_resistance  : 1.000 ;
        related_pin      : "S" ;
    }
    timing() {
        timing_type      : preset ;
        timing_sense     : positive_unate ;
        intrinsic_rise   : 1.000 ;
        rise_resistance  : 1.000 ;
        related_pin      : "R" ;
    }
}
}

```

To fix the warning, the timing arc of S in the pin 'Q' has to be positive_unate.

EXAMPLE MESSAGE

Warning: Line 32, The 'S' asynchronous input of the 'libg39' cell is inconsistent in active level. (LIBG-39)

LIBG-40 (warning) The '%s' clock/gate input of the '%s' cell is inconsistent in active edge/level.

DESCRIPTION

A clock is consistent in triggering edge. If positive edge is triggered, only **rising_edge**, **setup_rising**, **hold_rising**, and **recovery_rising** timing types are allowed. If negative edge is triggered, only **falling_edge**, **setup_falling**, **hold_falling**, and **recovery_falling** timing types are allowed. Since the clock-pin triggering edge is not explicitly specified, the warning message simply indicates that, due to inconsistency, the triggering edge of the clock pin cannot be derived from its related timing-group data. An inconsistency is found at the given line number.

A gate is consistent in active level. If "active low," only **non_unate**, **falling_edge**, **setup_rising**, **hold_rising**, and **recovery_rising** timing types are allowed. If "active high," only **non_unate**, **rising_edge**, **setup_falling**, **hold_falling**, and **recovery_falling** are allowed. Since the gate-pin active level is not explicitly specified, the warning message simply indicates that, due to inconsistency, the

active level of the gate pin cannot be derived from its related timing group data. An inconsistency is found at the given line number.

There is one exception: **rising_edge** and **falling_edge** are not checked if the library cell is a black box.

WHAT NEXT

For a clock pin, determine the triggering edge first. Check the current timing group data, and modify timing-group data if found to be inconsistent with clock-triggering edge. Otherwise, check other timing groups that are related to the clock pin, and, if inconsistency is found, make the change.

For a gate pin, determine the active level first, check the current timing-group data, and modify timing-group data if found to be inconsistent with gate-active level. Otherwise, check other timing groups that are related to the gate pin, and, if inconsistency is found, make the change.

EXAMPLES

```
cell(RAM1) {
area : 4;
pin(D) {
direction : input;
capacitance : 2;
timing() {
    timing_type : setup_rising;
    intrinsic_rise : 1.00;
    intrinsic_fall : 1.00;
    related_pin : "WR";
}
}
pin(WR) {
    direction : input;
    capacitance : 1;
}
state ("IQ", "IQN") {
    force_01 : "D' WR";
    force_10 : "D WR ";
}
pin(QN) {
    direction : output;
    function : "IQN";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.00;
        intrinsic_fall : 1.00;
        rise_resistance : 0.1000;
        fall_resistance : 0.1000;
        related_pin : "WR";
    }
}
}
```

EXAMPLE MESSAGE

Warning: Line 266, The 'WR' clock/gate input of the 'RAM1' cell is inconsistent in active edge/level. (LIBG-40)

LIBG-41 (warning) The 'when' attribute (%s) uses pins that cannot be found in %s (%s).

DESCRIPTION

In a combinational cell, the following pins are allowed to appear in the **when** attribute of the state-dependent timing arc:

- 1) Pins in the **function** attribute for a combinational timing arc.
- 2) Pins in the **three_state** attribute for a three_state_disable timing arc.

This warning informs you that one of the previous restrictions has been violated.

WHAT NEXT

Check the **when** attribute and correct any wrong information in the string or in the timing type.

EXAMPLES

```
cell(libg41) {  
    area : 2;  
    pin(D1 D0 S0 EN) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(Z) {  
        direction : output;  
        function : "S0'D0 + S0 D1";  
        three_state : "EN";  
        timing() {  
            timing_sense : non_unate;  
            timing_type : three_state_disable;  
            intrinsic_rise : 1.00;  
            intrinsic_fall : 1.00;  
            rise_resistance : 0.1;  
            fall_resistance : 0.1;  
            related_pin : "EN";  
        }  
        timing() {  
            timing_sense : non_unate;  
            intrinsic_rise : 1.00;  
            intrinsic_fall : 1.00;  
        }  
    }  
}
```

```

        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "EN D1 D0 S0";
    }
    timing() {
        when : "S0'D0 + S0 D1' + EN";
        sdf_cond : "(D1 == 1'b0 && S0 == 1'b1) || (D0 == 1'b1 && S0 == 1'b0)";
        timing_sense : positive_unate;
        intrinsic_rise : 1.00;
        intrinsic_fall : 1.00;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "S0";
    }
}
}
}

```

In this case, the pin 'EN' is not included in the function string of the pin 'Z'.

EXAMPLE MESSAGE

Warning: Line 69, The 'when' attribute ($S0'D0 + S0 D1' + EN$) uses pins
that cannot be found in function attribute ($S0'D0 + S0 D1$). (LIBG-41)

LIBG-42 (error) The '%s' related pin of the '%s' cell has clear/
preset
timing arcs but is not asynchronous.

DESCRIPTION

The timing group is a clear/preset arc but the related pin is not asynchronous. The related pin must be in a force statement or in a clear/preset statement to be in a clear/preset timing arc.

WHAT NEXT

Define the related pin as asynchronous in the functional description or remove the timing arc.

EXAMPLES

```

cell (libg42)  {
    area : 8.000;
    pin(D)  {
        direction : input;
        capacitance : 0.100;
    }
    pin(CK)  {

```

```

        direction : input;
        capacitance : 0.100;
    }
    ff(IQ,IQB)  {
        next_state : "D";
        clocked_on : "CK";
    }
    pin(QB)  {
        direction : output;
        function : "IQB" ;
        timing()  {
            timing_type : rising_edge;
            intrinsic_rise : 2.000;
            intrinsic_fall : 3.000;
            rise_resistance : 8.000;
            fall_resistance : 6.000;
            related_pin : "CK";
        }
    }
    pin(Q)  {
        direction : output;
        function : "IQ" ;
        timing()  {
            timing_type : clear ;
            timing_sense : negative_unate ;
            intrinsic_fall : 1.000;
            fall_resistance : 4.000;
            related_pin : "QB";
        }
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 270, The 'QB' related pin of the 'libg42' cell has clear/preset timing arcs but is not asynchronous. (LIBG-42)

LIBG-43 (error) The '%s' related pin of this timing arc is an output pin and
the **timing_sense** is not specified.

DESCRIPTION

If the related pin of a timing arc is an output pin, provide the **timing_sense** attribute.

WHAT NEXT

Check the functionality of the cell, and provide the correct **timing_sense** to this

timing arc.

EXAMPLES

```
cell(libg43) {
    area : 8.000;
    pin(A E) {
direction : input;
capacitance : 1.00;
    }
    pin(B) {
direction : output;
function : "!A";
timing() {
    related_pin : "A";
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
}
    }
    pin(C) {
direction : inout;
function : "A";
three_state : "E";
timing() {
    related_pin : "E";
    timing_type : three_state_disable;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
}
timing() {
    related_pin : "E";
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
}
    }
    timing() {
    related_pin : "B";
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
}
    }
}
```

In this case, a timing_sense attribute is missing in the timing group between the inout pin 'C' and the output pin 'B'.

EXAMPLE MESSAGE

```
Error: Line 75, The 'B' related pin of this timing arc is an output pin and
      the timing_sense is not specified. (LIBG-43)
```

LIBG-44 (error) The logic represented by the 'when' string (%s)

in this timing group is not mutually exclusive with the logic represented by the 'when' string (%s) in the timing group on line %d.

DESCRIPTION

The logic represented by the 'when' string of all state-dependent timing arcs between a pair of pins should be mutually exclusive. If it isn't, Library Compiler is not be able to determine which timing arc to use to propagate signal through the path when the condition causes both of them to be evaluated 'TRUE'.

WHAT NEXT

Check the 'when' strings of both timing groups for wrong information and fix it.

EXAMPLES

```
cell(libg44) {
    area : 2;
    pin(D1 D0 S0) {
        direction : input;
        capacitance : 1;
    }
    pin(Z) {
        direction : output;
    }
    function : "S0'D0 + S0 D1";
    timing() {
        timing_sense : non_unate;
        intrinsic_rise : 1.00;
        intrinsic_fall : 1.00;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : " D0 D1";
    }
    timing() {
        when : "S0'D0 + S0 D1";
        when : "D1' S0 + S0'D0 ";
        sdf_cond : "(D1 == 1'b0 && S0 == 1'b1) || (S0 == 1'b0 && D0 == 1'b1)";
        timing_sense : positive_unate;
        intrinsic_rise : 1.00;
        intrinsic_fall : 1.00;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "S0";
    }
    timing() {
        when : "D1 S0 + S0'D0";
        sdf_cond : "(D1 == 1'b1 && S0 == 1'b1) || (S0 == 1'b0 && D0 == 1'b0)";
        timing_sense : non_unate;
    }
}
```

```

intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "S0";
}
timing() /* default */
intrinsic_rise : 1.00;
intrinsic_fall : 2.00;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "S0";
}
}
}

```

In this case, the second when attribute's string has a typo. It should be "D1 S0 + S0'D0"'; where the pin D0 should be ticked according to the sdf_cond attribute's string.

EXAMPLE MESSAGE

Error: Line 258, The logic represented by the 'when' string (S0'D0 + S0 D1') in this timing group is not mutually exclusive with the logic represented by the 'when' string (D1 S0 + S0'D0) in the timing group on line 268. (LIBG-44)

LIBG-45 (error) The 'timing_sense' attribute is missing. It is required for '%s' timing arc.

DESCRIPTION

For timing arcs of timing_type 'clear' or 'preset', timing_sense is a required attribute. It can be either 'positive_unate' or 'negative_unate' or 'non_unate'.

WHAT NEXT

Check your logic between the input and output pins and put the appropriate timing_sense in the timing group.

EXAMPLES

```

cell(libg45) {
    area : 9;
    pin(D CP CD) {
direction : input;
capacitance : 1;

```

```

        }
        state("IQ", "IQN") {
next_state : "D";
clocked_on : "CP";
force_01   : "CD' ";
        }
        pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : clear; /* timing_sense missing */
    intrinsic_fall : 0.77;
    fall_resistance : 0.0523;
    related_pin : "CD";
}
        }
        pin(QN) {
direction : output;
function : "IQN";
timing() {
    timing_type : preset;
    timing_sense : negative_unate;
    intrinsic_rise : 0.87;
    rise_resistance : 0.1523;
    related_pin : "CD";
}
        }
    }
}

```

In this case, there is a missing timing_sense attribute with positive_unate for the 'clear' timing arc of the pin 'Q'.

EXAMPLE MESSAGE

Error: Line 256, The 'timing_sense' attribute is missing. It is required for 'clear' timing arc. (LIBG-45)

LIBG-46 (error) The '%s' pin of the '%s' cell is not a clock/enable pin and cannot be used in the 'related_pin' of timing arc with the '%s' timing_type.

DESCRIPTION

Pin in the 'related_pin' of the timing group with the timing_type rising_edge or falling_edge should be a clock/enable pin.

WHAT NEXT

Check your library to see if you place the wrong pin in the 'related_pin' attribute or you have specified wrong 'timing_type'.

EXAMPLES

```
cell(libg46) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
        min_period : 99
        timing() {
            timing_type : rising_edge
            intrinsic_rise : 1.640000
            intrinsic_fall : 1.880000
            rise_resistance : 0.182000
            fall_resistance : 0.059000
            related_pin : "D"
        }
    }
    statetable ( "D CP", "Q QB") {
        table : "L/H R : - - : L/H H/L,
                  - ~R : - - : N   N";
    }
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    inverted_output : FALSE;
    timing() {
        timing_type : rising_edge
        intrinsic_rise : 1.640000
        intrinsic_fall : 1.880000
        rise_resistance : 0.182000
        fall_resistance : 0.059000
        related_pin : "CP"
    }
}
pin(QB) {
    direction : output;
    internal_node : "Q";
    inverted_output : TRUE;
    timing() {
        timing_type : rising_edge
        intrinsic_rise : 1.640000
        intrinsic_fall : 1.880000
        rise_resistance : 0.182000
        fall_resistance : 0.059000
        related_pin : "CP"
```

```
    }
}
}
```

EXAMPLE MESSAGE

Error: Line 120, The 'D' pin of the 'libg46' cell is not a clock/enable pin and cannot be used in the 'related_pin' of timing arc with the 'rising_edge' timing_type. (LIBG-46)

LIBG-47 (warning) Cell(%s): The state table entries have been expanded.

The following %d %s of overlapping entries %s been found:
For each occurrence, the first "rule out" entry is used.

DESCRIPTION

This message informs the user that overlapping entries have been found in the state table, and that the first one encountered is being used. Overlapping entries can occur when entries (that is, rules) in the **table** attribute of the **statetable** group are expanded. Overlapping means that for a single input value combination, there are multiple next internal node combinations. During expansion, some entries might overlap with others; the entry highest in the table overrides those below it.

NOTE:

All inputs that are **always** don't care are not mentioned in the input string of occurrences.

WHAT NEXT

You can avoid receiving this message by once explicitly listing the next internal node for every permutation of L and H for the current inputs, previous inputs, and current states.

EXAMPLES

```
statetable ( "D WR WRN", "Q QN") {
    table : "L/H H L : - - : L/H H/L, \ /* rule 1 */
              - - - : - - : N   N";   /* rule 2 */
}
```

During the expansion of the table into an ordered table with L and H inputs and L, H, X, and N next internal nodes, rule 1 expands into

```
L H L : - - : L H /* rule 3 */
H H L : - - : H L /* rule 4 */
```

and rule 2 expands into

```
L H L : - - : N N /* rule 5 */  
H H L : - - : N N /* rule 6 */
```

In this case, there is an overlap between rules 3 and 5 and rules 4 and 6.

EXAMPLE MESSAGE

```
Warning: Line 214, Cell(libg47): The state table entries have been expanded.  
The following 2 occurrences of overlapping entries have been found:  
occurrence 1: rule in: "L H L", rule out #1: "L H", rule out #2: "N N"  
occurrence 2: rule in: "H H L", rule out #1: "H L", rule out #2: "N N"  
For each occurrence, the first "rule out" entry is used. (LIBG-47)
```

LIBG-48 (warning) Cell(%s): The following %d %s, which includes current and delayed input values in the state table, %s unspecified: %s
Outputs are made unknown.

DESCRIPTION

In the 'table' attribute of the 'statetable' group, some entries (rules) are unspecified. All permutations of the input nodes are not specified by the table. Therefore, the internal node is made unknown for all of the missing entries.

WHAT NEXT

This warning can be eliminated by carefully specifying the state table to avoid unspecified entries.

NOTE:

The input edges symbols, {"R", "~R", "F", "~F"}, represent permutations of L and H for the delayed input and the current input. Every edge-sensitive input (one with at least one input edge symbol) is expanded into two level-sensitive inputs: the current input value and the delayed input value. For example, the input edge symbol "R" expands to "L" for the delayed input value and "H" for the current input value.

EXAMPLES

```
statetable ( "D CP", "Q QB") {
```

```
    table : "L R : - - : L H,\n          - ~R : - - : N   N";\n}
```

During the table expansion, the output for the input permutation of CP* (delayed), CP, and D: "L H H" is not specified. The output is set to "X X".

EXAMPLE MESSAGE

```
Warning: Line 134, Cell(libg48): The following 1 entry, which includes\n      current and delayed input values in the state table, is unspecified:\n      inputs: CP*, CP, D\n            \"011\"\n      Outputs are made unknown. (LIBG-48)
```

LIBG-49 (error) Cell(%s): '%s' token in "%s" field is not recognized.

DESCRIPTION

The token is not a valid state table token for that field in the table. The valid tokens for input nodes are {L, H, -, L/H, H/L, R, F, ~R, and ~F}. The valid tokens for current internal nodes are {L, H, -, L/H, and H/L}. The valid tokens for next internal nodes are {L, H, L/H, H/L, X, and N}. Therefore, the table is deleted.

WHAT NEXT

Replace the invalid token with a valid one.

LIBG-50 (error) Cell(%s): Incorrect "%s" field size in table. Size found: %d, expecting: %d.

DESCRIPTION

In the 'table' attribute of the 'statetable' group, either the input nodes, the current internal nodes, or the next internal nodes has an incorrect number of tokens.

WHAT NEXT

Fix the number of entries in the table.

EXAMPLES

```
statetable ( "D CP", "Q QB") {
    table : "L/H R : - : L/H H/L,\n
              - ~R : - : N   N";
}
```

The current field must have 2 tokens instead of 1. Change the state table to

```
statetable ( "D CP", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : N   N";
}
```

EXAMPLE MESSAGE

Error: Line 134, Cell(libg50): Incorrect "current" field size in table.
Size Found: 1, expecting: 2. (LIBG-50)

LIBG-51 (error) Cell(%s): The '%s' port has too many port names in 'input_map'.

Number of ports specified is %d, the maximum number expected is %d.

DESCRIPTION

There are too many port names specified in the 'input_map' attribute of the port. The maximum number of ports in 'input_map' is equal to the number of input nodes plus the number of internal nodes plus the number of input nodes that are edge sensitive. Therefore, the table is deleted.

WHAT NEXT

Remove some of the port names.

EXAMPLES

```
statetable ( "D CP", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : N   N";
}
pin(Q) {
    direction : output;
    function : "IQ";
    internal_node : "Q";
```

```

    input_map : "D CP Q QB CP CP";
    ...
}

```

The maximum number of port names expected in the input_map attribute is 5: 2 input nodes (D, CP), one delayed input (CP*), and 2 internal nodes(Q, QB).

EXAMPLE MESSAGE

Error: Line 139, Cell(libg51): The 'Q' port has too many port names in 'input_map'. Number of ports specified is 6, the maximum number expected is 5. (LIBG-51)

LIBG-52 (error) Cell(%s): The '%s' port requires either 'internal_node' or 'state_function'.

DESCRIPTION

The output or inout port does not have either an 'internal_node' attribute or a 'state_function' attribute even though a state table is defined. If a state table is defined, every output and inout port must have either an 'internal_node' or a 'state_function'. Therefore, the table is deleted.

WHAT NEXT

Add either an 'internal_node' attribute or a 'state_function' attribute to the port.

EXAMPLES

```

statetable ( "D CP", "Q QB") {
    table : "L/H R  : - - : L/H H/L,\n
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    function : "IQ";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}

```

In this example, the pin Q is missing the **state_function** or the **internal_node** attribute.

EXAMPLE MESSAGE

```
Error: Line 139, Cell(libg52): The 'Q' port requires either 'internal_node' or  
'state_function'. (LIBG-52)
```

LIGB-53 (error) Cell(%s): The 'internal_node' in the '%s' port does not match any internal node name in the state table.

DESCRIPTION

The 'internal_node' attribute on the port is not equal to the name of any internal node in the state table. Every 'internal_node' attribute must match one of the internal node names. Therefore, the table is deleted.

WHAT NEXT

Change the 'internal_node' attribute to equal an internal node name, or change an internal node name to equal the 'internal_node' attribute.

EXAMPLES

```
statetable ( "D CP", "Q QB") {  
    table : "L/H R : - - : L/H H/L,\n        - ~R : - - : N N";  
}  
  
pin(Q) {  
    direction : output;  
    function : "IQ";  
    internal_node : "Q1";  
    timing() {  
        timing_type : rising_edge;  
        intrinsic_rise : 1.34;  
        intrinsic_fall : 1.54;  
        rise_resistance : 0.0718;  
        fall_resistance : 0.0347;  
        related_pin : "CP";  
    }  
}
```

In this case, Q1 is not an internal node in the state table.

EXAMPLE MESSAGE

Error: Line 139, Cell(libg53): The 'internal_node' in the 'Q' port does not match any internal node name in the state table. (LIBG-53)

LIBG-54 (information) Cell(%s): The '%s' internal pin does not drive any output or is unneeded. The pin is ignored.

DESCRIPTION

This message indicates that the specified internal pin does not directly or indirectly drive any output port, or that the pin can be deleted without affecting the functionality of the cell. An internal pin that is never visible is functionally useless. Every internal pin must have a unique functional relationship with an output port. The specified internal pin is ignored.

WHAT NEXT

Either delete the internal pin or give it a unique functional relationship with an output port.

EXAMPLES

```
cell(libg54) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.9;
            intrinsic_fall : 0.9;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.4;
            intrinsic_fall : 0.4;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    statetable ( "D CP", "Q QB" ) {
        table : "L/H R : - - : L/H H/L, \
    }
```

```

-      ~R : - - : N    N";
}

pin(n1) {
    direction : internal;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}
pin(Q) {
    direction : output;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}
pin(QB) {
    direction : output;
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}
}

```

In this case, n1 is not functionally used.

EXAMPLE MESSAGE

Information: Line 139, Cell(libg54): The 'n1' internal pin does not drive any output or is unneeded. The pin is ignored. (LIBG-54)

LIBG-55 (error) Cell(%s): The 'input_map' in the '%s' port is not

allowed with the 'state_function'. Deleting the table.

DESCRIPTION

This message indicates that the specified port has both a **state_function** attribute and an **input_map** attribute. A port with a **state_function** attribute cannot have an **input_map** attribute. The **input_map** attribute can occur only with the **internal_node** attribute. Therefore, the table is deleted. However, the following combinations of attributes can be specified on the same port:

- * **state_function** and **three_state** attributes
- * **internal_node** and **input_map** attributes
- * **internal_node** and **three_state** attributes

WHAT NEXT

Either replace the **state_function** attribute with an **internal_node** attribute, or delete the **input_map** attribute.

EXAMPLES

```
pin(Q) {
    direction : output;
    state_function : "Q";
    input_map : "D CP";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}
```

You cannot have both **state_function** and **input_map** attributes in the same pin group.

EXAMPLE MESSAGE

Error: Line 139, Cell(libg55): The 'input_map' in the 'Q' port is not allowed with the 'state_function'. Deleting the table. (LIBG-55)

LIBG-56 (error) Cell(%s): The '%s' node must be specified in

the 'input_map' of the '%s' port. Deleting the table.

DESCRIPTION

This message indicates that a node was specified as a don't care "--" in the 'input_map' of the port, but the node is necessary for the port. Every functionally related input node and current internal node must be specified. Therefore, the table is deleted.

WHAT NEXT

Investigate why the assumption that the node is functionally unrelated to the port is incorrect. Possible reasons might be that the wrong internal code is chosen, the state table is incorrectly specified, or the 'input_map' is incorrect.

EXAMPLES

```
statetable ( "D CP", "Q QB") {
    table : "L/H R  : -- : L/H H/L,\n
              - ~R : -- : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "D -";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}
```

The use of a dont'care, "--", in the input_map means that the inputs 'CP' and 'CP*' are not used for the outport port 'Q'. However, given the state table, the nodes 'CP' and 'CP*' (delayed) are necessary for 'Q' and must be specified in the input_map string.

EXAMPLE MESSAGE

```
Error: Line 139, Cell(libg56): The 'CP' node must be specified in
the 'input_map' of the 'Q' port. Deleting the table. (LIBG-56)
```

LIBG-57 (error) Cell(%s): Duplicate '%s' names in the

'input_map' of the '%s' port.

DESCRIPTION

Two or more nodes have been mapped to the same name either implicitly or explicitly in the 'input_map' attribute of the port. Every node used in the table must be mapped to a unique port. Unspecified node names in the 'input_map' are implicitly mapped to the node names specified in the state table. Therefore, the table is deleted.

WHAT NEXT

Change the 'input_map' attribute to eliminate duplicate names.

EXAMPLES

```
statetable ( "D CP", "Q") {
    table : "L/H R : - - : L/H,\n
              - ~R : - - : N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "D D";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
```

In the previous case, the port name 'D' is explicitly duplicated for nodes D and CP.

```
statetable ( "D CP", "Q") {
    table : "L/H R : - - : L/H,\n
              - ~R : - - : N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "CP";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
```

```

        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

```

In the previous case, the port name 'CP' is implicitly duplicated for nodes 'D' (explicitly specified in the input_map string) and 'CP' (implicitly mapped to the node name specified in the state table).

EXAMPLE MESSAGE

Error: Line 139, Cell(libg57): Duplicate 'D' names in the 'input_map' of the 'Q' port. (LIBG-57)

LIBG-58 (error) Cell(%s): For the '%s' port, the '%s' node is mapped to '%s', which is not a port.

DESCRIPTION

After the state table node names have been explicitly and implicitly mapped to names, one of the mapped node names is not the name of a port. Every mapped node name must be the name of a port. Unspecified node names in the 'input_map' are implicitly mapped to the node names specified in the state table. Therefore, the table is deleted.

The state table is in a completely independent, isolated name space. The term "node" refers to the identifiers. The "input nodes" and the "internal nodes" can have any name made up of any character except white space and comments.

The node names are resolved to the real port names by each port with an internal_node attribute. This mapping occurs by a combination of the 'input_map' attribute and the 'internal_node' attribute. If a node name is not mapped explicitly to a real port name in the 'input_map', it automatically inherits the node name as the real port name. The internal node name specified by the 'internal_node' attribute maps implicitly to the output being defined.

After all node names have been mapped to real port names, the real port names are checked to verify that they exist and are of the right direction. That is why the error message occurs at the output port. This is when elaboration occurs.

WHAT NEXT

Change the **input_map** attribute.

EXAMPLES

```
statetable ( "D CP", "Q") {
    table : "L/H R : - - : L/H, \
              - ~R : - - : N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "data CP";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
```

In this case, the port 'data' does not exist in the cell.

EXAMPLE MESSAGE

```
Error: Line 139, Cell(libg58): For the 'Q' port, the 'D' node is mapped to
      'data', which is not a port. (LIBG-58)
```

LIBG-59 (error) Cell(%s): The 'input_map' of the '%s' port maps the '%s' input port to the '%s' internal node.

DESCRIPTION

The mapped internal node name refers to an input port. An internal node must be mapped to either an output, an internal pin, or an inout port but not to an input port. An input port cannot be driven. Therefore, the table is deleted.

WHAT NEXT

Change the 'input_map' attribute.

EXAMPLES

```
pin(CP EN) {
    direction : input;
    capacitance : 1;
}
```

```

statetable ( "D CP", "Q QB") {
    table : "L/H R : L - : L/H H/L,\n
              L/H R : H - : L H,\n
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "D CP EN";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}

```

In this case, The internal node 'Q' is mapped to an input port 'EN'. Remove 'EN' from the input_map, or change its direction.

EXAMPLE MESSAGE

Error: Line 140, Cell(libg59): The 'input_map' of the 'Q' port maps the 'EN' input port to the 'Q' internal node. (LIBG-59)

LIBG-60 (warning) Cell(%s): translates into a combinational cell. The State table information is not created.

DESCRIPTION

This message indicates that the library cell has a sequential description that actually represents a combinational function. The state table information is allowed only for describing sequential functions. This situation occurs only when reading in an old technology library DB file. Issuing this warning is controlled by the **dc_shell** or the **lc_shell** environment variable **read_db_lib_warnings**.

WHAT NEXT

Update the original technology library source file and recompile.

EXAMPLE MESSAGE

Warning: Cell(libg60): translates into a combinational cell.

The state table information is not created. (LIBG-60)

LIBG-61 (error) Cell(%s): Verification failure on the '%s' port. Deleting the table.

DESCRIPTION

When a cell has both a state table and the v3.1 format, the Library Compiler automatically converts the v3.1 format to UNIGEN. The UNIGEN generated from the v3.1 format is formally compared against the UNIGEN generated from the state table. They must match.

This message indicates that the state table description for the port does not match its sequential description. If both a state table description and a sequential description (ff, latch, ff_bank, or latch_bank) are specified for the library cell, they must match each other exactly. A listing of the differences is printed out. The maximum number of differences to be listed is controlled by the **dc_shell** environment variable **libgen_max_difference**.

WHAT NEXT

Fix or delete the state table, or fix or delete the sequential description.

EXAMPLES

```
cell(libg61) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
}
seq( IQ, IQN) {
```

```

    clocked_on : "CP";
    next_state : "D";
}

statetable ( "D CP", "Q QB") {
    table : "L/H F  : - - : L/H H/L,\n
              - ~F : - - : N   N";
}

pin(Q) {
    direction : output;
    function : "IQ";
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
pin(QB) {
    direction : output;
    function : "IQN";
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 139, Cell(libg61): Verification failure on the 'Q' port. Deleting the table. (LIBG-61)
Both table inputs are: D*, CP*, CP
List of differences between statetable vs. v3.1 table:
001 N <=> L
010 L <=> N
101 N <=> H
110 H <=> N

LIBG-62 (warning) Cell(%s): The '%s' input node is not required by any

internal node used. The input node is ignored.

DESCRIPTION

This message indicates that the specified input node is not functionally related to any internal node used. Therefore, the input node is unused. An input node must be related to at least one internal node. This warning is for informational purposes because of the possibility of a user error. This message is suppressed if the input node has always been specified with the don't care, "-", token.

WHAT NEXT

Determine why the input node is unused, and correct the problem.

EXAMPLES

```
cell(libg62) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }

    ff( IQ, IQN) {
        clocked_on : "CP";
        next_state : "D";
    }

    statetable ( "D CP X", "Q QB") {
        table : "L/H R - : - - : L/H H/L, \
                  - ~R L/H : - - : N   N";
    }

    pin(Q) {
        direction : output;
    }
}
```

```

        function : "IQ";
        internal_node : "Q";
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "CP";
        }
    }
    pin(QB) {
        direction : output;
        function : "IQN";
        internal_node : "QB";
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "CP";
        }
    }
}

```

EXAMPLE MESSAGE

Warning: Line 134, Cell(libg62): The 'X' input node is not required by any internal node used. The input node is ignored. (LIBG-62)

LIBG-63 (error) Cell(%s): The '%s' internal node is combinational.****

DESCRIPTION

In the table description of the internal node, there is no hold state "N". Every internal node should have a hold state "N". Otherwise, it is not a sequential node. Every internal node should be a single sequential storage element. Therefore, the table is deleted.

WHAT NEXT

Add a hold state to the internal node or delete the internal node.

EXAMPLES

```
cell(libg63) {
    area : 10;
```

```

pin(D) {
    direction : input;
    capacitance : 1;
    timing() {
        timing_type : setup_rising;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        related_pin : "CP";
    }
    timing() {
        timing_type : hold_rising;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        related_pin : "CP";
    }
}
pin(CP) {
    direction : input;
    capacitance : 1;
}

statetable ( "D CP", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : L   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
pin(QB) {
    direction : output;
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

In this case, the node 'QB' has a "N" state in the table but, the node 'Q' does not have an "N" state. All internal nodes in the table require at least one "N" state

and at least one "non-N", or "non-X" state.

EXAMPLE MESSAGE

Error: Line 134, Cell(libg63): The 'Q' internal node is combinational. (LIBG-63)

LIBG-64 (error) Cell(%s): The '%s' port cannot have both 'internal_node' and 'state_function' attributes.

DESCRIPTION

The port has both an 'internal_node' attribute and a 'state_function' attribute. Ports can only have either an 'internal_node' attribute, which is a name of an internal node, or a 'state_function' attribute, which is the output logic. Therefore, the table is deleted.

A port can have the following combination of attributes:

- * **state_function** and **three_state** attributes
- * **internal_node** and **input_map** attributes
- * **internal_node** and **three_state** attributes

WHAT NEXT

Remove either the 'internal_node' attribute or the 'state_function' attribute.

EXAMPLES

```
cell(libg64) {  
    area : 10;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
        timing() {  
            timing_type : setup_rising;  
            intrinsic_rise : 0.1;  
            intrinsic_fall : 0.1;  
            related_pin : "CP";  
        }  
        timing() {  
            timing_type : hold_rising;  
            intrinsic_rise : 0.1;  
            intrinsic_fall : 0.1;  
            related_pin : "CP";  
        }  
    }  
    pin(CP) {
```

```

        direction : input;
        capacitance : 1;
    }

statetable ( "D CP", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    state_function : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
pin(QB) {
    direction : output;
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}
}

```

EXAMPLE MESSAGE

Error: Line 139, Cell(libg64): The 'Q' port cannot have both 'internal_node' and 'state_function' attributes. (LIBG-64)

LIBG-65 (error) Cell(%s): The '%s' internal pin cannot have a 'three_state' attribute.

DESCRIPTION

The internal pin has a 'three_state' attribute. Internal pins are not allowed to have a 'three_state' attribute. The attribute 'three_state' can only be specified on output or inout ports.

WHAT NEXT

Either change the internal pin to a port or remove the 'three_state' attribute.

EXAMPLES

```
cell(libg65) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }

    statetable ( "D CP", "Q QB" ) {
        table : "L/H R  : - - : L/H H/L,\n
                  - ~R : - - : N   N";
    }

    pin(Q) {
        direction : internal;
        internal_node : "Q";
        three_state : "D";/* not allowed for internal pin */
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "CP";
        }
    }

    pin(QB) {
        direction : output;
        internal_node : "QB";
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
```

```

        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 139, Cell(libg65): The 'Q' internal pin cannot have a 'three_state' attribute. (LIBG-65)

LIBG-67 (warning) Cell(%s): The '%s' port has both the internal_node and the input_map specified. However, there is a mismatch in the mapping.

The '%s' port is mapped by the input_map instead of the '%s' port, the name of the internal_node. The '%s' port, specified in the input_map, is used.

DESCRIPTION

The port mapped by 'input_map' to the internal node specified in internal_node is not equal to the name of the port being defined. The current state of an output port should be equal to the state of the output port, not another port. This condition should almost never be violated, but the user is given the freedom to do so with a warning.

WHAT NEXT

Change the input_map attribute to map the current state to the port being defined.

EXAMPLES

```

cell(libg67) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
        }
    }
}

```

```

        intrinsic_fall : 0.1;
        related_pin : "CP";
    }
    timing() {
        timing_type : hold_rising;
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        related_pin : "CP";
    }
}
pin(CP) {
    direction : input;
    capacitance : 1;
}

statetable ( "D CP", "Q QB") {
    table : "L/H R : L - : L/H H/L,\n
              L/H R : H - : L H,\n
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "D CP QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
pin(QB) {
    direction : output;
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Warning: Line 140, Cell(libg67): The 'Q' port has both the internal_node and the input_map specified. However, there is a mismatch in the mapping. The 'QB' port is mapped by the input_map instead of the 'Q' port,

the name of internal_node. The 'QB' port, specified in the input_map, is used. (LIB G-67)

LIBG-68 (error) Cell(%s): Mismatch in internal pins between the v3.1 format and the state table. Deleting the table.

DESCRIPTION

UNIGEN generated from the v3.1 format is formally compared against UNIGEN generated from the state table. They must match.

This message indicates that the v3.1 format has an implied internal pin that cannot be mapped to an internal pin in the state table. There must be a one-to-one match between the internal pins of the state table and the v3.1 format.

WHAT NEXT

Determine whether the state table is specified incorrectly or is missing an internal pin. Correct the problem.

EXAMPLES

```
cell(libg68) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP CP_ALSO) {
        direction : input;
        capacitance : 1;
    }
}
ff( IQ, IQN) {
    clocked_on : "CP";
    clocked_on_also : "CP_ALSO";
```

```

    next_state : "D";
}

statetable ( "D CP", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : N   N";
}

pin(QB) {
    direction : output;
    function : "IQN";
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP_ALSO";
    }
}
}
}

```

EXAMPLE MESSAGE

Error: Line 140, Cell(libg68): Mismatch in internal pins between the v3.1 format and the state table. Deleting the table. (LIBG-68)

LIBG-69 (warning) Cell(%s): The '%s' input is specified as delayed in the state table. It will be used.

DESCRIPTION

Delayed input nodes are specified in the state table description, and can be specified with the asterisk (*) suffix. Only advanced users should consider specifying delayed inputs because there is a potential for error and confusion.

WHAT NEXT

Try to specify the state table without referring to delayed inputs.

EXAMPLES

```
cell(libg69) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }

    statetable ( "D CP* CP", "Q QB" ) {
        table : "L/H L H : - - : L/H H/L, \
                  - H - : - - : N N, \
                  - L L : - - : N N";
    }
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

pin(QB) {
    direction : output;
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
```

```

        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Warning: Line 134, Cell(libg69): The 'CP' input is specified as delayed in the state table. It will be used. (LIBG-69)

LIBG-70 (warning) Cell(%s): Delayed inputs are specified in the input_map of the '%s' port. They will be used.

DESCRIPTION

Delayed input ports are specified in the `input_map` attribute, and are specified after the undelayed inputs and the internal nodes. Only advanced users should consider specifying delayed inputs because there is a potential for error and confusion.

WHAT NEXT

Try to specify the `'input_map'` without mapping to delayed inputs.

EXAMPLES

```

cell(libg70) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CP";
        }
    }
    pin(CP) {

```

```

direction : input;
capacitance : 1;
}

statetable ( "D CP", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    inverted_output : FALSE;
    internal_node : "Q";
    input_map : "D CP Q - CP";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

pin(QB) {
    direction : output;
    internal_node : "QB";
    inverted_output : TRUE;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Warning: Line 139, Cell(libg70): Delayed inputs are specified in
the input_map of the 'Q' port. They will be used. (LIBG-70)

**LIBG-71 (error) Cell(%s): The '%s' port was expected to be %s
with**

respect to the '%s' port.

DESCRIPTION

The two ports are not the function of each other as expected. The expected behavior is derived from the v3.1 format, and the state table is expected to match. Therefore, the table is deleted.

WHAT NEXT

Correct the state table or the v3.1 format.

EXAMPLES

```
cell(libg71) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    ff( IQ, IQN) {
        clocked_on : "CP";
        next_state : "D";
    }
    statetable ( "D CP", "Q QB") {
        table : "L/H R : - - : L/H H/L, \
                  - ~R : - - : N   N";
    }
    pin(Q) {
        direction : output;
        function : "IQ";
    }
}
```

```

internal_node : "Q";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
}

pin(QB) {
    direction : output;
    function : "IQ"; /* Wrong! function should be IQN */
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

In this case, the function descriptions for the two ports are inconsistent. From the v3.1 table, the two ports have the same function (notice the typo in the function of the pin 'QB', instead of 'IQN', the function string is 'IQ'). From the UNIGEN table they are inverted.

EXAMPLE MESSAGE

Error: Line 139, Cell(libg71): The 'Q' port was expected to be uninverted with respect to the 'QB' port. (LIBG-71)

LIBG-72 (error) Cell(%s): Cannot find an implicit internal pin in the v3.1 format to match the '%s' internal pin.****

DESCRIPTION

The internal pin does not have a corresponding internal pin in the v3.1 format. The internal pins of both the v3.1 format and the state table format must match. Therefore, the table is deleted.

WHAT NEXT

Correct the state table or the v3.1 format.

EXAMPLES

```
cell(libg72) {
    area : 10;
    pin(force11) {
        direction : input;
        capacitance : 1;
    }
    pin(force10) {
        direction : input;
        capacitance : 1;
    }
    pin(force01) {
        direction : input;
        capacitance : 1;
    }
    pin(force00) {
        direction : input;
        capacitance : 2;
    }
    pin(ck ck_also) {
        direction : input;
        capacitance : 2;
    }
    pin(next) {
        direction : input;
        capacitance : 2;
    }

    state("IQ", "IQN") {
        next_state : "next";
        clocked_on : "ck";
        clocked_on_also : "ck_also";
        force_00 : "force00";
        force_01 : "force01";
        force_10 : "force10";
        force_11 : "force11";
    }
}

statetable ("next ck force00 force01 force10 force11", \
"int_net") {

    table : "- - H L L L : - : L, \
              - - L H L L : - : L, \
              - - L L H L : - : H, \
              - - L L L H : - : H, \
              - ~R L L L L : - : N, \
              L/H R L L L L : - : L/H";
}
```

```

pin(int_net) {
    direction : internal;
    internal_node : "int_net";
    input_map : "next ck_also force00 force01 force10 force11 int_net";
}

pin(Q) {
    direction : output;
    function : "IQ";
    internal_node : "int_net";
    input_map : "int_net ck_also force00 force01 force10 force11 Q";
}
}

```

EXAMPLE MESSAGE

Error: Line 165, Cell(libg72): Cannot find an implicit internal pin in the v3.1 format to match the 'int_net' internal pin. (LIBG-72)

LIBG-73 (warning) Cell(%s): Table inputs for the '%s' port exceed 16 inputs.

DESCRIPTION

The state table is stored with over 16 table inputs. There is an exponential cost in performance and memory as the number of table inputs increases. This warning tells the user about the excessive size of table inputs. To list the table, use the report_lib command with the **full_table** option.

WHAT NEXT

If possible, take advantage of the input_map attribute to reduce the size of the table.

EXAMPLES

```

cell(libg73) {
    area : 10;
    pin(i0 i1 i2 i3 i4 i5 i6 i7 i8 j0 j1 j2 j3 j4 j5) {
        direction : input;
        capacitance : 1;
    }
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.9;
        }
    }
}

```

```

        intrinsic_fall : 0.9;
        related_pin : "CP";
    }
    timing() {
        timing_type : hold_rising;
        intrinsic_rise : 0.4;
        intrinsic_fall : 0.4;
        related_pin : "CP";
    }
}
pin(CP) {
    direction : input;
    capacitance : 1;
}

statetable ( "D i0 i1 i2 i3 i4 i5 i6 i7 i8 j0 j1 j2 j3 j4 j5 CP", "Q " ) {
    table : "H H H H H H H H H H H H H H H R      : - : H,\n
              - - - - - - - - - - - - - - - - - R      : - : L,\n
              - - - - - - - - - - - - - - - - - ~R     : - : N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.34;
        intrinsic_fall : 1.54;
        rise_resistance : 0.0718;
        fall_resistance : 0.0347;
        related_pin : "CP";
    }
}
}
}

```

EXAMPLE MESSAGE

Warning: Line 149, Cell(libg73): Table inputs for the 'Q' port exceed 16 inputs.
 (LIBG-73)

LIBG-74 (error) Cell(%s): No internal_node output pin is found.

DESCRIPTION

A state table is defined for the library cell, but none of the output pins are defined as sequential. There must be at least one output with an internal_node attribute specified.

WHAT NEXT

Remove the state table description or add an internal_node attribute to at least one output.

EXAMPLES

```
cell(libg74) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }

    statetable ( "D CP ", "Q QB") {
        table : "L/H R : - - : L/H H/L,\n
                  - ~R : - - : N   N";
    }
}

pin(Q) {
    direction : output;
    state_function : "D";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

pin(QB) {
    direction : output;
    state_function : "D";
    timing() {
        timing_type : rising_edge;
```

```

        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
}
}

```

In this case, both output pins 'Q' and 'QB' have state_function and no internal_node attribute.

EXAMPLE MESSAGE

Error: Line 137, Cell(libg74): no internal_node output pin is found. (LIBG-74)

LIBG-75 (error) Cell(%s): The state_function on the '%s' port has an invalid port in the expression.****

DESCRIPTION

A valid port in a state_function expression is either an input port, an inout port with a three_state attribute, or an output port with the internal_node attribute. This error is issued if a port in the state_function is either an output port without an internal_node attribute or an inout port without a three_state attribute. Neither of these two kinds of ports is allowed in the state_function expression.

WHAT NEXT

Change the state_function expression, or change the invalid port.

EXAMPLES

```

cell(libg75) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
        }
    }
}

```

```

        intrinsic_fall : 0.1;
        related_pin : "CP";
    }
}

pin(CP) {
    direction : input;
    capacitance : 1;
}

statetable ( "D CP ", "Q QB") {
    table : "L/H R : - - : L/H H/L,\n
              - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

pin(QB) {
    direction : output;
    state_function : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

pin(QC) {
    direction : output;
    state_function : "QB"; /* 'QB' is an output without internal_node*/
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 167, Cell(libg75): The state_function on the 'QC' port has an invalid port in the expression. (LIBG-75)

LIBG-76 (warning) The '%s' test cell pin on the '%s' cell has a timing arc. The timing arc is ignored.

DESCRIPTION

The test cell pin has a timing arc, but timing arcs are only valid on the library cell.

WHAT NEXT

Move all timing arcs in the test cell to the top-level library cell.

EXAMPLES

```
cell(libg76) {
    area : 11;
    pin(D0) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CK1";
        }
    }
    pin(TI) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
        }
    }
}
```

```

        related_pin : "CK1";
    }
}

    signal_type : "test_scan_out";
}
pin(QN) {

```

```
        direction : output;
state_function : "Q'";
    signal_type : "test_scan_out_inverted";
}
}
}
```

EXAMPLE MESSAGE

Warning: Line 209, The 'TI' test cell pin on the 'libg76' cell
has a timing arc. The timing arc is ignored. (LIBG-76)

LIBG-77 (error) The '%s' test cell pin on the '%s' cell has a conflicting pin type.

DESCRIPTION

This message indicates that the test cell has one of these invalid combinations:

Two pins, of which one has the **signal_type** attribute
"test_scan_in" and the other has "test_scan_in_inverted";
or Two pins, of which one has the **signal_type** attribute
"test_scan_enable" and the other has "test_scan_enable_inverted".

A test cell cannot have two pins whose **signal_type** attributes are the inversions of each other.

WHAT NEXT

Change one of the **signal_type** attributes so that the test cell has only one of the pins in the above invalid combinations.

LIBG-78 (warning) The '%s' test cell pin on the '%s' cell has a conflicting pin type. Removing the test cell.

DESCRIPTION

This message indicates that the test cell has one of these invalid combinations:

Two pins, of which one has the **signal_type** attribute
"test_scan_in" and the other has "test_scan_in_inverted";
or Two pins, of which one has the **signal_type** attribute

"test_scan_enable" and the other has "test_scan_enable_inverted".

A test cell cannot have two pins whose **signal_type** attributes are the inversions of each other. The test cell has been removed; DFT Compiler will not use it.

WHAT NEXT

Change one of the **signal_type** attributes so that the test cell has only one of the pins in the above invalid combinations. Then re-execute.

LIBG-79 (error) The '%s' test cell pin on the '%s' cell has a conflict between the function and the test type.

DESCRIPTION

The test cell pin either has a signal_type attribute of "test_scan_out" and a function of the inverted output (i.e. second variable) or the pin has a signal_type attribute of "test_scan_out_inverted" and a function of the non-inverted output (i.e. first variable).

If a pin has both a signal_type attribute and a function attribute, the two attributes must be consistent. A "test_scan_out" corresponds to the non-inverted output function and a "test_scan_out_inverted" corresponds to the inverted output.

WHAT NEXT

Change either the signal_type attribute or the function.

LIBG-80 (warning) The '%s' test cell pin on the '%s' cell has a conflict between the function and the test type. The test cell is removed.

DESCRIPTION

The test cell pin either has a signal_type attribute of "test_scan_out" and a function of the inverted output (i.e. second variable) or the pin has a signal_type attribute of "test_scan_out_inverted" and a function of the non-inverted output (i.e. first variable).

If a pin has both a signal_type attribute and a function attribute, the two attributes must be consistent. A "test_scan_out" corresponds to the non-inverted output function and a "test_scan_out_inverted" corresponds to the inverted output.

The test cell is removed and DFT Compiler will not use it.

WHAT NEXT

Change either the signal_type attribute or the function.

LIBG-81 (error) Cell(%s): translates into a combinational cell.

DESCRIPTION

The library cell has a sequential description, which represents a combinational function. The state table information is only allowed on sequential library cells.

WHAT NEXT

Change the sequential description.

EXAMPLES

```
cell(libg81) {
    area : 4;

```

EXAMPLE MESSAGE

Error: Line 109, Cell(libg81): translates into a combinational cell. (LIBG-81)

LIBG-82 (error) The test cell on the '%s' cell is not DFT Compiler supported.

DESCRIPTION

This message indicates that the description of the specified test cell is not supported by DFT Compiler. DFT Compiler has restrictions on the non-test mode and test inputs; the test cell violates one or more of these restrictions. For details on these restrictions, refer to the [DFT Compiler Test Design Rule Checking User Guide](#).

WHAT NEXT

Revise the test cell description so that it conforms to DFT Compiler restrictions; or, remove the test cell.

LIBG-83 (warning) The test cell on the '%s' cell is not DFT Compiler supported.

Removing the test cell.

DESCRIPTION

The test cell has a description that is not supported by DFT Compiler. DFT Compiler has restrictions on the non-test mode and test inputs; the test cell violates one or more of these restrictions. For details on these restrictions, refer to the [DFT Compiler Test Design Rule Checking User Guide](#).

The test cell has been removed; DFT Compiler will not use this cell during scan insertion.

WHAT NEXT

Obtain the technology library source and revise the test cell description so that it conforms to DFT Compiler restrictions; or, remove the test cell.

LIBG-84 (warning) The '%s' port in the '%s' cell does not have a function in the test cell descriptions. The cell is a black box.

DESCRIPTION

No function for that port can be derived from the test cells. The port function must be either explicitly specified or inferable from the test cell descriptions. The cell is a black box.

This warning is issued when reading a .db library and can be switched off by setting the environment variable `read_db_lib_warnings` to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-85.

WHAT NEXT

Change the technology library source by explicitly or implicitly providing the function for that port.

LIBG-85 (error) The '%s' port in the '%s' cell does not

have a function in the test cell descriptions.

DESCRIPTION

No function for that port can be derived from the test cells. The port function must be either explicitly specified or inferable from the test cell descriptions. Some functional information is described but not all. Either the cell is completely specified, or it is completely unspecified.

WHAT NEXT

Change the technology library source by either describing the port function explicitly or implicitly in the test cell descriptions or removing all functional descriptions.

EXAMPLES

```
cell(libg85) {
    area : 11;
    pin(D0) {
        direction : input;
        capacitance : 1;

        }

        pin(Q) {
            direction : output;
            internal_node : "Q";
            signal_type : "test_scan_out";
        }
        pin(QN) {
            direction : output;
            signal_type : "test_scan_out_inverted";
        }
    }
}

```

EXAMPLE MESSAGE

Error: Line 177, The 'QN' port in the 'libg85' cell does not have a function in the test cell descriptions. (LIBG-85)

LIBG-86 (warning) The '%s' port in the '%s' cell has a timing arc related to '%s' that is inconsistent.

DESCRIPTION

The timing type of the timing arc from the specified port to the related port is inconsistent with respect to other timing in the cell. For example, a port cannot have both a **rising_edge** timing type and a **falling_edge** timing type.

This warning occurs only when reading in a technology library DB file. Issuing this warning is controlled by the **dc_shell** or the **lc_shell** environment variable **read_db_lib_warnings**.

The same problem in a .lib library causes an error. See the .lib example for LIBG-88.

WHAT NEXT

Update the original technology library source. Make timing arcs consistent.

EXAMPLE MESSAGE

Warning: The 'Q' in the 'libg86' cell has a timing arc related to 'D' that is inconsistent. (LIBG-86)

LIGB-87 (error) Cell(%s): the internal node has L/H or H/L but no input has L/H or H/L. Deleting the table.

DESCRIPTION

In the **table** attribute of the **statetable** group, an internal node has either L/H or H/L specified but none of the input nodes have either L/H or H/L specified. If an internal node has either the L/H or H/L value, at least one input node must be L/H or H/L. Therefore, the table is deleted.

WHAT NEXT

Change the **table** attribute to replace L/H or H/L for the internal node with either L, H, X, or N, or make one of the input nodes L/H or H/L.

EXAMPLES

```
cell(libg87) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
}
```

```

statetable ( "D CP", "Q QB") {
    table :      "L R  : - - : L/H H/L,\ \
                  - ~R : - - : N   N";
}

pin(Q) {
    direction : output;
    internal_node : "Q";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}

pin(QB) {
    direction : output;
    internal_node : "QB";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 132, Cell(libg87): the internal node has L/H or H/L but no input has L/H or H/L. Deleting the table. (LIBG-87)

LIBG-88 (error) The '%s' port in the '%s' cell has a timing arc related to '%s' that is inconsistent.

DESCRIPTION

The timing type of the timing arc from the specified port to the related port is inconsistent with respect to other timing in the cell. For example, a port cannot have both a **rising_edge** timing type and a **falling_edge** timing type.

WHAT NEXT

Update the technology library source to make the timing arcs consistent.

EXAMPLES

```
cell(libg88) {
    area : 13;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "C";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "C";
        }
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
    pin(D2) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "C2";
        }
        timing() {
            timing_type : hold_falling; /* error */
            intrinsic_rise : 0.0;
            intrinsic_fall : 0.0;
            related_pin : "C2";
        }
    }
    pin(C2) {
        direction : input;
        capacitance : 2;
    }
    pin(Q) {
        direction : output;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 0.1;
            rise_resistance : 0.1;
        }
    }
}
```

```

        fall_resistance : 0.1;

        intrinsic_fall : 2.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C2";
    }
}
test_cell() {
    pin(D) {
        direction : input;
    }
    pin(C) {
        direction : input;
    }
    pin(D2) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(C2) {
        direction : input;
        signal_type : "test_scan_clock";
    }
    state ("IQ", "IQN") {
        next_state : "D";
        clocked_on : "C";
    }
    pin(Q) {
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
    }
}

```

```
        pin(QN) {
            direction : output;
            function : "IQN";
            signal_type : "test_scan_out_inverted";
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 89, The 'D2' port in the 'libg88' cell has a timing arc related to 'C2' that is inconsistent. (LIBG-88)

LIBG-89 (warning) The '%s' port in the '%s' cell has an inconsistent function in the test cells.

DESCRIPTION

The test_cells define different functions for the port. The port must have one unique function among all of the test cells.

When reading a .db library, Library Compiler uses the first test_cell to create the full functional description. The second test_cell is ignored.

This warning can be switched off by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-90.

WHAT NEXT

The default behavior of selecting the first test_cell as the correct one should be correct in most cases.

Change the technology library source to make the function of the port in all of the test cells consistent.

LIBG-90 (error) The '%s' port in the '%s' cell has an inconsistent

function in the test cells.

DESCRIPTION

This message indicates that the test cells define different functions for the specified port. The port must have one unique function among all test cells.

WHAT NEXT

Update the technology library source so that the function of the port in all test cells is consistent.

EXAMPLES

```
cell(libg90) {
    area : 21;
    pin(D1) {
        direction : input;
        capacitance : 1;
    }
    pin(C1) {
        direction : input;
        capacitance : 2;
    }
    pin(D2) {
        direction : input;
        capacitance : 1;
    }
    pin(C2) {
        direction : input;
        capacitance : 2;
    }
    pin(C3) {
        direction : input;
        capacitance : 1;
    }

    pin(Q1) {
        direction : output;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 0.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "C1";
        }
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 0.0;
            rise_resistance : 0.1;
        }
    }
}
```

```

    fall_resistance : 0.1;
    related_pin : "C2";
}
}
pin(Q2) {
    direction : output;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C3";
    }
}
test_cell() {
    pin(D1) {
        direction : input;
    }
    pin(C1) {
        direction : input;
    }
    pin(D2) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(C2) {
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    pin(C3) {
        direction : input;
        signal_type : "test_scan_clock_b";
    }
    state("IQ", "IQN") {
        force_10 : "C1 D1";
        force_01 : "C1 D1'";
    }
    pin(Q1) {
        direction : output;
        function : "IQ";
    }
    pin(Q2) {
        direction : output;
        signal_type : "test_scan_out";
    }
}
test_cell() {
    pin(D1) {
        direction : input;
    }
    pin(C1) {
        direction : input;
    }
    pin(D2) {

```

```

        direction : input;
        signal_type : "test_scan_in";
    }
    pin(C2) {
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    pin(C3) {
        direction : input;
    }
    seq("IQ","IQN") {
        data_in : "D1";
        enable : "C1";
        enable_also : "C3'";
    }
    pin(Q1) {
        direction : output;
    }
    pin(Q2) {
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
    }
    pin(Q2N) {
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
    }
}
}
}

```

For the pin 'Q2', the 'function' attribute is missing in the first test_cell.

EXAMPLE MESSAGE

Error: Line 175, The 'Q2' port in the 'libg90' cell has an inconsistent function in the test cells. (LIBG-90)

LIBG-91 (error) The '%s' attribute is required when both 'clear' and 'preset' are present in the sequential model and the %s '%s' is used in the function attribute of the output pin(s) of the cell.

DESCRIPTION

When both 'clear' and 'preset' are present in the sequential model, the **clear_preset_var1** and/or **clear_preset_var2** attributes are required, depending on which variable of the sequential model is used in the function attribute of the output pin(s) of the cell. For example, if the first variable is used, **clear_preset_var1** is required.

WHAT NEXT

Make the appropriate correction in your library, as indicated in the error message. For more information on the `clear_preset_var` attributes, refer to the **Library Compiler Reference Manual**, Vol. 1.

LIBG-92 (warning) The '%s' port in the '%s' cell has a circular dependency.

DESCRIPTION

There is an undelayed feedback loop to the output, inout, and internal port. This circular dependency is not allowed.

This warning is issued if the current port appears in the list of expanded inputs of the port.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable `read_db_lib_warnings` to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-93.

WHAT NEXT

Break the feedback loop by delaying one of the inputs in the feedback path.

LIBG-93 (error) The '%s' port in the '%s' cell has a circular dependency.

DESCRIPTION

There is an undelayed feedback loop to the output port. This circular dependency is not allowed.

This error is issued if the current port appears in the list of expanded inputs of the port.

WHAT NEXT

Break the feedback loop by delaying one of the inputs in the feedback path.

EXAMPLES

```
cell(libg93) {
    area : 7;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(R) {
        direction : input;
        capacitance : 1;
    }

    statetable("D R CP", "Q") {
        table : "H/L L  R : - : H/L, \
                  - L ~R : - : N, \
                  - H - : - : H";
    }

    /* internal sequential state_function */
    pin(E) {
        direction : internal;
        state_function : "Q1+R";
    }

    /* slave with sequential reset */
    pin(Q1) {
        direction : internal;
        internal_node : "Q";
        input_map : "D Q2 CP";
    }

    /* master driving Q1 */
    pin(Q2) {
        direction : output;
        internal_node : "Q"
        input_map : "D E CP";
    }

    pin(CP) {
        direction : input;
        capacitance : 1;
    }

}
```

In this case, there is a feedback loop for 'Q1'. To break the dependency, delay one of the inputs in the feedback path. The pins 'E' and 'Q2' in the cell group can be changed as follows:

```
pin(E) {
    direction : internal;
    state_function : "D+Q1";
```

```
}

pin(Q2) {
    direction : output;
    internal_node : "Q"
    input_map : "E R CP";
}
```

EXAMPLE MESSAGE

Error: Line 274, The 'Q1' port in the 'libg93' cell has a circular dependency. (LIB G-93)

LIBG-94 (warning) The '%s' cell needs a noninverted output.

DESCRIPTION

The test cell does not have any noninverted output. This particular type of test cell requires at least one noninverted output to be defined.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-95.

WHAT NEXT

Specify the full function or define an output to be noninverted.

LIBG-95 (error) The '%s' cell needs a noninverted output.

DESCRIPTION

The test cell has no noninverted output. This particular type of test cell requires at least one noninverted output to be defined.

WHAT NEXT

Specify the full function or define an output to be noninverted.

EXAMPLES

```
cell(libg95) {
    area : 15;
    pin(D) {
```

```

        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
    pin(TSI) {
        direction : input;
        capacitance : 1;
    }
    pin(TSE) {
        direction : input;
        capacitance : 2;
    }
    pin(QN) {
        direction : output;
        capacitance : 2;
    }
    pin(TSO TSOI) {
        direction : output;
    }
    test_cell() {
        pin(D) {
            direction : input;
        }
        pin(C) {
            direction : input;
        }
        pin(TSI) {
            direction : input;
            signal_type : "test_scan_in";
        }
        pin(TSE) {
            direction : input;
            capacitance : 2;
            signal_type : "test_scan_enable";
        }
        statetable("D C", "QN") {
table : "L/H H : - : H/L,\

- L : - : N";
        }

        pin(TSOI) {
            direction : output;
            signal_type : "test_scan_out_inverted";
        }
        pin(TSO) {
            direction : output;
            signal_type : "test_scan_out";
        }
        pin(QN) {
            direction : output;
internal_node : "QN";

```

```
    }
}
}
```

In this case, the cell is a latch. To fix the problem, add another noninverted pin. For example, the following change to the cell will fix the problem.

```
cell(libg95) {
...
pin(Q) {
    direction : output;
    capacitance : 2;
}
...
test_cell() {
...
    statetable("D C", "Q QN") {
table : "L/H H : - - : L/H H/L,\n
-   L : - - : N N";
    }
...
    pin(Q) {
        direction : output;
internal_node : "Q";
    }
}
}
```

EXAMPLE MESSAGE

Error: Line 142, The 'libg95' cell needs a noninverted output. (LIBG-95)

LIBG-96 (warning) The '%s' port in the '%s' cell is used in both test and non test mode.

DESCRIPTION

The input port has a test attribute and is also used in the non test mode. This is not allowed.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-97.

WHAT NEXT

Specify the full function of the test cell.

LIBG-97 (error) The '%s' port in the '%s' cell is used in both test and non test mode.

DESCRIPTION

The input port has a test attribute and is also used in the non test mode. This is not allowed.

WHAT NEXT

Specify the full function of the test cell.

EXAMPLES

```
cell(libg97) {
    area : 13;
    pin(D TSI) {
        direction : input;
        capacitance : 1;
    }
    pin(C TSE) {
        direction : input;
        capacitance : 2;
    }
    pin(Q TSO) {
        direction : output;
    }
    test_cell() {
        pin(D C) {
            direction : input;
        }
        pin(TSI) {
            direction : input;
            signal_type : "test_scan_in";
        }
        pin(TSE) {
            direction : input;
            capacitance : 2;
            signal_type : "test_scan_enable";
        }
        statetable("C D TSI", "Q") {
            table : "H L/H H/L : - : L/H, \
L - - : - : N";
        }
    }
}
```

```

        pin(Q) {
            direction : output;
internal_node : "Q";
        }
        pin(TSO) {
            direction : output;
            signal_type : "test_scan_out";
        }
    }
}

```

In this case, the input port 'TSI' has the "test_scan_in" attribute, and it is used in the state table input entry.

EXAMPLE MESSAGE

Error: Line 141, The 'TSI' port in the 'libg97' cell is used in both test and non test mode. (LIBG-97)

LIBG-98 (warning) The '%s' test cell has an incompatible non test mode.

DESCRIPTION

The non test mode of the test cell is incompatible with the test attributes of the test cell.

This warning appears after any of the following warning messages: LIBG-128, LIBG-129, LIBG-130, and LIBG-131. For more information, refer to the man page of the issued warning.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-99.

WHAT NEXT

Specify the full function of the test cell.

LIBG-99 (error) The '%s' test cell has an incompatible non test

mode.

DESCRIPTION

This message indicates that the non test mode of the test cell is incompatible with the test attributes of the test cell.

This error is displayed for a cell in UNIGEN format after any of the following error messages: LIBG-158, LIBG-159, LIBG-160, and LIBG-161. For more information, refer to the man page of the issued error.

WHAT NEXT

Update the non test mode description or the test mode description to make them consistent.

EXAMPLES

```
cell(libg99) {
    area : 11;
    pin(D1 D2 D3) {
        direction : input;
        capacitance : 1;
    }
    pin(CP SCK1 SCK2) {
        direction : input;
        capacitance : 1;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_falling;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "SCK2";
        }
    }
    pin(Q) {
        direction : output;
    }
    pin(Q2) {
        direction : output;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "CP SCK1";
        }
    }
}
```

```

test_cell() {
    pin(D1 D2 D3 CP) {
        direction : input;
    }
    pin(SCK1) {
        direction : input;
        signal_type : "test_scan_clock_b";
    }
    pin(SCK2) {
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    pin(SI) {
        direction : input;
        signal_type : "test_scan_in";
    }
    statetable("C D ", "Q") {
        table : "R H/L : - : H/L,\n
~R - : - : N";
    }
    pin(Q) {
        direction : output;
    internal_node : "Q";
    input_map : "CP D1";
        signal_type : "test_scan_out";
    }
    pin(Q2) {
        direction : output;
    internal_node : "Q";
    input_map : "CP D2";
        signal_type : "test_scan_out";
    }
}
}

```

In this case, the pin 'Q' generated error LIBG-161, which generated this error.

MESSAGE EXAMPLE

Error: Line 62, The 'libg99' test cell has an incompatible non test mode. (LIBG-99)

LIGB-100 (warning) The '%s' port in the '%s' cell has both a function and a test attribute. The test_cell will be deleted.

DESCRIPTION

This message indicates that the specified port has both a function statement and a test attribute. For this particular test cell type, a port cannot have both a

function statement and a test attribute.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-101.

WHAT NEXT

Remove either the function statement or the test attribute to correctly specify the test_cell.

LIGB-101 (error) The '%s' port in the '%s' cell has both a function and a test attribute.

DESCRIPTION

This messages is issued only for single-latch LSSD and muxed-latch scan cells. The port has both a function statement and a test attribute. For the particular test cell type, a port cannot have both a function statement and a test attribute.

A function statement can be a **function**, a **state_function**, or an **internal_node** attribute.

A test attribute can be a **test_scan_in**, a **test_scan_in_inverted**, a **test_scan_enable**, a **test_scan_enable_inverted**, a **test_scan_out**, a **test_scan_out_inverted**, a **test_scan_clock**, a **test_scan_clock_a**, a **test_scan_clock_b**, or a **test_clock**.

WHAT NEXT

If you can access the original technology library source file, remove either the function statement or the test attribute to correctly specify the test_cell.

EXAMPLES

```
cell(libg101) {  
    area : 13;  
    pin(D SDI) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(C SE) {  
        direction : input;  
        capacitance : 2;  
    }  
    pin(QN) {
```

```

        direction : output;
    }
    test_cell() {
        pin(D C) {
            direction : input;
        }
        pin(SDI) {
            direction : input;
            signal_type : "test_scan_in";
        }
        pin(SE) {
            direction : input;
            capacitance : 2;
            signal_type : "test_scan_enable";
        }
        statetable("D C", "QN") {
table : "L/H H : - : H/L, \
- L : - : N";
        }
        pin(QN) {
            direction : output;
            inverted_output : TRUE;
            internal_node : "QN";
            signal_type : "test_scan_out_inverted";
        }
    }
}

```

In this case, the pin 'QN' has both an **internal_node** and a **test_scan_out_inverted** attributes.

MESSAGE EXAMPLE

Error: Line 152, The 'QN' port in the 'libg101' cell has both a function and a test attribute. (LIBG-101)

LIBG-102 (warning) The '%s' cell has more than one clock.

DESCRIPTION

The auxiliary clocked LSSD cell has more than one clock. This is not supported by DFT Compiler.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-103.

WHAT NEXT

This type of cell is not supported by DFT Compiler, so no further action is indicated.

LIBG-103 (error) The '%s' cell has more than one clock.

DESCRIPTION

The auxiliary clocked LSST cell has more than one clock. This is not supported by DFT Compiler.

WHAT NEXT

This type of cell is not supported by DFT Compiler, so no further action is indicated.

EXAMPLES

```
cell(libg103) {
    area : 12;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CK,CK2,IH) {
        direction : input;
        capacitance : 1;
    }
    pin(A,B) {
        direction : input
        capacitance : 2;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_falling;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "A";
        }
        timing() {
            timing_type : hold_falling;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "A";
        }
    }
    pin(Q) {
```

```

direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CK IH";
}
timing() {
    timing_type : falling_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "B";
}
}
pin(XQ) {
    direction : output;
}
test_cell(){
    pin(D,CK,CK2){
        direction : input;
    }
    pin(IH){
        direction : input;
        signal_type : "test_clock";
    }
    pin(SI){
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(A){
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    pin(B){
        direction : input;
        signal_type : "test_scan_clock_b";
    }
    ff("IQ", "IQN"){
        clocked_on : "CK CK2";
        next_state : "D";
    }
    pin(Q){
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
    }
    pin(XQ){
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
    }
}

```

```
    }
}
```

In this case, there are two clocks, 'CK' and 'CK2', which is not allowed.

MESSAGE EXAMPLE

Error: Line 162, The 'libg103' cell has more than one clock. (LIBG-103)

LIBG-104**** (warning) The '%s' pin of the '%s' design is not a clock pin
and should not be used in the 'related_pin' of '%s' timing arc.

DESCRIPTION

By definition, a pin in the **related_pin** attribute of the timing group with the **timing_type setup_rising, setup_falling, hold_rising or hold_falling** should be a clock pin. It is treated as a warning only for backward compatibility.

WHAT NEXT

Check your library for a wrong pin in the **related_pin** attribute or for an incorrect **timing_type**.

EXAMPLES

```
cell(libg104) {
    area : 10;
    pin(CK) {
        direction : input;
        clock      : true;
        capacitance : 1.0;
    }
    pin(D) {
        direction : input ;
        capacitance : 1.0 ;
        timing() {
            related_pin : "CK";
            timing_type : setup_rising;
            intrinsic_fall : 1.0;
            intrinsic_rise : 1.0;
        }
        timing() {
            related_pin : "CK";
            timing_type : hold_rising;
            intrinsic_fall : 0.1;
            intrinsic_rise : 0.1;
        }
    }
}
```

```

}
pin(P) {
    direction : input;
    capacitance : 1.0;
    timing() {
        related_pin : "CK";
        timing_type : setup_rising;
        intrinsic_rise : 0.0;
    }
}
ff ("IQ", "IQN") {
    next_state : "D";
    clocked_on : "CK";
    preset : "P";
}
pin(Q) {
    direction : output;
    function : "IQ";
    timing() {
        related_pin : "P";
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
    }
}
}

```

The timing group of the pin 'Q' contains the pin 'P' in the related_pin attribute. This caused the warning because the timing_type is **setup_rising**

MESSAGE EXAMPLE

Warning: Line 153, The 'P' pin of the 'libg104' design is not a clock pin and should not be used in the 'related_pin' of 'setup' timing arc. (LIBG-104)

LIBG-105 (error) There is a missing timing arc between the '%s' and '%s' pins in the '%s' cell. A timing arc of the right timing_type is expected between the two specified pins of the cell.

DESCRIPTION

A timing arc of the right timing_type is expected between the two specified pins of the cell. For example, a timing arc with timing_type rising_edge/falling_edge is required from the clock/enable pin to the output pin. This error might be generated by a previous warning or error such as: LIBG-104.

WHAT NEXT

Specify or correct the timing arc to make the cell description complete.

EXAMPLES

```
cell(libg105) {
    area           : 10;
    pin(CK) {
        direction      : input;
        clock          : true;
        capacitance   : 1.0;
    }
    pin(D) {
        direction      : input;
        capacitance   : 1.0;
        timing() {
            related_pin : "CK";
            timing_type  : setup_rising;
            intrinsic_fall : 1.0;
            intrinsic_rise  : 1.0 ;
        }
        timing() {
            related_pin : "CK";
            timing_type  : hold_rising;
            intrinsic_fall : 0.0;
            intrinsic_rise  : 0.0;
        }
    }
    pin(P) {
        direction      : input;
        capacitance   : 1.0;
        timing() {
            related_pin : "CK";
            timing_type  : setup_rising;
            intrinsic_rise  : 0.0;
        }
    }
    ff ("IQ", "IQN") {
        next_state : "D";
        clocked_on : "CK";
        preset   : "P";
    }
    pin(Q) {
        direction      : output;
        function       : "IQ";
        timing() {
            related_pin : "CK";
            timing_type  : rising_edge;
            intrinsic_rise  : 1.0;
            intrinsic_fall : 1.0;
        }
    }
}
```

A timing group is missing in the pin 'Q' for the pin 'P'.

MESSAGE EXAMPLE

Error: Line 151, There is a missing timing arc between the 'P' and 'Q' pins in the 'libg105' cell. A timing arc of the right timing_type is expected between the two specified pins of the cell. (LIBG-105)

LIBG-106 (warning) The '%s' timing type is invalid between the two specified pins.

DESCRIPTION

The specified **timing_type** attribute is invalid between the pin that has the timing group and the pin in the **related_pin** attribute specified. It is most likely that you have specified a "combinational" timing arc from the clock, enable, clear, or preset pin to the output pin, or that the **timing_type** attribute is missing.

WHAT NEXT

Specify the correct timing_type attribute.

EXAMPLES

```
cell(libg106) {
    area           : 10;
    pin(CK) {
        direction      : input;
        clock          : true;
        capacitance   : 1.0;
    }
    pin(D) {
        direction      : input;
        capacitance   : 1.0;
        timing() {
            related_pin : "CK";
            timing_type : setup_rising;
            intrinsic_fall : 1.0;
            intrinsic_rise : 1.0;
        }
        timing() {
            related_pin : "CK";
            timing_type : hold_rising;
            intrinsic_fall : 0.0;
            intrinsic_rise : 0.0;
        }
    }
    pin(P) {
        direction      : input;
```

```

    capacitance          : 1.0;
    timing() {
        related_pin      : "CK";
        timing_type       : setup_rising;
        intrinsic_rise    : 0.0;
    }
}
ff ("IQ", "IQN") {
    next_state : "D";
    clocked_on : "CK";
    preset : "P";
}
pin(Q) {
    direction         : output;
    function          : "IQ";
    timing() {
        related_pin      : "CK";
        timing_type       : setup_rising;
        intrinsic_rise    : 1.0;
        intrinsic_fall    : 1.0
    }
}
}

```

In this case, there is a 'setup_rising' attribute between the output port 'Q' and the clock 'CK'.

MESSAGE EXAMPLE

Warning: Line 151, The 'setup_rising' timing type is invalid between the two specified pins. (LIBG-106)

LIBG-107 (error) The complex state_function is not allowed in the '%s' test cell.

DESCRIPTION

The test cell has a port with a complex state_function. A complex state_function is any expression not equivalent to a buffer or an inverter.

Currently, complex state_functions are not supported in test cells.

WHAT NEXT

Either remove the state_function or make it into a buffer or an inverter.

EXAMPLES

```
cell(libg107) {
```

```

area : 21;
pin(D1 D2) {
    direction : input;
    capacitance : 1;
}
pin(C1 C2 C3) {
    direction : input;
    capacitance : 2;
}
pin(Q1 Q2 Q2N) {
    direction : output;
}
pin(Q1N) {
    direction : output;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C2";
    }
}
test_cell() {
    pin(D1 C1 C3) {
        direction : input;
    }
    pin(D2) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(C2) {
        direction : input;
        signal_type : "test_scan_clock_a";
    }
    statetable ("C1 D1 C3", "Q1 Q2") {
        table : "H L/H - : H - : L/H -, \
                  H - - : L - : L -, \
                  - - H : L/H - : - L/H, \
                  - - - : - - : N   N";
    }
    pin(Q1) {
        direction : output;
internal_node : "Q1";
    }
    pin(Q1N) {
        direction : output;
        state_function : "Q1'";
    }
    pin(Q2) {
        direction : output;
    }
}

```

```

internal_node : "Q2";
    signal_type : "test_scan_out";
}
pin(Q2N) {
    direction : output;
/* This state_function is too complex, change it to a buffer/inverter*/
    state_function : "Q2' + C1";
    signal_type : "test_scan_out_inverted";
}
}
}
}

```

EXAMPLE MESSAGE

Error: Line 134, The complex state_function is not allowed in the 'libg107' test cell.
 11. (LIBG-107)

LIBG-108 (error) The three_state attribute is not allowed in the '%S' test cell.

DESCRIPTION

The test cell has a port with a three_state attribute.

Currently, the three_state attribute is not supported in test cells.

WHAT NEXT

Remove the three_state attribute from the test cell.

EXAMPLES

```

cell(libg108) {
    area : 21;
    pin(D1 D2) {
        direction : input;
        capacitance : 1;
    }
    pin(C1 C2 C3) {
        direction : input;
        capacitance : 1;
    }
    pin(Q1 Q2 Q2N) {
        direction : output;
    }
    pin(Q1N) {
        direction : output;
    }
}

```

```

timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C2";
}
}

test_cell() {
    pin(D1 C1 C3) {
        direction : input;
    }

    direction : output;
internal_node : "Q2";
    signal_type : "test_scan_out";
}
pin(Q2N) {
    direction : output;
    state_function : "Q2'";
}
/* three_state attribute is not allowed in test_cell */
three_state : "C1";
    signal_type : "test_scan_out_inverted";
}
}
}
}

```

EXAMPLE MESSAGE

Error: Line 169, The three_state attribute is not allowed in the 'libg108' test cel
l. (LIBG-108)

LIBG-109 (warning) Asynchronous specifications in the '%s' cell are incompletely specified.

DESCRIPTION

There is a set of input values for asynchronous inputs that causes more than one force_* condition to be true. The force_* conditions are not mutually exclusive; the cell is unspecified when more than one force_* condition is valid.

Design Compiler cannot support this cell and might generate invalid logic if the cell is used.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-110.

WHAT NEXT

You can put the attributes **dont_touch** and **dont_use** on the library cell to prevent this cell from being used and potentially generating invalid logic.

Alternatively, you can change the source technology library. Change the force_* expressions so they are mutually exclusive. There should be no input condition for which more than one force_* statement is valid.

LIBG-110 (warning) Asynchronous specifications in the '%s' cell are incomplete or are not mutually exclusive. The cell has been made a black box.

DESCRIPTION

There is a set of input values for asynchronous inputs that causes more than one force_* condition to be true.

The force_* conditions are not mutually exclusive; the cell is unspecified when more than one force_* condition is valid.

Design Compiler cannot support this cell; therefore, the cell has been made a black box.

WHAT NEXT

Change the force_* expressions so they are mutually exclusive. There should be no input condition for which more than one force_* statement is valid.

EXAMPLES

```
cell(libg110) {
    area : 10;
    pin(force11) {
        direction : input;
        capacitance : 1;
    }
    pin(force10) {
        direction : input;
        capacitance : 1;
    }
    pin(force01) {
        direction : input;
        capacitance : 1;
    }
    pin(force00) {
        direction : input;
        capacitance : 2;
    }
    pin(ck) {
        direction : input;
        capacitance : 2;
    }
    pin(next) {
        direction : input;
        capacitance : 2;
    }
    state("IQ", "IQN") {
        next_state : "next";
        clocked_on : "ck";
        force_00 : "force00";
        force_01 : "force01";
        force_10 : "force10";
        force_11 : "force11";
    }
    statetable ("next ck ck* force00 force01 force10 force11", "out") {
        table : " - - - H L L L : - : L, \
                  - - - L H L L : L/H : L, \
                  - - - L L H L : - : H, \
                  - - - L L L H : - : H, \
                  L/H H L L L L L : - : L/H, \
    
```

```

    - L L L L L L : - : N,\

    - L H L L L L : - : N,\

    - H H L L L L : - : N";
}

pin(Q) {
    function : "IQ";
    internal_node : "out";
    direction : output;
}
}

```

EXAMPLE MESSAGE

Warning: Line 111, Asynchronous specifications in the 'libg110' cell
 are incomplete or are not mutually exclusive.
 The cell has been made a black box. (LIBG-110)

LIBG-111 (warning) Design Compiler does not support the
 values for
 clear_preset_var? in the '%s' cell. The cell has been made a
 black box.

DESCRIPTION

The cell has invalid values (N, X or T) for clear_preset_var1 and clear_preset_var2.
 Because of these values, Design Compiler cannot support the cell. The cell has been
 made a black box.

WHAT NEXT

Change the N, X or T value to a L or H value.

EXAMPLES

```

cell(libg111) {
area : 11;
pin(D) {
direction : input;
capacitance : 1;
}
pin(CP) {
direction : input;
}

```

```

capacitance : 1;
}
pin(CLR) {
direction : input;
capacitance : 1;
}
pin(SET) {
direction : input;
capacitance : 1;
}
ff("IQ","IQN") {
next_state : "D";
clocked_on : "CP";
clear : "CLR'";
preset : "SET'";
clear_preset_var1 : X;
clear_preset_var2 : X;
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CP";
}
timing() {
timing_type : clear;
timing_sense : positive_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "CLR";
}
timing() {
timing_type : preset;
timing_sense : negative_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "SET";
}
}
pin(QN) {
direction : output;
function : "IQN";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CP";
}
}

```

```

        timing() {
timing_type : preset;
timing_sense : negative_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "CLR";
}
        timing() {
timing_type : clear;
timing_sense : positive_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "SET";
}
}

```

EXAMPLES

Warning: Line 111, Design Compiler does not support the values for
 clear_preset_var? in the 'libg111' cell. The cell has been made a black box
. (LIBG-111)

LIBG-112 (error) The timing check condition represented in this timing

group is not mutually exclusive with the timing check condition represented in the timing group on line %d.

DESCRIPTION

The timing check conditions represented by the 'when' string of all conditional period and pulse width timing checks should be mutually exclusive. A nonconditional timing check is assumed to have the implied '1' timing check condition (always **TRUE**). If timing check conditions are not mutually exclusive, Library Compiler cannot determine which timing check to use when the condition causes both timing check conditions to be evaluated **TRUE**.

WHAT NEXT

Check the 'when' strings of both timing groups, and make corrections necessary to eliminate duplicate nonconditional timing checks or other erroneous information. Also, ensure that there is no nonconditional timing check defined when at least one conditional timing check of the same pins and timing type is defined.

EXAMPLES

```
cell(libg112) {
```

```

area : 6.0;
pin(CLK) {
direction : input;
capacitance : 1.0;
minimum_period() {
    constraint : 99;
    when : " Q'";
    sdf_cond : "SIG_5 == 1'b1 ";
}
minimum_period() {
constraint : 99;
when : " Q'"
    sdf_cond : "SIG_5 == 1'b0 ";
}
}
pin(SET) {
direction : input;
capacitance : 1.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CLK";
}
timing() {
timing_type : preset;
timing_sense : negative_unate;
intrinsic_rise : 1.0;
rise_resistance : 0.1;
related_pin : "SET";
}
}
pin(QN) {
direction : output;
function : "IQN";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CLK";
}
timing() {

```

```
timing_type : clear;
timing_sense : positive_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "SET";
}
}
```

EXAMPLE MESSAGE

Error: Line 115, The timing check condition represented in this timing group is not mutually exclusive with the timing check condition represented in the timing group on line 120. (LIBG-112)

LIBG-113 (error) The timing check starting and ending conditions represented in this timing group are not mutually exclusive with the timing check starting and ending conditions represented in the timing group on line %d.

DESCRIPTION

One of the following two conditions must be satisfied between two conditional timing checks of the same pins:

1. The timing check starting conditions represented by the **when_start** or **when** string of all conditional timing checks (setup, hold, recovery, removal and skew) are mutually exclusive.
2. The timing check ending conditions represented by the **when_end** or **when** string of all conditional timing checks (setup, hold, recovery, removal and skew) are mutually exclusive.

A nonconditional timing check is assumed to have the implied '1' timing check starting and ending condition (always **TRUE**). If both starting and ending conditions are not mutually exclusive, Library Compiler cannot determine which timing check to use when the condition enables both conditional timing check conditions.

WHAT NEXT

Check the **when_start**, **when_end** and **when** strings of both timing groups and make any corrections necessary to eliminate duplicate nonconditional timing checks or other erroneous information. Also, ensure that there is no nonconditional timing check defined when at least one conditional timing check of the same pins and timing type

is defined.

```
cell(libg113) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
        /* these two timing groups are not mutually exclusive */
        timing() {
            timing_type : setup_falling;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
        when : " MQ ";
        sdf_cond : " MQ == 1'b1 ";
            related_pin : "MC";
        }
        timing() {
            timing_type : setup_falling;
        when : " MQ ";
        sdf_cond : " MQ == 1'b1 ";
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "MC";
        }
    }
    pin(MC) {
        direction : input;
        capacitance : 2;
    }
    statetable ( "D CP", "Q" ) {
table : "H/L R : - : H/L,\ \
- ~R : - : N ";
    }
    pin (MQ) {
        direction : internal;
        inverted_output : FALSE;
        internal_node : "Q";
        input_map : "D MC MQ";
    }
    pin(Q) {
        direction : output;
        internal_node : "Q";
        input_map : "MQ MC Q";
        inverted_output : FALSE;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "MC";
        }
    }
}
```

```
}
```

EXAMPLE MESSAGE

Error: Line 116, The timing check starting and ending conditions represented in this timing group are not mutually exclusive with the timing check starting and ending conditions represented in the timing group on line 124. (LIBG-113)

LIBG-115 (warning) The when attribute uses '%s' pins that cannot be found in the %s %s.

DESCRIPTION

In a sequential cell, the following pins are allowed to appear in the **when** attribute of the **state-dependent** timing arc:

- 1) Pins used in **enable**, **enable_also**, and **data_in** in the **latch** group
- 2) Pins used in **clocked_on**, **clocked_on_also**, and **next_state** in the **ff** group for **timing_arc** with **timing_type** of **rising_edge/falling_edge**

This warning informs you that one of the previous restrictions has been violated.

WHAT NEXT

Check your **when** attribute, and correct any wrong information in the string or in the **timing_type**.

EXAMPLES

```
cell(libg115) {  
    area : 9;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(CP) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(CD) {  
        direction : input;  
        capacitance : 2;  
    }  
    ff("IQ","IQN") {  
        next_state : "D";  
        clocked_on : "CP";  
        clear : "CD'";  
    }  
}
```

```

}
pin(Q) {
    direction : output;
    function : "IQ";
    timing() {
        when : "CD";
        sdf_cond : "D==1'b1";
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CP";
    }
    timing() {
        timing_type : clear;
        timing_sense : positive_unate;
        intrinsic_fall : 1.0;
        fall_resistance : 0.1;
        related_pin : "CD";
    }
}
}
}

```

EXAMPLE MESSAGE

Warning: Line 134, The when attribute uses 'CD' pins
 that cannot be found in the ff/latch group . (LIBG-115)

LIBG-116 (warning) No test_scan_in/test_scan_in_inverted signal

types exist on the '%s' test_cell cell. Converting the entire cell to a black box.

DESCRIPTION

To be able to accept scan data, each test_cell must have either a **test_scan_in** or **test_scan_in_inverted** signal type.

This warning informs you that the indicated test_cell does not have the **test_scan_in** or **test_scan_in_inverted** signal types. Thus, the test_cell is not valid, and the entire cell has been converted to a black box.

There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. you can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-147.

WHAT NEXT

Check the library description to ensure that each test_cell has a **test_scan_in** or **test_scan_in_inverted** signal type. These signal types can be added within the test_cell using this syntax:

```
signal_type : test_scan_in (or test_scan_in_inverted)
```

LIBG-117 (warning) No test_scan_out/test_scan_out_inverted signal

types exist on the '%s' test_cell cell. Converting the entire cell to a black box.

DESCRIPTION

To be able to scan out data, each test_cell must have either a **test_scan_out** or a **test_scan_out_inverted** signal type.

This warning informs you that the indicated test_cell has neither the **test_scan_out** nor the **test_scan_out_inverted** signal types. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-148.

WHAT NEXT

Check the library description to ensure that each test_cell either has a **test_scan_out** or a **test_scan_out_inverted** signal type. These signal types can be added within the test_cell using this syntax:

```
signal_type : test_scan_out (or test_scan_out_inverted)
```

LIBG-118 (warning) The clocked_on_also function on the '%s' port for

test_cell on the '%s' cell is not specified on the correct pin. Converting the entire cell to a black box.

DESCRIPTION

The **clocked_on_also** function for this test_cell is not specified on the correct pin. This function needs to be specified on the clock of the slave stage of a master-slave configuration.

This warning informs you that the test_cell pointed to has the **clocked_on_also** function specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. Other tools will not be able to use this cell if it is made into a black box.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-149.

WHAT NEXT

Check the library description to ensure that each test_cell has specified the **clocked_on_also** function. To determine the correct function:

- * Create a cell with the non test mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-119 (warning) The **test_scan_clock_b** signal type on the '%s' port for **test_cell** on the '%s' cell is not specified on the correct pin. Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_clock_b** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the clock of the slave stage of an LSST configuration.

This warning informs you that the test_cell pointed to has the **test_scan_clock_b** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. Other tools will not be able to use this

cell if it is made into a black box.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-150.

WHAT NEXT

Check the library description to ensure that each test_cell has specified the **test_scan_clock_b** signal type.

LIBG-120 (warning) The **test_scan_in** signal type on the '%s' port for
test_cell on the '%s' cell is not specified on the correct pin.
Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_in** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that takes in the scan data. All scan types and, thus, all test_cells need to have either the **test_scan_in** or **test_scan_in_inverted** signal type.

This warning informs you that the test_cell pointed to has the **test_scan_in** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-151.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_in** signal type.

LIBG-121 (warning) The **test_scan_in_inverted** signal type on the '%s' port for

test_cell on the '%s' cell is not specified on the correct pin. Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_in_inverted** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that takes in the scan data. All scan types and, thus, all test_cells need to have either the **test_scan_in** or **test_scan_in_inverted** signal type.

This warning informs you that the test_cell pointed to has the **test_scan_in_inverted** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-152.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_in_inverted** signal type.

LIBG-122 (warning) The **test_scan_enable** signal type on the '%s' port for **test_cell** on the '%s' cell is not specified on the correct pin. Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_enable** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that switches the input mode of the cell between test and mission mode. Only multiplexed flip-flop requires this signal type. This signal type can also be used in clocked scan cells.

This warning informs you that the test_cell pointed to has the **test_scan_enable** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-153.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_enable** signal type.

LIBG-123 (warning) The **test_scan_enable_inverted** signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.
Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_enable_inverted** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that switches the input mode of the cell between test and mission mode. Only, multiplexed flip-flop requires this signal type. This signal type can also be used in clocked scan cells.

This warning informs you that the test_cell pointed to has the **test_scan_enable_inverted** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-154.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_enable_inverted** signal type.

LIBG-124 The **test_scan_clock** signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.

Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_clock** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the scan clock for clocked scan cells.

This warning informs you that the test_cell pointed to has the **test_scan_clock** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-155.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_clock** signal type.

LIBG-125 warning) The test_scan_clock_a signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.
Converting the entire cell to a black box.

DESCRIPTION

The **test_scan_clock_a** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the clock of the master stage of an LSST configuration.

This warning informs you that the test_cell pointed to has the **test_scan_clock_a** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-156.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the `test_scan_clock_a` signal type.

LIBG-126 (warning) The `test_clock` signal type on the '%s' port for
test_cell on the '%s' cell is not specified on the correct pin.
Converting the entire cell to a black box.

DESCRIPTION

The `test_clock` signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the clock used for ATPG capture in auxiliary clock lssd cells.

This warning informs you that the test_cell pointed to has the `test_clock` signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable `read_db_lib_warnings` to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-157.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the `test_clock` signal type.

LIBG-127 (warning) The '%s' clocked test cell is not valid because it has a master-slave cell as its nontest mode.
Converting the entire cell to a black box.

DESCRIPTION

A clocked test cell has the following characteristics:

- signal types : `test_scan_in/test_scan_in_inverted`, `test_scan_enable/test_scan_enable_inverted` (optional), `test_scan_clock`, `test_scan_out/test_scan_out_inverted`

- nontest modes : flip-flop or latch

This warning informs you that the signal types identify this cell as a clocked scan test cell, but it does not have a flip-flop or latch as its nontest mode. It is currently specified as a master-slave cell. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-174.

WHAT NEXT

Check the library description to ensure that nontest modes and signal types are correctly pointed to by the test_cell. To determine why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

LIBG-128 (warning) Invalid nontest mode for test_cell on the '%s' cell;
there are more than 2 sequential elements.
Converting the entire cell to a black box.

DESCRIPTION

The nontest mode for test_cells must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using clocked_on and clocked_on_also

This warning informs you that the nontest mode of the test_cell has more than 2

distinct sequential elements, so the test_cell does not fit the previous requirements. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

WHAT NEXT

Check the library description to ensure that each test_cell has properly specified the correct nontest mode. To determine why there are multiple sequential elements in this description,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

LIBG-129 (warning) Invalid nontest mode for test_cell on the '%s' cell.

This mode describes a ganged cell.

DESCRIPTION

The nontest mode for test_cells must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using clocked_on and clocked_on_also

This warning informs you that the nontest mode of the test cell is a ganged cell, and it does not fit the previous requirements. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

WHAT NEXT

Check the library description to ensure that each test_cell does not specify a

ganged cell as its nontest mode. Ganged cells can be recognized by the keywords `ff_bank` or `latch_bank`.

LIBG-130 (warning) The nontest mode for test_cell on the '%s' cell is invalid.

The '%s' slave port does not directly feed the output.

DESCRIPTION

The nontest mode for `test_cells` must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using `clocked_on` and `clocked_on_also`

This warning informs you that in nontest mode of the test cell, the slave does not directly feed the output. This means that it is not a master-slave latch configuration that the DFT Compiler supports. Thus, the `test_cell` is not valid, and the entire cell is a black box.

This warning is issued when reading a `.db` library. You can switch off the warning by setting the environment variable `read_db_lib_warnings` to FALSE (default).

The same problem in a `.lib` library causes an error. See the `.lib` example for LIBG-160.

WHAT NEXT

Check the library description to ensure that the nontest mode of the `test_cell` is correctly specified. If you are using a master-slave configuration as the nontest mode, the only accepted description is the state description using

```
clocked_on : <master clock>
clocked_on_also : <slave clock>
```

LIBG-131 (warning) The nontest mode for test_cell on the '%s' cell is invalid.

The '%s' state pin is not a latch for a master-slave configuration.

DESCRIPTION

The nontest mode for `test_cells` must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using `clocked_on` and `clocked_on_also`

This warning informs you that the nontest mode of the test cell is an incorrect master-slave description. This stage of the master-slave configuration is not a latch, and it does not fit the previous requirements. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable `read_db_lib_warnings` to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-161.

WHAT NEXT

Check the library description to ensure that the nontest mode of the `test_cell` is correctly specified. If you are using a master-slave configuration as the nontest mode, the only accepted description is the state description using `clocked_on` :
`<master clock> clocked_on_also : <slave clock>`

LIBG-132 (warning) The test cell for auxiliary clocked lssd '%s' cell is not valid because its nontest mode is not a flip-flop.

DESCRIPTION

An auxiliary clocked lssd `test_cell` has the following characteristics:

- signal types : `test_scan_in/test_scan_in_inverted`,
`test_scan_out/test_scan_out_inverted`,
`test_scan_clock_a`, `test_scan_clock_b`, `test_clock`
- nontest mode : flip-flop

This warning informs you that the signal types point to this auxiliary clocked lssd `test_cell`, but it does not have a flip-flop as its nontest mode. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable `read_db_lib_warnings` to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-175.

WHAT NEXT

Check the library description to ensure that nontest modes and signal types are correctly pointed to by the test_cell. To determine why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

LIBG-133 (warning) The test_cell on the '%s' cell cannot have more than one test_scan_in/test_scan_in_inverted signal type. This happens on the '%s' port.

DESCRIPTION

Each test_cell must have only one test_scan_in or test_scan_in_inverted signal type. This signal type is specified on the pin that is used to take scan data into the cell.

This warning informs you that the test_cell pointed to has multiple test_scan_in(test_scan_in_inverted) signal types. The message points to the second port that has this signal type. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-162.

WHAT NEXT

Check the library description to ensure that each test_cell has only one test_scan_in or test_scan_in_inverted signal type.

LIBG-134 (warning) The '%s' port in test_cell on the '%s' cell has a test_scan_out signal type on an inverted output.

DESCRIPTION

The test_scan_out signal type can only be specified on a noninverted output. If the output is inverted, the proper signal type should be test_scan_out_inverted. This signal type specifies the polarity of the port with respect to the state.

This warning informs you that the test_cell pointed to has the test_scan_out signal type specified on an inverted output. When reading a .db library, Library Compiler ignores the scan_out attribute and creates the functional description of the cell using the function statement. In other words, that output is inverted in the functional description.

The same problem in a .lib library causes an error. See the .lib example for LIBG-163.

WHAT NEXT

The default behavior of selecting the function over the signal_type to determine the inversion of the output is correct in most cases.

Check the library description to ensure that the test_scan_out signal type is only placed on noninverted outputs. To determine if this is an inverted or noninverted output,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, an inverted output is not a state if it does not have N. Instead, the output contains an inversion of the state pin.

LIBG-135 (warning) The '%s' port in test_cell on the '%s' cell has a test_scan_out_inverted signal type on a noninverted output.

DESCRIPTION

The test_scan_out_inverted signal type can only be specified on an inverted output. If the output is noninverted, the proper signal type should be test_scan_out. This

signal type specifies the polarity of the port with respect to the state.

This warning informs you that the test_cell pointed to has the test_scan_out signal type specified on an inverted output. When reading a .db library, the Library Compiler ignores the scan_out_inverted attribute and creates the functional description of the cell using the function statement. In other words, that output is noninverted in the functional description.

The same problem in a .lib library causes an error. See the .lib example for LIBG-164.

WHAT NEXT

The default behavior of selecting the function over the signal_type to determine the inversion of the output is correct in most cases.

Check the library description to ensure that the test_scan_out_inverted signal type is only placed on inverted outputs. To determine if this is an inverted or noninverted output,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, an inverted output is not a state if it does not have N. Instead, the output contains an inversion of the state pin.

LIBG-136 (warning) The test cell on the '%s' cell cannot have more than one test_scan_enable or test_scan_enable_inverted signal type. This happens on the '%s' port.

DESCRIPTION

Each test_cell must have only one test_scan_enable or test_scan_enable_inverted signal type. This signal type is specified on the pin that is used to select between scan and mission mode operation of the cell.

This warning informs you that the test_cell pointed to has multiple test_scan_enable(test_scan_enable_inverted) signal types. The message points to the second port that has this signal type. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-165.

WHAT NEXT

Check the library description to ensure that each test_cell has only one test_scan_enable or test_scan_enable_inverted signal type.

LIBG-137 (warning) The test_scan_clock '%s' port in test_cell on the '%s' cell does not have an active sense.

DESCRIPTION

The test_scan_clock must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock is the scan clock in the clocked scan type.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell is recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-138 (warning) The test_scan_clock_a '%s' port in test_cell

on the '%s' cell does not have an active sense.

DESCRIPTION

The test_scan_clock_a must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock_a is the scan clock for the master stage of the LSSD scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell is recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell,

- * Create a cell with the non test mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-139 (warning) The test_scan_clock_b '%s' port in test_cell on the '%s' cell does not have an active sense.

DESCRIPTION

The test_scan_clock_b must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock_a is the scan clock for the slave stage of the LSSD scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell is recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools

cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-140 (warning) The test_clock '%s' port in test_cell on the '%s' cell does not have an active sense.

DESCRIPTION

The test_clock must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_clock is the capture clock used by ATPG in the auxiliary clocked lssd scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell is recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell,

- * Create a cell with the nontest mode as the functional part

- of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-141 (warning) The '%s' port in test_cell for the '%s' cell has an invalid signal type %s.

DESCRIPTION

The valid signal_types in test_cells are

- test_scan_in
- test_scan_in_inverted
- test_scan_enable
- test_scan_enable_inverted
- test_scan_out
- test_scan_out_inverted
- test_scan_clock
- test_scan_clock_a
- test_scan_clock_b
- test_clock

This warning informs you that the port in the test_cell pointed to has a signal_type other than the ones listed previously. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

WHAT NEXT

Check the test_cell pointed to, and change the invalid signal_type.

LIBG-142 (warning) The LSSD test_cell for the '%s' cell has neither a test_scan_clock_b signal type nor a master-slave configuration as its non test mode.

DESCRIPTION

LSSD scan styles must have the following test_cell characteristics:

clocked lssd

```

- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
- nontest mode: flip_flop
    auxiliary clock lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b,
test_clock
- nontest mode : flip_flop
    single-latch lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
- nontest mode: latch
    single-latch lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a,
test_scan_clock_b (optional)
- nontest mode: master-slave (clocked_on & clocked_on_also)

```

This warning informs you that the other signal types point to the fact that this is an lssd scan style because it has test_scan_in or test_scan_in_inverted, test_scan_out or test_scan_out_inverted, and test_scan_clock_a signal types. However, it is invalid because it has neither a test_scan_clock_b signal type nor a master-slave configuration as its nontest mode. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-171.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the nontest modes and signal types in the test_cell pointed to. If you do not understand why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

LIBG-144 (warning) The test_cell for the '%s' cell is not valid because

it has missing or extra test signals.

DESCRIPTION

The supported scan styles must have the following test_cell characteristics:

```
    multiplexed flip-flop
- signal types : test_scan_in/test_scan_in_inverted, test_scan_enable/
test_scan_enable_inverted, test_scan_out/test_scan_out_inverted
- nontest mode : flip-flop, master slave latch pair, or latch
    clocked scan
- signal types : test_scan_in/test_scan_in_inverted, test_scan_enable/
test_scan_enable_inverted (optional), test_scan_clock,
test_scan_out/test_scan_out_inverted
- nontest modes : flip-flop or latch
    clocked lssd
        - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
        - nontest mode: flip-flop
auxiliary clock lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b,
    test_clock
    - nontest mode : flip-flop
single-latch lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
    - nontest mode: latch
single-latch lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
    - nontest mode: latch
single-latch lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a,
    test_scan_clock_b (optional)
    - nontest mode: master-slave (clocked_on & clocked_on_also)
```

This warning informs you that the other signal types do not correspond to one of the previously supported scan styles. Because there are extra or missing signal types, this test_cell is not valid, and the entire cell is a black box.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-172.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the nontest modes and signal types in the test_cell pointed to. If you do not understand why the nontest function is not one of the previous types,

- * Create a cell with the non test mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by checking their functional description.

LIBG-145 (warning) Cannot derive full function based on test_cell on the '%s' cell in a library with DPCM vendor specific delay model.

DESCRIPTION

The Library Compiler generates a functional description of the entire cell based on the information in the test_cell. However, if the library is a DPCM library, no full function description will be generated.

This warning is not issued when reading a .db library.

WHAT NEXT

Fill the full function with state table description.

LIBG-146 (warning) Cannot derive full function based on test_cell on the '%s' cell due to previous warnings or errors.

DESCRIPTION

The Library Compiler generates a functional description of the entire cell based on the information in the test_cell. However, if there are warnings or errors in the test_cell, a functional description of the entire cell cannot be generated.

This warning informs you that the test_cell pointed to has previous errors or warnings. Thus, the test_cell is not valid, and the entire cell is a black box. There is functional information missing, and other tools cannot use this cell.

This warning is issued when reading a .db library. You can switch off the warning by setting the environment variable **read_db_lib_warnings** to FALSE (default).

The same problem in a .lib library causes an error. See the .lib example for LIBG-173.

WHAT NEXT

Fix the previous problems in order to recognize both the test_cell and full cell functionality. You might have to add a state table description of the entire cell.

LIBG-147 (error) No test_scan_in/test_scan_in_inverted signal types exist on the '%s' test_cell cell.

DESCRIPTION

Each test_cell must have either a test_scan_in or test_scan_in_inverted signal type to be valid. Otherwise, this cell cannot accept scan data.

This warning informs you that the test_cell pointed to does not have the test_scan_in or test_scan_in_inverted signal types. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has a **test_scan_in** or **test_scan_in_inverted** signal type. These signal types can be added within the test_cell using the syntax:

```
signal_type : test_scan_in [ or test_scan_in_inverted]
```

EXAMPLES

```
cell(libg147) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
    pin(D2) {
        direction : input;
        capacitance : 1;
    }
    pin(C2) {
        direction : input;
        capacitance : 2;
```

```

        }
    pin(C3) {
direction : input;
capacitance : 1;
}
pin(MQ) {
direction : internal;
internal_node : "MQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C C2";
}
}
pin(Q) {
direction : output;
internal_node : "SQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C C3";
}
}
pin(QN) {
direction : output;
state_function : "(Q)'";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C C3";
}
}
statetable("C D C2 C3 D2", "MQ SQ") {
table : "R H/L L L - - - : H/L H/L,\n
          ~R - - H - : H/L - : - H/L,\n
          ~R - - L - : - - - : - N,\n
          R - H - - : - - - : X X,\n
          R - - H - : - - - : X X,\n
          ~R - H - H/L : - - - : H/L -, \n
          ~R - L - - : - - - : N - ";
}

```

```

        }
        test_cell() {
pin(D) {
    direction : input;
}

    direction : input;
    capacitance : 2;
    signal_type : "test_scan_clock";
}
pin(D2) {
/* missing test_scan_in signal_type */
    direction : input;
}
pin(C2) {
    direction : input;
    capacitance : 2;
    signal_type : "test_scan_clock_a";
}
pin(C3) {
    direction : input;
    capacitance : 1;
    signal_type : "test_scan_clock_b";
}
ff ("IQ", "IQN") {
    next_state : "D";
    clocked_on : "C";
}
pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(QN) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
        }
    }
}

```

EXAMPLE MESSAGE

Error: Line 177, No test_scan_in/test_scan_in_inverted signal
 types exist on the 'libg147' test_cell cell. (LIBG-147)

LIBG-148 (error) No test_scan_out/test_scan_out_inverted signal

types exist on the '%s' test_cell cell.

DESCRIPTION

Each test_cell must have either a test_scan_out or test_scan_out_inverted signal type in order to be valid. Otherwise, this cell cannot scan out data.

This warning informs you that the test_cell pointed to does not have the test_scan_out or test_scan_out_inverted signal types. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has a test_scan_out or test_scan_out_inverted signal type. These signal types can be added within the test_cell using the syntax:

```
signal_type : test_scan_out [ or test_scan_out_inverted]
```

EXAMPLES

```
cell(libg148) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 1;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
    }
    pin(SE) {
        direction : input;
        capacitance : 2;
    }

    pin(Q) {
        direction : output;
        inverted_output : FALSE;
    }
    pin(QN) {
        direction : output;
        inverted_output : TRUE;
    }
    test_cell()
```

```

pin(D) {
    direction : input;
}
pin(C) {
    direction : input;
}
pin(SI) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(SE) {
    direction : input;
    signal_type : "test_scan_enable";
}

ff ("IQ", "IQN") {
    next_state : "D";
    clocked_on : "C";
}

pin(Q) {
    direction : output;
    function : "IQ";
    /*      signal_type : "test_scan_out"; */
}
pin(QN) {
    direction : output;
    function : "IQN";
    /*      signal_type : "test_scan_out_inverted"; */
}

```

EXAMPLE MESSAGE

Error: Line 139, No test_scan_out/test_scan_out_inverted signal types exist on the 'libg148' test_cell cell. (LIBG-148)

LIBG-149 (error) The `clocked_on_also` function on the '%s' port for `test_cell` on the '%s' cell is not specified on the correct pin.

DESCRIPTION

The `clocked_on_also` function for this `test_cell` is not specified on the correct pin. This function needs to be specified on the clock of the slave stage of a master-slave configuration.

This warning informs you that the `test_cell` pointed to has the `clocked_on_also`

function specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly used the **clocked_on_also** function. To determine the correct function,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-150 (error) The test_scan_clock_b signal type on the '%s' port for
test_cell on the '%s' cell is not specified on the correct pin.

DESCRIPTION

The test_scan_clock_b signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the clock of the slave stage of an LSST configuration.

This warning informs you that the test_cell pointed to has the test_scan_clock_b signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the test_scan_clock_b signal type.

EXAMPLES

```
cell(libg150) {

EXAMPLE MESSAGE

Error: Line 181, The test_scan_clock_b signal type on the 'C' port for
 test_cell on the 'libg150' cell is not specified on the correct pin.(LIBG-
 150)

LIBG-151 (error) The test_scan_in signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.

DESCRIPTION

The **test_scan_in** signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that takes in the scan data. All scan types, and therefore, all test_cells need to have either the **test_scan_in** or **test_scan_in_inverted** signal type.

This warning informs you that the test_cell pointed to has the **test_scan_in** signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the test_scan_in signal type.

EXAMPLES

```
cell(libg151) {
    area : 13;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
    pin(D2) {
        direction : input;
        capacitance : 1;
    }
    pin(C2) {
        direction : input;
        capacitance : 2;
    }
    pin(C3) {
        direction : input;
        capacitance : 1;
    }
    pin(MQ) {
        direction : internal;
        internal_node : "MQ";
        timing() {
            timing_type : rising_edge;
        }
    }
}
```

```

        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C C2";
    }
}
pin(Q) {
    direction : output;
    internal_node : "SQ";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C C3";
    }
}
pin(QN) {
    direction : output;
    state_function : "(Q)'";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C C3";
    }
}
statetable("C D C2 C3 D2", "MQ SQ") {
    table : "R H/L L L - : - - - : H/L H/L, \
              ~R - - H - : H/L - : - H/L, \
              ~R - - L - : - - - : - N, \
              R - H - - : - - - : X X, \
              R - - H - : - - - : X X, \
              ~R - H - H/L : - - - : H/L -, \
              ~R - L - - : - - - : N - ";
}
test_cell() {
    pin(D) {
        direction : input;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
        signal_type : "test_scan_in";
    }
}

```

```

pin(D2) {
    direction : input;
}
pin(C2) {
    direction : input;
    capacitance : 2;
    signal_type : "test_scan_clock_a";
}
pin(C3) {
    direction : input;
    capacitance : 1;
    signal_type : "test_scan_clock_b";
}
ff ("IQ","IQN") {
    next_state : "D";
    clocked_on : "C";
}
pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(QN) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
}
}

```

In this case the pin 'C' is a clock and should not have a test_scan_in signal_type attribute. The test_scan_in should be on the pin 'D2'.

EXAMPLE MESSAGE

Error: Line 182, The test_scan_in signal type on the 'C' port for test_cell on the 'libg151' cell is not specified on the correct pin. (LIBG-151)

LIBG-152 (error) The test_scan_in_inverted signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.

DESCRIPTION

The test_scan_in_inverted signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin which takes in the scan data. All scan types, and all test_cells need to have either the test_scan_in or test_scan_in_inverted signal type.

This warning informs you that the test_cell pointed to has the test_scan_in_inverted

signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools will not be able to use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_in_inverted** signal type.

EXAMPLES

```
cell(libg152) {
    area : 13;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
    pin(D2) {
        direction : input;
        capacitance : 1;
    }
    pin(C2) {
        direction : input;
        capacitance : 2;
    }
    pin(C3) {
        direction : input;
        capacitance : 1;
    }
    pin(MQ) {
        direction : internal;
        internal_node : "MQ";
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "C C2";
        }
    }
    pin(Q) {

        fall_resistance : 0.1;
        related_pin : "C C3";
    }
}
statetable("C D C2 C3 D2", "MQ SQ") {
    table : "R H/L L L - : - - : H/L H/L, \
              ~R - - H - : H/L - : - H/L, \
              ~R - - L - : - - - : - N, \
              R - H - - : - - - : X X, \
              R - - H - : - - - : X X, \
              ~R - H - H/L : - - - : H/L -, \
              ~R - L - - : - - - : N - ";
}
test_cell() {
    pin(D) {
        direction : input;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
        signal_type : "test_scan_in_inverted";
    }
    pin(D2) {
        direction : input;
    }
    pin(C2) {
        direction : input;
        capacitance : 2;
        signal_type : "test_scan_clock_a";
    }
    pin(C3) {
        direction : input;
        capacitance : 1;
        signal_type : "test_scan_clock_b";
    }
    ff ("IQ","IQN") {
        next_state : "D";
        clocked_on : "C";
    }
}

```

```

        }
        pin(Q) {
            direction : output;
            function : "IQ";
            signal_type : "test_scan_out";
        }
        pin(QN) {
            direction : output;
            function : "IQN";
            signal_type : "test_scan_out_inverted";
        }
    }
}

```

In this case the pin 'C' is a clock and should not have a test_scan_in_inverted signal_type attribute. The test_scan_in_inverted should be on the pin 'D2'.

EXAMPLE MESSAGE

Error: Line 181, The test_scan_in_inverted signal type on the 'C' port for test_cell on the 'libg152' cell is not specified on the correct pin. (LIBG-152)

LIBG-153 (error) The test_scan_enable signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.

DESCRIPTION

The test_scan_enable signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that switches the input mode of the cell between test and mission mode. Only, a multiplexed flip-flop requires this signal type. This signal type can also be used in clocked scan cells.

This warning informs you that the test_cell pointed to has the test_scan_enable signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_enable** signal type.

EXAMPLES

```

cell(libg153) {
    area : 13;
}

```

```

        signal_type : "test_scan_out_inverted";
    }
}
}

```

The pin 'C' is a clock and should not have a test_scan_enable signal_type attribute. The test_scan_enable should be on the pin 'D2'.

EXAMPLE MESSAGE

Error: Line 181, The test_scan_enable signal type on the 'C' port for test_cell on the 'libg153' cell is not specified on the correct pin. (LIBG-153)

LIBG-154** (error) The test_scan_enable_inverted signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.**

DESCRIPTION

The test_scan_enable_inverted signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the pin that switches the input mode of the cell between test and mission mode. Only a multiplexed flip-flop requires this signal type. This signal type can also be used in clocked scan cells.

This warning informs you that the test_cell pointed to has the test_scan_enable_inverted signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_enable_inverted** signal type.

EXAMPLES

```
cell(libg154) {  
    area : 13;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(C) {  
        direction : input;  
        capacitance : 2;  
    }  
    pin(D2) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(C2) {  
        direction : input;  
        capacitance : 2;  
    }  
}
```

```

}

}
}

```

The pin 'C3' is not a clock and should not have a test_scan_clock signal_type attribute.

EXAMPLE MESSAGE

Error: Line 195, The test_scan_clock signal type on the 'C3' port for test_cell on the 'libg155' cell is not specified on the correct pin. (LIBG-155)

LIBG-156 (error) The test_scan_clock_a signal type on the '%s' port for test_cell on the '%s' cell is not specified on the correct pin.

DESCRIPTION

The test_scan_clock_a signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the clock of the master stage of an LSST configuration.

This warning informs you that the test_cell pointed to has the test_scan_clock_a signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_scan_clock_a** signal type.

EXAMPLES

```
cell(libg156) {
    area : 13;
    pin(D) {
        direction : input;
        capacitance : 1;
    }

        }
    }
}

```

The pin 'C' is a clock and should not have a test_scan_clock_a signal_type attribute.

EXAMPLE MESSAGE

Error: Line 214, The test_scan_clock_a signal type on the 'C' port for test_cell on the 'libg156' cell is not specified on the correct pin. (LIBG-156)

LIBG-157 (error) The test_clock signal type on the '%s' port for test_cell on the '%s' cell is not specified correctly.

DESCRIPTION

The test_clock signal type for this test_cell is not specified on the correct pin. This signal type needs to be specified on the clock used for ATPG capture in auxiliary clock lssd cells.

This warning informs you that the test_cell pointed to has the test_clock signal type specified on an incorrect pin. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the **test_clock** signal type.

EXAMPLES

```

cell(libg157) {
    area : 13;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
}

```

```

        signal_type : "test_scan_clock_b";
    }
    ff ("IQ","IQN") {
        next_state : "D";
        clocked_on : "C";
    }
    pin(Q) {
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
    }
    pin(QN) {
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
    }
}
}
}

```

The pin 'C2' is not a clock and should not have a test_clock signal_type attribute.

EXAMPLE MESSAGE

Error: Line 233, The test_clock signal type on the 'C2' port for
 test_cell on the 'libbg157' cell is not specified correctly. (LIBG-157)

LIBG-158 (error) Invalid nontest mode for test_cell on the '%s' cell.

This are more than 2 sequential elements.

DESCRIPTION

The nontest mode for test_cells must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using clocked_on and clocked_on_also

This warning informs you that the nontest mode of the test cell has more than 2 distinct sequential elements. Thus, it does not fit the previous requirements. The test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has properly specified the correct nontest mode. To determine the multiple sequential elements in this description,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

LIBG-159 (error) Invalid nontest mode for test_cell on the '%s' cell.

This describes a ganged cell.

DESCRIPTION

The nontest mode for test_cells must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using clocked_on and clocked_on_also

This warning informs you that the nontest mode of the test cell is a ganged cell. Thus, it does not fit the previous requirements. The test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell does not specify a ganged cell as its nontest mode. Ganged cells can be recognized by the keywords ff_bank or latch_bank.

LIBG-160 (error) The nontest mode for test_cell on the '%s' cell is invalid.

The '%s' slave port does not directly feed the output.

DESCRIPTION

The nontest mode for test_cells must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using clocked_on, clocked_on_also

This warning informs you that in nontest mode of the test cell, the slave does not directly feed the output. This means that this is not a master-slave latch configuration that DFT Compiler supports. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

WHAT NEXT

Check the library description to ensure that the nontest mode of the test_cell is correctly specified. If you are using a master-slave as the non test mode, the only accepted description is the state description using

```
clocked_on : <master clock>
clocked_on_also : <slave clock>
```

EXAMPLES

```
cell(libg160) {
    area : 10;
    bundle (D) {
members(D1, D2);
direction : input;
capacitance : 1;
    }
    pin(G) {
```

```

direction : input;
capacitance : 1;
}
latch_bank ("IQ","IQN", 2) {
data_in : "D";
enable : "G";
}
bundle (Q) {
members(Q1, Q2);
direction : output;
function : "IQ";
timing() {
    timing_sense : positive_unate;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "D";
}
timing() {
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G";
}
}
test_cell() {
pin(D1) {
    direction : input;
}
pin(G) {
    direction : input;
}
pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(Q1 Q2 ) {
    direction : output;
    function : "G D2 D1";
    signal_type : "test_scan_out";
}
}
}

```

EXAMPLE MESSAGE

Error: Line 193, The nontest mode for test_cell on the 'libg160' cell is invalid.
The 'Q1' slave port does not directly feed the output. (LIBG-160)

LIBG-161 (error) The nontest mode for test_cell on the '%s' cell

is invalid

The '%s' state pin is not a latch for a master-slave configuration.

DESCRIPTION

The nontest mode for test_cells must be one of the following:

- A single flip-flop
- A single latch
- A single master-slave latch configuration using clocked_on and clocked_on_also

This warning informs you that the nontest mode of the test cell is an incorrect master-slave description. This stage of the master-slave configuration is not a latch, thus, it does not fit the previous requirements. The test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that the nontest mode of the test_cell is correctly specified. If you are using a master-slave as the nontest mode, the only accepted description is the state description using

```
clocked_on : <master clock>
clocked_on_also : <slave clock>
```

EXAMPLES

```
cell(libg161) {
    area : 11;
    pin(D1 D2 D3) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 2;
    }
    pin(SCK1 SCK2) {
        direction : input;
        capacitance : 2;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
    }
    timing() {
        timing_type : setup_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "SCK2";
    }
}
```

```

}

timing() {
    timing_type : hold_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "SCK2";
}

    }

    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP SCK1";
}

    }

    pin(Q2) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP SCK1";
}

    }

    pin(Q3) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;

    direction : input;
}

pin(CP) {
    direction : input;
}

pin(SCK1) {

```

```

direction : input;
signal_type : "test_scan_clock_b";
}
pin(SCK2) {
    direction : input;
    signal_type : "test_scan_clock_a";
}
pin(SI) {
    direction : input;
    signal_type : "test_scan_in";
}
statetable("C D ", "Q") {
    table : "R H/L : - : H/L,\n
              ~R - : - : N";
}
pin(Q) {
    direction : output;
    internal_node : "Q";
    input_map : "CP D1";
    signal_type : "test_scan_out";
}
pin(Q2) {
    direction : output;
    internal_node : "Q";
    input_map : "CP D2";
    signal_type : "test_scan_out";
}
pin(Q3) {
    direction : output;
    internal_node : "Q";
    input_map : "CP D3";
    signal_type : "test_scan_out";
}
}
}
}

```

EXAMPLE MESSAGE

Error: Line 218, The nontest mode for test_cell on the 'libg161' cell is invalid.
The 'Q2' state pin is not a latch for a master-slave configuration. (LIBG-161)

LIBG-162 (error) The test_cell on the '%s' cell cannot have more than one test_scan_in or test_scan_in_inverted signal type. This happens on the

'%S' port.

DESCRIPTION

Each test_cell must have only one test_scan_in or test_scan_in_inverted signal type. This signal type is specified on the pin that is used to take scan data into the cell.

This warning informs you that the test_cell pointed to has multiple test_scan_in or test_scan_in_inverted signal types. The message points to the second port that has this signal type. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has only one test_scan_in or test_scan_in_inverted signal type.

EXAMPLES

```
cell(libg162) {
    area : 2;
    pin_opposite ( "Q", "NQ" );
    latch ( "QX" , "QY" ) {
        data_in : " ((D!*SE) + (SI*SE)) ";
        enable : " CK ";
    }
    pin (D) {
        direction : input;
        capacitance : 1;
    }
    pin (SI, SIN, SE) {
        direction : input;
        capacitance : 1;
    }
    pin (CK) {
        direction : input      ;
        capacitance : 2 ;
    }
    pin (Q) {
        direction : output     ;
        function : "QX" ;
    }
    pin (NQ) {
        direction : output     ;
        function : "QY" ;
    }
    test_cell() {
latch ( "QX", "QY") {
        data_in : " D ";
        enable : " CK' ";
    }
}
```

```

}
pin (D,CK) {
    direction : input;
}
pin (SI) {
    direction : input;
    signal_type : "test_scan_in";
}
pin (SIN) {
    direction : input ;
    signal_type : "test_scan_in_inverted";
}
pin (SE) {
    direction : input ;
    signal_type : "test_scan_enable";
}
pin (Q) {
    direction : output ;
    function : " QX ";
    signal_type : "test_scan_out";
}
pin (NQ) {
    direction : output ;
    function : " QY ";
    signal_type : "test_scan_out_inverted";
}
}
}
}

```

EXAMPLE MESSAGE

Error: The test_cell on the 'libg162' cell cannot have more than one test_scan_in or test_scan_in_inverted signal type. This happens on the 'SIN' port. (LIBG-162)

LIBG-163 (error) The '%s' port in test_cell on the '%s' cell has a test_scan_out signal type on an inverted output.

DESCRIPTION

The test_scan_out signal type can only be specified on a noninverted output. If the output is inverted, the proper signal type is test_scan_out_inverted. This signal type specifies the polarity of the port with respect to the state.

This warning informs you that the test_cell pointed to has the test_scan_out signal type specified on an inverted output. Thus, the test_cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

The default behavior of selecting the function over the signal_type to determine the inversion of the output is correct in most cases.

Check the library description to ensure that the test_scan_out signal type is only placed on noninverted outputs. To determine if this is an inverted or noninverted output

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

EXAMPLES

```
cell(libg163) {  
    area : 13;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
        timing() {  
            timing_type : setup_falling;  
            intrinsic_rise : 1.0;  
            intrinsic_fall : 1.0;  
            related_pin : "C";  
        }  
        timing() {  
            timing_type : hold_falling;  
            intrinsic_rise : 1.0;  
            intrinsic_fall : 1.0;  
            related_pin : "C";  
        }  
    }  
    pin(C) {  
        direction : input;  
        capacitance : 2;  
    }  
    pin(SDI) {  
        direction : input;  
        capacitance : 1;  
        timing() {  
            timing_type : setup_rising;  
            intrinsic_rise : 1.0;  
            intrinsic_fall : 1.0;  
            related_pin : "C";  
        }  
        timing() {  
            timing_type : hold_rising;  
            intrinsic_rise : 0.0;
```

```

        intrinsic_fall : 0.0;
        related_pin : "C";
    }
}
pin(SE) {
    direction : input;
    capacitance : 2;
}
pin(TQ) {
    direction : output;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C";
    }
}
pin(SDO) {
    direction : output;
    timing() {
        timing_type : falling_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "C";
    }
}
test_cell() {
    pin(D) {
        direction : input;
    }
    pin(C) {
        direction : input;
    }
    pin(SDI) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(SE) {
        direction : input;
        capacitance : 2;
        signal_type : "test_scan_enable";
    }
}

statetable("C D SDI", "Q") {
table : "H L/H H/L : - : L/H,\n
L - - : - : N";
}

pin(TQ) {
    direction : output;

```

```

internal_node : "Q";
}
pin(SDO) {
state_function : "TQ";
direction : output;
signal_type : "test_scan_out";
}
}
}
}

```

EXAMPLE MESSAGE

Error: Line 176, The 'SDO' port in test_cell on the 'libg163' cell has a test_scan_out signal type on an inverted output. (LIBG-163)

LIBG-164 (error) The '%s' port in test_cell on the '%s' cell has a test_scan_out_inverted signal type on a noninverted output.

DESCRIPTION

The test_scan_out_inverted signal type can only be specified on an inverted output. If the output is noninverted, the proper signal type is test_scan_out. This signal type specifies the polarity of the port with respect to the state.

This error informs you that the test_cell pointed to has the test_scan_out_inverted signal type specified on a noninverted output. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that the test_scan_out_inverted signal type is only placed on inverted outputs.

To determine if this is an inverted or noninverted output

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, an inverted output is a state only if it has N. Instead the output contains an inversion of the state pin.

EXAMPLES

```
cell(libg164) {
    area : 11;
    pin(D0) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
    }
    pin(TI) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
    }
    pin(TE) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
    }
}
```

```

pin(CK1) {
    direction : input;
    capacitance : 1;
}
pin(Q) {
    direction : output;
    inverted_output : FALSE;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CK1";
    }
}

pin(QN) {
    direction : output;
    inverted_output : TRUE;

        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CK1";
    }
}

test_cell() {
    pin(D0) {
        direction : input;
    }
    pin(TE) {
        direction : input;
        signal_type : "test_scan_enable";
    }
    pin(TI) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(CK1) {
        direction : input;
        capacitance : 1;
    }

    statetable("D0 CK1", "Q") {
table : "L/H F : - : L/H,\n
- ~F : - : N";
    }
}

pin(Q) {
    direction : output;

```

```

inverted_output : FALSE;
    internal_node : "Q";
    signal_type : "test_scan_out";
}

pin(QN) {
    direction : output;
    inverted_output : TRUE;
state_function : "Q";
    signal_type : "test_scan_out_inverted";
}
}
}

```

EXAMPLE MESSAGE

Error: Line 220, The 'QN' port in test_cell on the 'libg164' cell has a test_scan_out_inverted signal type on a noninverted output. (LIBG-164)

LIBG-165 (error) The test cell on the '%s' cell cannot have more than one test_scan_enable or test_scan_enable_inverted signal type. This happens on the '%s' port.

DESCRIPTION

Each test_cell must have only one test_scan_enable or test_scan_enable_inverted signal type. This signal type is specified on the pin that is used to select between scan and mission mode operation of the cell. Using the state table format, Library Compiler expects a single test_scan_enable or test_scan_enable_inverted signal type. Otherwise, Library Compiler generates a black box cell.

This warning informs you that the test_cell pointed to has multiple test_scan_enable or test_scan_enable_inverted signal types. The message points to the second port that has this signal type. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has only one test_scan_enable or test_scan_enable_inverted signal type. Otherwise, provide a full functional description of the non test_cell cell to bypass the multiple scan enable check.

EXAMPLES

```
cell(libg165) {
    area : 13;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(G) {
direction : input;
capacitance : 2;
    }
    pin(D2) {
direction : input;
capacitance : 1;
    }
    pin(C2) {
direction : input;
capacitance : 2;
    }
    pin(SE) {
direction : input;
capacitance : 2;
    }
    pin(SEB) {
direction : input;
capacitance : 2;
    }
    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    pin(QN) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    test_cell() {
pin(D) {
    direction : input;
}
pin(G) {
```

```

    direction : input;
}
pin(D2) {
    direction : input;

}
}
}

```

EXAMPLE MESSAGE

Error: The test cell on the 'libg165' cell cannot have more than one
 test_scan_enable or test_scan_enable_inverted signal type.
 This happens on the 'SEB' port. (LIBG-165)

**LIBG-166 (error) The '%s' test_scan_clock port in test_cell on
 the '%s' cell
 does not have an active sense.**

DESCRIPTION

The test_scan_clock must have an active sense in the full cell description. The

Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock is the scan clock in the clocked scan type.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

- * Create a cell with the non test mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-167 (error) The '%s' test_scan_clock_a port in test_cell on the '%s' cell does not have an active sense.

DESCRIPTION

The test_scan_clock_a must have an active sense in the full cell description. The Library Compiler determines the active sense by checking the function of the full cell. The test_scan_clock_a is the scan clock for the master stage of the LSSD scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-168 (error) The '%s' test_scan_clock_b port in test_cell on the '%s' cell does not have an active sense.

DESCRIPTION

The test_scan_clock_b must have an active sense in the full cell description. The active sense is determined by Library Compiler by checking the function of the full cell. The test_scan_clock_b is the scan clock for the slave stage of the LSSD scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-169 (error) The '%s' test_clock port in test_cell on the '%s' cell does not have an active sense.

DESCRIPTION

The test_clock must have an active sense in the full cell description. Library Compiler determines the active sense by checking the function of the full cell. The test_clock is the capture clock used by ATPG in the auxiliary clocked lssd scan style.

Because the test_cell and the full cell have a discrepancy, neither the test cell nor the full cell are recognized. Both the test_cell and the entire cell are

converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that the functional descriptions in the test_cell and full cell are correct and that the timing arcs are consistent. To report on the active sense and functions of the full cell

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

LIBG-170 (error) The '%s' port in test_cell for the '%s' cell has an invalid signal type %s.

DESCRIPTION

The valid signal_types in test_cells are

- test_scan_in
- test_scan_in_inverted
- test_scan_enable
- test_scan_enable_inverted
- test_scan_out
- test_scan_out_inverted
- test_scan_clock
- test_scan_clock_a
- test_scan_clock_b
- test_clock

This warning informs you that the port in the test_cell pointed to has a signal_type other than the ones listed previously. Thus, the test_cell is not valid, and the entire cell is converted to a black box.

WHAT NEXT

Check the test_cell pointed to and change the invalid signal_type.

LIBG-171 (error) The LSSD test_cell for the '%s' cell has neither a test_scan_clock_b signal type nor a master-slave as its

nontest mode.

DESCRIPTION

LSSD scan styles must have the following test_cell characteristics:

```
    clocked lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
- nontest mode: flip_flop
    auxiliary clock lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b,
test_clock
- nontest mode : flip_flop
    single-latch lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
- nontest mode: latch
    single-latch lssd
- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
test_scan_out_inverted, test_scan_clock_a,
test_scan_clock_b (optional)
- nontest mode: master-slave (clocked_on & clocked_on_also)
```

This error informs you that this cell is an lssd scan style because it has test_scan_in/test_scan_in_inverted, test_scan_out/test_scan_out_inverted, and test_scan_clock_a signal types. However, it is invalid because it has neither a test_scan_clock_b signal type nor a master-slave as its nontest mode. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the nontest modes and signal types in the test_cell pointed to. If you do not understand why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

EXAMPLES

```
cell(libg171) {
    area : 21;
```

```

pin(D1) {
    direction : input;
    capacitance : 1;
}
pin(C1) {
    direction : input;
    capacitance : 2;
}
pin(D2) {
    direction : input;
    capacitance : 1;
}
pin(C2) {
    direction : input;
    capacitance : 2;
}
pin(C3) {
    direction : input;
capacitance : 1;
}

pin(Q1) {
    direction : output;
    timing() {
        timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 0.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "C1";
    }
    timing() {
        timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 0.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "C2";
    }
}
pin(Q2) {
    direction : output;
    timing() {
        timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "C3";
    }
}
test_cell() {
    pin(D1) {
direction : input;
    }
}

```

```

    pin(C1) {
direction : input;
    }
    pin(D2) {
direction : input;
signal_type : "test_scan_in";
    }
    pin(C2) {
direction : input;
signal_type : "test_scan_clock_a";
    }
    pin(C3) {
direction : input;
signal_type : "test_scan_clock_b";
    }
    state("IQ","IQN") {
force_10 : "C1 D1";
force_01 : "C1 D1'";
    }
    pin(Q1) {
direction : output;
function : "IQ";
    }
    pin(Q2) {
direction : output;
signal_type : "test_scan_out";
    }
}
test_cell() {
    pin(D1) {
direction : input;
    }
    pin(C1) {
direction : input;
    }
    pin(D2) {
direction : input;
signal_type : "test_scan_in";
    }
    pin(C2) {
direction : input;
signal_type : "test_scan_clock_a";
    }
    pin(C3) {
direction : input;
    }
    state("IQ","IQN") {
force_10 : "C1 C3' D1";
force_01 : "C1 C3' D1'";
    }
    pin(Q1) {
direction : output;
    }
    pin(Q2) {
direction : output;
}

```

```

        function : "IQ";
        signal_type : "test_scan_out";
    }
}
}

```

EXAMPLE MESSAGE

Error: Line 229, The LSSD test_cell for the 'libg171' cell has neither a test_scan_clock_b signal type nor a master-slave as its nontest mode. (LIBG-171)

LIBG-172 (error) The test_cell for the '%s' cell is not valid because it has missing or extra test signals.

DESCRIPTION

The supported scan styles must have the following test_cell characteristics:

```

multiplexed flip-flop
- signal types : test_scan_in/test_scan_in_inverted, test_scan_enable/
test_scan_enable_inverted, test_scan_out/test_scan_out_inverted
- nontest mode : flip-flop, master-slave latch pair, or latch
    clocked scan
- signal types : test_scan_in/test_scan_in_inverted, test_scan_enable/
test_scan_enable_inverted (optional), test_scan_clock,
test_scan_out/test_scan_out_inverted
- nontest modes : flip-flop or latch
    clocked lssd
        - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
        test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
        - nontest mode: flip-flop
auxiliary clock lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
    test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b,
    test_clock
    - nontest mode : flip-flop
single-latch lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
    test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
    - nontest mode: latch
single-latch lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
    test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b
    - nontest mode: latch
single-latch lssd
    - signal types : test_scan_in/test_scan_in_inverted, test_scan_out/
    test_scan_out_inverted, test_scan_clock_a,
    test_scan_clock_b (optional)

```

- nontest mode: master-slave (`clocked_on` & `clocked_on_also`)

This warning informs you that the other signal types do not correspond to one of the previously supported scan styles. Extra or missing signal types point to the fact that the test_cell is not valid, and the entire cell is a black box.

WHAT NEXT

Check the library description to ensure that each test_cell has correctly specified the nontest modes and signal types in the test_cell pointed to. If you do not understand why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

EXAMPLES

```
cell(libg172) {
    area : 13;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(C) {
        direction : input;
        capacitance : 2;
    }
    pin(SDI) {
        direction : input;
        capacitance : 1;
    }
    pin(SDOB) {
        direction : output;
    }
    test_cell() {
        pin(D) {
            direction : input;
        }
        pin(C) {
            direction : input;
        }
        pin(SDI) {
            direction : input;
            signal_type : "test_scan_in";
        }
    statetable("D C", "QN") {
        table : "L/H H : - : H/L,
    }
}
```

```

    - L : - : N";
}

pin(SDOB) {
    direction : output;
    inverted_output : TRUE;
    internal_node : "QN";
    signal_type : "test_scan_out_inverted";
}
}
}
}
}

```

EXAMPLE MESSAGE

Error: Line 160, The test_cell for the 'libg172' cell is not valid because it has missing or extra test signals. (LIBG-172)

LIBG-173 (error) Cannot derive full function based on test_cell on the '%s' cell due to previous warnings or errors.

DESCRIPTION

Library Compiler generates a functional description of the entire cell based on the information in the test_cell. However, if there are warnings or errors in the test_cell, a functional description of the entire cell cannot be generated.

This error informs you that the test_cell pointed to has previous errors or warnings. Thus, the test_cell is not valid, and the entire cell is a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Fix the previous problems in order to recognize both the test_cell and full cell functionality. You might have to add a state table description of the entire cell.

EXAMPLES

```

cell(libg173) {
    area : 11;
    pin(D0) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : setup_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
    }
}

```

```

        timing() {
            timing_type : hold_rising;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            related_pin : "CK1";
        }
    }

pin(TI) {
    direction : input;
    capacitance : 1;
    timing() {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CK1";
    }
    timing() {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CK1";
    }
}

pin(TE) {
    direction : input;
    capacitance : 1;
    timing() {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CK1";
    }
    timing() {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "CK1";
    }
}

pin(CK1) {
    direction : input;
    capacitance : 1;
}
pin(Q) {
    direction : output;
    inverted_output : FALSE;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
    }
}

```

```

        related_pin : "CK1";
    }
}

pin(QN) {
    direction : output;
    inverted_output : TRUE;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "CK1";
    }
}

test_cell() {
    pin(D0) {
        direction : input;
    }
    pin(TE) {
        direction : input;
        signal_type : "test_scan_enable";
    }
    pin(TI) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(CK1) {
        direction : input;
        capacitance : 1;
    }

    statetable("D0 CK1", "Q") {
table : "L/H F : - : L/H, \
- ~F : - : N";
    }

    pin(Q) {
        direction : output;
        inverted_output : FALSE;
        internal_node : "Q";
        signal_type : "test_scan_out";
    }

    pin(QN) {
        direction : output;
        inverted_output : TRUE;
        state_function : "Q";
        signal_type : "test_scan_out_inverted";
    }
}
}

```

In this case, the test_cell pointed to has the test_scan_out_inverted signal type specified on a noninverted output 'QN' (LIBG-164). Thus, the test_cell is not valid, and the entire cell is converted to a black box.

EXAMPLE MESSAGE

```
Error: Line 189, Cannot derive full function based on test_cell  
on the 'libg173' cell due to previous warnings or errors. (LIBG-173)
```

LIBG-174 (error) The '%s' clocked test cell is not valid because it has a master-slave configuration as its nontest mode.

DESCRIPTION

A clocked test_cell has the following characteristics:

- signal types : test_scan_in/test_scan_in_inverted, test_scan_enable/test_scan_enable_inverted (optional), test_scan_clock, test_scan_out/test_scan_out_inverted
- - nontest modes : flip-flop or latch

This warning informs you that the signal types point to this cell as being a clocked scan test_cell, but it does not have a flip-flop or latch as its nontest mode; it is currently specified as a master-slave cell. Thus, the test cell is not valid, and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that nontest modes and signal types are correctly pointed to by the test_cell. To determine why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

EXAMPLES

```
cell(libg174) {  
    area : 10;
```

```

pin(D) {
    direction : input;
    capacitance : 1;
    timing() {
        timing_type : setup_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "G";
    }
    timing() {
        timing_type : hold_falling;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "G";
    }
}
pin(G G2) {
    direction : input;
    capacitance : 1;
}
pin(D2) {
    direction : input;
    capacitance : 1;
    timing() {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "C2";
    }
    timing() {
        timing_type : hold_rising;
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "C2";
    }
}
pin(C2) {
    direction : input;
    capacitance : 2;
}
pin(Q) {
    direction : output;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "G C2";
    }
}
pin(QN) {
    direction : output;
    timing() {
        timing_type : rising_edge;

```

```

        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : " G2 G C2";
    }
}
test_cell() {
    pin(D) {
        direction : input;
    }
    pin(G G2) {
        direction : input;
    }
    pin(D2) {
        direction : input;
        signal_type : "test_scan_in";
    }
    pin(C2) {
        direction : input;
        signal_type : "test_scan_clock";
    }
    latch ("IQ","IQN") {
data_in : "D";
        enable : "G";
        enable_also : "G2";
    }
    pin(Q) {
        direction : output;
        function : "IQ";
        signal_type : "test_scan_out";
    }
    pin(QN) {
        direction : output;
        function : "IQN";
        signal_type : "test_scan_out_inverted";
    }
}
}

```

In this case, the cell is a master-slave with an unknown test cell type.

EXAMPLE MESSAGE

```

Error: Line 208, The 'libg174' clocked test cell is not valid
      because it has a master-slave configuration as its nontest mode. (LIBG-174)
fi

```

LIBG-175 (error) The test cell for the '%s' auxiliary clocked lssd cell is not

valid because its nontest mode is not a flip-flop.

DESCRIPTION

An auxiliary clocked lssd test_cell has the following characteristics:

- signal types : test_scan_in/test_scan_in_inverted, test_scan_out/test_scan_out_inverted, test_scan_clock_a, test_scan_clock_b, test_clock
- nontest mode : flip-flop

This warning informs you that the signal types point to this cell as being a auxiliary clocked lssd test_cell, but it does not have a flip-flop as its nontest mode. This makes the test_cell invalid and the entire cell is converted to a black box. There is functional information missing, and other tools cannot use this cell.

WHAT NEXT

Check the library description to ensure that nontest modes and signal types are correctly pointed to by the test_cell. To determine why the nontest function is not one of the previous types,

- * Create a cell with the nontest mode as the functional part of the cell.
- * Compile this cell.
- * Issue the following command:

```
report_lib -table <library name> <cell name>
```

In the report_lib command's report, determine which pins correspond to states (pins with an N output) by looking at their functional description.

EXAMPLES

```
cell(libg103) {  
    area : 12;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(CK,IH, CK1) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(A,B) {  
        direction : input;  
        capacitance : 2;  
    }  
    pin(SI) {  
        direction : input;  
        capacitance : 1;  
    }  
    timing() {
```

```

timing_type : setup_falling;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
related_pin : "A";
}
timing() {
    timing_type : hold_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "A";
}
}
pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CK IH CK1";
}
timing() {
    timing_type : falling_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "B";
}
}
pin(XQ) {
direction : output;
}
test_cell(){
pin(D,CK,CK1){
    direction : input;
}
pin(IH ){
    direction : input;
    signal_type : "test_clock";
}
pin(SI){
    direction : input;
    signal_type : "test_scan_in";
}
pin(A){
    direction : input;
    signal_type : "test_scan_clock_a";
}
pin(B){
    direction : input;
    signal_type : "test_scan_clock_b";
}
ff("IQ","IQN"){

```

```

    clocked_on : "CK";
    next_state : "D";
    clocked_on_also : "CK1";
}

pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(XQ) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
}
}

```

EXAMPLE MESSAGE

Error: Line 196, The test cell for the 'libg175' auxiliary clocked lssd cell is not valid because its nontest mode is not a flip-flop. (LIBG-175)

LIBG-176 (error) Neither the memory_read nor the memory write group is allowed on scalar ports.

DESCRIPTION

Either the memory_read group or the memory_write group is specified on a scalar port. These groups are only allowed on bus groups.

WHAT NEXT

Remove the memory_read and memory_write group from all scalar ports.

LIBG-177 (error) The '%s' cell is a ROM, and ROMs cannot have any

memory_write groups.

DESCRIPTION

The cell is defined as a ROM type in the memory group. ROM cells cannot have any memory_write groups because the memory block cannot be written to.

WHAT NEXT

Either change the memory type to a ram type or remove the memory_write group.

EXAMPLES

```
cell(libg177) {  
    ...  
    memory() {  
        type : rom;  
        address_width : 10;  
        word_width : 8;  
    }  
    ...  
    bus (data_in) {  
        bus_type : "bus8"  
        direction : input;  
        capacitance : 1.46;  
        fanout_load : 1.46;  
  
        memory_write() /* Not allowed on ROM cells */  
        address : ram_addr;  
        enable : WR;  
    }  
}  
...  
}
```

EXAMPLE MESSAGE

Error: Line 22, The 'libg177' cell is a ROM, and ROMs cannot have any memory_write groups. (LIBG-177)

LIBG-178 (error) The '%s' cell is a RAM, and RAMs must have at least one memory_read port and at least one memory_write

port.

DESCRIPTION

The cell is defined as a RAM type in the cell memory group. RAM cells must have at least one memory_read port and at least one memory_write port.

WHAT NEXT

You can implement either of the following suggestions:

- (1) Change the memory type to **rom** and ensure only the memory_read group is provided.
- (2) If the model is for a RAM, make sure that both the memory_read and memory_write groups are provided.

EXAMPLES

```
cell (libg178) {

    area : 2300.0;
    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }

    bus (data_out) {
        bus_type : "bus8";
        direction : output;
```

```
    }
}
```

In this case, the memory_read group is missing in the cell. Add the following group to the port 'data_out' :

```
memory_read() {
    address : ram_addr;
}
```

EXAMPLE MESSAGE

Error: Line 22, The 'libg178' cell is a RAM, and RAMs must have at least one memory_read port and at least one memory_write port. (LIBG-178)

LIBG-179 (error) The '%s' cell is a ROM, and ROMs must have at least one memory_read group.****

DESCRIPTION

The cell is defined as a ROM type in the cell memory group. ROM cells require at least one memory_read port.

WHAT NEXT

Add the memory_read group to the data port.

EXAMPLES

```
cell (libg179) {

    area : 2300.0;
    memory() {
        type : rom;
        address_width : 10;
        word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.0;
    }
}
```

```

        }
        pin (WR) {
            direction : input;
            capacitance : 1.13;
            clock : true;
        }
        bus(data_out){
            bus_type : "bus8";
            direction : output;
        }
    }
}

```

In this case, the memory_read group is missing in the cell. Add the following group to the port 'data_out' :

```

memory_read() {
    address : ram_addr;
}

```

EXAMPLE MESSAGE

Error: Line 22, The 'libg179' cell is a ROM, and ROMs must have at least one memory_read group. (LIBG-179)

LIBG-180 (error) The '%s' bus has a %s group, but the '%s' cell has no memory group.

DESCRIPTION

The cell is missing a memory group. The bus has memory specific syntax, which is not allowed.

WHAT NEXT

Either add the memory group to the cell or remove the memory_read/write groups from the ports.

EXAMPLES

```

cell (libg179) {

    area : 2300.0;
    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"
    }
}

```

```

        direction : input;
        capacitance : 1.0;
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }
    bus(data_out){
        bus_type : "bus8";
        direction : output;
    }
}

```

EXAMPLE MESSAGE

Error: Line 38, The 'data_in' bus has a memory_write group, but the 'lib180' cell has no memory group. (LIBG-180)

LIBG-181 (error) In the '%s' cell, the '%s' data bus has a width of %d,
but the memory group has a word width of %d.

DESCRIPTION

The size of the data bus does not match the size of the memory group specified in the cell memory group. They must be consistent.

WHAT NEXT

Change the library to make the data bus width and the memory group word's width consistent.

EXAMPLES

```

cell (libg181) {
    area : 2300.0;
    memory() {
        type : ram;
    }
    address_width : 8;
    word_width : 6;
}

```

```

bus (ram_addr) {
    bus_type : "bus8"; /* defined in the library */
    direction : input;
    capacitance : 1.0;
}
bus (data_in) {
    bus_type : "bus8"
    direction : input;
    capacitance : 1.0;

    memory_write() {
        address : ram_addr;
        enable : WR;
    }
}
pin (WR) {
    direction : input;
    capacitance : 1.0;
    clock : true;
}

bus (data_out) {
    bus_type : "bus8";
    direction : output;
    memory_read() {
        address : ram_addr;
    }
}
}

```

In this case, the width of the bus data_out is 8 and the word width in the memory group is 6. Change either the bus_data's width to 6 or the memory group's word width to 8 to make them consistent.

EXAMPLE MESSAGE

Error: Line 54, In the 'libg181' cell, the 'data_out' data bus has a width of 8, but the memory group has a word width of 6. (LIBG-181)

LIBG-182 (error) The '%s' memory_write data bus can not be an output.

DESCRIPTION

The bus is an input to the memory block because it has the memory_write group specified. Inputs to the memory block can not be an output type.

WHAT NEXT

The direction of the bus must be changed to either input, inout, or internal.

1.TH messages n "May 1994"

LIBG-183 (error) In the '%s' cell, the '%s' address bus is not defined.

The address bus specified in the group is not defined in the cell.

The address specification must refer to a bus defined in the cell.

```
cell (libg183) {
    area : 2300.0;

    memory() {
        type : ram;
    address_width : 8;
    word_width : 8;
    }
    bus (data_in) {
        bus_type : "bus8" /* defined in the library */
        direction : output;
        capacitance : 1.0;
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }
    bus(data_out){
        bus_type : "bus8";
        direction : output;
        memory_read() {
            address : ram_addr;
        }
    }
}
```

In this case, define the ram_addr as a port in the cell as follows:

```
bus (ram_addr) { bus_type : "bus8"; /* defined in the library */ direction : input;
capacitance : 1.0; }
```

Error: Line 58, In the 'libg183' cell, the 'ram_addr' address bus is not defined. (LIBG-183)

LIBG-184 (error) In the '%s' cell, the '%s' address bus has a

width of %d,
but the memory group has an address width of %d.

DESCRIPTION

The size of the address bus does not match the address size of the memory group specified in the cell memory group. They must be consistent.

WHAT NEXT

Change the library to make the address bus width and the memory group address width consistent.

EXAMPLES

```
cell (libg184) {
    area : 2300.0;
    memory() {
        type : ram;
    }
    address_width : 10;
    word_width : 8;
}

bus (ram_addr) {
    bus_type : "bus8"; /* defined in the library */
    direction : input;
    capacitance : 1.0;
}
bus (data_in) {
    bus_type : "bus8"
    direction : input;
    capacitance : 1.0;

    memory_write() {
        address : ram_addr;
        enable : WR;
    }
}
pin (WR) {
    direction : input;
    capacitance : 1.0;
    clock : true;
}

bus (data_out) {
    bus_type : "bus8";
    direction : output;
    memory_read() {
        address : ram_addr;
    }
}
```

```
}
```

In this case, the width of the bus data_out is 8 and the address width in the memory group is 10. Either change the width of the ram_addr to 10 or change the memory group's address width to 8 to make them consistent.

EXAMPLE MESSAGE

Error: Line 58, In the 'libg184' cell, the 'ram_addr' address bus has a width of 8, but the memory group has an address width of 10. (LIBG-184)

LIBG-185 (error) The '%s' memory address can not be an output.

DESCRIPTION

The address bus is an input to the memory block. Inputs to the memory block can not be an output type.

WHAT NEXT

The direction of the bus must be changed to either input, inout, or internal.

LIBG-186 (error) In the '%s' cell, the '%s' memory_read data bus cannot be an input.

DESCRIPTION

The data bus is an output of the memory block because it has the memory_read group specified.

WHAT NEXT

Change the direction of the bus that has the memory_write group to either output, inout, or internal.

EXAMPLES

```
cell (libg186) {
    area : 2300.0;
    memory() {
        type : ram;
```

```

address_width : 8;
word_width : 8;
}
bus (ram_addr) {
    bus_type : "bus8"; /* defined in the library */
    direction : output;
    capacitance : 1.0;
}
bus (data_in) {
    bus_type : "bus8"
    direction : input;
    capacitance : 1.0;
    memory_write() {
        address : ram_addr;
        enable : WR;
    }
}
pin (WR) {
    direction : input;
    capacitance : 1.13;
    clock : true;
}
bus(data_out){
    bus_type : "bus8";
    direction : input; /* should be output */
    memory_read() {
        address : ram_addr;
    }
}
}
}

```

EXAMPLE MESSAGE

Error: Line 54, In the 'libg186' cell, the 'data_out' memory_read data bus cannot be an input. (LIBG-186)

LIBG-187 (error) In the '%s' cell, The %s '%s' attribute is not the name of a port or bus.

DESCRIPTION

The attribute specified in the group is not defined in the cell as either a port or a bus.

You cannot specify an expression here, only a port or a bus is valid. If you need to model an expression(logic), create a pin with a state_function attribute and use that internal pin.

WHAT NEXT

Make sure the specification refers to a port or a bus defined in the cell.

EXAMPLES

```
cell (libg187) {
    area : 1380.0;
    interface_timing : TRUE;

    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

        bus (RA) {
    bus_type : "bus10";
    direction : input;
    capacitance : 1.0;
    }

        bus (DI) {
    bus_type : "bus8";
    direction : input;
    capacitance : 1.0;

    memory_write() {
        address : RA;
        enable : "WRE";
    }
    }

        pin (WE) {
    direction : input;
    capacitance : 1.0;
    clock : true;
    }

        pin (CE) {
    direction : input;
    capacitance : 1.0;
    clock : true;
    }

        bus (DO) {
    bus_type : "bus8";
    direction : output;
    capacitance : 1.0;

    memory_read() {
        address : RA;
    }
    }
}
```

In this case, the port 'WRE' can be defined :

1. as an internal pin
2. is state_function defines the writing occurrence only when WE and CE are active.

```
pin (WRE) {
direction : internal;
capacitance : 1.0;
state_function : "! (WE' * CE')";
clock : true;
}
```

EXAMPLE MESSAGE

Error: Line 43, In the 'libg187' cell, the enable 'WRE' attribute is not the name of a port or bus. (LIBG-187)

LIBG-188 (error) In the '%s' cell, the %s '%s' bus has a width of %d,
but the memory group has a word width of %d.

DESCRIPTION

The size of the bus does not match the word size of the memory block specified in the cell memory group. They must be consistent.

WHAT NEXT

Change the library to make the bus width and the memory group word width consistent.

EXAMPLES

```
cell (libg188) {
    area : 2300.0;
    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"
    }
}
```

```

        direction : input;
        capacitance : 1.0;

        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    bus (WR) {
        bus_type : "bus10"
        direction : input;
        capacitance : 1.0;
        fanout_load : 1.0;
        clock : true;
    }
    bus(data_out){
        bus_type : "bus8";
        direction : output;
        memory_read() {
            address : ram_addr;
        }
    }
}

```

In this case, the bus type of the enable 'WR' is bus10. Change it to bus8.

EXAMPLE MESSAGE

Error: Line 42, In the 'libg188' cell, the enable 'WR' bus has a width of 10,
but the memory group has a word width of 8. (LIBG-188)

LIBG-189 (error) In the '%s' cell, the memory_write group
cannot
have both the enable attribute and the clocked_on attribute.

DESCRIPTION

The memory_write group has both the enable attribute and the clocked_on attribute specified. The Library Compiler does not allow it.

WHAT NEXT

If the memory write process is edge triggered, use the clocked_on attribute. If the memory write process is level-sensitive triggered, use the enable attribute. You cannot specify both at once.

EXAMPLES

```
cell (libg189) {
    area : 2300.0;
    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8";
        direction : input;
        capacitance : 1.0;

        memory_write() {
            address : ram_addr;
            enable : WR;
        clocked_on : WR;
        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }

    bus (data_out) {
        bus_type : "bus8";
        direction : output;
        memory_read() {
            address : ram_addr;
        }
    }
}
```

For the bus 'data_in', you can either have the enable attribute or the clocked_on attribute defined in the memory_write, but not both.

EXAMPLE MESSAGE

Error: Line 40, In the 'libg189' cell, the memory_write group cannot have both the enable attribute and the clocked_on attribute. (LIBG-189)

LIBG-190 (error) In the '%s' cell, the v3.1 sequential syntax is not

supported on memory cells.

DESCRIPTION

The cell has both the memory syntax and the v3.1 sequential syntax defined by either the **function** attribute or the **ff** and **latch** groups. The two syntaxes are not compatible and cannot both be specified on the same cell.

WHAT NEXT

Remove the v3.1 sequential syntax, and use the new state table syntax.

EXAMPLES

```
cell (libg190) {
    area : 2300.0;
    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.0;

        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }

    bus(data_out) {
        bus_type : "bus8";
        direction : output;
        function : "WR + data_in";
        memory_read() {
            address : ram_addr;
        }
    }
}
```

The function attribute is defined for the pin 'data_out'. This message is displayed for each element of the bus data_out that has the function attribute. To fix the problem, remove the function attribute from the pin.

EXAMPLE MESSAGE

Error: Line 60, In the 'libg190' cell, the v3.1 sequential syntax is not supported on memory cells. (LIBG-190)

LIBG-191 (error) The '%s' memory output cannot have a function.

DESCRIPTION

The memory output has an internal_node or a state_function attribute. A memory output has its function defined by the memory_read group and cannot also have an internal_node or a state_function attribute.

WHAT NEXT

Remove the internal_node or state_function attribute.

EXAMPLES

```
cell (libg191) {
    area : 2300.0;
    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.46;
    }
    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.46;

        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    pin (WR) {
        direction : input;
```

```

    capacitance : 1.13;
    clock : true;
}

bus(data_out) {
    bus_type : "bus8";
    direction : output;
    state_function : "WR + data_in";/* not allowed */
    memory_read() {
        address : ram_addr;
    }
}
}

```

This message is displayed for each element of the bus data_out that has the state_function attribute.

EXAMPLE MESSAGE

Error: Line 60, The 'data_out[0]' memory output cannot have a function. (LIBG-191)

LIBG-192 (error) The '%s' port that has both memory_read and memory_write must have the inout direction.

DESCRIPTION

Buses with both memory_read and memory_write groups must have the direction inout.

WHAT NEXT

Either change the direction of this bus to inout, or remove either the memory_read or memory_write group from this bus.

EXAMPLES

```

cell (libg192) {
    area : 2300.0;
    memory() {
        type : ram;
    address_width : 10;
    word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
}

```

```

        }
    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.0;

    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }

    bus(data_out){
        bus_type : "bus8";
        direction : output; /* must be inout */
        memory_read() {
            address : ram_addr;
        }
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
}

```

In this case, the direction of the bus 'data-out' is output. To fix the problem, set the direction to inout. This message is displayed for each element of the bus data_out.

EXAMPLE MESSAGE

Error: Line 62, The 'data_out[0]' port that has both memory_read and memory_write must have the inout direction. (LIBG-192)

LIBG-193 (error) The '%s' port that has both memory_read and memory_write must have a three_state expression.

DESCRIPTION

Buses with both memory_read and memory_write groups must have the **three_state** attribute. During the memory write cycle, when the new data value is driven in from outside the cell, the port associated with the memory_read group must have a three_state attribute.

WHAT NEXT

Add a valid three_state expression to this bus, or remove either the memory_read or

memory_write group from this bus.

EXAMPLES

```
cell (libg193) {
    area : 2300.0;
    memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.0;
    }

    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }

    bus(data_out){
        bus_type : "bus8";
        direction : inout; /* must have three_state */
        memory_read() {
            address : ram_addr;
        }
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
}
```

In this case, the bus 'data_out' has both memory_read and memory_write groups, but no three_state attribute. This message is displayed for each element of the bus data_out. To fix the problem, add the three_state attribute to the bus as follows:

```
pin (CE) {
    direction : input;
    capacitance : 1.0;
    clock : true;
}
bus(data_out){
    bus_type : "bus8";
    direction : inout;
    three_state : "CE"; /* new statement */
```

```

    memory_read() {
        address : ram_addr;
    }
    memory_write() {
        address : ram_addr;
        enable : WR;
    }
}

```

EXAMPLE MESSAGE

Error: Line 62, The 'data_out[0]' port that has both memory_read and memory_write must have a three_state expression. (LIBG-193)

LIBG-194 (warning) The function attribute on the '%s' pin is ignored.

DESCRIPTION

This message indicates that the **function** attribute on the specified pin is ignored. If the pin is an internal pin, use **state_function** attribute. Internal pins are equal to internal nodes, which are single sequential elements. If the cell is a memory cell, it does not need a **function** attribute if the pin already has a **memory_read**, has a **state_function** attribute, or is an internal node.

WHAT NEXT

Either change the internal pin to a output or inout port or remove the **function** attribute.

EXAMPLES

```

cell(libg202) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    statetable ( "D CP", "Q QB" ) {
        table : "L/H R : - - : L/H H/L,\n
                  - ~R : - - : N   N";
    }
    pin(Q) {

```

```

        direction : output;
        inverted_output : FALSE;
        function : "Q";
        internal_node : "Q";
    }
    pin(QB) {
        direction : output;
        inverted_output : TRUE;
        internal_node : "QB";
    }
}

```

EXAMPLE MESSAGE

Warning: Line 127, the function attribute on the 'Q' pin is ignored. (LIBG-194)

LIBG-195 (warning) A bundle is not supported in the memory group.

DESCRIPTION

Currently, Library Compiler does not support memory cells with bundles.

WHAT NEXT

Modify the bundle into a bus.

EXAMPLES

```

cell (libg195) {
    area : 2300.0;
    memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
    }

    bundle (ram_addr) {
        members( D_1 D_2);
        direction : input;
        capacitance : 1.0;
    }

    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.0;
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
}

```

```

        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }
    bus(data_out){
        bus_type : "bus8";
        direction : output;
        memory_read() {
            address : ram_addr;
        }
    }
}

```

EXAMPLE MESSAGE

Warning: Line 94, A bundle is not supported in the memory group. (LIBG-195)

LIBG-196 (error) The inverted_output attribute is not defined in the '%s' output port.

DESCRIPTION

Library Compiler uses the **inverted_output** attribute value to determine whether a sequential output pin is inverting or noninverting.

WHAT NEXT

Make sure each inout and output pin has its "inverted_output" attribute set.

EXAMPLES

```

cell(libg202) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    statetable ( "D CP", "Q QB") {
        table : "L/H R : - - : L/H H/L,\n
                  - ~R : - - : N   N";
    }
}

```

```

pin(Q) {
    direction : output;
/*    inverted_output : FALSE; */
    internal_node : "Q";
}
pin(QB) {
    direction : output;
    inverted_output : TRUE;
    internal_node : "QB";
}
}

```

In this case, set the inverted_output value to FALSE in the port 'Q' to construct the correct logic for the Design Compiler.

EXAMPLE MESSAGE

Error: Line 127, The inverted_output attribute is not defined in the 'Q' output port. (LIBG-196)

LIBG-197 (warning) In the '%s' cell, the '%s' and '%s' memory read or memory write ports have the same address attribute.

DESCRIPTION

This message indicates that the same address attribute is used for both of the specified memory read or memory write ports. Each port must have a unique address attribute.

WHAT NEXT

Edit the cell description so that the specified ports have unique address attributes.

EXAMPLES

```

cell (libg197) {
    area : 2300.0;
    memory() {
        type : ram;
        address_width : 10;
        word_width : 8;
    }

    bus (ram_addr) {
        bus_type : "bus10"; /* defined in the library */
    }
}

```

```

        direction : input;
        capacitance : 1.0;
    }
    bus (data_in) {
        bus_type : "bus8"
        direction : input;
        capacitance : 1.0;
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
    pin (WR) {
        direction : input;
        capacitance : 1.0;
        clock : true;
    }
    pin (EN) {
        direction : input;
        capacitance : 1.0;
    }

    bus(data_out){
        bus_type : "bus8";
        direction : inout;
        three_state : "EN";
        memory_read() {
            address : ram_addr;
        }
        memory_write() {
            address : ram_addr;
            enable : WR;
        }
    }
}

```

In this case, the ports 'data_in' and 'data_out' have the same address attribute for the memory_write group. This message is displayed for each element of the bus data_in and the bus data_out.

EXAMPLE MESSAGE

Warning: Line 38, In the 'libg197' cell, the 'data_in[0]' and 'data_out[0]' memory read or memory write ports have the same address attribute. (LIBG-197)

LIBG-198 (error) The '%s' pin of the '%s' design must be an

'%S'.

DESCRIPTION

By definition, a pin in the **related_pin** attribute for timing constraints must be a input pin.

WHAT NEXT

Check your library for a wrong pin in the **related_pin** attribute or for an incorrect **timing_type**.

EXAMPLE MESSAGE

Error: Line 153, The 'P' pin of the 'libg198' design must be an 'input'. (LIBG-198)

LIBG-199 (error) The '%s' input port in the '%s' cell cannot have timing arcs.

DESCRIPTION

Input ports cannot have timing arcs. There is a possible problem in the direction of the pin, which should be output or inout.

WHAT NEXT

Check your library for a pin with a wrong direction. Change the direction to output or inout.

EXAMPLE MESSAGE

Error: Line 53, The 'D' input port in the 'libg199' cell cannot have timing arcs. (LIBG-198)

LIBG-201 (error) The **min_period** and **min_pulse_width** attributes are not allowed on the '%s' port in the '%s' cell.

DESCRIPTION

This message indicates that the specified port has a **min_period**, **min_pulse_width_high**, or **min_period_width_low** attribute. These attributes are allowed only on clock enable ports.

WHAT NEXT

Update the technology library source to remove the offending attributes.

LIBG-202 (information) In the '%s' cell, the '%s' internal pin is replaced with the inverted '%s' output pin.

DESCRIPTION

This message indicates that the specified internal pin is an inversion of the output pin. The internal pin is replaced by the inverted output pin. This deletion is done without affecting the functionality of the cell. An internal pin that is never visible is functionally useless. Every internal pin must have a unique functional relationship with an output port.

WHAT NEXT

Either delete the internal pin or give it a unique functional relationship with an output port.

EXAMPLES

```
cell(libg202) {
    area : 10;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    statetable ( "D CP", "Q QB") {
        table : "L/H R : - - : L/H H/L,\n
                  - ~R : - - : N   N";
    }
    pin(Q2) {
        direction : internal ;
        internal_node : "QB" ;
    }
    pin(Q) {
        direction : output;
        internal_node : "Q";
    }
    pin(QB) {
        direction : output;
        state_function : "Q2'";
    }
}
```

```
    }  
}
```

In this case the internal node 'Q2' is an inversion of the output 'Q'.

EXAMPLE MESSAGE

Information: Line 125, In the 'libg202' cell, the 'Q2' internal pin is replaced with the inverted 'Q' output pin. (LIBG-202)

LIBG-203 (warning) The '%s' test cell has no function.

DESCRIPTION

One of the test_cells has no functional description. Each test cell needs a functional description (flip-flop or latch description). This is used to determine the full functionality of the cell and is also used for the command `insert_test`.

When reading a .db library, Library Compiler creates a full function if there is any test_cell with a functional description. If no test_cells have a functional description and there is no full cell functional description, the cell is converted to a black box.

WHAT NEXT

Modify the library to specify a functional description within the test_cell group. If a full cell has the function description instead, the cell is no longer a black box, but the `insert_test` command will not be able to use the functional description.

LIBG-204 (error) The '%s' test cell has no function and the cell is black box.

DESCRIPTION

One of the test_cells has no functional description. Each test cell needs a functional description (ff or latch description). This is used to determine the full function of the cell and is also used for the command `insert_test`.

This cell becomes a black box and `read_lib` cannot proceed with reading the library if this error is found.

WHAT NEXT

Specify a functional description within the test_cell. If you specify a full cell description instead, the cell is no longer a black box but `insert_test` cannot use

the functional description.

LIBG-205 (warning) Cell(%s): The function cannot be recognized during functional optimization by Design Compiler.

DESCRIPTION

This message informs you that Library Compiler fails to map the state table description of the cell to the flip-flop or latch group description due to complexity of the function. Therefore, it cannot be recognized by Design Compiler. This cell becomes a black box cell during synthesis. However, it might not be a black box cell to DFT Compiler or other tools, depending on its test_cell description if there is one, for example.

WHAT NEXT

Ignore this message if the intended function cannot be described in v3.1 flip-flop or latch syntax. Otherwise, correct the state table function.

EXAMPLES

```
cell(libg205) {  
    area : 16;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(CP) {  
        direction : input;  
        capacitance : 2;  
    }  
    pin (Q0) {  
        direction : output;  
        internal_node : "Q";  
        input_map : "D CP";  
        ...  
    }  
    pin (Q1) {  
        direction : output;  
        internal_node : "Q";  
        input_map : "Q0 CP";  
        ...  
    }  
    pin (Q2) {  
        direction : output;  
        internal_node : "Q";  
        input_map : "Q1 CP";  
        ...  
    }  
}
```

```

}

pin (Q3) {
    direction : output;
    internal_node : "Q";
    input_map : "Q2 CP";
    ...
}
statetable( "D CP", "Q QN" ) {
    table : "- ~R : - - : N N,\n
              H/L R : - - : H/L L/H";
}
}

```

In this case, the cell cannot be modeled in v3.1 format and the warning message should be ignored.

EXAMPLE MESSAGE

Warning: Line 21, Cell(libg205): The function cannot be recognized by Design Compiler. The cell becomes a black box. (LIBG-205)

LIBG-206 (warning) The logic represented by the 'when' string (%s) in this %s group is equivalent to logic %s.

DESCRIPTION

The logic represented by the 'when' string of state-dependent internal_power and leakage_power groups should not be logically equivalent to logic 0 or logic 1.

A power table with its 'when' condition equivalent to logic 0 is meaningless because it will always be ignored during power calculation.

A power table with its 'when' condition equivalent to logic 1 is valid all states and is therefore not state dependent. It should be represented by a power table without the 'when' condition.

WHAT NEXT

Check the 'when' conditions in the internal power or leakage power group and check that they are not equivalent to logic 0 or 1. Since such condition values are typically meaningless, the power tables may have been characterized incorrectly. 'when' strings with conditions equivalent to logic 1 should be removed. Power tables with conditions equivalent to logic 0 should be removed. This warning may be promoted to an error in future releases.

LIBG-207 (error) The logic represented by the 'when' string (%s) in this

%s group is not mutually exclusive with the logic represented by the 'when' string (%s) in the %s group on line %d.

DESCRIPTION

The logic represented by the 'when' string of all state-dependent or path-dependent internal_power groups between a pair of pins should be mutually exclusive. If it is not, Library Compiler is not be able to determine which internal_power group to use when propagating a signal through the path, if the condition causes both of them to be evaluated 'TRUE'.

The logic represented by the 'when' string of all state-dependent leakage_power groups should be mutually exclusive. If it is not, Library Compiler is not be able to determine which leakage_power group to use if the condition cause more than one condition to be evaluated 'TRUE'.

WHAT NEXT

Check the 'when' strings of both timing groups for wrong information and fix.

EXAMPLES

```
cell(libg44) {
    area : 2;
    pin(D1 D0 S0) {
direction : input;
capacitance : 1;
    }
    pin(Z) {
direction : output;
function : "S0'D0 + S0 D1";
timing() {
    timing_sense : non_unate;
    intrinsic_rise : 1.00;
    intrinsic_fall : 1.00;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : " D0 D1";
}
timing() {
    when : "S0'D0 + S0 D1'";
    when : "D1' S0 + S0'D0 ";
    sdf_cond : "(D1 == 1'b0 && S0 == 1'b1) || (S0 == 1'b0 && D0 == 1'b1)";
    timing_sense : positive_unate;
    intrinsic_rise : 1.00;
    intrinsic_fall : 1.00;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
}
```

```

    related_pin : "S0";
}
timing() {
    when : "D1 S0 + S0'D0";
    sdf_cond : "(D1 == 1'b1 && S0 == 1'b1) || (S0 == 1'b0 && D0 == 1'b0)";
    timing_sense : non_unate;
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "S0";
}
timing() /* default */
{
    intrinsic_rise : 1.00;
    intrinsic_fall : 2.00;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "S0";
}
}
}
}

```

In this case, the second when attribute's string has a typographical error. It should be "D1 S0 + S0'D0'", where the pin D0 should be ticked according to the sdf_cond attribute's string.

EXAMPLE MESSAGE

Error: Line 258, The logic represented by the 'when' string ($S0'D0 + S0 D1$) in this timing group is not mutually exclusive with the logic represented by the 'when' string ($D1 S0 + S0'D0$) in the timing group on line 268. (LIBG-44)

LIBG-208 (warning) Different number of pins on the '%s' test_cell are found.

The test_cell is removed.

DESCRIPTION

The cell and its associated test_cell must have the same number of pins.

This warning informs you that the test_cell pointed to has a different number of pins than its parent cell.

WHAT NEXT

Check the library description to ensure that each test_cell has the same number of pins as the parent cell.

EXAMPLES

```
cell(1bdbb128) {
    area : 13;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(G) {
direction : input;
capacitance : 2;
    }
    pin(D2) {
direction : input;
capacitance : 1;
    }
    pin(C2) {
direction : input;
capacitance : 2;
    }
    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    pin(QN) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    test_cell() {
pin(D) {
    direction : input;
}
pin(G) {
    direction : input;
}
pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(C2) {
    direction : input;
```

```

    signal_type : "test_scan_clock";
}
pin(SE) {
    direction : input;
    capacitance : 2;
    signal_type : "test_scan_enable";
}
state ("IQ","IQN") {
    force_01 : "G D'";
    force_10 : "G D";
}
pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(QN) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
}
}

```

In this case, the 'SE' pin is defined in the test_cell, but it is not defined in the parent cell. To fix the problem, add the definition,

```

pin(SE) {
direction : input;
capacitance : 2;
}

```

EXAMPLE MESSAGE

Warning: Line 124, Different number of pins on the 'lbdb128' cell are found.
The test_cell is removed. (LIBG-208)

LIBG-209 (warning) Unable to find the '%s' pin on the '%s' test_cell.

The test_cell is removed.

DESCRIPTION

This message indicates that you specified a different pin name in the cell and its associated test_cell. This might be caused by a typo. The Library Compiler ignores the associated test_cell.

WHAT NEXT

Check the library description to ensure that each test_cell has the same number of pins as the parent cell.

EXAMPLES

```
cell(lbdb129) {
    area : 13;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(G) {
direction : input;
capacitance : 2;
    }
    pin(D2) {
direction : input;
capacitance : 1;
    }
    pin(C2) {
direction : input;
capacitance : 2;
    }
    pin(SE) {
direction : input;
capacitance : 2;
    }
    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    pin(QN) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    test_cell() {
pin(D) {
    direction : input;
}
}
```

```

pin(G) {
    direction : input;
}
pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(C2) {
    direction : input;
    signal_type : "test_scan_clock";
}
pin(SEB) {
    direction : input;
    capacitance : 2;
    signal_type : "test_scan_enable";
}
latch ("IQ", "IQN") {
    data_in : "D";
    enable : "G";
}
pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(QN) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
}
}

```

In this case, a pin is named 'SE' at the cell level and 'SEB' at the test_cell level. To fix the problem, give the pin the same name.

EXAMPLE MESSAGE

Warning: Line 124, Unable to find the 'SE' pin on the 'lbdb129' test_cell.
The test_cell is removed. (LIBG-209)

LIBG-210 (error) The '%s' pin of the '%s' cell has conflicting signal_types between the cell and the test_cell.

DESCRIPTION

This message indicates that you specified conflicting signal_type attributes for the same pin on different test_cell groups.

WHAT NEXT

Check the library description to ensure that each test_cell has no conflicting signal_type attributes on its pins.

EXAMPLES

```
cell(lbdbb131) {
    area : 13;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(G) {
direction : input;
capacitance : 2;
    }
    pin(D2) {
direction : input;
capacitance : 1;
    }
    pin(C2) {
direction : input;
capacitance : 2;
    }
    pin(SE) {
direction : input;
capacitance : 2;
    }
    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    pin(QN) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "G C2";
}
    }
    test_cell() {
pin(D) {
    direction : input;
}
}
```

```

pin(G) {
    direction : input;
}
pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(C2) {
    direction : input;
    signal_type : "test_scan_clock";
}
pin(SE) {
    direction : input;
    capacitance : 2;
    signal_type : "test_scan_enable";
}
state ("IQ", "IQN") {
    force_01 : "G D'";
    force_10 : "G D";
}
pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(QN) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
    }
    test_cell() {
pin(D) {
    direction : input;
}
pin(G) {
    direction : input;
}
pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(C2) {
    direction : input;
    signal_type : "test_scan_clock";
}
pin(SE) {
    direction : input;
    capacitance : 2;
    signal_type : "test_scan_enable_inverted";
}
state ("IQ", "IQN") {
    force_01 : "G D'";
    force_10 : "G D";
}

```

```

pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
pin(QN) {
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
}
}
}

```

In this case, The 'SE' pin has a test_scan_enable signal_type in the first test_cell group and a test_scan_enable_inverted signal_type in the second test_cell group. To fix the problem, make the signal_type consistent between the two test_cell groups.

EXAMPLE MESSAGE

Error: Line 94, The 'SE' pin of the 'lbdb131' cell has conflicting signal_types between the cell and the test_cell. (LIBG-210)

LIBG-211 (warning) Cell '%s' contains unused input pin(s). It is labeled dont_use and dont_touch.

DESCRIPTION

An input pin is unused if it does not appear in any functional statement, or state table input or input map, nor does it have any test signal_type description. Such cells may cause synthesis to generate erroneous logic because of incomplete modeling.

WHAT NEXT

Either delete the unused input pin or add it the functionality of the cell.

EXAMPLES

```

cell(acell) {
area : 6.50;
pin(CLK) {
direction : input;
capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ", "IQN") {

```

```

next_state : "IQ'";
clocked_on : "CLK";
}
pin(Q) {
direction : output;
function : "IQ";
}
pin(QN) {
direction : output;
function : "IQN";
}
}

```

EXAMPLE MESSAGE

Warning: Line 202, Cell 'acell' contains unused input pin(s).
It is labeled dont_use and dont_touch. (LIBG-211)

LIBG-212 (warning) The logic represented by the '%s' when string in this %s group does not sensitize one or all pins in the '%s' related_pin attribute for the %s function attribute.

DESCRIPTION

This message indicates that the when attribute within an internal_power group does not make sense given the function associated with the output pin. Library Compiler warns you that allowing these extra tables in the library, you are unnecessarily increasing the size of the library and may be characterizing unnecessary data.

WHAT NEXT

Check the 'when' string of internal_power group for wrong information and fix.

EXAMPLES

```

cell(libg212) {
    area : 2;
    pin(A B) {
direction : input;
capacitance : 1;
    }
    pin(Z) {
direction : output;
function : "A & B";
internal_power() {
    related_pin : "B";
}
}
}

```

```

when : "!A'";
...
}
}
}

```

In this case, this internal power table will never be accessed. This is because in order for B to cause Z to change, pin A must be high.

EXAMPLE MESSAGE

Warning: Line 191, The logic represented by the '!A' when string in this internal_power group does not sensitize one or all pins in the 'B' related_pin attribute for the (A & B) function attribute. (LIBG-212)

LIBG-213 (warning) The default internal power is not needed for the %s pin.

DESCRIPTION

This message indicates that the set of 'when' attributes is complete for the internal_power and there is no need for the default internal power table.

WHAT NEXT

Check the 'when' string of internal_power groups for wrong information and fix or remove the default internal power group.

EXAMPLES

```

cell(libg213) {
    area : 2;
    pin(A B) {
        direction : input;
        capacitance : 1;
    }

    pin ( Z ) {
        direction : output ;
        function : "A & B";
        internal_power () {
            when : "A";
                related_pin : "B";
                power(power_template) {
                    values (" 1.000000, 1.000000, 1.000000, 1.000000");
                }
            }
        internal_power () {
    }
}

```

```

when : "B";
    related_pin : "A";
    power(power_template) {
        values (" 1.000000, 1.000000, 1.000000, 1.000000");
    }
}
internal_power () {
    related_pin : "A B";
    power(power_template) {
        values (" 1.000000, 1.000000, 1.000000, 1.000000");
    }
}
}
}

```

In this case, the default internal power table is not needed. This is because in the when attribute contains all possible paths which will sensitize the related_pin B to the output. Therefore, no default internal power table is needed.

EXAMPLE MESSAGE

Warning: Line 183, The default internal power is not needed for the A pin. (LIBG-213)

LIBG-214 (warning) The default internal power is required for the '%s' pin.

DESCRIPTION

This message indicates that the set of 'when' attributes is not complete for the internal_power and there is a need for the default internal power table.

WHAT NEXT

Check the 'when' string of internal_power groups for wrong information and fix or add the default internal power group.

EXAMPLES

```

cell(libg214) {
    area : 2;
    pin(A B) {
direction : input;
capacitance : 1;
    }
}

pin ( Z ) {
    direction : output ;
    function : "A & B";

```

```

        internal_power () {
when : "A";
        related_pin : "B";
        power(power_template) {
            values (" 1.000000, 1.000000, 1.000000");
        }
    }
}

```

In this case, the default internal power table is needed for the related_pin A. This is because the when attribute does not contain all possible paths which will sensitize the related_pin A to the output. Therefore, you either add the power table associated with the related pin A and a when or add the default internal power table as show below:

```

either internal_power () { when : "B"; related_pin : "A"; power(power_template) {
values (" 1.000000, 1.000000, 1.000000, 1.000000"); } } or internal_power () {
related_pin : "B"; power(power_template) { values (" 1.000000, 1.000000, 1.000000,
1.000000"); } }

```

EXAMPLE MESSAGE

Warning: Line 183, The default internal power is required for the 'A' pin. (LIBG-214)

LIBG-215 (error) The '%s' when condition includes the '%s' related pin.

DESCRIPTION

This message indicates that the 'when' and 'related_pin' attributes contain the same pin. This condition does not make sense because the when attribute is a static state while the related_pin attribute is the transitioning pin.

Note that the 'related_pin' of a pin includes the pin itself.

WHAT NEXT

Check the 'when' and the 'related_pin' strings of the internal_power group for wrong information and fix it.

EXAMPLES

```

cell(libg215) {
    area : 2;
    pin(A B) {
direction : input;
capacitance : 1;

```

```

        }

    pin ( Z ) {
        direction : output ;
        function : "A & B";
        internal_power () {
    when : "A";
        related_pin : " A B";
        power(power_template) {
            values (" 1.000000, 1.000000, 1.000000, 1.000000");
        }
    }
}
}
}

```

In this case, the internal power table contains the A pin in both the when and the related_pin attributes. Either remove the A pin from the related_pin or change the when statement.

EXAMPLE MESSAGE

Error: Line 183, The 'A' when condition includes the 'A' related pin. (LIBG-215)

LIBG-220 (warning) The '%s' equation on the '%s' cell evaluates to a '%s' constant.

DESCRIPTION

This message is generated when Library Compiler encounters a three-stated pin, whose three_state attribute always evaluates to 1.

WHAT NEXT

Verify the cell and check the library description of the offending cell for correctness.

EXAMPLES

```

cell(libg220) {
area : 6.50;
pin(A) {
direction : input;
capacitance : 1.5;
}
pin(Y) {
direction : output;
function : "A";
three_state : "1";
}

```

```
}
```

EXAMPLE MESSAGE

Warning: Line 218, The 'three_state' equation on the 'libg220' cell evaluates to a '1' constant. (LIBG-220)

LIBG-221 (warning) Cell %s, referred to by cell %s, does not exist.

DESCRIPTION

The missing cell is referred to by the "single_bit_degenerate" attribute from a multibit cell. This attribute will be removed from the multibit cell.

WHAT NEXT

Correct the attribute value or remove the attribute, or add the required cell in the library.

EXAMPLES

```
cell(FDBBX4) {
    area : 18;
    single_bit_degenerate : FDBB;
    bus(D) {
        ...
    }
    ...
}
```

In this case, cell FDBB is not in the library.

EXAMPLE MESSAGE

Warning: Line 258, Cell FDBB, referred to by cell FDBBX4, does not exist. (LIBG-221)

LIBG-222 (warning) Cell %s, referred to by cell %s, is multibit.

DESCRIPTION

The offending cell is referred to by the "single_bit_degenerate" attribute from a multibit cell. This cell must be a single-bit cell.

WHAT NEXT

Correct the attribute value or remove the attribute, or add the required cell in the library.

EXAMPLES

```
cell(FDBBX4) {  
    area : 18;  
    single_bit_degenerate : FDBBX2;  
    bus(D) {  
        ...  
    }  
    ...  
}
```

In this case, cell FDBBX2 is a multibit cell.

EXAMPLE MESSAGE

Warning: Line 58, Cell FDBBX2, referred to by cell FDBBX4, is multibit. (LIBG-221)

LIBG-223 (warning) Cells %s and %s have different interfaces.

DESCRIPTION

The first cell is referred to by the "single_bit_degenerate" attribute from the second cell. These cells must have the same interfaces.

WHAT NEXT

Correct the interfaces.

EXAMPLES

```
cell(FDBBX4) {  
    area : 18;  
    single_bit_degenerate : FDDB;  
    bus(D) {  
        ...  
    }  
    pin(CP) {  
    }  
    bus(Q) {  
    }  
}  
cell(FDDB) {  
    pin(D) {  
    }
```

```

    }
    pin(clk) {
    }
    pin(Q) {
    }
}

```

In this case, bus D and pin D, and bus Q and pin Q are matched. But pin CP and pin clk, are not. To correct, either change clk to CP, or change CP to clk.

EXAMPLE MESSAGE

Warning: Line 58, Cells FDBB and FDBBX4 have different interfaces. (LIBG-223)

LIBG-224 (warning) Cell %s has unequal bus or bundle widths.

DESCRIPTION

To be eligible for having the "single_bit_degenerate" attribute, the cell must be a multibit black box, and all buses must have the same width.

WHAT NEXT

Correct the bus range.

EXAMPLES

```

type (downbus3) {
    base_type : array;
    data_type : bit;
    bit_width : 3;
    bit_from : 2;
    bit_to   : 0;
    downto   : true;
}
type (bus4) {
    base_type : array;
    data_type : bit;
    bit_width : 4;
    bit_from : 0;
    bit_to   : 3;
    downto   : true;
}
cell(FDBBX4) {

```

```

area : 18;
single_bit_degenerate : FDBB;
bus(D) {
    bus_type : downbus3;
    ...
}
pin(CP) {
}
bus(Q) {
    bus_type : bus4;
}
}

```

In this case, bus D has pin from 3 to 0, bus bus Q has range from 0 to 3.

EXAMPLE MESSAGE

Warning: Line 224, Cell FDBBX4 has unequal bus or bundle widths. (LIBG-224)

**LIBG-225 (warning) Errors have been detected. The
single_bit_degenerate
attribute is removed from cell %s.**

DESCRIPTION

The single_bit_degenerate attribute is removed from the cell because there is an error regarding the attribute specification on this cell or related cell.

WHAT NEXT

To specify "single_bit_degenerate" on a cell, the cell must satisfy:

It is a multibit black box with bused pins (NOT bundled pins)
The bus member must range from 0 to N-1, (N is the width)
The single-bit cell referred to must be a single-bit black box.
The two cells must have identical interface naming.

EXAMPLES

```

cell(FDBBX2) {
    area : 18;
    single_bit_degenerate : FDBB;
    bundle(D) {
        members(D0, D1); ...
    }
    pin(CP) { ... }
}

```

```

bundle(Q) {
    members(Q0, Q1); ...
}
bundle(QN) {
    members(Q0N, Q1N); ...
}
}

cell(FDBB) {
    area : 18;
    pin(D) { ... }
    pin(CP) { ... }
    pin(Q) { ... }
    pin(QN) { ... }
}

```

The single_bit_degenerate would be ok if the bundle groups are replaced with bus groups with bus member ranging from 0 to 1.

EXAMPLE MESSAGE

Warning: Line 225, Errors have been detected. Attribute single_bit_degenerate is removed from cell %s. (LIBG-225)

LIBG-226 (warning) Only cell %s has geometry_print %s.

DESCRIPTION

It is of no use to put a geometry_print on a single cell.

WHAT NEXT

Remove it or put it on other cells when appropriate.

EXAMPLES

```

cell(FDBBX2) {
    area : 18;
    geometry_print : GP1;
    bundle(D) {
        members(D0, D1); ...
    }
    pin(CP) { ... }

    bundle(Q) {
        members(Q0, Q1); ...
    }
    bundle(QN) {
        members(Q0N, Q1N); ...
    }
}

```

```
    }  
}
```

GP1 only appears on FDBBX2.

EXAMPLE MESSAGE

Warning: Line 226, Only cell FDBBX2 has geometry_print GP1. (LIBG-226)

LIBG-228 (warning) Failed to transform the function of cell '%s' to a netlist. The cell becomes a black box for Formality.

DESCRIPTION

Library Compiler fails to synthesize a netlist structure representing functionality of this cell. Library Compiler does not accept a derived statetable description when performing this netlist transformation. That is, if the full-function description is not specified in the .lib file, this warning message will be issued. Other causes of failure should have been reported by other warning messages. This netlist structure is referenced by Formality. Without this netlist, Formality can only treat this cell as a black box.

WHAT NEXT

Check the statetable description and make sure it is specified correctly.

LIBG-229 (warning) Cell '%s' has non-disjoint input.

DESCRIPTION

One or more input pins used in the statetable are used in more than one sequential function, such as clock and enable. As a result, this function cannot be transformed by Library Compiler to a netlist structure referenced by Formality.

WHAT NEXT

Check the statetable description and correct all mistakes.

LIBG-230 (warning) Internal pin '%s' is dangling. The pin is

removed.

DESCRIPTION

The internal pin is not associated with any statetable, it does not have a function or a state_function, it is not a memory port, nor is it part of any timing-arc specification. It is redundant and therefore being removed.

WHAT NEXT

You can add the required element if it is accidentally missing. Or a dummy timing arc will serve the purpose of keeping the internal pin interface.

LIBG-231 (information) Internal pin '%s' is for dcm timing.

DESCRIPTION

The internal pin is labeled for dcm timing use only.

WHAT NEXT

Make sure the pin is used for dcm timing only, not for any other purpose.

LIBG-232 (error) The 'function' attribute on the '%s' internal Pin/ bus of the '%s' cell is not allowed.

DESCRIPTION

This error is issued when any internal pin of a combinational cell defines a function attribute. In a combinational cell, a function attribute can only be defined on an output pin.

WHAT NEXT

Check your library for wrong attributes.

EXAMPLES

```
cell(libg232) {  
    area : 1 ;  
    pin (A) {
```

```

direction : input ;
capacitance : 0 ;
}
pin (A_INT) {
direction : internal ;
function : A;
capacitance : 0 ;
timing() {
related_pin: "A" ;
intrinsic_rise: 1.0 ;
rise_resistance : 0.0 ;
intrinsic_fall : 1.0 ;
fall_resistance : 0.0 ;
}
}
pin ("Y") {
direction : output ;
function : "A'" ;
timing() {
related_pin: "A_INT" ;
intrinsic_rise: 1.0 ;
rise_resistance : 0.0 ;
intrinsic_fall : 1.0 ;
fall_resistance : 0.0 ;
}
}

```

EXAMPLE MESSAGE

Error: Line 10, The 'function' attribute on the 'A_INT' internal pin/bus of the 'libg232' cell is not allowed. (LIBG-232)

LIBG-233 (error) The 'clock_gate_enable_pin' attribute is defined on more than one pin in the '%s' cell.

DESCRIPTION

This error is issued when the `clock_gate_enable_pin` attribute is defined on more than one pin in a cell. In a clock gating cell, there should only be at most one pin with the `clock_gate_enable_pin` attribute defined.

WHAT NEXT

Check your library and remove extra `clock_gate_enable_pin` attribute.

EXAMPLES

```
cell(libg233) {
    area : 1 ;
    is_clock_gating_cell : TRUE;
    pin (A) {
        direction : input ;
        capacitance : 0 ;
        clock_gate_enable_pin : TRUE;
    }
    pin (B) {
        direction : input ;
        capacitance : 0 ;
        clock_gate_enable_pin : TRUE;
    }
    pin ("Y") {
        direction : output ;
        function : "A' B'" ;
        timing() {
            related_pin: "A B" ;
            intrinsic_rise: 1.0 ;
            rise_resistance : 0.0 ;
            intrinsic_fall : 1.0 ;
            fall_resistance : 0.0 ;
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 10, The 'clock_gate_enable_pin' attribute is defined on more than one pin in the 'libg233' cell. (LIBG-233)

LIBG-234 (error) The '%s' cell cannot be used as a clock gating cell.

DESCRIPTION

This error is issued when the `is_clock_gating_cell` attribute is defined on a cell with disallowed function.

The `is_clock_gating_cell` attribute can be set on

- 2-input clock gates Examples of 2-input clock gates are AND, NAND, OR, and NOR library cells that are used to gate clocks.
- 1-input cells Examples of 1-input clock gates are buffer and inverter library cells that are used in the fanin and fanout of the 2-input clock gate.
- 2-input D latches These latches can be active high or low and must have a noninverting output.

WHAT NEXT

Check your library and correct the error.

EXAMPLES

```
cell(libg234) {
    area : 1 ;
    is_clock_gating_cell : TRUE;
    pin (A) {
        direction : input ;
        capacitance : 0 ;
        clock_gate_enable_pin : TRUE;
    }
    pin (B) {
        direction : input ;
        capacitance : 0 ;
    }
    pin (C) {
        direction : input ;
        capacitance : 0 ;
    }
    pin ("Y") {
        direction : output ;
        function : "A B C" ;
        timing() {
            related_pin: "A B C" ;
            intrinsic_rise: 1.0 ;
            rise_resistance : 0.0 ;
            intrinsic_fall : 1.0 ;
            fall_resistance : 0.0 ;
        }
    }
}
```

EXAMPLE MESSAGE

Error: Line 10, The 'libg234' cell cannot be used as a clock gating cell. (LIBG-234)

LIBG-235 (error) The '%s' attribute is either not defined on any pin in the integrated clock gated '%s' cell or it is defined on a wrong pin.

DESCRIPTION

This error is issued when the `clock_gate_enable_pin` or `clock_gate_clock_pin` or `clock_gate_outp_pin` attribute is either not defined on any pin in a cell or it is defined on the wrong pin. In a clock gating cell, there should only be at most one pin with the `clock_gate_enable_pin` or `clock_gate_out_pin` or `clock_gate_clock_pin` attribute defined.

WHAT NEXT

Check your library and add the missing clock gate attribute.

EXAMPLES

```
cell(libg235) {
    area : 1;
    clock_gating_integrated_cell : "latch_posedge";
    dont_use : true;
    dont_touch : true;
    statetable(" CP EN ", "IQ ") {
        table : " L  L  : - : L ,
                  L  H  : - : H ,
                  H  -  : - : N ";
    }
    pin(IQ) {
        direction : internal;
        internal_node : "IQ";
    }
    pin(EN) {
        direction : input;
        capacitance : 1.0;
    }
    pin(CP) {
        direction : input;
        capacitance : 1.0;
        min_pulse_width_low : 0.319;
        clock_gate_clock_pin : TRUE;
    }
    pin(Z) {
        direction : output;
        state_function : "CP * IQ";
        max_capacitance : 1.0;
        clock_gate_out_pin : TRUE;
    }
}
```

EXAMPLE MESSAGE

Error: Line 10, The 'clock_gate_enable_pin' attribute is either not defined on any pin in the integrated clock gated 'libg235' cell or it is defined on a wrong pin. (LIBG-235)

LIBG-236 (error) The '%s' clock gate cell has the wrong number

of pins.

DESCRIPTION

This error is issued when the `clock_gating_integrated_cell` attribute is defined on a cell with disallowed function.

The `clock_gating_integrated_cell` attribute must have at most two inputs pins and two output pins.

WHAT NEXT

Check your library and correct the error.

EXAMPLES

```
cell(libg236) {
    area : 1;
    clock_gating_integrated_cell : "latch_posedge";
    dont_use : true;
    dont_touch : true;
    statetable(" CP1 EN ", "IQ ") {
        table : " L  L  : - : L ,
                  L  H  : - : H ,
                  H  -  : - : N ";
    }
    pin(IQ) {
        direction : internal;
        internal_node : "IQ";
    }
    pin(EN) {
        direction : input;
        clock_gate_enable_pin : true;
        capacitance : 1.0;
    }
    pin(CP1) {
        direction : input;
        capacitance : 1.0;
        min_pulse_width_low : 0.319;
    }

    pin(CP2) {
        direction : input;
        capacitance : 1.0;
        min_pulse_width_low : 0.319;
    }
    pin(Z) {
        direction : output;
        state_function : "CP1 * IQ";
        max_capacitance : 1.0;
    }
}
```

EXAMPLE MESSAGE

Error: Line 10, The 'libg236' clock gate cell has the wrong number of pins. (LIBG-236)

LIBG-237 (error) The '%s' clock gate cell has the wrong type of pins.

DESCRIPTION

This error is issued when the `clock_gating_integrated_cell` attribute is defined on a cell with the wrong pin types

The `clock_gating_integrated_cell` attribute expects the following attributes on its pins:

- `clock_gate_enable_pin`
- `clock_gate_obs_pin`
- `clock_gate_test_pin`

WHAT NEXT

Check your library and correct the error.

EXAMPLES

```
cell(libg237) {
    area : 1;
    clock_gating_integrated_cell : "latch_posedge_precontrol";
    dont_use : true;
    dont_touch : true;
    statetable(" CP EN CTL", "IQ ") {
        table : " L  L  L : - : L ,
                  L  L  H : - : H ,
                  L  H  L : - : H ,
                  L  H  H : - : H ,
                  H  -  - : - : N ";
    }
    pin(IQ) {
        direction : internal;
        internal_node : "IQ";
    }
    pin(EN) {
        direction : input;
        capacitance : 0.017997;
        clock_gate_enable_pin : true;
    }
    pin(CTL) {
        direction : input;
        capacitance : 0.017997;
    }
    pin(CP) {
        direction : input;
        capacitance : 0.031419;
```

```

        min_pulse_width_low : 0.319;
    }
    pin(Z) {
        direction : output;
        state_function : "CP * IQ";
        max_capacitance : 0.500;
    }
}

```

The attribute `clock_gate_test_pin` is missing. You need to add it to the 'CTL' pin.

```
clock_gate_test_pin : true;
```

EXAMPLE MESSAGE

Error: Line 10, The 'libg237' clock gate cell has the wrong type of pins. (LIBG-237)

LIBG-238 (error) The '%s' clock gate cell is not of type '%s'.

DESCRIPTION

This error is issued when the `clock_gating_integrated_cell` attribute is defined on a cell with disallowed function.

Check the Library Compiler User Guide for the list of the clock gating integrated cell types.

WHAT NEXT

Check your library and correct the error.

EXAMPLES

```

cell(libg238) {
    area : 1;
    clock_gating_integrated_cell : "latch_posedge";
    dont_use : true;
    dont_touch : true;
    statetable(" CP EN ", "IQ ") {
        table : " L  L  : - : L ,
                  L  H  : - : H ,
                  H  -  : - : N ";
    }
    pin(IQ) {
        direction : internal;
        internal_node : "IQ";
    }
    pin(EN) {
        direction : input;
        capacitance : 1.0;
    }
}

```

```

}
pin(CP) {
    direction : input;
    capacitance : 1.0;
    min_pulse_width_low : 0.319;
}
pin(Z) {
    direction : output;
    state_function : "CP * IQ * EN";
    max_capacitance : 1.0;
}

```

EXAMPLE MESSAGE

Error: Line 10, The 'libg238' clock gate cell is not of type 'latch_pos'. (LIBG-238)

LIBG-239 (information) The timing arc from '%s' to '%s' is resolved into the three_state_enable type.

DESCRIPTION

The timing arc is entered as combinational/sequential. But the related pin is a fanin to the three_state function only.

WHAT NEXT

Add "timing_type : three_state_enable;" to the timing group. Or check if this arc is intended for three_state_enable.

LIBG-240 (warning) The phase relationship of the outputs of cell '%s'
is different from that of its test cell at line %d.

DESCRIPTION

The two outputs of the full cell are equal, but the outputs of the test cell are opposite; or vice versa.

WHAT NEXT

If you intended that the outputs of the full cell differ from the outputs of the test cell, no action is required. Otherwise, change the specification of one of the

cells so that they agree.

EXAMPLE

```
cell (SCAN) {
    ff(IQ, IQN) {
        ...
    }
    pin (Q1) {
        direction : output;
        function  : IQ;
        ...
    }
    pin (Q2) {
        direction : output;
        function  : IQ;
        ...
    }
    ...
    test_cell() {
        ff(IQ, IQN) {
            ...
        }
        pin (Q1) {
            direction : output;
            function  : IQ;
            ...
        }
        pin (Q2) {
            direction : output;
            function  : IQN;
            ...
        }
        ...
    }
}
```

EXAMPLE MESSAGES

Warning: Line 200, The phase relationship of the outputs of cell 'SCAN' is different from that of its test cell at line %300. (LIBG-240)

LIBG-241 (warning) The '%s' cell has %d pins which exceeds the limit 16.
The state table is not generated.

DESCRIPTION

The cell has over 16 pins. There is an exponential cose in performance and memory as

the number of pins increases. This warning tells the user about the excessive size of the table that is being generated.

WHAT NEXT

If possible, take advantage of the state table group and the input_map attribute to reduce the size of the table.

EXAMPLES

```
cell (libg241) {
latch(iq,iqn) {
    data_in : "((c1 *d1_b') +(c2 *d2_b') +(c3 *d3_b') +(c4 *d4_b') +(c5 *d5_b') +(c6 *d6_b') +(c7 *d7_b') +(c8 *d8_b') +(c9 *d9_b') +(c10 *d10_b') +(c11 *d11_b') +(c12 * d12_b'))" ;
    enable : "(c1 +c2 +c3 +c4 +c5 +c6 +c7 +c8 +c9 +c10 +c11 +c12)" ;
    clear : "!rb";
    preset : "s";
    clear_preset_var1 : "L";
    clear_preset_var2 : "H";
}

pin ( q ) {
    direction : output ;
    function : "iq";
    timing () {
        related_pin : "d1_b d2_b d3_b d4_b d5_b d6_b d7_b d8_b
d9_b d10_b d11_b d11_b" ;
        cell_rise ( prop1 ) {
            values ("0.102565, 0.092949, 0.117635, 0.129560");
        }
        rise_transition ( trans1 ) {

        values ("0.102461, 0.097734, 0.129652, 0.175103");
    }
    timing_type : preset ;
    timing_sense : positive_unate ;
}

timing () {
    related_pin : "rb" ;
    cell_fall ( prop1 ) {
        values ("0.135732, 0.139003, 0.193663, 0.182614");
    }
    fall_transition ( trans1 ) {
        values ("0.090745, 0.091247, 0.107943, 0.171294");
    }
    timing_type : clear ;
    timing_sense : positive_unate ;
}
}

pin(d1_b d2_b d3_b d4_b d5_b d6_b d7_b d8_b d9_b d10_b d11_b d12_b rb s) {
    direction : input ;
    capacitance : 0.1 ;
}

pin ( c1 c2 c3 c4 c5 c6 c7 c8 c9 c10 c11 c12) {
    direction : input ;
    capacitance : 0.1 ;
    clock : true ;
}
}
}

```

EXAMPLE MESSAGE

Warning: The 'libg241' cell has 26 pins which exceeds the limit of 16.

The state table is not generated. (LIBG-241)

LIBG-242 (warning) The '%s' cell has pins with 'x_function'

attribute and
it becomes a black box.

DESCRIPTION

For combinational cells with x function, th function id is set to be "unknown".

WHAT NEXT

Make sure the description is correct.

EXAMPLES

```
cell(test) {  
    area : 1;  
    pin(A) {  
        direction : input;  
        capacitance : 0;  
    }  
    pin(B) {  
        direction : input;  
        capacitance : 0;  
    }  
    pin(O) {  
        direction : output;  
        function : "A'";  
        x_function : "B";  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 34, The 'test' cell has pins with 'x_function' attribute and it becomes a black box. (LIBG-242)

LIBG-243 (warning) The '%s' cell is missing the "nextstate_type" attribute
for some input pin(s) specified in 'next_state' of its ff/ff_bank group.

DESCRIPTION

In a pin group, nextstate_type defines the type of a next_state attribute to be used in an ff group, a seq group, or a ff_bank group.

This message is generated when the attribute 'nextstate_type' is not defined in the input pin included in the next_state attribute from the cell's sequential state description.

WHAT NEXT

Check your library for each input pin used in the next_state statement of a sequential group and add nextstate_type attribute if it does not have it.

EXAMPLES

```
cell(libg243) {
area : 6.50;
pin(D) {
    direction : input;
    capacitance : 3.0;
}
pin(CLK) {
    direction : input;
    capacitance : 1.5;
}
pin(SET) {
    direction : input;
    nextstate_type : scan_in;
    capacitance : 3.0;
}

ff("IQ","IQN") {
    next_state : "D CLK";
    clocked_on : "CLK";
    preset     : "SET'";
}

pin(Q) {
    direction : output;
    function : "IQ";
}
pin(QN) {
    direction : output;
    function : "IQN";
}
}
```

EXAMPLE MESSAGE

Warning: Line 153, The 'libg243' cell is missing the "nextstate_type" attribute for some input pin(s) specified in 'next_state' of its ff/ff_bank group. (LIBG-243)

LIBG-244 (warning) The values for clear_preset_var1 and clear_preset_var2 in the '%s' cell are opposite.

This may cause incorrect DC optimization.

DESCRIPTION

WHAT NEXT

Change the value of clear_preset_var1 or clear_preset_var2.

EXAMPLES

```
cell(libg111) {
area : 11;
pin(D) {
direction : input;
capacitance : 1;
}
pin(CP) {
direction : input;
capacitance : 1;
}
pin(CLR) {
direction : input;
capacitance : 1;
}
pin(SET) {
direction : input;
capacitance : 1;
}
ff("IQ","IQN") {
next_state : "D";
clocked_on : "CP";
clear : "CLR'";
preset : "SET'";
clear_preset_var1 : L;
clear_preset_var2 : H;
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CP";
}
timing() {
timing_type : clear;
timing_sense : positive_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
}
```

```

        related_pin : "CLR";
    }
    timing() {
timing_type : preset;
timing_sense : negative_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "SET";
}
pin(QN) {
direction : output;
function : "IQN";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CP";
}
timing() {
timing_type : preset;
timing_sense : negative_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "CLR";
}
timing() {
timing_type : clear;
timing_sense : positive_unate;
intrinsic_fall : 1.0;
fall_resistance : 0.1;
related_pin : "SET";
}
}
}

```

Change the value of clear_preset_var1 to H or the value of clear_preset_var1 to L.

EXAMPLES

Warning: Line 244, The values for clear_preset_var1 and
clear_preset_var2 in the 'libg111' cell are opposite.
This may cause incorrect DC optimization. (LIBG-244)

LIBG-245 (information) Cell(%s) test scan type is %s. DFT Compiler
should be able to infer this cell during compile -scan.

It is not a black box for DFT Compiler.

DESCRIPTION

Library Compiler recognizes test scan type for the scan cell according to its test_cell description.

WHAT NEXT

report_lib also reports scan type for test scan cell.

LIBG-246 (warning) Cell(%s) test scan type is not recognized by Library Compiler. It becomes a black box for DFT Compiler.

DESCRIPTION

Library Compiler fails to recognize test scan type of the scan cell according to its test_cell description.

WHAT NEXT

Check the signal type of each pin in test_cell description and correct it if it is wrong.

LIBG-247 (error) In test_cell of Cell(%s) clocked_on pin's polarity is opposite from the cell's definition.

DESCRIPTION

The test_cell's non-test mode behavior has to be consistent with what is defined in the cell section. Library Compiler detects that the clocked_on pin in test_cell has opposite polarity than the cell's defintion.

WHAT NEXT

Correct test_cell's clocked_on pin's polarity to be consistent with the cell.

EXAMPLE

```
cell (TNB) {
    ff ("IQ", "IQZ") {
        next_state : " (D SCAN') + (SD SCAN) ";
```

```

        clocked_on : "CLK' ";
    }
test_cell() {
    ff ("IQ", "IQZ") {
        next_state : "D";
        clocked_on : "CLK";
    }
    ...
}

```

In this case the cell TNB is falling-edge triggered but its test_cell describes a rising-edge triggered flip-flop.

LIBG-248 (warning) The '%s' cell's %s groups for %s '%s'
do not cover all the states represented by the 'when' string, and
the default
leakage_power group is not defined for %s '%s', thus 0 will be
used as
the leakage_power value for the missing states of %s '%s'.

DESCRIPTION

This message indicates the leakage_power information defined in a cell does not cover all the states for the power_level(power_rail value). For the missing states of the power_level, 0 will be used as the leakage_power value.

It is also used to check for related_pg_pin-based leakage_power information.

WHAT NEXT

Add the missing leakage_power information for the power_level.

EXAMPLES

```

cell(AN2) {
    leakage_power () {
power_level : "VDD1";
when : "A";
value : 1.0;
    }
    leakage_power () {
power_level : "VDD1";
when : "!A";
value : 1.5;
    }
    leakage_power () {

```

```

power_level : "VDD2";
when : "A";
value : 1.0;
}
...
}

```

In this case, the leakage_power for the state '!A' of power_level 'VDD2' is missing. To fix the problem, add the leakage_power for the missing state in the cell group:

```

cell(AN2) {
    leakage_power () {
        power_level : "VDD1";
        when : "A";
        value : 1.0;
    }
    leakage_power () {
        power_level : "VDD1";
        when : "!A";
        value : 1.5;
    }
    leakage_power () {
        power_level : "VDD2";
        when : "A";
        value : 1.0;
    }
    leakage_power () {
        power_level : "VDD2";
        when : "!A";
        value : 1.2;
    }
    ...
}

```

EXAMPLE MESSAGE

Warning: Line 12, The 'AN2' cell's leakage_power groups for power_level 'VDD2' do not cover all the states represented by the 'when' string, and the default leakage_power group is not defined for power_level 'VDD2', thus 0 will be used as the leakage_power value for the missing states of power_level 'VDD2'. (LIBG-248)

LIBG-249 (error) The '%s' cell does not specify the %s group with the 'when' string (%s) for the power_level '%s'.

DESCRIPTION

This message indicates the leakage_power information defined in a cell does not cover the state('when' string) for the power_level(power_rail value). For the power-level specific leakage power modeling, for each 'when' statement which appears in the leakage_power groups of a cell, there must exist a leakage_power group with that

'when' statement for every modeled power_level.

The same rule applies for the internal_power groups.

WHAT NEXT

Add the missing leakage_power information for the power_level.

EXAMPLES

```
cell(AN2) {  
    leakage_power () {  
power_level : "VDD1";  
when : "AB";  
value : 1.0;  
    }  
    leakage_power () {  
power_level : "VDD1";  
when : "!AB";  
value : 1.5;  
    }  
    leakage_power () {  
power_level : "VDD2";  
when : "AB";  
value : 1.0;  
    }  
    ...  
}
```

In this case, the leakage_power for the state '!AB' of power_level 'VDD2' is missing, . To fix the problem, add the leakage_power for the missing state in the cell group:

```
cell(AN2) {  
    leakage_power () {  
        power_level : "VDD1";  
        when : "AB";  
        value : 1.0;  
    }  
    leakage_power () {  
        power_level : "VDD1";  
        when : "!AB";  
        value : 1.5;  
    }  
    leakage_power () {  
        power_level : "VDD2";  
        when : "AB";  
        value : 1.0;  
    }  
    leakage_power () {  
        power_level : "VDD2";  
        when : "!AB";  
        value : 1.2;  
    }  
}
```

```
    ...  
}
```

EXAMPLE MESSAGE

Error: Line 12, The 'AN2' cell does not specify the leakage_power group with the 'when' string (!AB) for the power_level 'VDD2'. (LIBG-249)

LIBG-250 (error) The logic represented by the 'when' string (%s) in this

%s group is not equal to or mutually exclusive with the logic represented by
the 'when' string (%s) in the %s group on line %d.

DESCRIPTION

The logic represented by the 'when' string of all state-dependent or path-dependent internal_power groups between a pair of pins should be either equal or mutually exclusive for different power_levels. If it is not, Power Compiler will not be able to determine correctly which internal_power group to use when propagating a signal through the path.

WHAT NEXT

Check the 'when' strings of both internal_power groups for wrong information and fix.

EXAMPLES

```
cell(libg44) {  
    area : 2;  
    pin(D1 D0 S0) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(Z) {  
        direction : output;  
        function : "S0'D0 + S0 D1";  
    }  
    ...  
    internal_power() {  
        power_level : VDD1;  
        when : "S0'D0 + S0 D1'";  
        when : "D1' S0 + S0'D0";  
        related_pin : "S0";  
  
        power(scalar) { values ( "1.0" ); }  
    }  
}
```

```

}
internal_power() {
    power_level : VDD2;
    when : "D1 S0 + S0'D0";
    related_pin : "S0";
    power(scalar) { values ( "2.0" ); }
}
}
}

```

In this case, the second when attribute's string has a typographical error. It should be "D1 S0 + S0'D0"'; where the pin D0 should be ticked according to the sdf_cond attribute's string.

EXAMPLE MESSAGE

```

Error: Line 258, The logic represented by the 'when' string (S0'D0 + S0 D1') in this
       internal_power group is not equal to or mutually exclusive with the logic r
epresented by
       the 'when' string (D1 S0 + S0'D0) in the internal_power group on line 268.
(LIBG-250)

```

LIBG-251 (error) The '%s' group has conflicting 'related_pin' with the '%s' group on line %d.

DESCRIPTION

The "related_pin" in different internal_power groups with the same power_level of the same pin must not share pins. Similarly, the related_pin in different internal_power groups without power_level definition of the same pin must not share pins.

One exception is that, for the above 2 cases, if the pins specified in the "related_pin" of the first internal_power are all included in the "related_pin" of the second internal_power, then Library Compiler will issue LBDB-107 warning and the second internal_power will overwrite the first one.

WHAT NEXT

Correct the 'related_pin' strings of both internal_power groups.

EXAMPLES

```

cell(libg44) {
    area : 2;
    pin(D1 D0 S0) {
direction : input;

```

```

capacitance : 1;
}
pin(Z) {
direction : output;
function : "S0'D0 + S0 D1";
...
internal_power() {
power_level : VDD1;
related_pin : "S0";

power(scalar) { values ( "1.0" ); }
}
internal_power() {
power_level : VDD1;
related_pin : "S0 S1";
power(scalar) { values ( "2.0" ); }
}
}
}

```

In this case, the second internal_power group's 'related_pin' conflicts with that of the first internal_power group. One fix can be that replacing the 'related_pin' of the second internal_power group from "S0 S1" to "S1".

EXAMPLE MESSAGE

Error: Line 251, The 'internal_power' group has conflicting 'related_pin' with the 'internal_power' group on line 268. (LIBG-251)

LIBG-252 (error) The 'function' of the '%s' pin/bus on the '%s' cell is not correctly defined.

DESCRIPTION

This error is issued when the function is not correctly defined. A valid function statement in the sequential model must satisfy the following 2 conditions:

For a ff/latch, the noninverted is called teh first variable and the inverted output is called the second variable. A function statement of each primary output must include either the first variable or the second variable.

1. It must include and can only include the the first variable or the second variable or a the valid input pins defined for the cell in addition to the boolean operators.
2. All the component insider the function statement should be separated by a space or spaces.

WHAT NEXT

Make the appropriate correction in your library, as indicated in the error message. For more information on sequential models, refer to the **Library Compiler Reference** and **User Guide Manuals**.

EXAMPLES

```
cell(libg17) {
area : 6.50;
pin(CLK) {
direction : input;
capacitance : 1.5;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ1";/* wrong, should be IQ */
}
pin(QN) {
direction : output;
function : "IQN";
}
}
```

EXAMPLE MESSAGE

Error: Line 23, The 'function' of the 'Q' in/bus on the 'libg17' cell
is not correctly defined. (LIBG-252)

LIBG-253 (error) Cell(%s): The '%s' pin is a duplicate of '%s' internal pin.

DESCRIPTION

This message indicates that the specified internal pin is a duplicate of the other relative pin. For statetable-based sequential cells, the "IQ" function can only be defined in an internal pin with `internal_node : "IQ"`.

WHAT NEXT

Combine the information of the two pins into the internal pin and remove the other pin.

EXAMPLES

```
cell(libg253) {  
    ...  
    statetable(" CEN CLK ", " IQ ") {  
        table : "  
        L L : - : L ,  
        H L : - : H ,  
        - H : - : N " ;  
    }  
    ...  
    pin(IQ){  
        direction : internal;  
        internal_node : "IQ";  
    }  
    pin(Y){  
        direction : output;  
        state_function : "IQ";  
    }  
    ...  
}  
...  
}
```

In this case, internal pin IQ and pin Y are duplicate. The correct model should be:

```
cell(libg253) {  
    ... statetable(" CEN CLK ", " IQ ") { table : " L L : - : L , H L : - : H , - H : -  
    : N " ; } ... pin(IQ){ direction : output; internal_node : "IQ"; ... } ... }
```

EXAMPLE MESSAGE

Warning: Line 139, Cell(libg253): The pin 'SOSV' is a duplicate of the 'IQ' internal pin. (LIBG-253)

LIBG-254 (error) An invalid '%s' %s string in the '%s' cell.

DESCRIPTION

The string given is not valid for representing a boolean logic defined in Synopsys format.

WHAT NEXT

Refer to your Library Compiler Reference Manual to find out the valid format of the string. It is described in the "function simple attribute" under the "Cell Group Description and Syntax".

EXAMPLES

```
cell(sample) {  
    switch_cell_type : coarse_grain;  
    area : 1 ;  
    pg_pin ("VVDD") {  
        pg_type : internal_power;  
        pg_function : "(IO" ;  
    }  
    ...
```

In this simple case, the closing parenthesis is missing in the function string.

EXAMPLE MESSAGE

```
Error: Line 400, An invalid '(IO' pg_function string in the 'sample' cell. (LIBG-  
254)
```

LIBG-255 (error) A bad '%s' pg_pin name in the '%s' cell.

DESCRIPTION

This error gets detected during a **read_lib** and an **update_lib** commands. The pg_pin name does not either exist or an previous error in any of the attributes of the pin group is detected. In this case the pg_pin group is not recognized and the pin name is labeled as bad.

WHAT NEXT

Check your library for a wrong pin name in any related attribute or for an incorrect pin group.

EXAMPLES

```
cell (libg3) {  
    pg_pin(VSS) {  
        pg_type : primary_power;  
        voltage_name : VSS;  
    }  
    pg_pin(VDD) {  
        pg_type : primary_power;  
        voltage_name : VDD;
```

```

    }
    pg_pin(VVDD) {
pg_type : internal_power;
voltage_name : VDD1;
    pg_function : "E";           /* <-- This is wrong */
}
}

```

EXAMPLE MESSAGE

Error: Line 426, A bad 'E' pg_pin name in the 'libg3' cell. (LIBG-255)

LIBG-256 (error) The '%s' group is overlapping with the '%s' group on line %d.

DESCRIPTION

This message indicates that two **dynamic_current** groups in ccs power are overlapping with each other.

If following three conditions is true, then two groups are considered to be overlapped :

1. Two groups have at least one pin specified in **related_inputs** attribtue is identical.
2. Both have same list of pins specified in **related_outputs** or both have no **related_outputs** attribtue.
3. **When** atrributes specified in both groups are not mutually exclusive, or both groups have no **when** attribute.

WHAT NEXT

Check **related_inputs**, **related_outputs**, and **When** attributes for all **dynamic_current** groups to see if any of them breaks above rules, and make the necessary correction.

EXAMPLES

```

cell(libg256) {
...
pin(A1) {
    direction : input;
...
}
pin(A2) {
    direction : input;
...
}

```

```

pin(A3) {
    direction : input;
    ...
}
pin(A4) {
    direction : input;
    ...
}
pin(A5) {
    direction : input;
    ...
}
pin(ZN1) {
    direction : output;
    ...
}
pin(ZN2) {
    direction : output;
    ...
}
...
dynamic_current() {
    when : "A2";
    related_inputs : "A5 A4";
    related_outputs : "ZN2 ZN1";
    switching_group() {
        pg_current(V2) {
            ...
        }
        ...
    }
}
dynamic_current() {
    when : "!A1";
    related_inputs : "A4 A3";
    related_outputs : "ZN1 ZN2";
    switching_group() {
        pg_current(V2) {
            ...
        }
        ...
    }
}
...

```

In this case, "A2" and "!A1" specified in two when attributes respectively are not mutually exclusive, pin "A4" is specified in both related_inputs groups, and same list of pins ("ZN1" and "ZN2") is specified in both related_outputs groups. Two dynamic_current are overlapping. You can modify any of these attributes to fix the problem. For example : change "A4 A3" to "A2 A3".

EXAMPLE MESSAGE

Error: Line 79, The 'dynamic_current' group is overlapping with the 'dynamic_current' group on line 88. (LIBG-256)

LIBG-257 (error) The %s must be set to 0.0 or omitted.

DESCRIPTION

There are two attributes, `input_high_value` and `input_low_value`, within a `gate_leakage` group. The `input_high_value` is to specify gate leakage current on a pin when this pin is set to high. The `input_low_value` is to specify gate leakage current on a pin when this pin is set to low. If the 'when' statement inside `leakage_current` or `va_leakage_current` implies that the pin high never occurs, then `input_high_value` shall be set to 0.0 or ignored. If the 'when' statement implies that the pin low shall never occur, then `input_low_value` must be set to 0.0 or ignored.

WHAT NEXT

Check `input_low_value` and `input_high_value`, and make the necessary correction.

EXAMPLES

```
leakage_current() {
    when : "A1 & A2 & !ZN";
    ...
    gate_leakage(A2) {
        input_high_value : 2.1;
        input_low_value : -1.7;
    }
    gate_leakage(A1) {
        input_high_value : 7.1;
        input_low_value : -8.7;
    }
}
```

In this case, we have when condition "A1 & A2 & !ZN", which means pins A1 and A2 shall never set to low because they will never occur within this `leakage_current`. So, `input_low_value` is meaningless for both pins. We shall set both to 0.0 or comment them out.

EXAMPLE MESSAGE

Error: Line 210, The `input_low_value` must be set to 0.0 or omitted. (LIBG-257)

LIBG-258 (error) No %s is allowed within an `intrinsic_parasitic` if `power_cell_type` is %s.

DESCRIPTION

If the `power_cell_type` is macro, then followings groups can't be specified within an `intrinsic_parasitic` : state-dependent condition, `intrinsic_resistance` and

intrinsic_capacitance.

If the power_cell_type is standard cell or there is no power_cell_type specified, then total_capacitance can't be specified within an intrinsic_parasitic.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell (test) {
    intrinsic_parasitic() {
        when : "!A1 & A2 & !ZN";
        total_capacitance(V2) {
            value : 9.0;
        }
    }
    ...
}
```

In this case, there is no power_cell_type specified under cell "test", meaning power_cell_type is defaulted to standard cell. The total_capacitance is not allowed within an intrinsic_parasitic group.

```
cell (test) {
    power_cell_type : macro;
    intrinsic_parasitic() {
        when : "!A1 & A2 & !ZN";
        intrinsic_resistance(G1) {
            related_output : "ZN";
            value : 9.0;
        }
        intrinsic_capacitance(G1) {
            value : 8.2;
        }
    }
    ...
}
```

In this case, 'when' attribute, 'intrinsic_resistance' and 'intrinsic_capacitance' are not allowed in an 'intrinsic_parasitic' group because the 'power_cell_type' is 'macro'.

EXAMPLE MESSAGE

Error Line 272, No intrinsic_resistance is allowed within an intrinsic_parasitic if power_cell_type is macro. (LIBG-258)

LIBG-259 (error) The power_cell_type must be macro if

`min_input_switching_count` and `max_input_switching_count` are defined.

DESCRIPTION

If `min_input_switching_count` and `max_input_switching_count` are defined within `switching_group`, then `power_cell_type` defined in `cell` must be macro.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell (test) {  
    ...  
    power_cell_type : stdcell;  
    dynamic_current() {  
        ...  
        switching_group() {  
            min_input_switching_count : 1;  
            max_input_switching_count : 9;  
            ...  
        }  
        ...  
    }  
    ...  
}
```

In this case, `min_input_switching_count` and `max_input_switching_count` both are defined under one of `switching_group` groups within a `dynamic_current`, and `power_cell_type` is standard cell, which is wrong. We shall change "stdcell" to "macro" to avoid the error.

EXAMPLE MESSAGE

Error Line 272, The `power_cell_type` must be macro if
`min_input_switching_count` and `max_input_switching_count` are defined. (LIBG-259)

LIBG-260 (error) The logic represented by the %s string is not equal to or mutually exclusive with the logic represented by the %s

string.

DESCRIPTION

The logic represented by one programmable driver type string must be not equal to or mutually exclusive with the logic represented by other programmable driver types under the same pin.

WHAT NEXT

EXAMPLES

```
cell(libg260) {
    pad_cell : true;
    ...
    pin(A1) {
        direction : input;
        is_pad : true;
    ...
    pin(A2) {
        direction : input;
    ...
    pin(A3) {
        direction : input;
    ...
    pin(ZN1) {
        direction : inout;
        max_capacitance : 0.1;
        pull_up_function : "!A1 * !A2 * !A3";
        pull_down_function : "A1 * A2 * !A3";
        bus_hold_function : "A1 * !A2 * !A3";
        open_drain_function : "!A1 * A2 * !A3";
        open_source_function : "!A1 * !A2 * A3";
        resistive_function : "A1 * A2 * A3";
        resistive_0_function : "A1 * A2";
        resistive_1_function : "!A1 * A2 * A3";
    ...
}
}
```

In this case, the resistive_0_function is not mutually exclusive with pull_down_function and resistive_function. To fix the problem, you might want to change it as following :

```
resistive_0_function : "A1 * !A2 * A3";
```

EXAMPLE MESSAGE

Error: Line 102, The logic represented by the resistive_0_function string is not equal

to or mutually exclusive with the logic represented by the pull_down_function string. (LIBG-260)

Error: Line 102, The logic represented by the resistive_0_function string is not eq

ual
to or mutually exclusive with the logic represented by the resistive_function string. (LIBG-260)

LIBG-261 (error) The programmable driver type can only be defined on a pad cell.

DESCRIPTION

The programmable driver type can only be defined on a pad cell, which has either pad_cell or auxiliary_pad_cell attribute.

WHAT NEXT

Check the library source file, and make the necessary correction.

EXAMPLES

```
cell (libg261) {  
    ...  
    pin (A) {  
        direction : input;  
        pull_up_function : "p1 * p2";  
        ...  
    }  
    ...}
```

In this case, a programmable driver type, pull_up_function, is defined on pin A, which is under a cell, libg261. The cell is not a pad cell, which is wrong. To fix the problem, please either add pad_cell attribute under cell level or remove pull_up_function attribute from the pin.

EXAMPLE MESSAGE

Error: Line 94, The programmable driver type can only be defined on a pad cell. (LIBG-261)

LIBG-262 (information) Cell(%s) is recognized as one-hot mux cell.

DESCRIPTION

This message is issued when a cell is recognized as one-hot mux cell.

One-hot mux cells have following characteristic: 1. Two equal sized, disjoint sets

of input pins, one is select pins(e.g. "S0,S1"), another set is data input pins(e.g. "D0,D1"). 2. Have cell attribute "contention_condition", e.g. $F_C = S_0' * S_1 + S_0 * S_1$. That is there could be one and ONLY one select pin can be logic 1, others are logic 0. 3. There is only one output pin defined and its function is defined with respect to all of its inputs, e.g. $F_O = S_0 * D_0 + S_1 * D_1$;

WHAT NEXT

The one-hot mux cell will be used in DC logical synthesis.

EXAMPLES

```
cell(OHMUX2) {  
    ...  
    contention_condition : "( S0 S1 + S0' S1' )";  
    pin(D0) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(D1) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(S0) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(S1) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(Z) {  
        direction : output;  
        function : "(S0 D0 + S1 D1)";  
        ...  
    }  
}
```

EXAMPLE MESSAGE

Warning: Line 139, Cell(OHMUX2) is recognized as one-hot mux cell.(LIBG-262)

SEE ALSO

LIBG-263

LIBG-263 (warning) Cell(%s) is not recognized as one-hot mux

cell.

DESCRIPTION

This message is issued when there is cell level attribute "contention_condition" defined, but it does not match with output pin function as a one-hot mux cell.

One-hot mux cells have following characteristic: 1. Two equal sized, disjoint sets of input pins, one is select pins(e.g. "S0,S1"), another set is data input pins(e.g. "D0,D1"). 2. Have cell attribute "contention_condition", e.g. $F_c = S_0' * S_1 + S_0 * S_1'$. That is there could be one and ONLY one select pin can be logic 1, others are logic 0. 3. There is only one output pin defined and its function is defined with respect to all of its inputs, e.g. $F_o = S_0 * D_0 + S_1 * D_1$;

This warning message is reported in step 3, when it find the output function with restriction of contention function does not match with the function of one-hot mux cell.

WHAT NEXT

If users intend to define the cell as one-hot mux cell, and use it later on in logical synthesis, check the cell contention_condition definition and output pin function, modify to make them match the definition of one-hot mux cell.

If users won't use the cell as one-hot mux cell, just ignore this warning.

EXAMPLES

```
cell(OHMUX2) {  
    ...  
    contention_condition : "( S0 S1 + S0' S1' )";  
    pin(D0) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(D1) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(S0) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(S1) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(Z) {  
        direction : output;  
        function : "(S0 D0 + S1 D1 + D0' D1)";  
        ...  
    }  
}
```

```
    }  
}
```

In this case, the contention function matches with one-hot mux cell select pin restriction, but the output pin function is not a function of one-hot mux cell.

EXAMPLE MESSAGE

Warning: Line 139, Cell(OHMUX2) is not recognized as one-hot mux cell. (LIBG-263)

LIBG-264 (warning) ICG cell '%s' function can not be recognized during functional optimization by Power Compiler.

DESCRIPTION

A cell with attribute "clock_gating_integrated_cell" defined as "generic" is called a generic ICG cell.

Library Compiler will try to resolve ICG type of a generic ICG cell. Valid resolved types are,

```
latch_(posedge | negedge | posedgeactivelow | negedgeactivelow )_ (precontrol |  
postcontrol| *)_(obs | *)_(invclk | *) or none | (posedge | negedge |  
posedgeactivelow | negedgeactivelow )_ (control | *)_(invclk | *).
```

Please refer to Library Compiler User Guide for the corresponding schematics of these types.

If a generic ICG cell can't be resolved as any exact type, Library Compiler will resolve them as blackbox. It means this generic ICG will not be auto inferred by Power Compiler and understood by Formality and other client tools that need to understand the function of such cells.

FF-based ICG cell won't be supported by Power Compiler, either.

WHAT NEXT

Change the cell to be one of the valid ICG types.

EXAMPLES

EXAMPLE MESSAGE

Warning: ICG cell 'cell1' function can not be recognized during functional optimization by Power Compiler. (LIBG-264)

LIBG-265 (information) Derived ICG type for cell '%s' is '%s'.

DESCRIPTION

A cell with attribute "clock_gating_integrated_cell" defined as "generic" is called a generic ICG cell.

Library Compiler will try to resolve ICG type of a generic ICG cell. If successful, the value of attribute "clock_gating_integrated_cell" will be updated.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Information: Derived ICG type for cell 'cell1' is 'latch_posedge'. (LIBG-265)

LIBG-266 (warning) The 'data_in_type' attribute on the '%s' pin/bus in the '%s' cell is inconsistent with its function. The attribute is ignored.

DESCRIPTION

In a pin group, data_in_type defines the type of a data_in attribute to be used in an ff group, a seq group, or a ff_bank group.

Any pin with the **data_in_type** attribute must be in the **data_in** function. A consistency check is also made between the pin's data_in_type attribute and the data_in function. This message is generated when the attribute 'data_in_type' does not match the functional information specified in the cell's sequential state description.

WHAT NEXT

Check your library for a pin with a data_in_type attribute but not used in the data_in statement of a sequential group and correct the inconsistency.

EXAMPLE MESSAGE

Warning: Line 153, The 'data_in_type' attribute on the 'SET' pin/bus in
the 'libg35' cell is inconsistent with its function. The attribute is ignor
ed. (LIBG-266)

LIBG-267 (error) The power_down_function attribute should not be specified inside the test_cell's ff/latch/statetable group.

DESCRIPTION

The power_down_function attribute should be specified in cell's ff/latch/statetable group, not be specified inside the test_cell.

WHAT NEXT

Check your library to delete the power_down_function attribute in test_cell.

EXAMPLES

```
test_cell () {
    pin (Q) {
        direction : output;
        function : "IQ";
        signal_type : test_scan_out;
    }
    pin (CK) {
        direction : input;
    }
    pin (D) {
        direction : input;
    }
    pin (SI) {
        direction : input;
        signal_type : test_scan_in;
    }
    pin (SE) {
        direction : input;
        signal_type : test_scan_enable;
    }
    ff (IQ,IQN) {
        clocked_on : "! (CK)";
        next_state : "D";
    }
    power_down_function : "!VDD + VSS"; /* <-- This is wrong */
}
```

EXAMPLE MESSAGE

Error: Line 426, Cell 'test', The power_down_function attribute should not be specified inside the test_cell's ff/latch/statetable group. (LIBG-267)

LICSVR

LICSVR-1 (error) Variable '%s' has invalid value '%s'. Allowed values are: 'package', 'individual', 'package individual' and 'individual package'.

DESCRIPTION

WHAT NEXT

LICSVR-2 (error) Could not obtain a license.

DESCRIPTION

The license for the feature being run could not be obtained.

WHAT NEXT

Check the key file to see if the feature exists. Check the location of the keyfile, either the default location or at \$SYNOPSYS_KEY_FILE. It could also be that all the licenses are in use.

LICSVR-3 (error) SYNOPSYS_DS is not set. You must set this environment variable to the root of the installed Synopsys software.

DESCRIPTION

SYNOPSYS_DS variable should be set inorder for the application to find the default location.

WHAT NEXT

Set the SYNOPSYS_DS environment variable to SYNOPSYS root.

LICSVR-4 (error) DISPLAY is not set. You must set this

environment variable before running the Synopsys software.

DESCRIPTION

The DISPLAY environment variable displays the application on the terminal on which it was brought up.

WHAT NEXT

Check to see if this environment variable is set to the correct value.

LICSVR-5 (error) Can't initialize the license server.

DESCRIPTION

The vendor daemon will be brought up by the Flexlm license manager lmgrd on the SERVER mentioned in the keyfile. The machine must be accessible.

WHAT NEXT

Check to see if the machine is up and running. If you are starting the license server from a machine other than the server, then you must be able to ping and rsh to the SERVER.

LICSVR-6 (error) The Synopsys License Server has crashed.

DESCRIPTION

The license server went down due to some reason. This may cause the lmgrd and synopsysd processes to hang.

WHAT NEXT

If the machine is down, the machine needs to be up and running. If the license server is being brought up from the startup script, check to make sure that the lmgrd and synopsysd processes have come up cleanly. Use lmstat to check. If you have to bring up the license server daemons manually, make sure that you do not have any zombie processes for lmgrd and synopsysd. Start the license manager using lmgrd.

LINK

LINK-1 (error) Can't find %s port '%s' on reference to '%s' in '%s'.

DESCRIPTION

This message indicates that the specified port has no corresponding port on the design to which the reference is to be linked. Therefore, the reference cannot be linked to the design.

This situation could arise if extra pin names were specified in the name-based instantiation of the cell in the source file. Alternatively, the name of the design port might be misspelled or incorrectly specified in the cell instantiation.

Another, less likely possibility is that there are design name conflicts that caused the linker to attempt to link the reference to the wrong design.

WHAT NEXT

Check the original source file for one or both of the above problems in the cell instantiation, and edit the file to correct the pin names. Check also for incorrect design names and correct them. Then re-execute **link**.

LINK-2 (error) Too many ports on reference to '%s' in '%s'.

DESCRIPTION

WHAT NEXT

LINK-3 (error) Width mismatch on port '%s' of reference to '%s' in '%s'.

DESCRIPTION

The reference above could not be resolved due to a port size mismatch. The linker found a design that matches the requested reference name, but the port sizes do not match.

WHAT NEXT

Check that the ports of the target design or library cell are compatible with the reference.

LINK-4 (error) Too few ports on reference to '%s' in '%s'.

DESCRIPTION

WHAT NEXT

LINK-5 (warning) Unable to resolve reference '%s' in '%s'.

DESCRIPTION

This warning is issued when a suitable design can not be found to link a cell reference to. This will result in any cells using that reference being left as "black boxes". Generally this will happen because of one of two reasons: (1) either a design with the same name as the reference does not exist in the database, link libraries and the directories specified by the `search_path`, or, (2) the design exists but there are port mismatches between the reference and the design. In the second case an additional error message indicating the exact nature of the mismatch would be given.

If this error occurs while building a synthetic library part, you probably need to use "set_local_link_library" within your implementation description. Please refer to the section "Adding Hierarchy-Control Directives" in the DesignWare Developer Guide.

WHAT NEXT

If there are additional error messages indicating the name and nature of the port mismatches, modify the original source to make the port specifications match in the instantiation and the design. If there are no such messages, find the library or the directory on which the required design resides. If it is a library, then add that library to the `link_library` variable, and the location of the library to the `search_path` variable. If it is in a design file, add its directory to the `search_path` variable. After doing this, run the `link` command again.

LINK-6 (error) Could not find pin '%s' on design '%s' for cell '%s'.

DESCRIPTION

WHAT NEXT

LINK-7 (error) Recursive hierarchy detected in design '%s'.

DESCRIPTION

WHAT NEXT

LINK-8 (error) Cannot resolve enumeration for cell '%s' on design '%s'.

DESCRIPTION

WHAT NEXT

LINK-9 (warning) Unable to resolve reference to synthetic module '%s' in '%s'.

DESCRIPTION

WHAT NEXT

LINK-10 (error) '%s' was not identified as a synthetic library module
and could not be successfully elaborated from design library

'%S'.

DESCRIPTION

The reference above could not be resolved to a synthetic library module in your current **link_library** variable. The design also could not be elaborated from a design that had been analyzed into the given design library. This causes linking to fail for parameterized instances.

WHAT NEXT

If the reference should resolve to a synthetic library module, you should double check that the appropriate synthetic library is in your **link_library** and that the library contains the given module. If other libraries precede your synthetic library in the **link_library** list, be sure that the two libraries do not contain a cell of the same name. Note that VHDL references are case-insensitive; for example, you could erroneously link to a cell named *ADD* from a technology library when you intended to link to a module *add* from a synthetic library.

If the reference should resolve to a parameterized part, you must analyze that part into an appropriate design library before linking. There may have been an error in the actual elaboration. Check the error messages that preceded this one.

LINK-11 (error) Unconstrained port '%s' in design referenced by '%s' in '%s'.

This version does not support unconstrained ports.

DESCRIPTION

WHAT NEXT

LINK-12 (warning) Unable to find library '%s'. This was probably caused by bad Synopsys installation.

DESCRIPTION

WHAT NEXT

LINK-13 (warning) design library '%s' was used in design '%s'

but it was never defined. Ignoring.

DESCRIPTION

Your VHDL source code contains a library clause for the given design. This library has not been defined in Design Compiler.

WHAT NEXT

Define the library using `define_design_lib`.

LINK-14 (warning) Instance of '%s' is defined in both libraries '%s' and '%s', which are both visible in design '%s'.

The first library will be used.

DESCRIPTION

Your VHDL source code for the given design contains a library clause for both libraries listed above. Both libraries define an entity for the instance given. Technically, this is an error in VHDL. We are using the entity from the first library listed.

WHAT NEXT

There is nothing to do for now. In the future, it will be important to choose an entity explicitly in a VHDL configuration.

LINK-15 (error) Cannot continue with auto_link disabled. Set 'auto_link_disable = false'.

DESCRIPTION

The `auto_link_disable` variable is only to be used for speeding up long sequences of `set_load`, `set_resistance`, and `set_annotated_delay` commands. The current command cannot be executed while `auto_link` is disabled.

WHAT NEXT

Set `auto_link_disable = false`, and re-execute the command.

LINK-16 (warning) Parameter mismatch in linking reference '%s' by name.

Linked to '%s', which has the correct parameters.

DESCRIPTION

An attempt was made to link a parameterized reference by name, but the name of the reference pointed to a design with incorrect parameters. The link process resolved the reference to the design above, which had the correct parameters.

WHAT NEXT

To avoid this message, you should attempt to keep your design names unique. This is done by keeping your parameter values below the **hdl_naming_threshold**, and by including special naming parameters in your HDL designs. For details, refer to the *VHDL Compiler Reference Manual*.

LINK-17 (warning) Design '%s' was renamed to '%s' to avoid a conflict with another design that has the same name but different parameters.

DESCRIPTION

A design was automatically elaborated by HDL Compiler, but the name generated for the new design was already in use by another design. The new design was renamed to avoid overwriting the existing design.

WHAT NEXT

To avoid this message, ensure that your design names are unique by keeping your parameter values below the **hdl_naming_threshold**, and by including special naming parameters in your HDL designs. For details, refer to the *VHDL Compiler Reference Manual*.

LINK-18 (warning) Parameter mismatch in linking reference '%s' by name.

Can't find design.

DESCRIPTION

An attempt was made to link a parameterized reference by name, but the name of the reference pointed to a design with incorrect parameters. The processing that follows this message will attempt to elaborate a new design with the correct parameters. If it fails, this reference will remain unresolved.

WHAT NEXT

To avoid this message, you should attempt to keep your design names unique. This is done by keeping your parameter values below the **hdl_naming_threshold**, and by including special naming parameters in your HDL designs. For details, refer to the *VHDL Compiler Reference Manual*.

LINK-19 (warning) "Port '%s' was unresolved on reference to '%s' in '%s'.

DESCRIPTION

This warning is issued when a port can not be resolved on a reference. Ports in the given reference may be duplicate by ignoring cases. If it fails, this reference will remain unresolved.

WHAT NEXT

To avoid this message, you should attempt to keep your ports in a reference unique. Check for attribute value `dblink_case_insensitive` in the warning reference.

LINK-20 (warning) "Attempting to resolve reference '%s' from non-synthetic design library '%s'.

DESCRIPTION

This warning is issued when a reference suspected to be a DesignWare part fails to link from a DesignWare library such as dw02.sldb. However, the reference may still successfully link from a non-DesignWare library.

WHAT NEXT

Often this warning results from neglecting to specify the required synthetic

libraries using the link_library variable. This can be quickly fixed using the following shell script line:

```
link_library = link_library + synthetic_library
```

This ensures that the link_library variable specifies the necessary DesignWare libraries for your design. Also check that the variable, synlib_library_list, specifies the correct design library names for DesignWare parts. Note that if you are using an external implementation of a DesignWare part, you may receive this warning during normal use.

LINK-21 (warning) Design '%s' has %d extra %s port(s) than reference '%s' in '%s'.

DESCRIPTION

You receive this message if the external netlist used by the preserved function has extra ports that are not defined in the preserved function. These ports are unused.

WHAT NEXT

To avoid this message, use a netlist with I/O ports exactly matching the I/O ports specified in the preserved function.

LINK-22 (error) Reference '%s' in '%s' is a preserved function and cannot have inout ports.

DESCRIPTION

This error is issued when a port can not be resolved on a reference because the direction of the port is inout. Bidirectional ports are not allowed with preserved functions and external netlists.

WHAT NEXT

To avoid this error, change the direction of the port to make it either an input or output port.

LINK-23 (error) Design '%s' used to resolve reference '%s' in

'%s' is a external netlist and cannot have inout ports.

DESCRIPTION

You receive this message if a port cannot be resolved on a reference. In the external netlist used to resolve the reference, the direction of the corresponding port is inout. Bidirectional ports are not allowed with preserved functions and external netlists.

WHAT NEXT

To avoid this error, use a netlist that has only input or output ports that match the ports of the preserved function.

**LINK-24 (error) Port '%s' of reference '%s' in '%s'
is connected to port '%s' of the external netlist '%s'.
The directions of these two ports are not compatible.**

DESCRIPTION

This error is issued when a port can not be resolved on a reference because the direction of the corresponding port of the netlist is different. Note that 'inout' ports are not allowed in preserved functions and external netlists.

WHAT NEXT

To avoid this error, input ports in the preserved function must be same as the input ports in the external netlist. Similarly, output ports in the preserved function must be same as the output ports in the external netlist.

LINK-25 (error) Unable to match ports of cell %s ('%s') to '%s'.

DESCRIPTION

The tool issues this error message because it encountered problems when attempting to match the ports of the cell's existing reference to the new reference.

WHAT NEXT

Check that the ports of the target design or library cell are compatible with the cell's current reference. You may need to modify the original source to make the port specifications match in the instantiation and the design.

SEE ALSO

`change_link (2)`, `link (2)`.

LINK-26 (warning) Design '%s' was renamed to '%s' to resolve a long name which is not supported by some down stream tools.

DESCRIPTION

Down stream tools have limitation for the length of design name. The design name generated by HDL compiler is shortened, then the design can be accepted by down stream tools.

WHAT NEXT

To avoid this message, ensure that your design names do not exceed the limit.

LINK-27 (warning) Width mismatch on port '%s' of reference to '%s' in '%s'.

DESCRIPTION

The linker found a design that matches the requested reference name, but the port sizes do not match. This is usually a design error, and should be corrected.

Due to a special request, the linker will resolve the mismatch rather than leaving the reference unlinked. The port and connected value will be right-aligned. Any excess bits in the left side of the connected value will be truncated. Any excess bits in the left side of the port will be driven by 0 (for input ports) or left unconnected (for out and inout ports).

Note this amounts to zero-extension rather than sign-extension, regardless of the type of the connected value.

WHAT NEXT

Check that the ports of the target design or library cell are compatible with the reference.

LINT

LINT-0 (warning) In design '%s', input pin '%s' of leaf cell '%s' is not connected to any net. %s assumed.

DESCRIPTION

This message appears when a leaf cell has an unconnected input pin. Synopsys tools assume a logical value (for example, logic zero or logic one) for such unconnected signals, based on the type of technology library you are using. This warning message is a notification of the assumption that is being made for the named input pin in the named design.

WHAT_NEXT

Verify that the assumption made by Synopsys regarding the logical value for the given signal is correct. If the assumption is not correct, then connect the floating input pin to the correct logical value in your design.

LINT-1 (warning) In design '%s', cell '%s' does not drive any nets.

DESCRIPTION

This warning alerts you that the output(s) of a component is not connected to any load nets. This usually indicates that a design has not been correctly specified. The Design Compiler may remove such components from your design unless they are protected by a *dont_touch* attribute.

WHAT_NEXT

Make sure that you really want the named component to exist in the given design, even though it has no output pins connected. If so, add a *dont_touch* attribute with the *dont_touch* command to keep the component from being removed.

LINT-2 (warning) In design '%s', net '%s' driven by pin '%s' has

no loads.

DESCRIPTION

This warning message occurs when a net is driven by an output pin (or pins) but has no load pins connected to it. This usually indicates that a design is not correctly specified. The Design Compiler may remove such nets and their driving components from your design unless they are protected by a don't touch attribute.

WHAT_NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Make sure that you want the named net to exist in the given design, even though it has no load pins connected. If so, add a don't touch attribute with the **dont_touch** command to keep the net from being removed.

Check the value of the **hdlin_keep_signal_name** variable. For some settings, signals without drivers or loads are preserved in the elaborated design. Check the **hdlin_keep_signal_name** man page for more information.

SEE ALSO

`hdlin_keep_signal_name(3)`

LINT-3 (warning) In design '%s', net '%s' has no drivers. %s assumed.

DESCRIPTION

This warning message occurs when there is a net that is not driven by any source pins. Synopsys tools will assume a logical value, such as logic zero or logic one) for these unconnected signals, based on the type of technology library you are using. This warning message is a notification of the assumption that is being made for the named input pin in the named design.

WHAT_NEXT

This is only a warning. You can eliminate this warning message by the following the instructions below.

Verify that the assumption made by Synopsys regarding the logical value for the given signal is correct. If the assumption is not correct, then connect the floating net to the correct logical value in your design.

Check the value of the **hdlin_keep_signal_name** variable. For some settings, signals

without drivers or loads are preserved in the elaborated design. Check the **hdlin_keep_signal_name** man page for more information.

SEE ALSO

`hdlin_keep_signal_name(3)`

LINT-4 (information) In design '%s', net '%s' has multiple drivers. Wired AND assumed.

DESCRIPTION

This warning indicates that *check_design* has found a net with multiple source pins. Synopsys tools must make an assumption regarding the functionality of such wired-logic nets. This message indicates which wired-logic net (for example, wired-AND, wired-OR) will be used for this particular net. The assumption is made based on a description of wired-logic functionality in the technology library that you are using.

WHAT_NEXT

Make sure that you intended to have multiple drivers on the given net. Errors in specifying a design could lead to this message in a situation where wired logic is not intended.

You could also use *set_attribute* and *remove_attribute* commands to specify or remove the wired logic type for a given net.

For example,

```
set_attribute [get_nets z] wired_and true -type boolean  
would set 'wired_and' attribute on net 'z'. While  
remove_attribute [get_nets z] wired_and  
would remove the 'wired_and' attribute on net 'z'.
```

LINT-5 (warning) In design '%s', output port '%s' is not driven.

DESCRIPTION

This error message occurs when the **check_design** command finds the specified output port for the design is not driven by any signal.

WHAT_NEXT

Check your design to be sure that it is connected correctly, and then run the command again.

SEE ALSO

`check_design` (2).

LINT-6 (warning) In design '%s', input port '%s' drives wired logic. (port-direction may have been specified incorrectly.)

DESCRIPTION

This warning is issued when the `check_design` command encounters an input port connected to a net which has multiple drivers. In other words, the input port (which acts as a driver on the net) is part of a wired-logic gate.

WHAT_NEXT

Make sure that you intend to have multiple drivers on the net driven by the indicated port. Errors in specifying a design could lead to this message in a situation where wired logic is not intended. For example, if the direction of an output port is accidentally specified as "input," then this message could occur. Otherwise, you've encountered a situation where the optimizer has created wired logic on a design boundary. Check the components created by the optimizer to ensure that this is the functionality that you originally intended. Use the `verify` command to compare the design you currently have with the original design, in addition to simulating the synthesized design to ensure correctness.

LINT-7 (error) Recursive hierarchy detected in design '%s'.

DESCRIPTION

The `check_design` command traces the hierarchy of your design to ensure that "recursive hierarchy" does not occur. The term "recursive hierarchy" means that a module in a design instantiated a sub-module that, in turn, instantiated the original module. Hierarchically recursive designs cannot be handled by the Design Compiler. This is an error message, not a warning.

WHAT_NEXT

This error usually occurs when a design has been incorrectly described. Modify your

design description to remove the recursive hierarchy.

LINT-8 (warning) In design '%s', input port '%s' is unloaded.

DESCRIPTION

The *check_design* command issues this warning when it finds an unconnected (for example, "unloaded") input port on a design. This means that the given input port does not connect to any logic inside the design.

WHAT_NEXT

Make sure that you intended that the specified port be unused in your design.

LINT-10 (warning) In design '%s', cell '%s' has no output pins.

DESCRIPTION

This warning message indicates that *check_design* has found a cell with no output pins. Unless such cells are protected through the use of the *dont_touch* command, the *compile* command will remove them from the design, since they have no functionality.

WHAT_NEXT

This warning probably appeared because of an error in specifying a component in your design, or a component in your technology library. Check the design/library to find the problem, and correct the description of the given cell/design.

LINT-11 (fatal) In design '%s', db_object '%s' does not have a '%s' attribute.

DESCRIPTION

This is a fatal error in the *check_design* command. An object in the Synopsys internal database for your design has become corrupt or does not have information regarding signal direction (for example, input, output or bidirectional).

WHAT_NEXT

Recreate or re-read your design. If you specified a component pin without a direction attribute, you can fix the problem by making sure that a direction exists

for the given pin. Otherwise this error could indicate that there is an internal problem in the Synopsys software that needs to be reported to the Synopsys Hotline or to your Synopsys application engineer.

LINT-12 (fatal) Unable to db_gen_init '%s' from db_object '%s'.

DESCRIPTION

This is a fatal error in the *check_design* command. An object in the Synopsys internal database for your design has become corrupt, or that an object in your design does not have ports attached to it.

WHAT_NEXT

Recreate or re-read your design. If you specified a component without ports, you can fix the problem by making sure that ports exist for the given pin. Otherwise this error could indicate that there is an internal problem in the Synopsys software that needs to be reported to the Synopsys Hotline or to your Synopsys application engineer.

LINT-20 (error) In design '%s', cell '%s' does not have a reference.

DESCRIPTION

This error describes a problem in the database representation for your design. The error means that a particular instantiation of a component (or "cell" in Synopsys terms) does not indicate which type of component it actually is. In Synopsys terminology "reference" describes the part of a design representation that points to the actual component for a given instantiation or cell. If you have an inverter (INV) in your technology library, and you've instantiated that inverter in your design as cell13 and cell123, then each of the instantiations (cells) should own a pointer (reference) to the actual component (in this case INV). This error indicates that, for some reason, the reference does not exist on the cell.

WHAT_NEXT

Make sure that your design specifies the type of the given cell. If you specified a cell without a type, fix the problem by changing your design description. Otherwise this error could indicate that there is an internal problem in the Synopsys software that needs to be reported to Synopsys Hotline or to your Synopsys application engineer.

LINT-21 (fatal) Unable to db_new_attribute to db_object '%s'.

DESCRIPTION

This is a fatal error in the *check_design* command. Synopsys tools were unable to allocate memory to create an object in the Synopsys internal database description for your design. The *check_design* command creates small markers on your design as it traverses the design checking for errors. These small markers are removed after *check_design* is finished. This error indicates that an attempt to create a marker failed for some reason. This is probably due to a lack of memory, in which case the fatal error was accompanied by an "out of memory" error message. It is also possible that this message could occur in a badly mangled design which has recursive hierarchy.

WHAT_NEXT

Check the message for an "out of memory" error to determine if your platform needs more virtual memory. Otherwise, the problem is likely to be a faulty design or an internal Synopsys error.

LINT-22 (warning) In design '%s', ref '%s' was not used.

DESCRIPTION

This warning indicates that there is a dangling "reference" with the given name on your design. In Synopsys terminology "reference" describes the part of a design representation that points to the actual component for a given instantiation or cell. If you have an inverter (INV) in your technology library, and you've instantiated that inverter in your design as cell113 and cell123, then each of the instantiations (cells) should own a pointer (reference) to the actual component (in this case INV). Sometimes, during the process of building or modifying a design, a reference will remain, even though all cells that refer to it have been removed or changed. Although this is a waste of memory, it should not impair the functionality of the design or the operation of Synopsys tools.

WHAT_NEXT

A large number of dangling references in your design can increase the memory size of the design. Sometimes these can be removed by writing the entire design out (in Synopsys database "db" format) and then reading it to Synopsys tools again. Otherwise, make a note of when the message occurs and pass the problem and an example to the Synopsys support Hotline or to your application engineer. Dangling references indicate that the tool is not managing memory efficiently.

LINT-23 (fatal) Unable to remove attribute '%s' from db_object

'%S'.

DESCRIPTION

This is a fatal error in the *check_design* command. Synopsys tools were unable to deallocate memory to free an object in the Synopsys internal database description for your design. The *check_design* command creates small markers on your design as it traverses the design checking for errors. These markers are removed after *check_design* is finished. This error indicates that an attempt to remove a marker failed for some reason. This is probably due to an internal memory error in Synopsys tools.

WHAT_NEXT

The problem is either a faulty design or an internal Synopsys error. The *check_design* command may have destroyed your design. Report the problem to the Synopsys Hotline or to your Synopsys application engineer.

LINT-25 (warning) Design '%s' does not have any output ports.

DESCRIPTION

This warning message indicates that *check_design* has found a design with no output pins. Unless such designs are protected through the use of the *dont_touch* command, the *compile* command will remove instances of such designs, since they have no functionality.

WHAT_NEXT

This warning probably appeared because of an error in specifying a component in your design, or a component in your technology library. Check the design/library to find the problem, and correct the description of the given cell/design.

LINT-26 (fatal) Unable to db_set_attribute to db_object '%s'.

DESCRIPTION

This is a fatal error in the *check_design* command. Synopsys tools were unable to allocate memory to create an attribute in the Synopsys internal database description for your design. The *check_design* command creates small markers on your design as it traverses the design checking for errors. These markers are removed after *check_design* is finished. This error appears when an attempt to create a marker failed for some reason. This is probably due to a lack of memory, in which case the fatal error was accompanied by an "out of memory" error message. It is also possible that this message could occur in a badly mangled design which has recursive

hierarchy.

WHAT_NEXT

Check the message for an "out of memory" error to determine if your platform needs more virtual memory. Otherwise, the problem is likely to be a faulty design or an internal Synopsys error.

LINT-27 (error) Object '%s' is not of class dd_design, and should not be seen by db_lint.

DESCRIPTION

This message indicates that the *check_design* command has been called on a database object that is not a design. It indicates an internal problem in the user-interface for the *check_design* command, or a corrupted design database.

WHAT_NEXT

Recreate or re-read your design, and then runn *check_design*. If this does not work, then there is probably an internal problem in the Synopsys software that should be reported to the Synopsys Hotline or to your Synopsys application engineer.

LINT-28 (warning) In design '%s', port '%s' is not connected to any nets.

DESCRIPTION

This warning alerts you that a port in a design is not connected to any nets. This usually indicates that a design has not been correctly specified. However, there are some situations where, as a designer, you choose to specify a port on a design for compatibility reasons, even though the port is not internal to design use. The Synopsys tools leave unconnected ports alone, with one exception; that is, you specified that a given input port is opposite or equal to another input port in a design.

WHAT_NEXT

Make sure that you want the named port to exist in the given design, even though it has no nets connected. Remove the port from your design if you choose.

LINT-29 (warning) In design '%s', input port '%s' is connected directly to output port '%s'.

DESCRIPTION

This warning alerts you to a situation where an input port in a design is directly connected to an output port. This warning is issued because some technologies do not allow such a connection. Many ASIC vendors stipulate that a buffer must be used to connect an input to an output. This restriction might or might not apply to your technology.

WHAT_NEXT

If directed to do so, *compile* inserts the necessary buffering to prevent a direct connection of an input port and an output port. To do this, set the boolean variable *compile_fix_multiple_port_nets* to TRUE, then compile your design. This variable also instructs *compile* to make sure that multiple output ports are not connected to the same electrical net. See the manual page on *compile_variables* for more information.

LINT-30 (warning) In design '%s', %s.

DESCRIPTION

This is the terse version of a *check_design* warning message. This message is displayed when Synopsys command *check_design -summary* performs a design check and gives a summary of warnings.

WHAT_NEXT

Use *check_design* to obtain more information about the warning.

LINT-31 (warning) In design '%s', output port '%s' is connected directly to output port '%s'.

DESCRIPTION

This warning alerts you to a situation where an output port in a design is connected directly to another output port. This warning is issued because some technologies do not allow such a connection. This restriction might or might not apply to your technology.

WHAT_NEXT

If directed to do so, *compile* inserts the necessary buffering to make sure that multiple output ports are not connected to the same electrical net. To do this, set the boolean variable *compile_fix_multiple_port_nets* to TRUE, then compile your design.

This variable also instructs *compile* to prevent a direct connection of an input port and an output port. See the manual page on *compile_variables* for more information.

LINT-32 (warning) In design '%s', a pin on submodule '%s' is connected to logic 1 or logic 0.

DESCRIPTION

check_design issues this warning when it finds an instance of a hierarchical design (for example, a sub-module) that has an input connected to a logic constant. This warning is issued to verify that this is a desired connection on the submodule. Be aware that *compile* can remove logic in a design that is redundant. So, *compile* can produce designs that display this warning if it has optimized and eliminated the logic driving a submodule.

WHAT_NEXT

Verify that you want the given submodule input connected to logic one or zero. If you have run *compile*, you might want to use *verify* to verify the optimized design with your original. Or, use the -verify option to *compile*, whenever feasible.

LINT-33 (warning) In design '%s', the same net is connected to more than one pin on submodule '%s'.

DESCRIPTION

check_design issues this warning when it finds an instance of a hierarchical design (for example, a sub-module) that has more than one input connected to the same net. This warning is issued to verify that these are desired connections on the submodule. Be aware that *compile* can remove logic in a design that is redundant. So, *compile* can produce designs that display this warning if it determines that multiple inputs on a submodule are driven by the same logical signal.

WHAT_NEXT

Verify that you want the given submodule inputs connected to the same logical signal. If you have run *compile*, you might want to use *verify* to verify the optimized design with your original. Or, use the -verify option to *compile* whenever

feasible.

LINT-34 (warning) In design '%s', three-state bus '%s' has non three-state driver '%s'.

DESCRIPTION

Synopsys libraries contain descriptions of three-state driving pins on components. Synopsys tools classify a net as a three-state net if it is driven by at least one pin that has this three-state attribute. Normally, if there are multiple drivers on such nets, it is assumed that all driving pins should be three-state drivers, for correct operation of the three-state bus. This warning message indicates a situation where at least one non-three-state driver appears on a three-state net.

WHAT_NEXT

Verify that this is what you have intended for the given net. If the *non-three-state* driver pin specified in the message is really on a three-state driver in your ASIC technology, verify that the technology library description is correct.

LINT-35 (information) In design '%s', net '%s' has multiple drivers. Wired OR assumed.

DESCRIPTION

This warning message indicates that *check_design* has found a net with multiple source pins. Synopsys tools make an assumption regarding the functionality of such *wired logic* nets. This message gives the interpretation (for example, *Wired-And*, *Wired-Or*) that will be used for this particular net. This assumption is made based on a description of wired logic functionality in the technology library used.

WHAT_NEXT

Make sure that you intend to have multiple drivers on the given net. Errors in specifying a design could lead to this message in a situation where wired logic is not intended.

You could also use *set_attribute* and *remove_attribute* commands to specify or remove the wired logic type for a given net.

For example,

```
set_attribute [get_nets z] wired_and true -type boolean
```

would set 'wired_and' attribute on net 'z'. While

```
remove_attribute [get_nets z] wired_and  
would remove the 'wired_and' attribute on net 'z'.
```

LINT-38 (warning) In design '%s', net '%s' has multiple drivers (unknown wired-logic type).

DESCRIPTION

This warning message indicates that *check_design* has found a net with multiple source pins. Synopsys tools must make an assumption regarding the functionality of such *wired logic* nets. This message indicates that the tool was unable to determine the *wired-logic* type of the net. The assumption about *wired-logic* type is made based on a description of *wired logic* functionality in the technology library that you are using. This message could indicate that *wired-logic* information was not correctly specified in your technology library, or that the description of the design is incorrect.

WHAT_NEXT

Examine the net(s) in question, the descriptions of the components connected to the net, and their respective technology library descriptions. Make sure that the net is not the result of an error in specifying a design. Design Compiler is capable of creating *wired logic* during optimization, but only in the situation where the logical function of that *wired logic* is understood (for example, *Wired-OR*).

You could also use *set_attribute* command to specify the *wired logic* type for a net with multiple drivers. The possible *wired types* include '*wired_and*', '*wired_or*' and '*three_state*'.

For example,

```
set_attribute [get_nets z] wired_and true -type boolean  
would set 'wired_and' attribute on net 'z'.
```

LINT-39 (warning) In design '%s', net '%s' has %s emitters, exceeding the maximum of %s.

DESCRIPTION

This warning message indicates that *check_design* has found a *wired logic* net that is illegal. *Wired logic* nets in ECL have a limit on the number of emitters that can legally be connected together. This limit is given by the *max_wired_emitters* attribute in the technology library.

WHAT_NEXT

Make sure that you intend to have this many emitters on the given net. Errors in specifying a design can lead to this message in a situation where a wired logic net of this size is not intended. The Synopsys ECL Compiler can build wired logic to meet design constraints and will legalize illegal wired logic, unless the wired logic net is protected by a *dont_touch* attribute. Finally, you might want to check your technology library to be sure that the specification for the maximum number of wired emitters is correct.

LINT-40 (warning) In design '%s', net '%s' has drivers with conflicting wired connection classes.

DESCRIPTION

This warning message indicates that *check_design* has found a wired logic net that is illegal. Wired logic nets in ECL have to meet *connection class* requirements that ensure that all drivers on the net may be legally connected together. All drivers on a wired logic net must share the same wired connection class. Each driver's class is defined in the technology library description for the driver by the *wired_connection_class* attribute.

WHAT_NEXT

Make sure that you intend to have these drivers on the given net. Errors in specifying a design can lead to this message in a situation where a wired logic net with these drivers is not intended. The Synopsys ECL Compiler can build wired logic to meet design constraints and will legalize illegal wired logic, unless the wired logic net is protected by a *dont_touch* attribute. Finally, you might want to check your technology library, to be sure that the connection classes for the given components are correct.

LINT-41 (warning) In design '%s', pin '%s' is not allowed to drive wired logic.

DESCRIPTION

This warning message indicates that *check_design* has found a wired logic net that is illegal. All driving pins on a wired logic net must be capable of driving wired logic. The technology library description for driving pins includes the *multiple_drivers_legal* attribute, which will be TRUE if the driving pin can legally drive wired logic, and FALSE otherwise. This attribute also exists at the library level and gives a default value for components in the library.

WHAT_NEXT

Make sure that you intend to have these drivers on the given net. Errors in specifying a design can lead to this message in a situation where a wired logic net with these drivers is not intended. The Synopsys ECL Compiler can build wired logic to meet design constraints and will legalize illegal wired logic, unless the wired logic net is protected by a *dont_touch* attribute. Finally, you might want to check your technology library to be sure that the *multiple_drivers_legal* attributes for the given component is correct.

LINT-42 (warning) In design '%s', pin '%s' is not allowed to be driven by wired logic.

DESCRIPTION

This warning message indicates that *check_design* has found a wired logic net that is illegal. All load pins on a wired logic net must be capable of being driven by wired logic. The technology library description for pins includes the *multiple_drivers_legal* attribute, which will be TRUE if the driving pin can legally drive wired logic, and FALSE otherwise. This attribute also exists at the library level to give a default value for components in the library.

WHAT_NEXT

Make sure that you intend to have these loads on the given net. Errors in specifying a design can lead to this message in a situation where a wired logic net with these loads is not intended. The Synopsys ECL Compiler can build wired logic to meet design constraints and will legalize illegal wired logic, unless the wired logic net is protected by a *dont_touch* attribute. Finally, you might want to check your technology library to be sure that the *multiple_drivers_legal* attributes for the given component is correct.

LINT-44 (information) In design '%s', %s.

DESCRIPTION

This is the terse version of a *check_design* informational message. This message is displayed when Synopsys command *check_design -summary* performs a design check and gives a summary of some important information.

WHAT_NEXT

Use *check_design* to obtain more information about the informational message.

LINT-45 (information) Design '%s' is instantiated %d times.

DESCRIPTION

This information message indicates that a single design is instantiated more than once in the design hierarchy below the current design. This message is issued when "check_design -multiple_designs" is used in XG mode.

WHAT_NEXT

Right now all DC commands handle designs with multiple instances. Each command may invoke *uniquify* under the hood to uniquify user designs if necessary.

LINT-46 (warning) Design '%s', cell '%s', pin '%s' is illegally connected, since primary output '%s' is unconnected.

DESCRIPTION

This warning message occurs for ECL designs in ECL technologies that use the *primary output* designator for paired ECL outputs. By designating an output as a *primary output* your ASIC vendor has indicated that the given output must be connected before any other outputs of the same polarity are used. As an example, suppose that a component NOR2 has two positive phase outputs, X1 and X2. Suppose that the technology library description for the gate shows X1 as a primary output.

Designating X1 as a primary output means that it is illegal to connect output X2 to a net unless X1 is already connected to a different net. This warning indicates a case where (to use this example) output X2 is connected but output X1 is not connected. This is a violation of the design rule described in the technology library.

WHAT_NEXT

Be sure that your design was created correctly. If the Design Compiler or DFT Compiler have created an illegal design, check the technology library to be sure that the *primary_output* attribute is used properly for the given technology. If everything is alright in the technology library and *compile* has created an illegal design, contact your Synopsys application engineer or the Synopsys Hotline with a test case.

LINT-47 (warning) In design '%s' net '%s' has a connection

class violation:

DESCRIPTION

This warning message indicates that *check_design* has found a net that does not meet the connection class requirements described in the technology library. These connection class requirements ensure that all pins on a net can legally be connected. All pins connected together on a net must share at least one connection class in common. Each pin's class is defined in the technology library description for the pin, through the *connection_class* attribute.

WHAT_NEXT

Determine whether the design you are checking was (1) created manually as a netlist, or (2) created by Design Compiler (possibly from a high-level description) or DFT Compiler. If (1) is true, investigate the violation to be sure that you have specified the net correctly in your design. If (2) is true, examine the illegal net(s) created by the tool. It might not always be possible for the given net to be legalized. For example, a net might connect though hierarchy to pins whose connection classes cannot be matched. Or, other design rules, such as fanout restrictions or transition time restrictions might have made legalization for connection rules impossible. Also, check your technology library to determine whether there are level shifting components available to convert between the given connect classes.

LINT-48 (error) Not a valid part and speed grade

DESCRIPTION

This error message indicates that *check_design* has found that the part specified on the design does not exist in the technology library.

WHAT_NEXT

Do a *report_library* on the technology library to get the list of parts supported. Select the one you want and attribute on the design.

LINT-49 (warning) The part %s has fewer I/O ports %d than that required by the design %d.

DESCRIPTION

This warning message indicates that *check_design* has found that the part specified on the design does not have enough number of input/output ports to hold the design.

WHAT_NEXT

Do a *report_library* on the technology library to get the list of parts supported. Select the bigger part and attribute it on the design.

LINT-50 (warning) The part %s has fewer flip-flops %d than that required by the design %d.

DESCRIPTION

This warning message indicates that *check_design* has found that the part specified on the design is unable to accomodate the number of flip-flops present in your design.

WHAT_NEXT

Do a *report_library* on the technology library to get the list of parts supported. Select the part which has more number of flip-flops than the previous part and attribute it on the design.

LINT-51 (warning) Part related checkings is not supported for the technology library.

DESCRIPTION

This warning message indicates that *check_design* has found that the technology library doesn't have any parts information specified in it.

WHAT_NEXT

Part specific checking is supported only for FPGA technology library. Make sure that you are using FPGA technology library and they have part information specified in them. If there is no part information, ask your vendor to supply a technology library with part information.

LINT-52 (warning) In design '%s', output port '%s' is connected

directly to '%s'.

DESCRIPTION

This warning alerts you to a situation where an output port in a design is connected directly to Logic 1 or Logic 0. This warning is issued because some technologies do not allow such a connection. This restriction might or might not apply to your technology. Most case it is a design error.

WHAT_NEXT

Please check the net list carefully to make sure this case is desired, and discuss with your technology team to make sure it is allowed.

LINT-53 (error) In design '%s', net '%s' is driven by both logic 0 and logic 1.

DESCRIPTION

WHAT_NEXT

LINT-54 (warning) In design '%s', net '%s' is driven by %s.

DESCRIPTION

This message alert you the net is driven by const net.

WHAT_NEXT

Please visit your design and make sure it is desired.

LINT-55 (information) Design '%s' does not contain any cells or

nets.

DESCRIPTION

WHAT_NEXT

LINT-56 (error) In design '%s', net '%s' has multiple drivers (unknown wired-logic type).

DESCRIPTION

This error message indicates that *check_design* has found a net with multiple source pins. Synopsys tools must make an assumption regarding the functionality of such *wired logic* nets. This message indicates that the tool was unable to determine the wired-logic type of the net. The assumption about wired-logic type is made based on a description of wired logic functionality in the technology library that you are using. This message could indicate that wired-logic information was not correctly specified in your technology library, or that the description of the design is incorrect.

WHAT_NEXT

Examine the net(s) in question, the descriptions of the components connected to the net, and their respective technology library descriptions. Make sure that the net is not the result of an error in specifying a design. Design Compiler is capable of creating wired logic during optimization, but only in the situation where the logical function of that wired logic is understood (for example, Wired-OR).

You could also use *set_attribute* command to specify the wired logic type for a net with multiple drivers. The possible wired types include 'wired_and', 'wired_or' and 'three_state'.

For example,

```
set_attribute [get_nets z] wired_and true -type boolean
```

would set 'wired_and' attribute on net 'z'.

To reduce the severity of this error message to a warning, set the variable *check_design_allow_unknown_wired_logic_type* to true.

LINT-57 (error) In design '%s', %s.

DESCRIPTION

This is the terse version of a *check_design* error message. This message is displayed when Synopsys command *check_design -summary* performs a design check and gives a summary of errors.

WHAT_NEXT

Use *check_design* to obtain more information about the error.

LINT-58 (warning) In design '%s', input pin '%s' of leaf cell '%s' is connected to undriven net '%s'.

DESCRIPTION

This message appears when leaf cell input pin has a connected net, but the net has no driver.

WHAT_NEXT

LINT-59 (warning) In design '%s', input pin '%s' of hierarchical cell '%s' has one or more internal loads, but is not connected to any nets. '%s' is assumed.

DESCRIPTION

This message appears when hierarchical cell input pin has internal load, but no driver. Synopsys tools assume a logical value (for example, logic zero or logic one) for such unconnected signals, based on the type of technology library you are using. This warning message is a notification of the assumption that is being made for the named input pin in the named design.

WHAT_NEXT

Verify that the assumption made by Synopsys regarding the logical value for the given signal is correct. If the assumption is not correct, then connect the floating input pin to the correct logical value in your design.

LINT-60 (warning) In design '%s', input pin '%s' of hierarchical cell '%s' has no internal loads and is not connected to any nets.

DESCRIPTION

This message appears when hierarchical cell input pin has no internal load and no driver. Synopsys tools assume a logical value (for example, logic zero or logic one) for such unconnected signals, based on the type of technology library you are using. This warning message is a notification of the assumption that is being made for the named input pin in the named design.

WHAT_NEXT

Verify that the assumption made by Synopsys regarding the logical value for the given signal is correct. If the assumption is not correct, then connect the floating input pin to the correct logical value in your design.

LINT-62 (error) In design '%s', three-state bus '%s' has non three-state driver '%s'.

DESCRIPTION

Synopsys libraries contain descriptions of three-state driving pins on components. Synopsys tools classify a net as a three-state net if it is driven by at least one pin that has this three-state attribute. Normally, if there are multiple drivers on such nets, it is assumed that all driving pins should be three-state drivers, for correct operation of the three-state bus. This Error message appears when at least one non-three-state driver appears on a three-state net.

WHAT_NEXT

Verify that this is what you have intended for the given net. If the *non-three-state* driver pin specified in the message is really on a three-state driver in your ASIC technology, verify that the technology library description is correct.

To reduce the severity of this error message to a warning, set the variable `check_design_allow_non_tristate_drivers_on_tristate_bus` to `true`.

LINT-63 (warning) Net '%s' has a single tri-state driver.

DESCRIPTION

You receive this warning message when the `check_design` command detects that a net is

driven by a single tri-state driver.

WHAT NEXT

LINT-78 (information) Design '%s' has multiply instantiated designs. Use the '-multiple_designs' switch for more information.

DESCRIPTION

This message indicates that the current_design has one or more multiply instantiated designs. To get a list of all the multiply instantiated designs with the instance names, use *-multiple_designs* switch.

WHAT_NEXT

Use *-multiple_designs* to obtain more information about the multiply instantiated designs.

LINT-98 (information) Use the 'check_design' command for more information about warnings.

DESCRIPTION

This message indicates that a terse version of informational messages or warnings on a design has just been displayed. To obtain more complete information, use *check_design*. This message is displayed when user used *check_design -summary* to get a summary of the potential design problems.

WHAT_NEXT

Use *check_design* to obtain more information about the design.

LINT-99 (information) There are %d potential problems in your design. Please run 'check_design' for more information.

DESCRIPTION

This message indicates that there are %d potential design problems in the user

design. To obtain detailed information, use *check_design*. This message is displayed when Synopsys commands like *compile* perform a design check as part of their operation. If *compile* issued the message but completed its operation, the design might have to be read again for *check_design* to report what was wrong initially.

WHAT_NEXT

Use *check_design* to obtain more information about the design.

LINT-100 (warning) The design does not have back-annotated delays.

DESCRIPTION

check_design -post_layout issues this warning when it finds that the design does not have back-annotated delays.

WHAT_NEXT

To back-annotate delays onto the design, use the *read_timing* command or a series of *set_annotated_delay* command.

LINT-101 (warning) Missing '%s delay annotation between pins '%s' and '%s' on cell '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a timing arc on a cell that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the *set_annotated_delay* command.

LINT-102 (warning) The design does not have back-annotated

cluster assignments.

DESCRIPTION

check_design -post_layout issues this warning when it finds that the design does not have back-annotated cluster assignments (The clusters corresponds to the physical hierarchy of the design).

WHAT_NEXT

To back-annotate cluster assignments onto the design, use the *read_clusters* command to read in the *PDEF* file.

LINT-103 (warning) Missing cluster annotation on cell '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a cell which is not assigned to a cluster.

WHAT_NEXT

Modify the *PDEF* file before applying *read_clusters* command such that cells with missing cluster assignment are correctly assigned to a cluster.

LINT-104 (warning) The design does not have back-annotated cell locations.

DESCRIPTION

check_design -post_layout issues this warning when it finds that the design does not have cell locations back-annotated.

WHAT_NEXT

To back-annotate cell locations onto the design, use the *read_clusters* command to read in the *PDEF* file with cell location (i.e., *PDEF* version 2.0 or later)..

LINT-105 (warning) Missing cell location for cell '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a cell which does not have cell location back-annotated.

WHAT_NEXT

Modify the *PDEF* file before applying *read_clusters* command such that cells with missing cell locations are correctly assigned a cell location.

LINT-106 (warning) Missing %s delay annotation from pin '%s/%s' to pin '%s/%s' on net '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a net timing arc that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the *set_annotation_delay* command.

LINT-107 (warning) The design does not have back-annotated net capacitances.

DESCRIPTION

check_design -post_layout issues this warning when it finds that the design does not have back-annotated net capacitances.

WHAT_NEXT

To back-annotate net capacitances on the design, use a series of *set_load* command.

LINT-108 (warning) Missing capacitance annotation on net '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a net that does not have back-annotated capacitance.

WHAT_NEXT

To back-annotate capacitances on nets with missing capacitance annotation, use a series of *set_load* command.

LINT-109 (warning) Missing orientation annotation on cluster '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a leaf level cluster that does not have back-annotated row-orientation.

WHAT_NEXT

Modify the *PDEF* file before applying *read_clusters* command such that clusters with missing orientations are correctly assigned an orientation.

LINT-110 (warning) Missing bounding box for cluster '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a leaf level cluster that does not have back-annotated bounding box.

WHAT_NEXT

Modify the *PDEF* file before applying *read_clusters* command such that clusters with missing bounding box are correctly assigned a bounding box.

LINT-111 (warning) Missing %s delay annotation for setup arc

from pin '%s' to pin '%s' on cell '%s'.

DESCRIPTION

`check_design -post_layout` issues this warning when it finds a *setup* timing arc on a cell that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the `set_annotated_delay` command.

LINT-112 (warning) Missing %s delay annotation for *hold* arc from pin '%s' to pin '%s' on cell '%s'.

DESCRIPTION

`check_design -post_layout` issues this warning when it finds a *hold* timing arc on a cell that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the `set_annotated_delay` command.

LINT-113 (warning) Missing %s delay annotation for 'preset' or 'clear' timing arc from pin '%s' to pin '%s' on cell '%s'.

DESCRIPTION

`check_design -post_layout` issues this warning when it finds a *preset* or *hold* timing arc on a cell that does not have back-annotated delay. If the warning message indicates a missing *rise* delay annotation, the timing arc with missing annotation is a *preset* timing arc; otherwise, it is a *clear* timing arc.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the `set_annotated_delay` command.

LINT-114 (warning) Missing %s delay annotation from port '%s%s' to pin '%s/%s' on net '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a net timing arc from a *port* to a pin that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the *set_annotated_delay* command.

LINT-115 (warning) Missing %s delay annotation from pin '%s/%s' to port '%s%s' on net '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a net timing arc from a pin to a *port* that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the *set_annotated_delay* command.

LINT-116 (warning) Missing %s delay annotation from port '%s%s' to port '%s%s' on net '%s'.

DESCRIPTION

check_design -post_layout issues this warning when it finds a net timing arc from a *port* to a *port* that does not have back-annotated delay.

WHAT_NEXT

Modify the *SDF* file such that the missing delay is correctly described or annotate the delay directly with the *set_annotated_delay* command.

LINT-117 (warning) The design does not have any back-annotation information.

DESCRIPTION

You receive this warning message when the `check_design -post_layout` command is executed and it detects that the design does not have any back-annotation information.

WHAT NEXT

To back-annotate delays onto the design, use the `read_sdf` command or a series of `set_annotated_delay` commands. To back-annotate cluster assignments onto the design, use the `read_clusters` command to read in the PDEF file. To back-annotate net capacitances on the design, use a series of `set_load` commands.

LINT-118 (warning) The design has '%d' cells which do not have cluster annotation on them. The cells with missing annotations represent '%f' of all cells.

DESCRIPTION

You receive this warning message when the `check_design -post_layout -summary` command detects that the design has cells that do not have cluster information back-annotated on them. The message reports the total number of all such cells, and prints the percentage of cells with missing annotations.

The `check_design -only_post_layout -summary` command also issues this warning message when it finds cells with missing cluster annotations.

WHAT NEXT

To back-annotate cluster assignments onto the design, correct the PDEF file and use the `read_clusters` command to read in the PDEF file.

LINT-119 (warning) The design has '%d' cells which do not have locations annotation on them. The cells with missing annotations

represent '%f' of all cells.

DESCRIPTION

You receive this warning message when the **check_design -post_layout -summary** command detects that the design has cells that do not have location information back-annotated on them. The message reports the total number of all such cells and gives the percentage of the cells with missing annotations.

The **check_design -only_post_layout -summary** command also issues this warning when it finds cells with missing location annotations.

WHAT NEXT

To back-annotate location assignments onto the design, correct the PDEF file, and use the **read_clusters** command to read in the PDEF file.

LINT-120 (warning) The design has '%d' cells annotated with clusters which have no orientation. The cells with this type of missing annotations represent '%f' of all cells.

DESCRIPTION

You receive this warning message when the **check_design -post_layout -summary** command detects that the design has cells that are annotated with clusters that have no orientation. The warning message reports the total number of all such cells and prints the percentage of the cells with missing annotations.

The **check_design -only_post_layout -summary** command also issues this warning message when it finds cells annotated with clusters that have no orientation.

WHAT NEXT

To back-annotate cluster assignments with orientation onto the design, correct the PDEF file and use the **read_clusters** command to read in the PDEF file.

LINT-121 (warning) The design has '%d' cells annotated with clusters which have no bounding box. The cells with this type of

missing annotations represent '%f' of all cells.

DESCRIPTION

You receive this warning message when the **check_design -post_layout -summary** command detects that the design has cells that are annotated with clusters that have no bounding box. The command reports the total number of all such cells and prints the percentage of cells with missing annotations.

The **check_design -only_post_layout -summary** command also issues this warning when it detects cells annotated with clusters that have missing bounding box.

WHAT NEXT

To back-annotate cluster assignments with a bounding box onto the design, correct the PDEF file and use the **read_clusters** command to read in the PDEF file.

LINT-122 (warning) The design has '%d' cells which have missing delay arc annotations. The cells with missing annotations represent '%f' of all cells.

DESCRIPTION

You receive this warning message when the **check_design -post_layout -summary** command detects that the design has cells that have missing delay arc annotations. The command reports the total number of all such cells and prints the percentage of cells with the missing annotations.

The **check_design -only_post_layout -summary** command also issues this warning when it finds cells with missing delay arc annotations.

WHAT NEXT

To back-annotate delays onto the design, use the **read_sdf** command, or a series of **set_annotated_delay** commands.

LINT-123 (warning) The design has '%d' nets which have missing delay arc annotations. The nets with missing

annotations represent '%f' of all nets.

DESCRIPTION

You receive this warning message when the **check_design -post_layout -summary** command detects that the design has nets that have missing delay arc annotations. The command reports the total number of all such nets and prints the percentage of nets with the missing annotations.

The **check_design -only_post_layout -summary** command also issues this warning when it finds nets with missing delay arc annotations.

WHAT NEXT

To back-annotate delays onto the design, use the **read_sdf** command or a series of **set_annotated_delay** commands.

LINT-124 (warning) The design has '%d' nets which do not have capacitance annotation on them. The nets with missing annotations represent '%f' of all nets.

DESCRIPTION

You receive this warning message when the **check_design -post_layout -summary** command detects that the design has nets that do not have capacitance information back-annotated on them. The command reports the total number of all such nets and prints the percentage of nets with missing annotations.

The **check_design -only_post_layout -summary** command also issues this warning message when it finds nets with missing capacitance annotations.

WHAT NEXT

To back-annotate net capacitances on the design, use a series of **set_load** commands.

LNK

LNK-001 (error) Cannot read link_path file '%s'.

DESCRIPTION

The file, specified in the link_path variable, cannot be read. Either the file does not exist or it is not a DB file.

WHAT NEXT

Check the existence of the file in the search_path using the **which** command.

LNK-002 (information) Design '%s' is already linked.

DESCRIPTION

The specified design has already been linked.

WHAT NEXT

Verify that this is the design that you wanted to link.

LNK-003 (information) Design '%s' was not successfully linked: %d unresolved references.

DESCRIPTION

A summary message indicating that the link process failed for your design.

WHAT NEXT

See previous error messages for more details.

LNK-004 (error) Unsupported LSI reference '%s' to '%s'

cannot be resolved

DESCRIPTION

The linker tried to resolve a reference which was derived from an LSI netlist, and the reference a form that the tool does not support. This tool only supports fully name-based references from LSI netlists. Order-based or mixed order and name based references are not supported.

WHAT NEXT

Use another Synopsys tool to read the DB, link it, and write it out to a new DB file. This will resolve the naming issue.

LNK-005 (warning) Unable to resolve reference to '%s' in '%s'.

DESCRIPTION

During the link process, a reference in the design could not be resolved. This means that no match was found for the reference using the semantics of the `link_path` variable.

This message is generated only for the first instance of the reference. In order to see all of the instances that are unresolved, use "`link_design -verbose`".

WHAT NEXT

Examine the `link_path` variable, log messages, and use the `which` command to find out which files were loaded.

LNK-006 (warning) Cannot resolve instance %s/%s (%s).

DESCRIPTION

During the link process, a reference in the design could not be resolved. This message is for the instance that was trying to link to the reference.

This message is only displayed in verbose mode.

WHAT NEXT

Examine the `link_path` variable, log messages, and use the `which` command to find out which files were loaded.

LNK-007 (error) Cannot instantiate design '%s' in '%s'.

DESCRIPTION

During the link process, a reference was resolved, but the design to which it resolved cannot be instantiated due to errors in the read process.

This message is generated only for the first instance of the reference. Use "link_design -verbose" in order to see all of the instances of this design which could not be instantiated.

WHAT NEXT

Examine the output of the tool when design files were loaded to see what caused the design to be in a state that cannot instantiate.

LNK-008 (error) Cannot find port '%s' on design '%s', referenced by instance '%s'.

DESCRIPTION

During the link process, an instance in the design could not be resolved because a port on the instance was not found in the design. This indicates a mismatch between the pinout of the instance and the design to which it should have resolved.

For example, if you have only these three instances of an FD1 in a design:

```
FD1 u1 (.Q(n1), .CP(clock1), .D(data1));  
FD1 u2 (.Q(n2), .CP(clock2), .D(data2));  
FD1 u3 (.Q(n3), .CK(clock3), .D(data3));
```

There is a typo in the third instance, listing "CK" instead of "CP". By default, you will get the LNK-008 message for the first instance only.

```
Error: Cannot find port 'CK' on design 'FD1',  
referenced by instance 'u1'. (LNK-008)
```

This might seem confusing, since that instance does not have a CK port. But for a name-based reference, each instance expects at least the total of all listed ports. To see all instances which cannot be resolved, use the -verbose option to **link_design**:

```
Warning: Cannot resolve instance top/u1 (FD1). (LNK-006)  
Warning: Cannot resolve instance top/u2 (FD1). (LNK-006)  
Warning: Cannot resolve instance top/u3 (FD1). (LNK-006)
```

The LNK-006 messages are generated in addition to LNK-008.

WHAT NEXT

Examine the link_path variable, log messages, and use the **which** command to find out which files were loaded. This could also be due to a typo in the netlist source.

SEE ALSO

link_design (2). **LNK-006** (n).

LNK-009 (error) Reference '%s' to '%s' is missing the following ports:

%s.

DESCRIPTION

The linker tried to resolve a reference which had the correct number of ports, but was unable to match the ports on the reference to those on the target design or library cell. This is an indication of a mismatch between the library and the netlist.

WHAT NEXT

Verify that the library and netlist are in sync.

LNK-010 (error) Too few ports on instance '%s' of '%s' in '%s'.

DESCRIPTION

The specified reference to a design or library cell does not have enough ports. This indicates a mismatch between the library and the netlist.

WHAT NEXT

Make sure the library is correct. Then, verify that the netlist is referencing the correct cell.

LNK-011 (error) Too many ports on instance '%s' of '%s' in '%s'.

DESCRIPTION

The specified reference to a design or library cell has too many ports. This usually indicates a mismatch between the library and the netlist. It can also indicate that there are multiple conflicting references to the same library cell or black box. One such conflict is two references with different pin counts.

WHAT NEXT

This error will cause the link to fail. Make sure the library is correct. Then, verify that the netlist is referencing the correct cell.

If this occurs during black box creation, you would see additional messages, for example:

```
Error: Too many ports on instance 'u1' of '*SELECT_OP' in 'd1'. (LNK-011)
```

The first instance of *SELECT_OP for which a black box was created had fewer pins than this reference. This often happens with generic logic. Other than GTECH, PrimeTime does not support generic logic. In this case, the solution is to remove the design containing the generic logic from the link path, or add a wrapper design which creates a black box at a higher level.

LNK-012 (error) Width mismatch on port '%s' of reference to '%s' in '%s'.

DESCRIPTION

The linker matched a bused port on an instance with a bused port on a library cell, but bus width is different between the two. This could indicate an incorrect library or a netlist which is out of date with the library.

WHAT NEXT

Verify that your source is in sync with the library.

LNK-013 (error) Could not resolve %s port '%s' of reference to '%s' in '%s'.

DESCRIPTION

The linker could not find a port (bused or not) on an instance while resolving a

reference with a target library cell. This could indicate an incorrect library or a netlist which is out of date with the library.

WHAT NEXT

Verify that your source is in sync with the library.

LNK-014 (error) Could not resolve direction of port '%s' of reference to '%s' in '%s'.

DESCRIPTION

The linker matched a port on an instance with a port on a library cell, but the directions do not match. This might indicate an incorrect library or a netlist which is out of date with the library.

WHAT NEXT

Verify that your source is in sync with the library.

LNK-015 (Warning) Could not swap '%s' ('%s') with '%s'%s.

DESCRIPTION

You tried to swap a cell with a new design or lib cell, and this action failed. Additional information might be included with this message and previous messages.

WHAT NEXT

Action based on reasons given in message text.

LNK-016 (Information) %s failed due to previous errors.

DESCRIPTION

This is a summary message indicating that the given action was not accomplished.

WHAT NEXT

Action based on reasons given in text of previous messages.

LNK-018 (Error) Cannot swap cells; design is not linked.

DESCRIPTION

The current design is either unlinked or partially linked. Swapping a cell for a new library cell or design can only be done in the context of a linked design.

WHAT NEXT

Link the current design, then retry your swap operation.

LNK-019 (Error) Can only swap in a single target object.

DESCRIPTION

The specification for the design or library cell to **swap_cell** resulted in more than one object. Either you specified a list or used a collection that matched multiple objects.

WHAT NEXT

Narrow the search parameters so only a single object is selected.

LNK-020 (Error) Cannot swap in '%s': it is the current design.

DESCRIPTION

The design you specified is the current design and you cannot instantiate a design within itself.

WHAT NEXT

Select a different design.

LNK-021 (Information) Previous messages occurred while trying to do:

'%S'.

DESCRIPTION

While linking the design, an attempt was made to transfer some information from the source design files which you read to the final linked design and some diagnostics occurred. This message shows you what was attempted which caused the diagnostics.

WHAT NEXT

Action based on the messages referenced.

LNK-023 (error) Recursive hierarchy detected in design '%s': %s.

DESCRIPTION

The linker detected recursive hierarchy in the design that is being linked. This is a design error. The message will list the designs that create the recursion.

For example, if design A has an instance of B and design B has an instance of A, that is a recursive loop.

WHAT NEXT

Remove the recursion, reread the designs, and relink.

LNK-024 (Warning) All timing information (backannotation, exceptions, etc.) is being removed from design '%s'. User-created annotations must be restored after relinking this design.

DESCRIPTION

When a design is linked and there is another design currently linked, the current design is unlinked before the new design is linked. When this occurs, all annotations on the currently linked design are removed. This includes any timing information loaded from DB or added by user commands.

The next time the design is linked, information originally loaded from DB will be automatically restored. For example, clocks stored in the DB which was read in to

PrimeTime will be recreated on the design. However, any information which was added to the design after the link can only be restored if it was saved with **write_script**. For example, if you used the `create_clock` command to create a new clock, this clock will not be automatically restored.

WHAT NEXT

To save the state of the design before linking a new design, use the `write_script` command. Then, after relinking the design, source the script which was written to restore all annotations.

LNK-025 (information) Link interrupted. Unlinking design: please wait...

DESCRIPTION

You entered a control-C to interrupt the link before it completed. The design which was being linked will be unlinked.

WHAT NEXT

No action.

LNK-026 (warning) min library '%s' found in link_path.

DESCRIPTION

During the link process, a library has been found in the link path that is in use as a min library. Only the max library is used in the link path for min/max analysis with the **set_min_library** command.

WHAT NEXT

Remove the min library from the value of the **link_path** variable, and ensure that the max library is in the link path.

SEE ALSO

set_min_library (2), **link_path** (3).

LNK-028 (Warning) unable to apply some DB constraints because they were cached in file '%s' and that file no longer exists.

DESCRIPTION

While linking the design, an attempt was made to transfer some information from the source design DB files which you read to the final linked design. When that information (constraints, exceptions, and so on) is large, it is cached to disk after an initial link. On a subsequent link, that data will be reloaded and reapplied. If the file has been deleted between the first link and the subsequent link, this message is issued.

WHAT NEXT

Examine why the file may have been deleted. Equally, examine why you are linking a second time. Usually this is a bug in a script, for example, executing a command which does an implicit link, followed by an explicit link. It is usually best to pick one style: implicit or explicit. Synopsys recommends that you build the design explicitly, that is, read the files that you want, then issue a `link_design` command.

SEE ALSO

`link_design(2)`.

LNK-030 (information) Using '%s' as link path for instance '%s'

DESCRIPTION

This informational message tells you that the `link_path_per_instance` variable has been used, and an a match has been found for an instance. The link path and the instance name are shown in the message. The link path should match your setting in `link_path_per_instance` for the instance.

This message is displayed only if the `-verbose` option is used with `link_design`.

WHAT NEXT

No action required. This is strictly for your information.

SEE ALSO

`link_design (2)`. `link_path_per_instance (3)`.

LNK-031 (warning) Replacing link path for '%s' with '%s'

DESCRIPTION

This message warns you that you have the same instance listed multiple times in the setting for the **link_path_per_instance** variable. For example, here the instance *i2* is listed twice.

```
set link_path_per_instance [list
    [list i2 "* lib1.db"]
    [list i2 "* lib2.db"]
    [list i2/u1/u1 "* lib1.db"]]
```

WHAT NEXT

Examine the setting for the **link_path_per_instance** variable, and ensure that only one valid link path exists per instance.

SEE ALSO

[link_path_per_instance \(3\)](#).

LNK-033 (error) Incorrect format for link_path_per_instance: %S

DESCRIPTION

This message tells you that the format for the **link_path_per_instance** variable is incorrect. Various things can be wrong. The variable must be a list. Each element is itself a list of exactly two elements, where the first sub-element is a list of instances, and the second is a valid link path. The content of the message will isolate where the problem exists.

WHAT NEXT

Correct the setting for the **link_path_per_instance** variable.

SEE ALSO

[link_path_per_instance \(3\)](#).

LNK-034 (information) Removing %d unneeded designs.....

DESCRIPTION

This message tells you that a number of designs are being deleted following a successful link. This message is issued when you issue **link_design** command without using the **-keep_sub_designs** option or issued a command that performed an implicit link.

WHAT NEXT

No action is required. This is just information only.

SEE ALSO

link_design (2).

LOGDB

LOGDB-0 (error) Design is currently not represented as a PLA.

DESCRIPTION

WHAT NEXT

LOGDB-1 (error) Cells at the current level of the design are not combinational.

DESCRIPTION

WHAT NEXT

LOGDB-2 (error) Cannot write out design with INOUT ports.

DESCRIPTION

WHAT NEXT

LOGDB-3 (error) Cannot write out design with ports with unknown direction.

DESCRIPTION

WHAT NEXT

LOUT

LOUT-1 (warning) %s '%s' is renamed to '%s' in design '%s' because it isn't a legal name.

DESCRIPTION

WHAT NEXT

LOUT-2 (warning) %s '%s' is renamed to '%s' in design '%s' because of %s of the same name.

DESCRIPTION

WHAT NEXT

LOUT-3 (warning) Pin '%s' on cell '%s' has no direction. Not written.

DESCRIPTION

WHAT NEXT

LOUT-4 (information) Net '%s' is renamed to '%s' in design '%s' because it's connected to the port by that name.

DESCRIPTION

WHAT NEXT

LOUT-5 (warning) The name of net '%s' in design '%s'

can't be changed to the name of both ports '%s' and '%s' to which it's connected.

DESCRIPTION

WHAT NEXT

LOUT-6 (warning) Direction of port '%s' in design '%s' is unknown.

It will not be declared as a port in the output LSI/NDL netlist.

DESCRIPTION

This message is generated by the LSI/NDL writer whenever it encounters a port with an 'unknown' direction. The port is not written out into the LSI/NDL netlist, even though references to the port may exist.

This symptom is most commonly caused by writing out LSI/NDL from a database that has been built with missing references. This causes port directions in the database to be unresolved since the lower level cells that contain the port are not available.

WHAT NEXT

Create and link the database so that the system does not return any errors.

LOUT-7 (error) (Internal error) Pin '%s' cannot be found in cell '%s'.

DESCRIPTION

We do not expect this message ever to be issued. But if it is, contact your AE for further assistance because it indicates an internal error.

This error message is issued when the LSI/NDL writer is attempting to write out the output-connection list and input-connection list. It indicates that an incorrect pin, as named in the message, has been associated with the current cell (named in the message) being processed. This symptom can be caused by writing out LSI/NDL from a database that has been built with missing references.

WHAT NEXT

Create and link the database so that the system does not return any errors. Call your AE for further assistance.

LSIN

LSIN-1 (error) Can't open the input file.

DESCRIPTION

WHAT NEXT

LSIN-2 (warning) File %s [Line %d]:

'%s' is not supported as an NC value .This is being reset to '0'
[logic zero]

DESCRIPTION

WHAT NEXT

LSIN-3 (error) File %s, line %d: Mixed explicit and implicit

connections.

DESCRIPTION

WHAT NEXT

LSIN-4 (error) File %s, line %d: Module '%s' used inconsistently.

DESCRIPTION

WHAT NEXT

LSIN-5 (error) File %s, line %d: Illegal %s specification.

DESCRIPTION

WHAT NEXT

LSIN-6 (warning) File %s, line %d: Unsupported NC connection.

DESCRIPTION

WHAT NEXT

LSIN-7 (error) File %s, line %d: Component '%s' could not be

found.

DESCRIPTION

WHAT NEXT

LSIN-8 (error) File %s, line %d: Cell '%s' could not be added.

DESCRIPTION

WHAT NEXT

LSIN-9 (warning) File %s, line %d: %s port '%s' specified twice.

DESCRIPTION

WHAT NEXT

LSIN-10 (warning) The value of variable 'lsiin_net_name_prefix' isn't valid--using 'NET_'.

DESCRIPTION

WHAT NEXT

LSIN-11 (error) File %s [Line %d]:

%s is not a valid NC value.

DESCRIPTION

WHAT NEXT

LSIN-12 (warning) File %s [Line %d]:
'use_global' is not supported.

DESCRIPTION

This warning message is caused by the **USE_GLOBAL** keyword. The global signals feature is not supported now.

WHAT NEXT

Delete **USE_GLOBAL**, and define local signals instead.

MCMM

MCMM-101 (error) Must give one of *-hosts*, *-lsf*, *-grd*, or *-nqs*.

DESCRIPTION

This error message occurs when you have not given any option to specify the distributed computing mode. The currently supported modes are *-hosts*, *-lsf*, *-grd*, or *-nqs*.

WHAT NEXT

Give exactly one of these options.

SEE ALSO

`set_mcmm_job_options(2)`

MCMM-102 (error) Cannot give more than one distributed computing mode option.

DESCRIPTION

This error message occurs when you specify more than one distributed computing mode. The currently supported modes are *-hosts*, *-lsf*, *-grd*, or *-nqs*.

WHAT NEXT

Give exactly one of the options.

SEE ALSO

`set_mcmm_job_options(2)`

MCMM-103 (error) Option %s is valid only in host mode.

DESCRIPTION

This error message occurs when you give an option that is valid only in host mode (i.e. the *-hosts* option).

WHAT NEXT

Remove the offending option.

SEE ALSO

`set_mcmm_job_options(2)`

MCMM-104 (error) Option %s is valid only for compute farm modes.

DESCRIPTION

This error message occurs when you give an option that is valid only in compute farm mode (i.e. the `-lsf`, `-grd`, or `-nqs` options).

WHAT NEXT

Remove the offending option or give one of the compute farm options.

SEE ALSO

`set_mcmm_job_options(2)`

MCMM-105 (error) Option %s is valid only in GRD mode.

DESCRIPTION

This error message occurs when you give an option that is valid only in GRD mode (i.e. the `-grd` option).

WHAT NEXT

Remove the offending option.

SEE ALSO

`set_mcmm_job_options(2)`

MCMM-106 (error) Distributed MCMM job options are not

properly set.

DESCRIPTION

This error message occurs when you try to run Distributed MCMM without first having specified a useable set of job options with the *set_mcmm_job_options* command.

WHAT NEXT

Use the *set_mcmm_job_options* command to set up the job options.

SEE ALSO

set_mcmm_job_options(2)
get_dominant_scenarios(2)

MCMM-110 (error) Could not read TCL variables from file %s.

DESCRIPTION

This error message occurs the Distributed MCMM slave flow could not read the TCL variable state from the given file. Either the file does not exist in the correct location, there is a problem accessing the correct directory, or its contents have become damaged.

WHAT NEXT

Review any warning or error messages from the main Distributed MCMM flow to see if the file was properly created.

SEE ALSO

get_dominant_scenarios(2)
set_mcmm_job_options(2)

MCMM-111 (error) No scenarios are active.

DESCRIPTION

The command cannot run because there are no active scenarios. Most likely the current design is not a multi-scenario design.

WHAT NEXT

Review the results of the commands that were originally supposed to have created the scenarios.

SEE ALSO

`get_dominant_scenarios(2)`
`report_scenarios(2)`

MCMM-112 (error) The distributed MCMM flow did not run correctly.

DESCRIPTION

An error occurred during the Distributed MCMM flow, and it did not finish properly. Quite possibly one of the slave jobs did not run correctly due to network, fileserver, or compute farm problems.

WHAT NEXT

Review any previous warning or error messages from the run, and also review the log files for each slave job. If only one or a few slave jobs did not run correctly, it may be possible to manually re-run them, and then run "get_dominant_scenarios - process_distributed" to post-process all the results.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-113 (error) Data from the distributed MCMM flow could not be processed successfully.

DESCRIPTION

An error occurred during the post-processing phase of the Distributed MCMM flow, and it did not finish properly. The slave jobs presumably finished successfully, but the results files (<scenario_name>.gds) could not be read and processed.

WHAT NEXT

Review any previous warning or error messages from the run, and also review the log files for each slave job. Examine the work dir to see if there is a .gds file for every scenarios that was to be analyzed.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-114 (error) No valid scenarios were specified.

DESCRIPTION

No valid scenario names were given to `get_dominant_scenarios`, and the command cannot run.

WHAT NEXT

Ensure that each scenario name given to `get_dominant_scenarios` actually exists.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-120 (error) Could not determine the path to the ICC executable.

DESCRIPTION

The Distributed MCMM flow could not determine where the ICC executable is located. Possibly the ICC installation is non-standard

WHAT NEXT

Ensure that the `$synopsys_root` and `$arch` TCL variables have appropriate values.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-121 (error) The ICC executable %s does not exist, or

does not have execute permission.

DESCRIPTION

The Distributed MCMM flow could not find a usable ICC executable. Possibly the ICC installation is non-standard, or an incorrect executable path was specified via the *set_mcmm_job_options* command.

WHAT NEXT

Ensure that the \$synopsys_root and \$arch TCL variables have appropriate values. If *set_mcmm_job_options -exec* was used, ensure that it referred to a valid ICC executable.

SEE ALSO

get_dominant_scenarios(2)
set_mcmm_job_options(2)

MCMM-122 (error) Could not create file %s in the Distributed MCMM work directory.

DESCRIPTION

The Distributed MCMM flow could not create the given file in the work directory.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is writable. Ensure that the work directory does not contain an existing file of this name that cannot be overwritten.

SEE ALSO

set_mcmm_job_options(2)

MCMM-123 (error) Problem writing parasitics files to the

Distributed MCMM work directory.

DESCRIPTION

The Distributed MCMM flow could not write all the necessary binary parasitics files (*.sbpf) to the work directory.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is writable. See if the `extract_rc` and `write_parasitics -format SBPF` commands work correctly.

SEE ALSO

`extract_rc(2)`
`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`
`write_parasitics(2)`

MCMM-124 (error) Problem writing the TCL variable file %s to the Distributed MCMM work directory.

DESCRIPTION

The Distributed MCMM flow could not write the TCL variable file to the work directory.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is writable.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-125 (error) Problem writing the library attributes script

file %s to the Distributed MCMM work directory.

DESCRIPTION

The Distributed MCMM flow could not write the library attributes script file to the work directory.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is writable.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-126 (error) Problem writing the netlist file %s to the Distributed MCMM work directory.

DESCRIPTION

The Distributed MCMM flow could not write the design netlist file to the work directory.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is writable.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-127 (error) User-specified work directory %s does not exist or is not a directory.

DESCRIPTION

The user-specified work directory for Distributed MCMM does not exist or is not a directory. Generally, an existing file of the same name will prevent Distributed

MCMM from being able to create the work directory. In certain modes of operation, Distributed MCMM expects the work directory to already exist, and will not automatically create it.

WHAT NEXT

Ensure that the work directory actually exists and is a writable directory.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-128 (error) Could not determine absolute path name for file or directory %s.

DESCRIPTION

ICC could not expand the given file or directory name to a full rooted pathname (i.e. starting with "/").

WHAT NEXT

Ensure that the given name is a legal file or directory name. Ensure that the present working directory of the ICC process is known. Ensure that there are no filesystem or network problems.

SEE ALSO

`get_dominant_scenarios(2)`
`pwd(2)`
`set_mcmm_job_options(2)`

MCMM-129 (warning) Script file %s does not exist or is not readable.

DESCRIPTION

The given script file does not exist or is not readable. This is considered a warning rather than a fatal error, since you may be able to create the file or otherwise resolve the problem before the file is actually read by the Distributed MCMM slave jobs.

WHAT NEXT

Ensure that the given script file exists and is readable. Ensure that there are no filesystem or network problems.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-130 (error) Could not create the work directory %s.

DESCRIPTION

ICC could not create a given work directory with the given name (either auto-generated or user-specified).

WHAT NEXT

Ensure that the given name is a legal directory name. Ensure that there is not already a regular file of the same name. Ensure that the present working directory of the ICC process is writable. Ensure that there are no filesystem or network problems.

SEE ALSO

`get_dominant_scenarios(2)`
`pwd(2)`
`set_mcmm_job_options(2)`

MCMM-131 (error) The work directory %s is not writable.

DESCRIPTION

The user-specified work directory exists, but is not writable.

WHAT NEXT

Check the filesystem permissions for the directory.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-132 (error) There must be a user-defined work directory.

DESCRIPTION

In the current mode of operation, the Distributed MCMM flow needs to have a pre-existing user-specified work directory that already contains the necessary data and script files.

WHAT NEXT

Specify the work directory with the *set_mcmm_job_options* command.

SEE ALSO

get_dominant_scenarios(2)
set_mcmm_job_options(2)

MCMM-133 (error) Could not build a temporary directory name under %s.

DESCRIPTION

ICC could not construct a usable directory name (of the form `mcmm_xxxx`) under the given directory.

WHAT NEXT

Ensure the parent directory exists and is writable. Ensure that there are no filesystem or network problems.

SEE ALSO

get_dominant_scenarios(2)
pwd(2)
set_mcmm_job_options(2)

MCMM-134 (error) Could not create the work directory %s.

DESCRIPTION

ICC could not create the given directory.

WHAT NEXT

Ensure the parent directory exists and is writable. Ensure that there are no filesystem or network problems.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-135 (error) No valid hosts have been specified.

DESCRIPTION

None of the hosts specified by the `set_mcmm_job_options -hosts` command actually exist, or they are all inaccessible.

WHAT NEXT

Check the host list given to the `set_mcmm_job_options` command. Ensure that there are no network problems.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-136 (error) Could not submit job to the %s compute farm.

DESCRIPTION

Job submission to the given compute farm (LSF or GRD) failed.

WHAT NEXT

Ensure that the job submission command (by default `/lsf/bin/bsub` or `/lsf/bin/qsub`) actually works. If necessary specify an alternate job submission command with the `set_mcmm_job_options` command.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-137 (error) Could not submit job to host %s.

DESCRIPTION

Job submission to the given compute host failed.

WHAT NEXT

Ensure that the given host is actually accessible, and that it will accept remote commands for the current user via the Unix *rsh* command.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-138 (error) The %s batch submission program %s does not exist, or is not executable.

DESCRIPTION

The default or user-specified LSF/GRD batch submission program does not exist, or does not have execute permission.

WHAT NEXT

Ensure that the job submission command (by default `/lsf/bin/bsub` or `/lsf/bin/qsub`) actually exists and works. If necessary specify an alternate job submission command with the `set_mcmm_job_options` command.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-139 (error) Could not set up master-slave inter-process communication.

DESCRIPTION

Distributed MCMM's inter-process communication mechanism did not start up properly. This is not caused by a problem with a particular remote host, but by a problem with

the master ICC job's networking, threading, or IPC environment.

WHAT NEXT

Check for any networking or Unix system configuration problems.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-140 (error) Could not determine the local host name.

DESCRIPTION

ICC cannot determine the local host name. This is the name that would be returned by the Unix `hostname` command.

WHAT NEXT

Check for any networking or Unix system configuration problems.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-141 (warning) Could not find remote host %s. Skipping.

DESCRIPTION

ICC cannot find a remote host of the given name. The host name will be ignored, and Distributed MCMM execution will continue without it.

WHAT NEXT

Check the all the host names specified by the `set_mcmm_job_options -hosts` command are valid. Check for any networking or Unix system configuration problems.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-142 (error) Could not write scenario analysis data to file %s.

DESCRIPTION

This error message occurs a Distributed MCMM slave could not create a scenario analysis data file for a particular scenario. Either there is a problem accessing the Distributed MCMM work directory, or there is an existing file that cannot be overwritten.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is writable.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-143 (error) Syntax error in violation file %s at line %d.

DESCRIPTION

There is a syntax error in the `get_dominant_scenarios` violation file at the given line number. Either the file was not generated correctly, or has been damaged.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the file has not become corrupted.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-144 (error) Could not properly read scenario analysis data file %s.

DESCRIPTION

This error message occurs when `get_dominant_scenarios` could not access a scenario

analysis data file, or the file has syntax errors. Either the file does not exist, does not have read permission, or has become corrupted. This could happen in the Distributed MCMM flow if any of the slave jobs (which create these data files) did not finish properly.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the work directory actually exists and is readable.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-145 (error) Error while reading violation file.

DESCRIPTION

There has been a syntax error in the `get_dominant_scenarios` violation file that is being read. A previous message should have described the error in more detail.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that the file has not become corrupted.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-146 (error) Violation data for scenario %s has already been read.

DESCRIPTION

`Get_dominant_scenarios` is reading multiple violation files, and data for the same scenario has been found in more than one file.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow. Ensure that none of the files have become corrupted.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-147 (warning) Can't notify master- we are not a slave.

DESCRIPTION

If this warning occurs during an automatically-run Distributed MCMM slave job, then there has been some problem with the master-slave communication mechanism. This warning will always occur if a Distributed MCMM slave job script is manually run. In this case, it may safely be ignored.

WHAT NEXT

Review any previous warning or error messages from the Distributed MCMM flow.

SEE ALSO

`get_dominant_scenarios(2)`

MCMM-205 (error) Cannot create signature file under working directory

DESCRIPTION

This error message is generated if the master cannot generate a signature file under the working directory. The signature file is used by slaves to check that the work directory seen by master is also visible by slaves.

WHAT NEXT

Check the permission of the current directory from where the master is launched. The permission must be writeable, readable and executable.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MCMM-206 (info) Tlu+ for scenario (%s) is set to change.

DESCRIPTION

This error message is generated when tlu+ files are being re-defined for a named scenario.

WHAT NEXT

This is just to inform the users that tlu+ files are being overwritten. If this is the intention of the user, nothing need to be done.

SEE ALSO

MCMM-207 (warning) Clock names, sources, and/or periods are different across scenarios.

DESCRIPTION

This error message is generated when the tool found that clock names and clock sources do not match or there are difference in clock periods for the same source, etc.

WHAT NEXT

This is just to inform the users that there are mis-match clock information in the design across scenarios. If this is the intention of the user, nothing need to be done.

SEE ALSO

MCMM-208 (warning) Design timing derates are not set for the following scenario(s).

DESCRIPTION

This error message is generated when the tool found that design timing derate(s) for max are not set on the listed hold-only scenario(s).

WHAT NEXT

SEE ALSO

MCMM-209 (info) The following scenario(s) are set as hold-only or set_fix_hold, but the variable timing_remove_clock_reconvergence_pessimism is set to false. The recommendation is to set this variable to true for better QoR.

DESCRIPTION

This message is generated when the tool found that a scenario is set as hold-only and user does not turn on the engine which will improve hold violations.

WHAT NEXT

User can set the variable timing_remove_clock_reconvergence_pessimism to true to improve hold violations.

SEE ALSO

MCMM-210 (warning) The following scenario(s) contain ILMs with mis-match PVT and/or TLU+.

DESCRIPTION

This message is generated when the tool found that the listed scenario(s) have PVT and/or TLU+ files do not match PVT and/or TLU+ of their parents. This condition is required by the tool.

WHAT NEXT

User need to match ILM's PVT and/or TLU+ with that of their parent.

SEE ALSO

MCMM-211 (warning) The following scenario(s) do not have TLU+ defined.

DESCRIPTION

This message is generated when the tool found that the listed scenario(s) do not have TLU+ files defined. This condition is required by the tool.

WHAT NEXT

User need to define TLU+ for the listed scenario.

SEE ALSO

MCMM-212 (warning)

DESCRIPTION

WHAT NEXT

SEE ALSO

MCMM-213 (warning) The following scenario(s) have library setup issue with respect to PVT and opcond.

DESCRIPTION

This message is generated when the tool found that the listed scenario(s) have library setup issue with respect to pvt and opcond.

WHAT NEXT

Look at the table generated which lists the lib cells that do not have matching opconds, click on the lib cell, this will bring forward another table which lists the libraries contain the lib cells, along with available PVT and opcond needed by the lib cell. Please look at the list and choose the appropriate libraries.

SEE ALSO

MCMM-214 (error) Please check your ICC environment on machine <name>.

DESCRIPTION

This error message is generated if the master process cannot invoke the helper script "helper.sh" in the Distributed MCMM work directory.

WHAT NEXT

Run <work_dir>/helper.sh from the unix shell where master icc_shell was invoked. Check if SYNOPSYS_ROOT variable is a valid path where the icc_shell executable is available.

Try issuing the command "rsh <machine_name> -login <login_name> '\$path/helper.sh'" where \$path is the full path to the Distributed MCMM work directory. If the command fails you may need to check the reason. Sometimes the user may have problems in the environment setting, e.g "rsh is not in the user path".

SEE ALSO

get_dominant_scenarios(2)
set_mcmm_job_options(2)

MCMM-218 (error) ICC shell executable on machine <machine_name> has different label.

DESCRIPTION

The error message is generated if the master and the slave executables are not from same installation. Both master and slave should have same synopsys_root. Check the shell scripts generated in the work directory by the setup stage and ensure that the synopsys root is same as in the master.

The message can also be generated if the user cannot do rsh to the slave machine. Run "rsh <machine_name>" from the master shell and check if there is any problem to access the specified machine name.

WHAT NEXT

Fix the rsh problem. Also make sure that master and slave runs using same synopsys root. Open "helper.sh" shell script in the Distributed MCMM work directory and

verify that the SYNOPSYS_ROOT variable is the same as the synopsys_root for master
icc_shell.

SEE ALSO

`get_dominant_scenarios(2)`
`set_mcmm_job_options(2)`

MEM

MEM-1 (error) Pointer %s is not within the range of allocated memory.

DESCRIPTION

This error indicates a potentially serious problem with the internal memory management of the program you are running. It might lead to a fatal error or have no noticeable effect. In very rare cases you can get incorrect results from the program after one of these messages.

WHAT NEXT

If the program appears to execute properly after this message, it is usually OK to continue. It is safest to save your work and exit the program as soon as possible.

In any event, please report the problem to Synopsys.

MEM-2 (error) A memory pad has been overwritten at 0x%x.

DESCRIPTION

This error indicates a potentially serious problem with the internal memory management of the program you are running. It might lead to a fatal error or have no noticeable effect. In very rare cases, you can get incorrect results from the program after one of these messages.

WHAT NEXT

If the program appears to execute properly after this message, it is usually OK to continue. It is safest to save your work and exit the program as soon as possible.

In any event, please report the problem to Synopsys.

MEM-3 (error) Pointer was never allocated, was already freed or was not allocated from an item free group.

DESCRIPTION

This error indicates a potentially serious problem with the internal memory

management of the program you are running. It might lead to a fatal error or have no noticeable effect. In very rare cases, you can get incorrect results from the program after one of these messages.

WHAT NEXT

If the program appears to execute properly after this message, it is usually OK to continue. It is safest to save your work and exit the program as soon as possible.

In any event, please report the problem to Synopsys.

MEM-4 (error) Memory group structure is not intact.

DESCRIPTION

This error indicates a potentially serious problem with the internal memory management of the program you are running. It might lead to a fatal error or have no noticeable effect. In very rare cases, you can get incorrect results from the program after one of these messages.

WHAT NEXT

If the program appears to execute properly after this message, it is usually OK to continue. It is safest to save your work and exit the program as soon as possible.

In any event, please report the problem to Synopsys.

MEM-5 (fatal) Out of memory.

DESCRIPTION

This error is generated when there is not enough memory to run the Design Compiler.

WHAT NEXT

Check your machine memory and reinvoke the Design Compiler.

MEM-6 (warning) A call to SBRK has been made outside the

memory allocator. This should be avoided.

DESCRIPTION

This error indicates a potentially serious problem with the internal memory management of the program you are running. It might lead to a fatal error or have no noticeable effect. In very rare cases, you can get incorrect results from the program after one of these messages.

WHAT NEXT

If the program appears to execute properly after this message, it is usually OK to continue. It is safest to save your work and exit the program as soon as possible.

In any event, please report the problem to Synopsys.

MEM-7 (error) %S

DESCRIPTION

This error indicates a potentially serious problem with the internal memory management of the program you are running. It might lead to a fatal error or have no noticeable effect. In very rare cases, you can get incorrect results from the program after one of these messages.

WHAT NEXT

If the program appears to execute properly after this message, it is usually OK to continue. It is safest to save your work and exit the program as soon as possible.

In any event, please report the problem to Synopsys.

MENO

MENO-1 (error) No schematic exists for design '%s'.

DESCRIPTION

WHAT NEXT

MENO-2 (error) Design '%s' has no external_scale defined in its symbol library.

DESCRIPTION

WHAT NEXT

MENO-3 (error) Design '%s' has no route_grid defined in its symbol library.

DESCRIPTION

WHAT NEXT

MENO-4 (warning) Design '%s' has no landscape defined; assuming landscape.

DESCRIPTION

WHAT NEXT

MENO-5 (error) All pins on symbol '%s' in library '%s' must have

same Y coordinate.

DESCRIPTION

WHAT NEXT

MENO-6 (error) Net connector symbol '%s' in library '%s' has %d pins; two are required.

DESCRIPTION

WHAT NEXT

MENO-7 (warning) Sheet '%s' of design '%s' exceeds Mentor's maximum size of %0.2f.

DESCRIPTION

WHAT NEXT

MENO-8 (error) Off-sheet connector symbol '%s' has no name

text.

DESCRIPTION

WHAT NEXT

MENO-9 (error) Port symbol '%s' has no name text.

DESCRIPTION

WHAT NEXT

MENO-10 (error) Symbol '%s' has no name text.

DESCRIPTION

WHAT NEXT

MENO-11 (warning) Cannot fix feedthroughs on sheet '%s'; no NETCON symbol found.

DESCRIPTION

WHAT NEXT

MENO-12 (warning) Symbol '%s' exceeds Mentor's maximum

size of %0.2f.

DESCRIPTION

WHAT NEXT

MENO-13 (error) Pin '%s' of symbol has unknown direction.

DESCRIPTION

WHAT NEXT

MENO-14 (warning) Unable to fix all feedthroughs on sheet '%s' of design '%s'.

DESCRIPTION

WHAT NEXT

MENO-15 (information) Instance of connector symbol '%s' is

being treated as a port.

DESCRIPTION

WHAT NEXT

MENO-16 (information) Design '%s' had %d name changes.

DESCRIPTION

WHAT NEXT

MENO-17 (warning) Can't write symbol information for connector '%s'.

DESCRIPTION

WHAT NEXT

MENO-18 (error) Can't find the symbol libraries attached to design '%s'.

Check the value of the 'search_path' variable.

DESCRIPTION

WHAT NEXT

MENO-19 (error) Can't write out a bussed design '%s'.

DESCRIPTION

WHAT NEXT

MENO-20 (error) No schematic or symbol exists for design '%s'.

DESCRIPTION

WHAT NEXT

MENO-21 (information) Schematic '%s' might have been modified due to netcon insertion.

DESCRIPTION

This message is issued when the Mentor Do writer is executed. If "netcons" are inserted into the schematic, the schematic database from which the writer extracts data may have been modified with those instances. Note that this message is issued when the Mentor Do writer operates, and not when a "netcon" is actually inserted. To determine whether the "netcon" has been inserted into the schematic, examine the schematic after transferring it to the Mentor/Neted system, or by perusing the generated Do-file.

WHAT NEXT

This is not a problem unless "netcon" insertion actually takes place and the user plans to write other data from the same design database the Mentor Do-file was written from. In such a case, "netcons" will appear in the other target format.

To avoid the above situation, regenerate the schematic with the **create_schematic**

command after the Mentor Do writer has completed execution.

Note that "netcons" are inserted within shorted nets (ports) to satisfy design-check criteria on the Mentor/Neted system. To avoid shorted nets altogether, you might consider setting the I/O variable `compile_fix_multiple_port_nets` to "true" prior to running the `compile` command. This action causes buffers to be inserted within shorted nets (ports), which in turn obviates the need for "netcon" insertion. As noted in the **DESCRIPTION** section, however, the diagnostic will still be issued.

MENO-22 (warning) Symbol for cell '%s' in design '%s' is too large for the sheet.

DESCRIPTION

This message is generated when the writer tries to place an instance of a cell within the schematic for a design, causing the symbol boundary to extend beyond the sheet.

WHAT NEXT

This situation is usually caused by autogenerated symbols that have a large number of ports. Regenerate the schematic within Design Analyzer using the next larger sheet size.

MENU

MENU-001 (Error) Menu name is empty.

DESCRIPTION

WHAT NEXT

MENU-002 (Error) The menu name needs to be a full hierarchical menu name.

DESCRIPTION

A full hierarchical menu name needs to be specified for the menu name. An example: "&File->Exit".

WHAT NEXT

Checks the option value of the -menu option.

MENU-003 (Error) The -anchor_offset option value needs to be a positive/negative integer and not zero.

WHAT NEXT

Correct the option value of the -anchor_offset option.

MENU-004 (Error) -anchor_offset option needs to be specified

when -anchor_item option is present.

MENU-005 (Error) %s option value is specified incorrectly.

WHAT NEXT

Checks and correct the option value for the specified option.

MENU-006 (Error) -anchor_item option needs to be specified when -anchor_offset option is present.

MENU-007 (Error) Anchor menu item '%s' not found.

WHAT NEXT

Checks the spelling of the option value of the -anchor_menu option. Make sure that the anchor menu item already existed before this gui_add_menu command is called.

MENU-008 (Error) Menu bar items must be popup menus.

DESCRIPTION

First-level items on the menu bar must be popup menus.

WHAT NEXT

Check and correct the option value of the -menu option.

MENU-012 (Error) Menu root: %s not found.

WHAT NEXT

Check and correct the option value of the -menu_root option.

MENU-013 (Warning) Hotkey string: %s is either not supported or reserved by system for other use.

WHAT NEXT

Please check and correct the option value of the -hot_key option. This hotkey key combination may not be supported or has been reserved by the application for some other use. You can try to use another hotkey.

MENU-014 (Error) Duplicate menu item: %s .

DESCRIPTION

Another existing menu item already has this menu name.

MENU-015 (Error) %s option is specified with invalid value: %s.

WHAT NEXT

Check and correct the option value of the specified option.

MENU-016 (Error) Cannot specify both -anchor_offset and -position options.

MENU-017 (Error) -position option value must not be a negative integer.

DESCRIPTION

Position option value must be zero or a positive integer. It specifies the position of the menu item within the parent popup menu.

MENU-018 (Warning) Specified hotkey %s for this menu item

%s will be ignored. Had been used for %s menu item.

DESCRIPTION

This hotkey has already been mapped to another existing menu item. So it will be ignored and not set for this menu item.

WHAT NEXT

Change the -hotkey option value to specify another hotkey or remove this option.

MENU-019 (Error) Menu item '%s' not found.

DESCRIPTION

The specified menu item was not found in the currently active window. It could not be executed.

WHAT NEXT

Check the menu name to make sure it matches an existing menu item in the active window.

MENU-020 (Error) There is no active main window.

DESCRIPTION

No active main window was found.

WHAT NEXT

Activate a main window before executing this command.

MENU-021 (Error) Menu %s is not a popup menu item.

WHAT NEXT

Add menu items to a popup menu, not to an item with associated command or action. Popup menus are created implicitly by specifying a full hierarchical menu name.

MENU-022 (Warning) Menu bar items must be popup menus. %s not added.

DESCRIPTION

First-level items on the menu bar must be popup menus.

WHAT NEXT

Do not explicitly create popup menus in hierarchical menus. Pop-up menus are created implicitly by creating command menu items with full hierarchical names, e.g. "&File->&Open..." creates File pop-up menu in the menu bar.

MEXT

MEXT-1 (error) Design '%s' does not have any connections between cells. Model extraction is not allowed on such designs.

DESCRIPTION

You received this message because you executed the `extract_model` command but the extractor detects that the netlist to be extracted does not have any effective net connectivities among the cells that are instantiated from the library.

WHAT NEXT

Please inspect the netlist and make sure there are effective connectivities among cell instances. This is to avoid improperly exposing timing related information in the libraries you are using.

MEXT-2 (warning) Variable
'extract_model_use_conservative_current_slew'
is set to 'true' while design is in 'worst_arrival' slew propagation mode.

The variable is not effective in this mode and therefore ignored in extraction.

DESCRIPTION

You received this message because you executed the `extract_model` command with variable 'extract_model_use_conservative_current_slew' set to 'true' while the design is in 'worst_arrival' slew propagation mode. The 'worst_arrival' slew propagation mode makes this model extraction variable not effective and therefore its value is ignored and it will have no impact on model extraction.

WHAT NEXT

Please decide what model you want. If you want the model to propagate the worst conservative slew calculated from the context slews set on input ports, put the design in 'worst_slew' mode and set the model extraction variable to 'true'. If you want the model to propagate real path specific slew regardless of any context slews propagated from other paths, set the model extraction variable to 'false'. This

makes the model match the netlist better if the timing report of the netlist is performed in 'worst_arrival' slew propagation mode.

MEXT-03 (error) The value '%s' set for the modeling environment variable '%s' is illegal.

DESCRIPTION

You receive this message because the value you set for the specified variable is illegal. If it is for number of table index points, it has to be a positive integer; if it is for the maximum limit of the table index, it has to be a non-negative floating point number.

WHAT NEXT

Adjust the settings of these PrimeTime environment variables before executing model extraction.

MEXT-3 (warning) The %s '%s' timing arc extracted from pin '%s' to pin '%s' has only '%s' tables. They are copied to make the missing '%s' tables.

DESCRIPTION

You received this message because the sequential paths contribute to the specified timing arc only have the specified transition applicable. The resulting timing arc is half-unate. It could be caused by disable timing, false paths or cells with half-unate timing arcs in the path. Because there are tools, such as LibraryCompiler, etc. which do not accept half unate sequential arcs. The extracted model has copied the existing half to create the missing half.

WHAT NEXT

Please verify the path setup and confirm that the arcs are what you expected.

MEXT-4 (warning) Detected max_transition violation in the

circuit to be extracted.

DESCRIPTION

You receive this message if the circuit you are currently extracting has max_transition violations. The resulting model can do max_transition checking only at its boundaries; therefore, the model will be inaccurate because it does not reproduce the errant behavior.

The current problem might be caused by an unrealistically low value of the maximum transition time. Many ASIC libraries supply a **default_max_transition** or a **max_transition** attribute on the gate outputs. If a gate in the design does not have a **max_transition** attribute in its library definition, the **extract_model** command uses the value of the **extract_model_transition_limit** variable; the default is 5.0.

WHAT NEXT

Correct the violations using timing analysis and synthesis on the original circuit, or reset the maximum transition time to a higher value. Then reexecute **extract_model**.

MEXT-5 (warning) Some pins do not have clock defined.

One example is pin '%s'.

Paths to and from such pins are ignored.

Run **check_timing** for details.

DESCRIPTION

You receive this message because the **extract_model** command did not find a clock for some pins. Transparent latches and flip-flops in a design you want to extract must have a clock defined for them. This message warns you that **extract_model** is ignoring all paths to and from such pins that have no clock.

WHAT NEXT

If it is acceptable to you for **extract_model** to ignore paths to and from such pins, no action is required on your part. Otherwise, use the **create_clock** command to define all design clocks on the pins or clock networks. Then reexecute **extract_model**.

In the future, to prevent receiving this message, first execute the **check_timing** command to detect any clock pins that are missing clocks. Create the missing clocks, then execute **extract_model**.

MEXT-6 (warning) Environment variable '%s' has not been set during this session. Using default value '%s'.

DESCRIPTION

You receive this message if the specified environment variable is not set. This message informs you that the default value is being used.

WHAT NEXT

If it is acceptable to you for the specified default value to be used for this environment variable, no action is required on your part. Otherwise, set this variable to one of its allowed values using the command **set variable value**. If you want to set the value only for the current session, you can enter this command at the **pt_shell** prompt or place it in a script file, which you then execute. If you want the variable value to persist, you can enter it in your **.synopsys_pt.setup** file.

MEXT-7 (warning) Environment variable 'extract_model_tolerance' has a value that is too low. Using minimum value '%s'.

DESCRIPTION

You receive this message if the **extract_model_tolerance** variable is set with a value less than 0.02. The behavior of the extractor degrades sharply when tolerances are below these values. This message informs you that the specified minimum value is being used instead.

WHAT NEXT

If it is acceptable to you for the **extract_model** command to use the specified minimum value, no action is required on your part. Otherwise, set the **extract_model_tolerance** variable to a value greater than 0.02. Then reexecute **extract_model**.

MEXT-8 (warning) Environment variable 'extract_model_tolerance' has a value that is unreasonably high.

Using maximum value '%s'.

DESCRIPTION

You receive this message if the **extract_model_tolerance** variable is set with a value greater than .50. There is little benefit in extractor speed or output file size beyond 50% tolerance. This message informs you that the specified maximum value is being used instead.

WHAT NEXT

If it is acceptable to you for the **extract_model** command to use the specified maximum value, no action is required on your part. Otherwise, set the **extract_model_tolerance** variable to a value less than 0.50. Then reexecute **extract_model**.

MEXT-10 (error) Unknown format '%s' for the -format option.

DESCRIPTION

You received this message because you executed the **extract_model** command and specified an argument for the **-format** option that was neither *db* or *lib*. These are the only valid arguments for the **-format** option; you can use one or both.

WHAT NEXT

Reexecute **extract_model** and specify one or both of **-format db** or **-format lib**.

MEXT-11 (error) Invalid operating condition '%s' specified.

DESCRIPTION

You receive this message if the operating condition you specified using **extract_model -operating_conditions** cannot be found in any library. The operating condition must exist in some library that is in the **link_path**.

This error could be caused by a spelling error or typo, or by the appropriate library not being in the **link_path**.

WHAT NEXT

First, examine the libraries, design files, and library files listed in the **link_path** variable, to ensure that the intended operating condition appears in one of them. (Use the **report_lib** command to list operating conditions defined in a

single library.) If so, note the correct spelling. If not, add the appropriate library to the `link_path`. Next, reexecute `extract_model -operating_conditions` using the correct operating condition name.

MEXT-12 (warning) Pin '%s' is an internal start or end point. Ignoring paths to and from this pin.

DESCRIPTION

You receive this message if the `extract_model` command finds a pin that is an external start or end point, indicating that the pin is participating in a timing exception or has an input delay specified on it. Because of an extracted model (ETM) limitation, `extract_model` does not support such qualifiers.

WHAT NEXT

Remove all `max_delay`, `min_delay`, and external delays from the pin. Then reexecute `extract_model`.

MEXT-16 (warning) No master clock exists for generated clock '%S'.

DESCRIPTION

You receive this message because the `extract_model` command found a generated clock without a master clock defined.

WHAT NEXT

If it is acceptable to you for `extract_model` to ignore paths to and from the named generated clock, no action is required on your part. Otherwise, use the `report_clock` command to see the source pin that needs a clock defined on it.

MEXT-17 (warning) Zero (or negative) max capacitance on library pin.

Assuming %f for library cell %s output %s.

DESCRIPTION

You receive this message if the `extract_model` command finds a 0.0 or negative

maximum capacitance specified on a library cell pin. You cannot have a zero or negative maximum capacitive loading for a library output pin. This message warns you that **extract_model** is assuming the specified value for max capacitance instead.

Many ASIC libraries supply a maximum allowable capacitance on gate outputs. If a gate in the design does not have a **max_capacitance** attribute in its library definition, the **extract_model** command uses the value of the PrimeTime **extract_model_capacitance_limit** variable. The default is 64.

WHAT NEXT

Correct the library to specify a maximum capacitance for all arcs. Or, use the PrimeTime variable **extract_model_capacitance_limit** to set a maximum allowable capacitance for all gate outputs in the design. Then reexecute **extract_model**.

MEXT-19 (information) Clock '%s' has multiple sources.

DESCRIPTION

You receive this message to inform you that the specified clock has multiple sources, potentially causing longer runtime and higher memory use than a clock with a single source. Timing arcs are extracted from all clock sources, so a larger model will result because of an increase in the number of timing arcs.

WHAT NEXT

Consider redeclaring your clocks with a single source pin per clock. For information about the implications of delaring clocks with multiple sources, see the *PrimeTime Modeling User Guide*.

MEXT-20 (warning) Clock '%s' has source on hierarchical pin '%s'. Consider moving to: %s

DESCRIPTION

The specified clock has a source on the specified hierarchical pin. This message warns you that PrimeTime might not be able to extract a propagated delay for this clock.

WHAT NEXT

If it is acceptable to you for PrimeTime not to extract a propagated delay for the clock, no action is required on your part. Otherwise, to avoid ambiguity of design

intent, move the clock source back to an output pin of the physical driver circuit, then reexecute `extract_model`. The list of possible driver pins to use are those that drive the net containing the hierarchical pin.

MEXT-21 (error) Cannot compute generated clock propagated delay.

Cannot compute delay from pin '%s'
to hierarchical pin '%s'.

DESCRIPTION

You receive this message if a clock pin has a source specified on a hierarchical pin of a net containing RC data. The model extractor cannot compute the propagated delay to this logical node on the net. This message is related to the MEXT-20 warning message.

WHAT NEXT

Move clock sources back to output pins of the physical clock divider circuit to avoid delays to non-physical pins, then reexecute `extract_model`. Warning MEXT-20 might have been issued previously with a list of driver pins on the net with the hierarchical pin.

MEXT-22 (warning) A path from generated clock '%s' back to its master clock is ignored because its length exceeded %d arcs.

DESCRIPTION

A path from the specified generated clock back to the master clock was found to exceed the specified number of arcs. This message warns you that the path(s) is being ignored. The propagated delay to the generated clock will include only the paths shorter than this length. Thus, the propagated delay might not represent the correct min or max path value.

WHAT NEXT

If it is acceptable to you for the path(s) to be ignored, no action is required on your part. Otherwise, check the design topology for excessively long (false) paths from a master clock to a generated clock, and make changes if necessary. Then reexecute `extract_model`.

MEXT-23 (warning) No net is connected to generated clock '%s' %s pin '%s'.

DESCRIPTION

The specified generated clock has no net connected to either the master clock pin or a clock source pin, as the message indicates. Generated clocks must have net connections even if the clocks are not set to be propagated.

WHAT NEXT

Review the circuit to ensure that all clock specification points are properly connected within the design. Make necessary corrections, then reexecute **extract_model**.

MEXT-24 (error) Internal error found while creating a generated clock.

DESCRIPTION

You receive this message if an internal error is detected during the creation of a generated clock.

WHAT NEXT

Execute the **report_clocks** command on both the original netlist and the extracted model. Verify that the period and edges of the generated clocks in the model match those in the original netlist.

MEXT-28 (warning) More than %d boundary nets have detailed parasitics and multiple drivers or load pins.

DESCRIPTION

This message is issued to limit the number of MEXT-27 messages you receive, and warns you of the total number of boundary nets that have detailed parasitics and multiple drivers or load pins.

Model extraction sometimes combines the RC characteristics of one fanout or fanin with the constraint characteristics of another. This can lead to an inaccurate model.

WHAT NEXT

If possible, buffer the net, then reexecute `extract_model`. Always verify the model if you receive this warning.

MEXT-29 (error) ETM Limitation - Arcs between operating conditions do not match.

No model will be written. The first mismatch is from '%s' to '%s'.

DESCRIPTION

You receive this message if `extract_model` cannot write a model because the arcs between the various operating conditions do not match. For correct DB format, arcs between the different operating conditions of the same model must match exactly.

This error could be caused by a difference in naming of internal nodes, or by the merging of arcs being different between operating conditions.

WHAT NEXT

Write the models for each condition to separate files, or use an interface logic model (ILM) instead of an extracted model (ETM).

MEXT-30 (warning) ETM Limitation - Option '-operating_conditions' is not recommended.

The extracted models may not be able to be combined into one db file.

DESCRIPTION

You receive this message if you issue the `extract_model` command with the `-operating_conditions` option. Using this option is not recommended, because there might be a mismatch between extracted arcs for various operating conditions of the same model. DB format requires that the arcs match exactly between the different operating conditions of the same model. If the arcs do not match, an error message is generated and the model is not written.

Mismatch errors could be caused by a difference in naming of internal nodes, or by the merging of arcs differing between operating conditions.

WHAT NEXT

Write the models for each condition to separate files or use an interface logic model (ILM) instead of an extracted model (ETM).

MEXT-35 (warning) ETM Limitation - `-remove_internal_arcs` option
is not recommended.

DESCRIPTION

You receive this message if you issued the `extract_model` command with the `-remove_internal_arcs` option. This option removes all internal pins from the extracted model without moving the constraints or generated clocks to external pins, and its use is not currently recommended.

WHAT NEXT

Reexecute `extract_model` without the `-remove_internal_arcs` option.

MEXT-36 (warning) A core-cell stamp model will be written.
The stamp model must be used with a wrapper design.

DESCRIPTION

The stamp model written without using the `-library_cell` option models only the core of the design being extracted. Boundary nets are modeled in a separate wrapper model. This default behavior was different in previous releases.

WHAT NEXT

If you want a stamp model that includes the boundary nets, rerun the `extract_model` with the `-library_cell` option.

SEE ALSO

`extract_model` (2).

MEXT-37 (error) `extract_model -parasitic_format` option has

unknown format '%s'.

DESCRIPTION

The valid formats for the **-parasitic_format** option of the **extract_model** command are **spef**, **dspf**, and **binary**. Any other option is invalid.

WHAT NEXT

Use only the **spef**, **dspf**, and **binary** formats.

SEE ALSO

extract_model (2).

MEXT-38 (error) -parasitic_format cannot be used with the -library_cell option.

DESCRIPTION

The **-parasitic_format** option controls the format for boundary net parasitics. When you use the **-library-cell** option, the boundary nets are included in the model and no parasitics can be written for them.

WHAT NEXT

Remove either the **-parasitic_format** option or the **-library-cell** option, and execute the **extract_model** command again.

SEE ALSO

extract_model (2).

MEXT-40 (warning) ETM Limitation - the -latch_level option is recommended only when you know the latch-borrowing behavior at the interface. Use -context_borrow

instead.

DESCRIPTION

You receive this message if you execute `extract_model` and use the `-latch_level` option. This option is provided for backward compatibility and is not recommended for general use.

WHAT NEXT

Reexecute the `extract_model` command and use the `-context_borrow` option instead of `-latch_level`.

MEXT-43 (information) When tracing paths from '%s' '%s',
borrowing level-sensitive
latches ('%s') were traversed through.

DESCRIPTION

You receive this message to inform you that the tracing for model extraction started from the indicated port/clock has gone through some borrowing level-sensitive latches.

WHAT NEXT

If you observe timing discrepancies, this message might be helpful in debugging.

MEXT-44 (information) Sequential arc '%s' is added only as an
'%s' transition.
Transition ('%s') is being copied from the existing transition.

DESCRIPTION

You receive this message to inform you that in the process of extracting the named sequential arc, either the rising output or falling output is not a valid path. PrimeTime does not support this type of arc. The invalid transition is being added to the model by giving it the same values as the valid transition.

WHAT NEXT

You can set false paths when using this model to avoid using the invalid transition.

MEXT-45 (warning) ETM Limitation - hold value for `-arc_types` specified without specifying setup value.

Clock gating hold arcs will not be extracted.

DESCRIPTION

You receive this message because you specified `hold`, but not `setup`, among your values for the `-arc_types` option of the `extract_model` command. Clock gating hold arcs will not be extracted without relevant setup arcs. As a result, your model will not include clock gating hold arcs. All other hold arcs will be extracted.

WHAT NEXT

If you want clock gating hold arcs, reissue the `extract_model` command with the `-arc_types` option specifying both setup and hold values.

SEE ALSO

`extract_model` (2).

MEXT-46 (error) The requested number of delay table points %d does

not fit into the %3.4f to %3.4f index range that is set on, or derived
for, %s %s.

DESCRIPTION

You receive this message because the requested number of delay table points is so big or the min/max bounds for the table index are so tight that the delay table points cannot be reasonably divided into the requested number of pieces. For SI analysis, the transition set on block input ports is used as the maximum transition table point; if the input transition is zero, then this message will result.

WHAT NEXT

Adjust the settings of the PrimeTime environment variables before executing model extraction. For SI analysis, check the transition value on input ports and increase it to the expected maximum value.

MEXT-47 (error) You must adjust the value of the environment variable '%s' or '%s' before model extraction can proceed. The range is too tight to fit in the requested number of table points.

DESCRIPTION

You receive this message because the requested number of delay table points is so big or the max bound for the table index is so small that it cannot be reasonably divided into the requested number of pieces.

WHAT NEXT

Adjust the settings of these PrimeTime environment variables before executing model extraction.

MEXT-48 (error) You must adjust the value of the environment variable '%s' or '%s' before model extraction can proceed. The product of these two variables %d indicates that the requested size of delay tables is bigger than 100.

DESCRIPTION

You receive this message because the requested number of delay table points is too big. The size of delay tables in the extracted model is limited to less than 100 (for example, less than a 10 by 10 table).

WHAT NEXT

Adjust the settings of these PrimeTime environment variables before executing model extraction.

MEXT-49 (warning) The model extraction environment variable

%s

is obsolete and has no effect on model extraction.

DESCRIPTION

You received this message because you have set the indicated model extraction environment variable to some value before you execute the model extraction.

If the variable warned is 'extract_model_transition_limit', start from the PrimeTime 2002.03 release, this variable is obsolete and replaced by two new variables "extract_model_data_transition_limit" and "extract_model_clock_transition_limit".

If the variable warned is 'extract_model_core_cell_stamp', start from PrimeTime 2001.08 release, the behavior has changed and the models will always be the same regardless of output format. The model is totally controlled by the "-library_cell" option of command **extract_model**.

If the variable warned is 'extract_model_min_delay_threshold', start from PrimeTime 2001.08 release, the variable has been obsolete and all minimum delay and hold timing arcs are extracted.

WHAT NEXT

Please remove the settings of the old variable and use the new variables to set up the environment for model extraction if applicable.

MEXT-50 (error) ETM Limitation - The design has multiple clocks on the same source. Clock '%s' defines multiple clocks on source %s.

DESCRIPTION

You receive this message because you defined multiple clocks on the same source, so extraction cannot be performed on that design.

WHAT NEXT

Eliminate the definition of multiple clocks on a single source. Do this by removing all but one clock on the clock source.

SEE ALSO

remove_clock (2).

MEXT-51 (error) ETM Limitation - Path borrowing is not supported for short paths during extraction.

DESCRIPTION

You received this message because you set "timing_allow_short_path_borrowing" variable to TRUE. Path borrowing is not supported for min paths during extraction.

WHAT NEXT

Set the variable "timing_allow_short_path_borrowing" to FALSE.

MEXT-52 (error) ETM Limitation - Timing paths cannot be propagated through unclocked registers during extraction.

DESCRIPTION

You received this message because you set "timing_propagate_through_unclocked_registers" variable to TRUE. Unclocked registers are not supported during extraction.

WHAT NEXT

Set the variable "timing_propagate_through_unclocked_registers" to FALSE.

MEXT-53 (warning) The model generated is a context-dependent w.r.t clock frequency on certain clocks. This is done because certain constraints had to be moved to the closing edge of latch. Example: %s.

DESCRIPTION

You receive this message because the model extraction process found that the design has a specific set of non-borrowing latch arrangements where it was necessary to move the constraint from the opening to the closing edge. Hence, the model arc embodies a half-a-clock-cycle and, so, is not a context-independent w.r.t clock frequency.

WHAT NEXT

If you observe timing discrepancies at a different clock frequency, this message might be helpful in debugging.

MEXT-54 (warning) The model generated is a context-dependent w.r.t clock frequency on certain clocks. This is done because some of the MCP exceptions could not be moved to the boundary. Example: %s.

DESCRIPTION

You receive this message because the model extraction process found that the design has a specific set of multi-cycle path exceptions where it was not possible to move the MCP out to boundary. Hence, the model arc embodies the MCP shift and, so, is not a context-independent w.r.t clock frequency.

This means that the ETM arc has had the current clock period subtracted from the arcs effected by this MCP. When validating the module, use the default slack mode. The option -timing_type arc should not be used for write_interface_timing.

WHAT NEXT

Use write_interface_timing -timing_type slack to validate the model. Do not use write_interface_timing -timing_type arc, or the model arc will differ from the netlist arc, my the MCP adjustment value.

If you observe timing discrepancies at a different clock frequency, create a new ETM for the new clock frequency.

MEXT-55 (warning) The -ignore_ports is obsolete.

DESCRIPTION

You receive this message because you have used the -ignore_ports option. This option will reduce the amount of the design that arcs are extracted for, but may in some cases extract some arcs for the ignored ports.

WHAT NEXT

Use the report_etm_arc command to debug the model.

MEXT-56 (warning) Model cannot create a valid noise table for pin %s.

DESCRIPTION

You received this message because the noise immunity table for one or more noise regions of this pin cannot be created. This can occur either because there's no noise immunity table defined for the given region or because the effective capacitance loading of the first level cell(s) or the noise width points is far outside the bounds of its library cell characterization. Only one message is output per extract_model command, so other pins may also be missing one or more noise immunity tables in the model.

WHAT NEXT

If there's no noise immunity table defined for the given noise region, then use set_noise_immunity_curve or set_noise_margin for that region.

If there is a noise immunity table for the given noise region, there are several options: 1. If possible, re-characterize the library to expand the width and capacitance range of the pertinent library cell to include the width/capacitance value used in this design. 2. Use set_load to override the load capacitance of the library cell(s) affecting the pin of interest. 3. Set the variable extract_model_noise_width_points to the same set of widths used for the noise_immunity_table of interest. 4. Use set_noise_immunity_curve or set_noise_margin for the given pin for the problematic region(s).

MEXT-57 (error) The -operating_conditions option can not be used with min_library.

DESCRIPTION

You receive this message because you have used the -operating_conditions option while the -min_library option was used for the set_operating_condition command. The -operating_conditions option to extract_model is obsolete and does not work correctly when the -min_library option to set_operating_condition is used.

WHAT NEXT

Either produce one ETM for bc_wc or on_chip_variation mode, or create one ETM for each desired operating condition by using the set_operating_condition command followed by extract_model.

MEXT-58 (warning) The -operating_conditions option is

obsolete.

DESCRIPTION

You receive this message because you have used the `-operating_conditions` option. This option is being phased out because it can not support all the functionality of `set_operating_condition`. Today, it will produce a model for each of the operating conditions listed in single analysis mode. It can not support `min_library` or multi-voltage options.

WHAT NEXT

Convert your script to call `extract_model` once for each desired operating condition. Use `set_operating_condition` and related commands to set the operating conditions between each call to `extract_model`.

MEXT-59 (warning) The `-update` option is obsolete.

DESCRIPTION

You receive this message because you have used the `-update` option. This option is being phased out because support for the scaled cell model it produces is being phased out.

WHAT NEXT

Create separate models for each operating condition.

MEXT-60 (warning) Noise features are not supported for the format '`%s`'

DESCRIPTION

You received this message because you executed the `extract_model` command and specified an option `-noise` with the `-format` option that included an argument other than `lib`. Noise features are not supported in any format other than `lib`, so only the timing model will be written in those formats.

WHAT NEXT

If the `lib` format was not used, re-execute `extract_model` including the `lib` argument with the `-format` option.

MEXT-61 (warning) Model does not support noise steady state current tables.

DESCRIPTION

You received this message because some cell(s) in the design that reach an output port contain steady state current tables for noise analysis. This feature is not supported yet. Steady-state resistance will be used if it's available either in the cell library or added via user-defined commands.

WHAT NEXT

Either re-characterize the affected cell libraries with steady state resistance or set steady-state resistance via noise commands on the output pins of interest.

MEXT-62 (warning) Model cannot create a valid noise I-V curve for pin %s.

DESCRIPTION

You received this message because the steady-state current table (i.e., I-V curve) for one or more noise regions of this pin cannot be created. This may occur because the voltage bounds or number of points need to be adjusted. Only one message is output per extract_model command, so other pins may also be missing one or more noise steady-state current tables in the model.

WHAT NEXT

Use the extract_model variables for noise I-V tables to adjust the number of points or the range of voltages.

MEXT-63 (warning) No input noise defined on port %s.

DESCRIPTION

You received this message because there was no positive input noise defined on the specified input port. It is assumed that all input ports are set to their worst-case input noise level in order to ensure a conservative noise model. Only one message is output per extract_model command, so other input ports may also have no input noise defined.

WHAT NEXT

Use `set_input_noise` to define an input noise for the specified port.

MEXT-64 (warning) Conflicting clock sense at model pin: %s

DESCRIPTION

You received this message because a pulse clock sense propagates the model pin in the message, but there is a conflicting clock sense that also propagates to this pin. No `pulse_clock` attribute was added to the model at this pin.

WHAT NEXT

In using the model add generated clocks to model the different pulse clock generators internal to this model.

MEXT-65 (information) Found logic constant value '%s' at output boundary pin/port '%s' due to propagation of case analysis value.

DESCRIPTION

You receive this message to inform you that model extractor detected the specified logic constant has propagated to the output boundary of the block due to certain case analysis settings for the block.

WHAT NEXT

Some tools treat logic constant values differently depending on the values are caused by user set case analysis or intrinsic functional constant of the circuit. By default, ETM writes out .lib and .db files the resulting logic constants from both cases as 'function' attributes for relevant pins. If this behavior is not desired, you can optionally use variable `extract_model_write_case_values_to_constraint_file` to write the user case analysis caused constant values to the ETM constraint files. Note logic value due to functional constant propagation is always written in the .lib and .db ETM files as "function" attribute for pin.

MGI

MGI-1 (information) %s

DESCRIPTION

This is a message that is returned from the generator.

WHAT NEXT

MGI-2 (error) %s

DESCRIPTION

This error represents a generic error condition which occurs during netlist generation.

WHAT NEXT

MGI-3 (warning) %s

DESCRIPTION

This error represents a generic warning which occurs during netlist generation.

WHAT NEXT

MGI-4 (error) Failed to create or open '%s'.

DESCRIPTION

This message indicates a failure to read a file or directory, write a file, execute a file, create a directory, or traverse a directory structure.

WHAT NEXT

MGI-5 (error) Could not execute shell command '%s'.

DESCRIPTION

The generator failed to invoke a shell command.

WHAT NEXT

MGI-6 (error) More than one %s files are found in '%s'.

DESCRIPTION

Only one such file (script, HDL, etc.) should be found in the directory.

WHAT NEXT

MGI-7 (error) No %s file is found in directory '%s'.

DESCRIPTION

At least one of such file (script, HDL, etc.) should be in the directory.

WHAT NEXT

MGI-8 (error) Design '%s' contains %s which is not allowed.

DESCRIPTION

A netlist created by an external generator must not contain any generic logic gates, any sequential cells, any design hierarchy (including both user design hierarchy and synthetic design hierarchy).

WHAT NEXT

MGI-9 (error) Failed to link design '%s' created by '%s'.

DESCRIPTION

The netlist created by the external generator failed to link to the technology libraries in the link path.

WHAT NEXT

MGI-10 (error) File '%s' is not an executable file.

DESCRIPTION

DC expected the file to be executable. This file names a generator that DC attempts to invoke to create netlists.

WHAT NEXT

MGI-11 (error) Unauthorized '%s' file name '%s' is found in directory '%s'.

DESCRIPTION

The generated file containing a netlist in the named directory must match the naming convention.

WHAT NEXT

MGI-12 (error) No dc_shell script is found in directory '%s'.

DESCRIPTION

If the generator sets the "read_script" attribute in its .sl file, there must be a dc_shell script file in the temporary directory.

WHAT NEXT

MGI-13 (warning) Design '%s' contains cells that are not in the target library '%s', these cells will be re-mapped to '%s'.

DESCRIPTION

Generated netlists can be linked using technology libraries specified with the 'set_local_link_library' command in an embedded dc_shell script. Cells linked from a technology library specified in this manner may not have equivalent cells in the target library. These cells will get re-mapped to the target library cells.

WHAT NEXT

MGI-14 (error) Unable to spawn a child process for the generator
'%s' specified within the '%s' synthetic library.

DESCRIPTION

MGI failed to create a process for this generator. The problem can stem from a system-imposed limit on the total number of processes allotted to one user. Alternately, the total amount of system memory available may be insufficient to spawn this process.

WHAT NEXT

MGI-15 (error) Unable to properly subinvoke generator '%s'.

DESCRIPTION

This system error is encountered when spawning a generator. There may be other messages written to the transcript in conjunction with this error message. Please refer to the error messages immediately preceding this message in the transcript for a more detailed diagnostic message.

WHAT NEXT

MGI-16 (error) Incorrect type for argument '%s' is detected in the '%s' command.

DESCRIPTION

This error indicates that a communication error occurred during netlist generation.

WHAT NEXT

MGI-17 (warning) Incorrect syntax detected in the '%s' command at '%s'.

DESCRIPTION

This error indicates that a communication error occurred during netlist generation.

WHAT NEXT

MGI-18 (error) Unrecognized return status code from generator %s.

DESCRIPTION

Recognized status codes from external generator are either "0" or "1".

WHAT NEXT

MGI-19 (error) %s exited with an error condition. Please see directory

'%s' for more information.

DESCRIPTION

The child process exited with an error code.

WHAT NEXT

MGI-20 (error) Failed to communicate with generator %s via IPC. See directory '%s' for more information.

DESCRIPTION

A datapath generator is still running, but either isn't responding or is returning undecipherable messages.

Any error messages left by the generator follow this message, preceded with the string "generator:".

MGI-24 (error) Command string, '%s', exceeds the allowable length ('%d') when communicating with generator from the '%s' synthetic library.

DESCRIPTION

The command string's length exceeds the limit imposed by the interface in server mode.

WHAT NEXT

NAME MGI-25 (warning) The path '%s' specified by variable

'%s' cannot be found.

DESCRIPTION

The variable **synlib_mc_root** specifies the root directory for an MC installation. When the value of **synlib_mc_root** cannot be matched to a directory on the filesystem Design Compiler assumes Module Compiler to be installed in the default location.

WHAT NEXT

Check the value of the **synlib_mc_root** variable for spelling errors. Check that the directory exists on the filesystem.

NAME MGI-26 (error) The directory '%s' cannot be created.

DESCRIPTION

A necessary directory could not be created.

WHAT NEXT

Ensure that proper write permissions exist for the directory's parent.

NAME MGI-27 (warning) The directory '%s' cannot be removed.

DESCRIPTION

DC creates temporary directories during the course of creating generated synthetic parts. This warning indicates an unsuccessful attempt to remove such a temporary directory.

WHAT NEXT

The temporary directory may be manually removed.

NAME MGI-28 (warning) The library '%s' cannot be written to

'%s'.

DESCRIPTION

The DesignWare generator mechanism was unable to write a temporary copy of a library

to disk. The generator used to create the netlist may fail due to the missing library.

WHAT NEXT

Check that you are able to write to the current directory. Check that free disk space is available in the current directory.

NAME **MGI-29** (error) Invalid Module Compiler installation.

DESCRIPTION

The DesignWare generator mechanism requires Module Compiler for proper operation. DesignWare verifies the Module Compiler environment by checking for the existence of a few Module Compiler files. The missing files are listed after the error message.

WHAT NEXT

Ensure that Module Compiler is properly installed.

MGI-30 (error) %s

DESCRIPTION

This messages reports an error detected by the DesignWare generator environment. It should have been preceeded by other error messages with more specific information.

WHAT NEXT

MGI-31 (error) A datapath generator process has received a fatal (%s) signal %s

DESCRIPTION

A datapath generator process has exited unexpectedly after receiving a fatal signal from the system. The error message identifies the signal, and lists whether or not a "core" file was left in the generator invocation directory.

Any error messages left by the generator follow this message, preceded with the string "generator:".

WHAT NEXT

Contact the Synopsys Customer Support Center in one of the following ways:

- Open a call to your local support center from the Synopsys Web page at <http://www.synopsys.com> and click SolvNET (SOLV-IT! user name and password required).
- Send an e-mail message to support_center@synopsys.com.
- Telephone your local support center.

Call (800) 245-8005 from within the continental United States.

Call (650) 584-4200 from Canada.

Find other local support center telephone numbers at http://www.synopsys.com/support/support_ctr.

MGI-32 (error) A datapath generator process has exited with status code %d %s

This probably means the generator detected an illegal condition and aborted.

DESCRIPTION

This error message occurs when a datapath generator process exits unexpectedly. The exit was probably the result of the datapath generator detecting a fatal error and canceling its run. The error message lists the status code returned from the generator, and whether or not a core file is left in the invocation directory.

Any error messages left by the generator follow this message, preceded with the string *generator:*.

WHAT NEXT

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

MGI-33 (error) A datapath generator process has exited with status code % d %s

This probably means the generator %s and aborted.

DESCRIPTION

This error message occurs when a datapath generator process exits unexpectedly. The exit is probably the result of the datapath generator detecting a fatal error and canceling its run. The error message lists the status code returned from the generator, a description of the fatal error, and whether or not a core file is left in the invocation directory.

Another possible cause of this error message is that the system has run out of resources. If the datapath generator process ran out of disk space or memory, this message occurs.

Any error messages left by the generator follow this message, preceded with the string *generator:*.

WHAT NEXT

Check that you have sufficient disk space and memory.

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

MGI-34 (error) Could not extract parameters of physical wire load mode

DESCRIPTION

This error message occurs when a datapath generator process is about to be started, the wire load mode in use is physically aware but the then necessary parameters could not be extracted.

Without those parameters, the generator would produce sub-optimal results.

WHAT NEXT

Check for warnings and errors a prior `set_wire_load_mode physical` command reported.

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

MODEL

MODEL-1 (error) Cannot write the updated model to the db file.
The scaled cell model has different ports from the original model
saved
in the db file %s.

DESCRIPTION

You receive this message if you execute **extract_model** with the **-update** option, and the ports or timing arcs of the updated model are different from those of the original model. Two models written to the same db file must have exactly the same ports and number and order of arcs; the only difference allowed is in the timing values. This message informs you that **extract_model** did not update the db file with the new information.

Some possible reasons why the two models are different could include these:

- You might have used a slightly different version of the design when performing the update.
- The design might have different false path definitions, which could result in different timing arcs.
- You might have inadvertently used a different design when performing the update.
- You might have used different options (for example, **-library_cell** or **-ignore_ports**) for the original and for the updated model.

WHAT NEXT

Ensure that the original and the updated model have the same timing arcs and ports. Then reexecute **extract_model** with the **-update** option.

SEE ALSO

extract_model (2).

MODEL-2 (error) Port name %s found in %s design is not

found in %s design (operating_condition - %s).

DESCRIPTION

You receive this message if **extract_model** detects a port in the nominal model (that is, at nominal operating condition) that is not in the scaled cell (at a different operating condition). The scaled cell must contain the same ports and arcs as the nominal model.

WHAT NEXT

Ensure that the scaled cell model contains the same ports as the nominal model, then reexecute the command.

SEE ALSO

extract_model (2).

MODEL-3 (warning) A scaled cell for operating condition %s already exists. Replacing it with the new cell.

DESCRIPTION

You receive this message if **extract_model** finds that a scaled cell is already present for the specified operating condition. This message warns you that the existing scaled cell is being replaced by the new one.

WHAT NEXT

This is a warning message only; no action is required on your part. In the future, before executing this command, save a copy of the *_lib.db file so that you can restore any cells that are unintentionally overwritten.

SEE ALSO

extract_model (2).

MODEL-4 (error) Cannot generate a report; cell %s is not an

interface timing specification (ITS) cell.

DESCRIPTION

You receive this message if `report_model` finds in the design an instantiated cell that is not an interface timing specification (ITS) cell. `report_model` generates reports only for designs that are composed entirely of ITS cells. You create such designs using `extract_model`.

WHAT NEXT

Ensure that your design contains only ITS cells. Then reexecute `report_model`.

SEE ALSO

`extract_model` (2), `report_model` (2).

MODEL-5 (error) Cannot generate a report; the design %s does not instantiate a PrimeTime model.

DESCRIPTION

You receive this message if `report_model` finds that the design does not instantiate a PrimeTime model. The design might contain more than one cell; a PrimeTime model contains one cell per library. `report_model` generates reports only for PrimeTime designs.

WHAT NEXT

You cannot use `report_model` on this design.

SEE ALSO

`report_model` (2).

MODEL-6 (Information) Min delay arc from '%s' to '%s' missing for

`operating_condition %s'; substituting with a max_delay arc.`

DESCRIPTION

The extractor did not extract the min delay arc between the two points for the operating condition. This min delay arc is present in other operating conditions.

WHAT NEXT

No further action is needed.

MODEL-7 (Error) Cannot open file %s for writing.

DESCRIPTION

You receive this message if the command could not write to the specified file. You might be in a directory where you do not have write permission, or perhaps the file exists and is write-protected.

WHAT NEXT

Either change the permissions on the file or directory so that you can write to it, or use another file and directory for which you have write permission. Then reexecute the command.

SEE ALSO

`extract_model (2), save_qtm_model (2), write_interface_timing (2).`

MODEL-8 (information) STAMP %s file %s was successfully compiled.

DESCRIPTION

This is an informational message indicating the STAMP file has been compiled successfully.

WHAT NEXT

No action is needed.

SEE ALSO

`compile_stamp_model` (2).

MODEL-9 (Error) You must use the `-library_cell` option with the `-remove_internal_arcs` option.

DESCRIPTION

You receive this message if you execute `extract_model` with the `-remove_internal_arcs` option and did not also use the `-library_cell` option. You cannot use `-remove_internal_arcs` without also using `-library_cell`.

WHAT NEXT

Reexecute `extract_model` and use the `-library_cell` option along with the `-remove_internal_arcs` option.

SEE ALSO

`extract_model` (2).

MODEL-10 (warning) The `-test_design` option is valid only with the `-library_cell` option. Ignoring the `-test_design` option.

DESCRIPTION

You receive this message if you execute `extract_model` and use the `-test_design` option without the `-library_cell` option. The `-test_design` option specifies that a test design instantiating the model lib_cell is to be generated; therefore, `-test_design` is invalid without the `-library_cell` option. This message warns you that the `-test_design` option is being ignored.

WHAT NEXT

If it is acceptable to you that the `-test_design` option is ignored, no action is required on your part. However, if you still want to use the `-test_design` option, reexecute the `extract_model` command and use both the `library_cell` and `-test_design` options.

SEE ALSO

`extract_model` (2).

MODEL-11 (warning) Cannot update library %s; that library does not exist.

DESCRIPTION

You receive this message if you execute `extract_model` with the `-update` option, but the specified library does not exist. `extract_model` therefore cannot update the library.

WHAT NEXT

If it is acceptable to you that the specified library was not updated, no action is required on your part. Otherwise, do one of the following:

1. Reexecute `extract_model -update` and specify the name of an existing library that is consistent with the current design; or
2. Reexecute `extract_model` without the `-update` option and write a new library.

SEE ALSO

`extract_model` (2).

MODEL-12 (information) %s.

DESCRIPTION

This is a general purpose modeling related informational message usually issued to indicate the progress or status of the program.

WHAT NEXT

No action is needed.

MODEL-13 (warning) Cannot write generated clock %s to the model because all of the clock's derived sources are on internal pins and the `-remove_internal_arcs` option was

specified.

DESCRIPTION

You receive this message if you execute **extract_model** with the **-remove_internal_arcs** option, but one or more generated clocks have their derived sources on internal pins. This message warns you that if internal arcs are removed, the specified clock cannot be written to the extracted model.

WHAT NEXT

If it is acceptable to you that the specified generated clock is not written to the extracted model, no action is required on your part. However, if you want the generated clock to be written, reexecute **extract_model** and do not use the **-remove_internal_arcs** option.

SEE ALSO

extract_model (2).

MODEL-14 (warning) Cannot write generated clock %s to the model

because the clock's master pin is on an internal pin, and the **-remove_internal_arcs** option was specified.

DESCRIPTION

You receive this message if you execute **extract_model** with the **-remove_internal_arcs** option, but the specified generated clock has its master pin on an internal pin. This message warns you that if internal arcs are removed, the specified clock cannot be written to the extracted model.

WHAT NEXT

If it is acceptable to you that the specified generated clock is not written to the extracted model, no action is required on your part. However, if you want the generated clock to be written, reexecute **extract_model** and do not use the **-remove_internal_arcs** option.

SEE ALSO

extract_model (2).

MODEL-16 (warning) The models to be merged have different design names

%s and %s, respectively, use %s."

DESCRIPTION

This is to warn that the design names defined in the models to be merged are not the same.

WHAT NEXT

Please check if the names are actually correct. This is a warning message, the models will still be merged.

MODEL-17 (information) extract_model: %-40s

DESCRIPTION

This message shows the progress of the **extract_model** command. The body of each message reflects a specific aspect of the process.

WHAT NEXT

This is an informational message only; no action is required on your part. However, if you want to suppress the display of these messages, or change the level of messages that are displayed, set the **extract_model_status_level** variable to a different value. Allowed values are none, low, medium, or high.

SEE ALSO

extract_model (2); **extract_model_status_level** (3).

MODEL-18 (error) Found different values defined for attribute '%s', %s and %s in the models, cannot merge them.

DESCRIPTION

This is an error indicating that the named attribute defined for the models to be merged are not the same. Model merging cannot proceed with this difference.

WHAT NEXT

Please make sure that the named attribute is defined to have the same values across all the models to be merged.

MODEL-19 (error) The %s defined in the models are different.

DESCRIPTION

This is a general error indicating that the named object(s) defined in the models to be merged are not the same. Model merging cannot proceed with the difference.

WHAT NEXT

Please make sure that the named object(s) are defined the same across all the models to be merged.

MODEL-20 (error) Found %s '%s' in the models defined with different %s, cannot merge them.

DESCRIPTION

This is a general error indicating that the named object(s) defined in the models are not the same. Model merging cannot proceed with the difference.

WHAT NEXT

Please make sure that the named object(s) are defined the same across all the models to be merged.

MODEL-21 (error) %s '%s' is not defined in all models, cannot merge.

DESCRIPTION

This is a general error indicating that the named object is not defined in all the models. Model merging cannot proceed with the difference.

WHAT NEXT

Please make sure that the named object is defined across all the models to be merged.

MODEL-22 (error) The port/pin number %d is different in the models. They are defined as %s and %s, respectively.

DESCRIPTION

This is an error message indicating that the port/pin defined at the specified position in the models are not the same. Model merging cannot proceed with the difference.

WHAT NEXT

Please make sure that the order of pins of direction INPUT/OUTPUT/INOUT/TRIOUT are defined the same across all the models to be merged. INTERNAL pin order is not important.

MODEL-23 (error) Cannot merge %s '%s' with different '%s' %s and %s in the models.

DESCRIPTION

This is an error indicating that the named attribute defined for the named object are not the same. Model merging cannot proceed with this difference.

WHAT NEXT

Please make sure that the named attribute is defined to have the same values across all the models for the named object.

MODEL-24 (warning) Found %s '%s' with different '%s'

%s and %s in the models, use %s.

DESCRIPTION

This is a warning indicating that the named attribute defined for the named object are not the same. Model merging will use the value specified.

WHAT NEXT

Please check if the named attribute should have the same values for the named object.

MODEL-25 (error) The bit number %d in bus %s is different in the models.

They are defined as %s and %s, respectively.

DESCRIPTION

This is an error message indicating that the specified bit of the bus in the models are not the same. Model merging cannot proceed with the difference.

WHAT NEXT

Please make sure that the bits and the order of bits are the same in the bus across all models to be merged.

MODEL-26 (information) Found unique internal pin '%' in one of the models,

copied into the merged model.

DESCRIPTION

This is an informational message.

WHAT NEXT

No action required.

MODEL-27 (error) %s.

DESCRIPTION

This is a general purpose modeling related error message usually issued to indicate the reason why model merging cannot proceed.

WHAT NEXT

Please investigate the models to be merged and fix the identified problems and try merge them again.

MODEL-28 (warning) Found %s '%s' with conflict '%s' '%s' and '%s' set in the models, no constant is set for it in the merged model.

DESCRIPTION

This is a warning indicating that the named attribute defined for the named object are not the same. Model merging will use the value specified.

WHAT NEXT

Please check if the named attribute should have the same values for the named object.

MODEL-29 (warning) The %s command will be discontinued in future releases. Changes to model validation has made this command unnecessary

DESCRIPTION

A command has been rendered unnecessary by changes to model validation commands. The old command is being supported temporarily but will cause syntax errors in future releases

WHAT NEXT

Use the new functionality instead of the discontinued command.

SEE ALSO

MODEL-30 (error) Cannot merge models because no model files were specified

DESCRIPTION

You receive this message if you execute **merge_models** without specifying model files through either the **-model_files** or **-lib_files** option.

WHAT NEXT

Add model files to the command using either the **-model_files** or **-lib_files** option.

SEE ALSO

merge_models (2).

MODEL-31 (error) Cannot merge models because no data files were specified

DESCRIPTION

You receive this message if you execute **merge_models** without specifying any data files in conjunction with the **-model_files** option. The **merge_models** command requires data files when **-model_files** is present.

WHAT NEXT

Add data files to the command using the **-data_files** option.

SEE ALSO

merge_models (2).

MODEL-32 (error) Cannot merge models because no mode

names were specified

DESCRIPTION

You receive this message if you execute **merge_models** without specifying any mode names. The **merge_models** command requires one mode name for each input file.

WHAT NEXT

Add mode names to the command using the **-mode_names** option.

SEE ALSO

merge_models (2).

MODEL-33 (error) Cannot merge models because the number of model files does not match the number of data files.

DESCRIPTION

The **merge_models** command requires the number of model and data files match. One model and data file combine to define a model in STAMP format, so **merge_models** requires a one for one correspondance.

WHAT NEXT

Adjust the **-data_files** or **-model_files** as needed so the list lengths match.

SEE ALSO

merge_models (2).

MODEL-34 (error) Cannot merge models because the number of mode names does not match the number of model files.

DESCRIPTION

The **merge_models** command requires the number of mode names to match the number of model files. The model files are specified with either the **-model_files** or **-lib_files** option. A combination of model file and mode name defines a model to merge, so the number in each list must match.

WHAT NEXT

Adjust the mode names or the number of models so that the list lengths match.

SEE ALSO

`merge_models` (2).

MODEL-35 (error) Cannot merge models because there are duplicate mode names

DESCRIPTION

The `merge_models` command requires that the mode names be unique. There cannot be any duplicates.

WHAT NEXT

Change the duplicate mode names to be unique.

SEE ALSO

`merge_models` (2).

MODEL-36 (error) Cannot merge models because of an empty %S list

DESCRIPTION

A list for `merge_models` is empty. All lists must have at least one element in them.

WHAT NEXT

Add elements to the list, or remove the option for the list from the command line.

SEE ALSO

`merge_models` (2).

MODEL-37 (error) Cannot use %s in conjunction with %s

DESCRIPTION

You cannot specify both of these options for **merge_models** at the same time.

WHAT NEXT

Remove one or both of these options from the command.

SEE ALSO

merge_models (2).

MODEL-38 (error) Cannot merge models because there are data files with no model files.

DESCRIPTION

The **merge_models** command cannot have **-data_files** without corresponding **-model_files**.

WHAT NEXT

Either add **-model_files** to merge STAMP files, or remove the **-data_files** to merge LIB files.

SEE ALSO

merge_models (2).

MODEL-39 (error) Library file was not extracted.

DESCRIPTION

When the **merge_models** command read in one of the files in the **-lib_files** list of library files, it did not see at least one required attribute. Each of the library files must be the result of the **extract_models** command.

WHAT NEXT

Ensure that all of the library files are the output of the **extract_model** command.

SEE ALSO

`merge_models` (2). `extract_model` (2).

MODEL-40 (error) Library file is invalid for merging.

DESCRIPTION

When the `merge_models` command read in one of the files in the `-lib_files` list of library files, it found that one of the libraries was missing some expected attributes, had inconsistant attributes, or had unexpected attributes. Each of the library files must be the result of the `extract_models` command.

WHAT NEXT

Ensure that all of the library files are the output of the `extract_model` command.

SEE ALSO

`merge_models` (2). `extract_model` (2).

MODEL-41 (error) The %s and %s arguments are mutually exclusive

DESCRIPTION

The `merge_models` command cannot be invoked with both of the arguments at the same time, only one is allowed.

WHAT NEXT

Remove one of the arguments and invoke the command again.

MOUI

MOUI-1 (error) Could not create menu item: '%s'.

DESCRIPTION

WHAT NEXT

MOUI-2 (error) Widget name conflict: %s.

DESCRIPTION

WHAT NEXT

MOUI-3 (error) Dialog %s is not posted.

DESCRIPTION

WHAT NEXT

MOUI-4 (error) Could not read bitmap file: '%s'.

DESCRIPTION

WHAT NEXT

MOUI-5 (fatal) Could not create the designs view.

Your generic symbol library may be old or non-existent.

DESCRIPTION

WHAT NEXT

MOUI-6 (error) Could not create viewer log file: '%s'.

DESCRIPTION

WHAT NEXT

MOUI-7 (error) Minimum rise time must not be greater than maximum rise time.

DESCRIPTION

WHAT NEXT

MOUI-8 (error) Minimum fall time must not be greater than

maximum fall time.

DESCRIPTION

WHAT NEXT

MOUI-9 (error) Unable to push into design %s

DESCRIPTION

WHAT NEXT

MOUI-10 (error) Unable to open file: %s

DESCRIPTION

WHAT NEXT

MOUI-11 (error) '%s': is a file. Choose a directory name.

DESCRIPTION

WHAT NEXT

MOUI-12 (error) '%s': No write permission. Choose another

directory.

DESCRIPTION

WHAT NEXT

MOUI-13 (error) Please specify an output file name.

DESCRIPTION

WHAT NEXT

MOUI-14 (error) Background '%s' task '%s' has exited abnormally.

DESCRIPTION

WHAT NEXT

MOUI-15 (error) You cannot execute '%s' because it is the

current view_log_file.

DESCRIPTION

WHAT NEXT

MOUI-16 (error) No design has been selected to plot.

DESCRIPTION

WHAT NEXT

MOUI-17 (error) Can't plot design '%s' because the schematic could not be created.

DESCRIPTION

WHAT NEXT

MOUI-18 (error) No plot file specified.

DESCRIPTION

WHAT NEXT

MOUI-19 (error) Specified selecting color '%s' is not a valid

color.

DESCRIPTION

WHAT NEXT

MOUI-20 (error) Only schematics can be plotted.

DESCRIPTION

WHAT NEXT

MOUI-21 (error) Additional errors suppressed.

See the Command Window for a full error message listing.

DESCRIPTION

WHAT NEXT

MOUI-22 (warning) Unable to execute watcher process: '%s'.

DESCRIPTION

The watcher process is a child process of the Design Analyzer that watches for user interrupts during drawing and selection. If the DA cannot execute this process, the user will not be able to interrupt drawing and selection, but this is not a FATAL error. The most likely cause of this message is that the software has not been installed properly. The DA expects the watcher process to be in the synopsys bin directory.

WHAT NEXT

If there is some reason why you cannot install the software in the normal manner, you can disable this message by putting the statement `view_watcher = ""` in one of the .synopsys setup files.

MOUI-23 (error) HDL library '%s' does not exist.

Click on "Create New Library if it Doesn't Exist"
in the "Analyze File" dialog to override this error

DESCRIPTION

You have named a non-existent HDL library in the Analyze File dialog box.

WHAT NEXT

Click on "Create New Library if it Doesn't Exist" in the "Analyze File" dialog box to override this error.

MOUI-24 (error) Command %s requires at least one selected object.

DESCRIPTION

WHAT NEXT

MOUI-25 (information) Multi-lined command flushed.

DESCRIPTION

While entering a multilined command at the command line in the cmdtool window, you hit Ctrl-C, and the lines in progress were flushed from the buffer.

WHAT NEXT

You probably typed Ctrl-C because you noticed an error on a previously entered line, or you no longer wished to enter this command sequence. Reenter the command (cutting and pasting with the mouse is useful here), or enter another command.

MOUI-26 (error) Command incomplete. Command ignored.

DESCRIPTION

Because the Design Analyzer cannot execute an incomplete command, the command was

ignored. Either you improperly entered a user submenu item (through the *view_script_submenu_items* variable) or you used a user alias that redefined a **dc_shell** command.

WHAT NEXT

If you entered the command from a user submenu (on the Setup->Scripts submenu), check the variable setting to see if it was a complete **dc_shell** command. The variable setting is in one of the *.synopsys_dc.setup* files in either the <Synopsys_Root>/admin/setup directory, your home directory, or the local directory.

If the command was automatically generated from the Design Analyzer, check to see if the command was aliased to an incomplete **dc_shell** command. This information is also in one of the *.synopsys_dc.setup* files.

You can quickly see the result of all *.synopsys_dc.setup* settings in the *command.log* file generated by Design Analyzer.

An incomplete command is usually an **if**, **while**, or **foreach** command that was not terminated with its closing "}".

MOUI-27 (error) Can't invoke Design Analyzer because the value of

the %s variable contains options

which are ambiguous. Please fix the value of this variable in your initialization file and re-invoke Design Analyzer.

To see the valid options to *create_schematic*, use

the help command in dc_shell.

DESCRIPTION

WHAT NEXT

MOUI-28 (error) Unable to Highlight Selected object(s).

DESCRIPTION

WHAT NEXT

MOUI-29 (warning) Ignoring the value of the variable
default_schematic_options

because it is incorrect. Type 'help create_schematic' in the
Command Window or 'create_schematic' in the Help->Commands

dialog box for a description of the options to the

create_schematic command.

DESCRIPTION

WHAT NEXT

MOUI-30 (error) String required for the option(s) : %s.

DESCRIPTION

WHAT NEXT

MOUI-31 (error) Invalid instance name: '%s'.

DESCRIPTION

The instance name is invalid because it contains a backslash (\).

WHAT NEXT

Remove the backslash from the instance name and try again.

MOUI-32 (warning) '%s' does not have a schematic object.

DESCRIPTION

This given object does not have a schematic object to be viewed or selected.

WHAT NEXT

MOUI-33 (error) The pattern %s to define the From-%s of the

paths does not match any instance.

DESCRIPTION

The tool issues this error when a pattern is given to define From-instances but no instance matches this pattern.

WHAT NEXT

Check the pattern for spelling errors or remove the entire pattern to allow paths to start at any start point.

MOUI-34 (error) The pattern %s to define the Through-%s of the paths does not match any instance.

DESCRIPTION

The tool issues this error when a pattern is given to define Through-instances but no instance matches this pattern.

WHAT NEXT

Check the pattern for spelling errors or remove the entire pattern to allow paths to start at any start point.

MOUI-35 (error) The pattern %s to define the To-%s of the paths does not match any instance.

DESCRIPTION

The tool issues this error when a pattern is given to define To-instances but no instance matches this pattern.

WHAT NEXT

Check the pattern for spelling errors or remove the entire pattern to allow paths to start at any start point.

MPC

MPC-001 (warning) This command will be obsolete in a future release. Please use %s.

DESCRIPTION

You receive this warning message because you are using an obsoleting command. We are changing some older MPC command names. FROM TO set_floorplan_options
set_mpc_options set_floorplan_port_options set_mpc_port_options

report_mpc_port_options (2), set_mpc_macro_options (2), report_mpc_macro_options
(2), set_mpc_macro_array (2), report_mpc_macro_array (2), set_mpc_pnet_options (2),
report_mpc_pnet_options (2).
```

MPC-002 (Error) Failed to find valid base core site.

DESCRIPTION

The tool is looking at physical library for the site(s) to be instantiated in site array. A base core site is the site which is core type and is having minimum height and width, and is used by cells in current design. If such a site can not be identified, the tool errors out.

WHAT NEXT

Please check your physical library. Usually this error is caused by error in physical library. The site used by design is not defined in library.

SEE ALSO

`set_mpc_options (2)`, `report_mpc_options (2)`

MPC-003 (Warning) Output file is not defined for derive-mpc. Derived constraints will be directly annotated on design objects.

DESCRIPTION

Commands `derive_mpc_options`, `derive_mpc_port_options` and `derive_mpc_macro_options`, all have `-output` option for you to specify output file name. The tool will write the derived constraints to the file. These commands also take a `-apply` options. If `-apply` is specified, the tool will directly annotate the derived constraints on design objects. Both `-output` and `-apply` are optional. You can specify both of them or one of them. If both of them are not specified, the tool will imply `-apply` and issue this warning message.

WHAT NEXT

You don't have to do anything if your intention is to apply the derived constraints to the design objects.

SEE ALSO

`derive_mpc_options (2)`, `derive_mpc_port_options (2)`, `derive_mpc_macro_options (2)`

MPC-004 (warning) The %s %s is having FIXED location at (%f %f). initialize_mpc can't move it.

DESCRIPTION

You receive this warning message because the cell or port is marked as fixed. `initialize_mpc` will not change the location for it. If the core area is changed, the location might be valid any more.

WHAT NEXT

If your intension is to keep it at the fixed location, you can ignore this warning message. If you want the location to be reset by the tool, you have to remove fixed placement by using `remove_dont_touch_placement` command.

SEE ALSO

`set_mpc_options` (2), `report_mpc_options` (2), `set_dont_touch_placement` (2),
`remove_dont_touch_placement` (2),

MPC-005 (warning) No Track is empty on %s, port %s is set to (%d %d).

DESCRIPTION

You receive this warning message because MPC is unable to find an empty track to place the port on the side in `create_placement -mpc` and `physopt -mpc` flows.

WHAT NEXT

This is happening as no tracks are available on this side, constraint the port to a different side. You can also limit the number of ports on this side.

SEE ALSO

`set_mpc_options` (2), `set_mpc_port_options` (2)

MPC-006 (warning) Port Group '%s' too large to fit in core.

DESCRIPTION

You receive this warning message because the port group is too large to fit in the core area specified by `mpc` in the `physopt -mpc` and `create_placement -mpc` flows.

The tool will honor the side constraints on these ports.

WHAT NEXT

Try to reduce the number of ports in the port group. Pitch specified for this port group might also cause the port group to be too large.

SEE ALSO

`set_mpc_options` (2), `set_mpc_port_options` (2)

MPC-007 (Warning) Minimum site %s in physical library is

different from the minimum site %s used in design. Choose site %s as base site.

DESCRIPTION

The minimum site defined in physical library is not used in the design. Instead a bigger site is used. By default, the minimum site used in design is chosen as the base site.

MPC-008 (Warning) No site is used in design. Minimum site %s from library is used as base site.

DESCRIPTION

The minimum site in the library is chosen as base site. There is no cell in the design that uses sites defined in the library. This can happen if there is no standard cell in the design. Or the sites for standard cells are not defined in library. In this case, please check whether your library is valid.

MTCMOS

MTCMOS-1 (error) Cannot open library %s.

DESCRIPTION

This error message occurs when the specified library is not found.

WHAT NEXT

Option -lib of commands report_IV_table and get_switch_resistance need to be specified as a library name. Make sure the library has been opened before run these commands. Correct this error as following: 1) Use the get_libs command to verify the libraries has been opened currently. 2) If not opened, to open the library, if you will re-run the whole process before the current command, try to put the expected library's .db file in the tcl variable link_library before execute the link command. Re-run the whole process and run the command again. 3) Make sure the library is opened and run the command again.

SEE ALSO

get_libs(2)

MTCMOS-2 (error) Library %s has no cell named %s.

DESCRIPTION

This error message occurs when the specified cell is not found in library.

WHAT NEXT

Option -cell of commands report_IV_table and get_switch_resistance need to be specified as a cell name. Make sure the cell exist in the library. Use the report_lib command to report the info of the lib. Verify the cell list section of the library to check if the specified cell exist in the list. Run the command again by pass in the correct cell name.

SEE ALSO

report_lib(2)

MTCMOS-3 (error) Check number of output_voltage: at least

%d values is needed, but only %d values in cell %s of lib %s.

DESCRIPTION

This error message occurs when the number of output_voltage less than required value. See the detail as following: 1) At least 3 values for output_voltage is needed to shape an IV(ISD-VVPG) curve. 2) If voltage level of related_pg_pin not equals anyone value in the list of VVPG(voltage on virtual power or ground), it means this value has been omitted in the list, then the least number is 2.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-4 (warning) Check monotonicity of output_voltage:
VVPGs should monotonically rise, but drop from %f to %f in cell %s of lib %s.

DESCRIPTION

This warning message occurs when the output_voltage not monotonically rise. The output_voltage is assumed monotonically rise to assure there is no "dirty data" in the IV curve table.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-5 (error) Check number of input_voltage: at least 2 values is needed, but only %d values in cell %s of lib %s.

DESCRIPTION

This error message occurs when the number of input_voltage less than required value. At least 2 values for input_voltage is needed to determine whether rise or fall turns on the switch.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-6 (warning) Check monotonicity of input_voltage:
VENs should monotonically rise, but drop from %f to %f in cell %s of lib %s.

DESCRIPTION

This warning message occurs when the input_voltage not monotonically rise. The input_voltage is assumed monotonically rise to assure there is no "dirty data" in the IV curve table.

WHAT NEXT

This is only a warning message. To eliminate this warning message, please contact the library provider to correct this issue in library.

MTCMOS-7 (error) Check number of ISD: numOfISD %d not equal numOfVVPG %d multiply numOfVEN %d in cell %s of lib %s.

DESCRIPTION

This error message occurs when the number of numOfISD not equal (numOfVVPG*numOfVEN) .

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-8 (error) Check direction of ISD: ISDs should not all

be zero in cell %s of lib %s.

DESCRIPTION

This error message occurs when the all value of ISDs are zero.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-9 (error) Check direction of ISD: %s cell %s of lib %s has too much false direction %s ISDs.

DESCRIPTION

This error message occurs when the specified cell has over 25% of false direction ISDs. For header, negative ISD is invalid. For footer, positive ISD is invalid.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-10 (warning) Check direction of ISD: %s cell %s of lib %s has false direction %s ISDs.

DESCRIPTION

This error message occurs when the specified cell has false direction ISD. For header, negative ISD is invalid. For footer, positive ISD is invalid.

WHAT NEXT

This is only a warning message. To eliminate this warning message, please contact the library provider to correct this issue in library.

MTCMOS-11 (error) Check ISD-VVPG monotonicity: IV curve table for cell %s in lib %s should not has wholly rise ISD-VVPG

monotonicity.

DESCRIPTION

This error message occurs when the IV curve table has false wholly drop ISD-VVPG monotonicity. See the detail as following: 1) A drop ISD-VVPG point means for the same VEN, the ISD drop as VVPG rise at the point. A rise ISD-VVPG point means for the same VEN, the ISD rise as VVPG rise at the point. 2) When the number of drop ISD-VVPG point is greater than the number of rise ISD-VVPG points in the IV curve table, the IV table has wholly drop ISD-VVPG monotonicity. Otherwise, it has wholly rise ISD-VVPG monotonicity. 3) The IV curve table should has wholly drop ISD-VVPG monotonicity.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-12 (warning) Check ISD-VVPG monotonicity: ISD of the ISD-VVPG curve for %s cell %s in lib %s should not rise as VVPG rise.

DESCRIPTION

This warning message occurs when the ISD of the ISD-VVPG curve is not drop as VVPG rise. For the same VEN, ISD should always drop as VVPG rise.

WHAT NEXT

This is only a warning message. To eliminate this warning message, please contact the library provider to correct this issue in library.

MTCMOS-13 (error) Check ISD-VEN monotonicity: %s, IV curve table for cell %s in lib %s should not has wholly %s ISD-VEN monotonicity.

DESCRIPTION

This error message occurs when the IV table has false wholly ISD-VEN monotonicity. See the detail as following: 1) A drop ISD-VEN point means for the same VVPG, the ISD drop as VEN rise at the point. A rise ISD-VVPG point means for the same VVPG,

the ISD rise as VVPG rise at the point. 2) When the number of drop ISD-VEN point is greater than the number of rise ISD-VEN points in the IV curve table, the IV table has wholly drop ISD-VEN monotonicity. Otherwise, it has rise ISD-VEN monotonicity. 3) If Ven is swept from the pin before the internal inverter, the IV curve table should have wholly rise ISD-VEN monotonicity. Otherwise, the IV curve table should have wholly drop ISD-VEN monotonicity.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-14 (warning) Check ISD-VEN monotonicity: ISD of the ISD-VEN curve for %s cell %s in lib %s should not %s as VEN rise.

DESCRIPTION

This warning message occurs when the ISD of the ISD-VEN curve does not abide by its correct monotonicity. See the detail as following: 1) If Ven is swept from the pin before the internal inverter, the ISD of the ISD-VEN curve at the same VVPG should rise as VEN rise. 2) Otherwise, the ISD of the ISD-VEN curve at the same VVPG should drop as VEN rise.

WHAT NEXT

This is only a warning message. To eliminate this warning message, please contact the library provider to correct this issue in library.

MTCMOS-15 (error) IV curve has questionable zero lsd when VVPG %4.2f not equal vlotage value %4.2f on related_pg_pin in library.

DESCRIPTION

This error message occurs when the ISD equals to zero while VVPG not equal to the voltage level of related_pg_pin defined in library. When VVPG not equal to the voltage level of related_pg_pin, the voltage Vds will not equal to zero, then the current flow through the cell will not equal to zero too.

WHAT NEXT

To fix this error, please contact the library provider to correct this issue in library.

MTCMOS-16 (error) Working VDD is %4.2f, its corresponding Ven %4.2f is out of range of IV curve table.

DESCRIPTION

This error message occurs when the value of working VDD out of range of IV curve table. It may occurs at following circumstance: 1) The value of working VDD out specified by -vdd option of command get_switch_resistance is out of range of IV curve talbe. 2) When do PNA/PNS, the working VDD retrieved from design is out of range of IV curve talbe.

WHAT NEXT

This is only a warning message. To eliminate this warning message, follow the instructions below: 1) The value of the working VDD and the value of corresponding VEN has been report in this error message. 2) Contact the library provider to ask if the value of corresponding VEN of the working VDD is out of range of VENs in IV curve table. 3) If not, maybe the value of working VDD is not correct, change the value and run the command again. 4) It could also because the VENs range in the IV curve table is not wide enough. Please raise the problem to the library provider to ask for an updated .db file or .lib file with wider range of VEN.

MTCMOS-17 (error) No dc_current data for cell %s in library %s.

DESCRIPTION

This error message occurs when there is no IV curve table data for the specified cell of the specified library.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-18 (error) No template is defined for LUT in library

%s.

DESCRIPTION

This error message occurs when there is no template is defined for LUT in the specified library.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-19 (error) Failed to read values from dc_current section of library %s.

DESCRIPTION

This error message occurs when there is something wrong in the values of dc_current section of the specified library.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-20 (error) Failed to get voltage value of related_pg_pin for cell %s in library %s.

DESCRIPTION

This error message occurs when failed to get voltage value of related_pg_pin.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-21 (error) Type of related_pg_pin is not correct for

cell %s in library %s.

DESCRIPTION

This error message occurs when the type of related_pg_pin is not power or ground type.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-22 (error) Failed to get related_switch_pin of dc_current for cell %s in library %s.

DESCRIPTION

This error message occurs when failed to get related_switch_pin of IV curve talbe in dc_current section in the library.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-23 (error) Failed to get the primary power of related_switch_pin for cell %s in library %s.

DESCRIPTION

This error message occurs when failed to get the primary power of related_switch_pin.

WHAT NEXT

Please contact the library provider to correct this libraray error.

MTCMOS-24 (error) Cell %s in library %s has more than one IV

curve tables, Currently not supported.

DESCRIPTION

This error message occurs when the specified cell contains more than one IV curve tables. Currently only one IV curve table for a MTCMOS cell is supported by automatic resistance extraction.

WHAT NEXT

When this error happen, please specify mtcmos cell resistance manually before PNA/PNS. A example shown as following: set_attribute [get_physical_lib_cel HDRSID2HVT] "mtcmos_resistance" 20

MTCMOS-25 (Warning) Command '%s' is obsolete. Please use '%s' instead.

DESCRIPTION

This warning message occurs when you use a certain command which is obsolete and will be removed in later release.

WHAT NEXT

Please use the new command proponed in the warning message.

MTCMOS-26 (Warning) Option '%s' is obsolete. Please use '%s' instead.

DESCRIPTION

This warning message occurs when you use a certain option which is obsolete and will be removed in later release.

WHAT NEXT

Please use the new option proponed in the warning message.

MUTIL

MUTIL-1 (fatal) Could not create menu item '%s'.

DESCRIPTION

WHAT NEXT

MUTIL-2 (fatal) More than one menu item has the name '%s'.

DESCRIPTION

WHAT NEXT

MUTIL-3 (fatal) Could not open menu files.

DESCRIPTION

This error occurs if the menu files don't exist or the protection is not set correctly. The menu files are in the <synopsys_root>/<arch>/motif/syn/uid directory.

For example, design analyzer exits with these messages:

```
Could not open one or more of the following menu files: /remote/rd40/src/dc/UIL/mview.uid /remote/rd40/src/dc/UIL/mview1.uid /remote/rd40/src/dc/UIL/mview2.uid /remote/rd40/src/dc/UIL/mview3.uid Fatal: Could not open menu files. (MUTIL-3)
```

WHAT NEXT

Check and correct uid_directory variable in your .synopsys_dc.setup file, then reinvoke the design_analyzer.

MV

MV-001 (warning) cell %s(%s) was constrained to operate under the operating condition %s, but the library cell %s matching this characterization cannot be found in the link libraries. Instead, library cell %s from %s:%s (voltage = %s, process = %f, temperature = %f) has been used.

DESCRIPTION

This warning message occurs when your block or the cell has been required to operate under a certain supply voltage (using `set_operating_condition` command), but this particular cell cannot be linked to a library cell that was characterized under this supply voltage.

WHAT NEXT

Check the operating condition for the particular block or cell. Set the proper operating condition using the `set_operating_conditions` command or check the library.

SEE ALSO

`set_operating_conditions(2)`

MV-001a (information) The cell %s with library cell %s is a %s.

DESCRIPTION

This information message occurs when there is a MV-001 happened earlier. This message is to tell what kind of cell this cell is. The cell can be one of the following: isolation cell, level shifter, switch cell, retention register or a normal cell. The normal cells are non power-design-specific cells, which includes standard cells and macro cells.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

MV-001 (2)

MV-001b (information) Library cell %s from %s:%s (voltage = %s, process = %f, temperature = %f) has been found.

DESCRIPTION

This information message occurs when there is a MV-001 happened earlier. This message intends to help user identify what causes the eariler MV-001, whether it is due to a library setup issue or a tool's problem. This message reports, one at a time, the related library cell found in both target and link library with its supply voltage information.

WHAT NEXT

Check all MV-001b against the previous MV-001 and make sure the library setup is correct.

SEE ALSO

MV-001 (2)

MV-002 (error) command %s is not supported in mv_mode in psyn_shell; please use dc_shell -mv_mode.

DESCRIPTION

This error message occurs because the current release does not support the specified command in mv_mode in psyn_shell.

WHAT NEXT

Do not use the mv_mode option for this command, or try dc_shell -mv_mode.

MV-003 (error) The %s option is not supported.

DESCRIPTION

This error message occurs because the specified option is supported only in mv_mode.

WHAT NEXT

Either use mv_mode, or remove the option that is not supported, and run the command again.

MV-004 (information) The operating condition of the parent cell %s is different from that of the child cell %s in the design %. The child cell will not be ungrouped.

DESCRIPTION

This information message occurs when a cell will not be ungrouped by default if its operating condition is different from its parent.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

compile(2)

MV-005 (error) The %s command is not supported.

DESCRIPTION

This error message occurs because the specified command is supported only in mv_mode.

WHAT NEXT

Rerun the command using mv_mode, or remove the unsupported command.

MV-006 (error) The target_library does not contain an inverter characterized for operating condition %s.

DESCRIPTION

The target_library does not contain an inverter corresponding to the operating condition. For MV design, it is required that all libraries corresponding to the

operating conditions used in the current design be included in the target_library, and each library contains at least an inverter.

WHAT NEXT

Make sure the library characterized for the operating condition is included in the target_library variable, and add an inverter to the library for that operating condition if none exists.

MV-007 (error) The target library for the opcond %s does not contain all required gates.

Either a NOR, or an AND and an OR gate (two-input) is required for mapping.

DESCRIPTION

The target_library corresponding to the operating condition does not contain the minimum set of gates required by the mapping algorithms. For performing mapping, it is required that each opcond that is used in the current design has a target library with minimum set of gates.

WHAT NEXT

Add all the required gates to the target_library for that opcond and rerun the command.

MV-008 (error) The instance %s has the operating condition %s which is different from top level design.

Compile command is not supported with instance specific operating conditions

Please use ACS or bottom up methodology.

DESCRIPTION

This error message is printed out when compile is used without -top option and there are instance specific opconds. It is OK for the instance to have instance specific operating conditions if it has been dont_touched.

WHAT NEXT

Either use ACS or use bottom up methodology and compile -top.

SEE ALSO

`set_operating_conditions(2)`

MV-009 (error) Object %s has target_library_subset {%s}.
Compile command is not supported with target library
subsetting.

Please use ACS or bottom up methodology.

DESCRIPTION

This error message is printed out when compile is used without -top option and there are instance specific target library settings. It is OK for the instance to have instance specific target library subset if it has been dont_touched.

WHAT NEXT

Either use ACS or use bottom up methodology and compile -top.

SEE ALSO

`set_target_library_subset(2)`

MV-010 (error) The target_library_subset {%s} does not contain
an inverter characterized for operating condition %s.

DESCRIPTION

For MV design, it is required that each target library subset that is set on instances has an inverter that is characterized for the operating conditions of the instances.

WHAT NEXT

Make sure the library characterized for the operating condition is included in the target library subset, and add an inverter to the library for that operating condition if none exists.

SEE ALSO

[set_target_library_subset\(2\)](#)

MV-011 (error) The target_library_subset does not contain all required gates for the operating condition %s.

Either a NOR, or an AND and an OR gate (two-input) is required for mapping.

DESCRIPTION

For performing mapping, it is required that each target_library_subset that is set on instances has at least the minimum set of gates.

WHAT NEXT

Add all the required gates to the target_library_subset and rerun the command.

SEE ALSO

[set_target_library_subset\(2\)](#)

MV-012 (error) Library '%s' specified in target library subset on cell '%s' is not in global target library list.

DESCRIPTION

All the libraries specified using target_library_subset should be listed in the global target library list.

WHAT NEXT

Either add those libraries to target_library TCL variable, or remove them from the target_library_subset.

SEE ALSO

[set_target_library_subset\(2\)](#)
[remove_target_library_subset\(2\)](#)

MV-013 (error) There is mismatch between the target library subset and operating condition specified on cell '%s'.

DESCRIPTION

There must be at least one library in the defined target_library_subset on a block which has nominal process, voltage and temperature (PVT) same as the PVT parameters of the operating condition defined on that block.

WHAT NEXT

Either modify the target_library_subset that is defined on that particular block or modify the operating condition on that block.

SEE ALSO

`set_operating_conditions(2)`
`set_target_library_subset(2)`

MV-014 (warning) The library cell of cell %s is not from the target_library_subset being used on that block.

DESCRIPTION

The target_library_subset defined on a block is used when a new cell is created during optimization. Existing mapped cells are not required to come from this subset. However, check_target_library_subset will issue this message to alert you that such a situation exists.

WHAT NEXT

Based on your requirements, you can ignore the message, modify the target_library_subset on the block, or manually translate that cell to use a library cell from the target_library_subset.

SEE ALSO

`set_target_library_subset(2)`

MV-015 (error) Cannot read target_library_subset file %s

defined on %s.

DESCRIPTION

The library file defined in the target_library_subset cannot be found, or cannot be read into memory.

WHAT NEXT

Check the spelling of that file name, or check your search_path to make sure that the file can be found through search_path.

SEE ALSO

`set_target_library_subset(2)`

MV-016 (warning) Different operating conditions are used in scenarios %s and %s.

This multicorner functionality requires running with -mv_mode.

DESCRIPTION

Each scenario has its own operating conditions. If you specify different operating conditions across the scenarios, this activates multicorner behavior, which requires running the shell with the -mv_mode option.

WHAT NEXT

Run the shell with the -mv_mode option.

SEE ALSO

`set_operating_conditions(2)`
`report_design(2)`
`create_scenario(2)`

MV-017 (warning) %s operating condition %s for instance %s has a different temperature than top level %s operating condition %s.

Delays may be inaccurate as a result.

DESCRIPTION

In multi voltage synthesis, you may define different operating conditions for the top level design and cell instances. However, only one max temperature (and one min temperature) is used for wire delay evaluation in the design, so delays may be inaccurate.

WHAT NEXT

Change the conflicting operating condition, or accept delay inaccuracies.

SEE ALSO

`set_operating_conditions(2)`

MV-018 (error) command %s in mv_mode is not supported in db_mode; please use xg_mode.

DESCRIPTION

This error message occurs because the current release in `mv_mode` does not support the specified command in `db_mode`.

WHAT NEXT

Do not use the `mv_mode` option for this command, or use `xg_mode`.

MV-019 (error) Use of SPDM library %s is not supported.

DESCRIPTION

Libraries using Single Polynomial Delay Models (SPDM) format are not supported in MV compile.

WHAT NEXT

Supply library which makes use of formats supported in MV compile.

MV-021 (warning) No operating condition was set in scenario %s

DESCRIPTION

If you are creating scenarios with the `create_scenario` command, it is also necessary to set an operating condition for each scenario. This is done by giving the command `set_operating_conditions` somewhere after the `create_scenario` command.

WHAT NEXT

Use the `set_operating_conditions` command within each scenario.

SEE ALSO

`create_scenario(2)` `set_operating_conditions(2)`

MV-022 (Error) A total of %d operating condition problems (MV-001) have been detected; %d of them have been reported above. Delay calculation will be incorrect if these problems are not fixed. %s

DESCRIPTION

This is a summary message for a number of operating condition problems (MV-001) detected in the design linking, `check_mv_design`, or `compile/physopt` commands. It tells you how many operating condition problems have been detected by the tools, and what libraries have been searched in a prior attempt to link the design.

WHAT NEXT

Check the operating condition for the particular block or cell. Set the proper operating condition using the `set_operating_conditions` command or check the library.

SEE ALSO

`set_operating_conditions(2)`

MV-024 (error) Found '%d' occurrence(s) of target library subset

specification(s) with conflicting operating conditions.

DESCRIPTION

This message provides number of target library subset specifications that have conflict with the operating condition specified on respective blocks. The conflict occurs if none of the libraries in a target library subset has nominal process, voltage and temperature values (PVT values) which agree with the PVT values specified in operating condition.

WHAT NEXT

Please run `check_mv_design` command to get details on incorrect target library subset specifications. Then make sure each specification has at-least one library that matches the operating condition specified on the block.

SEE ALSO

```
set_operating_conditions(2)
set_target_library_subset(2)
remove_target_library_subset(2)
check_mv_design (2)
```

MV-025 (warning) You have used `set_target_library_subset`, but the design already contains %d cells mapped to libraries outside the subset. The `target_library_subset` will apply to new cells created or modified during optimization.

DESCRIPTION

This message alerts you to the fact that, prior to optimization, your design already contains some cells which are mapped to libraries outside of the `target_library_subset` you requested.

Depending on your requirements, this may or may not be a problem.

The `target_library_subset` only affects cells that are created or modified during optimization. Existing mapped cells are not required to come from this subset.

If you are getting this message, and did not want to allow existing cells to be mapped to libraries outside the subset, you need to manually translate those cells using `change_link`, or recompile the block on its own using a more restrictive `$target_library`. This situation should not arise if you set the `target_library_subset` prior to the initial compile from RTL.

WHAT NEXT

Based on your requirements, you may ignore the message, or may need to manually translate existing cells. Use `check_mv_design` for details about the cells outside the subset.

SEE ALSO

```
set_target_library_subset(2)  
remove_target_library_subset(2)  
check_mv_design(2)
```

MV-026 (warning) No default operating condition is defined for library %s.

DESCRIPTION

All libraries used for multi-voltage design must have the 'default_operating_conditions' attribute defined.

WHAT NEXT

Make sure the library has its 'default_operating_conditions' defined. Re-generate the DB file for the library using library compiler after correcting the problem.

SEE ALSO

```
check_mv_design (2)
```

MV-027 (warning) The nominal operating conditions (process = %.3f, voltage = %.3fV, temperature = %.3f) of library %s do not match the values (process = %.3f, voltage = %.3fV, temperature = %.3f) of its default operating conditions %s.

DESCRIPTION

All libraries used for multi-voltage design must have their nominal process, voltage and temperature values matching that of their default operating conditions, respectively.

WHAT NEXT

Make sure the library has the correct nominal process, voltage and temperature, and they are matching the values defined in the default operating condition. Re-generate the DB file for the library using library compiler after correcting the problem.

SEE ALSO

`check_mv_design (2)`

MV-028 (warning) No operating condition has been set explicitly on the current design. A default operating condition will be assumed.

DESCRIPTION

The user must use `set_operating_conditions` command to explicitly apply an operating condition onto the current design, otherwise, a default operating condition will be assumed, which may not be what the user desires.

WHAT NEXT

Use `set_operating_conditions` command to explicitly apply an operating condition onto the current design.

SEE ALSO

`check_mv_design (2)`
`set_operating_conditions (2)`

MV-029 (error) Either no operating condition has been applied for the current design (warning MV-028), or the libraries have improper operating condition characteristics, as reported in warnings MV-026 or MV-027.

DESCRIPTION

Make sure the libraries have `default_operating_conditions` defined, and are matching the nominal process, voltage and temperature values of the libraries. Also make sure that `set_operating_conditions` command has been used to explicitly apply an operating condition onto the current design.

WHAT NEXT

Check and correct the library problems in warning MV-026 or MV-027. Also check that an operating condition has been applied onto the current design.

SEE ALSO

`check_mv_design (2)`
`set_operating_conditions (2)`

MV-030 (warning) Improper use of %s %s as a core cell in the design.

DESCRIPTION

This message is printed when isolation cell that connects logic cells fully contained in same sub design is found. This results in isolation cell being used as a core cell in the design. Isolation cells should be used as boundary cells to isolate two different power domains. Improper use of isolation cell may result in unexpected tool behavior during placement and routing phase.

WHAT NEXT

Remove isolation cell.

SEE ALSO

`check_mv_design (2)`

MV-031 (warning) You have used isolation cells without power domains. Please check %s %s is correctly used in the design.

DESCRIPTION

This message is printed when isolation cells or enable level shifters are found but when power domain definitions are not found. Proper use of isolation cells can't be checked in the absence of power domains. You can ignore this message if cells are properly instantiated. Otherwise, unexpected results may occur.

WHAT NEXT

Define power domains.

SEE ALSO

`check_mv_design (2)`
`create_power_domains (2)`

MV-032 (warning) Found %d isolation cell(s) or enable level shifter cell(s) used in the core of the design.

DESCRIPTION

This message summarizes number of isolation cells or enable level shifters used as core cells in the design.

WHAT NEXT

Run `check_mv_design` for more details.

SEE ALSO

`check_mv_design (2)`

MV-033 (warning) Found %d isolation cell(s) or enable level shifter cell(s) whose connections could not be checked for correctness. Please ensure correct use of isolation cells or use power domain specification.

DESCRIPTION

This message summarizes number of isolation cells or enable level shifters whose connections could not be checked to ensure their proper use . This message is issued when power domain definitions are not found but when isolation cells or enable level shifters are found.

WHAT NEXT

Specify power domain definitions. When power domain definitions are provided, isolation cell connections can be checked to make sure they connect to boundaries of power domains.

SEE ALSO

`check_mv_design (2)`

MV-034 (error) When power domain is used, your design can not be written in DB format.

DESCRIPTION

This message is issued when you are trying to write the design in DB Format while there is a power domain in your design. Since power domain information can not be saved with design in DB format, please write the netlist using DDC format instead of DB format.

WHAT NEXT

Write the design in DDC format.

SEE ALSO

`write(2).`

MV-035 (error) Use of merged NLDM library %s is not supported.

DESCRIPTION

Libraries using merged Non-linear Delay Model (NLDM) format are not supported in MV compile.

WHAT NEXT

Supply library which makes use of formats supported in MV compile.

MV-036 (error) Cannot find power on signal '%s' in power domain '%s' defined on '%s'.

DESCRIPTION

Power on signal could not be located inside specified power domain.

WHAT NEXT

Check signal name to make sure it is correct. If signal is optimized away, to

prevent optimization mark it dont touch.

MV-037 (error) Cannot find power acknowledge signal '%s' in power domain '%s' defined on '%s'.

DESCRIPTION

Power acknowledge signal could not be located inside specified power domain.

WHAT NEXT

Check signal name to make sure it is correct. If signal is optimized away, to prevent optimization mark it dont touch.

MV-038 (warning) Disable state logic- %d of %s %s differs from value of constant net %s connected to its input pin.

DESCRIPTION

This message is displayed when the disable state of the isolation cell or enable level shifter differs from the logic constant connected to the input of that cell.

WHAT NEXT

Ensure intended use of the isolation cell.

MV-039 (warning) Found %d isolation cells or enable level shifters with inputs connected to logic constants that differ from disable state of these cells.

DESCRIPTION

This message summarizes total number of isolation cells and enable level shifters whose inputs are connected to constants that differ from disable state of these cells.

WHAT NEXT

Ensure intended use of the isolation cell.

MV-040 (error) Cannot find instances of cells matching name(s) '%s' in power domain '%s' defined on '%s'.

DESCRIPTION

This message is printed when instance names are specified in \$power task but when instances could not be found in the net-list.

WHAT NEXT

Make sure instance names are correctly specified.

MV-041 (error) Net '%s' crossing two power domain boundaries could not be constrained.

DESCRIPTION

This message is printed when a net crossing power domain boundaries could not be constrained properly. This can happen in extreme cases such as when net has loop on it.

WHAT NEXT

Please check connection on net to make sure it is properly connected to cells. Otherwise, please contact Synopsys Technical Support.

SEE ALSO

`check_mv_design (2)`.

MV-042 (warning) Isolation cell is required on net %s connecting %s and %s.

DESCRIPTION

This message is printed when a net with missing isolation is found. A net must have isolation cell if it is driven by always on domain and connected to relatively less power down domains. If isolation cell on such nets is not provided, then circuit may draw excessive short circuit current. This may result in unexpected behavior.

WHAT NEXT

Please specify proper always on relationship between two power domains or add isolation cell on the net. The message is issued only on first violation detected on the net. Please analyze isolation cell requirement on all connections between drivers and load pins on the net.

SEE ALSO

`check_mv_design (2). set_relative_always_on (2).`

MV-043 (warning) Found redundant isolation cell on net %s connecting %s and %s.

DESCRIPTION

This message is printed when isolation cell is found when it is not required. This can happen when a net driven by always on domain and connected to relatively power down domain is isolated using isolation cell. Presence of isolation cells triggers design constraining. This may result in QOR loss in the final net-list.

WHAT NEXT

Please check always on relationship between two power domains or remove isolation cell from the net. The message is issued only on first violation detected on the net. Please analyze isolation cells on all connections between drivers and load pins on the net and fix isolation requirement accordingly.

SEE ALSO

`check_mv_design (2). set_relative_always_on (2).`

MV-044 (warning) Found isolation cell %s in the logic core of the power domain.

DESCRIPTION

This warning message occurs when the specified isolation cell does not connect two different power domains. The isolation cell should be used as the boundary cell to isolate two different power domains. Improper use of the isolation cell may result in unexpected tool behavior during the place and route phase.

WHAT NEXT

This is only a warning message. No action is required.

However if the results are not what you intended, remove the isolation cell and run the command again.

SEE ALSO

`check_mv_design(2)`

MV-045 (error) Found '%d' net(s) which could not be properly constrained.

DESCRIPTION

This message provides number of nets which tool could not constrain properly for various reasons.

WHAT NEXT

Please run command `check_mv_design` for details.

SEE ALSO

`check_mv_design (2)`.

MV-046 (warning) Found %d net(s) without isolation.

DESCRIPTION

This message provides number of nets for which isolation is missing.

WHAT NEXT

Please run command `check_mv_design -verbose` for details.

SEE ALSO

`check_mv_design (2)`.

MV-047 (warning) Found %d net(s) with redundant isolation cells.

DESCRIPTION

This message provides number of nets on which redundant isolation cell is found.

WHAT NEXT

Please run command **check_mv_design -verbose** for details.

SEE ALSO

check_mv_design (2).

MV-048 (warning) Found %d isolation cell(s) on net(s) not crossing power domain boundaries.

DESCRIPTION

This message provides number of isolation cells which are not connected to nets crossing power domain boundaries.

WHAT NEXT

Please run command **check_mv_design -verbose** for details.

SEE ALSO

check_mv_design (2).

MV-049 (warning) Block '%s' contain(s) %d instance(s) of library cell(s) defined in libraries that (is)are not part of the target library subset '%s' specified on it.

DESCRIPTION

This message summarizes number of technology cells linked to libraries that are not part of target library specification set on that block.

WHAT NEXT

Depending upon your circumstances, you can ignore this message. Alternatively, you can modify target library subset specification on the block.

SEE ALSO

`check_mv_design` (2).

MV-050 (error) %s is required for %s.

DESCRIPTION

-power_down_ctrl requires -power_down option; -power_down_ack requires -power_down_ctrl option.

WHAT NEXT

Add required option to the command

MV-051 (error) %s %s already exists.

DESCRIPTION

The power domain or power net already exist. This error is issued either because the named power domain or net already exist, or because you are creating a design-level domain that exists already.

WHAT NEXT

MV-052 (error) Power net %s does not exist.

DESCRIPTION

Could not find the power net.

WHAT NEXT

MV-053 (error) Cannot attach internal net to unswitched domain %s.

DESCRIPTION

Internal power net can only be attached to power down domain.

WHAT NEXT

MV-054 (error) nominal_voltages_list and voltage_ranges_list must be defined together, and the length of the voltage_ranges_list (currently %d) must be twice the length of the nominal_voltages_list (currently %d).

DESCRIPTION

Whenever -nominal_voltages option is specified for create_power_net_info command, -voltage_ranges must also be specified, and vice versa. Furthermore, since voltage_ranges_list define the left and right ranges around the nominal_voltages, its length must be twice that of the length of the nominal_voltages_list.

WHAT NEXT

MV-055 (error) Nominal voltages, voltage ranges, and "switchable" option cannot be used with ground nets.

DESCRIPTION

Nominal voltages, voltage ranges, or 'switchable' option can only be specified for power nets.

WHAT NEXT

MV-056 (error) %s need to be all positive, and listed in ascending order.

DESCRIPTION

WHAT NEXT

MV-057 (error) Nominal voltage %f is not within the range [%f,%f].

DESCRIPTION

WHAT NEXT

MV-058 (error) Could not connect power net '%s' with power pin '%s' on cell '%s'.

DESCRIPTION

The power pin is not compatible with the type of power net.

WHAT NEXT

Check the types of power net and power pin.

MV-059 (error) Could not find power pin '%s' on cell '%s'.

DESCRIPTION

WHAT NEXT

MV-060 (info) Power domain %s has already been defined as always_on relative to power domain %s.

DESCRIPTION

The relative always on relationship between two power domains has already defined.

WHAT NEXT

MV-061 (warning) Power domain %s is always on. Power domain %s can't be explicitly set less always on relative to it.

DESCRIPTION

Relative always on behavior can be set when both power domains are power down domains.

WHAT NEXT

MV-062 (error) Instance domain %s cannot be created until top-level power domain is defined.

DESCRIPTION

WHAT NEXT

MV-063 (error) Domain %s is not a power down domain. Power

down ack signal can be specified only on power down domain.

DESCRIPTION

WHAT NEXT

MV-064 (error) Cell %s can not be added to the power domain.

DESCRIPTION

Only hierarchical cell or black box cell can be added to power domain. Black box cells are defined as cells without behavior.

WHAT NEXT

MV-065 (error) Cell %s already belongs to power domain %s.

DESCRIPTION

A cell can not belong to more than one power domain.

WHAT NEXT

MV-066 (error) Root cell %s is a child cell of %s. Root cells located at different level of hierarchy must not enclose each other.

DESCRIPTION

This message is issued when cell which is a child cell of another cell is specified in power domain definition.

WHAT NEXT

MV-067 (error) Power down signal must be specified using

either port, net or pins.

DESCRIPTION

WHAT NEXT

MV-068 (error) Power down port can be specified only on top-level domain.

DESCRIPTION

WHAT NEXT

MV-069 (error) Only one power down port can be specified on top-level domain.

DESCRIPTION

WHAT NEXT

MV-070 (error) Only input port can be specified as power down

port on top-level domain.

DESCRIPTION

WHAT NEXT

MV-071 (error) Cannot mix power down pin and net definitions.

DESCRIPTION

WHAT NEXT

MV-072 (error) Only one power down net can be specified per domain.

DESCRIPTION

WHAT NEXT

MV-073 (error) Cannot add partial set of instances of the non-uniquified design %s to a power domain.

DESCRIPTION

WHAT NEXT

MV-074 (error) Design-level power domain %s cannot be

removed until all instance power domains are removed.

DESCRIPTION

WHAT NEXT

MV-075 (error) This grouping will split power domain '%s'.

DESCRIPTION

WHAT NEXT

MV-076 (warning) Always on net '%s' is driven by normal cell '%s' of type '%s'.

DESCRIPTION

You receive this message when `check_connection_rules` command detects an always on net that is driven by regular cell. Always on nets must be driven by special cells which always stay powered during operation of the circuit.

WHAT NEXT

Design compiler will automatically fix this error when design is compiled. If you receive this message after design is compiled, please make sure at least one always on buffer and one always on inverter is defined in the target library.

SEE ALSO

`check_mv_design` (2).

MV-077 (warning) Net '%s' drives pass gate pin '%s' of cell '%s' of type '%s' instantiated in power down region.

DESCRIPTION

You receive this message when `check_mv_design` command detects a pass gate pin of a cell that is driven by always on net or a net driven by always on domain. Such

connections are not recommended for power saving reasons since always on nets stay powered during operation of the circuit. This results in power leakage through the pass gate circuit of the pin.

WHAT NEXT

Design Compiler will automatically fix this violation when design is compiled. If you receive this message after design is compiled, please make sure target library has functionally equivalent cell that does not have pass gate pin.

SEE ALSO

`check_mv_design` (2).

MV-078 (warning) Always on cell '%s' of type '%s' drives normal net '%s'.

DESCRIPTION

You receive this message when `check_connection_rules` command detects always on cell driving normal net. Such connection is not recommended for power saving reasons since always on cells drain more power compared to regular cells implementing same functionality.

WHAT NEXT

Design Compiler will automatically fix this violation when design is compiled. Please compile design to eliminate this violation.

SEE ALSO

`check_mv_design` (2).

MV-079 (warning) Output pass gate pin '%s' of cell '%s' drives input pass gate pin '%s' of cell '%s'.

DESCRIPTION

You receive this message when `check_connection_rules` command detects cascaded connection of pass gates. Such connection is not recommended for signal integrity related reasons.

WHAT NEXT

Design Compiler will automatically fix this violation when design is compiled. If you receive this error after design is compiled, please check target libraries and make sure cells without pass gate pins are available.

SEE ALSO

`check_mv_design` (2).

MV-080 (warning) Found '%d' always on nets that are driven by normal cells.

DESCRIPTION

You receive this message when `check_connection_rules` command detects always on nets that are driven by regular cells. Always on nets must be driven by special cells which always stay powered during operation of the circuit.

WHAT NEXT

Design compiler will automatically fix these errors when design is compiled. If you receive this message after design is compiled, please make sure at least one always on buffer and one always on inverter is defined in the target library.

SEE ALSO

`check_mv_design` (2).

MV-081 (warning) Found '%d' net(s) that drive pass gate pins of cells instantiated in power down regions.

DESCRIPTION

You receive this message when `check_connection_rules` command detects pass gate pins of cells that are driven by always on nets or nets driven by always on regions. Such connections are not recommended for power saving reasons since always on cells stay powered during operation of the circuit. This results in power leakage through the pass gate circuit of the pin.

WHAT NEXT

Design Compiler will automatically fix these violations when design is compiled. If

you receive this message after design is compiled, please make sure target library has functionally equivalent cell that does not have pass gate pin.

SEE ALSO

`check_mv_design` (2).

MV-082 (warning) Found '%d' always on cell(s) that drive normal nets.

DESCRIPTION

You receive this message when `check_connection_rules` command detects always on cells driving normal nets. Such connections are not recommended for power saving reasons since always on cells consume more power compared to regular cells implementing same functionality.

WHAT NEXT

Design Compiler will automatically fix these violations when design is compiled. Please compile design to eliminate these violations.

SEE ALSO

`check_mv_design` (2).

MV-083 (warning) Found '%d' cells whose output pass gate pins drive input pass gate pins of other cells.

DESCRIPTION

You receive this message when `check_connection_rules` command detects cascaded connection of pass gates. Such connections are not recommended for signal integrity related reasons.

WHAT NEXT

Design Compiler will automatically fix these violations when design is compiled. If you receive these errors after design is compiled, please check target libraries and make sure cells without pass gate pins are available.

SEE ALSO

`check_mv_design` (2).

MV-084 (error) Always on buffer and inverter were not found in target libraries.

DESCRIPTION

You receive this message when design contains always on logic but always on inverter and buffers were not found in the target libraries.

WHAT NEXT

Add always on buffer and inverter for each operating condition and re-run design compiler.

SEE ALSO

MV-085 (error) Always on buffer and inverter cells are found in target libraries.

DESCRIPTION

You receive this message when always on buffers and inverters are found in the target libraries. These special cells are not supported.

WHAT NEXT

Please remove these cells from target libraries or exclude these cells using `set_dont_use` command.

SEE ALSO

`set_dont_use` (2)

MV-086 (warning) You have provided ambiguous libraries:

%S:%S

%S:%S

Both are characterized for voltage %fV, process %f,
temperature %f
and contain the same lib_cell names (e.g. %s).
The latter library will be ignored.

DESCRIPTION

This warning message occurs when your \$link_library and \$target_library contain multiple libraries which characterize the same lib_cells for the same voltage, process, and temperature. The tool has no way to distinguish which library should be used. This warning will be issued and the first library will be used.

WHAT NEXT

Remove one of the ambiguous libraries from your \$link_library and \$target_library. If you wanted to use both libraries, and they represent different characterization points, the libraries would need to have different nominal_voltage, nominal_process, and nominal_temperature values. The tool matches these library values with the operating conditions applied to the design, to decide which libraries are suitable for the design cells.

SEE ALSO

set_operating_conditions(2)

MV-087 (error) lib_cell %s:%s/%s is inconsistent with lib_cell %s:%s/%s.
%s %s:%s/%s will be ignored.
Please correct your \$link_library and/or \$target_library.

DESCRIPTION

You have provided two libraries describing the same lib_cell name (characterizing the part for different operating conditions). However, the descriptions of the part are not consistent, apart from variation allowed for the characterization.

The reason for the inconsistency is reported following this error message. A typical example is if the lib_cells have a different set of pins.

WHAT NEXT

Remove one of the inconsistent libraries from your \$link_library and \$target_library.

SEE ALSO

MV-088 (error) Library inconsistencies have been reported. This command will not execute.

DESCRIPTION

Inconsistent libraries have been found, and reported with MV-087. The current command will not execute. You need to correct your \$link_library and \$target_library to remove one or both of the inconsistent libraries.

WHAT NEXT

Remove one of the inconsistent libraries from your \$link_library and \$target_library.

SEE ALSO

MV-089 (error) Unsupported method to create always on exception paths in domain '%s' created inside block '%s'.

DESCRIPTION

This message is printed when tool encounters \$power HDL directive that translates into power down domain but has primitive instances in instance list. When tool finds domain with primitive instances, it marks input pins of all these instances with always on attribute. However, this is done only when the domain is designated as always on domain. When domain with a power down signal is found, the tool does not know how to handle domain creation. This message informs users of this condition.

WHAT NEXT

Check \$power directives specified in the RTL and rerun infer_power_domains command.

SEE ALSO

`infer_power_domain(2)`

MV-090 (error) You are using isolation cells without power domains. Use of isolation cells without power domain definitions

is not supported.

DESCRIPTION

This message is printed when isolation cells are found in the design but no power domain specification is found. Starting 2006.06 release of Design Compiler, the tool set is enhanced to support power domain specification. Power domain specification allow users to identify multi voltage / multi supply blocks and specify relative power sequencing behavior between them. This enhancement enables Design Compiler to properly derive constraints on nets connected to isolation cells. Power domains also allow tool to check for incorrect use of isolation cells.

WHAT NEXT

It recommended to use power domain specification for designs containing isolation cells.

SEE ALSO

```
create_power_domain(2)  
check_mv_design(2)
```

MV-091 (error) You are using isolation cells without power domains, as a result the derived design constraints may not be correct. Supply power domain definitions and re-start synthesis session.

DESCRIPTION

This message is printed when isolation cells are found in the design but no power domain specification is found. Starting 2006.06 release of Design Compiler, the tool set is enhanced to support power domain specification. Power domain specification allows users to identify multi voltage / multi supply blocks and specify relative power sequencing behavior between them. This enhancement enables Synopsys tools to properly derive constraints on nets connected to isolation cells so that nets can be optimized using buffers from correct power domain.

Power domains also allow tool to check for incorrect use of isolation cells. This helps identification of incorrect use of ISO cells in early stages of design development.

WHAT NEXT

It recommended to use power domain specification for designs containing isolation cells. If you still want to continue without aborting synthesis, use TCL variable

`allow_iso_cell_without_power_domains` and set it to true prior to compile. Support for derived constraints related to isolation cells without power domains specification will be obsoleted in the next major release of software.

SEE ALSO

`create_power_domain(2)`
`check_mv_design(2)`

MV-092 (error) The command `translate` is not supported for MV designs. In order to translate, please write out a Verilog netlist and run the command in a separate shell.

DESCRIPTION

The command `translate` should only be used for non-MV designs.

WHAT NEXT

Do not use this command for MV designs, or in a shell with `-mv_mode` option. Instead, follow these steps to translate a design that was originally an MV design:

Step 1: start `dc_shell` (without `-mv_mode` option) Step 2: set `link_library` to the old libraries used by the design Step 3: read the design netlist (Verilog/VHDL etc.)
Step 4: set `target_library` to the new libraries Step 5: invoke '`translate`' command
Step 6: apply the multi-voltage constraints now (operating conditions, target library subsets, etc.)

If the original netlist has level-shifters, they would have been removed during the translation. You have to invokes '`insert_level_shifters`' command again to insert level-shifters for the MV design based on the new libraries.

MV-093 (warning) Power domain %s inferred from HDL source is removed. Simulation and synthesis results may not match.

DESCRIPTION

This messages is printed when power domain inferred from HDL is removed using `remove_power_domain` command. Its purpose is to warn users that pre synthesis simulation results of design with power domain definitions in HDL may not match post synthesis simulation results.

SEE ALSO

`infer_power_domain (2)`

MV-094 (warning) Signal %s controlling switching of the domain %s is not connected to cell %s. Power down signal will not be associated with domain being propagated during constrain budgeting.

DESCRIPTION

This message is printed when signal controlling power down behavior was not found during constraint propagation. This can happen when `dc_allocate_budget` or `characterize` command is issued on a cell which does not have power down signal connected to it. Tool will mark propagated domain as power down domain, however, power down signal will not be associated with it. For more information on how domain is marked power down without power down signal, please refer to `create_power_domain` man page.

WHAT NEXT

Connect power down signal to the cell.

SEE ALSO

`create_power_domain(2)`

MV-095 (warning) Power acknowledgement signal %s for domain %s is not connected to cell %s. Power acknowledge signal will not be associated with domain being propagated during constrain budgeting.

DESCRIPTION

This message is printed when power acknowledge signal was not found during constraint propagation. This can happen when `dc_allocate_budget` or `characterize` command is issued on a cell which does not have power acknowledge signal connected to it.

WHAT NEXT

Rewire connections to connect power acknowledge signal to the cell.

SEE ALSO

`create_power_domain(2)`

MV-096 (warning) Retiming will not be performed because one of the blocks (%s) specified for retiming contains heterogeneous operating conditions.

DESCRIPTION

Retiming can only be performed if all the blocks specified for retiming contains homogeneous operating conditions. In other words, every one of them can only have one operating conditions between its hierarchy.

WHAT NEXT

Check that every block specified by `set_optimize_registers` or `set_balance_registers` commands contains only homogenous operating conditions. Specify the sub-blocks separately for retiming if the top block is heterogeneous.

SEE ALSO

`set_optimize_registers(2)`
`set_balance_registers(2)`

MV-097 (error) You have specified power domain definitions and also set variable `disable_iso_net_constraints` to true. Please remove variable from script.

DESCRIPTION

This message is printed when power domain definitions are provided and at the same time `disable_iso_net_constraints` variable is set to true. Variable `disable_iso_net_constraints` should be used only when power domain definitions are not provided.

WHAT NEXT

Remove disable_iso_net_constraints from the script.

SEE ALSO

MV-098 (error) No power domain has been created.

DESCRIPTION

This message is printed when a power domain is needed but has not been created.

WHAT NEXT

Create a power domain.

SEE ALSO

`create_power_domain(2)`

MV-099 (warning) Control signal %s specified on power domain %s will be removed from power domain.

DESCRIPTION

This message is printed when power down control signal or power acknowledge signal is deleted during optimization. This can happen if logic connected to this signal is redundant and optimization algorithms decided to eliminate that logic for saving design area.

This message is also printed when power acknowledge signal is removed from power domain when power down signal is optimized away during optimization. This is because power acknowledge signal can be specified only when power down signal is specified.

When power down signal is removed, domain is marked as power down domain without power down signal.

WHAT NEXT

SEE ALSO

`create_power_domain(2)`

MV-100 (error) For power net %s, either max-delay operating voltage (%f) or min-delay operating voltage (%f) do not reside within a valid range, or they do not reside in the same range.

DESCRIPTION

Both max-delay and min-delay operating voltages must reside in a valid voltage range, and in the same range.

WHAT NEXT

MV-101 (error) Internal power net %s attached to a power domain cannot have different nominal/ranges properties from the primary power net %s.

DESCRIPTION

Internal and primary power nets connected to a power domain must have the same nominal voltages and voltage ranges.

WHAT NEXT

`create_power_net_info`

MV-102 (error) Power/ground net %s cannot be connected to the internal port of a coarse-grained MTCMOS switch-box because the power/ground net is already switched by another switch-box in the design.

DESCRIPTION

To prevent multiple sources/sinks of different voltage levels from connecting to the same power/ground net, only one coarse-grained switch is allowed for a power/ground net.

WHAT NEXT

`create_power_net_info`
`connect_power_domain`

MV-103 (warning) Power/ground net %s is being replaced by %s as a %s connection for power domain %s.

DESCRIPTION: You received this message because this command does not take incremental definitions.

WHAT NEXT: Combine all the power and ground declarations for one particular power domain in one statement for `connect_power_domain`. `connect_power_domain -primary_power_net [] -primary_ground _net []`

MV-104 (error) Redefinition of power net %s.

DESCRIPTION

Power net has been redefined.

WHAT NEXT

MV-105 (error) The template of power states is not defined.

DESCRIPTION

The template of power states need to be defined before create or remove nominal power states.

WHAT NEXT

Set power state template by `set_nominal_power_state_template`.

SEE ALSO

`set_nominal_power_state_template(2)`

MV-106 (error) The definition of power states is incompatible

with the current template.

DESCRIPTION

The definition of power states must be compatible with the template created using the **create_pst** command in UPF mode, or the **set_nominal_power_state_template** command in non-UPF mode. For example:

```
prompt> create_pst my_pst -supplies {VDD VDDG VDDGS VDDMS VDDX VDDXS VDDY VDDYS}
prompt> add_pst_state overdrive -pst my_pst -state {HV HV HV HV LV LV LV}
```

In this example, the number of supplies listed in the template (8) does not match those listed in **add_pst_state** (7).

WHAT NEXT

Rerun the **add_pst_state** command listing the correct number of supplies.

SEE ALSO

add_pst_state(2)
create_nominal_power_state(2)
create_pst(2)
remove_nominal_power_state(2)
set_nominal_power_state_template(2)

MV-107 (error) Voltage %s is not a nominal voltage of %s.

DESCRIPTION

Voltage used to define power state should be one of the nominal voltages of the power net.

WHAT NEXT

SEE ALSO

set_nominal_power_state_template(2)
create_nominal_power_state(2)
remove_nominal_power_state(2)

MV-108 (error) Power net %s is not switchable.

DESCRIPTION

The power net should be switchable if 'off' is used as a nominal voltage.

WHAT NEXT

SEE ALSO

```
set_nominal_power_state_template(2)  
create_nominal_power_state(2)  
remove_nominal_power_state(2)
```

MV-109 (error) power state %s has been defined.

DESCRIPTION

The power state has already been defined.

WHAT NEXT

MV-110 (Error) Power domain %s cannot be defined as always on relative to itself.

DESCRIPTION

The always on relationship can be specified between two different domains.

WHAT NEXT

MV-111 (error) power state template has been defined. To proceed please reset the template.

DESCRIPTION

The power state template can not be set multiple times.

WHAT NEXT

MV-112 (error) can not find power state %s.

DESCRIPTION

The power state to be deleted must be created first.

WHAT NEXT

MV-113 (error) Multicorner feature is not supported in Design Compiler.

DESCRIPTION

All the scenarios should have the same operating conditions.

WHAT NEXT

Specify the same operating conditions for all the scenarios.

SEE ALSO

MV-114 (error) Multi-scenario and multi-voltage features can only be used together in UPF mode in Design Compiler.

DESCRIPTION

You must invoke dc_shell with UPF mode in order to take advantage of the combined support of multi-scenario creation and multi-voltage synthesis.

WHAT NEXT

Rerun the DC script with UPF mode turned on.

MV-115 (warning) Correct %s operating condition cannot be

determined for macro cell %s given the supply voltages %s.

DESCRIPTION

Worst-case or best-case operating conditions are normally derived for a supply connected macro cell if a library containing the macro cell can be determined, and the library has been characterized for the given worst-base or best-case voltage settings, respectively. This warning is given when such a library cannot be found. Instead, the instance-specific operating condition on the macro-cell is used, if given. Otherwise, operating condition of the macro-cell's parent is inherited.

WHAT NEXT

Make sure that all power pins of the macro cell are connected to proper supply nets, and operating voltages (worst and best cases) are properly set. Use check_mv_design command to aid debugging.

To be included in the search for the proper operating condition, the worst-case libraries must be specified in link_library variable, and the best-case libraries must be specified through set_min_library command. The best-case libraries should not be included in the link_library variable.

SEE ALSO

set_min_library

MV-116 (warning) Characterization of power supply data (UPF constraints, operating_voltages, etc.) to hierarchical cell '%s' have been skipped.

DESCRIPTION

In order to correct characterize power supply intent into a hierarchical cell, certain requirements on UPF constraints in terms of the topology of the power domains, its scope, and the supply ports must be met. Some basic requirements are: (1) The instance being characterized to must be aligned to the scope of the power domain containing (covering, in terms of extent) this instance. (2) There should not exist any descendent cell that belongs to a power domain whose scope is above the hierarchical instance we are characterizing to. (3) No supply net should cross the hierarchical boundary of instance being characterized to connect to a lower-level supply port. This is to avoid supply port punching that inadvertently modifies the power intent.

WHAT NEXT

Make sure that the basic requirements as stated in the messages are met, then re-

issue characterize command for the problematic cell.

SEE ALSO

characterize

MV-117 (warning) Characterization of %s '%s' has been skipped because it is referring to objects outside the scope of its domain '%S'.

DESCRIPTION

In order to characterize a strategy (set_retention or set_isolation) or create_power_switch command, the command must not refer to any object outside of its scope.

WHAT NEXT

Correct the skipped commands to refer only to objects defined at the same scope as the domain, then re-issue characterize.

SEE ALSO

characterize set_retention set_isolation create_power_switch

MV-118 (warning) The exception supply connections on cell '%s' are getting lost because its libcell '%s' is being relinked/resized to an incompatible one.

DESCRIPTION

This problem happens when the old and new library cells are incompatible libraries in terms of the followings: (1) have different sets of pg_pin's, (2) have different pg_pin to voltage_name mapping.

The problem is really in the libraries. The libraries in use are either incompatible, or have errors.

WHAT NEXT

Check your libraries using check_lib command.

MV-119 (warning) Characterization of %s '%s' has been skipped because it contains objects not fully representable in the target instance '%s' of characterize.

DESCRIPTION

In order to characterize a strategy that has -elements list, the objects in the -elements list must be fully representable in the target instance of characterize. For example, the following set_retention strategy cannot be characterized to instance U1:

```
set_retention ret1 -domain U1/PD -retention_power_net U1/TVDD -elements {U1  
U1/U2/U3}
```

because within U1, U1 cannot be referenced.

On the other hand, the following set_retention strategy can still be characterized to instance U1:

```
set_retention ret1 -domain U1/PD -retention_power_net U1/TVDD -elements {U1}
```

because within U1, this strategy can be represented using an equivalent form:

```
set_retention ret1 -domain PD -retention_power_net TVDD
```

WHAT NEXT

Correct the skipped commands, possibly by splitting the original strategies into two.

MV-150 (error) Cells '%s' and '%s' in power domain '%s' have different %spower supply voltages.

DESCRIPTION

This error message is printed when two cells in the same power domain are detected to have different power supply voltages. Within one power domain, only one power supply voltage is allowed for all the hierarchical cells.

WHAT NEXT

Check the operating condition for the particular block or cell. Set the proper operating condition using the **set_operating_conditions** command. Or create new power domains to separate cells with different power supply voltages in the different power domains.

SEE ALSO

`set_operating_conditions(2)`
`create_power_domain(2)`
`check_mv_design(2)`

MV-151 (warning) %d more voltage mismatches (MV-150) found in the power domain.

DESCRIPTION

This warning message is printed when there are more MV-150 errors but the `check_mv_design` command has not reported their details.

WHAT NEXT

Use a larger value for the `-max_messages` option of the `check_mv_design` command to see the detailed MV-150 error reporting.

SEE ALSO

`set_operating_conditions(2)`
`create_power_domain(2)`
`check_mv_design(2)`

MV-152 (error) Using %s net %s as a %s connection of a power domain is not allowed.

DESCRIPTION

You are either trying to: (1) use a power net as a ground connection for a power domain, or, (2) use a ground net as a power connection for a power domain. This is not allowed.

WHAT NEXT

MV-155 (information) Found target library subset specification

on cell "%s". The cell will not be ungrouped.

DESCRIPTION

Cells with target library subset specification can't be ungrouped.

WHAT NEXT

SEE ALSO

`compile(2)`

MV-156 (warning) Retention strategy "%s" will not be implemented for cell "%s" in power domain "%s". This cell has no mapping constraint defined using the `map_retention_cell` command.

DESCRIPTION

This warning indicates that the specified cell targeted for retention synthesis has not been mapped using the `map_retention_cell` command. As a result, the strategy will not be implemented for the specified cell.

WHAT NEXT

Use the `map_retention_cell` command to map all the cells specified using the `-elements` option of the `set_retention` command.

SEE ALSO

`set_retention(2)`
`map_retention_cell(2)`

MV-157 (warning) Retention strategy "%s" for power domain "%s" has no mapping constraints defined using the `map_retention_cell` command. No retention cells will be inserted

for this strategy.

DESCRIPTION

This warning indicates that mapping constraints have not been defined on the retention strategy for the specified power domain using the `map_retention_cell` command. As a result, no retention cells will be inserted for the specified strategy.

WHAT NEXT

Define the mapping constraints for the retention strategy using the `map_retention_cell` command.

SEE ALSO

`set_retention(2)`
`map_retention_cell(2)`

MV-158 (warning) The library cell "%s" does not exist in the target libraries.

DESCRIPTION

This warning indicates that the library cell specified using the `map_retention_cell` command, does not exist in the target libraries.

WHAT NEXT

Make sure the library cell specified using the `map_retention_cell` command exists in the target libraries.

SEE ALSO

`map_retention_cell(2)`

MV-161 (warning) The library cell "%s" is not in the correct power and ground(PG) pin format.

DESCRIPTION

This warning indicates that the target libraries contain retention cells that are not in the correct power and ground(PG) pin format.

WHAT NEXT

Use the target libraries which have all the retention cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-162 (warning) The library cell "%s" does not have a primary power pin.

DESCRIPTION

This warning indicates that the library cell must have a primary power pin for it to be in the correct power and ground(PG) pin format.

WHAT NEXT

Use the target libraries that have all the library cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-163 (warning) The library cell "%s" does not have a primary ground pin.

DESCRIPTION

This warning indicates that the library cell must have a primary ground pin for it to be in the correct power and ground(PG) pin format.

WHAT NEXT

Use the target libraries that have all the library cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-164 (warning) The multi-rail %s library cell "%s" does not have a backup power or backup ground pin.

DESCRIPTION

This warning indicates that the multi-rail library cell must have a backup power or backup ground pin for it to be in the correct power and ground(PG) pin format.

WHAT NEXT

Use the target libraries that have all the library cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-165 (warning) Found %d retention library cell(s) that are not in the correct power and ground(PG) pin format.

DESCRIPTION

This warning is a summary of the violating retention library cells that are not in the correct power and ground(PG) pin format.

WHAT NEXT

Use the `check_mv_design -verbose` command to view the details of these violations.
Use the target libraries that have retention cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`
`check_mv_design(2)`

MV-165a (warning) The multi-rail retention library cell "%s" does not have the save pin related to its backup power pin.

DESCRIPTION

This warning indicates that the multi-rail retention library cell does not have the save pin related to its backup power pin. This relation is required by the tool to synthesize this cell.

WHAT NEXT

Use the target libraries that have all the retention cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-165b (warning) The multi-rail retention library cell "%s" does not have the restore pin related to its backup power pin.

DESCRIPTION

This warning indicates that the multi-rail retention library cell does not have the restore pin related to its backup power pin. This relation is required for the tool to synthesize this cell.

WHAT NEXT

Use the target libraries that have all the retention cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-165c (warning) The retention library cell "%s" does not have all its signal pins related to a primary power or primary ground pin.

DESCRIPTION

This warning indicates that one or more signal pins of the retention library cell are not related to a primary power or primary ground pin. This relation is required for the tool to synthesize this cell.

WHAT NEXT

Use the target libraries that have all the retention cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-166 (warning) The retention cell "%s" does not have any associated UPF retention strategy.

DESCRIPTION

This warning indicates that the retention cell in the design is not associated with any UPF retention strategy. All retention cells need to have an associated strategy.

WHAT NEXT

Use the **set_retention** command to define a new strategy in the power domain to which the cell belongs. After defining the strategy, use the **map_retention_cell** command to map this cell. Mapping the cell associates it with a UPF retention strategy.

SEE ALSO

```

"%s" is not related to any of its power pins.

DESCRIPTION

This warning indicates that the pin is not related to any power pins of the level shifter library cell.

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-167b (warning) The pin "%s" of the level shifter library cell "%s" is not related to any of its ground pins.

DESCRIPTION

This warning indicates that the pin is not related to any ground pins of the level shifter library cell.

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-167c (warning) The power pin "%s" of the level shifter library cell "%s" is not related by any of its signal pins.

DESCRIPTION

This warning indicates that the power pin of the level shifter library cell is not the related power pin for any of its signal pins.

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-167d (warning) The enable and the output pin of the enabled level shifter library cell "%s" are not related to the same primary power pin.

DESCRIPTION

This warning indicates that the enable and the output pin of the enabled level shifter library cell must be related to the same primary power pin.

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-167e (warning) The "input_signal_level" attribute is required on the input pin of the single-rail level shifter library cell "%s".

DESCRIPTION

This warning indicates that the "input_signal_level" attribute is not defined on the input pin of the single-rail level shifter library cell. The definition of this attribute is expected on the input pin of the single-rail level shifter library cell.

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-167f (warning) The "input_voltage_range" attribute is required on the input pin of the level shifter library cell "%s".

DESCRIPTION

This warning indicates that the "input_voltage_range" attribute is required on the input pin of the level shifter library cell unless the variable "mv_default_level_shifter_voltage_range_infinity" is set to "TRUE".

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-167g (warning) The "output_voltage_range" attribute is required on the output pin of the level shifter library cell "%s".

DESCRIPTION

This warning indicates that the "output_voltage_range" attribute is required on the output pin of the level shifter library cell unless the variable "mv_default_level_shifter_voltage_range_infinity" is set to "TRUE".

WHAT NEXT

Use the target libraries that have all the level shifter cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-168 (warning) The isolation cell "%s" does not have any

associated UPF isolation strategy.

DESCRIPTION

This warning indicates that the isolation cell in the design is not associated with any UPF isolation strategy. All isolation cells must have an associated strategy.

WHAT NEXT

Use the **set_isolation** command to define a new isolation strategy in the power domain, on the port that the cell is isolating.

SEE ALSO

`set_isolation(2)`

MV-169 (warning) Found %d isolation library cell(s) that are not in the correct power and ground(PG) pin format.

DESCRIPTION

This warning is a summary of the violating isolation library cells that are not in the correct power and ground(PG) pin format.

WHAT NEXT

Use the **check_mv_design -verbose** command to view the details of these violations. Use the target libraries that has isolation cells in the correct power and ground(PG) pin format.

SEE ALSO

`check_mv_design(2)`

MV-169a (warning) The pin "%s" of the isolation library cell "%s" is not related to any of its power pins.

DESCRIPTION

This warning indicates that the pin of the isolation library cell is not related to any of its power pins. All the pins of the isolation library cell must be related to a power pin (must have the `related_power_pin` attribute defined).

WHAT NEXT

Use the target libraries that have all the isolation cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-169b (warning) The pin "%s" of the isolation library cell "%s" is not related to any of its ground pins.

DESCRIPTION

This warning indicates that the pin of the isolation library cell is not related to any of its ground pins. All the pins of the isolation library cell must be related to a ground pin (must have the `related_ground_pin` attribute defined).

WHAT NEXT

Use the target libraries that have all the isolation cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-169c (warning) The isolation library cell "%s" does not have its output pin related to its backup power pin.

DESCRIPTION

This warning indicates that the isolation library cell must have its output pin related to its backup power pin (through the `related_power_pin` attribute), if it exists.

WHAT NEXT

Use the target libraries that have all the isolation cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-169d (warning) The isolation library cell "%s" does not have its output pin related to its backup ground pin.

DESCRIPTION

This warning indicates that the isolation library cell must have its output pin related to its backup ground pin (through the `related_ground_pin` attribute), if it exists.

WHAT NEXT

Use the target libraries that have all the isolation cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-170 (warning) Found %d always-on library cell(s) that are not in the correct power and ground(PG) pin format.

DESCRIPTION

This warning is a summary of the violating always-on library cells which are not in the correct power and ground(PG) pin format.

WHAT NEXT

Use the `check_mv_design -verbose` command to view the details of these violations. Use target libraries that have always-on cells in the correct power and ground(PG) pin format.

SEE ALSO

`check_mv_design(2)`

MV-170a (warning) The always-on library cell "%s" does not

have a backup power or backup ground pin. This can lead to undesirable results in synthesis as the cell may lose power.

DESCRIPTION

This warning indicates that the always-on library cell does not have a backup power pin. As there are no backup pins on the cell, it may not remain powered when the power domain containing the cell turns off. Special consideration needs to be given to the cell's placement, while going to place and route, to ensure the cell stays on.

WHAT NEXT

Use the target libraries that have all the always-on cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-170b (warning) Pin "%s" of the always-on library cell "%s" is not related to its backup power pin.

DESCRIPTION

This warning indicates that the always-on library cell does not have all its signal pins related to the cell's backup power pin. This relation is required for the tool to synthesize this cell.

WHAT NEXT

Use the target libraries that have all the always-on cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-170c (warning) Pin "%s" of the always-on library cell "%s" is

not related to a backup ground pin.

DESCRIPTION

This warning indicates that the always-on library cell does not have all its signal pins related to the cell's backup ground pin. This relation is required for the tool to synthesize this cell.

WHAT NEXT

Use the target libraries that have all the always-on cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-171 (warning) Buffer or Inverter library cell "%s" is not in the proper PG pin format. Connecting supply nets to these cells may not be possible.

DESCRIPTION

This is a severe warning which indicates that always on cells that exist in the target libraries violate the PG pin rules. Using such cells in synthesis can cause undesirable results.

WHAT NEXT

Use the target libraries that have all the always-on cells in the correct power and ground(PG) pin format.

SEE ALSO

`target_library(2)`

MV-172 (information) A total of %d cases found where a retention strategy or a cell targeted for retention synthesis do not have a map_retention_cell constraint defined; %d of them have

been reported.

DESCRIPTION

This is a summary of total number of retention strategies or cells targeted for retention synthesis that do not have a `map_retention_cell` constraint defined.

WHAT NEXT

All of these violations can be viewed using the `check_mv_design -max_messages` command. Use a larger value with `-max_messages` if you are already seeing this message with the `check_mv_design` command.

SEE ALSO

```

MV-176 (warning) The operating condition of the cell "%s", under retention strategy "%s", in power domain "%s", does not

match with the operating condition of any of the retention library cells, which have been set as a mapping constraint.

DESCRIPTION

This warning indicates that the operating condition of the specified cell does not match with the operating condition of any of the retention library cells, set as a mapping constraint using the **-lib_cells** option of the **map_retention_cell** command.

WHAT NEXT

Check if at least one of the retention library cells, set as a mapping constraint, have been characterized for the required operating voltage in the target libraries/target library subset. Also check if the correct voltage has been set for the cell which needs to be mapped. The existing operating condition for the cell can be viewed using the **report_cell** command.

SEE ALSO

```
set_retention(2)
set_voltage(2)
set_target_library_subset(2)
map_retention_cell(2)
report_cell(2)
```

MV-177 (warning) The operating condition of the cell "%s", under retention strategy "%s", in power domain "%s", does not match with the operating condition of retention library cells of type "%s".

DESCRIPTION

This warning indicates that the operating condition of the specified cell does not match with the operating condition of any of the retention library cells of the specified type, set as a mapping constraint using the **-lib_cell_type** option of the **map_retention_cell** command.

WHAT NEXT

Check if at least one of the retention library cells of the specified type, set as a mapping constraint, have been characterized for the required operating voltage in the target libraries/target library subset. Also check if the correct voltage has been set for the cell which needs to be mapped. The existing operating condition for the cell can be viewed using the **report_cell** command.

SEE ALSO

```
set_retention(2)
set_voltage(2)
set_target_library_subset(2)
map_retention_cell(2)
report_cell(2)
```

MV-178 (information) A total number of %d retention library cells and/or cell types found, whose operating conditions do not match with that of cells, on which they have been set as mapping constraints; %d of them have been reported.

DESCRIPTION

This is a summary of a total number of cases where the specified retention library cells or library cells of a specified type, have their operating conditions mismatched with the operating conditions of the cells, on which they have been set as mapping constraints, using **-lib_cells** and/or **-lib_cell_type** of the **map_retention_cell** command.

WHAT NEXT

As a result of the mismatch of the operating conditions, the cells which bear the retention library cells or library cell type constraints will not be mapped. Clear the existing mapping constraints, set the correct mapping constraints on the cell and run **compile** again to map these cells.

SEE ALSO

```
map_retention_cell(2)
compile(2)
```

MV-179 (warning) Non-technology cell pin %s will not be applied related supply nets.

DESCRIPTION

`set_related_supply_net` command is supported only on design ports and leaf cell pins.

WHAT NEXT

If hierarchical pins were included unintentionally in the objects, no action is

needed. The design ports and leaf cell pins specified in the object list have been applied related_supply_net attributes.

SEE ALSO

`set_related_supply_net(2)`

MV-180 (information) Applying related_supply_nets (power = '%s', ground = '%s') to port/pin '%s'.

DESCRIPTION

This is just an information to inform you are the `set_related_supply_net` setting has been applied.

WHAT NEXT

None.

SEE ALSO

`set_related_supply_net(2)`

MV-200 (error) No power domain definitions found in the design.

DESCRIPTION

This message is printed when power domain definitions are not found in the design. Power domains allow precise definition of operating environment and switching behavior of the design. Without power domains, certain operations, such as insertion of isolation cells, cannot be performed.

WHAT NEXT

Provide power domain definitions.

SEE ALSO

`create_power_domains(2)`

MV-201 (error) Usable ISO/ELS cells matching name %s could

not be found in link libraries.

DESCRIPTION

This message is displayed when ISO/ELS cells for a given name do not exist in link libraries or when cells are marked dont_use or dont_touch.

WHAT NEXT

Check link library setting. Check library cell name or remove dont_use or dont_touch attribute from library cells.

MV-202 (warning) Changes to electrical isolation between power domains modified design functionality.

DESCRIPTION

Insertion or deletion of ISO/ELS cells modify design functionality. Formal verification may fail to compare post and pre synthesis designs.

WHAT NEXT

MV-203 (error) ISO/ELS cell %s is marked dont touch. It will not be removed.

DESCRIPTION

remove_isolation_cell command does not remove isolation cells with dont touch attribute.

WHAT NEXT

Use -force option and re-run remove_isolation_cell command.

SEE ALSO

`remove_isolation_cell(2)`

MV-204 (error) Cell %s is not isolation cell or enabled level

shifter. It will not be removed.

DESCRIPTION

WHAT NEXT

SEE ALSO

`remove_isolation_cell(2)`

MV-205 (error) Pin or port %s controlling enable pins of isolation cell must have output direction.

DESCRIPTION

WHAT NEXT

SEE ALSO

`insert_isolation_cell(2)`

MV-206 (warning) ISO cell was added on always on net %s.

DESCRIPTION

This message informs that ISO cell was added on always on net.

WHAT NEXT

SEE ALSO

`remove_isolation_cell(2)`

MV-210 (warning) Found %d incorrect instantiation(s) of level

shifters.

DESCRIPTION

This message summarizes total number of level shifters in design which do not implement correct voltage shifts. Information on individual violation can be obtained by running check_mv_design command using -verbose switch.

WHAT NEXT

Make sure reference library cell in each violation reported by check_mv_design implements voltage shift correctly.

SEE ALSO

check_mv_design(2)

MV-211 (warning) Found %d level shifter(s) with input pin fan-in logic operating at different voltages.

DESCRIPTION

This message summarizes total number of level shifters in design whose input pins are driven by cells which operate at different voltages. Information on individual violation can be obtained by running check_mv_design command using -verbose switch.

WHAT NEXT

Make sure each level shifter is driven by cells which operate at same voltage.

SEE ALSO

check_mv_design(2)

MV-212 (warning) Found %d level shifter(s) with output pin fan-out logic operating at different voltages.

DESCRIPTION

This message summarizes total number of level shifters in design which drive cells operating at different voltages. Information on individual violation can be obtained by running check_mv_design command using -verbose switch.

WHAT NEXT

Check connections and make sure level shifters drive cells which operate at same voltage.

SEE ALSO

`check_mv_design(2)`

MV-213 (warning) Found %d level shifter(s) not conforming to level shifter insertion strategy.

DESCRIPTION

This message summarizes total number of level shifters which do not conform to level shifter insertion strategy set by `set_level_shifter_strategy` command. Information on individual violation can be obtained by running `check_mv_design` command using -verbose switch.

WHAT NEXT

Change level shifter insertion strategy or remove appropriate level shifters from net-list.

SEE ALSO

`check_mv_design(2)`
`set_level_shifter_strategy(2)`

MV-214 (warning) Found %d pin to pin connection(s) without level shifter(s).

DESCRIPTION

This message summarizes total number pin to pin connections which require level shifters but on which no level shifters were found. Information on individual violation can be obtained by running `check_mv_design` command using -verbose switch.

WHAT NEXT

If you receive this warning after compile, make sure nets are not dont touched. If they are dont touched, remove dont touch attribute and recompile design. Also, make sure technology libraries have level shifters which implement appropriate level shifts. You can ignore this warning issued at the beginning of the compile. Compile

will automatically insert level shifters. Alternatively, you can insert level shifters manually by issuing `insert_level_shifter` command.

SEE ALSO

`check_mv_design(2)`
`insert_level_shifter(2)`

MV-215 (warning) Found %d net(s) with net drivers operating at different voltages.

DESCRIPTION

This message summarizes total number of nets in design which are driven by cells operating at different voltages. Information on individual violation can be obtained by running `check_mv_design` command using `-verbose` switch.

WHAT NEXT

Make sure each net is driven by cells which operate at same voltage.

SEE ALSO

`check_mv_design(2)`

MV-216 (warning) Cell %s is used to shift voltage levels %.3f->%.3f. However, its reference cell %s is designed to shift %.3f->%.3f.

DESCRIPTION

This message is printed when incorrect level shifter is instantiated to shift voltage difference between driver and load pins.

WHAT NEXT

If this level shifter is manually instantiated in the design and if it is deliberately marked as `dont touch`, then this message can be ignored. If this level shifter is not `dont touch`, then compile or `insert_level_shifter` command will replace it with the correct level shifter available in the library.

SEE ALSO

`compile(2)`
`insert_level_shifter(2)`

MV-217 (warning) Input pin %s of level shifter %s is driven by pins %s(%fV) and %s(%fV) which operate at different voltages.

DESCRIPTION

This message is printed when a level shifter input pin is driven by two drivers which operate at different voltages. The tool prints the first two pins that it finds. It is possible that additional pins operating at different voltages are connected to level shifter.

WHAT NEXT

Check level shifter connections.

SEE ALSO

`insert_level_shifter(2)`

MV-218 (warning) Output pin %s of level shifter %s drives pins %s(%fV) and %s(%fV) which operates at different voltages.

DESCRIPTION

This message is printed when a level shifter ouput pin drivs two load pins which operate at different voltages. The tool prints the first two pins that it finds. It is possible that additional pins operating at different voltages are connected to level shifter.

WHAT NEXT

Check level shifter connections.

SEE ALSO

`insert_level_shifter(2)`

MV-219 (warning) Level shifter %s(%f->%f) does not conform to strategy "%s".

DESCRIPTION

This message is printed when level shifter is found when it is not required based on strategy specified by set_level_shifter_strategy command was found.

WHAT NEXT

Check level shifter strategy setting. If the level shifter cell is dont touch, remove dont touch. Rerun insert_level_shifter or compile.

SEE ALSO

```
set_level_shifter_strategy(2)
insert_level_shifter(2)
compile(2)
```

MV-220 (warning) Found multi voltage net %s without level shifter. The net connects pins %s(%fV) and %s(%fV) which operate at different voltages.

DESCRIPTION

This message is printed when a multi voltage net crossing voltage boundary without level shifter is found.

WHAT NEXT

Insert level shifters using insert_level_shifter command or compile the design.

SEE ALSO

```
insert_level_shifter(2)
compile(2)
```

MV-221 (warning) Net %s is driven by pins %s(%fV) and

%s(%fV) which operate at different voltages.

DESCRIPTION

This message is printed when a net is driven by two drivers which operate at different voltages. The tool prints the first two driver pins that it finds. It is possible that additional pins operating at different voltages are connected to the net.

WHAT NEXT

Check net connections.

SEE ALSO

`insert_level_shifter(2)`

MV-222 (warning) Found %d pin to pin connections requiring level shifter(s) on dont touch nets.

DESCRIPTION

This message summarizes total number of pin to pin connections on dont touch nets with missing level shifters. More information on each net connection can be obtained by running `check_mv_design` in verbose mode.

WHAT NEXT

Use `check_mv_design` in verbose mode to report the details of level shifter violations. Use `insert_level_shifter` and/or `compile` to insert level shifters to remove the violations.

SEE ALSO

`check_mv_design(2)`
`insert_level_shifter(2)`
`compile(2)`

MV-223 (warning) Found %d violating level shifter(s) that are

marked dont touch.

DESCRIPTION

This message summarizes total number of level shifters that are marked dont touch. Tool will not be able to perform optimization of these cells. More information on each violation can be obtained by running check_mv_design in verbose mode.

WHAT NEXT

Run check_mv_design to report the details of the violations on those level shifters. In order to remove the level shifters with violations, please remove the dont_touch on the level shifters.

SEE ALSO

check_mv_design(2)

MV-224 (warning) Net %s is dont touch. Level shifter will not be added on this net.

DESCRIPTION

This message informs that level shifter cannot be added on the net because it is marked dont touch.

WHAT NEXT

SEE ALSO

MV-225 (warning) Level shifter %s is marked dont touch. It will not be optimized.

DESCRIPTION

This message informs that level shifter will not be optimized because it is marked dont touch.

WHAT NEXT

In order to enable optimization on the level shifters, remove the dont touch on

them.

SEE ALSO

MV-226 (information) Net %s is clock net which requires level shifter.

DESCRIPTION

This message informs that level shifter is required on a clock net.

WHAT NEXT

SEE ALSO

MV-227 (warning) Found clock net %s without level shifter. The net connects pins %s(%fV) and %s(%fV) which operate at different voltages.

DESCRIPTION

This message is printed when a clock net crossing voltage boundary without level shifter is found.

WHAT NEXT

Insert level shifters using `insert_level_shifter` command or compile the design. Check man pages of these commands on further instructions on how level shifters on clock nets can be inserted.

SEE ALSO

`insert_level_shifter(2)`
`compile(2)`

MV-228 (warning) Found %d pin to pin connections on clock

nets requiring level shifter(s).

DESCRIPTION

This message summarizes total number of pin to pin connections with missing level shifters on clock nets. More information on each connection can be obtained by running check_mv_design in verbose mode.

WHAT NEXT

Insert level shifters using insert_level_shifter command or compile the design. Check man pages of these commands on further instructions on how level shifters on clock nets can be inserted.

SEE ALSO

```
check_mv_design(2)
insert_level_shifter(2)
compile(2)
```

MV-229 (warning) Found %d pin to pin connections requiring level shifter(s).

DESCRIPTION

This message summarizes total number of pin to pin connections with missing level shifters. More information on each net connection can be obtained by running check_mv_design in verbose mode.

WHAT NEXT

Run check_mv_design in verbose mode to report more details. Run insert_level_shifter or compile the design to insert level shifters.

SEE ALSO

```
check_mv_design(2)
insert_level_shifter(2)
compile(2)
```

MV-230 (warning) Found dont touch net %s without level shifter. The net connects pins %s(%fV) and %s(%fV) which operate

at different voltages.

DESCRIPTION

This message is printed when a dont touch net crossing voltage boundary without level shifter is found.

WHAT NEXT

Remove dont touch attribute. Insert level shifters using `insert_level_shifter` command or compile the design.

SEE ALSO

`insert_level_shifter(2)`
`compile(2)`

MV-231 (warning) Pin '%s'(%s) cannot drive '%s'(%s) due to %s.

DESCRIPTION

This message is printed when the driver pin can not drive the load pin. The reasons are: 1) Driver pin and load pin is operating at different voltages (`set_voltage` defines the operating voltage of a supply net). 2) PST indicates that the driver pin and load pin could operate at different voltages. 3) The port states definition are incomplete. For example, port states have been defined on the supply of the driver pin but not the load pin.

WHAT NEXT

Completely define port states on supply nets if it is not done yet. Insert level shifters using `insert_level_shifter` command or `compile` the design.

SEE ALSO

`insert_level_shifter(2)`
`compile(2)`
`set_level_shift_strategy(2)`
`set_voltage(2)`

MV-232 (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has any of the following violations.
'Floating': the input/output pin of the level shifter is not connected.
'Voltage range mismatch': the level shifter library cell cannot satisfy the voltage shifting range.
'Level shifter type mismatch': the type of the level shift library cell is incompatible with the level shifting rule defined by set_level_shift_strategy.
'Location mismatch': the location of the level shifter cannot satisfy the location requirement defined on the level shifter library cell.

WHAT NEXT

Re-insert level shifters using remove_level_shifter and insert_level_shifter commands or re-compile the design.

SEE ALSO

```
insert_level_shifter(2)  
compile(2)  
set_level_shift_strategy(2)
```

MV-232a (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'voltage range mismatch' violation: the level shifter library cell cannot satisfy the voltage shifting range. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check if the voltage range defined for the level shifter library cell has covered the voltage range specified by the power state table in the design.

Re-insert level shifters using remove_level_shifter and insert_level_shifter commands or re-compile the design.

SEE ALSO

```
insert_level_shifter(2)  
compile(2)  
set_level_shift_strategy(2)  
report_level_shifter(2)
```

MV-232b (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'type mismatch' violation: the type of the level shift library cell is incompatible with the level shifting rule defined by `set_level_shift_strategy`. More detail information are shown by the `report_level_shifter` command.

WHAT NEXT

Check if the level shifter type defined for the level shifter library cell has covered the all possible conversion type specified by the power state table in the design.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

`report_level_shifter(2)`
`insert_level_shifter(2)`
`compile(2)`
`set_level_shift_strategy(2)`

MV-232c (warning) Level shifter '%s' has %s violation due to location constraint.

DESCRIPTION

This message is printed when a level shifter has 'main power mismatch' violation: the location of the level shifter cannot satisfy the location requirement defined by the level shifter library cell. More detail information are shown by the `report_level_shifter` command.

WHAT NEXT

Check if the power pin with attribute of `std_cell_main_rail` is connected to the default supply of the domain where the level shifter is located at.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

`insert_level_shifter(2)`

```
compile(2)
set_level_shift_strategy(2)
```

MV-232d (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'Floating' violation: the level shifter is floating. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check the input/output connectivity of the level shifter.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

```
report_level_shifter(2)
insert_level_shifter(2)
compile(2)
set_level_shift_strategy(2)
```

MV-232e (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'Unmapped' violation: the level shifter is unmapped. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check if there exist level shifter libraries for mapping the level shifter cell.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

```
report_level_shifter(2)
insert_level_shifter(2)
compile(2)
```

```
set_level_shift_strategy(2)
```

MV-232f (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'operating condition mismatch' violation. This violation could be caused by an mismatch between the input/output signal levels of the level shifter and operating voltages of its driver and load, or by an mismatch between the process and temperature of the level shifter and its operating environment. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check if the operating condition of the level shifter library cell matches the voltage specified on the supplies connected to the level shifters.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

```
report_level_shifter(2)
insert_level_shifter(2)
compile(2)
set_level_shift_strategy(2)
set_voltage(2)
```

MV-232g (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'target library subset mismatch' violation. This violation shows that the level shifter library cell doesn't belong to the target library subset defined on its parent block. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check if the level shifter belongs to a library that is included in the target library subset defined for the parent hierarchy for the level shifter.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

```
report_level_shifter(2)
insert_level_shifter(2)
compile(2)
set_level_shift_strategy(2)
set_target_library_subset(2)
```

MV-232h (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'no state on supply' violation. This violation shows that no valid port states have been defined on any port connected to one of the supply net of the level shifter. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check if the supplies of the level shifter are connected to a supply port with port states defined.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

```
report_level_shifter(2)
insert_level_shifter(2)
compile(2)
set_level_shift_strategy(2)
add_port_state(2)
```

MV-232i (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'isolation violation'. This violation occurs when PST has defined a power state that the input supply of the buffer-type level shifter is off while the output supply of the buffer-type level shifter is on. More detail information are shown by the **report_level_shifter** command.

WHAT NEXT

Check if PST has defined a state where the input supply of the level shifter is off

and the output is not.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

`insert_level_shifter(2)`
`compile(2)`
`set_level_shift_strategy(2)`

MV-232j (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'supply not available' violation. This violation occurs when the supply of the level shifter has not been defined inside the domains of the level shifter. More detail information are shown by the `report_level_shifter` command.

WHAT NEXT

Define the supplies of the level shifter in the domain where the level shifter is located.

SEE ALSO

`insert_level_shifter(2)`
`compile(2)`
`set_level_shift_strategy(2)`

MV-232k (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'supply undetermined' violation. This violation occurs when the supply of a level shifter is not determined. More detail information are shown by the `report_level_shifter` command.

WHAT NEXT

This warning occurs when the tool can not automatically determine the supply of the level shifter. Connecting the power pins of the level shifter to appropriate supplies would help to resolve the problem.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

`report_level_shifter(2)`
`insert_level_shifter(2)`
`compile(2)`
`set_level_shift_strategy(2)`
`connect_supply_net(2)`

MV-232I (warning) Level shifter '%s' has violations(s): %s.

DESCRIPTION

This message is printed when a level shifter has 'redundant' violation. This violation occurs when the level shifter is not needed in the design. More detail information are shown by the `report_level_shifter` command.

WHAT NEXT

Check if the input and output supply of the level shifter is the same or connected.

Re-insert level shifters using `remove_level_shifter` and `insert_level_shifter` commands or re-compile the design.

SEE ALSO

`report_level_shifter(2)`
`insert_level_shifter(2)`
`compile(2)`
`set_level_shift_strategy(2)`

MV-233 (error) An off state (supply port state) has been defined on supply port %s, which is part of a ground supply network.

DESCRIPTION

You have added an off supply port state to a supply port which is part of a ground supply network. This is not allowed, because 2007.12 release does not support power switching at ground supply network.

WHAT NEXT

Re-design your supply network. Specifically, remove any off state from supply ports

that are part of any ground supply networks.

MV-234 (error) remove_upf command cannot be used once a UPF design has been compiled.

DESCRIPTION

You were trying to remove UPF constraints after the UPF design has gone through compile. This is not supported, and design compiler does not support reverting netlist changes effected by UPF constraints.

The command 'remove_upf' can only be used on a UPF design if it has not been compiled at all.

WHAT NEXT

Please fix your UPF files as needed, and reload into the original RTL netlist.

MV-235 (error) UPF/MV data '%s' cannot be retrieved because of previous error.

DESCRIPTION

Some errors have occurred and they prevent further progress in retrieving UPF data. This could happen in the following cases (not exhaustive): (1) you are reading a .ddc with incorrect library setup. For example, missing some macro cell libraries. Watch out for LINK-5 error happening before this. (2) you are reading a .ddc from ICC into DC, and the .ddc file contains PG netlist. This is currently not supported as of 2009.06.

WHAT NEXT

Fix previous errors and try again.

MV-250 (warning) Voltage Area %s has no placeable area, voltage area utilization will not be computed.

DESCRIPTION

This warning message is issued when the placeable area is 0 in the VA (voltage

area), it happens because there are no free space for placement, the VA is fully occupied by : (1) blockages; (2) hard macros;

WHAT NEXT

Please check what fully occupies the VA.

SEE ALSO

`create_voltage_area` (2) `report_voltage_area` (2)

MV-499 (warning) A dual power always-on cell '%s' of type '%s' is used in power domain with always-on strategy of single_power.

DESCRIPTION

You receive this message when `check_connection_rules` command detects that a dual power always on cell is instantiated in shutdown power domain that requires single power cells as always-on. This is violation of always-on strategy specified on the power domains.

WHAT NEXT

Design Compiler will automatically fix this violation when design is compiled. Please compile design to eliminate this violation.

SEE ALSO

`check_mv_design` (2).

MV-500 (error) The support of power_domain and power_net_info is not available in current shell.

DESCRIPTION

The support of power_domain and power_net_info is limited to some tools such as IC Compiler and Design Compiler. This message is printed when power_domain or power_net_info objects are to be created in a shell not supporting them.

WHAT NEXT

Use a product/shell supporting power_domain/power_net_info. For example, IC Compiler or Design Complier.

SEE ALSO

`create_power_domain(2)`
`create_power_net_info(2)`

MV-501 (error) Failed to load voltage area %s because no cell is associated with it.

DESCRIPTION

This error occurs when there is a voltage area in Milkyway database, but no cell is associated with it.

WHAT NEXT

Check the tool/script that generated the Milkyway database. Or re-create the voltage area using `create_voltage_area` command.

SEE ALSO

`create_voltage_area(2)`

MV-502 (error) Consistency check between power domains and voltage areas failed.

DESCRIPTION

This error message occurs when the matching between power domains and voltage areas failed. For a design with both voltage areas and power domains, there should be one voltage area with the same name for each power domain (except the top power domain) and vice versa. And the matching voltage area and power domain should also include the same set of hierarchical cells.

WHAT NEXT

Check voltage areas and power domains in the design and make them consistent.

SEE ALSO

`report_voltage_area(2)` `report_power_domain(2)`

MV-503 (error) Power net hookup for power domains is not specified properly.

DESCRIPTION

This error occurs when the tool cannot get the required power net hookup information for power domains. It may due to the following issues:

- A power domain does not have primary power/ground net.
- A power net info object does not have a power/ground net with same name in the netlist.

WHAT NEXT

Hookup primary power/ground connections for all power domains. Make sure each power net info object have a matching power/ground net with same name in the design. If the auto-hookup for tie-off cells is not needed, this requirement can be waived by using variable `mv_enable_power_domain_power_net_check`.

SEE ALSO

`connect_power_domain(2)` `connect_pg_net(2)` `connect_logic_zero(2)` `connect_logic_one(2)`
`mv_enable_power_domain_power_net_check(3)`

MV-504 (warning) Tie high/low pin %s of always-on cell %s is connected to power/ground net %s.

DESCRIPTION

This messages is printed when an always-on cell has an input pin tied to logic constant and a power/ground net is connected to the pin.

SEE ALSO

`create_power_domain (2)` `create_power_net_info (2)` `connect_power_domain (2)`
`connect_logic_one(2)` `connect_logic_zero(2)`

MV-505 (warning) Tie high/low pin %s of cell %s is connected to

power/ground net %s other than the primary power/ground net %s of its power domain.

DESCRIPTION

This messages is printed when a power/ground net is used for a tie-high/low connection, and the power/ground net is not the primary power/ground net of the cell's power domain. This happens often on cells with special and/or mutliple power connections, such as always-on cells, retention registers, macros, etc.

SEE ALSO

`create_power_domain (2)` `create_power_net_info (2)` `connect_power_domain (2)`
`connect_logic_one(2)` `connect_logic_zero(2)`

MV-506 (warning) Power/ground net %s connected to logic constant pin %s of cell %s does not match the cell's power connection.

DESCRIPTION

This messages is printed when the power/ground net connected to a tie off pin is not the same net derived based power connections of the cell's power domain.

WHAT NEXT

Check whether the tie high/low connection is correct. If not, fix it automatically using commands `connect_logic_one -reconnect_all`, `connect_logic_zero -reconnect_all`, or perform manual connection through command `connect_pg_net`.

SEE ALSO

`connect_logic_one(2)` `connect_logic_zero(2)` `connect_pg_net(2)` `create_power_domain (2)`
`create_power_net_info (2)` `connect_power_domain (2)`

MV-507 (warning) The power domain %s has an associated voltage area. This association will be lost after removal of the

power domain.

DESCRIPTION

This message is printed when a power domain being removed using `remove_power_domain` command has an associated voltage area. It is recommended to also remove the associated voltage areas and have a consistent design information.

WHAT NEXT

Remove the associated voltage area using `remove_voltage_area` command.

SEE ALSO

`create_power_domain` (2) `remove_power_domain` (2) `create_voltage_area` (2)
`remove_voltage_area` (2)

MV-508 (error) Power pins in logical lib_cell %s (linked to cell %s) do not match with power pins in the corresponding FRAM lib_cell.

DESCRIPTION

This messages is printed when the power pin information in logical lib_cell does not match with that in the corresponding FRAM lib_cell.

WHAT NEXT

Check whether the logical lib_cell and the corresponding FRAM lib_cell have same number of power pins, the power pins have same names, and a power pin with the same name have the same power/ground type.

SEE ALSO

`check_mv_design(2)`

MV-509 (error) Total %d logical lib_cell(s) used in the design have power pins not matching with the corresponding FRAM

lib_cell(s).

DESCRIPTION

This messages is printed when the power pin information in one or more logical lib_cells do not match with that in the corresponding FRAM lib_cells.

WHAT NEXT

Use **check_mv_design -power_net -verbose** to print out the lib_cells having inconsistent power pin information.

SEE ALSO

check_mv_design(2)

MV-510 (warning) Power connection/checking is skipped for %d power pins because the required power pin information cannot be found in logical libraries.

DESCRIPTION

This messages is printed when one or more logical lib_cells do not have power pin information.

WHAT NEXT

Get detail information on lib_cells without power pins using **check_mv_design -power_net -verbose**, and switch to logical libraries with power pins.

SEE ALSO

check_mv_design(2)

MV-511 (warning) Total %d power pin(s) are found having connections inconsistent with their power domain(s).

DESCRIPTION

This messages is printed when there are one or more power pins whose existing

connection is inconsistent to power domain connection.

WHAT NEXT

Get detail information on these power pins using `check_mv_design -power_net -verbose`.

SEE ALSO

`check_mv_design(2)` `connect_power_net_info(2)` `create_power_domain(2)`
`connect_power_domain(2)` `auto_connect_pg_nets(2)`

MV-512 (warning) Logical lib_cell %s (linked to cell %s) does not have power/ground pin definition.

DESCRIPTION

This messages is printed when the logical lib_cell do not have power pin information. The automatic power connection and checking may not work for cells using the lib_cell.

WHAT NEXT

Switch to logical libraries with power pins.

SEE ALSO

`check_mv_design(2)`

MV-513 (warning) Isolation cell %s connecting pin %s (related supply net %s) and %s (related supply net %s) may be redundant. Supply net %s is more always on or equal always on to supply net %s.

DESCRIPTION

This is message is printed when isolation cell is found on a signal path that does not require isolation cell. Isolation cell is required to isolate signal path only if domain of the driver pin is less always on than domain of the load pin. When the tool determines that domain of the driver pin is equal to or more always on than the domain of the load pin, then it considers isolation cell as redundant and issues the

message.

EXAMPLES

Let us consider design with following power state table. PORT1, PORT2 and PORT3 are supply ports connected to 0.7V supply. These ports also have off state informing the tool that domain connected to ports can switch off. Lets assume, VDD_1, VDD_2 and VDD_3 are connected to PORT1, PORT2 and PORT3, respectively.

```
add_port_state -state {s_off off} -state {s0.7 0.7} PORT1
add_port_state -state {s_off off} -state {s0.7 0.7} PORT2
add_port_state -state {s_off off} -state {s0.7 0.7} PORT3
create_pst pst_table -supplies {PORT1 PORT2 PORT3}

add_pst_state -pst pst_table -state {s0.7 s0.7 s_off} state1
add_pst_state -pst pst_table -state {s0.7 s0.7 s0.7} state2
add_pst_state -pst pst_table -state {s_off s_off s_off} state3
```

Now let us consider ISO cell ISO_CELL1 connected between driver and load pins two gates, G1 and G2. Also consider that power pin of G1 is connected to PORT1 supply port and power pin of G2 is connected to supply port PORT2. From state1 and state2 of the power state table, it is evident that PORT1 is equal always on to PORT2. That means G1 and G2 are in operation or switched off simultaneously. The tool will detect this and inform that ISO_CELL1 may not be required.

Warning: Isolation cell ISO_CELL1 connecting pin G1/Q (related supply net VDD_1) and G2/A (related supply net VDD_2) may be redundant. Supply net VDD_1 is more always on or equal always on to supply net VDD_2. (MV-513)

Now let us consider ISO cell ISO_CELL2 connected between driver and load pins two gates, G3 and G4. Also consider that power pin of G3 is connected to PORT1 supply port and power pin of G4 is connected to supply port PORT3. From state1 and state3 of the power state table, it is evident that PORT1 is more always on to PORT3. That means G3 is always in operation when G4 is in operation (but not the other way). The tool will detect this and inform that ISO_CELL2 may not be required.

Warning: Isolation cell ISO_CELL2 connecting pin G3/Q (related supply net VDD_1) and G4/A (related supply net VDD_3) may be redundant. Supply net VDD_1 is more always on or equal always on to supply net VDD_3. (MV-513)

WHAT NEXT

Check power state table table and ensure always on relationship between supply nets is correctly specified.

SEE ALSO

```
create_pst(2)
add_port_state(2)
report_pst(2)
```

MV-514 (warning) Power state of driver pin %s (related supply net %s) is less always on or unrelated to power state of load pin %s (related supply net %s). Isolation cell is required on net %s connecting these pins.

DESCRIPTION

This message occurs when a net without an isolation cell is found. The isolation cell is required to isolate the signal path if the domain of the signal's driver pin is *less always on* or *unrelated* to the domain of the signal's load pin. When the tool determines that the domain of the driver pin is *less always on*, or *unrelated* compared to the domain of the load pin, then it considers a need for the isolation cell and issues the warning message.

EXAMPLES

Let us consider design with following power state table. PORT1, PORT2 and PORT3 are supply ports connected to 0.7V supply. These ports also have off state informing the tool that domain connected to ports can switch off. Lets assume, VDD_1, VDD_2 and VDD_3 are connected to PORT1, PORT2 and PORT3, respectively.

```
add_port_state -state {s_off off} -state {s0.7 0.7} PORT1
add_port_state -state {s_off off} -state {s0.7 0.7} PORT2
add_port_state -state {s_off off} -state {s0.7 0.7} PORT3
create_pst pst_table -supplies {PORT1 PORT2 PORT3}

add_pst_state -pst pst_table -state {s0.7 s_off s0.7} state1
add_pst_state -pst pst_table -state {s0.7 s_off s_off} state2
add_pst_state -pst pst_table -state {s_off s0.7 s_off} state3
```

Now let us consider a net N1, between two gates, G1 and G2. Also consider that power pin of G1 is connected to PORT1 supply port and power pin of G2 is connected to supply port PORT2. From state3 of the power state table, it is evident that PORT1 is less always on than PORT2. That means G1 can switch off when G2 is in operation. The tool will detect this and indicate the need of isolation cell on net N.

Warning: Power state of driver pin G1/Q (related supply net VDD_1) is less always on or unrelated to power state of load pin G2/A (related supply net VDD_2). Isolation cell is required on net N1 connecting these pins. (MV-514)

Now let us consider a net N2, between two gates, G3 and G4. Also consider that power pin of G3 is connected to PORT2 supply port and power pin of G4 is connected to supply port PORT3. From state1 and state3 of the power state table, it is evident that PORT2 and PORT3 do not have specific always on relationship. That is, their switching behavior is unrelated. That means G3 can switch off when G4 is in operation and vice a versa. The tool will detect this and indicate the need of isolation cell on net N2.

Warning: Power state of driver pin G3/Q (related supply net VDD_2) is less always on or unrelated to power state of load pin G4/A (related supply net VDD_3). Isolation

cell is required on net N2 connecting these pins. (MV-514)

WHAT NEXT

This is only a warning message. No action is required.

However, if the results are not what you intended, check the power state table and ensure the *always on* relationship between supply nets are correctly specified. Correct errors if needed, or insert the isolation cell and run the command again.

MV-515 (error) Following %d regular cell(s) on always-on path(s) is(are) having no corresponding always-on power guide(s). It will cause always-on legality violation.

DESCRIPTION

This messages is printed when the always-on paths contains one or more regular single-powered cells but there exists no corresponding always-on power_guide.

WHAT NEXT

Set always-on power guides inside the relevant voltage area.

SEE ALSO

`set_power_guide(2)`

MV-516 (warning) Found two back to back connected isolation cells %s and %s with same enable signals and connected to equivalent power supply network. One of the isolation cells may be redundant.

DESCRIPTION

This message is printed when tool detects two isolation cells with same enable

signal and connected to equivalent power supply.

WHAT NEXT

Remove one of the isolation cells.

SEE ALSO

MV-517 (warning) Found %d isolation cell(s) whose power on state is less always on or unrelated to the power on state of domain connected to its output pin.

DESCRIPTION

This message summarizes number of isolation cells with improper power supply connection.

WHAT NEXT

Please run command **check_mv_design** in verbose mode for details.

SEE ALSO

check_mv_design (2).

MV-518 (error) Supply nets connected together cannot have different operating voltages.

DESCRIPTION

This error message occurs when you attempt either of the following actions:

- Connect two groups of supply nets that are currently operating at different voltages.
- Specify different operating voltages on supply nets that are connected together as a group.

WHAT NEXT

Respecify the operating voltages on the supply nets so that all supply nets connected together as a group operate at the same voltage.

MV-519 (error) Cannot insert an isolation cell on net %s connected to pin %s.

DESCRIPTION

This error message occurs when the `insert_isolation_cell` command cannot insert an isolation cell on the specified net.

The tool cannot insert an isolation cell when it encounters any of the following conditions:

- The isolation cell reference is not characterized to the operating condition specified on the net's subdesign.
- The isolation cell does not exist in the target library subset specified on the net's subdesign.
- The net has multiple drivers or it is connected to an I/O driver.
- The net is set as `dont_touch` or always on.
- The net has load pins operating at multiple voltages.

WHAT NEXT

Run the `insert_isolation_cell -verbose` command on the error nets for more information. After making any necessary changes, run the command again.

SEE ALSO

`insert_isolation_cell(2)`

MV-520 (warning) On state of isolation cell output pin %s (related supply net %s) is less always on or unrelated to the on state of pin %s (related supply net %s). Signal path through net %s from pin %s to pin %s may be broken when isolation cell gets

turned off.

DESCRIPTION

This message is printed when tool detects the on state of isolation cell output pin is less always on compared to on state of load pin driven by isolation cell. The message is also printed when these two pins have undefined always on relationship. If isolation cell loses power when the domain that it is isolating is in operation, the it is possible for isolation cell's floating output pin to drive logic that is powered on. This may cause unexpected consequences.

EXAMPLES

Let us consider design with following power state table. PORT1, PORT2 and ISO_PORT are supply ports connected to 0.7V supply. These ports also have off state informing the tool that domain connected to ports can switch off. Lets assume, VDD_1, VDD_2 and VDD_ISO are connected to PORT1, PORT2 and PORT_ISO, respectively.

```
add_port_state -state {s_off off} -state {s0.7 0.7} PORT1
add_port_state -state {s_off off} -state {s0.7 0.7} PORT2
add_port_state -state {s_off off} -state {s0.7 0.7} ISO_PORT
create_pst pst_table -supplies {PORT1 PORT2 ISO_PORT}

add_pst_state -pst pst_table -state {s0.7 s0.7 s_off} state1
add_pst_state -pst pst_table -state {s0.7 s0.7 s0.7} state2
add_pst_state -pst pst_table -state {s_off s0.7 s0.7} state3
```

Let us consider that ISO cell "iso" connects driver and load pins of two gates G1 and G2. Let us also consider that power pins of G1 and G2 are connected to supply ports PORT1 and PORT2 respectively. Cell iso is required since PORT1 is less always on than PORT2 which is evident from state1 and state2 of the power state table. Let us consider that ISO_PORT is connected to isolation power supply of "iso". Looking at state1 of the power state table, it is evident that ISO_PORT is less always on than PORT2. This can result in output of "iso" to switch off when gate G2 is in operation. Tool detects this condition and issues message.

On state of isolation cell output pin iso/DO (related supply net ISO_VDD) is less always on or unrelated to the on state of pin G1/A (related supply net VDD2). Signal path through net N from pin iso/DO to pin G/A may be broken when isolation cell gets turned off. (MV-520)

WHAT NEXT

Check power state table table and ensure always on relationship between supply nets is correctly specified.

add_pst_state(2)
```

```
report_pst(2)
```

MV-521 (warning) Found %d always on cell(s) without supply connections.

DESCRIPTION

This warning message advises you of the number of always on cells for which the tool cannot determine the power connections.

WHAT NEXT

This is only a warning message. No action is required.

However, to obtain more information, run the **check_mv_design** command with the **-verbose** option.

SEE ALSO

```
check_mv_design(2)
```

MV-522 (warning) Found cell %s with missing supply connection. The cell is on always on path ending at %s pin(s).

DESCRIPTION

This message is printed when tool could not derive power connection for cells on always-on path. To connect power for always on cells, the tool first determines the supply net of the always on anchor pin such as enable pin of isolation cell or control pins of retention register. It then uses the supply net to connect power pins of always on cells. Such power hookup ensures that always on path is in operation as long as control pin is operation.

WHAT NEXT

You can take one or more of the following steps to debug the power connections.

1. Use net-list traversal commands to determine the always on anchor pins driven by the output of the cell with missing connection. Few always on anchor pin are printed in the message.
2. By inspecting UPF file, identify related supply net of the always on anchor pin.
3. Make sure the supply net is available in the cell's parent domain. If the supply

net is not available, then use -reuse switch of create_supply_net command to declare the availability of the net.

4. Check if cell drives multiple always on anchor pins with different supply nets.

5. Check if the cell will missing connection is linked to a library that is characterized for voltage other than always on anchor pin's related supply. This can happen if cell is inserted on always on path to fix functionality violations and when domain's primary supply voltage is different than always on anchor pin's supply voltage. The functionality violations are fixed when identical power management cell is not available and sense specification on control pin requires insertion of inverter on AO net.

`connect_logic_one(2)`
`connect_logic_zero(2)`

MV-532 (error) Load pins of hierarchical tie-off pin %s requires conflicting P/G nets; for example, load pin %s requires P/G net %s, while load pin %s requires P/G net %s.

DESCRIPTION

This error happens when the multiple load pins of a hierarchical tie-off pin have

conflicting P/G net requirement. When a hierarchical signal pin is connected to logic constant or P/G nets, the hierarchical pin together with its load nets and load pins become a hierarchical tie-off net. All load pins of a hierarchical tie-off net need to be connected to the same power or ground net finally because they are all driven by one hierarchical pin and the pin can be driven by only one P/G net. In multi-voltage designs, different tie-off pins may require different P/G nets, depending on their voltage areas, power domains, or P/G pins' power connections. Therefore, a hierarchical tie-off net will get this error when not all its load pins require the same P/G net. This typically happens for hierarchical tie-off nets crossing multiple voltage areas and/or power domains. The error needs to be fixed by users through manual netlist editing to break such a hierarchical tie-off net, such that all load pins of each hierarchical tie-off net need the same P/G net. Reporting commands **all_fanin** and **all_fanout** can be used to trace the connections of a hierarchical tie-off net.

WHAT NEXT

report_voltage_area(2)
```

MV-610 (info) Needs level shifters %s from %s to %s. No suitable library cells are found.

DESCRIPTION

This message shows that certain level shifters are needed to be inserted on a particular net or replace an isolation (or enabled level shifter) cell. Adding suggested level shifters to the library is one way (but not the only way) to help the tool to eliminate voltage violations on the global net to which the target net/cell belongs. This message is followed by the reasons why level shifters in current libraries can not be used.

The following factors are considered for level shifter insertion: functionality, target library (subset), input/output signal level, level shifter type, input/output voltage range, and standard cell main power setting.

WHAT NEXT

Add qualified level shifter cells to the library and/or making more power nets (in power domain or UPF designs) available for level shifters.

SEE ALSO

MV-611 (warning) %d nets required level shifters but matching

level shifters were not found.

DESCRIPTION

This warning message shows the total number of global nets which requires level shifters but no suitable level shifters can be found in the library. In general, to successfully insert level shifter, all conditionals including level shifter type, operating conditions, target library subset, standard cell main power setting, input/output_voltage_range, and availability of supply nets should be satisfied. If it is possible, information message **MV-753** would be shown to identify the root cause. Otherwise, setting variable **mv_insert_level_shifter_verbose** to be **true** could also help to find the exact reason(**MV-610**) why level shifters could not be inserted.

WHAT NEXT

Use **check_mv_design -level_shifters -verbose** to display the required level shifters on each net. In particular, MV-231 would be found to describe the pin-to-pin voltage shifting violations if no level shifters could be found to fix the violations.

Follow MV-753 and MV-610 to ensure that appropriate level shifters could be inserted to fix existing level shifter violations in the design.

SEE ALSO

```
report_level_shifter(2)
insert_level_shifter(2)
compile(2)
set_level_shift_strategy(2)
MV-753(n)
MV-610(n)
```

MV-612 (warning) %d nets required level shifters but was ignored.

DESCRIPTION

This warning message shows the total number of global nets which require level shifters, but are considered ineligible for level shifter insertion and ignored.

WHAT NEXT

Use 'check_mv_design -level_shifters -verbose' to show why the nets are not eligible for level shifter insertion.

SEE ALSO

MV-613 (warning) The global net driven by pin %s is ineligible for level shifter insertion %s.

DESCRIPTION

This warning message shows why a global net is not eligible for level shifter insertion.

WHAT NEXT

SEE ALSO

MV-614 (warning) %d nets has level shifter constraints but no level shifters are inserted.

DESCRIPTION

This warning message shows the total number of global nets which have level shifter strategy (constraints) defined but no violations are found. No level shifters are inserted to these nets.

WHAT NEXT

SEE ALSO

MV-616 (warning) Some nets (ports) in the global net driven by pin %s is not allowed for level shifter insertion.

DESCRIPTION

The message states that some ports of a global net are not allowed for level shifter insertion, which could be caused by dont_touch, special handling of clock net, and no_shift level shifter strategy. This could make it more difficult to find a solution for level shifter insertion on the global net.

WHAT NEXT

SEE ALSO

MV-617 (warning) large distance (%d) between components %d and %d may stop the proper buffering on paths between them.

DESCRIPTION

The message is printed when large distances are found in disjoint VA design.

In disjoint VA design, if a distance between two disjoint components is too large, QoR issues might be caused in place and route phase. In pre-place phase, ICC will try to find and report such components so that user can adjust the design floorplan in early phase.

By default, the tool will use value defined by `set_max_net_length` as threshold to analyze the large distances. If the value is not defined, a threshold based on the buffer features used by current design will be derived.

The disjoint voltage area analysis can be triggered by `check_physical_design -phase pre_place_opt`.

WHAT NEXT

User should try to adjust the large voltage areas by put them closer to avoid this warning.

SEE ALSO

`check_physical_design(2)`

MV-618 (info) found %d disjoint voltage areas.

DESCRIPTION

This message is triggered by `check_physical_constraint` when disjoint voltage areas are found. All disjoint voltage areas will be shown.

The distance of any two disjoint components in a disjoint va will be checked. If the distance is potentially large to impact buffering, warning message **MV-617** will be given.

WHAT NEXT

SEE ALSO

MV-617

MV-627 (error) Supply net %s and %s are connected to the same power switch %s, but they have been used as different power/ground types.

DESCRIPTION

This error message occurs when there are supply nets of different power or ground types, as used in other commands, being connected to the same power switch. A power switch is used to switch either the power, or the ground network, but not a mixture of both.

WHAT NEXT

Check all UPF connections and constraints using the specified supply net and its connected supply nets, and make sure they are all used only as a power net or only as a ground net.

SEE ALSO

```
connect_supply_net(2)
create_power_switch(2)
set_domain_supply_net(2)
set_isolation(2)

```

MV-750 (error) The point with coordinate %s is not in voltage area %s.

DESCRIPTION

This error occurs when a point which is supposed to be inside the given voltage area, is not inside.

WHAT NEXT

Check the point's coordinate and voltage area boundary

MV-751 (information) Apply operating condition %s (voltage = %s, process = %f, temperature = %f) to cell %s.

DESCRIPTION

This information message happens when an operating condition is automatically applied to a cell. For each type of operating condition at most 10 messages are allowed by default. Variable **mv_max_auto_opcond_message** can be used to change the total number of allowed messages.

WHAT NEXT

The automatic application of opcond could have eliminated some MV-001 errors shown previously. Please use `check_mv_design` to display the updated list of MV-001 errors.

If the automatically applied operating condition is not desired, use **set_operating_conditions** to prevent the automatical application of operating conditions by the tool.

SEE ALSO

`set_operating_conditions(2)`

MV-752 (information) No port state has been defined. Level shifter insertion is based on operating voltages.

DESCRIPTION

This information message happens when no port state has been defined on any port of the design. Under this circumstances, level shifters are inserted with only consideration of operating voltages defined by **set_voltage** or operating conditions defined by **set_operating_conditions**.

WHAT NEXT

Define port states on supply ports and power state table if necessary.

SEE ALSO

`set_operating_conditions(2)`
`set_voltage(2)`
`create_pst(2)`
`add_port_state(2)`

MV-753 (info) Level shifter %s from library %s cannot be %s because %s.

DESCRIPTION

This message shows that certain (enabled) level shifters cannot be instantiated in the design due to tight constraints.

WHAT NEXT

Relax the constraints would help the insertion of level shifters.

SEE ALSO

`set_level_shifter(2)`

MV-754 (error) Cannot insert an isolation cell on net %s because it is undriven.

DESCRIPTION

This error message occurs when the `insert_isolation_cell` command cannot insert an isolation cell on an undriven net.

The tool cannot insert an isolation cell when it encounters any of the following conditions:

- The isolation cell reference is not characterized to the operating condition specified on the net's subdesign.
- The isolation cell does not exist in the target library subset specified on the net's subdesign.
- The net has multiple drivers or it is connected to an I/O driver.
- The net is set as `dont_touch` or always on.
- The net has load pins operating at multiple voltages.
- The net is not driven by any pin.
- The port is floating.

WHAT NEXT

Run the **insert_isolation_cell -verbose** command on the error nets for more information. After making any necessary changes, run the command again.

SEE ALSO

[insert_isolation_cell\(2\)](#)

MV-755 (error) Cannot insert an isolation cell on port %s because it is floating.

DESCRIPTION

This error message occurs when the **insert_isolation_cell** command cannot insert an isolation cell on floating port.

The tool cannot insert an isolation cell when it encounters any of the following conditions:

- The isolation cell reference is not characterized to the operating condition specified on the net's subdesign.
- The isolation cell does not exist in the target library subset specified on the net's subdesign.
- The net has multiple drivers or it is connected to an I/O driver.
- The net is set as dont_touch or always on.
- The net has load pins operating at multiple voltages.
- The net is not driven by any pin.
- The port is floating.

WHAT NEXT

Run the **insert_isolation_cell -verbose** command on the error nets for more information. After making any necessary changes, run the command again.

SEE ALSO

```

MV-757 (error) Failed to get matching power or ground net for power_net_info object %s.

DESCRIPTION

This error message occurs when the specified power_net_info does not have a matching power or ground net.

WHAT NEXT

Use the **derive_pg_connection -create_net** command to create power or ground nets if they are missing. Ensure that all supply nets and ports are properly defined and connected.

check_mv_design(2)
derive_pg_connection(2)
```

MWCN

MWCN-001 (error) When build and check full name for "%s", error "%s

DESCRIPTION

Please find cooresponding explanation for each error:

mwcnMsgEscStyleMismatch: The base name's escaping style (NO_ESCAPE) is not compatible with the database (APF). Please add '' in front of every hierarchical delimiter.

mwcnMsgNameTooLong: The full name's length exceeds 1024 characters that database can support. You can try to use a shorter name instead.

MWCN-002 (information) The database is not modified.

DESCRIPTION

This message occurs when the tool attempted to change object names in the database into an supported escaping style, but did not change any name or database property.

MWCN-003 (warning) Changing name from %s to %s is NOT the default behavior!

DESCRIPTION

This warning message occurs when the tool is trying to do a non-default change to the escaping style of the object names in the database. The default change of each escaping style is listed below:

```
NO_ESCAPE --> NO_ESCAPE (no change)
APF --> APF (no change)
VERILOG --> NO_ESCAPE
APF_VERILOG(mixed) --> APF
DEF --> APF
UNKNOWN --> NO_ESCAPE
```

MWCN-004 (error) Changing name from %s to %s is not

allowed!

DESCRIPTION

This warning message occurs when the tool is ordered to do an unsupported change of the escaping style of the object names in the database. The supported change for each escaping style is listed below:

```
NO_ESCAPE --> NO_ESCAPE (no change)
APF --> APF (no change), NO_ESCAPE
VERILOG --> NO_ESCAPE
APF_VERILOG(mixed) --> APF, NO_ESCAPE
DEF --> APF, NO_ESCAPE
UNKNOWN --> NO_ESCAPE
```

MWCN-005 (information) Changing names from %s to %s...

DESCRIPTION

This message indicates that the tool is changing the object names in the database into a different escaping style and the user need to wait for the change to complete. The supported target escaping styles are APF and NO_ESCAPE style.

MWCN-006 (warning) Cannot open name-change log file %s for write.

DESCRIPTION

This warning message occurs when the tool is changing the escaping style of object names in the database. It attempts to record the object name changes in a log file with a given name, but the file cannot be opened.

MWCN-007 (information) Log file %s generated for changed object name.

DESCRIPTION

This message occurs after the tool has changed the object names in the database into a different escaping style. It indicates that a log file with a given name is generated for the user's reference. All name changes are recorded in the log file.

MWCN-008 (information) The database is changed into %s style.

DESCRIPTION

This message indicates that the tool has changed the escaping style of object names in the database into a different style.

MWCN-009 (error) The target style %s is not supported!

DESCRIPTION

This warning message occurs when the tool is trying to change the object names in the database into an unsupported escaping style. The supported target escaping styles are APF and NO_ESCAPE style.

MWCN-010 (warning) The hierarchy information of net 0x%08x %s cannot be decided, skipped changing the name of 0x%08x.

DESCRIPTION

This warning message occurs when the tool is trying to change the name of a flat net from an unsupported escaping style to a supported one. Because the flat net or one of its hierarchical net is not contained in any hierarchical cell instance, its full name cannot be decided. Therefore the name changing does not happen.

MWCN-011 (warning) %s 0x%08x and %s 0x%08x both have name %s. Skipped changing the name of 0x%08x due to undecidable hierarchy information.

DESCRIPTION

This warning message occurs when a scalar name is colliding with a bus name due to name escaping style changing. When this happens, the tool always tries to change the scalar name instead of the bus name. This message indicates that at least one of the two objects is not contained in any hierarchical cell instance. The full name of the uncontained object cannot be decided. So the attempted changing of the scalar name does not happen.

MWCN-020 (information) Changed name of %s 0x%08x from %s to %s.

DESCRIPTION

This information message shows up when the name of an object is being changed from an unsupported escaping style into a supported style. It lists the object id, old name and new name. The name changing information can also be found in the name-change log file.

WHAT NEXT

See name-change log file for record of name changes.

MWDB

MWDB-1 (error) Cell does not have a cell boundary.

DESCRIPTION

You received this error message because cell boundary is missing.

WHAT NEXT

Run initialize_floorplan

MWDC

MWDC-001 (error) Can not create instance master '%s' in FRAM view.

DESCRIPTION

You receive the error message because for some reasons, the instance master can't be created in FRAM view. For instance, please check the read and write permission for FRAM directory, please check if the instance master name is longer than 1024 chars, the instance master should not existed.

WHAT NEXT

Please check the read and write permission for the FRAM directory

MWDC-002 (error) Can not create cell instance '%s' because can't find the reference cell in FRAM view.

DESCRIPTION

For create operation, user should have full permission of the library. The cell instance's name should be valid, that means the name is unique, the name's length should not be longer than 1024 chars. Another thing is the master of the cell instance should be available in FRAM view.

WHAT NEXT

MWDC-003 (error) Can not create cell instance '%s'.

DESCRIPTION

You receive this error message because by some reasons the cell instance can't be created, for instance, the cell instance name is not unique, master of the cell instance can't be found in FRAM view, the cell instance's name is too long, more than 1024 chars, permission is not allowed to create it in the library.

WHAT NEXT

MWDC-004 (error) Can not create port '%s'.

DESCRIPTION

For create operation, user should have full permission for the milkyway library, and the name should be unique, the name length should not be longer than 1024 chars.

WHAT NEXT

MWDC-005 (error) Cannot find instance in CEL view '%s'.

DESCRIPTION

User should have read permission for CEL view, and check that the instance name being input is correct or not.

WHAT NEXT

MWDC-006 (error) Cannot create net '%s'.

DESCRIPTION

For create action, user should have full permission for the Milkyway library, and the name should be unique; also the name length should not be longer than 1024 chars.

WHAT NEXT

MWDC-007 (warning) Scaling factor less than 1, will result in

loss of accuracy.

DESCRIPTION

WHAT NEXT

MWDC-008 (error) Unable to get direction for pin '%s' of cell '%s', assuming INPUT.

DESCRIPTION

During loading Milkyway library, a no direction pin was found: by default, the pin will be set to INPUT pin.

WHAT NEXT

MWDC-009 (error) Unable to find port '%s' in CEL.

DESCRIPTION

To find a port in CEL, you should provide a valid port name, and the owner cell should exist and be valid too.

WHAT NEXT

MWDC-010 (error) Failed to open %s %s.

DESCRIPTION

This error message indicates that the specified MW design library cannot be open. The reasons for this could be either of the following.

- Library/CEL name not specified.
- Library/CEL named not found in the search_path.

- Library/CEL named not found in the search_path.
- Library/CEL is locked.
- No read/write permissions for the Library/CEL.

WHAT NEXT

Please check that the MW design library/CEL names are specified, and that they exist in one of the directories specified in the search_path. They should also be unlocked and the user should have read/write permissions for them.

MWDC-011 (error) Hierarchy preservation does not exist; this command cannot proceed.

DESCRIPTION

This error message occurs when the input CEL view does not contain hierarchy preservation data. Various commands eg **link**, **current_design** require hierarchy preservation data to be present in the CEL view, in order to properly create the data structures required to execute those commands. Since the hierarchy preservation data cannot be found, the command cannot continue.

WHAT NEXT

Regenerate the input CEL view with hierarchy preservation data and run the command again. For example, if the CEL was created using some other tool, eg Astro, use Astro to save the CEL properly.

SEE ALSO

`link(2)`
`current_design(2)`

MWDC-012 (error) Cannot open library '%s'.

DESCRIPTION

This error message occurs when the FRAM view and technology file cannot be found. Or, the design lib directory name may be an invalid Milkyway design lib, for example, an existing normal unix dir.

WHAT NEXT

Verify that the Milkyway library directory is a valid mw design lib directory and the files are available and that you have write permission for the Milkyway library directory and then run the command again.

MWDC-013 (error) Cannot initialize route storage for design '%S'.

DESCRIPTION

This error message occurs when route info will not be loaded for this design.

WHAT NEXT

Check that you have write permission for the directory which the test case is running. Also check that there is disk space available in the directory. Some disk space is necessary for storing route information used in the current session.

MWDC-014 (error) Cannot write Milkyway for un-uniquified, un-mapped design.

DESCRIPTION

For a design to be written out in Milkyway database format, it has to be uniquified and mapped, since the Milkyway database does not support un-uniquified or un-mapped design. This error occurs when the design in memory is un-uniquified/un-mapped, and a command was executed that would trigger writing of design to Milkyway database. Besides save_mw_cel, commands that internally link the design could trigger creation of auto-CEL, which could lead to this error if the design is un-uniquified or un-mapped.

WHAT NEXT

Please make sure the design is mapped and uniquified.

MWDC-015 (error) Invalid hierarchy preservation: hierPort (0x%x) is connected to hierNet (0x%x), which is not in the same

level of hierarchy.

DESCRIPTION

This error message occurs when the hierarchy preservation data in the Milkyway CEL is inconsistent. A hierarchical port can only be connected to a hierarchical net that is within the same level of hierarchy. In this case, the hierPort and the hierNet above are not in the same level of hierarchy. This Milkyway CEL cannot be read in.

WHAT NEXT

Run the `astRepairHierPreservation` command in Jupiter or Astro.

MWDC-016 (error) Invalid hierarchy preservation: hierNet (0x%x) is connected to hierPort (0x%x) but hierPort is not connected to hierNet.

DESCRIPTION

This error message occurs when the hierarchy preservation data in the Milkyway CEL is inconsistent. The hierNet appears to be connected to the hierPort, but the hierPort does not appear to be connected to this hierNet.

WHAT NEXT

Run the `astRepairHierPreservation` command in Jupiter or Astro.

MWDC-017 (warning) Leaf pin (0x%x) connected to hier net (0x%x) but not connected to any flat net.

DESCRIPTION

You receive the error message because the flat and hierarchical netlist in the CEL have been found to be inconsistent. A leaf pin connected to hier net should be connected to a corresponding flat net.

WHAT NEXT

If this CEL was generated by Astro/JXT, try running '`astRepairHierPreservation`' command in Astro/JXT. If the CEL was generated by PC/ICC, or if

'astRepairHierPreservation' in Astro/JXT did not resolve the issue, please contact Synopsys Support.

MWDC-020 (Warning) Design is from MW. This command does not incrementally update the CEL. This will result loosing route data.

DESCRIPTION

This design is read from MW database. Command you are currently running does not incrementally update the in-memory CEL. This means the changes done by this command will not be there in CEL and you will loose some data.

WHAT NEXT

set the variable mw_create_cel_force to TRUE, to avoid incremental update of CEL. However this might results in loosing the route data.

MWDC-021 (Error) Design is from MW. This command does not incrementally update the CEL. Can not proceed.

DESCRIPTION

This design is read from MW database. Command you are currently running does not incrementally update the in-memory CEL. As the variable mwdc_update_bypass_error is set to FALSE, this error can not be bypassed.

WHAT NEXT

Set the variable mw_create_cel_force to TRUE, to avoid incremental update of CEL. Set the variable mwdc_update_bypass_error to TRUE to bypass this error. However this will results in loosing the route data.

MWDC-022 (warning) Some MWDC messages have been suppressed. The following list gives the number and format of

the messages.

DESCRIPTION

Some MWDC message formats are issued no more than 20 times (by default) to avoid extremely long log files.

WHAT NEXT

Use the **`mwdc_message_limit`** variable to allow more instances of each format to be issued. Example: set **`mwdc_message_limit`** 10000 allows ten thousand instances of each format to be issued before suppressing the rest.

MWDC-023 (information) CellInst '%s' (%s) is not part of hierarchy or did not link and will be treated as physical only.

DESCRIPTION

This message may be followed by MWDC-024 which is a serious error related to linking or a corrupt Milkyway CEL. If there is no later MWDC-024 error, then this message just indicates that certain cellInsts in the design are physical only.

WHAT NEXT

MWDC-024 (error) Either 1) link error or 2) corrupted Milkyway database: The signal net '%s' connects to pin '%s' on cellInst '%s' with physical masterCell '%s'

DESCRIPTION

The full message is:

Error: Either 1) link error or 2) corrupted Milkyway database: The signal net '<net_name>' connects to pin '<pin_name>' on cellInst '<cell_name>' with physical masterCell '<master_cell_name>' but the cellInst either did not link or is inaccessible in the Milkyway database. 1) If there are earlier MWDC-023 messages stating that the masterCell did not link, then the logical library must be updated to have the logical cell description. 2) If there are no link warnings, then the Milkyway database may be corrupted and should be rebuilt.

Issue 1) occurs when there was a previous linking error, MWDC-023, because a logical cell in the design had no physical cell description in the physical library. The

physical library needs to be updated to provide a physical cell for each logical cell used in the design.

Issue 2) occurs when there is some corruption in the input Milkyway CEL and some cellInsts are not included in the Milkyway hierarchy information. When that happens, a DC netlist cannot be properly constructed. Possibly, the hierarchy information can be repaired, using the Milkyway or Astro executables. If not, then the Milkyway CEL should be re-built.

WHAT NEXT

MWDC-025 (error) FPGA libraries are not supported in Incremental/Hybrid mode.

DESCRIPTION

WHAT NEXT

MWDC-026 (error) Failed to link physical library with link library.

DESCRIPTION

Make sure that 1) the logical library is defined, 2) the physical library is defined, 3) any earlier library errors are addressed (PSYN-141, PSYN-125, PSYN-027, PSYN-028).

WHAT NEXT

MWDC-027 (error) Failed to load design from MW CEL named '%S'.

DESCRIPTION

Earlier MWDC-* errors and warnings should explain what went wrong when trying to build a DC design from a MW CEL.

If there were messages about inconsistencies between hier_nets and flat_nets in the MW CEL, then it may be necessary to run astRepairHierarchy in Astro or Jupiter before loading the MW CEL in IC Compiler.

WHAT NEXT

MWDC-028 (Warning) The non-constant Milkyway net '%s' has %s load pin '%s' on cell instance '%s' but no driver. It will now be driven by logic zero.

DESCRIPTION

The named net connects to a load pin (input or inout) of a cell instance in the target_library, but the net has no driver. Such nets are given a logic zero driver by default. The net is considered non-constant because the name is not equal to either variable **mw_logic0_net** or **mw_logic1_net**.

There are several possible scenarios for this message to be printed.

Recommended actions are given below on a case-by-case basis.

WHAT NEXT

- 1) The net name pertains to a power/ground net:

The words POWER or GROUND may appear in the message to help the user identify the type of net involved. The user must independently make sure that the variables **mw_logic0_net** and **mw_logic1_net** are properly set to indicate which nets are power/ground. Without proper settings, there is a potential for bad logic. This message is important and indicates a problem with your design that must be addressed by the user.

- 2) The net name is unrelated to power/ground nets:

It is most likely a signal net that simply has no driver. The user may want to make an explicit assignment in the original HDL or ignore the message.

MWDC-029 (error) %s

DESCRIPTION

This is a internal error. Please report to Synopsys

WHAT NEXT

Please alert the Synopsys Support Center.

MWDC-030 (Warning) No uniquify allowed on design with Milkyway already written in IC Compiler.

DESCRIPTION

This warning message is issued by the **uniquify** command. No uniquify is allowed by IC Compiler after a Milkyway database has been written (by **link** or other commands that link the design).

WHAT NEXT

Uniquify the design before loading it in IC Compiler.

Check the man page for the **uniquify** command.

MWDC-032 (Warning) No Route constrains on dangling net, or net with constant driver '%s'.

DESCRIPTION

This warning message can be issued by the **read_mw_cel** command and physopt command. Route onstraints will not be set on dangling net, or net with constant driver.

MWDC-033 (Error) Cannot use a pin on a physical-only cell, %s, for logical operations.

DESCRIPTION

This error occurs when the user of IC Compiler is trying to connect a signal net to a pin on a physical-only cell. The cell is physical-only because there is no logical library cell for the cell. Also, some types of cells are always treated as physical-only, such as filler and tap cells.

WHAT NEXT

Use the **fconnect_pg_nets** command to connect pins on physical-only cells.

MWDC-034 (Error) The cell instance '%s' with reference type '%s' was not linked to the logical library and cannot be written to

the database.

DESCRIPTION

This error can occur when a design is read in from Verilog and there is a linking error because a cell instance has an unknown reference type. IC Compiler does not write black-boxes automatically from Verilog when there are missing library references.

WHAT NEXT

Either fix the Verilog type reference or augment the link library and re-run.

MWDC-035 (warning) The cell instance '%s' has reference type '%s' which is not in the Physical Library.

DESCRIPTION

This warning occurs because a Milkyway design has a cell instance with a reference type that is not in the Physical Library. The tool does not allow the creation of black boxes from unknown references.

WHAT NEXT

Either fix the Verilog type reference or augment the link and physical libraries and rerun the command.

MWDC-036 (Warning) The cell instance '%s' with reference type '%s' has non-power/ground pins but is not part of the hierarchy.

DESCRIPTION

This warning occurs when a cell instance has non-power/ground pins but is not part of the Milkyway hierarchy. The database may be corrupt and the user should look for later messages about failed attempts to connect to this cell instance.

WHAT NEXT

If there are later errors about connections to the cell instance, then report the problem to Synopsys. If the cell instance is not connected to the logical netlist, then IC Compiler can proceed.

MWDC-037 (Warning) The cell instance '%s' (%s) has non-power/ground pins (or no pins), but is not in the link library. It will be treated as an unlinked black-box. The physical library cell %s.

DESCRIPTION

This warning occurs when a Milkyway design has a cell instance with a reference type that is not in the link library.

IC Compiler will create a black-box for this instance and can proceed. Some advantages of having a link libray cell are listed below.

The message also tells whether the physical library cell exists or not.

WHAT NEXT

The user may want to provide a link library cell for the cell instance so that optimizations can work on it. Timing will also be more accurate if the link library cell is provided.

MWDC-038 (Error) Cannot delete the physical_only net '%s'.

DESCRIPTION

This error occurs when a Milkyway net cannot be deleted.

WHAT NEXT

Look for earlier messages for possible explanations. If there are none, then there is some database inconsistency problem: call Synopsys.

MWDC-039 (Error) A Milkyway cell instance has an inconsistency between its hierarchical name '%s' and flat name '%S'.

DESCRIPTION

This error occurs when a Milkyway cell instance has different names stored for the same Milkyway object. The database is inconsistent.

WHAT NEXT

Report the problem to Synopsys.

MWDC-040 (Information) Net %s has no connections.

DESCRIPTION

This information message can be issued when trying to iterate over the ports/pins connected to a net in Milkyway.

MWDC-041 (information) CellInst '%s' (%s) is part of the hierarchy but has only power/ground pins. It will be treated as physical only.

DESCRIPTION

This message may be followed by MWDC-024 which is a serious error related to linking or a corrupt Milkyway CEL. If there is no later MWDC-024 error, then this message just indicates that certain cellInsts in the design are physical only.

WHAT NEXT

MWDC-042 (warning) The net connection on the leaf cell input pin '%s' is not complete. The Milkyway net is %s.

DESCRIPTION

This message may be preceded by MWDC-125, which describes a mismatch between the mw_logic0/1 variable and the value stored in the Milkyway design library. Example:

Warning: Name of mw_logic0/1 net 'vdd' specified by TCL variable does not match the name of mw_logic0/1 'VDD' in milkyway design library. (MWDC-125)

WHAT NEXT

You might be able to fix this problem if the net is a power/ground net reported by MWDC-125:

```
set mw_logic0_net VSS set mw_logic1_net VDD
```

where VDD and VSS are the names for power and ground stored in the Milkyway design library.

Otherwise, report this problem to Synopsys.

MWDC-043 (error) Multiply-instantiated Hierarchical Cell Master '%s' (one instance is '%s').

DESCRIPTION

This error occurs because designs should be uniquified before loading them in the tool.

WHAT NEXT

Use the **uniquify** command after reading verilog and before using the **link** command. Designs that are already in MW CEL format must be uniquified in Astro or written to verilog and read again.

MWDC-044 (Warning) Net %s has multiple drivers.

DESCRIPTION

This warning message can be issued if net has multiple drivers.

MWDC-052 (warning) Some MWDC messages have been suppressed. The following list gives the number and format of the messages.

DESCRIPTION

Some MWDC message formats are issued no more than 20 times (by default) to avoid extremely long log files.

WHAT NEXT

Use the **mwdc_message_limit** variable to allow more instances of each format to be issued. Example: set **mwdc_message_limit** 10000 allows ten thousand instances of each format to be issued before suppressing the rest.

MWDC-053 (Error) The -only_physical option may not be used on remove_nets in IC Compiler.

DESCRIPTION

Do not use the -only_physical option on **remove_nets** in IC Compiler. No option is needed to remove physical only nets, but remember that power/ground nets cannot be removed.

WHAT NEXT

Try **remove_nets** with no options.

MWDC-054 (Error) Hier net %s (0x%x) has no type.

DESCRIPTION

The Milkyway database does not contain type information for the named net.

WHAT NEXT

Contact Synopsys.

MWDC-055 (Error) PG pin (0x%x) is connected with multiple %s nets: net1 = (0x%x) and net2 = (0x%x)

DESCRIPTION

In the Milkyway database, the named PG pin has connections to more than one net. This is an inconsistency.

WHAT NEXT

Contact Synopsys.

MWDC-056 (Error) Hierarchical Tie Net %s (0x%x) connected to

output pin (0x%x).

DESCRIPTION

The named net is a tie high or low net and is connected to an output port. Tie nets should only be connected to input pins of leaf cells or hierarchical cells.

WHAT NEXT

Contact Synopsys.

MWDC-057 (Error) Flat PG net %s contains %s pin %s

DESCRIPTION

The flat Milkyway PG net contains either a VDD or GND pin.

WHAT NEXT

MWDC-060 (Error) Unable to create cell inst master '%s'.

DESCRIPTION

Unable to create cell inst master for the given reference.

WHAT NEXT

Make sure the reference cel exists and library is writable.

MWDC-061 (Error) Cannot add new cellInst '%s'.

DESCRIPTION

Unable to add new instance in the MW design.

WHAT NEXT

Make sure the reference cel exists and library is writable.

MWDC-066 (error) Internal error - %s.

DESCRIPTION

Internal error.

WHAT NEXT

Report the problem to Synopsys

MWDC-070 (Error) Could not get milkyway id from "%s".

DESCRIPTION

This error message occurs when the milkyway id for the given object is not found in the database.

WHAT NEXT

Please check the DC object specified in the command.

MWDC-100 (error) CEL consistency check failed.

DESCRIPTION

This error occurs because the netlist data in the CEL view is inconsistent. The inconsistencies should have been reported before this error message appeared.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-101 (error) The design is not uniquified.

DESCRIPTION

You receive the error message because the input design has non-uniquified netlist,

i.e. there are more than one hierarchical cell instances with the same reference.

WHAT NEXT

If the design comes from JupiterXT or Astro, please go back and uniquify the Milkyway design in JupiterXT or Astro.

If you are running a design with multi instantiated modules (MIM) inside IC Compiler, please identify which MIM flow (Top-Down MIM Flow; Black Box MIM Flow; or Virtual Flat MIM Flow) you are working on and follow the suggestions as stated in IC Compiler Design Planning's User Guide or Application Note.

Otherwise, uniquify the design with `uniquify_fp_mw_cel` before saving it.

MWDC-102 (error) The flat net %s (0x%x) is connected to PortInst %s (0x%x) in a flat netlist, but not in a hierarchical netlist.

DESCRIPTION

This error occurs because the flat and hierarchical netlist in the CEL are inconsistent. In this case, a PortInst is connected to a flat net in the flat netlist, but is not connected to the corresponding hierarchical net in the hierarchical netlist.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the `astRepairHierPreservation` command. If the CEL is generated by IC Compiler or if running `astRepairHierPreservation` in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-103 (error) The flat net %s (0x%x) is connected to port %s (0x%x) in a flat netlist, but not in a hierarchical netlist.

DESCRIPTION

This error occurs because the flat and hierarchical netlist in the CEL are inconsistent. In this case, a port is connected to a flat net in the flat netlist, but is not connected to the corresponding hierarchical net in the hierarchical netlist.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-104 (error) The following hier nets should correspond to one flat net, but they do not.

DESCRIPTION

This error occurs because the flat and hierarchical netlist in the CEL are inconsistent. Hierarchical nets connected together through hierarchical ports should belong to one single flat net; but, in this case, they belong to multiple flat nets.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-105 (error) The cell inst %s (0x%x) has no parent hierarchy, but is connected to a logical netlist.

DESCRIPTION

This error occurs because a leaf cell instance that does not belong to any hierarchy is connected to a hierarchical netlist.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-106 (error) The cells (0x%x) and (0x%x) have the same

name, '%s', in the same level of hierarchy.

DESCRIPTION

This error occurs because multiple cell instances have the same name in the same level of hierarchy, which is not allowed.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-107 (error) A cross-hierarchy connection exists for HierNet %s (0x%x).

DESCRIPTION

This error occurs because a HierNet is connected to ports/portInsts not within the same level of hierarchy, without crossing via a hierarchical port.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-108 (error) The hierCells (0x%x) and (0x%x) have the same name, '%s', in the same level of hierarchy.

DESCRIPTION

This error occurs because more than one hierCellInst with the same name exists in the same level of hierarchy, which is not allowed.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

Synopsys Support.

MWDC-109 (error) More than one port exists with the name %s.

DESCRIPTION

This error occurs because more than one port with same name exists in the same level of hierarchy, which is not allowed.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-110 (error) Orphaned hierarchical cells exist.

DESCRIPTION

This error occurs because certain hierarchical cells exist in the database that cannot be reached by traversing the hierarchy.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-111 (error) The hier net %s (0x%x) is connected to the port/pin %s (0x%x) in a hierarchical netlist, but is not connected to the corresponding flat net %s (0x%x) in the flat netlist.

DESCRIPTION

This error occurs because the flat and hierarchical netlist connections are inconsistent. In this case, a port/pin is connected to a hierNet, but is not connected to the corresponding flat net.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-112 (error) HierPortInst %s (0x%x) is reachable from the HierNet %s (0x%x), but the HierNet is not reachable from HierPortInst.

DESCRIPTION

This error occurs because a HierPortInst is connected to a HierNet, but the same HierNet is not connected to the HierPortInst.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-113 (error) Internal database error.

DESCRIPTION

You receive the error message because an internal database access has failed.

WHAT NEXT

Please contact Synopsys support.

MWDC-114 (error) Port %s does not exist in the hierarchy.

DESCRIPTION

This error occurs because a port exists in the flat netlist, but does not exist in the hierarchical netlist.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-115 (error) Unable to find the TOP instance in the hierarchy.

DESCRIPTION

This error occurs because the database does not identify any instance as the TOP instance in the netlist hierarchy.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-116 (error) Unable to get the parent of the cell %s (0x%x).

DESCRIPTION

This error occurs because a leaf cellInst has no parent in the hierarchy preservation data.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-117 (error) Unable to get the parent of the hier cell %s

(0x%x).

DESCRIPTION

This error occurs because a hier cellInst has no parent in the hierarchy preservation data.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-118 (info) Performing CEL netlist consistency check.

DESCRIPTION

This message indicates that consistency check for netlist data in CEL is being performed.

WHAT NEXT

MWDC-119 (info) CEL consistency check PASSED.

DESCRIPTION

This message indicates that consistency check of CEL netlist data was performed and no issues were found.

WHAT NEXT

MWDC-120 (warning) Net %s (0x%x) has no type.

DESCRIPTION

This message indicates that a net with no valid type was found.

WHAT NEXT

Please contact Synopsys Support.

MWDC-121 (error) Net %s (0x%x) is connected to port %s (0x%x), but the port is connected to a different net, %s (0x%x).

DESCRIPTION

This error occurs because netlist data in a CEL is inconsistent. A net is connected to a port, but the port is connected to a different net.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-122 (error) Net %s (0x%x) is connected to PortInst %s (0x%x), but PortInst is connected to a different net, %s (0x%x).

DESCRIPTION

This error occurs because netlist data in a CEL is inconsistent. A net is connected to a PortInst, but the port is connected to a different net.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-123 (error) Nets (0x%x) and (0x%x) have the same name, '%s'.

DESCRIPTION

This error occurs because two flat nets have the same name, which is not allowed.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-124 (error) The tool cannot find hierarchy preservation data. A CEL cannot be read in.

DESCRIPTION

This error occurs because the input CEL does not contain any hierarchy preservation data. The tool cannot open such a CEL.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-125 (warning) Name of mw_logic0/1 net '%s' specified by TCL variable does not match the name of mw_logic0/1 '%s' in milkyway design library.

DESCRIPTION

Logic0/1 nets are identified by their names. When the name specified by the TCL variables (`mw_logic0_net`, `mw_logic1_net`) does not match the setting in the database, TCL variables are given preference.

WHAT NEXT

Please make sure that the values of TCL variables `mw_logic1_net` and `mw_logic0_net` match the names of logic0/1 nets in the Milkyway design library.

MWDC-126 (warning) Found mw_logic0/1 net '%s' in the

database with non PG net type.

DESCRIPTION

You receive this warning message when a net with mw_logic0/1_net name was found in the database but was not of type PG. Logic0/1 nets should be of type PG in the database.

WHAT NEXT

Please make sure mw_logic0/1 nets are defined as PG in the database.

MWDC-127 (warning) Mw_logic0/1 net '%s' not found in the database.

DESCRIPTION

You receive this warning message when a net with mw_logic0/1_net name is not found in the database. The logic0/1 net name is determined by TCL variables mw_logic0_net (defalut VSS) and mw_logic1_net (default VDD). Note that a net not being found indicates that either the TCL variables are not set correctly, or there are no logic0/1 connections in the netlist. In the latter case, this warning should be ignored.

WHAT NEXT

Please make sure the settings for TCL variables mw_logic0_net/mw_logic1_net match the names of logic0/1 nets in the database. If there are no logic0/1 connections in the netlist, then this warning should be ignored.

MWDC-128 (warning) TCL variable mw_logic0/1 not set, using the logic0/1 net names setting from the database %s.

DESCRIPTION

You receive this warning message when you have not define the TCL variables (mw_logic0_net, mw_logic1_net) to specify the names of tiehi/lo nets in the netlist, and a setting for these names exists in the database. The tool will pick up the name specified in the database.

WHAT NEXT

Please make sure that the tool is picking up correct logic0/1 net names as specified in the message. If not, please restart after setting correct values for TCL variables `mw_logic0_net` and `mw_logic1_net`.

MWDC-129 (Error) Unable to infer names for logic0/1 net.

DESCRIPTION

You receive this error message when the tool was unable to find the names for logic0/1 nets in TCL variables as well as in the milkyway design library. In order for the tool to proceed, logic0/1 net names need to be defined.

WHAT NEXT

Please specify logic0/1 net names using TCL variables `mw_logic0_net` and `mw_logic1_net`. For example, '`set mw_logic1_net VDD`'.

MWDC-130 (error) Cell %s (0x%x) belongs to multiple hierarchies

DESCRIPTION

This error occurs because a particular cell in the design has multiple immediate parents. A cell can have one, and only one, immediate hierarchical parent.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the `astRepairHierPreservation` command. If the CEL is generated by IC Compiler or if running `astRepairHierPreservation` in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-131 (error) Cell %s (0x%x) is reachable from parent hierarchy

DESCRIPTION

This error occurs because a particular cell in the design is reachable from its parent multiple times when traversing the netlist.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-132 (Error) Un-supported name-escaping style.

DESCRIPTION

You receive this error message when the CEL being opened contains names that have an escape style that is not supported by ICC. This could happen for CELs that are generated by Astro/JXT. ICC only supports names that are either not escaped, or are DEF style escaped. Names containing verilog-style escaping are not supported by ICC.

WHAT NEXT

Generate ASCII from the CEL using the tool that was used to generate the CEL, and read in ASCII (netlist, physical data and constraints) into ICC.

MWDC-133 (warning) CEL does not have hierarchy preservation.

DESCRIPTION

You receive this warning message when you are trying to open a CEL with no hierarchy preservation data. A design CEL is expected to have hierarchy preservation data. If this is a reference lib CEL, please ignore the message.

WHAT NEXT

If this is a design CEL, and the CEL was generated by Astro/JXT, try running **astRepairHierPreserve** command in Astro/JXT. If this is a library CEL, please ignore this message. Else, please contact Synopsys Support.

MWDC-134 (Error) Missing PG net information on voltage area

%S.

DESCRIPTION

You receive this error message when you are trying to open a CEL which contains voltage areas with no power and ground net information on them.

WHAT NEXT

If this is a design CEL, and the CEL was generated by Astro/JXT, try running axgLinkPowerNetToVoltageArea command in Astro/JXT and specify at least one set of power and ground net names. Alternatively, try running set_power_net_to_voltage_area command in ICC and specify at least one set of power and ground net names. Else, please contact Synopsys

MWDC-135 (Warning) The PG net %s specified on voltage area %s do not exist in CEL.

DESCRIPTION

You receive this warning message when you are trying to open a CEL where the power/ground nets on voltage area do not exist in CEL yet.

WHAT NEXT

MWDC-136 (Warning) The pin on cell %s (%s) in the scanDEF is lost, delete scanDEF definition of the scan chain.

DESCRIPTION

A pin in the scanDEF is missing. So the scanDEF information is wrong and has to be deleted from the design. This can happen on the combinational logic cells after optimization. In order to prevent this from happening, the user should either 1) set_dont_touch or size_only (with same pin names) on those combinational logic cells defined on the scanDEF, or 2) remove them from the scanDEF definition (not from the netlist).

WHAT NEXT

Check the scanDEF and find the combinational logic cells. Either remove them from the scanDEF or set_dont_touch or size_only on them.

MWDC-137 (Error) Remove the scanDEF definition because some scan chain contains combinational logic gates without dont_touch or size_only attribute.

DESCRIPTION

A combinational logic gate on a scan chain must be set_dont_touch or size_only. Please review the scanDEF and find the scan chain containing the combinational logics, then either set_dont_touch or size_only on them, or remove the combinational logic cells from the scanDEF (not from the netlist).

WHAT NEXT

Review the scanDEF and find the combinational logic cells, then either set_dont_touch or size_only on them, or remove them from the scanDEF. User can use report_scan_chain to find the scanDEF information as well.

MWDC-138 (Error) The net %s specified on voltage area %s is not PG type.

DESCRIPTION

You receive this error message because the nets you specified on voltage area property "VoltageAreaNetInfo" are not power/ground type.

WHAT NEXT

If this is a design CEL, and the CEL was generated by Astro/JXT, try running axgLinkPowerNetToVoltageArea command in Astro/JXT and specify at least one set of power and ground net names. Else, please contact Synopsys Support.

MWDC-139 (Error) Losing connection on the PG pin %s of cell instance %s. This pin was previously connected to regular signal net %s.

DESCRIPTION

Users are getting this message because the PG pin that used to connect to a regular signal net will now be disconnected. This might lead to this pin being grounded later. The reason why this is happening is because there is a discrepancy in terms

of pin type between FRAM and the logic db of the design.

WHAT NEXT

Please make sure that the FRAM and logic db are consistent across the Galaxy flow. Otherwise, users might need to establish the connection themselves by using netlist editing commands.

MWDC-140 (Warning) Scanning database for unsupported name escape style. This may take a few minutes depending on the size of your design.

DESCRIPTION

You receive this warning message when you are trying to open a CEL with a possible unknown or even unsupported name escape style. Under this circumstance, the tool is now performing a name scanning on CEL to clarify whether its name escape style can indeed be supported by the tool.

WHAT NEXT

If you do not want the name scanning to happen, you should try to regenerate the CEL with a supported name escape style. Else, please contact Synopsys Support.

MWDC-141 (Error) Command can not proceed when the Milkyway CEL is opened in read only mode.

DESCRIPTION

Users are getting this message because an optimization command is issued when the Milkyway CEL is opened in read only mode. Only pure analyze commands can proceed when the Milkyway CEL is opened in read only mode.

WHAT NEXT

Please make sure that the Milkyway CEL is opened in both read and write mode if trying to execute optimization commands. Otherwise, please contact Synopsys Support for further assistance.

MWDC-142 (Error) Un-supported name-escaping style.

DESCRIPTION

You receive this error message when the CEL being opened contains names that have an escape style that is not supported by ICC. This could happen for CELs that are generated by Astro/JXT and ICC failed to change names in CEL with ICC supported naming style. ICC only supports names that are either not escaped, or MW APF style escaped. Other naming style are not supported by ICC.

WHAT NEXT

Generate ASCII from the CEL using the tool that was used to generate the CEL, and read in ASCII (netlist, physical data and constraints) into ICC.

MWDC-143 (Error) Losing connection on the PG pin %s of cell instance %. This pin was previously connected to a power net %. This pin might now be tied to logic zero.

DESCRIPTION

Users are getting this message because the PG pin that used to connect to a power net will now be disconnected. This might lead to this pin being grounded later. The reason why this is happening is because there is a discrepancy in terms of pin type between FRAM and the logic db of the design.

WHAT NEXT

Please make sure that the FRAM and logic db are consistent across the Galaxy flow. Otherwise, users might need to establish the connection themselves by using netlist editing commands.

MWDC-150 (Error) Missing %s net information on voltage area %.S.

DESCRIPTION

You receive this error message when you are trying to open a CEL which contains voltage areas with no power or ground net information on them.

WHAT NEXT

If this is a design CEL, and the CEL was generated by Astro/JXT, try running `axgLinkPowerNetToVoltageArea` command in Astro/JXT and specify at least one set of power and ground net names. Alternatively, try running `set_power_net_to_voltage_area` command in ICC and specify at least one set of power and ground net names. Else, please contact Synopsys.

MWDC-155 (error) The hierarchy crossing flat net %s (0x%x) does not have a corresponding hier net.

DESCRIPTION

This error occurs because the flat and hierarchical netlist in the CEL is inconsistent. The flat net that crosses a hierarchy should have a corresponding hierarchical net; otherwise, it causes an error.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the `astRepairHierPreservation` command. If the CEL is generated by IC Compiler or if running `astRepairHierPreservation` in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-160 (warning) Found hierarchical net 0x%x without hierarchical port.

DESCRIPTION

You receive this warning message because there exists hierarchical net which has no hierarchical port attached to it. Every hierarchical net should always have a hierarchical port attached to it.

WHAT NEXT

Please contact Synopsys Support.

MWDC-161 (warning) Name of the flat net %s (0x%x) is not

derived correctly from its hierarchical nets.

DESCRIPTION

You receive this warning message because the name of flat net is not properly derived from one of its hierarchical net. Usually, every flat net should be assigned the name of one of its hierarchical net. The consequence of having inconsistent names for the net is that the user might get inconsistent collection results

WHAT NEXT

Please contact Synopsys Support.

MWDC-165 (warning) logic0/1 net names setting not found in milkyway design library, using the TCL variable mw_logic0/1_net setting.

DESCRIPTION

You receive this warning message because the logic0/1 net names setting does not exist in the Milkyway design library and you have defined the TCL variables (mw_logic0_net, mw_logic1_net) to specify the names of logic0/1 nets. The tool will pick up the names specified in the TCL variables as the logic1/0 net names.

WHAT NEXT

Please make sure that the tool is picking up correct logic0/1 net names as specified in the message. If not, please restart after setting correct values for TCL variables mw_logic0_net and mw_logic1_net.

MWDC-166 (warning) Using %s setting from the TCL variable %s

DESCRIPTION

You receive this warning message when tiehi/lo nets are not found in mw design library and tool uses the values defined by the TCl variables (mw_logic0_net, mw_logic1_net).

WHAT NEXT

Please make sure that the tool is picking up correct logic0/1 net names as specified in the message. If not, please restart after setting correct values for TCL variables `mw_logic0_net` and `mw_logic1_net`.

MWDC-169 (Information) Floating net %s is preserved.

DESCRIPTION

This information message is issued because user specify floating nets in "`preserve_floating_nets`" TCL variable. From the nets specified in "`preserved_floating_nets`", only floating nets will be honored, and a dont-touch is derived for these nets.

MWDC-170 (Warning) Power and Ground nets are never deleted by netlist editing.

DESCRIPTION

You receive this warning message when you are connecting a net to a hierarchical port that has a Power or Ground net attached on the other side. This warning informs the user that the Power or Ground net will be the surviving net when the two Milkyway nets are merged in the database.

WHAT NEXT

MWDC-171 (error) Exclusive movebound/plangroup '%s' partially overlaps with movebound/plangroup '%s'.

DESCRIPTION

You receive this error message when some of the movebounds or plangroups overlap.

WHAT NEXT

Please make sure all the movebounds and plangroups are not overlap to each other. And re-check the overlap/nesting of movebounds.

MWDC-172 (warning) Should load physical library before reading this design, which has physical information.

DESCRIPTION

You receive this warning message when you open the design, meanwhile the corresponding physical library is not opened.

WHAT NEXT

Please check the design library and find if the FRAM view is correctly created. You can also try the command "open_mw_lib" to open the library. If failed, you can try to re-create the design library.

MWDC-173 (warning) design via %s has too many rectangles (%d). Skip it.

DESCRIPTION

You receive this warning message when the design via has too many rectangles and out of limitation (e.g.10000). The tool perhaps can not match this kind of via.

WHAT NEXT

Please make sure the via description is right.

MWDC-174 (error) Failed to save CEL "%s".

DESCRIPTION

This error message indicates that the design CEL could not be saved into the Milkyway library. The reasons for this could be one of the following. No write permission for the Library/CEL. No disk space is available.

WHAT NEXT

Please check that the Milkyway design library and CEL are writeable and that there is sufficient disk space available.

MWDC-175 (warning) Found rectilinear region, only support

rectangles.

DESCRIPTION

You receive this warning message when the rectilinears are used. This version only supports rectangles region.

WHAT NEXT

Please make sure all region are in rectangle shape.

MWDC-176 (warning) Found disjoint bound, skip writing to database.

DESCRIPTION

You receive this warning message when the union of rectangles has disjoint bound. The tool will skip writing to database which may impact the voltage area creation.

WHAT NEXT

Please make sure the rectangle union areas are combined together.

MWDC-177 (error) The width and height values for cell %s differ between the reference library (width=%d, height=%d) and the design library (width=%d, height=%d).

DESCRIPTION

This error indicates that the bounding box defined for the cell differs between the design library and the reference library. This error can result in errors further in the design flow. For example, the design might contain cell overlaps, even after placement legalization.

WHAT NEXT

This error can occur if you change the reference library associated with the Milkyway design library after you saved the design. Use the report_mw_lib command to see the reference library associated with the current design library. If necessary, use the set_mw_lib_reference command to reset the reference library.

MWDC-178 (error) A physical-only cell instance %s (0x%x) has no parent hierarchy.

DESCRIPTION

This error occurs because a physical-only leaf cell instance exists that does not belong to any hierarchy.

WHAT NEXT

If this CEL was generated by Astro/JupiterXT or by an IC Compiler version before b2008.09, convert it into version b2008.09 by using the **convert_mw_lib** command in IC Compiler version b2008.09. Contact Synopsys Support if the issue remains unresolved after converting.

MWDC-179 (error) A physical-only cell instance %s (0x%x) has logical connections.

DESCRIPTION

This error occurs because a physical-only leaf cell instance has logical connections. A physical-only cell instance is not allowed to connect to logical nets.

WHAT NEXT

If this CEL was generated by Astro/JupiterXT or by an IC Compiler version before b2008.09, convert it into version b2008.09 by using the **convert_mw_lib** command in IC Compiler version b2008.09. Contact Synopsys Support if the issue remains unresolved after converting.

MWDC-180 (error) A non-physical-only cell instance %s (0x%x) has no parent hierarchy.

DESCRIPTION

This error occurs because a non-physical-only leaf cell instance does not belong to any hierarchy.

WHAT NEXT

If this CEL is generated by Astro/JupiterXT, run the **astRepairHierPreservation** command. If the CEL is generated by IC Compiler or if running **astRepairHierPreservation** in Astro/JupiterXT does not resolve the issue, contact Synopsys Support.

MWDC-181 (warning) Unable to support the type %srotate counter-clockwise %d degree, cell %s.

DESCRIPTION

The orientation of the following types currently can't been fully supported, it will been treated as orientation unknow: rotate counter-clockwise 45 degree rotate counter-clockwise 135 degree rotate counter-clockwise 225 degree rotate counter-clockwise 315 degree mirror, then rotate 45 degree mirror, then rotate 135 degree mirror, then rotate 225 degree mirror, then rotate 315 degree

WHAT NEXT

Please contact Synopsys Support.

MWDC-182 (Error) PG pin %s (0x%x) is connected with multiple %s nets: net1 is %s (0x%x) and net2 is %s (0x%x).

DESCRIPTION

PG pin should only connected with one flat net, you receive this message because in the MW CEL, the indicated PG pin is connected to more than one flat nets.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-183 (Error) Hierarchical Tie Net %s (0x%x) connected as output %s %s (0x%x) (hiConn net for port).

DESCRIPTION

You receive this message due to a Hier Tie Net is connected to output pin or as

output port hiConn net. which is not supported.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-184 (Error) Hierarchical net %s (0x%x) has no type.

DESCRIPTION

You receive this message due to a Hier Tie Net in MW CEL has no/Unknown net type.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-185 (Error) Flat PG net %s (0x%x) contains %s pin %s (0x%x).

DESCRIPTION

You receive this message due to the Flat PG net in the MW CEL contains VDD/GND pins. The leaf level VDD/GND pins should not be stored in the Flat PG net.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-186 (Error) Flat %s net %s (0x%x) associated with Hier %s Net %s (0x%x).

DESCRIPTION

You receive this message due to the Flat net is associated with wrong type of Hier net.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-187 (Error) Flat %s net %s (0x%x) associated with multiple Direct Hier %s Nets.

DESCRIPTION

You receive this message due to the Flat Tie net is associated with multiple Direct Hier Tie nets. only one is allowed in the MW CEL.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-188 (Error) Flat %s net %s (0x%x) not associated with any coresponding type Hier Net.

DESCRIPTION

You receive this message due to the Flat net is not associated with any coresponding type of Hier Net.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-189 (Error) PG PIN %s (0x%x) has broken flat/hier net connection, the pin is connected with Hier Net %s (0x%x) and Flat Net %s (0x%x), but the Hier Net %s (0x%x) is connected with Flat Net %s (0x%x).

DESCRIPTION

You receive this message because the hier/flat net cross hierarchy connection is broken. The pin connected to the Hier net and the Flat net, but the Hier and Flat nets are not associated with each other.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-190 (warning) Nets %d(NAME: %s)connected to ports %d(TYPE: %s) and %d(TYPE: %s) are not of same type even though they are connected to same physical net.

DESCRIPTION

The ports connected to one net have different type.

WHAT NEXT

Please contact Synopsys Support.

MWDC-191 (Error) Hierarchical Tie Net %s (0x%x) connected as input %s %s (0x%x) (loConn net of port).

DESCRIPTION

You receive this message due to a Hier Tie Net is connected to input pin or as input port loConn net which is not supported.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-192 (Information) CEL Checker is disabled.

DESCRIPTION

CEL Checker is disabled by mw_enable_cel_check control.

MWDC-193 (Error) P/G pin %s (0x%x) connected to non-P/G net %s (0x%x).

DESCRIPTION

You get this message because in the MW CEL, the pin is PG pin type, but it's connected to a net which is not PG net type.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-194 (Error) Hierarchical Port Instance %s (0x%x) %s Net %s (0x%x) is invalid.

DESCRIPTION

The particular connected net of the Hierarchical port is not a valid net in MW CEL.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-195 (Error) Hierarchical Port Instance %s (0x%x) on HierNet %s (0x%x) is invalid.

DESCRIPTION

The particular hierarchical port attached with the hierarchical net is not a valid net in MW CEL.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-196 (Error) %s Port Instance %s (0x%x) Master 0x%x is invalid.

DESCRIPTION

The particular port's Master is not a valid object in MW CEL.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-197 (Warning) Hier Net %s (0x%x) with multiple driver 0x%x and 0x%x.

DESCRIPTION

You get this message because the hierarchical net has multiple drivers as listed.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-198 (Error) Flat net 0x%x is connected with pin 0x%x but the pin is not listed in the flat net.

DESCRIPTION

You get this message because the pin has the flat net connection but from the flat net pin connection, the pin is not listed. PG pin will not be listed in flat PG net, this Error won't be reported for such case.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-199 (Error) %s pin/port %s (0x%x) connected net %s (0x%x) not with %s type.

DESCRIPTION

You get this message because the PG pin or port connected net does not have same PG polarity type or is not a PG net.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-200 (Error) Non-PG %s %s (0x%x) is driving PG net %s

(0x%x).

DESCRIPTION

You get this message because the PG net is driven by a non-PG type of pin or port.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-201 (Error) Flat net %s (0x%x) is connected with pin %s (0x%x) but the pin is not listed in the flat net.

DESCRIPTION

You receive this message because the flat net connection is attached in the pin, but the pin is not listed in the flat net pin connection attachment.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-202 (Error) Flat net %s (0x%x) is connected with pin %s (0x%x) but the pin is listed in the flat net %s (0x%x).

DESCRIPTION

You receive this message because the flat net connection is attached in the pin, but the pin is listed in another flat net.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-203 (Error) SCANDEF stored in DB is not updated to

design.

DESCRIPTION

You receive this message because SCANDEF and design stored in DB are asynchronous.

WHAT NEXT

Try `remove_scan_def` before reloading design.

MWDC-204 (Error) There is an inconsistency with regards to cover/bump cover cell type between cell instance %s and its master. The cover/bump cover cell info on master will be used as golden.

DESCRIPTION

You get this message because there is an inconsistency between cell instance and its master regarding the cover/bump cover cell type. In ICC, the cover/bump cover cell type is always taken from cell masters.

WHAT NEXT

Regenerate the MW CEL

MWDC-205 (Warning) Cover/bump cover cells are not marked fixed, a fixed placement status is now derived.

DESCRIPTION

You get this message because there is a cover/bump cover cell which does not have a fixed placement status. Since ICC does not intend to place and legalize these cells, a fixed placement status is now derived on such cover/bump cover cells.

WHAT NEXT

Please mark the non-fixed cover/bump cover cells explicitly, or make sure if they are not a part of the logical netlist.

MWDC-206 (Error) Cover/bump cover cell %s is not placed.

DESCRIPTION

You get this message because there is an unplaced cover/bump cover cell in the logical netlist. Since ICC does not perform placement or legalization on these cells, a fixed placement status with valid placement location is required for such cover/bump cover cells.

WHAT NEXT

Please place these unplaced cover/bump cover cells explicitly, and mark them with fixed placement status. Or else, remove them from the logical netlist.

MWDC-207 (Warning) Pad driver cells which are directly connected to universal bond pads are not marked fixed, a fixed placement status is now derived.

DESCRIPTION

You get this message because there are pad driver cells (they are directly connected to bond pads) which do not have a fixed placement status. Since ICC does not intend to place and legalize these cells, a fixed placement status is now derived on such pad driver cells.

WHAT NEXT

Please mark these non-fixed pad driver cells explicitly, or make sure if they are not directly connected to bond pads.

MWDC-208 (Error) Tie Net %s (0x%x) connected to an output pin %s (0x%x).

DESCRIPTION

You receive this message due to a Tie Net is connected to output pin, which is not supported.

WHAT NEXT

Check the MW CEL and correct the connection.

MWDC-209 (Warning) Failed to dump cell attach file %s to unix filename %s.

DESCRIPTION

Attempt was made to dump a cell attached file with pseudo-access name to a file with a unix filename, but the attempt failed.

WHAT NEXT

Contact your Synopsys technical support representative.

MWDC-210 (Error) %s failed in %s

DESCRIPTION

An internal error occurred.

WHAT NEXT

Contact your Synopsys technical support representative.

MWDC-211 (warning) cell %s is already attached to %s %s; skip attaching to %s %s.

DESCRIPTION

You receive this warning message when a cell is attached to multiple plangroups or movebounds in the database. While being loaded, the cell will just be considered to be attached to the first plangroup or movebound it hits, and the relationships to other plangroups or movebounds will be ignored.

WHAT NEXT

You need check the design by UI command "get_cells of [get_plan_group/get_bounds \$name]" or using "write_def -regions_groups -o \$DEF". And you can fix it by reading in a DEF with correct group and cell mapping, or using plangroup/bound editing commands.

NG

NG-1 (error) Generation error: %s (%s).

DESCRIPTION

WHAT NEXT

NLE

NLE-001 (Error) Specified pin '%s' is not connected to net '%s'.

DESCRIPTION

This error message occurs when all the pins specified in the `<pin object>` option is not connected to same net which is being buffered.

WHAT NEXT

May be the given pins are all connected electrically but are on different hierarchy. Check the pins connected to net being buffered using `all_connected` command.

SEE ALSO

`insert_buffer(2)`
`all_connected(2)`

NLE-002 (Warning) buffer cell '%s' has both inverted and non-inverted outputs connected.

DESCRIPTION

This warning message occurs when the buffer cell being removed has both its inverter and non-inverter output pin being used up.

WHAT NEXT

Such cells will not be removed by the `remove_buffer` command

However, if you want to remove such cells, disconnect one of the pins

SEE ALSO

`remove_buffer(2)`
`disconnect_net(2)`

NLE-003 (Warning) Could not derive location for the new buffer

cells; placing them at location {0 0}.

DESCRIPTION

This warning message occurs when the tool is not able to derive the location for new buffer cells.

WHAT NEXT

This is only a warning message.

However, if you want to place the new cells placed near to the driver pin of the net being buffered, check the location of the driver cell or assign the location for the new cells directly using **-location** option.

SEE ALSO

```
insert_buffer(2)  
set_cell_location(2)
```

NLE-004 (Error) library cell '%s' has dont_use attribute set on it.

DESCRIPTION

This error message occurs when the specified reference lib_cell has the dont_use attribute set to true.

WHAT NEXT

use other similar equivalent lib_cells from the target library or remove the dont_use attribute and then use the lib_cell.

SEE ALSO

```
insert_buffer(2)  
size_cell(2)  
remove_attribute(2)  
set_dont_use(2)
```

NLE-005 (Error) net '%s' is driving multiple cells.

DESCRIPTION

This error message occurs when the net driven by an inverter cell is driving more

than one cell.

WHAT NEXT

remove_buffer can only remove inverter-pair(s) or buffer(s) introduced by the **insert_buffer** command. To remove all the buffers in the path use **remove_buffer_tree** command.

SEE ALSO

`remove_buffer(2)`
`insert_buffer(2)`
`remove_buffer_tree(2)`

NLE-006 (Error) net '%s' should have one driver pin

DESCRIPTION

This error message occurs when the operating net has more than one driver pin or the net has no valid driver pin.

WHAT NEXT

remove_buffer and **insert_buffer** cannot operate on nets having multiple driver pins.

SEE ALSO

`remove_buffer(2)`
`insert_buffer(2)`

NLE-007 (Error) pin '%s' is not associated with the buffer tree path of the net '%s'.

DESCRIPTION

This error message occurs when the specified **-to** pin/port is not connected to the buffer tree path starting from the given net.

WHAT NEXT

check if the specified pin/port is on the buffer tree path using **report_buffer_tree** command.

SEE ALSO

```
remove_buffer(2)  
report_buffer_tree(2)
```

NLE-008 (Error) No buffer(s) or inverter-pair(s) connected to net '%S'.

DESCRIPTION

This error message occurs when the **remove_buffer** command is not able to find any buffer or inverter-pair for the given net.

WHAT NEXT

Report the buffer tree for the net using **report_buffer_tree** command and see if there are any buffer or inverter-pairs associated with it.

SEE ALSO

```
remove_buffer(2)  
report_buffer_tree(2)
```

NLE-009 (Error) Could not size '%s' ('%s') with '%s'.

DESCRIPTION

This error message occurs when the specified **lib_cell** is not logically matching with the library cell of the cell being sized.

WHAT NEXT

Check for the equivalence of library cells using **get_alternative_lib_cells** command.

- Check if their is a dont_touch or dont_use attribute for the specified library cell in the used scenarios. Remove the dont_touch and dont_use attributes settings ("remove_attribute") for the used library cell.

- Check the target library settings and the operating conditions. Make sure that the libraries which contain the specified library cell are included in target_library settings (variable "target_library" or command "set_target_library_subset") for each of the scenarios accordingly.

SEE ALSO

`size_cell(2)`
`get_alternative_lib_cells(2)`

NLE-010 (Error) library cell '%s' is not a buffer or an inverter.

DESCRIPTION

You receive this error message, if the library cell matching the specified name is not a buffer or inverter library cell from the target library.

WHAT NEXT

Check to make sure that the target_library is set correctly and use the `get_buffers` command to get the buffers and inverters that are available in the target library.

SEE ALSO

`insert_buffer(2)`
`get_buffers(2)`
`report_lib(2)`

NLE-011 (Error) Could not assign location (%d, %d) to the cell '%s'.

DESCRIPTION

You received this error message because the named cell could not be assigned the specified location.

WHAT NEXT

Perform a coarse placement on the cell to assign a new location for the cell.

SEE ALSO

`insert_buffer(2)`

```
create_placement(2)
```

NLE-012 (Warning) Net '%s' is not routed.

DESCRIPTION

This warning message occurs when the named net is not routed.

WHAT NEXT

This is only a warning message.

However, if the result is not what you intended. route the design or ECO route the net.

SEE ALSO

```
insert_buffer(2)
route_eco(2)
route_group(2)
```

NLE-013 (Error) Error in argument '%s'. '%s'.

DESCRIPTION

You received this error message because an option in the command has an incorrect value. Either the tool could not find the expected value for the argument or the number of arguments is invalid.

WHAT NEXT

Clarify the proper use of the option, see the man page of the command.

NLE-014 (Error) Cell '%s' has the dont touch attribute set on it.

DESCRIPTION

You receive this error message if `remove_buffer` or `size_cell` encounters a cell that has `dont_touch` attribute set to `true` on it. The `dont_touch` attribute is designed to protect cells from being modified or optimized, so these commands exit without making any changes.

WHAT NEXT

If you want to remove the cell or size the cell, remove the `dont_touch` attribute, either with `remove_attribute` or by executing `set_dont_touch false`.

SEE ALSO

```
remove_buffer(2)
size_cell(2)
remove_attribute(2)
set_dont_touch(2)
```

NLE-015 (Error) Net '%s' has the dont touch attribute set on it.

DESCRIPTION

You receive this error message if `remove_buffer` or `insert_buffer` encounters a net that has `dont_touch` attribute set to `true` on it. The `dont_touch` attribute is designed to protect nets from being modified or optimized, so these commands exit without making any changes.

WHAT NEXT

If you want to remove the net or buffer the net, remove the `dont_touch` attribute, either with `remove_attribute` or by executing `set_dont_touch false`.

SEE ALSO

```
remove_buffer(2)
insert_buffer(2)
remove_attribute(2)
set_dont_touch(2)
```

NLE-016 (Warning) buffer cell '%s' is not connected to any net.

DESCRIPTION

This warning message occurs when the buffer cell being removed is not connected is not driving any other cells in the netlist.

WHAT NEXT

Such cells will not be removed by the `remove_buffer` command

However, if you want to remove such cells, consider using `remove_cell` command

SEE ALSO

remove_buffer(2)
remove_cell(2)
disconnect_net(2)

NLE-017 (Error) Could not derive number of buffers.

DESCRIPTION

This error message occurs when **-max_route_length** option is used on a net that is not routed or trying to buffer a net that does not have RC-tree information annotated.

WHAT NEXT

see if you have **NLE-012** or **NLE-018** messages, remove those warnings.

SEE ALSO

insert_buffer(2)
NLE-012(n)
NLE-018(n)

NLE-018 (Warning) Could not traverse the RC tree of the net '%S'.

DESCRIPTION

This warning message occurs when the named net is not extracted.

WHAT NEXT

This is only a warning message.

However, if the result is not what you intended. Extract the design by running **extract_rc** before executing insert_buffer command.

SEE ALSO

insert_buffer(2)
extract_rc(2)
NLE-012(n)

NLE-019 (Warning) Not relinking cell '%s'.

DESCRIPTION

This warning message occurs when the above cell is already linked with the specified target library cell.

WHAT NEXT

This is only a warning message.

However, the result is not what is expected, specify the reference library cell different from the current one. Query the possible alternative library cells for the above cells by using **get_alternative_lib_cells** and use one of the library cells from its output.

SEE ALSO

`size_cell(2)`
`get_alternative_lib_cells(2)`

NLE-020 (Error) net '%s' does not have any loads.

DESCRIPTION

This error message occurs when the operating net has no load pin connected to it.

WHAT NEXT

insert_buffer will not buffer unconnected nets.

SEE ALSO

`insert_buffer(2)`

NLE-021 (Error) Could not find library cell '%s' matching the operating condition.

DESCRIPTION

This error message occurs when the given library cell does not have an equivalent library cell matching the operation condition of the net being buffered.

WHAT NEXT

- Check the target library settings and the operating conditions. Make sure that the libraries which contain the specified library cell are included in target_library settings (variable "target_library" or command "set_target_library_subset") for each of the scenarios accordingly.
- Check if there is a dont_touch or dont_use attribute for the specified library cell in the used scenarios. Remove the dont_touch and dont_use attributes settings ("remove_attribute") for the used library cell.

SEE ALSO

`insert_buffer(2)`
`set_target_library_subset(2)`
`remove_attribute(2)`

NLE-022 (Error) Could not find library cell '%s' matching the operating condition of cell '%s'.

DESCRIPTION

This error message occurs when the given library cell does not have an equivalent library cell matching the operation condition of the cell being sized.

WHAT NEXT

- Check the target library settings and the operating conditions. Make sure that the libraries which contain the specified library cell are included in target_library settings (variable "target_library" or command "set_target_library_subset") for each of the scenarios accordingly.
- Check if there is a dont_touch or dont_use attribute for the specified library cell in the used scenarios. Remove the dont_touch and dont_use attributes settings ("remove_attribute") for the used library cell.

SEE ALSO

`size_cell(2)`

```
set_target_library_subset(2)
remove_attribute(2)
```

NLE-023 (Info) Buffering entire segments of hierarchical nets driven by pin '%s'.

DESCRIPTION

This is an info message only. This occurs when `-repeater_distance` or `-divide_load_by` options is used and a hierarchical net or hierarchical pin is specified for `insert_buffer` command.

The `-on_route` option that is used along with `-repeater_distance` or `-divide_load_by` option works on the physical nets and hence the buffer can be introduced on any hierarchical net segment.

SEE ALSO

`insert_buffer(2)`

NLE-024 (Error) Could not find leaf driver pin associated with net '%s'.

DESCRIPTION

This error message occurs when their is no leaf driver pin for the hierarchical net segments starting from the given net.

WHAT NEXT

check if the hierarchical nets has at-least one pin with direction `out`.

SEE ALSO

`insert_buffer(2)`
`get_nets(2)`

NLE-025 (Warning) Need extraction information of net;

extracting RC values for the design.

DESCRIPTION

This warning message occurs when **insert_buffer** is issued with *-on_route* option without extracting RC values for the design.

WHAT NEXT

This is only a warning message.

If you don't want this message to appear do **extract_rc** prior to issuing **insert_buffer** command.

SEE ALSO

[insert_buffer\(2\)](#)
[extract_rc\(2\)](#)

NLE-026 (Error) Extraction information is not initialized.

DESCRIPTION

This error message occurs when the RC values for the design is not initialized correctly.

WHAT NEXT

See if any problem in the extraction; running of **extract_rc** command. Check if the net being buffered is ignored for extraction of RC values or if the extraction was interrupted prematurely.

SEE ALSO

[insert_buffer\(2\)](#)
[extract_rc\(2\)](#)
[get_nets\(2\)](#)

NLE-027 (Warning) Specified location (%d, %d) for buffer/

inverter is outside the core area.

DESCRIPTION

This warning message occurs when the coordinates provided for *-location* option of **insert_buffer** command is not inside the core area of the design.

WHAT NEXT

This is only a warning message.

If you don't want this message to appear provide locations for the buffers which are inside the core area.

SEE ALSO

`insert_buffer(2)`
`set_cell_location(2)`

NLE-030 (Error) Load capacitance of buffer '%s' is greater than total capacitance of the net '%s'.

DESCRIPTION

This error message occurs when **insert_buffer -divide_load_by** option is used and the capacitance of the specified buffer is greater than the total capacitance of the net being buffered.

Total net capacitance = Net capacitance + Pin capacitance(s) of all connected load pin(s)

This message means, specified buffer's capacitance is too large to be used for reducing(dividing) the load capacitance of the net.

WHAT NEXT

- a) Use different library buffer cell which has less capacitance.
- b) Make **insert_buffer** to ignore pin capacitance matching (use *-ignore_pin_cap* option)

SEE ALSO

`insert_buffer(2)`
`extract_rc(2)`
`get_attribute(2)`

```
get_buffers(2)
```

NLE-031 (Warning) Load capacitance of buffer '%s' is greater than required capacitance of the net '%s'.

DESCRIPTION

This warning message occurs when the capacitance of the specified buffer is greater than the required net capacitance.

Required net capacitance = Total net capacitance / *-divide_load_by* value

Total net capacitance = Net capacitance + Pin capacitance(s) of all connected load pin(s)

The **insert_buffer** command would continue with load based buffer insertion on the specified net. But this message would signify that more number of buffers may be introduced due to high load capacitance of buffer(s) being introduced.

WHAT NEXT

This is only a warning message, if the result is not what you expected.

- a) Use different library buffer cell which has less capacitance.
- b) Make **insert_buffer** to ignore pin capacitance matching (use *-ignore_pin_cap* option)

SEE ALSO

```
insert_buffer(2)
extract_rc(2)
get_attribute(2)
get_buffers(2)
```

NLE-033 (Warning) Library cell '%s' has dont_use attribute.

DESCRIPTION

This warning message occurs when the specified library cell for **insert_buffer** or **size_cell** command has a 'dont_use' attribute set to true.

WHAT NEXT

This is only a warning message, if the result is not what you expected.

- a) Use other equivalent library cell which does not have dont_use set.
- b) remove the dont_use setting on the library cell using **remove_attribute** command.

SEE ALSO

```
insert_buffer(2)
size_cell(2)
report_lib(2)
remove_attribute(2)
get_alternative_lib_cells(2)
get_buffers(2)
```

NLE-034 (Warning) Library cell '%s' is an inverter; assuming -inverter_pair option.

DESCRIPTION

You receive this message, if you have specified an inverter library cell for *buffer_lib_cell* option without specifying the *-inverter_pair* option.

WHAT NEXT

This is just a warning message, if result is not what you expected.

- a) specify a library buffer cell.
- b) specify *-inverter_pair* option along with inverter library cell.

SEE ALSO

```
insert_buffer(2)
get_buffers(2)
report_lib(2)
```

NLE-035 (Error) Could not find any common segment of the route driving the pins {%s}.

DESCRIPTION

This error message occurs when **insert_buffer -on_route** option is used on a multi load nets and the tool could not find any route segment where buffer can be inserted honoring the above load pins.

Sometimes the route topology of a net can be such that no buffers can be introduced

preserving the logical hierarchy.

WHAT NEXT

- a) Check the physical distribution of the above load pins and select only those pins/nets that can be buffered based on the route topology.
- b) Manually specify the location where the buffer needs to be inserted by using -location option.

SEE ALSO

`insert_buffer(2)`
`set_cell_location(2)`

NLE-036 (Error) no net connected to pin/port '%s'.

DESCRIPTION

This error message occurs when trying to place buffer connected to a pin which is not connected by a valid net.

WHAT NEXT

`insert_buffer` can only insert buffer on a net which is driven by a leaf pin or port. please check if the netlist is correct and the pin or net being buffered is connected correctly.

SEE ALSO

`all_connected(2)`
`insert_buffer(2)`

NLUTDB

NLUTDB-1 (error) Invalid I/P name at position '%d' of lut_function.

DESCRIPTION

LUT has invalid input port name.

WHAT NEXT

Check the target_library.

NLUTDB-2 (error) Unknown symbol encountered at position '%d' in lut_function.

DESCRIPTION

LUT has an unknown symbol in it's lut_function.

WHAT NEXT

Fix the lut_function in the input(edif/lib/db...).

NLUTDB-3 (warning) Right parenthesis is missing at position '%d' of lut_function.

DESCRIPTION

Right parenthes is missing in the lut function.

WHAT NEXT

Add missing parenthesis to the lut_function.

NLUTDB-4 (error) Unexpected error at position '%d' of

lut_function.

DESCRIPTION

Unexpected error.

WHAT NEXT

Contact Support.

NLUTDB-5 (error) Missing lut_bag in library design %s.

DESCRIPTION

The tool issues this error when the lut_bag is missing in the library design. The error can be caused by Library compiler or from the library.

WHAT NEXT

Contact vendor to get the correct library.

NLUTDB-7 (error) lut_function to EQN conversion failure, empty EQN.

DESCRIPTION

The tool issues this error message when the lut_function to EQN conversion has failed. Make sure the lut_function is supported by the tool.

WHAT NEXT

See the set_lut_function command for the valid symbols supported by the lut_function format.

NLUTDB-8 (error) EQN to lut_function conversion failure, leads

to empty lut_function.

DESCRIPTION

EQN to lut_function conversion failure, leads to empty lut_function. EQN string may have following symbols :- *, (,), ~, +

EXAMPLE

Following represents the same LUT functionality :-

```
EQN -> ((I0 * I1) + (I2 * ~I3) + (I0 * I1 * I2 * I3))
lut_function -> ((I0 I1) + (I2 I3') + (I0 I1 I2 I3))
INIT -> 88F8
```

WHAT NEXT

NLUTDB-9 (error) Invalid pin name '%s' while describing LUT functionality.

DESCRIPTION

Invalid pin name used while describing LUT's functionality. LUT's lut_function/EQN can only be described in terms of LUT pin names.

WHAT NEXT

Check the library for valid LUT pin names.

NLUTDB-10 (error) The cell %s is not a LUT (Look Up Table), or the cell is not linked.

DESCRIPTION

The tool issues this error message when the cell is not a LUT, or the cell is not linked. Make sure the target cell is a LUT primitive, or use the link command to link cells to its library.

WHAT NEXT

NLUTDB-11 (error) Invalid INIT value provided for LUT cell %s.

DESCRIPTION

INIT is a format to describe LUT's functionality. It is a string of hex digits, derived from the truth table of a given function.

EXAMPLE

If a 2-input AND functionality is built using a 2-input LUT, then the corresponding lut_function representation would be (I0 I1) and the EQN representation would be ($I_0 * I_1$). Table 1 shows the truth table representation of this function. The INIT value of this function would be computed by traversing the truth table output column in bottom-up fashion, that is, 1000 binary, which is equivalent to hexadecimal 8.

Table 1		
I1	I1	O
0	0	0
0	1	0
1	0	0
1	1	1

WHAT NEXT

NLUTDB-12 (error) %s-%s at column number '%d' of '%s' '%s'

DESCRIPTION

This indicates an Error in any of the below procedures :-

1. lut_function to EQN conversion
2. EQN to lut_function conversion
3. Mixed format to lut_function

Valid symbols supported in these formats are listed below.

lut_function format
AND space

```
OR      +
INV    '
Misc. (,),0,1
```

```
EQN format
AND *
OR +
INV ~
Misc. (,),0,1
```

```
Mixed format
AND *, &, space
OR +, |
INV ~, !, '
XOR ^,@
Misc. (,),0,1
```

```
INIT format
Hex Number to indicate the functionality 0-9 & A-F
```

SEE ALSO

```
set_lut_function (2)
```

NMA

NMA-2 (error) Negative max_length rule '%d' is invalid.

DESCRIPTION

You receive this message because the **change_names** command has found a negative **max_length** rule, so the names remain unchanged.

WHAT NEXT

Examine the **define_name_rules max_length** argument and provide a valid rule value.

SEE ALSO

change_names (2), **define_name_rules** (2).

NMA-3 (error) The max_length rule '%d' is invalid: It must be greater than 8.

NMA-4 (error) Special rules '%s' is invalid.

NMA-5 (error) Range specified in string '%s' is invalid.

NMA-6 (error) Replacement character '%c' is invalid. It is not an allowed character according to existing rules.

NMA-7 (error) String '%s' is invalid: At least 10 chars must be

allowed.

NMA-8 (information) %d names changed in design '%s'.

WHAT NEXT

This is an informational message only. No action is required on your part.

NMA-9 (information) No names changed in design '%s'.

WHAT NEXT

This is an informational message only. No action is required on your part.

NMA-10 (error) A %s named '%s' already exists in design '%s'.

DESCRIPTION

You receive this message because the **change_names** command has found conflicting names between the proposed new name and existing old names (for example: bus bag name), so the name remains unchanged.

WHAT NEXT

To correct the error, edit your names file to ensure that it contains new names that do not exist in the design.

SEE ALSO

change_names (2).

NMA-11 (error) name mapping string '%s' is illegal.

DESCRIPTION

You receive this message because the **change_names** command found an illegal name mapping string. The name remains unchanged.

WHAT NEXT

Replace the illegal name mapping string with a valid value.

SEE ALSO

`change_names` (2),

NMA-12 (error) Name mapping pattern string '%s' is illegal.

DESCRIPTION

You receive this message because the `change_names` command found an illegal name mapping pattern string. The names remained unchanged.

WHAT NEXT

Provide a valid value for the name mapping pattern string.

SEE ALSO

`change_names` (2).

NMA-13 (warning) The bus_naming_style variable is not defined. Use '%s' in the change_names command.

DESCRIPTION

You receive this message because the `bus_naming_style` variable is not defined. The `change_names` command uses this variable to handle bus type names. If it is not defined, `change_names` uses the "%s[%d]" default value during a name change. However, if the `define_name_rules` command `-special` option contains the predefined `sge_vhdl_output_format`, `change_names` uses the the "%s(%d)" default value.

WHAT NEXT

No action is necessary.

SEE ALSO

`change_names` (2), `define_name_rules` (2), `bus_naming_style` (3).

NMA-14 (warning) The `bus_naming_style` variable contains characters that are not defined within the "-allowed" character set in the current name rule. They are found in the following type(s) of objects: '%s'.

DESCRIPTION

You receive this message because the `define_name_rules` command has changed the bus naming style, so you must change the `bus_naming_style` variable to conform to the new one.

WHAT NEXT

Execute the `help define_name_rules` command for more detail.

SEE ALSO

`define_name_rules` (2), `bus_naming_style` (3).

NMA-15 (warning) Design '%s' has a duplicate reference '%s' that it ignores.

DESCRIPTION

You receive this message because the `change_names` command has been given a duplicate reference. It ignores the second reference.

WHAT NEXT

No action is necessary.

SEE ALSO

`change_names` (2).

NMA-16 (warning) In design %s, %s bus member '%s' has been

changed to '%s'.

DESCRIPTION

You receive this message because the specified bus member name has been changed. By default, the **change_names** command gives a bus member the base name from its owning bus. Thus, a possible reason for this change is that the member name did not previously use the base name from its owning bus.

WHAT NEXT

To recover the original name(s) of the bus member(s), reload your original **db** file and start again. In the future, to see the name changes without actually implementing them, first execute the **report_names** command; then, to prevent **change_names** from making unwanted name changes to bus members, set the **change_names_dont_change_bus_members** environment variable to *true*. For more information, see the **change_names_dont_change_bus_members** man page.

SEE ALSO

change_names (2), **change_names_dont_change_bus_members** (3).

NMA-17 (warning) File %s,
line %d: Can't find %s '%s' in %s '%s'.

NMA-18 (warning) The variable "%s" was set to "%s" from "".

NMA-19 (error) File %s, Line %d:
The names file is missing an expected delimiter '%s'.
Reading of the file has been terminated.

DESCRIPTION

You receive this message because your names file apparently contains **use delimiter:true** as the first line, so the command expects the fifth (delimiter) field. However, it has not found a delimiter where it expected one and, consequently, has stopped reading the file.

The normal names file format has four fields, each separated by a space:

```
<design_name> <object_type_string> <object_name> <new_name>
```

You have the option of adding a fifth field for a delimiter, currently a semicolon <;>. To specify the delimiter field, add **use delimiter:true** as the first line of the names file, as in the following example:

```
use delimiter:true
Design      Type       Object      New Name
-----
TOP         busport    DATAIN     NEW_DATAIN ;
```

WHAT NEXT

You can correct the error in either of the two following ways:

- Edit your names file to add the missing delimiter (;), and re-execute the command.
- Edit your names file to delete the first line **use delimiter:true**, remove any other delimiters, and reexecute the command.

For more information about the names file format, see the **change_names** man page.

SEE ALSO

change_names (2).

NMA-20 (error) File %s, Line %d:

The names file contains an unexpected delimiter '%s'.
Reading of the file has been terminated.

DESCRIPTION

You receive this message because your names file apparently contains **use delimiter:true** as the first line, so the command expects the fifth (delimiter) field. However, the command has found a delimiter in the wrong field and, consequently, has stopped reading the file.

The normal names file format has four fields, separated by a space:

```
<design_name> <object_type_string> <object_name> <new_name>
```

You have the option of adding a fifth field for a delimiter, currently a semicolon <;>. To specify the delimiter field, add **use delimiter:true** as the first line of the names file, as in the following example:

```
use delimiter:true
```

Design	Type	Object	New Name
TOP	busport	DATAIN	NEW_DATAIN ;

WHAT NEXT

To correct the error, edit your names file to ensure that all delimiters are in the fifth field, and reexecute the command. For more information about the names file format, see the **change_names** man page.

SEE ALSO

change_names (2).

NMA-21 (warning) No valid name changes found in names file '%S'.

DESCRIPTION

You receive this message because the specified names file contains invalid name changes. The **change_names** command has found invalid name changes and has stopped reading the names file.

WHAT NEXT

To correct the error, edit your names file to ensure that the name changes in the file are valid. For more information about the names file format, see the **change_names** man page.

SEE ALSO

change_names (2).

NMA-22 (error) Too many errors in names file '%s'.

DESCRIPTION

You receive this message because the specified names file contains too many errors, so the names remain unchanged.

WHAT NEXT

To correct the error, edit your names file to ensure that it contains the correct

information required by the **change_names** command. For more information about the names file format, see the **change_names** man page.

SEE ALSO

change_names (2).

NMA-23 (information) %d names changed using names file '%s'.

WHAT NEXT

This is an informational message only. No action is required on your part.

NMA-24 (warning) File %s,
line %d; and
File %s,
line %d: Unsupported multiple names files.
%s '%s' is the new name of %s '%s' in %s '%s'.

NMA-25 (error) Cannot open '%s' names file.

DESCRIPTION

You receive this message because the **change_names** command cannot open the names file to read. Consequently, it has stopped performing changing names.

WHAT NEXT

Check the read permission for the names file.

SEE ALSO

change_names (2).

NMA-26 (warning) File %s,

Line %d, ObjectType %s,
BusMemberName '%s', BusPortName '%s':
The change_names command cannot be applied to individual
bus members.
Specify the BusPortName instead.

DESCRIPTION

You receive this message because the **change_names** command does not allow individual bus members to be changed. In versions earlier than v3.1a, users could change bus members, and then the bus port was automatically changed. However, in the current version you cannot change individual bus members. You must change the entire bus, and then the names of bus members are simultaneously changed. Error message UIMG-32 warns users that they cannot change only a bus member.

WHAT NEXT

Instead of changing an individual bus member, specify the BusPortName.

SEE ALSO

[**change_names** \(2\)](#),

NMA-27 (warning) File %s,
line %d: Cannot find %s name '%s'.

NMA-28 (warning) File %s, line %d; and
File %s, line %d:
Duplicate change for %s '%s'.
The previous change is overwritten by the latest one.

NMA-29 (warning) File %s,

line %d: Unsupported class string '%s' in '%s'.

NMA-30 (error) Invalid class string '%s'.

NMA-31 (error) '%s' does not specify a unique %s.

Use the complete "full_file_name:%s_name" specification.

NMA-32 (error) Design '%s' is not in the system.

NMA-33 (warning) File %s, Line %d:

The %s named '%s' already exists in design '%s'.

NMA-34 (error) File %s, Line %d:

The names file contains an incomplete line.

Reading of the file has been terminated.

DESCRIPTION

You receive this message because the command has not found an entry in one or more of the expected nondelimiter fields in the names file and has stopped reading the file. The names file can have one of the following two formats:

```
<design_name> <object_type_string> <object_name> <new_name>
<design_name> <object_type_string> <object_name> <new_name> <" ; ">
```

WHAT NEXT

Edit the names file to add the missing field(s), and reexecute the command. For more information about the names file format, see the **change_names** man page.

SEE ALSO

change_names (2).

NMA-35 (error) File %s, Line %d:

This line has no effect on changing names in the %s command.

DESCRIPTION

You receive this message because the specified line does not have any effect on changing any name. This is an informational message.

WHAT NEXT

If this behavior is intended, no action is necessary.

NMA-36 (error) Cannot open the '%s' names file for writing.

DESCRIPTION

You receive this message because the change_names cannot open the names file to write and has stopped performing changing names.

WHAT NEXT

Check the write permission for the names file.

SEE ALSO

`change_names` (2).

NMA-37 (warning) Multiple changes to '%s'.

NMA-38 (error) Option target_bus_naming_style '%s' is invalid.

DESCRIPTION

You receive this message because only %s[%d], %s(%d), %s_%d, and %s_%d_ are supported `target_bus_naming_style` options.

WHAT NEXT

Use the valid options.

NMA-39 (warning) In design %s, the %s bus member '%s' contains a member '%s' with a different base name.

DESCRIPTION

You receive this message because the specified bus name contains a member with a different base name, so the **change_names** command uses this member instead of the base name from the owning bus.

SEE ALSO

change_names (2).

NMA-40 (warning) New net %s is added for design %s.

DESCRIPTION

You receive this message because either the design has an unconnected port or the port cannot be mapped due to a VHDL semantic error. An intermediate signal is created. This error message applies only to a port name that is designed to comply with the VHDL syntax rule.

NMA-41 (warning) Port or net name changed from %s to %s.

DESCRIPTION

You receive this message because a port or net has had a name change to comply with the VHDL syntax or semantic rule.

NMA-42 (warning) In design %s, net %s contains '%d' different bus bags.

DESCRIPTION

This warning message indicates that the specified net name contains more than one bus bag. The net is ignored.

WHAT NEXT

Check your design and make the appropriate changes to avoid this warning.

SEE ALSO

change_names (2).

ONH

ONH-001 (error) Flow error - (%s).

DESCRIPTION

This is a general error message that occurs when the command encountered errors in executing its sub-tasks and hence is unable to complete the flow.

WHAT NEXT

If there are other error messages generated by this command prior to this error, resolve those errors first and then try to re-run the command. If this is the only error message generated by the command, then it is likely an internal error. Please contact your technical support for further assistance.

SEE ALSO

none

ONH-002 (warning) Missing module type %s.

DESCRIPTION

This warning message indicates that command encountered a module while processing the input net-list and could not determine the type (such as soft macro, hard macro, IO, Standard cell, Black-Box etc). In this case, the command will proceed by assuming the type to be Black-box.

WHAT NEXT

If module type is expected to be defined, please check the object attributes in the Milkyway library. Black-boxes may need some values to be estimated for flow to work.

SEE ALSO

`estimate_fp_black_boxes (2)`

ONH-003 (error) File I/O error - (%s).

DESCRIPTION

This error message indicates that command was unable to perform file operation for the specified file.

WHAT NEXT

Check the file name and its path and verify that the directory allows file operations to be performed. To rectify, try changing the path/file name and then re-run the command.

SEE ALSO

none

ONH-004 (warning) Net hierarchy error - (%s).

DESCRIPTION

This warning indicates that the command encountered a hierarchical net with more than one parent net. This typically occurs when the command encountered an unexpected statement in the input net-list and performed an invalid action or encountered some other internal error.

WHAT NEXT

The command will try to auto-fix the problem by picking one of the parent nets and removing others. In order to avoid this message from recurring in future runs, first verify the input net-list consists of only supported syntax. If the input net-list is compatible, then this might indicate some internal error. Please consult with your technical support for further assistance.

SEE ALSO

none

ONH-005 (information) Net %s/%s is connected to instance %s

by floating ports only.

DESCRIPTION

This information message is given out when the command encounters net that is connected to an instance but the net does not have any corresponding lower hierarchy net inside the instance. For example if Cell A has net A1 which connects to instance B_1 (of Master B) via port B_1/A1. If master B has no internal net connected to its port A1 then the net A1 of Cell A is connected to a instance B_1 vis a floating port. This connection will not exist in flat netlist view.

WHAT NEXT

When debugging an incorrect output netlist, frequently the issue can be narrowed by inspecting these messages to see if non-floating ports have been incorrectly treated by the command as floating ports. This can help narrow the problem.

SEE ALSO

none

ONH-006 (error) Invalid value %s for option %s.

DESCRIPTION

This error message occurs when command options are specified invalid values.

WHAT NEXT

Please rectify the option value and re-run the command.

SEE ALSO

none

ONH-007 (warning) Conflicting options given. Will use option specified for %s. Ignoring following additional options given: %s"

DESCRIPTION

This warning message is triggered when command is invoked with a conflicting combination of options. The message clearly identifies which options are accepted and which are ignored as part of conflict resolution.

WHAT NEXT

This message does not need any action from user as command should automatically resolve the conflict and continue.

SEE ALSO

none

OPT

OPT-100 (error) %s has abnormally terminated.

DESCRIPTION

This message indicates that the synthesis command has terminated and has not written the intermediate design back to the database. Because the design has not been written back to the database, the current design is unchanged. The explanation for abnormal termination should have appeared in an error message previous to this one.

WHAT NEXT

Resolve errors and rerun optimization.

OPT-101 (error) The target library does not contain an inverter. An inverter is required for mapping.

DESCRIPTION

The target_library does not contain an inverter.

WHAT NEXT

Add an inverter to the target_library.

OPT-102 (error) The target library does not contain all required gates.

Either a NOR, or an AND and an OR gate (two-input) is required for mapping.

DESCRIPTION

The target_library does not contain the minimum set of gates required by the mapping algorithms.

WHAT NEXT

Add the required gates to the target_library.

OPT-103 (information) Verification Failed.

DESCRIPTION

This error indicates that the **compare_design** command (or the '-verify' option of **compile**) has determined that the combinational logic portions of the two designs being compared are not functionally equivalent.

Another cause for verification failure is if the primary inputs and outputs of the combinational logic partitions do not have the same names. For example, if the names of flip-flops, black boxes, or ports of the designs are not identical, then verification will fail because combinational logic partitions will appear as being fed by different signals.

WHAT NEXT

If you are using -verify and this error occurs, contact the Synopsys Hotline.

OPT-104 (information) Verification is too expensive...unable to complete.

DESCRIPTION

The default value for Verify_effort is "low" which means if the design cannot be verified in a relatively short amount of time, the process is terminated.

WHAT NEXT

When "effort" is set to "high", verification will continue indefinitely, so be cautioned that some designs may take an extremely long time to verify. Set "effort" to "medium" or "high" using the -effort option of **compare_design** or the -verify_effort option of **compile**.

OPT-105 (information) Flattening is too expensive...unable to complete.

Total Endpoints: %d Endpoints unable to be flattened: %d

DESCRIPTION

The flattening of one or more endpoints was determined to be too expensive relative to the specified 'flatten_effort'. An endpoint is considered too expensive to flatten if the flattened (sum of products) representation grows too large during the flattening process.

WHAT NEXT

The default value for 'flatten_effort' is "low". Use the **set_flatten** command to change the effort to "medium" or "high". Be aware that if an endpoint is considered difficult to flatten (i.e. the flattened representation is large) then this may be an indication that flattening is not a viable optimization strategy for this design. Also be aware that with flatten_effort set to "high" the flattening will continue indefinitely. Certain logic functions (large parity trees, for example) have an extremely large flattened representation, and it is possible that flattening with "high" effort will never terminate because of memory limitations of the machine you are running on.

OPT-106 (warning) Cell %s conflicts with the %s in the target library.

DESCRIPTION

The named cell in the design being compiled is linked to a design or library cell with the same name as a cell in your target_library. Due to this the initial technology translation step of **compile** was unable to resolve the conflict. Translation will not be able to resolve the conflict if the dont_touch attribute is assigned, if the cell is a black box (unresolved reference), or if the cell is hierarchical.

WHAT NEXT

If the conflicting cell is already in the target_library, add the target_library to the front of your link_library then do an explicit **link** before the compile.

If you do not want the conflicting cell to be mapped to the target_library, apply the **dont_use** attribute to the conflicting cell in the target_library.

If the conflicting cell is hierarchical, rename the referenced design using **rename_design** and **change_link**.

OPT-107 (warning) Cell %s conflicts with another %s in the

same design.

DESCRIPTION

The design being compiled has two or more cells linked to different library cells (or designs) which have the same name. This can happen if you have two different versions of the same library loaded in Design Compiler, or different libraries with the same cell names, and some cells in the design have been linked to one library and some to another. One possible way that cells will end up linked inconsistently is if you have changed `current_design` to a lower level module and did a **link** (or any command that causes an auto-link), and then changed `current_design` back to the top level module and changed your `search_path` or `link_path`.

WHAT NEXT

The design needs to be explicitly re-linked using the **link** command.

OPT-108 (information) Design '%s' has no optimization constraints set.

DESCRIPTION

The specified design will not be optimized for speed, area, or power consumption because no optimization constraint has been set. For additional information on how to set up optimization constraints, see Chapter 6 of the *Design Compiler Family Reference Manual*.

WHAT NEXT

Set optimization constraints, unless it is not important for your design to be optimized for area, delay, or power.

OPT-109 (warning) In design %s, there are sequential cells not driving any load.

DESCRIPTION

The design being compiled has sequential cells that are not driving any load. Therefore, there exists at least one sequential cell that has an explicit no-load or an inferred no-load due to optimized logic. The default in **compile** is to delete such cells. To make **compile** retain such cells, set variable "compile_delete_unloaded_sequential_cells" to "false" (default "true"). The command "check_design" lists all the unloaded sequential cells.

NOTE: In cases where there exists a feedback loop, with no path from any section of the loop to a primary output, a warning will not be issued as theoretically the output of the sequential cell is connected.

WHAT NEXT

Use `check_design` to obtain more information about the design.

OPT-110 (warning) %s libraries have conflicting technology types.

%s '%s' has technology '%s',
and %s '%s' has technology '%s'.

DESCRIPTION

The libraries in the `link_library` and `target_library` variables must have the same technology specified. It is invalid to have both ECL and CMOS libraries in the `link_library` or the `target_library`.

WHAT NEXT

Reset the `link_library` or `target_library` variable to a valid set of libraries. The libraries the `link_library` and `target_library` must all have the same technology attribute.

EXAMPLE MESSAGE

Warning: Target libraries have conflicting technology types. (OPT-110) Library 'xyz' has technology 'ecl', and library 'qrs' has technology 'cmos'.

OPT-111 (error) The `compile_new_optimization` variable is obsolete.

DESCRIPTION

This error message occurs because the `compile_new_optimization` variable enabled a set of optimizations in `compile_ultra` that caused excessive runtimes that are no longer used.

WHAT NEXT

Remove `compile_new_optimization` from your script in order to use the default `compile_ultra` flow, which is tuned up to produce the best quality of results.

SEE ALSO

`compile_ultra(2)`

**OPT-113 (warning) %s libraries have conflicting delay models.
Library '%s' has delay model '%s',
and library '%s' has delay model '%s'.**

DESCRIPTION

This error occurs when the libraries of link_library or target_library contain multiple delay models. A target_library or link_library that has more than one specified library must contain the same delay model.

WHAT NEXT

Set the link_library or target_library variable to a valid set of libraries. If you have the library source files, you can examine them to determine the delay model for each one. You might have omitted a "delay_model" attribute for one library, which results in the use of a default setting. If you do not have library source files, you might need to ask your library vendor whether the libraries you are using are compatible.

EXAMPLE MESSAGE

Warning: Target libraries have conflicting delay models. (OPT-113) Library 'xyz' has delay model 'generic_ecl', and library 'qrs' has delay model 'generic_cmos'.

OPT-114 (error) Delay model '%s' in library '%s' is not supported.

DESCRIPTION

This error occurs when the delay model of a library is not a supported model. Valid delay models are "generic_cmos" and "generic_ecl". A number of custom delay models are supported. Design Compiler is unable to time the design if the delay model is not valid.

WHAT NEXT

If you have library source files, edit the library source to set the `delay_model` to a valid value. Then use Library Compiler to save the library as a .db file.

If you do not have library source files, contact your library vendor to obtain a valid library file.

OPT-115 (warning) The target library '%s' was compiled with a version 1.1

Library Compiler; this version has a known bug when compiling multiple-output combinational gates.

To avoid this problem, either obtain a version of this library which

was compiled with version 1.2 or greater, or use the '`dont_use`' command to disable all of its multiple-output combinational gates.

DESCRIPTION

The target library specified was compiled with version 1.1 of Library Compiler; this version has a known bug when compiling multiple-output combinational gates.

WHAT NEXT

To avoid this problem, either obtain a version of this library which was compiled with version 1.2 or greater of Library Compiler from your ASIC vendor, or re-compile your library source file (.lib) with a version of Library Compiler greater than version 1.1, using the `read_lib`, `write_lib` command sequence (if you have access to the library source, and Library Compiler). Another solution is to keep the current library and use the `dont_use` command to disable in the target library the insertion of all multiple-output combinational cells during `compileFP`. **Note that this may result in creating a less optimum design than if those cells were available during compile.**

OPT-116 (warning) The target library '%s' was also compiled

using version 1.1.

DESCRIPTION

The target library specified was compiled with version 1.1 of Library Compiler; this version has a known bug when compiling multiple-output combinational gates.

WHAT NEXT

To avoid this problem, either obtain a version of this library which was compiled with version 1.2 or greater of Library Compiler from your ASIC vendor, or re-compile your library source file (.lib) with a version of Library Compiler greater than version 1.1, using the **read_lib**, **write_lib** command sequence (if you have access to the library source, and Library Compiler). Another solution is to keep the current library and use the **dont_use** command to disable in the target library the insertion of all multiple-output combinational cells during **compileFF**. **Note that this may result in creating a less optimum design than if those cells were available during compile.**

OPT-119 (information) Compatibility version is less than '%s'.

DESCRIPTION

This message indicates that the value of the **compatibility_version** variable is set to a release version that is less than the version that is being used.

This message will be followed by another message which will indicate some corresponding behavior of Design Compiler that is modified because of the compatibility version setting.

WHAT NEXT

Reset **compatibility_version**.

OPT-120 (information) Compile will ungroup all hierarchy that is not 'dont_touch'.

DESCRIPTION

This message indicates that the **compatibility_version** variable has been set to a release less than 'v2.0', so the default behavior of **compile** will be to ungroup all hierarchy that does not include the **dont_touch** attribute. For releases v2.0 and higher the normal default behavior of **compile** is to not ungroup hierarchy.

WHAT NEXT

Reset the `compatibility_version`.

OPT-121 (information) Replacing three-state busses with multiplexed busses.

DESCRIPTION

The `compile` or `translate` command is unable to find any three_state components in the target_library, so it replaces three_state busses with multiplexed busses. This process is completed by first mapping the three_state components into generic three_state cells, and then replacing each generic three_state by logic which AND's the Enable and Input pins and then replacing the bus with logic that OR's all of the signals together. This replacement algorithm assumes the original bus was fully decoded. This procedure is only performed if the variable `compile_assume_fully_decoded_three_state_busses` is set to "true".

WHAT NEXT

Recompile with a target library that contains three_state components if you want to keep three_state busses.

OPT-122 (information) Unable to remove three-state bus '%s' from design '%s'.

DESCRIPTION

The `compile` or `translate` attempted to replace the three-state bus with multiplexed bus, but was unable to do so. This can happen if the three-state cells on the bus could not be mapped into generic three_state cells because they included the `dont_touch` attribute. This can also happen if the hierarchy of the design is such that the transformation cannot legally be done. One case where this happens is when the bus leaves a lower level block but is also used inside that block. In this case you cannot replace the bus by a multiplexed bus, since that would require adding another port to the block to feed the bussed signal back into the block for the internal usage.

WHAT NEXT

Remove the `dont_touch` attribute or ungroup the hierarchy to allow replacement of the three_state bus.

OPT-123 (error) Unable to verify the two designs because at least one of the designs contains a state table.

DESCRIPTION

The **compare_design** command cannot verify state tables.

WHAT NEXT

Use **compile** to convert both designs into netlists, then use **compare_design** to verify them. Be aware that **compare_design** only verifies that the combinational logic of the two designs are functionally equivalent. If the state encoding or number of registers in the designs is different, then combinational verification is meaningless and will most likely report that the designs are not the same even though they might have the same sequential behavior.

You can also use the **comare_fsm** command to compare two state machines.

OPT-124 (error) Use the 'uniquify' command to fix multiply instantiated designs.

DESCRIPTION

The **compile** and **reoptimize_design** commands will not accept designs that have multiply-instantiated subdesigns because the commands need to be able to optimize each design specifically for the environment in which it is instantiated.

WHAT NEXT

To keep multiple instances of the same design, you must assign the **dont_touch** attribute to all instances. Otherwise, the multiply instantiated design will not be optimized. You must pick one instance to **characterize** from, and then optimize the multiply-instantiated design separately.

If you do not want to retain the multiple instances, use the **uniquify** command to eliminate multiple instances. This command creates a unique copy of the design for each instance and names the new designs according to the **uniquify_naming_style** variable. You can also manually uniquify by using the **copy_design** and **change_link** commands.

Another option is to apply **set_ungroup** to the multiply-instantiated design, which will cause all the instances to be ungrouped during optimization.

OPT-125 (information) Unable to map three-state cells.

DESCRIPTION

The **compile** or **translate** command was unable to map three_state cells because the target_library does not contain any three_state components.

WHAT NEXT

Rerun **compile** using a library that contains three_state components.

OPT-126 (information) Leaving generic three-state cells in design.

DESCRIPTION

The **compile** or **translate** command was unable to map into three_state components from the target_library so the three_state elements in the design are left as generic components.

WHAT NEXT

Rerun **compile** using three_state components.

OPT-127 (error) Designs which contain synthetic library parts cannot be %s when 'synthetic_library' is not specified or synthetic libraries are disabled.

DESCRIPTION

The design contains synthetic library parts, but synthetic libraries have been disabled.

WHAT NEXT

Enable synthetic libraries by setting the **synthetic_library** variable to "standard.sldb".

OPT-128 (error) There are conflicts between cells in libraries %s:%s (%s) and %s:%s (%s).

DESCRIPTION

This error message follows error messages OPT-106 or OPT-107 and gives the full path name of the libraries involved in cell conflicts. This information is useful when the cell conflicts are actually caused by having two versions of the same library (with different full path names) loaded into Design Compiler at one time.

WHAT NEXT

If you have two versions of the same library loaded you can remove the one you do not need with the **remove_design** command. Check your **search_path** to make sure the library you want to use can be found on the **search_path**.

OPT-129 (warning) The three_state bus '%s' drives more than one port and cannot be split apart because at least one of the ports is an inout mode port.

DESCRIPTION

This error message identifies a net that drives more than one port. The net cannot be split apart because it is a three-state bus with an inout mode port. The **set_fix_multiple_port_nets** command directs compile to insert enough extra logic in a design to ensure that there are no feedthroughs and/or that no two output ports are connected to the same net. In the case of three-state bus nets, however, it is impossible to alter the network without knowing the enabling conditions on the three states that drive the inout mode port from the outside.

WHAT NEXT

The designer needs to manually rearrange the logic hierarchy so that no multiple-port nets exist. The tool cannot automatically help in this case.

OPT-130 (warning) The cell '%s' has no drive (drive == 0.0)

and therefore no net driven by that cell will be buffered.

DESCRIPTION

This error message identifies a cell (or port) that has a drive of 0. That means the cell will not introduce any delay when driving loads of any size. If the net driven by that cell or port really needs buffering, then some drive should be set on it before command balance_buffer is invoked.

WHAT NEXT

Use command set_drive on the cell or port that drives the net being buffered, and then reinvoke command balnace_buffer.

OPT-140 (warning) Could not buffer the multiple port net %s because
doing so would increase the connection class violation of the design.

DESCRIPTION

Design Compiler could not buffer the multiple port net without increasing the connection class cost. Connection class cost is the highest priority cost used by Design Compiler. No transform is allowed to create a connection class violation or worsen an existing connection class violation.

WHAT NEXT

Find out and resolve why you are having connection class violations. You can use the 'check_design' command to know more about the connection class violations.

OPT-141 (warning) Port '%s' cannot be isolated with '%s' because the corresponding cell is not a buffer or an inverter.

DESCRIPTION

You received this warning message because you executed the **set_isolate_ports** command and specified a port with a cell that is not a buffer or an inverter. Design Compiler cannot isolate ports with cells that are not buffers or inverters.

WHAT NEXT

Reexecute the **set_isolate_ports** command and specify a cell that is a buffer or an inverter.

SEE ALSO

set_isolate_ports (2).

OPT-142 (warning) Port '%s' cannot be isolated with '%s' because the corresponding cell is not found in the library.

DESCRIPTION

You receive this warning message because you executed the **set_isolate_ports** command and specified a cell that is not in the target library. Therefore, Design Compiler could not isolate the port with the specified cell.

WHAT NEXT

Verify that the cell specified for isolating the port is in the target library.

SEE ALSO

set_isolate_ports (2).

OPT-143 (warning) Port '%s' cannot be isolated because the connected net '%s' is dont_touch.

DESCRIPTION

You receive this warning message because Design Compiler could not isolate the specified port because the net connected to the port has the **dont_touch** attribute set on it.

WHAT NEXT

Remove the **dont_touch** attribute from the net, then reexecute the **set_isolate_ports** command.

SEE ALSO

`remove_attribute` (2), `set_isolate_ports` (2).

OPT-144 (warning) Port '%s' cannot be isolated because it is driven by the tristate cell '%s'.

DESCRIPTION

You receive this warning message because Design Compiler could not isolate the specified port because the cell driving the port is a tristate cell. Port isolation cannot be performed on inout ports or ports driven by tristate cells.

WHAT NEXT

Remove the port from the list of ports given to `set_isolate_ports`, then reexecute the command.

SEE ALSO

`set_isolate_ports` (2).

OPT-145 (warning) The port named %s cannot be isolated because it is a clock port.

DESCRIPTION

This warning message occurs if Design Compiler cannot isolate the specified port because it is a clock source.

WHAT NEXT

This is a warning message only. No action is required.

However, you can eliminate the message by removing the port from the list of ports given to the `set_isolate_ports` command. After making your changes, reexecute the command.

SEE ALSO

`set_isolate_ports`(2)

OPT-150 (information) Timing loop detected.

DESCRIPTION

The design contains at least one timing loop. This message is followed by a list of pins on one loop and then messages indicating which timing arcs are being automatically disabled to break the loop.

WHAT NEXT

Use **report_timing -loops** to view all timing loops in your design. Use **disable_timing** to manually break the loops.

OPT-151 (information) %s interrupted. Saving intermediate design.

DESCRIPTION

A Control-C interrupt was received by the **compile** command or the **reoptimize_design** command. The current state of the design is being written back to the database. The design will reflect all of the optimization steps that have been performed. During a compile command, if the optimization has not progressed to the mapping step, the design will be unmapped (generic logic).

WHAT NEXT

You can start again from the original design by rereading it or by saving the current design.

OPT-153 (warning) Unable to maintain nets '%s' and '%s' as separate entities.

DESCRIPTION

Two named nets have **probe_point** assigned to them but during optimization they were merged into one net. The resulting net will retain the name of the second net indicated in the error message.

WHAT NEXT

If you need the two nets to remain separate entities throughout optimization, assign the **dont_touch** attribute to them.

OPT-155 (error) ECL technology libraries are not supported.

DESCRIPTION

Starting in release v3.4b, ECL technology libraries and (the ECL delay model) are no longer supported.

WHAT NEXT

Target a different (non-ECL) technology library when synthesizing a new design.

If your design was already compiled against an ECL library, revert back to an older version of the Design Compiler product (v3.4a and before) which supports ECL technology libraries and the ECL delay model. Use the older version of the Design Compiler product to translate the design to a new (non-ECL) library; then read that design into the latest version of the Design Compiler product.

OPT-156 (warning) max_power attribute is ignored on non-ECL designs.

DESCRIPTION

This message appears prior to optimization if the **max_power** attribute has been set on a non-ECL design. Design Compiler will ignore the attribute.

WHAT NEXT

If you are using a **dc_shell** script, edit it to remove the **max_power** command. You can remove the **max_power** attribute on a design with the command:
dc_shell> remove_attribute find(design,design_name) max_power.

OPT-157 (error) Cannot perform optimization with generic cell '%s' (reference %s) which is not dont_touched. Use the report_cell command to list all unmapped cells in the design.

DESCRIPTION

You receive this message because Compiler is unable to optimize the design due to generic logic that is not assigned the **dont_touch** attribute. To perform optimization, the design must either be free of any generic logic or all generic logic must be assigned the **dont_touch** attribute. Use the **report_cell** command to view all cells that are generic and do not have the **dont_touch** attribute assigned to

them.

WHAT NEXT

If you are doing technology translation, before you optimize the design, first do a normal compile or translate to fully map the design into the new technology.

SEE ALSO

`report_cell` (2).

OPT-160 (error) Unable to model design '%s'.

DESCRIPTION

The modeling of the specified design failed. This can be because the library could not be found or could not be modified. The modeling library can be manually created or read with `read_lib` command.

WHAT NEXT

Check if the modeling library is in memory with `list -libraries`. If the modeling library is not in memory, create it and then read it in with `read_lib`, or read the existing library in explicitly, with the `read` command. Also, check if the given library is found within the search path with `list search_path`. Verify you have write privileges to modify the modeling library. Re-initiate the `model` command.

OPT-161 (warning) Text file for model '%s' contains illegal or incomplete library compiler code.

DESCRIPTION

The `model` command did not succeed. The text file describing the model specified in this message could not be written properly. The text file generated cannot be used as a modeling library. This could be because the user ran out of disk space, or because the user has no write privileges for the modeling library.

WHAT NEXT

If the modeling library could not be written successfully, do not use the modeling library created. Check if there is enough disk space left on your device. Check for write permission on the library file and its directory. Once the problem is fixed, create another model for the specified design.

OPT-162 (error) Model can only currently handle busses which are arrays of bits.

DESCRIPTION

The **model** command did not complete successfully because the current design contains busses of a type different than an arrays of bits.

WHAT NEXT

Do not use the model created in the modeling library. Modify the HDL code that is being used as a source to the **model** command to use arrays of bits to represent busses, and use **model** to create a new model for the current design.

OPT-163 (error) Library '%s' must use the same technology as design '%s' to add a model.

DESCRIPTION

The model created must be added in a library with the same technology as the design to be modelled. The library used has a different technology as the design to model.

WHAT NEXT

Use another library to model the design. To check the technology library of a library, use **report_lib**, and look under "Library Type". One way to check the technology on the design is to use **write_timing -f sdf** and look at the PROGRAM field in the sdf file.

OPT-170 (information) Changed wire load model for '%s' from '%s' to '%s'.

DESCRIPTION

Your technology library contains a description of which wire load model to use based on the area of the design. During optimization, **compile** modifies the area of the design and automatically choose the new wire load model necessary to estimate net delays.

WHAT NEXT

Once **compile** completed, verify the constraints are still met, because changing a wire load model means changing net delay estimations. You verify the constraints with **report_constraints**.

OPT-171 (information) Changed minimum wire load model for '%s' from '%s' to '%s'.

DESCRIPTION

Your technology library contains a description of which wire load model to use for minimum delay analysis based on the area of the design. During optimization, **compile** modifies the area of the design and automatically chooses the new wire load model necessary to estimate net delays.

WHAT NEXT

Once **compile** completed verify the constraints are still met, because changing a wire load model means changing net delay estimations. Verify the constraints with **report_constraints**.

OPT-180 (Warning) File '%s' already exists; appending to the end of it.

DESCRIPTION

A command tried to open a file for writing/appending, but the file already existed. This warning message is to inform you that the new text will be appended to the end of the existing file. The old text will remain in the file.

WHAT NEXT

To avoid getting this message, make sure to delete the file before executing this command.

OPT-181 (Error) Could not open file '%s' for writing.

DESCRIPTION

A command tried to open a file for writing, but failed.

WHAT NEXT

Make sure that you have write permission in this directory. If the file already exists in the directory, make sure that you have write permission for that file.

If the permissions are OK, try NOT using the '~' (tilde) character. Some file manipulation functions do not accept path names that start with the tilde character. Try using absolute paths or relative paths instead.

OPT-187 (warning) There are conflicts between cells in libraries %S:%S (%S) and %s:%s (%S).

DESCRIPTION

This warning message follows the OPT-106 or OPT-107 warning message and provides the full path name of the libraries involved in cell conflicts. This information is useful when the cell conflicts are caused by having two versions of the same library (with different full path names) loaded into Design Compiler at one time.

WHAT NEXT

This is a warning message only. No action is required.

However, if you have two versions of the same library loaded, remove the unneeded library with the **remove_design** command. Check the **search_path** to ensure that the library you want to use can be found on the **search_path**.

SEE ALSO

remove_design(2)
OPT-106(n)
OPT-107(n)

OPT-190 (Error) Must have an expert license to use 'compile -in_place'.

DESCRIPTION

The **-in_place** option of **compile** requires an expert license.

WHAT NEXT

See command **get_license** to obtain the expert license.

OPT-191 (Error) Must have an expert license to use 'balance_registers'.

DESCRIPTION

The `balance_registers` command requires an expert license.

WHAT NEXT

OPT-192 (Error) Must have a Design Compiler Expert license to use complex clocking.

DESCRIPTION

A Design Compiler Expert license is required to use complex clocking. Complex clocking means multiple clocks with different periods or any clocks with multiple pulses in the waveform.

WHAT NEXT

Redefine clocks using common period and single pulse per waveform, or obtain a Design Compiler Expert license.

OPT-193 (Warning) Must have a Design Compiler Expert license to use 'balance_registers'.

DESCRIPTION

The `balance_registers` feature requires a Design Compiler Expert license. Register balancing will not be performed during compile if no Design Compiler Expert license is available.

WHAT NEXT

Check whether your site has a Design Compiler Expert key. If this is not the case, purchase one from Synopsys. Otherwise all your Design Compiler Expert Keys are currently in use. Wait until one becomes free at your site.

OPT-194 (Information) Expert license required for latch time-borrowing.

DESCRIPTION

Latch time-borrowing requires an expert license. Max_time_borrow will be set to zero for all latches if no expert license is available.

WHAT NEXT

OPT-195 (Error) Must have %s license(s) to use %S.

DESCRIPTION

A command was invoked which requires the specified license(s). However, this license either does not exist at this site or it is already in use by other users.

WHAT NEXT

To proceed with this command you must ensure that this license is available at this site. Then reinvoke the command.

OPT-196 (error) The target technology is '%s'. The design '%s' can only be optimized or mapped to an FPGA technology because either '%s' or at least one of its sub-designs was read or elaborated using the FPGA specific HDL-Compiler. The following design(s) in '%s' were read or elaborated by the FPGA specific HDL-Compiler: %s .

DESCRIPTION

An optimization command (**compile**) was issued. As the design was loaded, one or more designs were found to have been read or elaborated using an FPGA-specific HDL Compiler license. But the technology of the target library was not FPGA. To optimize these designs, the target technology must be FPGA.

WHAT NEXT

Reread or re-elaborate the designs, making sure that a nontechnology-specific HDL license is checked out by the **read** or **elaborate** command.

To do the above, remove all FPGA-specific HDL licenses, and get a nontechnology-specific HDL license, such as HDL Compiler or VHDL Compiler (see manual pages for **remove_license** and **get_license**).

OPT-197 (Error) You must have a BOA-BRT license to run the pipeline_design or optimize_registers commands.

DESCRIPTION

You receive this error message if you do not have a BOA-BRT license. The **pipeline_design** and **optimize_registers** commands run only with a BOA-BRT license. This license is either not available at your site, or all licenses for this feature are currently in use.

WHAT NEXT

Wait for one of the existing licenses to become available, or purchase an additional BOA-BRT license from Synopsys.

OPT-200 (Warning) Library cell '%s' has a valid function-id, but it has also been annotated with the user_function_class attribute. Resolving this conflict by ignoring the user_function_class attribute for this library cell.

DESCRIPTION

The specified cell has been annotated with the **user_function_classr** attribute even though it has a valid function-id. Library Compiler can generate a function-id for most cells in a technology library. However, there may be a few complex sequential or combinational cells that Library Compiler cannot successfully generate a function-id for. In addition, some black-box cells in the library do not have any function information. The **user_function_class** attribute is intended for such cells that otherwise would not have a function-id. The **user_function_class** attribute is not intended for library cells that already have a valid function-id.

WHAT NEXT

This warning message indicates that the **user_function_class** attribute for this

library cell will be ignored. No further action is required. To turn off this warning message in the future, make sure that a **user_function_class attribute** is not set on this library cell.

OPT-201 (Warning) Library cells '%s' and '%s' have different pin information, but they have been assigned the same user_function_class. Resolving this conflict by ignoring the user_function_class attribute on the latter library cell.

DESCRIPTION

Two library cells that are assigned the same **user_function_class** attribute should have the exact same pin information. That is, they must have the same number of pins and the same pin names. This requirement is necessary so that Design Compiler can establish pin-to-pin correspondence between two cells in the same **user_function_class** when it replaces a reference to one library cell by a reference to the other library cell.

This warning message indicates that an inconsistency was found between the pin information of two library cells in the same **user_function_class**. To resolve this conflict, the **user_function_class** attribute for the second library cell will be ignored.

WHAT NEXT

This warning message indicates that the **user_function_class** attribute for the second library cell will be ignored. No further action is required. To turn off this warning message in the future, make sure that all library cells in a given **user_function_class** attribute have the same pin information.

OPT-202 (warning) Variable '%s' is obsolete.

DESCRIPTION

Setting this variable has no effect on compile. Please see the the man page for the variable for alternatives.

WHAT NEXT

Please see the man page for the variable for alternatives.

OPT-203 (Warning) Library cells '%s' and '%s' have different function_id, but they have been assigned the same clock_gating_integrated_cell attribute. Resolving this conflict by removing the latter library cell from the clock_gating class.

DESCRIPTION

You receive this warning message when two library cells that have the same `clock_gating_integrated_cell` attribute have a different function_id. Library cells with the same `clock_gating_integrated_cell` attribute must have the same function_id.

WHAT NEXT

Verify that all library cells with the same `clock_gating_integrated_cell` attribute have the same function_id.

OPT-205 (error) Inconsistent references found for cell '%s'.

DESCRIPTION

This is an internal Design Compiler error which indicates that two references by the same name have different port interfaces.

WHAT NEXT

Ensure that no library cells addresses conflict. An example is a design named AND2 with ports I1, I2, O1 and a library cell of the same name with ports A, B, and Z. In this case changing the name of the design will solve the problem.

OPT-206 (warning) The sequential library cell '%s' does not have any setup or hold timing arcs.

DESCRIPTION

The sequential cell '%s' is inherently hazardous. Using such cells in synchronous designs may result in metastable behaviour.

WHAT NEXT

The user can infer this cell directly from HDL by using the `asynch_set_reset` pragma in the HDL description. See the Application Note "HDL Coding Style: Sequential Devices" for more detail.

OPT-210 (error) Variable '%s' is malformed near '%s' and will be ignored.

DESCRIPTION

The cost vector used by compile can be modified or overridden by environment variables to change the priority of the costs.

This warning message indicates that the user-defined cost vector could not be parsed successfully, and that the problem occurred near the reported word (only the first detected error is reported). Because of the error, the user-defined cost vector is ignored and the optimization will proceed with the standard cost vector.

WHAT NEXT

Check the variable definition for a misspelled word. Make sure that each cost is contained in a separate word, e.g.,

```
{ "delay", "area"},
```

instead of

```
{ "delay area"},
```

Also make sure that each modifier is a single word, e.g.,

```
{ ..., "max_cap before max_fo"},
```

instead of

```
{ ..., "max_cap", "before", "max_fo"}
```

OPT-220 (information) Switching to base optimization engine for the current compile run.

DESCRIPTION

The new optimization engine is known to give good results for rich libraries having several consistently sized cells. Before invoking the new optimization engine

library analysis is run to determine if the target library meets the above criterion.

The current target library has failed to meet the above criterion. For such a library the quality of results produced by the new optimization engine can be unpredictable. Hence the base optimization engine will be used for all compiles with the current library.

WHAT NEXT

Please contact your silicon vendor for the latest version of their library.

OPT-221 (warning) The new optimization engine might not produce the best results for the specified target library.

DESCRIPTION

The new optimization engine is known to give good results for rich libraries having several consistently sizes cells. Before invoking the new optimization engine library analysis is run to determine if the target library meets the above criterion.

The current target library has just met the above criterion. As the library analysis criterion is not very tight, the above does not imply good quality of results.

WHAT NEXT

Please contact your silicon vendor for the latest version of their library.

OPT-301 (warning) The design named %s has %d out of %d cells marked size-only, which may limit optimization.

DESCRIPTION

This warning message occurs when a large number of cells in the design are marked size-only. A cell is marked size-only by the **set_size_only** command or indirectly by any reference to the cell in a timing constraint, such as the **set_multicycle_path** command, or indirectly by **compile** in the early stage of **compile** to preserve the constraints being applied on the cell during **compile**. The size-only which is indirectly applied by **compile** to preserve the constraints is removed later when the constraint inheritance is done. So, you will not see the size-only attribute through report_cell command after **compile** if the size-only is indirectly applied by **compile**. Marking cells size-only significantly constrains logic optimization for the corresponding logic.

The following is an example of the warning message:

Warning: The design named top has 19034 out of 19641 cells marked size-only, which may limit optimization (OPT-301).

WHAT NEXT

This is only a warning message. No action is required.

However, if the large number of size-only cells is unexpected, review your constraints, particularly constraints using wildcards and filters that may accidentally be including more cells than you intended.

SEE ALSO

`set_multicycle_path(2)`
`set_size_only(2)`

OPT-306 (warning) Could not find '%s' in design '%s'.

DESCRIPTION

This error indicates that a pin or port cannot be found in the design. This can happen if an attribute was placed on an object that no longer exists. A pin name may be invalid because a new design has been linked to it.

WHAT NEXT

If the design hierarchy has changed, you should remove attributes and other information which refers to nonexistent pins or ports.

EXAMPLE MESSAGE

Warning: Could not find pin 'u1/u4/u3/u7/Z' in design 'top'. (OPT-306)

OPT-309 (warning) Design '%s' contains unmapped cells. Use report_cell to list unmapped cells in the design.

DESCRIPTION

This warning is displayed by the `check_timing` command if the design contains unmapped cells (generic logic). Timing paths that pass through generic logic will be inaccurate because zero delay is assumed for generic cells. Use `report_cell` to see

which cells in the design are unmapped.

WHAT NEXT

Use **compile** to map the generic logic in the design. Make sure that no generic cells have the **dont_touch** attribute set, because **dont_touch** attributes cause **compile** to display warning message before mapping the cell.

OPT-314 (warning) Disabling timing arc between pins '%s' and '%s' on cell '%s'%s

DESCRIPTION

This message is displayed when timing arcs are disabled by Design Compiler to break combinational feedback loops. It is not displayed for arcs that are manually disabled with the **disable_timing** command.

WHAT NEXT

If you want to manually break a timing loop, examine the design to see why there is combinational feedback and then choose a different point at which to break the loop. To do this, use the **disable_timing** command instead of letting Design Compiler automatically break the loop.

EXAMPLE MESSAGE

Warning: Disabling timing arc between pins 'A' and 'Z' on cell 'u10' to break a timing loop (OPT-314)

OPT-317 (warning) Could not fix %s violation of %.2f at %s '%s'.

DESCRIPTION

This warning may appear in the "Fixing Design Rules" phase of compile. This message indicates that there was a min_delay or hold violation which could not be corrected by adding delay in the form of inverters or buffers. It also indicates the pin or port at which the violation occurred.

WHAT NEXT

The violation could not be fixed either because adding a buffer violates higher priority costs. You can prioritize min-path over Design Rule/Max Path by using **set_cost_priority** command. You can examine the resulting netlist to see why there was a min_delay or hold violation. It may be possible to modify the original design

to avoid the violation. If the error was a hold violation, you can disable "fixing" by removing the **fix_hold** attribute from clocks in the design. If the error was a min_delay violation, you can disable "fixing" by removing any **min_delay** attributes in the design. Another possibility is to stop compile before the "Fixing Design Rules" phase using **compile-no_design_rule**. Use the **report_constraint** command to examine the design rule violations which **compile** would have attempted to fix. If you have a preferred method for correcting certain design rule violations, you can make the change in the design and then mark the changes with the **dont_touch** command before proceeding. Complete the procedure using **compile-only_design_rule** to correct any remaining design rule violations.

EXAMPLE MESSAGE

Warning: Could not fix hold violation of 2.40 at pin 'ff1/D'. (OPT-317).

OPT-318 (warning) Inserting delay to fix %s violation of %.2f at %s '%s'.

DESCRIPTION

This warning may appear in the "Fixing Design Rules" phase of compile. This message indicates that there was a min_delay or hold violation which was corrected by adding delay in the form of inverters or buffers. It also indicates the pin or port at which the violation occurred.

WHAT NEXT

You can examine the resulting netlist to see why there was a min_delay or hold violation. It may be possible to modify the original design to avoid the violation. If the error was a hold violation, you can disable "fixing" by removing the **fix_hold** attribute from clocks in the design. If the error was a min_delay violation, you can disable "fixing" by removing any **min_delay** attributes in the design. Another possibility is to stop compile before the "Fixing Design Rules" phase using **compile-no_design_rule**. Use the **report_constraint** command to examine the design rule violations which **compile** would have attempted to fix. If you have a preferred method for correcting certain design rule violations, you can make the change in the design and then mark the changes with the **dont_touch** command before proceeding. Complete the procedure using **compile-only_design_rule** to correct any remaining design rule violations.

EXAMPLE MESSAGE

Warning: Inserting delay to fix hold violation of 2.40 at pin 'ff1/D'. (OPT-318).

OPT-319 (information) Complementing port '%s' in design '%s'.

The new name of the port is '%s'.

DESCRIPTION

During **compile**, a hierarchical port in the design has undergone a phase change. This can occur only if that port was part of a hierarchical block that was enabled for boundary_optimization, or if the **compile** command was run with the boundary_optimization switch enabled.

WHAT NEXT

To completely disable boundary_optimization, remove the boundary_optimization attribute from all of the hierarchical blocks in the design. You can also selectively enable it on certain blocks.

To turn off only hierarchical phase optimization, set the environment variable `compile_disable_hierarchical_inverter_opt` to TRUE. This will prevent the **compile** command from changing the phase of hierarchical port signals. Other boundary optimizations will still be attempted.

OPT-320 (warning) Illegal value for variable `port_complement_naming_style`. Inverter optimization disabled for design '%s'.

DESCRIPTION

The `dc_shell` variable `port_complement_naming_style` has an illegal value. For more information, consult the man page for this variable.

WHAT NEXT

OPT-403 (warning) Could not find cell '%s' in design '%s'.

DESCRIPTION

This message indicates that a cell that exists in the .db database for the design could not be found in the optimization data structure representation for the same design.

WHAT NEXT

If this condition occurs, it means that the optimization datastructure is somehow

inconsistent with the .db database. Any attributes or directives that exist on this cell in the database will be ignored.

OPT-407 (warning) There are no unconnected '%s' pins with signal type '%s' in block '%s.'

DESCRIPTION

The **compile** or **translate** command attempted to connect the 'clocked_on_also' net in the designated block, but was unable to do so because there were no unconnected pins (load or driver) to connect the net to.

WHAT NEXT

Make sure that signal type attributes have been properly specified in the design.

OPT-408 (warning) No associated_clock found for clocked_on_also %s '%s' in block '%s'.

DESCRIPTION

The **compile** or **translate** command attempted to connect the **clocked_on_also** pin or port in the designated block, but was unable to do so because the **associated_clock** was not found.

Whenever a design has more than one clock port, all **clocked_on_also** ports must specify an **associated_clock**.

WHAT NEXT

Make sure that the **associated_clock** is correctly specified for the given **clocked_on_also** pin or port. The associated clock object must be only one port.

OPT-450 (warning) Could not find net '%s' in design '%s'.

DESCRIPTION

This message indicates that a net that exists in the .db database for the design could not be found in the optimization data structure representation for the same design.

WHAT NEXT

When this condition occurs, it means that the optimization data structure is somehow inconsistent with the .db database. Any attributes or directives that exist on this net in the database will be ignored.

OPT-455 (error) This design has no %ss for distribute_capacitance.

DESCRIPTION

The **distribute_capacitance** command requires that the current design has a wireload, a maximum delay constraint, and at least one appropriate net for distributing capacitance. An appropriate net is one that has no back-annotation, is not **dont_touch**'ed, and is constrained by the maximum delay constraint.

WHAT NEXT

Correct the design deficiency. Reissue the **distribute_capacitance** command.

OPT-460 (warning) Ignoring dont_touch on net '%s' because it is connected only to generic logic which must be mapped. Use all_connected to see net connections.

DESCRIPTION

A **dont_touch** attribute has been placed on a net that is connected only to unmapped (generic) logic. This **dont_touch** attribute is ignored by **compile** because it must map the logic. A **dont_touch** attribute on a net will only have an effect if there is mapped logic on that net. Use the **all_connected** command to list all objects connected to the net in question.

WHAT NEXT

If you are using a script to mark the net as **dont_touch**, you should remove that **dont_touch** command from the script.

OPT-461 (warning) Dont_touch on net '%s' may be overridden by compile because it

is connected to generic logic. Use `all_connected` to see net connections.

DESCRIPTION

A `dont_touch` attribute has been placed on a net that connects some unmapped (generic) logic. This `dont_touch` attribute may be ignored by `compile` because the structure of the design may change, eliminating the need for that net. The net might disappear if its logical value can be obtained from another point in the design, or if that value is not used.

If the net is not eliminated, the `dont_touch` attribute will allow the logic on the net to be mapped. An example of when the `dont_touch` will be useful is when you have a mapped multiple-output buffer driving a number of roughly balanced loads of generic logic. You can preserve balancing by marking the output nets of the buffer as `dont_touch`.

Use the `all_connected` command to list all objects connected to the net in question.

WHAT NEXT

After `compile` is finished, examine the design to see what changes were made to the net. If the net is lost and you want to preserve it, you can instantiate mapped logic connected to the net.

OPT-462 (error) The following net has multiple drivers which are logically opposite in function: '%s'
This is an illegal design. Type 'help OPT-462' for more details.

DESCRIPTION

As the design was being read into `compile`, it was found that a net in the design has more than one driver, and that the functions computed by a pair of drivers on the net are the inverse of each other. For example, if a net is connected to both logic one and logic zero or is connected to the Q and QBAR outputs of flip-flop, the drivers are inverse of each other. This type of connect is not allowed in `compile` and thus `compile` terminates.

WHAT NEXT

Fix the multiple driver net, such that there are no drivers on it which are opposite in functionality. Or make the net a wired-net of some known type.

OPT-463 (warning) Deleting scan chain information from design '%S'.

DESCRIPTION

This message tells you that **compile** has deleted scan chain information from a design. **report_test -scan_path** will no longer show that the design has scan chains. Hierarchical scan insertion will no longer infer that there are scan segments in the design.

compile needs to delete the scan chain information because the information includes references to design database objects that may get obsoleted by **compile**.

You can use **check_dft** to restore the scan chain information. It is important that you do this before using **insert_dft** to attempt hierarchical scan operations.

This message will appear regardless of whether test models are used. If you are using a Test Model flow (by setting the variable **test_use_test_models** to true), scan chain information is stored in a Test Model and so is not actually lost. The scan chain information stored in the Test Model will be used at the top level hierarchical scan.

WHAT NEXT

If you are not using a test model flow, run **check_dft** on the design to restore scan chain information.

If you are using a test model flow, you can safely disregard this message.

OPT-464 (warning) Library has non-scan cells like '%S'.

DESCRIPTION

This message tells you that you have set **compile_seqmap_is_scan_only** to true and the library has non-scan cells. This can result in incorrect results with **compile -scan**.

WHAT NEXT

Set **compile_seqmap_is_scan_only** to false(default) and execute **compile -scan** With new-scan flow this variable need to be set.

OPT-465 (warning) There are '%d' scan cells in the design

without scanned_by_test_compiler attribute

DESCRIPTION

This message tells you that **compile -scan** found the given no of scan cells that does not have scanned_by_test_compiler attribute on them. If this attribute is not set. **compile -scan** will try to scan-replace it, thinking that it is used functionally. This can result in redundant logic.

WHAT NEXT

Set scanned_by_test_compiler attribute on all scan cells that are not used functionally. The following example sets the attribute on all scan cells in the design

```
Eg., prompt>set scells [get_cells -hier * -filter @is_a_test_cell==true]  
prompt>set_attribute $scells scanned_by_test_compiler true
```

SEE ALSO

[set_attribute](#)

OPT-466 (warning) Optimization for shift-registers can be done only by compile_ultra -scan.

DESCRIPTION

This message is shown when **compile -scan** is invoked and you have set **set_scan_configuration -identify_shift_registers true**. for **compile -scan**. Only **compile_ultra -scan** can do shift-register optimizations for scan. Medium effort compile will do this optimization.

WHAT NEXT

Run **compile_ultra -scan** for optimizing back-to-back shift-registers for scan, if you want to see the best results in your first compilation.

SEE ALSO

[compile_ultra](#) [preview_dft](#) [insert_dft](#)

NAE

OPT-467 (information) Automatic shift-register identification is enabled for scan. Not all registers will be scan-replaced

DESCRIPTION

This message is shown when **compile -scan** is invoked and shift-register identification is enabled. Shift-register identification and optimization for scan will identify back-to-back shift-registers and scan only the first one. So the design after **compile_ultra -scan** will have non-scan cells with the attribute `shift_register-flop`.

WHAT NEXT

To disable this feature set **set_scan_configuration -identify_shift_registers false before compile_ultra -scan**.

SEE ALSO

`set_scan_configuration` `compile_ultra` `preview_dft` `insert_dft`

NAE

OPT-468 (information) Scan related optimization for shift-registers will be undone in this flow.

DESCRIPTION

This message is shown when **compile -scan** is invoked and shift-register identification is disabled for a test-ready design. Shift-register identification and optimization for scan will identify back-to-back shift-registers and scan only the first one. If this message was shown the design after **compile_ultra -scan** will not have non-scan cells with the attribute `shift_register-flop`.

WHAT NEXT

To enable this feature set **set_scan_configuration -identify_shift_registers true before compile_ultra -scan**.

SEE ALSO

`set_scan_configuration` `compile_ultra` `preview_dft` `insert_dft`

OPT-470 (information) Using 'high' timing effort.

DESCRIPTION

The target library being used indicates that the transition time (slew) at a gate's input pin may affect the output transition delay of the gate. Which means that local changes to the netlist may affect gate delays in the entire transitive fanout of the changed cells, requiring significant delay calculation and path tracing overhead. During optimization, all gate delays are being calculated exactly at the expense of greater run time.

By default all delays are calculated exactly; timing effort is high.

WHAT NEXT

Early in the design cycle, this additional timing accuracy may not be worth the increased run time incurred by modeling the input transition effect on output pin transition.

To optimize using approximate timing and reduce run time, set **compile_use_low_timing_effort = true**.

OPT-471 (information) Using 'low' timing effort.

DESCRIPTION

The target library being used indicates that the transition time (slew) at a gate's input pin may affect the output transition delay of the gate. Which means that local changes to the netlist may affect gate delays in the entire transitive fanout of the changed cells, requiring significant delay calculation and path tracing overhead. Optimization is using approximate output pin transitions to reduce runtime because the variable **compile_use_low_timing_effort** has been set to "true."

Since optimization is using approximate pin transitions, Design Compiler may meet the design's constraints using the approximate timing, but not meet them using exact timing. The compile log will show delay costs calculated using approximate timing. Timing and constraint reports are always produced using exact timing.

WHAT NEXT

Low timing effort should only be used early in the design cycle, when the additional timing accuracy of high timing effort may not be worth the increased run time incurred by modeling the input transition effect on output pin transition.

To optimize using exact timing, set **compile_use_low_timing_effort = false**.

OPT-472 (information) Using fast delay calculation mode.

DESCRIPTION

The variable **compile_use_fast_delay_mode** is set to *true* and optimization is using either the cmos2 delay model or the nonlinear delay model.

SEE ALSO

`compile_use_fast_delay_mode(3)`.

OPT-473 (warning) Cannot perform multibit optimization on '%s' '%S'.

DESCRIPTION

This message indicates that multibit optimization cannot be performed on a cell or a multibit component. The reasons include having a don't touch attribute, having local optimization disabled, the multibit component not being sufficiently wide, or the multibit component having cells with differing functionalities.

WHAT NEXT

If this condition occurs, it means that the multibit optimization could not be performed on the design object indicated. Check the multibit component or cell indicated and ensure that the above conditions are avoided. Use the **create_multibit** or **remove_multibit** commands to manipulate multibit components. Then re-run the **compile** command.

SEE ALSO

`create_multibit(2)`. `remove_multibit(2)`. `report_multibit(2)`.

OPT-474 (warning) Internal Scan State detection disabled.

DESCRIPTION

Internal scan-state detection is disabled when ungrouping or boundary optimizations are turned on.

WHAT NEXT

Turn off ungrouping and/or boundary optimizations in compile -scan.

SEE ALSO

compile_ultra preview_dft insert_dft

OPT-475 (information) Internal Scan State detection enabled.

DESCRIPTION

Internal scan-state detection is enabled to identify cells already stitched in the design.

WHAT NEXT

To turn off scan-state detection, set variable compile_scan_enable_state_detection to false

SEE ALSO

compile_ultra preview_dft insert_dft

OPT-500 (Error) LUT library design '%s' has more than one output port.

DESCRIPTION

LUT library design can not have more than one output port.

WHAT NEXT

OPT-501 (Error) LUT library design '%s' has pin count mismatch.

DESCRIPTION

LUT library design input pin count should match with lut_bag pin count.

WHAT NEXT

OPT-502 (Error) LUT library design '%s' has ports other than in and out direction types.

DESCRIPTION

LUT library design can not have ports other than in and out direction.

WHAT NEXT

OPT-503 (Warning) Constant sequential cell '%s'.

DESCRIPTION

The inputs to this sequential cell are tied to logic constants in such a way that the register will never change state.

WHAT NEXT

You can set the variable 'fpga_seq_const_prop = 1' and compile will push the constant through and remove the sequential cell. However, changing your hdl may be a cleaner option.

OPT-504 (Warning) Constant-push through sequential cell '%s'.

DESCRIPTION

The inputs to this sequential cell were tied to logic constants in such a way that the register would never change state. The constant has been pushed through and the cell has been removed.

WHAT NEXT

You can set the variable 'fpga_seq_const_prop = 0' and compile will just issue a warning but not push the constant through.

OPT-505 (Error) Clock gating cell '%s' was inserted by Power

Compiler.

This cannot be automatically removed. Please use Power Compiler to remove this clock-gating cell.

DESCRIPTION

DCFPGA cannot remove clock-gating logic that was inserted by the Power Compiler product. This logic must be removed using Power Compiler.

WHAT NEXT

Use Power Compiler to remove clock-gating logic.

OPT-506 (Information) Reimplemented clock-gating for cell '%S'.

DESCRIPTION

DCFPGA has reimplemented the clock-gating logic for this cell according to the 'cg_clk' and 'cg_en' attributes on the cell. This means that all registers that were gated by this cell have been rewired to use the ungated clock signal (the cg_clk function) at clock pins and the gating condition (the cg_en function) at clock-enable pins. Registers were replaced with clock-enabled versions if necessary.

If the clock-gating cell only drives registers then it will be removed after this rewiring. If the clock-gating cell has other non-register loads then the clock-gating cell will be retained to drive these other loads, even though the registers have been rewired.

WHAT NEXT

This is an informational message, no action is required. However, note that the design may fail formal verification (compile -verify) as a result of this clock-gate rewiring because the gate logic is different (even though sequential functionality is the same).

OPT-507 (Error) Bad clock-gating '%s' function (%s).

DESCRIPTION

DCFPGA was unable to reimplement clock-gating logic because the logic function given by this attribute was not parseable into a valid boolean equation. The function must

be a logic equation in terms of the clock-gate cell input pins using standard + and * operators. The tick ' is used for inversion, and parenthesis may be used in the equation as needed to specify operator precedence.

For example:

```
set_attribute find(cell,"CG1") cg_clk -type string "CP'" set_attribute  
find(cell,"CG1") cg_en -type string "E + TE"
```

WHAT NEXT

Fix the function attribute so equation is paresable.

OPT-508 (Error) Could not find cg_relink design '%s'.

DESCRIPTION

DCFPGA was unable to find a replacement design in the cg_relink attribute. The cg_relink attribute should be of the form:

```
"LIBCELL:REPLACEMENT_DESIGN [LIBCELL2:REPLACEMENT_DESIGN2 etc]"
```

For example:

```
set_attribute CG1 cg_relink -type string "CG:mycgx LD_1:myld1"
```

In this example the design 'myld1' will be substituted for instances of the LD_1 library cell found in this gated clock domain. The design 'myld1' can have ports named the same as the pins of LD_1, and these ports will be connected by name match when the substitution is performed. In addition, the replacement design may have additional input ports which match pin names on the original clock-gate cell (CG1 in this example), or on the replacement clock-gate design (mycgx in this example).

It may be possible to fully specify the latch replacement designs in terms of the original cg_cell inputs, in which case it would not be necessary to specify a replacement design for the cg_cell itself (the CG:mycgx in the above example).

WHAT NEXT

Make sure all referenced replacement designs are loaded into dcfpga before the compile command is executed.

OPT-509 (Error) Could not parse cg_relink attribute '%s'.

DESCRIPTION

DCFPGA was unable to parse the cg_relink attribute. The cg_relink attribute should be of the form:

```
"LIBCELL:REPLACEMENT_DESIGN [LIBCELL2:REPLACEMENT_DESIGN2 etc]"
```

For example:

```
set_attribute CG1 cg_relink -type string "LD_1:myld1"
```

In this example the design 'myld1' will be substituted for instances of the LD_1 library cell found in this gated clock domain.

WHAT NEXT

Fix the cg_relink attribute to conform to above syntax.

OPT-510 (Error) Unmatched cg_relink port '%s' for '%s:%s'.

DESCRIPTION

No match could be found for this replacement-design port. The replacement design ports must match by name to pins of the lib_cell type being replaced, or to input-pins of the cg_cell, or to any port of the cg_cell replacement design if there is one.

WHAT NEXT

Fix the replacement design ports to match by name as described above.

OPT-511 (Warning) Constant propagation through registers has been enabled by

`fpga_seq_const_prop = true`, but these registers will NOT be deleted after constant propagation because the variable

`compile_delete_unloaded_sequential_cells = false.`

DESCRIPTION

This behavior can be desirable to aid formal verification, as the formal verification tool will be able to match and verify the constant register endpoints.

WHAT NEXT

You can set '`compile_delete_unloaded_sequential_cells = true`' and compile will automatically delete unloaded registers. This is also the default behavior if the variable is not explicitly set in your script.

OPT-512 (Information) Reimplemented clock-gating at net '%S'.

DESCRIPTION

DCFPGA has reimplemented the clock-gating logic at this net according to the VIRTUAL_CLKBUF specification in a '`cg_relink`' attribute.

WHAT NEXT

This is an informational message, no action is required. However, note that the design may fail formal verification (`compile -verify`) as a result of this clock-gate rewiring because the gate logic is different (even though sequential functionally is the same).

OPT-513 (Information) Automatic clock-gate removal at net '%S'.

DESCRIPTION

DCFPGA has automatically reimplemented the clock-gating at this net by using clock-enabled sequential devices rather than a clock-gating element.

WHAT NEXT

This is an informational message, no action is required. However, note that the design may fail formal verification (`compile -verify`) as a result of this clock-gate rewiring because the gate logic is different (even though sequential functionally is the same).

OPT-600 (information) Translate interrupted. Saving intermediate design.

DESCRIPTION

A CONTROL-C interrupt was induced by the **translate** command. The design, in its current state, is being written back to the database. The design will reflect all translation steps that have been completed so far.

WHAT NEXT

You can start again from the original design by re-reading it or you can start again by saving the current design.

OPT-601 (warning) No sequential cell of target library has synchronous set/reset inputs as required by cell '%s'

DESCRIPTION

You receive this message if your HDL description indicates that the specified sequential element needs synchronous set and/or reset inputs, and there is no library cell with such functionality. Instead, a simple flip-flop is instantiated. However, instantiating a simple flip-flop could cause the synchronous set/reset signal(s) to be moved away from the sequential element, possibly causing simulation problems.

WHAT NEXT

Add the directive 'sync_set_reset' (// synopsys sync_set_reset) to the HDL source code, and reexecute the **compile** command.

SEE ALSO

compile (2).

OPT-700 (warning) Dual-site technology attributes are inconsistent across libraries.

These attributes will be ignored.

DESCRIPTION

Attributes specific to dual site technologies, needed for optimization geared towards such technologies, are required to have values consistent across all libraries used in the compile process. If the values are inconsistent, the normal optimization mode will be in use. Note that the absence of any of these attributes in a library forces default values to be used.

WHAT NEXT

Make attributes consistent across all libraries used in the compile process.

OPT-774 (information) '%s' will not be ungrouped because of the datapath_optimization_effort attribute set on it.

DESCRIPTION

You receive this message because the specified design/instance has datapath_optimization_effort attribute set on it even though automatic ungrouping is enabled during compile.

WHAT NEXT

This is an informational message only.

SEE ALSO

`compile (2)`, `set_datapath_optimization_effort (2)`,

OPT-775 (information) Ungrouping %d of %d hierarchies before Pass 1

DESCRIPTION

You receive this message because the specified number of hierarchies were automatically ungrouped before Pass 1 due to the enabling of automatic ungrouping during compile.

WHAT NEXT

This is an informational message only.

SEE ALSO

`compile` (2), `compile_ultra_ungroup_small_hierarchies` (3),

OPT-776 (information) Ungrouping hierarchy %s before Pass 1

DESCRIPTION

You receive this message because the specified hierarchy is automatically ungrouped before Pass 1 due to the enabling of automatic ungrouping during compile.

WHAT NEXT

This is an informational message only.

SEE ALSO

`compile` (2), `compile_ultra_ungroup_small_hierarchies` (3),

OPT-777 (information) Ungrouping hierarchy %s '%s' #insts = %d.

DESCRIPTION

You receive this message because the specified hierarchy is automatically ungrouped due to the enabling of automatic ungrouping during compile. Automatic ungrouping is enabled by using the `compile` command with the `-auto_ungroup [area|delay]` option. The hierarchy is specified by *Instance Name Cell Type Number of Instances*.

WHAT NEXT

This is an informational message only.

SEE ALSO

`compile` (2), `compile_auto_ungroup_override_wlm` (3),
`compile_auto_ungroup_area_num_cells` (3),

OPT-778 (information) Preview of ungrouping hierarchy.

DESCRIPTION

You receive this message to inform you that the hierarchy you specified is a possible candidate for ungrouping. You can selectively ungroup the listed hierarchy (or hierarchies) with subsequent **compile** commands: either use the **compile** command with the **-auto_ungroup** option or set the **compile_auto_ungroup_hierarchy** variable to 1.

WHAT NEXT

This is an informational message only. No action is required on your part.

If you choose to ungroup the specified hierarchy, use one of the methods described.

SEE ALSO

compile (2), **compile_auto_ungroup_hierarchy** (3).

OPT-779 (information) The wire load model of the parent cell %s is different from that of the child cell %s in the design %. The child cell will not be ungrouped.

DESCRIPTION

This information message occurs when a cell will not be auto_ungrouped by default if its wire load model is different from its parent.

WHAT NEXT

This is an informational message only. No action is required.

However, you can override the default by setting the **compile_auto_ungroup_override_wlm** to true.

SEE ALSO

compile(2)
compile_auto_ungroup_override_wlm(3)

OPT-780 (information) There is no timing violation in design %s.

Delay-based auto_ungroup will not be performed.

DESCRIPTION

This information message occurs when delay-based auto_ungroup will not take place if there is no timing violation for the current_design.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

compile(2)

OPT-781 (information) Using dc_star strategy for automatic ungrouping.

DESCRIPTION

You receive this information message when you use the **set_dc_star_optimization** command to enable enhanced features for automatic ungrouping during the execution of the **compile_ultra** command. You can revert to the standard **compile_ultra** command ungrouping strategy within dc_star by setting the **compile_dc_star_area_ungroup** variable to false.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

compile_ultra(2)
set_dc_star_optimization(2)
compile_dc_star_area_ungroup(3)

OPT-800 (warning) Removing some annotated net capacitances from design '%s'.

DESCRIPTION

One or more net capacitance values which were annotated with the **set_load** command

have been removed from the design. The capacitance values for these nets will now be estimated using wire load models.

All annotated net capacitance values are removed by the **compile** command (except with the **in_place** option) or the **translate** command.

Annotated net capacitance values are preserved wherever possible when running **compile -in_place**, **reoptimize_design -in_place**, or **reoptimize_design -post_layout_opto**.

The **reoptimize_design** command without the **in_place** or **-post_layout_opto** flags preserves annotated net capacitance on inter-cluster nets. Annotated capacitances are removed from nets enclosed within leaf-level clusters.

WHAT NEXT

The **set_dont_touch** command can be used to maintain annotation on nets during optimization, although it also limits optimization from certain transforms on those nets. The **dont_touch** attribute can be placed on nets directly and may also be placed on hierarchical cells to keep the capacitances annotated on nets within the hierarchical cell during optimization.

The **create_wire_load** command allows optimization to make use of annotated capacitance values which have been removed from the design by incorporating them into the wire load estimates.

OPT-801 (warning) Removing some annotated net resistances from design '%S'.

DESCRIPTION

One or more net resistance values which were annotated with the **set_resistance** command have been removed from the design. The resistance values for these nets will now be estimated using wire load models.

All annotated net resistance values are removed by the **compile** command (except with the **in_place** option) or the **translate** command.

Annotated net resistance values are preserved wherever possible when running **compile -in_place**, **reoptimize_design -in_place**, or **reoptimize_design -post_layout_opto**.

The **reoptimize_design** command without the **in_place** or **-post_layout_opto** flags preserves annotated net resistance on inter-cluster nets. Annotated resistances are removed from nets enclosed within leaf-level clusters.

WHAT NEXT

The **set_dont_touch** command can be used to maintain annotation on nets during optimization, although it also limits optimization from certain transforms on those

nets. The **dont_touch** attribute can be placed on nets directly and may also be placed on hierarchical cells to keep the capacitances annotated on nets within the hierarchical cell during optimization.

OPT-802 (warning) Removing some annotated pin to pin connect delays.

DESCRIPTION

One or more net delay values which were annotated with the **set_annotated_delay** or **read_timing** commands have been removed from the design. The delay values for these nets will now be estimated using wire load models and the interconnect model defined by the current operating conditions.

The following optimization modes remove all annotated net delay values from the design: **translate** (all modes), **compile** (except **-in_place**), and **reoptimize_design** (except **-post_layout_opto** and **-in_place**).

Annotated net delays are preserved wherever possible when running **compile -in_place**, or **reoptimize_design -in_place**. See the variable **compile_update_annotated_delays_during_inplace_opt** for more information on how these delays are treated during in-place optimization.

The **reoptimize_design** command with the **-post_layout_opto** option preserves annotated net delays on inter-cluster nets. Annotated delays are removed from nets enclosed within leaf-level clusters.

WHAT NEXT

The **set_dont_touch** command can be used to maintain annotation on nets during optimization, although it also limits optimization from certain transforms on those nets. The **dont_touch** attribute can be placed on nets directly and may also be placed on hierarchical cells to keep the capacitances annotated on nets within the hierarchical cell during optimization.

OPT-803 (warning) Removing annotated pin to pin cell delays.

DESCRIPTION

One or more cell-delay or timing-check values that were annotated with the **set_annotated_delay**, **set_annotated_check**, or **read_timing** commands have been removed from the design. The *delay* and *check* values for these cells will be calculated using the library's delay parameters.

All annotated cell-delay and check values are removed by the **compile** and **reoptimize_design** commands (except where the **-in_place** option is defined) or the

translate command.

Annotated cell-delay and check values are preserved wherever possible when running **compile -in_place** or **reoptimize_design**. See the variable **compile_update_annotated_delays_during_inplace_opt** for more information about how these delays are treated during in-place optimization.

WHAT NEXT

You can use the **set_dont_touch** command to maintain annotation on cells during optimization, although it limits optimization from certain transforms on those cells. During optimization, to keep the capacitances annotated on cells within the hierarchical block, you can place the **dont_touch** attribute directly on leaf cells and on hierarchical blocks.

OPT-804 (information) Removing all annotated delays from design '%s'.

DESCRIPTION

The cell and net delays annotated with the **set_annotated_delay** and **read_timing** commands are removed from the design. Annotated cell and net delays are removed from the design with the **remove_annotated_delay** command.

WHAT NEXT

The cell and net delays are now calculated from the library timing and from estimations of net length from the wire load models. To re-annotate net and cell delays, use the **set_annotated_delay** or **read_timing** commands.

OPT-805 (warning) Net '%s' already has '%s' for annotated resistance. '%s' is discarded.

DESCRIPTION

A net has already been annotated with a resistance value and has been annotated a second time with a new value. Net resistances are annotated with **set_resistance**.

This warning condition can happen when a net crossing hierarchical boundaries, has different names on either side of the boundary and thus would have been annotated twice. In this case, the maximum net resistance is kept.

WHAT NEXT

Update the script annotating resistances to avoid annotating the net twice. If the resistance value annotated on the net is unacceptable, use the **set_resistance** command to override the value annotated on the net.

OPT-806 (warning) Net '%s' already has '%s' for annotated capacitance. '%s' is discarded.

DESCRIPTION

A net has already been annotated with a capacitance value and is annotated a second time with a new value. Net capacitances are annotated with **set_load**.

This condition can happen when a net crossing hierarchical boundaries, and has different names on either side of the boundary. Thus the net would have been annotated twice. In this case, the maximum net capacitance is kept.

WHAT NEXT

Update the script annotating capacitances to avoid annotating the net twice. If the capacitance value annotated on the net is unacceptable, use the **set_load** command to override the value annotated on the net.

The current design has been modified. To save the changes, use the **write** command.

OPT-807 (warning) Annotation on pin '%s' is invalid because its cell, '%s', is not a leaf cell.

DESCRIPTION

This warning message occurs because pin-to-pin delay and timing-check back-annotation can be done only between pins of leaf cells. Leaf cells are cells that do not contain any other cells. Timing cannot be annotated to or from ports of nonleaf cells because pins of nonleaf cells have no physical location in layout. The tool does not use the timing value to and from the invalid pin.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, to avoid this warning, do not use pins of hierarchical cells with the **set_annotated_delay**, the **set_annotated_check**, and the **set_annotated_transition** commands, or in the timing files read with the **read_timing** command.

SEE ALSO

```
read_timing (2), set_annotated_check (2), set_annotated_delay (2),  
set_annotated_transition (2).
```

OPT-808 (warning) Connect delays annotated to and from this pin are removed.

DESCRIPTION

A connect delay has been annotated to or from an invalid pin. Connect delay can only be annotated between pins of leaf cells. Leaf cells are cells with no hierarchy, cells which do not contain any cells. Timing cannot be annotated to or from ports of non-leaf cells. This is because pins of non leaf-cells have no physical location in layout.

WHAT NEXT

The current design has been modified. To save the changes, use the **write** command. The connect delays annotated to and from this pin are removed from the design database automatically, so that next time the database is loaded, this warning will not appear.

OPT-809 (warning) Cell delays annotated from this pin are removed.

DESCRIPTION

A cell delay has been annotated to or from an invalid pin. Cell delays can only be annotated between pins of leaf cells. Leaf cells are cells which do not contain any cells.

Timing cannot be annotated to or from ports of non-leaf cells. This is because pins of non leaf-cells have no physical location in layout. This error message is generated after **OPT-807** error message. Refer to **OPT-807** error man page for more information on the context of this error message.

WHAT NEXT

The current design has been modified. To save the changes, use the **write** command. The cell delays annotated to and from this pin are removed from the design database automatically, so that next time the database is loaded, this warning will not appear.

OPT-810 (error) Direction of pin '%s' cannot be of type '%s'.

DESCRIPTION

Cell delays can only be annotated from pins of direction input or inout and to pins of direction output or inout. Net delays can only be annotated from pins of direction output or inout and to pins of direction input or inout. The **-net** or **-cell** options of **set_annotated_delay** might be used incorrectly.

Cell and net delays are annotated with **set_annotated_delay**. Cell and net delays can also be annotated with **read_timing**.

WHAT NEXT

Modify the **set_annotated_delay** command for the given pin. Verify the occurrences of the given pin in the timing file if **read_timing** was used.

OPT-811 (error) Direction of port '%s' cannot be of type '%s'.

DESCRIPTION

Net delays can also be annotated with **read_timing**. Net delays can only be annotated from pins with direction output or inout. Net delays can only be annotated to pins with direction input or inout. Net delays can be annotated between leaf cell pins and between the top level ports of the current design and leaf cell pins. If the driver pin of the annotated net is a port, the port direction must be input or inout. If the load pin of the annotated net is a port, the port direction must be output or inout.

Net delays are annotated with **set_annotated_delay -net**.

WHAT NEXT

Verify the use of **set_annotated_delay** command for the given port. Verify the use of the given port in the timing file if **read_timing** was used. Annotate the delay to or from the given port with **set_annotated_delay**.

OPT-812 (warning) Object '%s' is invalid. It must be a pin of a leaf cell or a port.

DESCRIPTION

Cell delays are annotated between input and output pins of leaf cells. Net delays can be annotated between leaf cells pins and between the ports of the current design

and leaf cell pins. A leaf cell is a cell which do not contain other cells. The given object is invalid if it is a pin of a non-leaf cell.

To annotate the given object, it should be a pin on a leaf cell or a port at the top level of the current design. All other object types are invalid for annotation. Net and cell delays are annotated with **set_annotation_delay**. Net and cell delays can also be annotated with **read_timing**.

WHAT NEXT

Verify the use of **set_annotation_delay** command with the given object. Verify the use of the given object in the timing file if **read_timing** was used.

OPT-813 (warning) Timing check annotated to and from this pin is removed.

DESCRIPTION

A timing check has been annotated to or from an invalid pin. Timing checks can be annotated only between pins of leaf cells. Leaf cells are cells with no hierarchy; they are cells that do not contain any cells. Timing cannot be annotated to or from ports of nonleaf cells because pins of nonleaf cells have no physical location in the layout.

WHAT NEXT

The current design has been modified. To save the changes, use the **write** command. The timing checks annotated to and from this pin are removed from the design database automatically so that the next time the database is loaded, this warning will not appear.

OPT-814 (error) Pins '%s' and '%s' are not on the same cell.

DESCRIPTION

For back-annotation of timing checks, the from and to pins must be on the same cell.

WHAT NEXT

Enter the command again with pins that are on the same cell.

OPT-815 (warning) There is no '%s' timing arc between pins

'%s' and '%s'.

DESCRIPTION

Back-annotated delays or timing checks on cells require that there be a corresponding timing arc on the referenced library cell. When no clock edge is specified in the SDF file, **read_timing** attempts to annotate the timing check on the timing arc with both clock rising and clock falling, thus possibly generating this warning message if the library has only either a clock rising or a clock falling timing check. This warning is not generated for HOLD if the library contains a removal timing check between the pins specified with the SDF HOLD construct, because the SDF HOLD construct is recommended for specifying removal timing checks.

WHAT NEXT

Check the library for a possible missing timing arc. Also, ensure that the direction of the arc is correct; for example, setup arcs must go from the clock pin to the data pin. For further information, refer to the appropriate command manual page.

OPT-822 (warning) Pins (or ports) '%s' and '%s' are not on the same net.

The back-annotated data between these two objects is removed.

DESCRIPTION

A net delay is back-annotated, but the two pins specified with **set_annotated_delay**, or in the timing file read with **read_timing**, are not on the same net. The net delays annotated from the given pin have been removed from the design.

WHAT NEXT

Verify the **set_annotated_delay** commands are used for pins on the same net, or verify the timing file specifies pin-to-pin timing for pins on the same net. Since the design database has been modified, to save the changes, write the design with the command **write**.

OPT-830 (information) Removing annotated delays from pin

'%S' to pin '%S'.

DESCRIPTION

The command `remove_annotated_delay` removes annotated delay between pins on the same net or cell. Use `remove_annotated_delay -to` to remove annotated delays set with `set_annotated_delay -to`. Use `remove_annotated_delay -from` to remove annotated delays set with `set_annotated_delay -from`. Use `remove_annotated_delay -from -to` to remove annotated delays set with `set_annotated_delay -from -to`.

WHAT NEXT

The design database has been modified. To save the changes, use the `write` command.

OPT-831 (information) Removing delays annotated to pin '%S'.

DESCRIPTION

The command `remove_annotated_delay -to` removes annotated delay up to the given pin. Use `remove_annotated_delay -to` to remove annotated delays set with `set_annotated_delay -to`. Use `remove_annotated_delay -from` to remove annotated delays set with `set_annotated_delay -from`. Use `remove_annotated_delay -from -to` to remove annotated delays set with `set_annotated_delay -from -to`.

WHAT NEXT

The design database has been modified. To save the changes, use the `write` command.

OPT-832 (information) Removing delays annotated from pin '%S'.

DESCRIPTION

The command `remove_annotated_delay -from` removes annotated delay from the given pin. Use `remove_annotated_delay -to` to remove annotated delays set with `set_annotated_delay -to`. Use `remove_annotated_delay -from` to remove annotated delays set with `set_annotated_delay -from`. Use `remove_annotated_delay -from -to` to remove annotated delays set with `set_annotated_delay -from -to`.

WHAT NEXT

The design database has been modified. To save the changes, use the `write` command.

OPT-833 (info) Deleted pin to pin delay values will be approximated via automatically annotated resistance.

DESCRIPTION

There are certain conditions under which annotated pin-to-pin net delays must be deleted; for details, refer to the OPT-802 man page. If delay is deleted during the use of **reoptimize_design -post_layout**, then the deleted delay annotation is approximated by automatically annotating resistance values. These values are calculated using the annotated pin-to-pin delays, annotated capacitance, and the delay equation appropriate for the current tree delay model. Note that if the tree type is 'best_case_tree', then no resistance annotation will be done, because wire delay is assumed to be 0 for this tree type.

WHAT NEXT

OPT-834 (warning) There is no timing annotated between pin '%s' and pin '%s'.

DESCRIPTION

You have tried to remove annotated delay set between two pins, where there is no delay annotated between the specified pins. This problem will occur when there is no timing arc between the specified pins. Either the two given pins are not on the same net or are not on the same cell or are on the same cell but there is no timing arc defined in the library between them. This can also happen if there was no delay annotated between the two pins.

WHAT NEXT

If you have specified valid pins, then no annotation is present. If you have not specified valid pins, then make this correction to your design.

OPT-835 (warning) Overwriting the %s delay between pin '%s' and pin '%s' with (%f).

DESCRIPTION

The rise/fall delay between the specified pins was already annotated. This is because *set_net_delay* was used multiple times and in different ways to specify the delay between the two pins. This created an ambiguity. For example, an ambiguity can appear when using *set_net_delay <value1> -from <pin_A>* and *set_net_delay <value2> -*

to `<pin_B>` where `pin_A` and `pin_B` are on the same net.

WHAT NEXT

No action is required. To eliminate the warning, check the back-annotation on each pin and remove the ambiguity. To remove annotated delays, use the `remove_delay` command. To check the delay annotated between two pins, use the command `report_annotated` or `report_timing -from <pin> -to <pin> -input_pin`.

OPT-836 (Information) Annotated delays on net/cells have been modified/deleted.

DESCRIPTION

When cells are swapped, the connect delays on nets connected to the swapped cells are updated to reflect the change of pin capacitance due to the new cells. The annotated connect delays on nets connected to the swapped cells have been incrementally modified. If the net resistance is zero, net delays will not be modified. If the net resistance is different than zero (worst case or balanced case) the annotated net delay is modified relative to the difference in pin capacitance.

Annotated delays are removed from cells in both the immediate fanout and the immediate fanin of a swapped cell. The delays through cells in the immediate fanout may have changed due to the different drive capability of the new cell. Delays through cells in the immediate fanin may have changed due to the change in load capacitance.

Back-annotated delays are updated in order to maintain delay accuracy while the design is being modified. More information is available in the `compile_update_annotated_delays_during_inplace_opt` man page. To avoid updating annotated delays, set `compile_update_annotated_delays_during_inplace_opt` to `false`.

WHAT NEXT

OPT-837 (Warning) Design '%s' already has annotated delays, `read_timing` and `set_annotated_delay` only annotate worse delays.

DESCRIPTION

The design already has annotated delays. `read_timing` and `set_annotated_delay` only annotated delays that were greater than the initially annotated delays. If you wish to overwrite previously annotated delays, independently of their values, use `remove_annotated_delay -all` before using `read_timing` or `set_annotated_delay`. The

worst option is useful when reading a timing file which might contain conditional timing. Refer to the **read_timing** and **set_annotated_delay** man pages for more information on the **worst** option.

WHAT NEXT

Use **remove_annotated_delay -all** and back-annotate the timing again if you wish to overwrite all old annotated delays with delays in the timing file. Use **set_annotated_delay** without the **worst** option, if you wish to overwrite old annotated delays with new delays.

OPT-850 (error) %s '%s' has annotated delays already including load delay.

Annotate delays including load delay or remove old annotated delays.

DESCRIPTION

The commands **set_annotated_delay** and **read_timing** annotate delays on cells and nets. You tried to annotate delays without load delay on a cell or a net that already has annotated delays including load delay. Delays must be consistently annotated on each cell and net. You either need to annotate delay values that include the load delay or remove the previously annotated delays before annotating new delays.

Load delay (also known as extra source gate delay) is the portion of cell delay which is due to the capacitive load of the net being driven. Some delay calculators consider load delay part of the net delay and others consider it part of the cell delay.

You specify that the load delay is included in the net delay values by using the **-load_delay net** option of **set_annotated_delay** or **read_timing**. You specify that the load delay is included in the cell delay values by using the **-load_delay cell** option of **set_annotated_delay** or **read_timing**.

WHAT NEXT

If the net delay values you wish to annotate include the load delay, use **-load_delay net** option of **set_annotated_delay** or **read_timing**. If the cell delay values you wish to annotate include the load delay, use the **-load_delay cell** option of **set_annotated_delay** or **read_timing**.

If the delay values you wish to annotate do not include the load delay, remove the existing annotated delays on the cell or net before proceeding in the back-annotation. To do so, run **report_annotated_delay** with **-net** or **-cell** option to report the annotated delays. Then, use **remove_annotated_delay** or **reset_design** to remove the annotated delays. Then use **read_timing** or **set_annotated_delay** to proceed in the delay back-annotation.

SEE ALSO

`read_timing(2)`, `set_annotated_delay(2)`.

OPT-851 (error) %s '%s' already has annotated delays, and these annotated delays do not include load delay.

You must either annotate delays without including load delay; or remove old annotated delays.

DESCRIPTION

The commands `set_annotated_delay` and `read_timing` annotate delays on cells and nets. You have tried to annotate a delay value that includes load delay on a cell or a net that already has annotated delays that do not include load delay. You need to annotate delay values without including the load delay or remove the previously annotated delays before annotating new delays.

Load delay is also known as extra source gate delay, and is the portion of cell delay caused by the capacitive load of the net being driven. Some delay calculators consider load delay part of the net delay and others consider it part of the cell delay.

You specify that the load delay is not included in the net delay values by using the `-load_delay cell` option of `set_annotated_delay` or `read_timing`. You specify that the load delay is not included in the cell delay values by using the `-load_delay net` option of `set_annotated_delay` or `read_timing`.

WHAT NEXT

If the cell or net delay values you wish to annotate do not include the load delay, use the `-load_delay net` or `-load_delay cell` options of `read_timing` or `set_annotated_delay`.

If the cell or net delay values you wish to annotate include the load delay, remove the annotated delays on the cell or net before proceeding with back-annotation. To remove annotated delays, first report them by running `report_annotated_delay` with the `-net` or `-cell` option. Next, use `remove_annotated_delay` or `reset_design` to remove the annotated delays. Finally, use `read_timing` or `set_annotated_delay` to proceed in the delay back-annotation.

SEE ALSO

`read_timing(2)`, `set_annotated_delay(2)`.

OPT-852 (warning) Use of the best_case_tree delay model

during reoptimize_design -post_layout is discouraged.

DESCRIPTION

This message indicates that you have used the best_case_tree model during **reoptimize_design**. During **reoptimize_design -post_layout**, all pin-to-pin net delays are deleted for nets that do not cross cluster boundaries. If the best_case_tree delay model is used, nets that do not have back-annotation will have 0 delay.

WHAT NEXT

Change the operating conditions so that the best_case_tree delay model is not used.

OPT-853 (warning) Target library does not contain any 2-1 multiplexor.

DESCRIPTION

The design contains generic multiplexor cells (MUX_OP). They were created by HDL Compiler (TM) because either the variable hdlin_infer_mux = all or the HDL code contains comments with infer_mux process_label. MUX_OP cells in the design were implemented without trees of multiplexors. This may severely effect quality of results.

WHAT NEXT

Add a library with a 2-1 multiplexor in the search path to make multiplexor mapping possible. Or turn off the multiplexor mapping feature by overriding the infer_mux directives in the HDL with hdlin_infer_mux = none. Or remove the infer_mux directives from the HDL code.

OPT-854 (warning) Ignoring dont_touch attribute on cell(s) in multiplexor implementation '%s'

DESCRIPTION

The multiplexor mapping functionality supports specification of the "dont_touch" attribute only on the entire multiplexor implementation. If a "dont_touch" is specified on a cell(or collection of cells) within the implementation, the "dont_touch" attribute is ignored.

WHAT NEXT

In order to apply a "dont_touch" attribute to a multiplexor implementation use the set_dont_touch command and specify the instance-name of the multiplexor implementation (e.g. U7/U4).

OPT-855 (error) Cannot estimate resistance or capacitance per unit length

DESCRIPTION

Cannot find enough back-annotated data for estimating the resistance or capacitance per unit length in the current design.

WHAT NEXT

Try to back annotate enough physical information for the current design, or change the option criteria. Possible commands are: set_load, read_sdf, read_pdef.

OPT-860 (Information) Back-annotated pin delays for Net: %s is ignored because net belongs to a clock mesh.

DESCRIPTION

The tool is ignoring the back-annotated pin-to-pin delays values for the specified net because the specified net is part of a clock mesh.

WHAT NEXT

To turn off the above filtering, please set variable ba_annotation_filter_clock_mesh to FALSE.

OPT-900 (error) replace_fpga terminated abnormally.

DESCRIPTION

This message indicates that an error occurred during the execution of the command replace_fpga which caused the command to abort. The intermediate design was not written back to the database. The *current_design* is not changed. The reason for the abnormal termination should have appeared in an error message previous to this one.

WHAT NEXT

Resolve errors and rerun *replace_fpga*.

OPT-901 (error) *replace_fpga* interrupted. Saving intermediate design.

DESCRIPTION

A CONTROL-C interrupt was received by the *replace_fpga* command. The design in its current state is being written back to the database. Note that some fpga cells may not be converted to their gate level equivalents and further generic logic may be present.

WHAT NEXT

OPT-902 (warning) This site does not have an FPGA License. Trying to obtain a CMOS license and enable CMOS optimizations. NO FPGA SPECIFIC OPTIMIZATIONS WILL BE ENABLED !

DESCRIPTION

The command executed required an FPGA license. Your site does not have an FPGA license (if such a license existed at your site the command would have aborted and this error message would not have appeared). The command will continue and attempt to obtain a CMOS license. If a CMOS license is obtained, the command will continue assuming the technology is CMOS. For example, if the command is *compile* then only CMOS related optimization will be performed.

WHAT NEXT

OPT-903 (error) The technology of the target library is the Xilinx %s series FPGA. Optimization requires that the library contain the Xilinx programmable cell core cell(CLB). Either the CLB cell does not exist in the library or a dont_use attribute has been

placed on the cell.

DESCRIPTION

Optimization, translation, and mapping that target a Xilinx FPGA technology requires that the library contain a Xilinx programmable core cell (CLB).

WHAT NEXT

Use the **report_lib** command to check the library for the existence of Xilinx programmable core cell (CLB). If it does not exist, contact Xilinx. If it does exist, there may be a **dont_use** attribute on the CLB cell. Remove the **dont_use** attribute on the CLB cell.

OPT-904 (warning) The **replace_fpga** command has already been run on this design, or sub-designs below this design. The proper methodology is to run **replace_fpga** AFTER this command.

DESCRIPTION

It is important to understand that **replace_fpga** removes CLBs and IOBs, and replaces them with primitive components in the Xilinx library. At the same time, **replace_fpga** places important mapping information on your design; this mapping information is used by the XNF writer to create Xilinx FMAP and HMAP directives for your design. These directives control how logic is divided among the CLBs and IOBs that are actually built for your design.

Remember also that **replace_fpga** is a necessary step that must be run before writing out XNF for your design. This is because Xilinx does not accept CLB or IOB symbols in their XC4000 family XNF. Instead, you must make sure that your XNF is in terms of primitive components. That's where **replace_fpga comes in. By running replace_fpga** before writing out a design, you can be sure that the design is implemented only in primitive gates.

This warning message tells you that **replace_fpga** has previously been run on this design, or subsections of this design, and that it is a methodology error to run the command from which this error was issued after running **replace_fpga**.

WHAT NEXT

Make sure that you, or your script, only invokes **replace_fpga** just before writing out the design to XNF. Only run the current command (the one that generated this error) BEFORE running **replace_fpga**, not after running **replace_fpga**.

OPT-905 (warning) The `replace_fpga` command has already been run on this design, or sub-designs below this design. Partitioning information created by `replace_fpga` may become invalid as a result. The proper methodology is to run `replace_fpga` AFTER this command.

DESCRIPTION

It is important to understand that `replace_fpga` removes CLBs and IOBs, and replaces them with primitive components in the Xilinx library. At the same time, `replace_fpga` places important mapping information on your design; this mapping information is used by the XNF writer to create Xilinx FMAP and HMAP directives for your design. These directives control how logic is divided among the CLBs and IOBs that are actually built for your design.

Remember also that `replace_fpga` is a necessary step that must be run before writing out XNF for your design. This is because Xilinx does not accept CLB or IOB symbols in their XC4000 family XNF. Instead, you must make sure that your XNF is in terms of primitive components. That's where `replace_fpga` comes in. By running `replace_fpga` before writing out a design, you can be sure that the design is implemented only in primitive gates.

This warning message tells you that `replace_fpga` has previously been run on this design, or subsections of this design. Since each invocation of `replace_fpga` (1) removes any pre-existing mapping information and then (2) replaces existing CLBs and IOBs by primitive gates, you can see that repeatedly calling `replace_fpga` can destroy mapping information on your design. This can possibly result in a lower quality circuit.

WHAT NEXT

Make sure that you, or your script, only invokes `replace_fpga` once on a design.

OPT-906 (error) The FPGA cell '%s' does not contain the proper instance specific configuration information.

DESCRIPTION

This error message, which indicates an illegal design, occurs when the identified FPGA cell does not contain the proper instance-specific configuration information. An example is when a design is saved using a format (such as Edif, Verilog, VHDL, and so forth) that is not the Synopsys DB format, and is then read back into Synopsys. If this is not the case, the DB file must be corrupt. Currently, FPGA designs created by compile that contain programmable cells can be saved only in DB format.

WHAT NEXT

You must recreate the original compiled design. If the original compiled design was saved in DB format, it can be read back into Synopsys.

OPT-907 (warning) Inverter Removal Optimization is being disabled because an FPGA license is not available.

DESCRIPTION

The specialized optimization for removing inverters is being turned off for this design, because a valid FPGA license was not available. FPGA Compiler or FPGA Option must be enabled before this extra optimization will be done.

WHAT NEXT

OPT-908 (warning) FPGA-specific Library Component Optimization is being disabled because an FPGA license is not available.

DESCRIPTION

This warning message occurs when your library contains components whose use requires an FPGA license. When such a library is encountered, the optimizer first tries to acquire an FPGA license. If this is not possible, **compile** continues, with the FPGA-specific optimization disabled.

WHAT NEXT

OPT-909 (error) The target technology is '%s'. Using fpga_shell or fpga_analyzer requires that the target technology be FPGA.

DESCRIPTION

Either **fpga_shell** or **fpga_analyzer** is being used, and an attempt has been made to optimize a design with the *target_library* set to a non-FPGA technology library. The **fpga_shell** or **fpga_analyzer** tools can be used only to optimize and map to FPGA technologies.

WHAT NEXT

Use `dc_shell` or `design_analyzer` instead of `fpga_shell` or `fpga_analyzer`.

OPT-910 (error) Target library must contain a usable N-input lut cell.

DESCRIPTION

This message indicates that one of the target libraries (as specified by the `dc_shell target_library` library variable) is a lut technology library, and no usable lut library cells can be found in any of the target libraries. The lut library must contain at least one lut library cell.

WHAT NEXT

Use `remove_attribute` to remove the `dont_use` attribute from one of the lut library cells.

OPT-911 (warning) Target library contains multiple lut output marker cells.

DESCRIPTION

This warning message occurs when the target libraries, as specified by the `dc_shell target_library` variable, contain more than one lookup table (lut) output marker cell. In this case, the `replace_fpga` command will use the first output marker cell that it finds. This warning indicates that it is possible for your library to be incorrect, because it has more than one lut output marker cell; or that in using multiple target libraries you have created a situation where more than one marker cell is available for `replace_fpga` to use.

WHAT NEXT

The lut library should contain only one lut output marker library cell. Make sure that `replace_fpga` is building your design with the marker cell that you expect it to use. If the desired marker cell is not being used, consider placing a `dont_use` attribute on the extra marker cell(s).

OPT-912 (warning) replace_fpga is not valid for designs implemented

with this target library. Use the '-force' option to override this message.

DESCRIPTION

This message indicates that you do not need to use **replace_fpga** for designs implemented in your current technology. If you are using an Altera library, your target library (as specified by the **dc_shell target_library** library variable) does not contain a usable lut output marker library cell. If you are using a Xilinx technology library, **replace_fpga** is not needed as part of your design flow.

Replacing lut cells is an irreversible process, so **replace_fpga** performs methodology checks to prevent its own execution if it determines that running **replace_fpga** on your design would be a methodology error.

WHAT NEXT

First, determine whether you really need to run **replace_fpga** in your design methodology. Some technology libraries (for example, Altera) require this command; but others (for example, Xilinx 3k family) do not. Use **replace_fpga -force** to disable the methodology checks, if 1) your FPGA vendor does require replacement of lut cells by gate equivalents but does not have an output marker cell in the library; or 2) you simply want to do a trial replacement without the risk of aborting.

For more information about using the **-force** option, refer to the **replace_fpga** manual page.

OPT-913 (error) Aborting replace_fpga due to lack of a usable output marker cell.

DESCRIPTION

This message indicates that the target libraries (as specified by the **dc_shell target_library** library variable) are lut technology but do not contain a usable lut output marker library cell. **replace_fpga** must abort. This message typically indicates a methodology error; that is, you might not need or want to run **replace_fpga**.

Replacing lut cells is an irreversible process, so **replace_fpga** performs methodology checks to prevent its own execution if it determines that running **replace_fpga** on your design would be a methodology error.

WHAT NEXT

First, determine whether you really need to run **replace_fpga** in your design

methodology. Some technology libraries (for example, Altera) require this command; but others (for example, Xilinx 3k family) do not. Use **replace_fpga -force** to disable the methodology checks, if 1) your FPGA vendor does require replacement of lut cells by gate equivalents but does not have an output marker cell in the library; or 2) you simply want to do a trial replacement without the risk of aborting.

For more information about using the **-force** option, refer to the **replace_fpga** manual page.

OPT-914 (warning) No single bit degenerate for multibit library cell '%s'.

DESCRIPTION

This message indicates that the target library/libraries (as specified by the **dc_shell target_library** library variable) have no single bit version of the multibit component named above. This means that the multibit element will not be constructed as part of the multibit component optimization process inside **compile**. Multibit optimization requires that a "single bit" version of each multibit component must exist in the target library.

WHAT NEXT

If you do not want this component to be built by **compile**, then you can ignore the warning. If, however, you do want **compile** to construct such gates then you'll need to modify your target library to contain a component which is a single bit version of the named multibit component.

OPT-915 (warning) Cannot perform multibit optimization on '%s' '%s'.

DESCRIPTION

This message indicates that multibit optimization cannot be performed on a cell or a multibit component. The reasons include having a don't touch attribute, having local optimization disabled, the multibit component not being sufficiently wide, or the multibit component having cells with differing functionalities.

WHAT NEXT

If this condition occurs, it means that the multibit optimization could not be performed on the design object indicated. If this is the desired effect, you can ignore this warning. Otherwise, check the multibit component or cell indicated and ensure that the aforementioned conditions are avoided. Use the **create_multibit** or

remove_multibit commands to manipulate multibit components then rerun the **compile** command.

SEE ALSO

create_multibit (2), **remove_multibit** (2), **report_multibit** (2).

OPT-916 (warning) Incorrect setting for bus naming style variables.

DESCRIPTION

The variables **bus_naming_style**, **bus_range_separator_style**, and **bus_multiple_separator_style** are used to generate names for multibit components. Set these variables to values so that a name can be unambiguously parsed to extract the base name and component bits of the name. The conditions checked are

- range and multiple separators cannot be empty.
- range separator, multiple separator, and bus_naming_style need to be distinct.
- range separator, multiple_separator, and bus_naming_style cannot contain digits.

WHAT NEXT

If this condition occurs, check the settings of **bus_naming_style**, **bus_range_separator_style**, and **bus_multiple_separator_style**. Set them to values that meet the aforementioned conditions and rerun the **compile** command. You need to reread HDL files if you change settings of these variables.

SEE ALSO

bus_naming_style (3), **bus_range_separator_style** (3), **bus_multiple_separator_style** (3).

OPT-917 (warning) Losing member of multibit component '%s'.

DESCRIPTION

This message indicates that some optimization, which is being performed on a member of a multibit component, cannot reliably assign a new cell to the component. As a result the multibit component might have missing bits.

WHAT NEXT

If this condition occurs, please report this testcase to Synopsys. The design will

still be logically correct, but the multibit components might not have the desired structure.

SEE ALSO

`create_multibit` (2), `remove_multibit` (2), `report_multibit` (2).

OPT-918 (warning) Multibit library cell '%s' will not be used in multibit optimization.

DESCRIPTION

This message indicates that the target library (as specified by the `dc_shell target_library` library variable), containing the multibit library cell named previous, was not compiled using the latest version of Library Compiler, or that the multibit cell was too complex to be recognized. As a result, some attributes needed to use this multibit library cell in optimization are missing. This means that this multibit library cell will not be constructed as part of the multibit component optimization process inside `compile`.

WHAT NEXT

If you do not want this component to be built by `compile`, you can ignore the warning. However, if you want `compile` to construct such gates, you need to use the latest version of Library Compiler on your target library, so that all the relevant attributes are available to `compile`. If the cell is too complex to be recognized by Library Compiler, it must be instantiated and cannot be inferred.

OPT-919 (warning) Invalid value '%d' for environment variable '%s'; resetting it to '%d'.

DESCRIPTION

This warning indicates that the specified environment variable contains an invalid value. Valid values for the variable are from -1 to 5.

WHAT NEXT

If the default value assigned to the environment variable is not acceptable, set the variable to one of the valid values specified above.

EXAMPLE MESSAGE

```
Warning: Invalid value '10' for environment variable 'compile_dash_top_drc_levels';
resetting it to '-1'. (OPT-919)
```

OPT-920 (Error) Found an unmapped cell '%s' in the design.

DESCRIPTION

The design contains unmapped logic. You cannot use the **-top** option of the **compile** command on designs that contain unmapped logic.

WHAT NEXT

Check the design to ensure that all cells are mapped before running **compile -top**.

EXAMPLE MESSAGE

```
Error: Found an unmapped cell 'adder' in the design. (OPT-920)
```

OPT-931 (information) High fanout net '%s' is not %s.

DESCRIPTION

You receive this message because this Net has more than 1000 pins. The recommended methodology is to set this net as **ideal_net**, as well as to set all timing paths through it as **false_path** so that it does not impact optimization. The high fanout net should be optimized at a separate stage with, for example, the **create_buffer_tree** command.

WHAT NEXT

Use the **set_ideal_net** command to mark this net as **ideal_net**. Use the **set_false_path** command to mark timing paths through this net as **false_path**.

EXAMPLE MESSAGE

```
Warning: High fanout net NET_B is not on false_path. (OPT-931)
```

SEE ALSO

create_buffer_tree (2), **set_false_path** (2), **set_ideal_net** (2).

OPT-932 (Warning) High fanout net '%s' is skipped by global route.

DESCRIPTION

You receive this warning message when you execute the **reoptimize_design** command, and a net with more than 10000 pins exists in the design. Global routing will not occur on this net because the allowed pin limit for an individual net has been exceeded.

EXAMPLE MESSAGE

Warning: High fanout net NET_A is skipped by global route. (OPT-932)

WHAT NEXT

This is a warning message. No action is required on your part.

OPT-933 (information) Dont_touch on cell '%s' of design '%s' will be ignored by compile because it contains unmapped synthetic cells.

DESCRIPTION

A **dont_touch** attribute has been placed on a cell that contains some unmapped synthetic logic. This **dont_touch** attribute will be ignored by **compile** to allow the unmapped logic to be mapped.

WHAT NEXT

This is an informational message. Unless your design requires the **dont_touch** functionality on the specified cell, no further action is required. If the **dont_touch** functionality is needed, the design must be restructured.

OPT-934 (information) High fanout net '%s' is not %s.

DESCRIPTION

You receive this message because this net has more than 1000 pins. The recommended methodology is to set this net as **ideal_net**, as well as to set all timing paths

through it as **false_path** so that it does not impact optimization. The high fanout net should be optimized at a separate stage with, for example, the **create_buffer_tree** command.

WHAT NEXT

Use the **set_ideal_net** command to mark this net as **ideal_net**. Use the **set_false_path** command to mark timing paths through this net as **false_path**.

EXAMPLE MESSAGE

Warning: High fanout net NET_B is not ideal_net. (OPT-934)

SEE ALSO

create_buffer_tree (2), **set_false_path** (2), **set_ideal_net** (2).

OPT-935 (Warning) Top-level nets do not have enough back-annotations to calculate RC value. Design Compiler will use all back-annotated nets for RC calculation.

DESCRIPTION

The **reoptimize_design** command using the **-top** option tries to come up with an estimated RC value using only back-annotated nets in the top-level only. If enough top-level nets are not back-annotated, Design Compiler uses all back-annotated nets in the design. This method takes more time to calculate RC value, but produces more accurate RC values.

WHAT NEXT

Make sure there are enough top-level nets to derive RC value.

SEE ALSO

compile (2), **reoptimize_design** (2).

OPT-936 (Information) Top level nets have enough back-annotations, so Design Compiler (DC) used back-annotated,

top-level nets for R and C calculation.

DESCRIPTION

You receive this message to inform you that enough top-level nets are back-annotated. As a result, the **reoptimize_design** command **-top** option can calculate the R/C value with back-annotated nets only in the top level. If enough top-level nets were not back-annotated, Design Compiler (DC) would use all back-annotated nets in the entire design.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

reoptimize_design (2).

OPT-937 (Information) Design Compiler (DC) is always forced to use back-annotated, top-level nets for R and C calculation if at least one top-level net is back-annotated.

DESCRIPTION

You receive this message to inform you of the following useful instruction. The **reoptimize_design** command **-top** option attempts to calculate an R/C value with back-annotated nets only in the top level, if enough top-level nets are back-annotated. Otherwise, Design Compiler (DC) uses all back-annotated nets for R/C calculation. If you use the **reopt_design_top_estimates_RC_with** variable with the **always_top_level_nets** option, DC always uses back-annotated top-level nets to the extent that at least one exists.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

reoptimize_design (2), **reopt_design_top_estimates_RC_with** (3).

OPT-938 (Information) Design Compiler (DC) is always forced

to use all back-annotated nets in the entire design for R and C calculation.

DESCRIPTION

You receive this message to inform you of the following useful instruction. The **reoptimize_design** command **-top** option attempts to calculate an R/C value with back-annotated nets only in the top level if enough top-level nets are back-annotated. Otherwise, Design Compiler (DC) uses all back-annotated nets for R/C calculation. If you use the **reopt_design_top_estimates_RC_with** variable with the **always_top_level_nets** option, DC always uses all back-annotated nets in the entire design even if top-level nets have enough back-annotations.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

reoptimize_design (2). **reopt_design_top_estimates_RC_with** (3).

OPT-939 (Warning) No top-level nets have back-annotation that can be used to calculate the R and C value. Design Compiler (DC) uses all back-annotated nets for R and C calculation.

DESCRIPTION

You receive this message because no annotated top-level nets are found that Design Compiler (DC) can use to calculate the R/C value. By default, the **reoptimize_design** command **-top** option attempts to calculate an R/C value with back-annotated nets only in the top level. If there are not enough back-annotated top-level nets, DC uses all back-annotated nets in the entire design. If you use the **reopt_design_top_estimates_RC_with** variable with the **always_top_level_nets** option, DC always uses back-annotated top-level nets to the extent that at least one exists.

WHAT NEXT

Ensure that at least one top-level net is back-annotated to use for deriving an R/C value.

SEE ALSO

reoptimize_design (2). **reopt_design_top_estimates_RC_with** (3).

OPT-940 (error) Virtex target library is missing the following required gate%s:

DESCRIPTION

The specified fpga_technology of the target_library is from the Xilinx Virtex family (Virtex, Virtex II, Virtex E) but the library is missing required gates. Assuming the vendor library originally had all of the required gates, this error should only happen if the user has explicitly done 'set_dont_use' on one or more of these gates.

WHAT NEXT

Remove the 'dont_use' from listed gates.

SEE ALSO

set_dont_use (2).

OPT-941 (error) Cannot find buffer '%s' in target library.

DESCRIPTION

The cell name specified could not be found in the target library.

WHAT NEXT

Check to make sure that the target_library is set correctly and that this cell is contained in the library. The 'report_lib' command can be used to list library cells.

SEE ALSO

report_lib (2). **set_fpga_global_buffer** (2). **set_fpga_global_buffer_min_fanout** (2).

OPT-942 (error) Cell '%s' is not a buffer.

DESCRIPTION

The cell specified must be a non-inverting buffer.

WHAT NEXT

Specify a valid buffer cell.

SEE ALSO

`set_fpga_global_buffer` (2). `set_fpga_global_buffer_min_fanout` (2).

OPT-943 (information) Minimum fanout for internal clock buffering is %d.

DESCRIPTION

Internal clock nets (those not driven by a top-level pad) will not be considered for a global-buffer if they have fanout less than the value specified by the '`set_fpga_global_buffer_min_fanout -clock`' command.

WHAT NEXT

SEE ALSO

`set_fpga_global_buffer` (2). `set_fpga_global_buffer_min_fanout` (2).

OPT-944 (information) Minimum fanout for internal non-clock buffering is %d.

DESCRIPTION

Internal non-clock nets (nets which are not a clock source) will not be considered for a global-buffer if they have fanout less than the value specified by the '`set_fpga_global_buffer_min_fanout -non_clock`' command.

WHAT NEXT

SEE ALSO

`set_fpga_global_buffer` (2). `set_fpga_global_buffer_min_fanout` (2).

OPT-945 (information) Buffering of internal non-clock nets is

disabled.

DESCRIPTION

Internal non-clock nets (nets which are not a clock source) will not be considered for a global-buffering.

WHAT NEXT

SEE ALSO

`set_fpga_global_buffer` (2). `set_fpga_global_buffer_min_fanout` (2).

OPT-946 (information) Buffering of internal clock nets is disabled.

DESCRIPTION

Internal clock nets (those not driven by a top-level pad) will not be considered for a global-buffering.

WHAT NEXT

SEE ALSO

`set_fpga_global_buffer` (2). `set_fpga_global_buffer_min_fanout` (2).

OPT-947 (error) Could not find resource '%s' in target library.

DESCRIPTION

The specified resource name was not found in the target library. Note that resource names are not necessarily the same as library cell names because a cell may use multiple resources.

WHAT NEXT

Use 'set_fpga_resource_limit -show_all' to see list of all valid resource names for the current target library.

SEE ALSO

`set_fpga_resource_limit` (2). `set_fpga_target_device` (2).

OPT-948 (information) No resource limits specified.

DESCRIPTION

No user-specified resource limits have been placed on the current_design. By default resource limits come from the specified target device and no user-interaction is required to specify them. However, if the user wishes to override a part value then the 'set_fpga_resource_limit' command can be used to do so. For example, in a bottom-up compile methodology it may be desireable to limit the resources allocated to the current block being compiled to a value less than the part maximum.

WHAT NEXT

SEE ALSO

`set_fpga_resource_limit` (2). `set_fpga_target_device` (2).

OPT-949 (error) Speed grade '%s' is not valid for part '%s'.

DESCRIPTION

The specified speed-grade is not valid for this target device.

WHAT NEXT

Use 'set_fpga_target_device -show_all' to see valid speed grades.

SEE ALSO

`set_fpga_target_device` (2). `set_fpga_resource_limit` (2).

OPT-950 (error) Could not find part '%s' in target library.

DESCRIPTION

The specified part name could not be found in the target library.

WHAT NEXT

Use 'set_fpga_target_device -show_all' to see valid device names.

SEE ALSO

set_fpga_target_device (2). **set_fpga_resource_limit** (2).

OPT-951 (information) Target device for current design is '%s'.

DESCRIPTION

This is the specified target device for this design.

WHAT NEXT

Use 'set_fpga_target_device -show_all' to see all valid device names.

SEE ALSO

set_fpga_target_device (2). **set_fpga_resource_limit** (2).

OPT-952 (Error:) No target device specified for current design.

DESCRIPTION

No target device has been specified for the current design.

WHAT NEXT

Use 'set_fpga_target_device -show_all' to see all valid device names.

SEE ALSO

set_fpga_target_device (2). **set_fpga_resource_limit** (2).

OPT-953 (warning) Multiple pads are connected to port '%s'.

DESCRIPTION

The instantiated pads at port '%s' are not correct for this technology. This may be caused by illegal connection of pads at the port's net (i.e. a non-pad cell or an extra pad cell is on the net in addition to the pad cells).

WHAT NEXT

Check the pad cells instantiated at this port and modify the cells or attributes which define the pad configuration at this port.

OPT-954 (warning) Cell '%s' count in design has violated the max_count value in the library. The design has '%d' instances but PART contains only '%d'.

DESCRIPTION

Design contains excess '%s' instantiated components. It has '%d' instances but PART contains only '%d'.

WHAT NEXT

Use a part that contains more resources than used or limit the no. of instances in the design.

OPT-955 (warning) LPM_TYPE parameter on cell '%s' does not match with the name of the cell reference

DESCRIPTION

There is a mismatch between the value of parameter LPM_TYPE set on cell '%s' and the name of the cell reference. This may lead to error during Place and Route.

WHAT NEXT

Check the HDL code where the parameter LPM_TYPE is set on the cell. Make sure that the parameter value is same as the name of module which is being instantiated.

OPT-996 (warning) Always on inverter characterized for "%s" operating condition was marked dont_use or it is not defined in target library.

DESCRIPTION

The target library does not contain an always on inverter, or always on inverter library cells are marked as dont_use, or dont_touch. When always on strategy is dual rail, optimization needs to use always on inverter and always on buffers on the always on path. If those cells are missing or being marked as dont_touch or dont_use, and always on strategy is dual rail, the always on path will be marked as dont_touch. i

In addition to that, if target library does not have always on inverters or they are marked as dont_touch or dont_use, and if the always on strategy is dual rail, when retention hookup, or isolation cell mapping need to put inverter on the retention or isolation control line to work with the control signal's sense value, those inverters will remain as normal inverters after optimization is done. check_mv_design will issue warning on those cells. In this case, user should either use single rail strategy or add always on inverters into the target_library.

WHAT NEXT

Add always on inverter to the target library. If always on inverter exists, then make sure it is not marked with dont_use attribute.

OPT-997 (warning) Always on buffer characterized for "%s" operating condition was marked dont_use or it is not defined in target library.

DESCRIPTION

The target library does not contain an always on buffer which optimization tool can use on always on paths.

WHAT NEXT

Add always on buffer to the target library. If always on buffer exists, then make sure it is not marked with dont_use attribute.

OPT-998 (warning) Operating condition %s set on design %s has different process,

voltage and temperatures parameters than the parameters at which target library

DESCRIPTION

When process, voltage and temperature parameters specified in design operating condition do not match parameters at which target library is characterized, the tool uses scaling to compute delays. Therefore delays may be inaccurate. This warning message informs about the resulting inaccuracies.

WHAT NEXT

Change either target libraries or operating condition.

SEE ALSO

`set_operating_conditions(2)`

OPT-1000 (error) Need to insert a pad on port '%s' before compiling.

DESCRIPTION

Pad optimization is done only on existing pads. The `insert_pad` command has to be used before `compile`, in order to add the IO pads to the design.

WHAT NEXT

Please use the `insert_pad` command and then `compile` again.

OPT-1001 (error) Multiple tristate buffers are driving pad net '%S'.

DESCRIPTION

Output pads can be added only to tristated lines driven by single tristate buffers. In this case, the pad will incorporate a single tristate buffer. When multiple tristate cells drive a single output port, it is not possible to use a single tristate in the output pad and still have an equivalent circuit. It is the responsibility of the user to resolve the problem by making sure a single tristate

buffer drives the output port.

WHAT NEXT

Two customary transformations obtain a single tristate driver out of many: tristate merging, and tristate-ORing. Tristate merging replaces all tristates with inputs $(\text{data}, \text{enable}) = (\text{D}_i, \text{E}_i)$ by a single tristate buffer with inputs $(\text{data} = \text{D}_0 * \text{E}_0 + \text{D}_1 * \text{E}_1 + \dots)$ and $(\text{enable} = \text{E}_0 + \text{E}_1 + \dots)$.

Note that this transformation is valid only if the enable signals are disjoint ($\text{E}_0 * \text{E}_1 * \dots = 0$).

Tristate-ORing adds one more tristate whose data input is connected to the OR of all pre-existing tristates, and whose enable signal is $\text{E}_0 + \text{E}_1 + \dots$.

Note that both transformations modify the logic behavior of the original circuit. They will not pass verification.

OPT-1002 (warning) Example pad '%s' is not in the library.

DESCRIPTION

The pad used as an example to specify the required attributes on the port is not available in the library. As a result, no constraints will be derived from the user-specified example pad.

WHAT NEXT

Please verify that the pad can be found in the library.

OPT-1003 (warning) Exact pad '%s' is not in the library.

DESCRIPTION

The exact pad specified as the cell to use on the port is not available. Therefore, pad selection will proceed with default cells selected from the library.

WHAT NEXT

Please verify that the pad can be found in the library.

OPT-1004 (warning) No matching pad found for port '%s';

DESCRIPTION

No IO pad having the right characteristics has been found to connect to the port. Therefore, no pad will be instantiated and connected to that port.

WHAT NEXT

The problem is probably due to over-constraining; that is, specifying too many IO pad constraints on the port.

OPT-1005 (warning) Relaxing user-specified IO pad constraints on port '%s'

DESCRIPTION

No matching pad was found for the port. Pad selection will now be done using only pads of the right direction (input/output/inout). All other constraints will be dropped.

WHAT NEXT

OPT-1006 (warning) Pad '%s' connected to port '%s' is dont-touch. No optimization done.

DESCRIPTION

Pad connected to port is marked as *dont_touch*. No pad optimization will take place for that port. In order to either remove or optimize the IO pad connected to the port, the dont-touch attribute has to be removed.

WHAT NEXT

See command `remove_attribute`

OPT-1007 (information) Insert_pads interrupted. Saving

intermediate design.

DESCRIPTION

A CONTROL-C interrupt was received by the *insert_pads* command. The design in its current state is being written back to the database. The design will reflect all of the pad insertion steps that have been performed so far.

WHAT NEXT

No action is required on your part.

OPT-1008 (error) Insert pads terminated abnormally.

DESCRIPTION

This error indicates that the *insert_pads* command terminated and did not write the intermediate design back to the database. Since the design was not written back to the database, the *current_design* is unchanged from before the insertion. The reason for the abnormal termination should have appeared in an error message prior to this one.

WHAT NEXT

Resolve errors and rerun *insert_pads*.

OPT-1009 (warning) Port '%s' has no net attached to it: no pad inserted.

DESCRIPTION

The port is not connected to any net. It does not drive, or is not driven, by any core-logic gates. As a result, no pad is needed on that port.

WHAT NEXT

Verify that the port is supposed to be unconnected. If not, then connect the port to the correct core-logic gates in your design.

OPT-1010 (warning) Output port '%s' is not driven: no pad will

be inserted.

DESCRIPTION

The output port is not driven by any core-logic cell. An output pad is not required and none will be connected to the particular port.

WHAT NEXT

Verify that the port is supposed to be unconnected. If not, then connect the port to the correct core-logic gates in your design.

OPT-1011 (warning) Target library has no pads in it. No pads inserted.

DESCRIPTION

There are no pad cells in the target library. The library needs to be updated with cells that have the *is_pad* attribute. Note that the pads should NOT have the *dont_use*, *dont_touch* attributes set. Otherwise, pad insertion and optimization will fail.

WHAT NEXT

Add a library with pads to the target_library.

OPT-1012 (warning) Design '%s' has no pad constraints. No pad inserted.

DESCRIPTION

The current design on which command `insert_pads` is operating does not need any pads. Use the commands `set_port_is_pad` to indicate the ports that require pads. Optionally, use command `set_pad_type` to indicate the properties of the pads that are to be connected to the port (for example, voltage levels, current levels, presence of pull ups, etc).

WHAT NEXT

Use the command `set_port_is_pad`.

OPT-1013 (warning) Net '%s' is dont_touch (connected to port '%s'). No pad inserted.

DESCRIPTION

The port which the user marked as requiring an I/O pad is connected to a *dont_touch* net. This implies opposite requirements, since *dont_touch* nets cannot have new cells connected to them. In this case, the *dont_touch* attribute on the net is honored and no pad is inserted. If a pad is really needed, the *dont_touch* attribute should be removed from the net.

WHAT NEXT

See command `remove_attribute`

OPT-1014 (warning) I/O pad attribute mismatch on port '%s'

DESCRIPTION

The I/O pad(s) attached to the port does not have the same attributes as those set by the user on the corresponding port. This message appears during optimization, which will try to instantiate pads having characteristics closer to those requested on the port.

WHAT NEXT

OPT-1015 (warning) Connection class of port '%s' does not match that of any I/O pads.

DESCRIPTION

The connection class on the port is not compatible with any I/O pad classes. For that reason, no I/O pad will be instantiated, and the port will be left untouched.

WHAT NEXT

Check the connection classes of the I/O pad cells in the library. The port's class should match them. Use command `set_connection_class` to specify the connection classes of ports.

OPT-1016 (information) Remove_pads interrupted. Saving intermediate design.

DESCRIPTION

A CONTROL-C interrupt was received by the **remove_pads** command. The design in its current state is being written back to the database. The design will reflect all of the pad removal steps that had been performed so far.

WHAT NEXT

No action is required on your part.

OPT-1017 (error) Remove pads terminated abnormally.

DESCRIPTION

This error indicates that the **remove_pads** command terminated and did not write the intermediate design back to the database. Since the design was not written back to the database, the `current_design` is unchanged from before the removal. The reason for the abnormal termination should have appeared in an error message previous to this one.

WHAT NEXT

Resolve errors and rerun **remove_pads**.

OPT-1018 (warning) Pad already present on port '%s'. No new pad inserted.

DESCRIPTION

This warning indicates that the **insert_pads** command was used on a design where pads were already present. IO pads will only be added to ports which are not yet connected to pads. A warning will be issued to tell the user about ports which didn't require pads.

WHAT NEXT

No action is required on your part.

OPT-1019 (warning) Input port '%s' is not loaded: no pad will be inserted.

DESCRIPTION

The input port is not loaded by any core-logic cell. An input pad is not required and none will be connected to the particular port.

WHAT NEXT

Verify that the port is supposed to be unconnected. If not, then connect the port to the correct core-logic gates in your design.

OPT-1020 (warning) Inout port '%s' not driven by a tristate element. Assumed to be an output port.

DESCRIPTION

This warning indicates that the inout port is not recognized as a bidirectional port because no tristate gate is driving it. It is therefore considered an output port.

WHAT NEXT

Verify that the assumption made by Synopsys regarding the direction for the given port is correct. If the assumption is not correct, then modify the design so that the inout port is driven by a tristate element.

OPT-1021 (warning) Inout port '%s' assumed to be an input port.

DESCRIPTION

This warning indicates that the inout port is not recognized as a bidirectional port because no tristate gate is driving it. In addition, there is no gate that drives this port. It is therefore considered to be an input port.

WHAT NEXT

Verify that the assumption made by Synopsys regarding the direction for the given port is correct. If the assumption is not correct, then modify the design so that the inout port is driven by a tristate element.

OPT-1022 (warning) IO pad '%s' is unusable: unknown logic function.

DESCRIPTION

This warning indicates that the logic function associated with that IO pad is not known. As a result, it will not be considered during IO pad insertion and/or optimization.

WHAT NEXT

OPT-1023 (warning) IO Pad '%s' ('%s') has unknown logic function

DESCRIPTION

This pad has an unknown logic function, which will be ignored for pad optimization.

WHAT NEXT

OPT-1024 (error) Cannot insert a pad to drive bidirectional port '%s'

DESCRIPTION

The bidirectional port is driven by a tristate which is in a different level of hierarchy than the level of the load going back into the core logic. In that case, it is not possible to correctly instantiate a bidirectional IO pad in the circuit.

WHAT NEXT

There are two solutions to this problem. The first solution is to pull the tristate element and the load into the same level of hierarchy (typically, pulling the tristate element at the highest level will solve the problem). The second solution is to make the port an output port instead of an inout port. In that case, a simple buffer IO pad will be inserted at the highest level of hierarchy, driving the port directly. The second solution is valid only in cases where the port is not a true inout port (the port can never be driven from outside).

OPT-1025 (warning) Multiple drivers for net '%s'

DESCRIPTION

The net is driven by more than one gate. If this net is going to an output port, then a simple buffer IO pad will be instantiated. If the net is going to a bidirectional port which feeds back into the core logic, then no IO pad will be instantiated.

WHAT NEXT

For true bidirectional ports, the driving logic needs to be modified such that a single driver (a tristate) will appear on the net.

OPT-1026 (warning) Fixing %s introduces worse %s from %f to %f

DESCRIPTION

Design rules have different priorities. For example, by default, max_transition has a higher priority than max_capacitance. To fix max_transition violations, max_capacitance could be sacrificed in some cases. The user could see more max_capacitance violations after max_transition fixing.

WHAT NEXT

One or a few more incremental runs of DRC fixing could probably resolve the newly generated low priority design rule violations. The user can also change the priority of design rules using command "set_cost_priority".

SEE ALSO

set_cost_priority (2)

OPT-1027 (warning) Has_builtin_pad attribute present on pin '%s' connected to port '%s'. No pad inserted.

DESCRIPTION

This warning indicates that the port is connected to the pin with has_builtin_pad attributed on it. IO pads will only be added to ports which are not connected to pins attributed with has_builtin_pad. A warning will be issued to tell the user

about ports which didn't require pads.

WHAT NEXT

No action required on your part.

OPT-1028 (error) Cannot insert pad at three-state port '%s' because driver cell '%s' is dont_touch.

DESCRIPTION

The port is driven by an existing three-state cell that is marked as dont_touch. The dont_touch prevents inserting a three-state pad here because doing so would require replacing the dont_touch cell.

WHAT NEXT

Remove dont_touch from the three-state cell.

OPT-1030 (error) No appropriate operating condition found for level-shifter cell %s.

DESCRIPTION

When you characterize or the design is written out, for each level-shifter cell there must be a correct operating condition defined in its library. Most importantly is to have the rails defined with the correct voltage levels, master power supply and input pins voltage.

WHAT NEXT

Make sure you are using the correct library in the link list. Create additional operating conditions if necessary. Make sure the rail names and the corresponding input/output supply voltages match the level-shifter cell instance.

SEE ALSO

`create_operating_condition(2),`

OPT-1050 (warning) The wire logic is found on %s

DESCRIPTION

This message shows that multiply drive net or wire logic net is found in netlist. It might be ignored for optimization.

WHAT_NEXT

If the wire logic is not desired, modify your netlist to remove WIRE logic.

OPT-1051 (Error) Cannot optimize wire logic net.

DESCRIPTION

You receive this error message when you issue the **reoptimize_design** command and the tool encounters wire logic net in the netlist. Wire logic is not available in this release of the software.

WHAT NEXT

Modify your netlist to remove wire logic, or run the **compile** command with the **-incremental** option to remove it.

SEE ALSO

compile (2), **reoptimize_design** (2).

OPT-1052 (warning) Cannot set global buffer on output port '%s'.

DESCRIPTION

This warning is displayed when user tries to set global buffer on output port. Global buffer can not be set on the output port.

WHAT NEXT

OPT-1053 (information) Simplify constants interrupted. Saving

intermediate design.

DESCRIPTION

A CONTROL-C interrupt was received by the *simplify_constants* command. The design in its current state is being written back to the database.

WHAT NEXT

No action is required on your part.

OPT-1054 (error) Simplify constants terminated abnormally.

DESCRIPTION

This error indicates that the *simplify_constants* command terminated and did not write the intermediate design back to the database. Since the design was not written back to the database, the *current_design* is unchanged from before the insertion. The reason for the abnormal termination should have appeared in an error message prior to this one.

WHAT NEXT

Resolve errors and rerun *simplify_constants*.

OPT-1055 (information) Removing unused design '%s'.

DESCRIPTION

The design is removed because it is no longer referred in the netlist. This usually happens in **ungroup** or **compile**.

WHAT NEXT

If you want to keep the design, set **ungroup_keep_original_design** to true in your script.

OPT-1100 (information) Balance_buffer interrupted. Saving

intermediate design.

DESCRIPTION

A CONTROL-C interrupt was received by the **balance_buffer** command. The design in its current state is being written back to the database. The design will reflect all of the buffering steps that had been performed so far.

WHAT NEXT

No action is required on your part.

OPT-1101 (error) Balance_buffer terminated abnormally.

DESCRIPTION

This error indicates that the **balance_buffer** command terminated and did not write the intermediate design back to the database. Because the design was not written back to the database, **current_design** is unchanged. The explanation for the abnormal termination should have appeared in an error message previous to this one.

WHAT NEXT

Resolve errors and rerun **balance_buffer**.

OPT-1102 (warning) Cannot find %s '%s'

DESCRIPTION

This error indicates that the object passed as a parameter does not have the expected type. That situation can happen when two objects with different types have the same name. A typical example is a port and a net connected to it, which often have the same name.

WHAT NEXT

Use the `find()` command to specify the right object.

OPT-1103 (warning) Pin (or port) '%s' has no net attached to it.

DESCRIPTION

This warning indicates that the pin (or port) passed as a parameter is not connected to any net. Therefore, that pin will not be considered by the **balance_buffer** command.

WHAT NEXT

Include only pins (or ports) that are connected to nets, or use the **-net** option to specify the desired nets.

OPT-1104 (information) A memory leak has been detected (%s).

DESCRIPTION

This message indicates that Design Compiler has detected a memory leak. It is an internal message which is important for Synopsys, but which has little importance for the customer.

The accompanying (OPT-103) message which immediately follows this is used internally to signal to us when this situation occurs in any of our regression tests (so we can check it out). It can be ignored.

WHAT NEXT

Supply a testcase to Synopsys illustrating this problem so it can be fixed.

OPT-1156 (information) Unbinding the '%s' unconnected pin, which was set to ignore binding by the 'ignore_binding_open_pins' variable.

DESCRIPTION

This information message advises you that you have set the specified open pin to be ignored by binding to a constant pin.

WHAT NEXT

This is an information message only. No action is required.

OPT-1200 (warning) Library cell '%s' has INOUT port(s). Not considered for sequential mapping.

DESCRIPTION

The library cell has an inout port, which will be ignored by the sequential mapping step.

WHAT NEXT

OPT-1201 (warning) Library cell '%s' could not be modeled for sequential mapping.

DESCRIPTION

The library cell has a complex functionality that could not be modeled for sequential mapping. So this cell will be ignored for sequential mapping.

WHAT NEXT

OPT-1202 (warning) Library cell '%s' has unknown behavior

DESCRIPTION

The library cell has a complex functionality that could not be modeled for sequential mapping. So this cell will be ignored for sequential mapping.

WHAT NEXT

OPT-1203 (warning) Combinational loop detected at '%s' during

sequential mapping

DESCRIPTION

A combinational feedback loop was detected during sequential mapping. None of the cells in this loop will be considered during the sequential mapping operation.

WHAT NEXT

OPT-1204 (warning) The cell '%s' will not be considered for sequential optimization.

DESCRIPTION

The cell '%s' has an output pin that feeds back (through some levels of logic) into its clock pin. This is an illegal configuration. Using such configurations may result in inaccurate timing information.

WHAT NEXT

Modify the specification such that the forementioned feedback is absent.

OPT-1205 (warning) The register '%s' may not be optimally implemented because of a lack of compatible components with correct clock/enable phase.

DESCRIPTION

The initial sequential mapping step tries to match the desired register clock phase exactly. When this matching fails due to a difference in clock phase, the mapper will attempt to avoid building a register with an incorrect clock/enable phase. When that happens, this warning is issued.

WHAT NEXT

If you want compile to initially build a register with the opposite clock/enable phase, then you can use the variable `compile_automatic_clock_phase_inference` to alter the way that mapping operates. Setting this variable to "none" will instruct the initial sequential mapping to ignore clock phase entirely during this process, thus allowing the mapper to consider registers with both positive and negative clock/enable phase as needed. Setting this variable to "relaxed" will instruct

sequential mapping to only try the opposite phase device if there is no other way to implement the register with the automatically inferred phase. And, setting the variable to "strict" (the default setting) will instruct the initial sequential mapping to reject all candidate components whose clock/enable phase does not match the automatically inferred phase.

OPT-1206 (information) The register '%s' is a constant and will be removed.

DESCRIPTION

When constant propagation is enabled, the sequential mapping step will remove any detected constant register. When that happens, this information is issued.

Removal of constant registers is controlled by two variables:
`compile_seqmap_propagate_constants` and `compile_seqmap_propagate_high_effort`, both of which are "true" by default.

WHAT NEXT

SEE ALSO

`compile_seqmap_propagate_constants` (3), `compile_seqmap_propagate_high_effort` (3).

OPT-1207 (information) The register '%s' will be removed.

DESCRIPTION

The register has been identified during optimization to be redundant. This could be due to optimizations like constant propagation, or the register being found to be unloaded.

WHAT NEXT

OPT-1208 (information) Sequential output inversion is enabled. SVF file must be used for formal verification.

DESCRIPTION

This message indicates that sequential output inversion is enabled for this

invocation of the compile or compile_ultra command. When sequential elements are inverted, Formality will not be able to verify the design unless the SVF file is used. To disable sequential output inversion for the **compile** command, set the variable **compile_seqmap_enable_output_inversion** to "false". To disable sequential output inversion for the **compile_ultra** command, use the **-no_seq_output_inversion** option to that command.

SEE ALSO

compile_seqmap_enable_output_inversion (3)

OPT-1209 (warning) The nextstate or clock_on object of the test_cell definition of the library cell '%s' has scan pins.

DESCRIPTION

The nextstate or clock_on object of the test_cell definition of the library cell '%s' has scan pins.

WHAT NEXT

OPT-1210 (information) Retiming is enabled. SVF file must be used for formal verification.

DESCRIPTION

This message indicates that retiming is enabled for this invocation of the compile_ultra command. If sequential cells are move across combinational cells, Formality will not be able to verify the design unless the SVF file is used. To disable retiming for the **compile_ultra** command, do not use the **-retime** option to that command and do not use the **optimize_registers** or **balance_registers** attributes.

WHAT NEXT

SEE ALSO

compile_ultra (2) **set_optimize_registers** (2) **set_balance_registers** (2)

OPT-1211 (warning) The DW sequential cell '%s' can not be

mapped to the preferred library cells.

DESCRIPTION

You set 'synlib_preferred_ffs' variable. But this DW sequential cell in a DW FF chain can not be mapped to the preferred library cell. This might be due to the fact that the functionality of the preferred library cell does not match that of the DW sequential cell; or you may have set 'dont_use' attribute on the preferred library cell.

SEE ALSO

OPT-1212 (warning) The DW synchronizer FF chain starting from '%s' can not be mapped to the preferred FF chain library cells.

DESCRIPTION

You set 'synlib_preferred_ff_chains' variable. But this DW sequential cells in a DW FF chain can not be mapped to the preferred FF chain library cell. This might be due to the fact that the functionality of the preferred FF chain library cell does not match that of the DW FF chain; or you may have set 'dont_use' attribute on the preferred FF chain library cell.

SEE ALSO

OPT-1213 (information) Register '%s' stores a value equal or opposite to register '%s', and will be removed.

DESCRIPTION

When sequential constant propagation is enabled, the sequential mapping step may remove registers that can be shown to be always equal or opposite to another register in the design. The OPT-1213 message reports registers that are removed from the design for this reason.

Removal of constant registers is controlled by two variables: `compile_seqmap_propagate_constants` and `compile_seqmap_propagate_high_effort`, both of which are "true" by default.

WHAT NEXT

SEE ALSO

`compile_seqmap_propagate_constants (3)`, `compile_seqmap_propagate_high_effort (3)`.

OPT-1215 (information) In design '%s', the register '%s' is removed because it is merged to '%s'.

DESCRIPTION

When register merging is enabled, compile state reachability will detect the set of equivalent registers and merge them. When that happens, this information is issued.

WHAT NEXT

SEE ALSO

`set_register_merging (2)`.

OPT-1216 (Warning) Sequential mapping has discovered reconvergent clock/data inputs on register '%s' in design '%s'. Simulation/synthesis mismatches could occur.

DESCRIPTION

Sequential mapping has discovered that the clock pin of a register appears in the "next-state" function of that register. When this happens, sequential mapping assumes that the clock signal will be logic 0 for a rising edge clock, or logic 1 for a falling edge clock.

For example, this error will occur in situations like the following:

```
assign next_q = clk | data;  
  
always @ (posedge clk)  
    q <= next_q;
```

In this case, Design Compiler will assume that clk is logic 0 (because it is a rising edge clock). Accordingly, Design Compiler will produce the following mapping for q_reg:

```
FD1 q_reg (.D(data), .CP(clk), .Q(q));
```

Note that Design Compiler is not guaranteed to detect this situation. It will only be detected if the reconvergence occurs entirely within the logic considered by sequential mapping (a few logic levels from the register being mapped).

WHAT NEXT

OPT-1240 (error) Failed to uniquify the design. Use the **uniquify -dont_skip_empty_designs** command to fix designs instantiated multiple times.

DESCRIPTION

You receive this error message because you executed the **remove_unconnected_ports** command and specified a design that has subdesigns instantiated multiple times. The command will not accept designs that have subdesigns instantiated multiple times, even if the subdesigns are empty, because this might cause some designs to be inconsistent.

WHAT NEXT

First, force all the subdesigns, including empty subdesigns, to be uniquified using the **uniquify -dont_skip_empty_designs** command. Then, reexecute the **remove_unconnected_ports** command.

SEE ALSO

remove_unconnected_ports (2), **uniquify** (2).

OPT-1241 (warning) The **remove_unconnected_ports** command skipped the following cells: %s.

DESCRIPTION

This warning message occurs when you execute the **remove_unconnected_ports** command and specify a cell that instantiates a subdesign that is multiply instantiated.

The command does not remove any unconnected port from the multiply instantiated subdesign because it may cause some designs to be inconsistent.

WHAT NEXT

This is a warning message only. No action is required.

However, if you do not want the cells to be skipped, use the **uniquify - dont_skip_empty_designs** command to force all of the subdesigns (including empty subdesigns) to be uniquified. Reexecute the **remove_unconnected_ports** command.

SEE ALSO

`remove_unconnected_ports(2)`
`uniquify(2)`

OPT-1242 (Warning) IOB register inference step is skipped because %s is not a valid value for fpga_iob_mapping.

DESCRIPTION

Allowed values for the **fpga_iob_mapping** variable are *all*, *none*, and *default*. When *all* is the value, compile tries to infer IOB registers for all ports with *port_is_pad* attribute. It ignores those ports for which IOB register inference is disabled using the command `set_fpga_iob_register`.

When *none* (the default value) is the value, then no IOB register inference is done.

When *default* is the value, compile tries to infer IOB registers for only those ports for which IOB register inference is enabled using the command `set_fpga_iob_register`.

To determine the current value of this variable, type `list fpga_iob_mapping`.

WHAT NEXT

Set **fpga_iob_mapping** to one of the values *all*, *default*, or *none*.

SEE ALSO

`compile(2)`, `set_port_is_pad(2)`, `set_fpga_iob_register(2)`, `fpga_iob_mapping(3)`.

OPT-1300 (warning) Location based buffer insertion disabled.

DESCRIPTION

The PDEF file read for the current design contained locations for the leaf cells. This typically enables location based optimization (buffer insertion and removal) to take place. In this case however, location based buffer insertion was not activated because it was explicitly disabled either by setting "compile_ok_to_buffer_during_inplace_opt" or "lbo_buffer_insertion_enabled" to FALSE.

WHAT NEXT

To enable location based buffer insertion, make sure that the above variables are set to true in the setup file.

OPT-1301 (warning) Location based buffer removal disabled.

DESCRIPTION

The PDEF file read for the current design contained locations for the leaf cells. This typically enables location based optimization (buffer insertion and removal) to take place. In this case however, location based buffer removal was not activated because it was explicitly disabled by setting "lbo_buffer_removal_enabled" to FALSE.

WHAT NEXT

To enable location based buffer removal, make sure that the previously stated variables are set to true in the setup file.

OPT-1302 (warning) The simple_compile_mode variable is obsolete. Setting this variable now defaults to compile -map_effort medium. Please update your script accordingly.

DESCRIPTION

Setting this variable now defaults to compile -map_effort medium.

WHAT NEXT

Please update your script accordingly.

OPT-1303 (warning) The compile -map_effort low is obsolete. Setting this variable now defaults to compile -map_effort medium. Please update your script accordingly.

DESCRIPTION

Setting this variable now defaults to compile -map_effort medium.

WHAT NEXT

Please update your script accordingly.

OPT-1304 (error) Using compile -top with unmapped logic

DESCRIPTION

This message indicates that some part of the design is not mapped.

WHAT NEXT

Resolve errors and rerun optimization.

OPT-1305 (error) The %s%s is obsolete in 2005.09 release. Please use Formality instead and update your script accordingly.

DESCRIPTION

Old verification code inside Design Compiler will no longer be supported, starting with the major release in 2005.09. Instead please use stand-alone Formality to verify your design.

WHAT NEXT

Please update your script accordingly.

OPT-1306 (warning) The %s%s will be obsolete in the next major release.

DESCRIPTION

Pad mapping code inside DesignCompiler will no longer be supported, starting with the next major release.

WHAT NEXT

Please update your script accordingly.

OPT-1307 (warning) Setting dont_use on dont_touched lib_cell '%S'/'%S'.

DESCRIPTION

Design Compiler will mark all dont_touched libcells in the given libraries as also being dont_use.

WHAT NEXT

OPT-1308 (error) The %s%s is now obsolete.

DESCRIPTION

Pad mapping code inside DesignCompiler will no longer be supported, starting with the next major release.

WHAT NEXT

Please update your script accordingly.

OPT-1309 (warning) The -no_auto_ungroup switch with compile_ultra will be obsolete in the next major release. Please use -no_aoutounroup instead.

DESCRIPTION

compile_ultra -no_auto_ungroup is being phased out. Please use compile_ultra -no_aoutounroup instead.

WHAT NEXT

Please update your script accordingly.

OPT-1310 (Information) No valid alib found for target library.

Proceeding with library analysis.

DESCRIPTION

The tool could not find a usable alib for one of the target libraries. Therefore the target libraries were analyzed. Given a target library file named 'x.db', the tool searches for an alib file named 'x.db.alib'. Two directories are searched: (1) the directory specified by the environment variable **alib_library_analysis_path**, and (2) the directory specified by the environment variable **alib_library_analysis_cache**. If the alib exists but is unusable, either the file-system modification date of the target library has changed since the alib was created, or the alib was created with a different version of the tool.

WHAT NEXT

To avoid library analysis at compile time, use the command **alib_analyze_libs** to generate alibs for your target libraries. For example:

```
set target_library "x.db y.db"
set alib_library_analysis_path "./"
alib_analyze_libs
```

OPT-1311 (Warning) Only placeholder alibs were found. Proceeding with library analysis.

DESCRIPTION

A placeholder alib represents a target library that is not complete or a target library that has not yet been fully analyzed.

A target library is complete if and only if both (1) it contains all of the following: logic zero, logic one, a buffer, an inverter; and (2) it contains one of the following: and2, or2, nand2, nor2.

One or more of the target libraries must have a corresponding non-placeholder alib. Otherwise, library analysis occurs.

WHAT NEXT

Use the **alib_analyze_libs** command to create alibs for your target libraries. Refer to the **OPT-1310** manpage for more information.

OPT-1312 (error) No target library found.

DESCRIPTION

The target_library is empty or the libraries contained in it are not found.

WHAT NEXT

Add valid libraries to target_library.

OPT-1313 (error) The alib file '%s' is not writable.

DESCRIPTION

The alib file in this message could not be written to disk. This could be because the user ran out of disk space, or because the user has no write privileges for the alib file directory.

WHAT NEXT

Check if there is enough disk space left on your device. Check for write permission on the alib file directory specified in *alib_library_analysis_path*.

SEE ALSO

alib_library_analysis_path.

OPT-1314 (Warning) The target_library cells '%s' will be ignored for mapping as the timing arcs mismatch with the logically equivalent cell '%s'.

DESCRIPTION

You receive this message because the timing arcs in the cells listed are not matching even though all the cells implement the same logic.

WHAT NEXT

Make sure that the cells in the library have accurate timing arcs.

OPT-1350 (warning) Using user selected most dominant scenario '%s', although '%s' might be a better choice.

DESCRIPTION

This message is issued because user has selected a dominant scenario that may not be the best one, although user's selection is still used.

WHAT NEXT

Check if variable dominant_scenario needs to be set to a better scenario.

OPT-1351 (warning) Ignoring preferred scenario '%s' because it %s.

DESCRIPTION

This message is issued because user has selected a preferred scenario that either does not exist or is not activated.

WHAT NEXT

Check the name of the scenario or make sure it exists and is active.

OPT-1401 (error) This design was created using DC Topographical technology. Command '%s' can not be used on this design.

DESCRIPTION

This message indicates that the current design was created using DC Topographical technology. The command indicated in the error message is not supported in the DC Topographical flow.

WHAT NEXT

OPT-1402 (error) This design was created using DC

Topographical technology. Please use the -incremental switch.

DESCRIPTION

This message indicates that the current design was created using DC Topographical technology. The DC Topographical flow requires that `compile_ultra` will be run with the `-incremental` switch.

WHAT NEXT

OPT-1403 (warning) Removing previous data generated by DC Topographical technology.

DESCRIPTION

This message indicates that all topographical data created previously using DC Topographical technology is being removed since `compile_ultra` non-incremental mode or incremental mode with `clock-gating` has been called. This may result in design qor convergence issues.

WHAT NEXT

If you want to use previous generated data use '`compile_ultra -incremental`'. Also, use '`-gate_clock`' option in the non-incremental `compile_ultra` rather than the incremental one.

OPT-1404 (warning) Found %d percent of cells (%d) without DC Topographical data. Generating data for those cells...

DESCRIPTION

This message indicates that the current design contain cells that were not created using DC Topographical technology. DC Topographical will try to generate data for those cells.

WHAT NEXT

OPT-1405 (error) DC Topographical Failed to place the design.

DESCRIPTION

This message indicates that DC Topographical technology could not place the design. No physically aware optimizations will be performed.

WHAT NEXT

OPT-1406 (error) Command %s is not supported in DC Topographical mode.

DESCRIPTION

This message indicates that the command you are trying to run is not supported in DC Topographical mode.

WHAT NEXT

Revise your script to avoid running the indicated command.

OPT-1407 (warning) Variable %s is not supported in DC Topographical mode and will be ignored.

DESCRIPTION

This message indicates that the variable you are trying to set is disabled in DC Topographical mode. The value of the variable will be ignored while running in Topographical mode.

WHAT NEXT

Revise your script to avoid using the indicated variable.

OPT-1408 (error) Failed to generate DC Topographical data.

DESCRIPTION

This message indicates that DC Topographical technology encountered errors while trying to generate the physical data it requires. The command that is being executed will be aborted.

WHAT NEXT

Check the run log for clues regarding the reasons for this error.

OPT-1409 (error) DC Topographical failed to find physical data for design %s.

DESCRIPTION

This message indicates that DC Topographical technology failed to locate the physical data it requires for the specified design. The command that is being executed will be aborted.

WHAT NEXT

Check the run log for clues regarding the reasons for this error.

OPT-1410 (error) DC Topographical design already exists.

DESCRIPTION

This message indicates that DC Topographical design already exists for a different top level design. DC Topographical technology supports only one top level design in memory.

WHAT NEXT

Modify your scripts to save and remove any previous designs.

OPT-1411 (Warning) Design %s contains the following

unmapped cells: %s.

DESCRIPTION

The design contains unmapped logic after compile_ultra mapping stage. DC Topographical technology requires that all cells will be mapped in the Topographical stage. This problem may have been caused by setting **dont_touch** attribute on a generic (unmapped) cell. This error may also be caused by running **compile_ultra -incremental** on a design which contain unmapped cells.

WHAT NEXT

Check the design to ensure that no unmapped cells have a dont_touch attribute.

OPT-1412 (Info) Ignoring the %s switch. It is no longer required for '%s' in topographical mode.

DESCRIPTION

The indicated switch is no longer required for the command in DC Topographical mode. Since the switch no longer has any functionality it is being ignored. This switch may be removed in future releases.

WHAT NEXT

Remove the switch to avoid problems in future releases.

OPT-1413 (Warning) Created physical library cell for logical library cell %s.

DESCRIPTION

DC Topographical technology requires that all logical library cells have corresponding physical library cells. If a physical library cell for a logical library cell is missing, DC Topographical technology creates one by default.

WHAT NEXT

Check the logical and physical libraries to make sure they match.

OPT-1414 (Warning) DC Topographical detected significant design changes. DC Topographical data will be reset.

DESCRIPTION

DC Topographical technology detected significant design change since the last compile was run. DC Topographical data will be regenerated for all the design. This may cause qor convergence issues. This problem is usually caused by a significant increase in design area that makes previous data invalid.

WHAT NEXT

Check the run log to understand the reasons for the design area increase.

OPT-1415 (Information) Voltage area %s will be created during compile.

DESCRIPTION

DC Topographical technology delays the creation of voltage area after netlist is mapped during compile. The delay is necessary to ensure the voltage area has correct cells and utilization.

OPT-1416 (Error) Failed to create voltage area %s.

DESCRIPTION

DC Topographical technology fails to create voltage area due of various reasons. The reasons should already be listed. Please check respective error messages for more informaiton.

WHAT NEXT

Modify command according to more specific error messages issued during voltage area creation.

OPT-1417 (Error) Failed to create voltage area %s on MW

design.

DESCRIPTION

DC Topographical technology fails to create voltage area on the MW design.

OPT-1418 (Information) Removed voltage area with name %s.

DESCRIPTION

The voltage area with the name is removed from the design.

OPT-1419 (Error) Specified voltage area does not exist in the design.

DESCRIPTION

The voltage area specified does not exist in the design. Please check voltage area name or object name in your command.

OPT-1420 (Error) There is no voltage area in the design

DESCRIPTION

When there is no voltage area specified in the design, report and remove voltage area command fails.

OPT-1421 (Error) Cell object %s doesn't have voltage area defined

DESCRIPTION

There is no voltage area defined on this object. Please check your report_voltage_area or remove_voltage_area command to see whether the cell name is specified correctly. Please use report_voltage_area -all to see voltage area name and cell object for each voltage area.

SEE ALSO

`report_voltage_area(2)`
`remove_voltage_area(2)`

OPT-1422 (Warning) Sub-block '%s' was not created using DC Topographical technology.

DESCRIPTION

DC Topographical detected a Hierarchy in the top-level design that does not contain DC Topographical data. For best results when using 'compile_ultra -top' in Topographical mode all sub-modules of the design should be compiled using DC Topographical technology.

WHAT NEXT

If possible, compile the sub-module using DC topographical technology.

OPT-1423 (Warning) User physical constraints set in DC-Topographical will be lost in non-topographical DC_SHELL.

DESCRIPTION

The DDC reader prints this message if the file being read into non-topo DC_SHELL contains any DCT user physical constraints. The physical constraints saved in DDC will not be restored in the current non-topo DC_SHELL.

WHAT NEXT

This is a warning. Please make sure you want to read a DCT DDC with physical constraints into non-topo DC_SHELL and lose all the user physical constraints.

OPT-1424 (Error) Design %s has no placeable technology leaf cells.

DESCRIPTION

DC failed to generate the Topographical data because the design does not have any placeable technology leaf cells.

OPT-1425 (warning) Cannot run compile_ultra in DC Topographical mode when variable '%s' is set.

DESCRIPTION

The indicated variable is not supported in DC Topographical mode. `compile_ultra` in DC Topographical mode cannot run correctly when this variable is set. The variable will automatically be reset.

EXAMPLE MESSAGE

Warning: Cannot run compile_ultra in DC Topographical mode when variable 'physopt_optimize_placement' is set. (OPT-1425)

OPT-1426 (Warning) Ignoring the %s option. Option is no longer supported for compile_ultra.

DESCRIPTION

The indicated command line option is no longer supported for `compile_ultra` in DC Topographical mode. The option is being ignored. This option may be removed in future releases.

WHAT NEXT

Remove the option to avoid problems in future releases.

OPT-1427 (warning) Not all metal layers have preferred routing direction.

DESCRIPTION

This error message occurs when not all metal layers have preferred routing direction set for them. The preferred routing direction of a metal layer is the library defined preferred routing direction unless a user defined library direction is explicitly set in the design.

WHAT NEXT

This is only a warning message. Use `set_preferred_routing_direction` command to set a user defined direction for a layer in the design. To remove a user defined direction and revert back to using the library defined direction, use `remove_preferred_routing_direction` command. To identify which layer does not have preferred routing direction, use `report_preferred_routing_direction` command.

SEE ALSO

`set_preferred_routing_direction(2)`
`remove_preferred_routing_direction`
`report_preferred_routing_direction`

OPT-1428 (error) DC-Topographical Failed to link physical library.

DESCRIPTION

You receive this error message because you have not read in a physical library before you ran one of these commands: `compile_ultra`, `extract_physical_constraints`, `set_ignored_layers`, or `report_ignored_layers`.

WHAT_NEXT

Check your setup to make sure the physical library is correct and is set properly. Also check that the search path is correctly stated in the `search_path` variable. Then invoke the command again.

SEE ALSO

`compile_ultra (2)`, `extract_physical_constraints (2)`, `report_ignored_layers (2)`,
`set_ignored_layers (2)`, `search_path (3)`.

OPT-1429 (error) TLU+ sanity check failed.

DESCRIPTION

You receive this error message because TLU+ sanity check have failed during the `compile_ultra` command.

WHAT_NEXT

Check your setup to make sure the TLU+ setting is correct and is set properly. Then

invoke the command again.

SEE ALSO

`compile_ultra` (2).

OPT-1430 (error) Routing layers sanity check failed.

DESCRIPTION

You receive this error message because the routing layers data is incomplete. The `compile_ultra` command cannot run properly in DC-Topographical mode without the missing data. The following data is required for every routing layer: width, direction, pitch, resistance and capacitance. Look for preceding errors to indicate which of the above is missing.

WHAT NEXT

Check your setup to make sure the routing layers data is correct and is set properly. Then invoke the command again.

SEE ALSO

`compile_ultra` (2), `set_tlu_plus_files` (2), `set_preferred_routing_direction` (2).

OPT-1431 (warning) Instantiated cell '%s' (Reference: '%s/%s') does not have a corresponding physical library cell.

DESCRIPTION

This warning message occurs because Design Compiler topographical technology requires that all instantiated cells have corresponding physical library cells. If a physical library cell for an instantiated cell is missing, Design Compiler topographical creates one by default.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, make sure every instantiated cell has a corresponding physical library cell, and run the command again.

OPT-1432 (warning) Total of %d instantiated cells without corresponding physical library cells are found. Run '-check_only' with 'compile_ultra' to see more details.

DESCRIPTION

This warning message occurs because Design Compiler topographical technology requires that all instantiated cells have corresponding physical library cells. If a physical library cell for an instantiated cell is missing, Design Compiler topographical creates one by default.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, make sure every instantiated cell has corresponding physical library cells, and run the command again.

SEE ALSO

`compile_ultra(2)`

OPT-1433 (warning) Multiple technology library cells with the same name '%s' are found in the following libraries: %s

DESCRIPTION

This warning message occurs when there are multiple technology library cells with same name in the target and/or link libraries. It is considered best practice to for Design Compiler topography to use technology library cells with unique names.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, make sure every technology library cell's name is unique, and run the command again.

OPT-1434 (warning) Total of %d technology library cells with the

same names are found. Run '-check_only' with 'compile_ultra' to see more details.

DESCRIPTION

This warning message occurs when there are multiple technology library cells with same names in the target and/or link libraries. It is considered best practice for Design Compiler topography to use technology library cells with unique names.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, make sure every technology library cell's name is unique, and run the command again.

SEE ALSO

`compile_ultra(2)`

OPT-1435 (error) Design %s has invalid ILM or physical hierarchy and cannot proceed with compile.

DESCRIPTION

This error message occurs when the design has Design Compiler ILM or non-Design Compiler topographical physical hierarchy. For the Design Compiler topographical hierarchical flow to run, all ILMs must be created on a placed IC Compiler netlist in IC Compiler, or on a Design Compiler topographical placed netlist in Design Compiler topographical. All Design Compiler topographical physical hierarchies must be Design Compiler topographical pre-placed.

WHAT NEXT

Make sure that the input hierarchies are valid, and run the command again.

OPT-1436 (Error) Design was not created using DC Topographical technology.

Command 'report_congestion' can not be run without DC

Topographical data.

DESCRIPTION

DC Topographical detected the design does not contain DC Topographical data. 'report_congestion' requires the design to be compiled using DC Topographical in order to run correctly.

WHAT NEXT

To use 'report_congestion', compile the design using DC topographical technology.

OPT-1437 (Error) Compile with multiple scenarios can only be used in DC Topographical mode.

DESCRIPTION

Compile detected that there are multiple scenarios in your design and this feature can only be used in DC Topographical mode.

WHAT NEXT

Compile the design in DC Topographical mode.

OPT-1438 (Error) Command '%s' does not work with active scenarios.

DESCRIPTION

The tool detected active scenarios in your design and this command is not compatible with active scenarios.

WHAT NEXT

OPT-1439 (error) TLU+ file not set for scenarios '%s'.

DESCRIPTION

You receive this error message because there is no TLU+ file set for the scenario.

`compile_ultra` command requires TLU+ file to be set for all the active scenarios.

WHAT_NEXT

Please specify the TLU+ file for every scenario using `set_tlu_plus_files` command before running `compile_ultra`.

SEE ALSO

`compile_ultra` (2). `set_tlu_plus_files`

OPT-1441 (warning) The ILM/physical block %s(%s) has `dont_touch` attribute set to FALSE. It will be affected by optimization.

DESCRIPTION

This warning message occurs when there are ILMs or physical blocks with the `dont_touch` attribute set to FALSE on their reference designs. This will cause optimization to modify the instances.

WHAT NEXT

Make sure that the reference designs have the `dont_touch` attribute set to TRUE. Remove any `dont_touch` attributes on the instances.

SEE ALSO

`compile_ultra`(2)

OPT-1442 (error) Total of %d cells do not have locations in the ILM or physical block (%s). Run '-check_only' with 'compile_ultra' to see more details.

DESCRIPTION

This error message occurs when there are cells in the ILM or physical block that do not have locations. Compile cannot propagate locations if the locations are not specified.

WHAT NEXT

Ensure that the ILM or physical block has valid cell locations, and run the command again.

SEE ALSO

`compile_ultra(2)`

OPT-1443 (error) Total of %d ports do not have locations in the ILM or physical block (%s). Run '-check_only' with 'compile_ultra' to see more details.

DESCRIPTION

This warning message occurs when there are ports in the ILM or physical block that do not have locations.

WHAT NEXT

Ensure that the ILM or physical block has valid port locations and run the command again.

SEE ALSO

`compile_ultra(2)`

OPT-1500 (information) Running optimization using a maximum of %d cores.

DESCRIPTION

This information tells the user that DC is running in multicore mode. The user may specify the maximum number of CPU cores to be used with the `set_max_cores` command.

SEE ALSO

`set_max_cores(2)`
`compile_ultra(2)`

OPT-1501 (error) Unable to start messaging for parallel

execution on host %s.

DESCRIPTION

This indicates that the tool was unable to set up the messaging infrastructure for the interprocess communication required to start parallel execution. This failure should only occur due to a system problem.

WHAT NEXT

If the problem is repeatable there is probably a problem with the current system. Try running the tool on a different host.

SEE ALSO

`set_max_cores(2)`
`compile_ultra(2)`

OPT-1503 (error) The `-num_cpus` option (%d) conflicts with the value set with

'`set_host_options -max_cores`' (%d). The `-num_cpus` option is obsolete and will be removed in a future release. Please use '`set_host_options -max_cores`' only.

DESCRIPTION

This message indicates that you have used the `-num_cpus` option to the `compile_ultra` command, and that the value provided is different than was set with the `set_host_options -max_cores` command. The command cannot proceed. The `-num_cpus` option is obsolete. Please use only the `set_host_options -max_cores` command to set the number of processor cores to use for parallel execution.

WHAT NEXT

Run `set_host_options -max_cores` before running `compile_ultra`, and remove the `-num_cpus` option from the `compile_ultra` command.

SEE ALSO

`set_host_options(2)`
`compile_ultra(2)`

OPT-1600 (information) Checkpoint design written: %s.
Checkpoint designs are for analysis purposes only. Optimization commands cannot be run on a checkpoint design.

DESCRIPTION

This information tells the user that the checkpoint design written out by optimization is to be used for analysis purposes only (eg. timing analysis). The user will not be able to run optimization commands on the checkpoint design.

SEE ALSO

```
set_checkpoint_strategy(2) report_checkpoint_strategy(2)  
remove_checkpoint_designs(2)
```

OPT-1601 (error) The options are not compatible.

DESCRIPTION

This error indicates to the user that the options used by the user are not compatible and the command did not succeed. Please provide compatible options.

WHAT NEXT

Refer to man page of the command and provide compatible options.

SEE ALSO

```
set_checkpoint_strategy(2) report_checkpoint_strategy(2)  
remove_checkpoint_designs(2)
```

OPT-1602 (error) Failed to save checkpoint design

DESCRIPTION

This error indicates to the user that an error occurred while optimization was trying to save a checkpoint design. Possible causes include insufficient disk space, error in filesystem access, etc.

WHAT NEXT

Check to see that there is enough disk space for saving checkpoint design or that filesystem access is working.

SEE ALSO

```
set_checkpoint_strategy(2) report_checkpoint_strategy(2)  
remove_checkpoint_designs(2)
```

OPT-1603 (error) Insufficient virtual memory. Please increase swap space, or reduce other processes on this host.

DESCRIPTION

This error message occurs when the host machine has insufficient virtual memory (swap space) to start another process. Possible causes are that the host does not have enough swap space configured, or there are too many other processes sharing the host and not leaving sufficient swap space available.

WHAT NEXT

Check what else is running on the host, and perhaps schedule large jobs to run at different times. Also, consider increasing swap space on the host.

OPT-1650 (warning) Area recovery is stopped due to unexpected long run time, and the final optimization QoR may be affected.

DESCRIPTION

This error indicates that the area recovery optimization takes too much time and it is stopped prematurely. This is likely due to potential run time issues in the tool. As the area recovery optimization does finish properly as in normal flow, the resulted design may have sub-optimal QoR.

WHAT NEXT

It is recommended to discard this result and re-run the optimization command in one of the two ways: (1) remove the **-area_recovery** option; (2) set **psynopt_disable_auto_cpulimit_for_area_recovery**. Please also contact Synopsys for additional support.

SEE ALSO

`psynopt_disable_auto_cpulimit_for_area_recovery(3) place_opt(2) psynopt(2)`
`remove_checkpoint_designs(2)`

OPT-9990 (warning) more hier VA overwrite DB VA message suppressed.

DESCRIPTION

When checking voltage area consistency, if there are more than 20 cell instances met with voltage area mismatch, the detail messages will be suppressed.

WHAT NEXT

Check voltage area setting of the whole hier scope.

SEE ALSO

OPT-999

OPT-9991 (warning) cannot find tech info about mask layer <%S>.

DESCRIPTION

Cannot find tech info about mask layer <%s> when loading layer info from technology file.

WHAT NEXT

Check technology file to make sure the setting about layer <%s>.

OPT-9992 (warning) hier %s does not exist.

DESCRIPTION

Cannot find hier in design when handle DontTouch setting.

WHAT NEXT

Check design and related DontTouch setting.

OPT-9993 (warning) level shifter '%s' could not be sized because it is marked as dont_touch.

DESCRIPTION

Shows level shifters could not be sized which are marked as dont_touch.

OPT-9994 (warning) Use 'astWriteDC' to dump all dont_touch cells.

DESCRIPTION

If necessary please use "astWriteDC" to dump all dont_touch cells and check them.

WHAT NEXT

Check DontTouch settings dumpped by "astWriteDC" if necessary.

OPT-9995 (warning) cell instance '%s' hier VA '%s' overwrite DB VA '%s'.

DESCRIPTION

When checking voltage area consistency, there may be mismatch between voltage area of hier scope of cell instance and voltage area of cell instance. This warning shows the mismatch occurs and the voltage area of cell instance is overwritten by the voltage area of hier scope of the cell instance.

WHAT NEXT

Check voltage area setting of the whole hier scope.

OPT-9996 (error) set_max_dynamic_power should be specified

for all the scenarios.

DESCRIPTION

For dynamic power optimization, set_max_dynamic_power should be specified for all the scenarios. If you do not want to optimize dynamic power, set_max_dynamic_power should not be specified for any scenario.

WHAT NEXT

Either specify set_max_dynamic_power for all the scenarios or do not specify it for any scenario.

OPT-9997 (error) %s can not be used for multi-corner designs.

DESCRIPTION

The feature is not supported for multi-corner designs.

WHAT NEXT

Remove the command or unset the environment variable that needs this feature in compile.

OPT-9998 (error) %s can not be used for multi-scenario designs.

DESCRIPTION

The feature is not supported for multi-scenario designs.

WHAT NEXT

Remove the command or unset the environment variable that needs this feature in compile.

OPT-9999 (error) Scenario {%-s} do not have scaling library

group setting.

DESCRIPTION

This error is issued when scaling library group has not been set for the reported scenario(s).

WHAT NEXT

Use 'set_scaling_lib_group' command to set scaling library group for the reported scenario(s).

PARA

PARA-001 (error) Cannot open file '%s'.

DESCRIPTION

The file name provided to `read_parasitics` cannot be opened.

WHAT NEXT

Validate that the file name is correct.

PARA-003 (information) The net '%s' has many (%d) nodes, which might result in long runtime.

DESCRIPTION

You receive this message if the number of nodes in an annotated parasitic network exceeds the value of the `parasitics_warning_net_size` variable (default 10000). This message warns you that extended runtime could occur.

If the number of nodes exceeds the value of `parasitics_rejection_net_size` (default 20000), the network is rejected and automatically replaced by a lumped capacitance to avoid extended runtime. You receive a message (PARA-004) warning you of that action.

The value of `parasitics_warning_net_size` is ignored if it is greater than or equal to the value of `parasitics_rejection_net_size`.

The values of these variables are checked every time `read_parasitics` is issued.

WHAT NEXT

This is an informational message only. No action is required on your part. To avoid receiving this message, you can increase the value of the `parasitics_warning_net_size` variable, or modify your parasitic network so that it contains fewer nodes.

SEE ALSO

`PARA-004` (n).

PARA-004 (warning) The net '%s' has too many (%d) nodes, so a lumped capacitance will be used instead.

DESCRIPTION

You receive this message if the number of nodes in an annotated parasitic network exceeds the value of the **parasitics_rejection_net_size** variable. This message warns you that the detailed network is being replaced by a lumped total capacitance to avoid extended runtime.

If the number of nodes exceeds the value of the **parasitics_warning_net_size** variable (default 10000), you receive a message (PARA-003) warning you that extended runtime could occur.

The value of **parasitics_warning_net_size** is ignored if it is greater than or equal to the value of **parasitics_rejection_net_size**.

The values of these variables are checked every time **read_parasitics** is issued.

WHAT NEXT

If it is acceptable to you for your detailed network to be replaced by a lumped total capacitance, no action is required on your part. Otherwise, you can increase the value of the **parasitics_rejection_net_size** variable, or modify the annotated parasitic network so that it contains fewer nodes.

SEE ALSO

PARA-003 (n).

PARA-005 (error) Cannot use -keep_capacitive_coupling with %s format.

DESCRIPTION

You specified the **read_parasitics** command with the **-keep_capacitive_coupling** option, and the file format does not support it. Detailed Standard Parasitic Format (DSPF) and Reduced Standard Parasitic Format (RSPF) do not support **-keep_capacitive_coupling**.

WHAT NEXT

To read this file, reenter the **read_parasitics** command without using the **-keep_capacitive_coupling** option.

PARA-006 (error) %s pin '%s' is missing in the RC annotation for net '%s'. Ignoring the incomplete RC annotation.

DESCRIPTION

You receive this message if **report_annotated_parasitics** detects an incompletely back-annotated RC network in the current design. The message informs you that the RC network annotation on the specified net is being ignored because it is incomplete; the specified pin is not physically connected to the RC network annotation.

An incomplete RC network might be caused by errors in the parasitics file, or by missing information from the tool that generated the parasitics file. For example, a parasitics file generated by a place and route tool that has parasitics only for the top level (between the blocks) would generate this error, because PrimeTime requires the RC network to connect all leaf drivers to all leaf nodes.

This message is not issued for unconnected hierarchy pins; when these are missing in RC annotations, warning message PARA-007 is issued and the annotation is not ignored during delay calculation.

WHAT NEXT

Examine the SPF or SPEF file to determine why the specified RC network is incomplete. If the error is caused by a valid incomplete network, you can complete it using the parasitics completion feature **read_parasitics -complete_with** or **complete_net_parasitics**. For other errors, you must correct the parasitics file manually. You might need to estimate the missing segments and manually add them. After you have corrected the SPF or SPEF file, reexecute **read_parasitics**.

To determine whether the parasitics file contains a valid incomplete RC network, start from a driver and try to reach all loads through resistances. If all missing segments of a net are between two pins, you can complete them using the parasitics completion feature; otherwise, you must correct the SPF or SPEF file manually.

SEE ALSO

PARA-007 (n), **read_parasitics** (2), **report_annotated_parasitics** (2),
complete_net_parasitics (2).

PARA-007 (warning) Unconnected hierarchy pin '%s' is missing

in the RC annotation for net '%s'.

DESCRIPTION

You receive this message if **read_parasitics** or **report_annotated_parasitics -check** detects an incompletely back-annotated RC network in the current design. PrimeTime can tolerate missing unconnected hierarchy pins in RC annotations, so the annotation is not ignored during delay calculation. This message is only a warning; it can be suppressed with the **suppress_message** command.

If a missing pin is not an unconnected hierarchy pin, error message PARA-006 is issued instead and the RC annotation is ignored during delay calculation.

WHAT NEXT

If you have not intentionally disconnected hierarchy pins from networks with existing RC annotations, investigate the source of the disconnection. Some tools temporarily add routing ports and fail to remove those unused after routing, and others disconnect test ports during scan-chain reordering.

SEE ALSO

PARA-006 (n), **read_parasitics** (2), **report_annotated_parasitics** (2),
complete_net_parasitics (2).

PARA-008 (error) The RC annotation for net '%s' has too many near-zero elements.

DESCRIPTION

This message is shown if **report_annotated_parasitics** detects that the RC annotation has too many near-zero elements. Too many near-zero elements can lead to numeric instability in calculations.

A resistor with value less than or equal to 0.01 ohm is considered near-zero.

A capacitor with value less than or equal to 0.001 femtofarad is considered near-zero.

PrimeTime allows up to ten-thousand near-zero resistors and up to ten-thousand near-zero capacitors before rejecting the annotation.

Please note that near-zero capacitor elements can occur in an annotation due to specifying resistors without specifying the capacitors at resistors' nodes. In such cases PrimeTime will automatically create such capacitors with values of 0.001 femtofarad.

WHAT NEXT

The only known instance of this problem is trying to annotate a gigantic clock-tree as a single net (i.e. with tens of thousands of fanouts) with near-zero placeholder data. The annotation must make physical sense in order to be used in RC delay calculations. Either the near-zero data must be changed or the net must be broken-up into smaller segments.

SEE ALSO

`read_parasitics (2)`, `report_annotated_parasitics (2)`, `complete_net_parasitics (2)`.

PARA-010 (error) multiple occurrences of net '%s' in this file. Removed parasitics from this net.

DESCRIPTION

You read a binary parasitics (SBPF) file and there were multiple occurrences of some nets in that file, which is illegal. This is a very serious error. Either the netlist does not match the parasitics file, or there is a problem with the writer of the file. Each of these nets with corrupt parasitics has had its parasitics removed, generating this message. Further, all coupling for the entire file is ignored.

The binary parasitics file is expected to be an image of parasitics. That is, it is meant to be restored to the same netlist from which it was generated. Attempting to restore a binary parasitics file to a different netlist is an unsupported flow.

WHAT NEXT

This condition has put the parasitics annotated on the design into an incomplete state. This may lead to inaccurate or incorrect results. You should discontinue the current session and determine if this is a mismatch between the file and the netlist, or if there is a problem with the provider of the binary parasitics file.

SEE ALSO

`read_parasitics (2)`. **PARA-011 (n)**.

PARA-011 (error) Due to previous errors, all effects of coupling have been ignored

from '%s'

DESCRIPTION

You receive this message in conjunction with PARA-010. You read a binary parasitics (SBPF) file and there were multiple occurrences of some nets in that file, which is illegal. Because of this problem, any effects of coupling were ignored for the file being read. If you were using `-keep_capacitive_coupling`, no new coupling capacitors would be added. If you were not using `-keep_capacitive_coupling`, no coupling capacitors would be reduced. They are simply ignored.

WHAT NEXT

It is not recommended that you continue at this point. See the documentation for PARA-010 for mode details.

SEE ALSO

`read_parasitics` (2). **PARA-010** (n).

PARA-020 (warning) -keep_capacitive_coupling not specified for
a design which already has coupling.

DESCRIPTION

You receive this message from the `read_parasitics` command if you did not specify the `-keep_capacitive_coupling` option, but you previously issued a `read_parasitics` command to read an SPEF file (for the same design) and did use the `-keep_capacitive_coupling` option. This message warns you about a possible inconsistency between multiple `read_parasitics` commands.

WHAT NEXT

If you intended not to use the `-keep_capacitive_coupling` option, no action is required on your part. Otherwise, reissue `read_parasitics` and use the `-keep_capacitive_coupling` option.

PARA-027 (error) Cannot specify both the -coupling_reduction_factor and

the **-keep_capacitive_coupling** options.

DESCRIPTION

The **read_parasitics** command found that both the **-coupling_reduction_factor** and the **-keep_capacitive_coupling** options are set.

WHAT NEXT

Choose either the **-coupling_reduction_factor** or the **-keep_capacitive_coupling** option, but not both. If you specify the **-coupling_reduction_factor** option, the coupling capacitors are reduced to ground with the factor specified by the *factor* value, which conflicts with the use of the **-keep_capacitive_coupling** option. If you intend to keep the coupling capacitors, you do not need to specify the **-keep_capacitive_coupling** option.

SEE ALSO

read_parasitics (2).

PARA-040 (warning) Coupling capacitor (%s %s %g) on net %s is discarded because %s

DESCRIPTION

The **read_parasitics** command found a problem with a coupling capacitor and the capacitor was discarded. The reason is given in the message. Typical reasons include missing objects (nets, pins), both nodes being in the same net (self-coupling of nets is not supported), or a capacitance value less than or equal to zero.

Note that in the case of self-coupling, this message will be issued whether or not the **-keep_capacitive_coupling** option is specified.

WHAT NEXT

Examine the Standard Parasitic Exchange Format (SPEF) file for correctness.

SEE ALSO

read_parasitics (2).

PARA-041 (warning) Coupling capacitor (%s %s %g) on net %s

is reduced because %s

DESCRIPTION

You receive this message if the **read_parasitics** command found a coupling capacitor in a SPEF file which specifies a nonexistent aggressor sub-node. This error could be caused by a large RC network that was discarded by PrimeTime. This message warns you that the coupling capacitor connected being reduced (grounded).

WHAT NEXT

This is a warning message only. If it is acceptable to you that the specified coupling capacitor is grounded, no action is required on your part. Otherwise, check the consistency between the netlist and SPEF file, and check for the presence of a large RC network. Make any changes necessary, then reexecute **read_parasitics**.

PARA-043 (warning) Invalid coupling capacitor (%s %s %g) on net %s:

%s

DESCRIPTION

While reading a SPEF file, the **read_parasitics** command found an invalid coupling capacitor. This is usually due to a semantic error in the specification of the capacitor.

WHAT NEXT

The reason is given in the body of the message.

SEE ALSO

read_parasitics (2).

PARA-044 (error) Invalid %s (%s %g) on net %s:

%s

DESCRIPTION

The **read_parasitics** command found a capacitor or resistor which is invalid. This is usually due to a mismatch between the netlist and the parasitics file. The reason is

given in the body of the message.

WHAT NEXT

Examine the parasitics file for correctness.

SEE ALSO

`read_parasitics (2)`.

PARA-045 (information) Merging parallel capacitor on net %s from %s %s with value %g: new total value %g.

DESCRIPTION

The `read_parasitics` command found a capacitor in parallel with another capacitor. This could be due to duplicate entries in a parasitics file, or a reduced coupling capacitor in a SPEF file.

WHAT NEXT

No action necessary.

SEE ALSO

`read_parasitics (2)`.

PARA-046 (warning) No matching coupling capacitor found with value %g for victim net %s and aggressor net %s:
Ground this coupling capacitor.

DESCRIPTION

The `read_parasitics` command found a coupling capacitor in the SPEF file in a victim D_NET which does not have a complimentary entry in the referenced aggressor D_NET. In this case, the coupling capacitor is grounded.

WHAT NEXT

Correct SPEF calls for symmetric entries. Validate that this is an expected behavior of your extraction application.

SEE ALSO

`read_parasitics` (2).

PARA-047 (warning) Net %s has been annotated with %s %s using the %s command. This takes precedence over values from parasitics.

DESCRIPTION

The `read_parasitics` command found a network which already has annotated lumped capacitance or resistance set using the `set_load` or `set_resistance` commands, respectively. Lumped values from these commands take precedence over the values from parasitics files.

WHAT NEXT

To use the total capacitance or resistance read in from a parasitics file, you must remove the existing values by using the `remove_capacitance` or `remove_resistance` command.s PrimeTime then reverts to the detailed (or other) RC network.

SEE ALSO

`read_parasitics` (2), `remove_capacitance` (2), `remove_resistance` (2), `set_load` (2), `set_resistance` (2).

PARA-050 (information) Merged %d parallel coupling capacitors to total %g pf between file nodes '%s' and '%s'

DESCRIPTION

While reading a SPEF file, the `read_parasitics` command found parallel coupling capacitors between two nets which needed to be merged. These parallel coupling capacitors are replaced by a single coupling capacitor with the capacitance equal to

the sum of the capacitance of the parallel coupling capacitors. The number of capacitors, and the resulting total capacitance, are shown in the message.

WHAT NEXT

No action necessary.

SEE ALSO

`read_parasitics` (2).

PARA-051 (warning) Self-coupling for net '%s' is discarded

DESCRIPTION

The `read_parasitics` command found coupling from a net to itself in a Synopsys Binary Parasitics Format (SBPF) file. PrimeTime does not support self-coupling, so this coupling is discarded. Note that this message will be issued whether or not the `-keep_capacitive_coupling` option is specified.

WHAT NEXT

No action is necessary. However, the user should determine if the application which wrote the binary parasitics file has a mode which will suppress self-coupling.

SEE ALSO

`read_parasitics` (2).

PARA-052 (warning) Cannot use -increment with reduced parasitics.

Net '%s' will be overwritten with %s parasitics from '%s'

DESCRIPTION

The `read_parasitics` command was used with the `-increment` option, and the net in question already has parasitics. This message is issued if the current file has reduced parasitics for the net, or if the net has reduced parasitics and the current file has detailed parasitics for the net. In any of these cases, the parasitics for the net are removed, and the parasitics from the file overwrite what was there. The `-increment` option only works for detailed parasitics.

WHAT NEXT

No action is necessary. However, the user should determine if the usage of the `-increment` option is correct.

SEE ALSO

`read_parasitics` (2).

PARA-053 (error) '%s' exists but is not connected to net '%s'

DESCRIPTION

The `read_parasitics` command was used to read binary parasitics. There is a mismatch between the binary parasitics file and the netlist. The data in the file indicates that the named pin or port is connected to the specified net, but it is not. This error will prevent the parasitics from being annotated on this net.

WHAT NEXT

Ensure that you are applying the correct binary parasitics file to the correct netlist.

SEE ALSO

`read_parasitics` (2).

PARA-060 (warning) failed to re-anchor parasitics on net '%s'

DESCRIPTION

An `insert_buffer` command was issued to buffer either the load or driver side pin of a net with parasitics. The parasitics are re-anchored on either the driver or load side of the buffer being inserted. If the re-anchoring failed all the parasitics of the original net will be removed. When this happens both the driver and load side nets of the inserted buffer will have no parasitics.

WHAT NEXT

Parasitics will only be preserved if a single load or driver pin is being buffered. Although multiple pins can be buffered parasitics will not be preserved if more than one pin is buffered.

Use `set_load` to try and compensate for the removed parasitics.

SEE ALSO

`insert_buffer`

PARA-061 (warning) failed to re-anchor parasitics on net '%s'

DESCRIPTION

A `remove_buffer` command was issued and parasitics were present on the driver and/or load side nets connected to the buffer. The parasitics with the worst ground capacitance are moved to the net resulting after the buffer removal. If the re-anchoring failed all the parasitics of the driver and/or load side nets originally connected to the buffer will be removed. When this happens the resulting net after the buffer removal will have no parasitics.

WHAT NEXT

Use `report_net` to examine the pins of load and driver side nets of the buffer being removed.

Use `set_load` to try and compensate for the removed_parasitics

SEE ALSO

`remove_buffer`

PARA-062 (error) -original_file_name used without -eco.

DESCRIPTION

The `original_file_name` can only be used along with the `eco` option to specify which original parasitic file that the given eco file corresponds to.

WHAT NEXT

Use `-eco` switch also if you are reading ECO parasitics. If not, do not use `-original_file_name` option.

SEE ALSO

`read_parasitics`

PARA-063 (error) An ECO file cannot be read without reading original parasitics in SPEF or in version 3 (or later) of SBPF.

DESCRIPTION

The **-eco** option is used to load parasitics incrementally for an ECO change after original analysis is performed. The original parasitics should be present before one can read the ECO parasitics. Also, even if the original parasitics were read using version 2 or version 1 of SBPF, ECO operation cannot be applied. Only the version 3 or later versions of SBPF can be used for ECO operations.

WHAT NEXT

Read the original parasitics before reading the ECO parasitics.

SEE ALSO

`read_parasitics`

PARA-064 (error) Cannot auto-determine original file name for the ECO.

DESCRIPTION

The **-eco** option is used to load ECO parasitics corresponding to a particular extraction database. In the current session, parasitics were read in using multiple files. The attempt to auto-determine the original file name failed. Use **-original_file_name** option to distinguish which parasitic file that this ECO file corresponds to.

WHAT NEXT

Give the **-original_file_name** option.

SEE ALSO

`read_parasitics`

PARA-065 (error) The specified original file cannot be found.

DESCRIPTION

The specified original file can not be found. If you used **-path** option while reading the original file, please issue the same **-path** for reading the ECO file also.

WHAT NEXT

Check the file name given to **-original_file_name** option.

SEE ALSO

`read_parasitics`

PARA-066 (information) Attempting to read the ECO file to determine original file name.

DESCRIPTION

The **-eco** option is specified without specifying the **-original_file_name** option. Since parasitics are annotated into the current session using multiple parasitic files, it is necessary to determine which file does the ECO file correspond to. An attempt is being made to determine this information by looking at the ECO file.

WHAT NEXT

If you do not want PTSI to auto determine this information, please provide **-original_file_name** option.

SEE ALSO

`read_parasitics`

PARA-067 (information) Attempting to read the parasitic file to auto-determine location transformation factors.

DESCRIPTION

The **-path** and **-increment** options are specified to read a parasitic file with locations without specifying the locations transformation factors. An attempt is

being made to determine this information by looking at the parasitic file.

WHAT NEXT

This is just information message, no action required.

SEE ALSO

`read_parasitics`

PARA-068 (information) Locations of block %s are being transformed for '%s' rotation, '%s' flip, '%i' X offset and '%i' Y offset.

DESCRIPTION

This message gets issued only when you are reading parasitics with locations turned on via the variable '`read_parasitics_load_locations`'. It was determined that the given block is rotated, flipped and/or offset before being placed at the chip-level. Hence, the locations will be automatically transformed to global co-ordinates. Global co-ordinates are determined by looking at the file that was read in without the `-path` option.

WHAT NEXT

This is just an information message.

SEE ALSO

`read_parasitics` (2)

PARA-069 (error) Invalid '%s' scale factor '%f'.

DESCRIPTION

A parasitic scale factor is defined as a floating point number greater than ZERO. You get this message when you specified a parasitic scale factor that is less than or equal to ZERO.

WHAT NEXT

Make sure you specify correct scale factors and re-run the command.

SEE ALSO

`scale_parasitics` (2)

PARA-070 (error) There are no parasitics loaded.

DESCRIPTION

You have attempted to perform an operation like `scale_parasitics` that requires parasitics to have been loaded but no parasitics are set on this current design.

WHAT NEXT

Read the parasitics first and re-run the command.

SEE ALSO

`read_parasitics` (2) `scale_parasitics` (2)

PARA-071 (error) No net-specific scaling has been done.

DESCRIPTION

You have attempted to reset scaling for few nets. But, `reset_scale_parasitics` on certain number of nets works only if there has been some previous net-specific scaling done. This message indicates that no such scaling has been done previously.

WHAT NEXT

You may not want to issue `reset_scale_parasitics`, you may want to use `scale_parasitics` instead with factors equal to 1.0.

SEE ALSO

`scale_parasitics` (2) `reset_scale_parasitics` (2)

PARA-072 (warning) No net-specific scaling has been done for

net '%S'.

DESCRIPTION

You have attempted to reset/report scaling for few nets. But, `reset_scale_parasitics` or `report_scale_parasitics` on certain number of nets works only if there has been some previous net-specific scaling done. This message indicates that no such scaling has been done previously.

WHAT NEXT

You may not want to issue `reset_scale_parasitics`, you may want to use `scale_parasitics` instead with factors equal to 1.0.

SEE ALSO

`scale_parasitics` (2) `reset_scale_parasitics` (2) `report_scale_parasitics` (2)

PARA-073 (error) No scaling has been done.

DESCRIPTION

You have attempted to reset scaling of parasitics. But, `reset_scale_parasitics` works only if there has been some previous parasitic scaling done. This message indicates that no such scaling has been done previously.

WHAT NEXT

You may not want to issue `reset_scale_parasitics`.

SEE ALSO

`scale_parasitics` (2) `reset_scale_parasitics` (2)

PARA-074 (error) Invalid ECO SBPF found.

DESCRIPTION

You have attempted to read an ECO SBPF file. PTSI determined that the ECO file does not correspond to the original parasitic file. No coupling will be read from this current file.

WHAT NEXT

You may not want to make sure you are using correct ECO SBPF file.

SEE ALSO

`read_parasitics (2)`

PARA-075 (error) Could not resolve net '%s'.

DESCRIPTION

This message gets issued when you are reading parasitics and a net name is found in the parasitic file that could not be resolved to any real net in the design. This happens when your physical design does not match the logical design. Net is searched by the net name and may also be searched by pin names associated on the net. This message tells you that all the searching did not map the net name to any net or it resolved it to more than one net in the design.

WHAT NEXT

Make sure your parasitic file matches the design.

SEE ALSO

`read_parasitics (2)`

PARA-076 (error) Failed to create on-disk-caching files.

DESCRIPTION

The program failed to create temporary files for on disk caching. This can be due to a number of reasons like the lack of write permissions on the specified cache directory, lack of disk space and so on.

WHAT NEXT

Verify the permissions, disk space and reissue the command

PARA-077 (information) Coupling separations are set on the

design that might overwrite the annotated cross-couplings.

DESCRIPTION

This message gets issued to inform you that you have set coupling separations for cross-talk or noise analysis and are reading parasitics. The coupling separation constraints take precedence and will overwrite the annotated cross-couplings for the specific nets.

WHAT NEXT

This is just an information. No action is required.

SEE ALSO

DESCRIPTION

You get this message when you are trying to read parasitics and a specified pin/port cannot be found in the design.

WHAT NEXT

Check the parasitic file/parasitic extractor for errors.

SEE ALSO

```
read_parasitics (2)
```

PARA-079 (error) Could not find net connected to pin/port '%s' in design.

DESCRIPTION

You get this message when you are trying to read binary parasitics and an unconnected pin/port is being annotated in the design.

WHAT NEXT

Check the parasitic file/parasitic extractor for errors.

SEE ALSO

`read_parasitics` (2)

PARA-080 (error) Cannot read variation-aware parasitics when parasitics are already present.

DESCRIPTION

You get this message when you are trying to read variation-aware parasitics and the design is already annotated with parasitics. This is a limitation for now, and will be supported in future.

WHAT NEXT

Remove the annotated parasitics and re-issue the `read_parasitics` command.

SEE ALSO

`read_parasitics` (2) `remove_annotated_parasitics` (2)

PARA-081 (error) Cannot read regular parasitics as variation-aware parasitics are already annotated on the design.

DESCRIPTION

You get this message when you are trying to read non-variation aware parasitics and variation-aware parasitics are already annotated on the design.

WHAT NEXT

Remove the annotated parasitics and re-issue `read_parasitics` command.

SEE ALSO

`read_parasitics` (2) `remove_annotated_parasitics` (2)

PARA-082 (error) Cannot open parasitic corner file '%s'.

DESCRIPTION

You get this message when you issue `set_parasitic_corner` command and the corner file cannot be opened for reading.

WHAT NEXT

Check the file permissions and re-issue the command.

SEE ALSO

`set_parasitic_corner` (2) `report_annotated_parasitics` (2)

PARA-083 (error) Unexpected data at line number '%d'.

DESCRIPTION

You get this message when you issue `set_parasitic_corner` and the parasitic corner file has unexpected contents.

WHAT NEXT

Check the file contents and re-issue the command.

SEE ALSO

`set_parasitic_corner` (2) `report_annotated_parasitics` (2)

PARA-084 (error) Variation-aware parasitics are not loaded.

DESCRIPTION

You get this message when you perform an operation that requires variation-aware parasitics to be set and there are no such parasitics currently annotated.

WHAT NEXT

Read the variation-aware parasitics and re-issue the command.

SEE ALSO

`set_parasitic_corner (2)` `remove_parasitic_corner (2)` `read_parasitics (2)`
`report_annotated_parasitics (2)`

PARA-085 (error) Parasitic corner is not set previously.

DESCRIPTION

You get this message when you issue 'remove_parasitic_corner' to remove the parasitic corner set for analysis in the presence of variation-aware parasitics and the tool determines that no parasitic corner was set previously.

WHAT NEXT

No action is required.

SEE ALSO

`remove_parasitic_corner (2)` `set_parasitic_corner (2)` `read_parasitics (2)`
`report_annotated_parasitics (2)`

PARA-086 (error) Parasitic corner cannot be found.

DESCRIPTION

You get this message when you issue 'set_parasitic_corner' to set the parasitic corner but the specified corner name cannot be found in the specified corner file.

WHAT NEXT

Check the corner file and re-issue the command.

SEE ALSO

`set_parasitic_corner (2)` `remove_parasitic_corner (2)` `read_parasitics (2)`
`report_annotated_parasitics (2)`

PARA-087 (warning) Variation multiplier value for '%s' is outside

the bounds at line '%d'.

DESCRIPTION

You get this message when you issue 'set_parasitic_corner' to set the parasitic corner but the specified corner in the corner file contains invalid variation multiplier values. These values are supposed to be within -3.0 to +3.0.

WHAT NEXT

Check the corner file.

SEE ALSO

`set_parasitic_corner (2)` `remove_parasitic_corner (2)` `read_parasitics (2)`
`report_annotated_parasitics (2)`

PARA-088 (error) Corner file does not match the base corner -- aborting the reading. This is occurring while reading ground capacitances/resistances of net '%s'.

DESCRIPTION

You get this message when you are trying to read multiple corner parasitics but it is found that the current corner topology does not match the base corner.

WHAT NEXT

Check the corner parasitic file and re-issue the command.

SEE ALSO

`read_parasitics (2)`

PARA-089 (warning) Ignoring the temperature parameter or unknown process variation parameter '%s'.

DESCRIPTION

You get this message when you are trying to read a corner file for variation-aware

parasitics but the variation parameters given in the file do not match with the defined parasitic parameters. This can also happen for temperature corner setting because PrimeTime VX does not currently support temperature as a variation.

WHAT NEXT

You may want to check the corner parasitic file.

SEE ALSO

`set_parasitic_corner` (2) `report_annotated_parasitics` (2)

PARA-090 (error) The "-create_default_variations" option can be used only along with "-keep_variations" option.

DESCRIPTION

You get this message when you are trying to read parasitics without keeping variation sensitivities but trying to generate default variation parameters.

WHAT NEXT

Re-issue the command without the "-create_default_variations" option.

SEE ALSO

`read_parasitics` (2)

PARA-091 (warning) Failed to create node map information for the parasitic file.

DESCRIPTION

You get this message when you are trying to read parasitics with keeping coupling but PT was unable to create node map information between the parasitic file and PT. This node map information is usually not needed for the operation of PT, unless when you try to read in an ECO parasitic file via "read_parasitics -eco" in future.

WHAT NEXT

You do not need to do anything.

SEE ALSO

`read_parasitics (2)`

PARA-092 (error) Cannot read variation-aware parasitics as regular parasitics are already annotated on the design.

DESCRIPTION

You get this message when you are trying to read variation-aware parasitics and non-variation-aware parasitics are already annotated on the design.

WHAT NEXT

Remove the annotated parasitics and re-issue `read_parasitics` command.

SEE ALSO

`read_parasitics (2) remove_annotated_parasitics (2)`

PARA-093 (error) Number of variation parameters do not match. Aborting the reading.

DESCRIPTION

You get this message when you are trying to read variation-aware parasitics and the number of variation parasitics do not match the previous annotation. It is assumed that all parasitic extractions are done with the same variation-ITF file, hence the number of variation parameters, their names and order is supposed to match across all parasitic files.

WHAT NEXT

Check the parasitic files, the writer and figure out the reason for the mismatch and re-issue the command.

SEE ALSO

`read_parasitics (2) remove_annotated_parasitics (2)`

PARA-094 (error) Number of variation parameters do not match. Aborting the reading.

DESCRIPTION

You get this message when you are trying to read variation-aware parasitics and the number of variation parasitics do not match the previous annotation. It is assumed that all parasitic extractions are done with the same variation-ITF file, hence the number of variation parameters, their names and order is supposed to match across all parasitic files.

WHAT NEXT

Check the parasitic files, the writer and figure out the reason for the mismatch and re-issue the command.

SEE ALSO

`read_parasitics` (2) `remove_annotated_parasitics` (2)

PARA-095 (error) Number of corners do not match for multi-corner read.

DESCRIPTION

You get this message when you are trying to read multi-corner binary parasitic file but the number of corners from the file do not match what is set previously. Aborting the read.

WHAT NEXT

Check the parasitic files, the writer and figure out the reason for the mismatch and re-issue the command.

SEE ALSO

`read_parasitics` (2)

PARA-096 (information) Scaling parasitics to operating

temperature of '%f'.

DESCRIPTION

You get this message when you are trying to read variation-aware parasitic files that have temperature sensitivities. If the operating condition temperature is different than the (global) extraction temperature, then this message is issued to inform you that the parasitics will be scaled to the given operating temperature.

WHAT NEXT

No need of any action.

SEE ALSO

`read_parasitics (2)`

PARA-097 (error) All instance paths in the -path option should correspond to valid and same sub-design.

DESCRIPTION

You get this message when you are trying to read parasitic files with a list of paths specified in the -path option and not all the paths correspond to the same sub design or some of the paths do not correspond to a valid hierarchical instances.

WHAT NEXT

Reissue the command with proper paths in the -path option.

SEE ALSO

`read_parasitics (2)`

PARA-098 (warning) Detected semantically incorrect SPEF in coupling section.

DESCRIPTION

You get this message when you are trying to read parasitic files where the coupling capacitances are written in semantically incorrect manner. According to IEEE Std

SPEF, coupling should be written so that current net comes first followed by coupled net. The application will read the file but runtime may be slower. Also, the support is not guaranteed in future versions.

WHAT NEXT

No action needed for now, but please check with the SPEF writer tool to see why it is not following the standard.

SEE ALSO

`read_parasitics (2)`

PARA-099 (error) Loading locations with simultaneous hierarchy reading is currently not supported.

DESCRIPTION

You get this message when you are trying to read parasitic files by loading the files simultaneously using multiple instances in the -path option but have also enabled loading locations. For loading locations, you have to issue each instance separately in -path option.

WHAT NEXT

Please re-issue `read_parasitics` command with one -path at a time.

SEE ALSO

`read_parasitics (2)`

PARA-100 (warning) No matching coupling capacitor found with value %g for victim net %s and aggressor net %s: Forcing symmetry for this coupling capacitor.

DESCRIPTION

The `read_parasitics` command found a coupling capacitor in the SPEF file in a victim

D_NET which does not have a complimentary entry in the referenced aggressor D_NET. In this case, the coupling capacitor is forced to be symmetric, that is, a coupling capacitor of that value is created between the two nets at the given nodes. If there are similar records in the two D_Nets, but the values are dissimilar, then the result will be a single coupling capacitor with a value that is the sum of the two dissimilar values.

WHAT NEXT

Correct SPEF calls for symmetric entries. Validate that this is an expected behavior of your extraction application.

SEE ALSO

`read_parasitics` (2).

PARA-101 (error) `read_parasitics -eco` can only be used when the program is in ECO mode.

DESCRIPTION

The `read_parasitics` command with `-eco` option can only be used in ECO mode.

WHAT NEXT

Use `set_program_options -enable_eco` to enable the ECO mode.

SEE ALSO

`set_program_options` (2), `sh_eco_enabled` (3).

PARA-102 (information) Reading parasitics file '%s' because parasitic information is required by the multicore master.

DESCRIPTION

During a multicore analysis using PrimeTime, the master process attempts to save runtime and memory by skipping the reading of parasitics, letting the remote processes perform this task instead. This saving is possible only when a single parasitics file, of any format other than PARA, DSPF or RSPF, is used within a session and the '`-keep_capacitive_coupling`', '`-verbose`', '`-syntax_only`', '`-`'

`keep_variations`', or '`-path`' options are not used with **read_parasitics**.

However, several subsequent ECO or reporting commands will force the master to read the parasitics file: `complete_net_parasitics`, `connect/disconnect_net`, `insert/remove_buffer`, `report_annotated_parasitics`, `scale_parasitics`, `set_parasitic_corner` and `write_parasitics`.

WHAT NEXT

No action is needed but, for optimal performance, check your script to see whether the command that forces the parasitics to be read is necessary.

SEE ALSO

read_parasitics (2),

PARA-103 (information) Parasitics file '%s' will be read by the remote processes.

DESCRIPTION

During a multicore analysis using PrimeTime, this message is outputted to indicate that the remote processes will read the parasitics file directly if it has not already been done so by the master process.

WHAT NEXT

No action necessary.

SEE ALSO

read_parasitics (2), **PARA-102** (n).

PARA-104 (error) Corner file does not match the base corner - aborting the reading. This occurs while reading coupling between nets '%s' and '%s'.

DESCRIPTION

You get this message when you are trying to read multiple corner parasitics but it is found that the current corner topology does not match the base corner in coupling section.

WHAT NEXT

Check the corner parasitic file and re-issue the command.

SEE ALSO

`read_parasitics (2)`

PARA-105 (warning) Parasitics file '%s' was not read by the multicore master because the `multi_core_read_parasitics` variable is set to 'disabled'.

DESCRIPTION

During a multicore analysis using PrimeTime, this warning is outputted to indicate that the master did not read the parasitics file because the `multi_core_read_parasitics` variable is set to 'disabled'.

WHAT NEXT

To allow the master to read the parasitics file, set `multi_core_read_parasitics` to 'auto'.

SEE ALSO

`read_parasitics (2)`,

PARSE

PARSE-1 (error) %s: %s on line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

PARSE-2 (error) %s on line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

PDC

PDC-1 (error) Internal error.

DESCRIPTION

This error message indicates an unexpected internal error.

WHAT NEXT

Contact technical support.

SEE ALSO

NONE

PDC-2 (warning) Requested object(s) not found in Milkyway database.

DESCRIPTION

This error message occurs when user requested data/action that depends on non-existing Milkyway objects. For example, user may have asked to report constraints on a pin but no constraints were previously set in the Milkyway database. In this case, user can either ignore the message or add the missing objects to the Milkyway database first and then re-try this command.

WHAT NEXT

If it is not obvious why the objects are missing in the database, verify the sequence of flow steps. If no flow error is identifiable, it is possible the database is corrupted. In that case either the database can be regenerated from scratch. If none of these steps remedy the situation consult your technical support

SEE ALSO

NONE

PDC-3 (error) File I/O error.

DESCRIPTION

There was an error in trying to create, access or update the specified file.

WHAT NEXT

Check the filename and path for correctness and verify if appropriate permissions exist.

SEE ALSO

NONE

PDC-4 (warning) Atleast one option should be specified

DESCRIPTION

The command requires atleast one of the listed options be specified.

WHAT NEXT

In some cases, the commands applies a default option. In that case nothing needs to be done. When a default is not obvious, command cannot continue. Try supplying the required option.

SEE ALSO

NONE

PDC-5 (error) Illegal value specified.

DESCRIPTION

The value supplied is not an acceptable value. Use the man page or command help or user's guide to find out how to determine allowed values.

WHAT NEXT

Re-try the command by supplying a valid value.

SEE ALSO

NONE

PDEFP

PDEFP-1 (error) The PDEF file contains cluster data for the design '%s';
this cluster data cannot be annotated on the design '%s'.

DESCRIPTION

This message indicates that the design for which the cluster data was written, as indicated by the DESIGN construct of the PDEF file, is not the **current_design**. The name in the DESIGN construct of the PDEF file must be the name of the **current_design**.

WHAT NEXT

Verify that the PDEF file was created for the **current_design**, and if so, edit the PDEF file so that the DESIGN construct contains the name of the **current_design**.

PDEFP-2 (warning) The PDEFVERSION values we accept are '%s'.

DESCRIPTION

This message indicates that the current PDEF file was written using an unrecognized revision of the PDEF language. Revisions recognized by the current version of the **read_clusters** command are listed in the message.

This message is a warning only; **read_clusters** will attempt to read the file. However, if syntactic or semantic errors occur, you should suspect version incompatibility.

WHAT NEXT

If the file is read successfully, you need do nothing. However, if the file is not read successfully, verify that the PDEF file created is compatible with one of the versions indicated by this warning message.

PDEFP-3 (warning) The cluster '%s' has been duplicated; the most recently

read description of the cluster will be kept, while all previous versions will be overwritten.

DESCRIPTION

This message indicates that the cluster identified in the message has been defined more than once in the PDEF file. The last instance of the cluster in the file is considered valid; all other instances are ignored.

WHAT NEXT

Search the PDEF file for more than one cluster whose hierarchical name is the same as the one identified in the message. Determine the intent behind the duplication, and make appropriate corrections to the file.

PDEFP-4 (warning) The cell instance '%s' does not exist.

DESCRIPTION

The identified cell instance cannot be found in the logical hierarchy beneath **current_design**. The instance will be ignored unless the `-allow_physical_cells` option of `read_pdef` is used.

WHAT NEXT

Check to see why the instance identified in the message was included in the PDEF file. If the instance is meant to be in the floorplan as a physical-only cell, such as a filler cell or endcap cell, re-run `read_pdef` with the `-allow_physical_cells` option.

PDEFP-5 (warning) The cell instance '%s' has already been listed under cluster '%s'; this previous classification will be overwritten.

DESCRIPTION

This message indicates that the identified cell instance was previously listed as part of another cluster. The previous association is ignored. Only the most recent cluster association (that is, the cluster association furthest down in the file) will be preserved.

WHAT NEXT

Investigate the reason why the cell instance was listed in more than one cluster, and correct any errors.

PDEFP-6 (error) %s at or near token '%s'.

DESCRIPTION

A lexical or syntactic error has occurred in processing this PDEF file.

WHAT NEXT

Look at the line and token indicated in the message, and fix the problem.

PDEFP-7 (warning) The name of the cluster '%s' contains the character '/', which cannot be processed by dc_shell commands.

DESCRIPTION

This message warns you that you will not be able to refer to the specified cluster, or its sub-clusters, by name within **dc_shell**. The name contains the slash character ("/"), commonly used as a separator to identify the names of hierarchical clusters; the **dc_shell** cluster-processing commands cannot properly parse a cluster name that contains an embedded slash character.

WHAT NEXT

If you will not be referring to the specified cluster within **dc_shell**, you can leave the name as it is; it is possible to optimize a design that contains clusters of this type.

However, if you do intend to refer to the cluster within **dc_shell**, edit the cluster file and replace the slash character with another character in each cluster name.

PDEFP-8 (warning) The cell instance '%s' is not a leaf cell. Its presence

within this cluster will be ignored.

DESCRIPTION

This message indicates that the identified cell instance does not refer to a leaf cell. Each cell instance defined within a cluster must refer to a leaf cell; you cannot completely enclose a hierarchical cell in a cluster.

WHAT NEXT

Enumerate all leaf cells contained in this cell, and put each of them individually into the cluster.

PDEFP-9 (error) The subdesign '%s' of the current design '%s' contains unmapped cells. The entire design must be fully mapped.

DESCRIPTION

This message indicates that an unmapped cell was found in a subdesign during the checking phase of the `read_clusters` command. `read_clusters` requires that a design be completely mapped.

WHAT NEXT

Ensure that all cells are mapped by executing `compile` on the `current_design`.

PDEFP-10 (warning) A percentage utilization less than 0.0 was specified.

DESCRIPTION

The negative utilization percentage specified here will be ignored.

WHAT NEXT

If the negative utilization percentage was not intended, re-create the PDEF file.

PDEFP-11 (warning) A percentage utilization greater than 100.0

was specified.

DESCRIPTION

A percentage utilization greater than 100% was defined, which means that there is more cell area than the cluster can contain.

WHAT NEXT

The situation was probably caused by an error in the application that produced the PDEF file. The **read_clusters** command accepts the erroneous value and interprets it as an over-utilized block.

The **reoptimize_design** command seeks a secondary objective to reduce the utilization of all clusters below their MAX_UTILIZATION constraint. This cluster receives special attention to reduce the cell-area.

PDEFP-12 (warning) No UTILIZATION has been specified; the MAX_UTILIZATION value cannot be correctly interpreted in its absence, so it will be ignored.

DESCRIPTION

You have assigned a MAX_UTILIZATION attribute to a cluster, but no corresponding UTILIZATION attribute. To enforce the MAX_UTILIZATION restriction and determine how large the cluster can become, we must know the current utilization of the cluster.

WHAT NEXT

Modify the PDEF file to define the UTILIZATION attribute for the indicated cluster. Then, reread the file using the **read_clusters** command.

PDEFP-13 (warning) The attribute '%s' has been specified more than once for the object '%s'; the new value will override the old.

DESCRIPTION

This message indicates that an attribute is defined more than once for the specified

cluster or cell. The last value defined will be used.

WHAT NEXT

Remove the extra attributes.

PDEFP-14 (warning) The attribute '%s' has been specified with a value whose type is not %s; this value will be ignored.

DESCRIPTION

This message indicates that an attribute has been found that has an invalid type. Each of the possible cluster attributes can be only of a specific type. For example, the UTILIZATION attribute can be only an integer or a floating-point number. If an invalid value type is defined, it will be ignored, and the attribute's value will remain unchanged.

WHAT NEXT

Set the value of the attribute to the correct type.

PDEFP-15 (warning) The wire_load '%s' for cluster '%s' could not be found.

DESCRIPTION

A wire-load defined for a cluster could not be found in the libraries linked to the design being annotated. Either the link libraries don't include the library with the wire-load, or the name of the wire-load is incorrect.

WHAT NEXT

Set the **link_library** variable to include the library that contains this wire-load, or change the name of the wire-load in the .PDEF file.

PDEFP-16 (warning) The cell instance '%s' is not linked. Its presence

within this cluster will be ignored.

DESCRIPTION

This message indicates that the specified cell instance is not linked. Each cell instance defined within a cluster must refer to a fully linked leaf cell. You cannot define a cell in a cluster that is not fully linked.

WHAT NEXT

Find the design or library cell to which this cell instance should be linked, and include it in the **search_path** or **link_library**.

PDEFP-17 (warning) The attribute '%s' of %s '%s' is not recognized and will be ignored.

DESCRIPTION

This message indicates that the specified attribute is not recognized by the **read_clusters** command. **read_clusters** recognizes only a certain number of attributes and ignores the rest. This attribute is not recognized and is being ignored.

WHAT NEXT

Make sure the unrecognized attribute is not the result of some typing or translation error. If you intended for the attribute to be in the PDEF file, it does no harm to leave it in the PDEF file, but it has no effect on the processing of the cluster or cell.

PDEFP-18 (warning) The attribute '%s' has been specified with an invalid value. The value must be %s.

DESCRIPTION

This message indicates that an attribute has been defined with an illegal value.

WHAT NEXT

Change the attribute value to a legal value, as stated in the message.

PDEFP-19 (warning) The attribute '%s' has been specified more than once for the cluster file %s; the new value will override the old.

DESCRIPTION

This message indicates that an attribute has been defined more than once for the specified cluster file. The last value defined will be used.

WHAT NEXT

Remove the extra attributes.

PDEFP-20 (warning) Attributes ignored for hierarchical cell %s.

DESCRIPTION

A cluster file has had an attribute defined for a hierarchical cell. Attributes are not currently supported on hierarchical cells.

WHAT NEXT

Remove the attributes from the hierarchical cell or else put leaf cells in the PDEF file instead, and set the attributes on the leaf cells.

PDEFP-21 (warning) Invalid NAMEPREFIX index (%d) for cell %s.

DESCRIPTION

The specified cell has a NAMEPREFIX index which was never defined via a NAMEPREFIX attribute in the current PDEF file. No prefix will be prepended to the cell name. This will most likely prevent the cell from being found in the design.

WHAT NEXT

Fix the PDEF file such that there is a NAMEPREFIX attribute with the proper index, or else remove the NAMEPREFIX index from the cell name definition.

PDEFP-22 (warning) Reading LOC attribute in a PDEF 1.x file.

DESCRIPTION

LOC attribute is defined only for version 2.0 and later. Though this application will read and utilize and write out the LOC attribute without any problem, we will also write out the same version number as read in. This may either cause problems for other application or if the other application ignores the LOC attributes in the PDEF file without warning the user, it may result in an unpredictable/inaccurate flow.

WHAT NEXT

Make sure that the PDEF writer that generated the file writes out correct PDEFVERSION.

PDEFP-23 (warning) There is no cluster information to write out.

DESCRIPTION

This happens when you tried to write out a pdef file and there is no cluster information for it to write out.

WHAT NEXT

Make sure to use read_pdef command or read a db file which contains cluster information.

PDEFP-24 (warning) The attribute %s %s will be not written out.

DESCRIPTION

This happens when you tried to write out a v2.0 pdef file after reading ieee pdef files.

WHAT NEXT

Try to write out a ieee pdef or change the attribute to be compatible with ieee pdef.

PDEFP-25 (warning) Obstruction size will be ignored in this

version. use CLUSTER RECT attribute to represent the obstruction size.

DESCRIPTION

In this version obstruction support is the same as the PDEF 2.0

WHAT NEXT

To represent the obstruction size, please use the cluster rect attribute. (RECT <llx> <lly> <urx> <ury>)

PDEFP-26 (warning) The pin '%s' does not exist.

DESCRIPTION

The identified pin/port cannot be found in the **current_design**. The pin/port will be ignored.

WHAT NEXT

Check to see why the pin identified in the message was listed in the PDEF file.

PDEFP-27 (warning) All the warnings will not print out when using -quiet.

DESCRIPTION

When -quiet option is used, then all the warning messages will not be printing out.

WHAT NEXT

remove -quiet to get all the warnings.

PDEFP-28 (error) The PDEF file does not contain core area data

for the design '%s'.

DESCRIPTION

It is required to have the core area description for physical synthesis. This message indicates either the core area description in the PDEF file is not in the right format or it is missing. The core area is expected in the following format: (CORE_AREA <number number number number>) The first two numbers are lower left coordinates and the last two numbers are upper right coordinates.

The core area must be either in CLUSTERFILE or in the first CLUSTER. For example A:
(CLUSTERFILE (PDEFVERSION "3.0") (DESIGN ctl_v) (DATE "Wed Nov 18 18:56:48 PST 1998") (VENDOR "SYNOPSYS") (PROGRAM "CONVERTER") (VERSION "1998.02") (DIVIDER /) (PIN_DELIMITER /) (BUS_DELIMITER []) (NETLIST_TYPE VERILOG) (DISTANCE_UNIT 0.01) (CORE_AREA 0 0 1728 15000)

For example B: (CLUSTERFILE (PDEFVERSION "3.0") (DESIGN ctl_v) (DATE "Wed Nov 18 18:56:48 PST 1998") (VENDOR "SYNOPSYS") (PROGRAM "CONVERTER") (VERSION "1998.02") (DIVIDER /) (PIN_DELIMITER /) (BUS_DELIMITER []) (NETLIST_TYPE VERILOG) (DISTANCE_UNIT 0.01) (CLUSTER TOP (CORE_AREA 0 0 1728 15000))

WHAT NEXT

Make sure the core area is in proper format in the PDEF file.

PDEFP-29 (warning) Ignore unknown orientation '%s'.

DESCRIPTION

This message indicates the orientation value is not according to the PDEF orientation. They are one of those following: "0", "0-mirror", "90", "90-mirror", "180", "180-mirror", "270", "270-mirror"

WHAT NEXT

Use the PDEF orientation enumeration.

PDEFP-30 (warning) Cells could be moved out of boundary.

DESCRIPTION

You receive this warning because the floorplan description contains move bounds descriptions. These specify that the placement of some cells should be constrained to be within the area specified by the move bounds. The move bounds constraint is read and stored in the design, however the coarse placer might place the cells

included in the move bound outside the move bounds area. This would occur if the placement engine was trying to resolve timing or congestion costs which would force the cells to be placed outside the desired area. This warning does not suggest that this will happen, it is merely reminding you that this might happen.

WHAT NEXT

Run write_pdef or run report_cell -physical on cells in the cluster to examine their placement after coarse placement or legalization. Check to see that your cells have been placed where you desire.

PDEFP-31 (warning) The net instance '%s' does not exist.

DESCRIPTION

The identified net instance cannot be found in the hierarchy beneath **current_design**. The instance will be ignored.

WHAT NEXT

Check to see why the net instance identified in the message was listed in the PDEF file.

PDEFP-32 (warning) The net instance '%s' has already been listed under cluster '%s'; this previous classification will be overwritten.

DESCRIPTION

This message indicates that the identified net instance was previously listed as part of another cluster. The previous association is ignored. Only the most recent cluster association (that is, the cluster association furthest down in the file) will be preserved.

WHAT NEXT

Investigate the reason why the net instance was listed in more than one cluster, and correct any errors.

PDEFP-33 (warning) This obstruction becomes placement obstruction. Obstruction size will be ignored for placement

obstruction. use CLUSTER RECT and CLUSTER X_BOUNDS/Y_BOUNDS attribute to represent the obstruction size.

DESCRIPTION

Though the OBSTRUCTION construct is syntactically correct, the size from this construct is ignored. Instead, the size from the parent cluster in which this construct is found, will be used to assign the size to this obstruction. RECT and X_BOUNDS/Y_BOUNDS from the parent cluster are used to arrive at the size of this obstruction.

WHAT NEXT

To represent the obstruction size, please use the cluster rect attribute. (RECT <llx> <lly> <urx> <ury>) (X_BOUNDS <llx> <urx>) (Y_BOUNDS <lly> <ury>)

PDEFP-34 (information) Cell '%s' of a '%s' is converted into a physical cell.

DESCRIPTION

This happens when the cell does not exist in the netlist but exist in the physical library. This conversion only happens using -allow_physical_cells in the read_pdef command.

WHAT NEXT

Make sure if the cell is a real physical cell by checking the gate existing in the physical library but not in the logical library.

PDEFP-35 (Error) The physical cell '%s' can not be generated because it is missing either FIXED_PLACEMENT attribute, GATE_NAME attribute , or location.

DESCRIPTION

The identified physical cell instance cannot be created because it requires to have fixed_placement and location. Also it requires GATE_NAME attribute. This gate name should be the one used in the physical library.

WHAT NEXT

Check to see why the cell instance identified in the message was listed in the PDEF file.

PDEFP-36 (Error) This layer '%s' is not defined in the LAYER_DEF section.

DESCRIPTION

The message indicates that this layer is not defined in the LAYER_DEF. This VIA_RECT will be ignored because of that.

WHAT NEXT

Add this missing layer_name into LAYER_DEF section. For example (LAYER_DEF (LAYER <missing_layer_name> <positive_number>) ...)

PDEFP-37 (warning) The PNET instance '%s' exists in the netlist.

DESCRIPTION

This warning means that the specified PNET instance exists in the netlist below the current design in the hierarchy. The instance will be transferred to NET construction from PNET construction in the PDEF file. In the PDEF file, NET construction is for logical nets and PNET construction is for physical nets.

WHAT NEXT

Run the **get_nets** command to see if there is already a net with the specified name. If you want to define the PNET, use a unique name. PNET can be defined in the PDEF file or created using the **create_net** command.

SEE ALSO

create_net (2), **get_nets** (2).

PDEFP-38 (warning) The site array has been defined more than

once.

DESCRIPTION

You receive this warning message because the site array read into the PDEF file has been defined more than once. You can define a site array only once, either in the cluster or in the design.

WHAT NEXT

Remove one of the site array definitions and reexecute the `read_pdef` command.

SEE ALSO

`create_site_row` (2), `get_site_row` (2), `ignore_site_row` (2), `remove_site_row` (2).

PDEFP-39 (Error) Cell information not present

DESCRIPTION

You get this error because you are trying to access the cell information that is either not loaded or removed from memory.

WHAT NEXT

Use `-load_pdef` option of `report_cell_displacement` command to load the cell information again.

SEE ALSO

`report_cell_displacement` (2)

PDEFP-40 (Error) The pdef data is not read properly

DESCRIPTION

You get this error when the data that is loaded using `report_cell_displacement` is not proper.

WHAT NEXT

Please check the input pdef file that is given as input to `report_cell_displacement`

command.

SEE ALSO

`report_cell_displacement(2)`

PDEFP-41 (Warning) No change in placement information.

DESCRIPTION

You get this warning when you try to compare the two placement information which are identical.

WHAT NEXT

Some placement changes should be there to see the report on `report_cell_displacement` command.

SEE ALSO

`report_cell_displacement(2)`.

PDEFP-42 (Error) The physical cell '%s' cannot be generated as its reference '%s' does not exist in the physical library

DESCRIPTION

You get this error if your PDEF file uses a `physical_only` cell that does not have a corresponding model in the physical library.

WHAT NEXT

Check that the reference (`GATE_NAME` attribute) of the `physical_only` cell in your PDEF is present in the physical library.

PDEFP-43 (warning) No orientation found for the cell '%s'.

Assigning the default orientation '%s'.

DESCRIPTION

You get this warning when the cell mentioned in the warning message has location specified in the pdef file, but not orientation. The default orientation, mentioned in the warning message, is assigned to the cell.

WHAT NEXT

If the default orientation is not acceptable, you must specify the ORIENT statement in CELL definition in the pdef file and read the pdef again. If the default orientation is acceptable, then you can continue with no changes made.

PDEFP-44 (information) Found program version '%s' from the PDEF file. Port shapes are considered to be relative to the corresponding port locations and are converted to be internally relative to the origin of the containing object.

DESCRIPTION

This message advises you that during execution of the **read_pdef** command. It occurs when reading a Physical Design Exchange Format (PDEF) file that contains the VERSION construct with one of the following sets of strings:

2001.08 (plus all variants)

2002.05

2002.05-1, 2002.05-2, 2002.05-2-RH7, 2002.05-3,

2002.05-3-RH7, 2002.05-4, 2002.05-4-RH7

For example, your PDEF file might contain the following statements:

```
(VENDOR "Synopsys, Inc" )
(PROGRAM "Design Compiler" )
(VERSION "2002.05-4" )
```

This allows the tool to identify PDEFs written by older releases of the tool. In these versions, the PDEF described the top level ports as PIN constructs with RECT statements using relative XY coordinates. The values of the coordinates are specified relative to the origin of the PIN. In later releases of the tool, the PDEF uses absolute coordinates to specify the PIN RECT statements. The values of the

coordinates are specified relative to the chip origin at (0,0).

EXAMPLE

Old style (incorrect)

```
(PIN data_1
(LOC 300 400)
(RECT -10 -20 30 40)
(LAYER 23)
)

(PIN data_1
(LOC 300 400)
(RECT 290 380 330 440)
(LAYER 23)
)
```

If you inadvertently read in an old version PDEF, you would be annotating incorrect coordinates for your top level ports. By identifying the older versions, the **read_pdef** command then automatically converts the PIN RECT coordinates from a relative to an absolute coordinate system before storing it onto your design .db database.

WHAT NEXT

This is only an informational message. No action is required. However, if your input PDEF contains relative coordinates to describe the PIN RECT statements, ensure that the VERSION construct uses one of the string values described above.

If your input PDEF contains absolute coordinates to describe the PIN RECT statements, ensure that the VERSION construct does not use one of the string values described above. For example (VERSION "2002.05-SP1") will not invoke the translation step.

You can use a text editor to change the PDEF VERSION value if necessary.

PDEFP-45 (warning) %s at or near token '%s'.

DESCRIPTION

A lexical or syntactic warning message.

WHAT NEXT

This is a warning message only. No action is required on your part. Check the line and the token indicated in the message, and be aware of the problem.

PDEFP-46 (Warning) The design name '%s' in input PDEF file dose not match the current design name '%s'.

DESCRIPTION

You receive this warning message because the design name in input PDEF file does not match the current design name.

WHAT NEXT

Make sure that the PDEF is loaded to the correct design.

PDEFP-47 (warning) A negative VIA number was specified in via_ref.

DESCRIPTION

A negative VIA number was specified. The via_ref section will be ignored.

WHAT NEXT

Modify the PDEF file to define VIA number positive.

PDEFP-48 (Error) This layer '%d' is not defined in the LAYER_DEF section.

DESCRIPTION

The message indicates that this layer is not defined in the LAYER_DEF. This VIA_RECT will be ignored because of that.

WHAT NEXT

Add this missing layer_name into LAYER_DEF section. Forexample (LAYER_DEF (LAYER <missing_layer_name> <positive_number>) ...)

PDIN

PDIN-1 (warning) Ignore '%s'.

DESCRIPTION

This PDEF syntax is ignored.

WHAT NEXT

PDIN-2 (warning) Ignore '%s'.

DESCRIPTION

Probably it does not have the right parameters. The parser will not process its value. This happens specially reading SYNOPSYS defined attributes: 1.

(DEF_CONVERSION_FACTOR <number>) example: (DEF_CONVERSION_FACTOR 1000) It describes 1000 as DEF CONVERSION FACTOR.

2. (SITE <site_name> "<origin_x origin_y>" "<H|V>" "<orientation>" "<space>" "<site width>" "<number of sites>") example: (SITE core "0 0" "H" "0-mirror" "0.8" "0.8" "100") It defined a horizontal row using 100 of site "core" starting (0,0). The width of the site is 0.8. There is no space between site. NOTE: <space> means distance from the lower left corner of a site to the next lower left corner of a site.

3. (SITE <row name> <site name> "<origin_x origin_y>" "<H|V>" "<orientation>" "<space>" "<site width>" "<number of sites>") This is the same as 2 except has additional row name.

4. (CORE_AREA <number number number number>) example: (CORE_AREA 100 100 200 200) The first two numbers are lower left coordinates of the core area. The last two numbers are upper right coordinates of the core area.

5. (LAYER_WIDTH <layer_id> <wire_width>) example: (LAYER_WIDTH 2 10.0) The layer_id is defined in the LAYER_DEF section. The wire width specified the wire width on that layer.

6. (LAYER_SPACING <layer_id> <space>) example: (LAYER_SPACE 2 10.0) The layer_id is defined in the LAYER_DEF section. The space specified the edge-to-edge separation on that layer.

7. (LAYER_SPACING_RANGE <layer_id> <minspace> <maxspace>) example: (LAYER_SPACE 2 10.0 100.0) It is like LAYER_SPACING except here specifying a range.

8. (VIA_PATTERN "<pattern_name>") example: (VIA_PATTERN "cut_layer111_\$\$_cut_layer222") This attribute is to describe the VIA pattern name.

9. (VIA_RECT <layer_name> "llx lly urx ury") example: (VIA_RECT METAL1 "-20 -20 20 20") This attribute is to describe a via rectangle on a specific layer.

WHAT NEXT

Edit your input PDEF file.

PDIN-3 (warning) Ignore '%s'.

DESCRIPTION

This message indicates that the attribute is not in the right context. This happens specially reading SYNOPSYS defined attributes: 1. (DEF_CONVERSION_FACTOR <number>) should be in the CLUSTERFILE context. example: (CLUSTERFILE (PDEFVERSION "IEEE 1481-1998") (DESIGN "the_design") (DATE "April 6, 1999") (VENDOR "Synopsys, Inc.") (PROGRAM "Design Compiler") (VERSION "1998.02") (DIVIDER /) (PIN_DELIMITER /) (BUS_DELIMITER []) (NETLIST_TYPE VERILOG) (DESIGN_FLOW " ") (DISTANCE_UNIT 0.00100000) (DEF_CONVERSION_FACTOR 1000)

2. (SITE <site_name> "<origin_x origin_y>" "<H|V>" "<orientation>" "<space>" "<site width>" "<number of sites>") It should be in either the clusterfile or in the first cluster which can represent the top. Example 1: (CLUSTERFILE (PDEFVERSION "IEEE 1481-1998") (DESIGN "the_design") (DATE "April 6, 1999") (VENDOR "Synopsys, Inc.") (PROGRAM "Design Compiler") (VERSION "1998.02") (DIVIDER /) (PIN_DELIMITER /) (BUS_DELIMITER []) (NETLIST_TYPE VERILOG) (DESIGN_FLOW " ") (DISTANCE_UNIT 0.00100000) (DEF_CONVERSION_FACTOR 1000) (SITE ROW_22 tsm1site "-92000.00 85000.00" "H" "0" "800.00" "231")

example 2: (CLUSTERFILE (PDEFVERSION "IEEE 1481-1998") (DESIGN "the_design") (DATE "April 6, 1999") (VENDOR "Synopsys, Inc.") (PROGRAM "Design Compiler") (VERSION "1998.02") (DIVIDER /) (PIN_DELIMITER /) (BUS_DELIMITER []) (NETLIST_TYPE VERILOG) (DESIGN_FLOW " ") (DISTANCE_UNIT 0.00100000) (DEF_CONVERSION_FACTOR 1000) (CLUSTER TOP (SITE ROW_22 tsm1site "-92000.00 85000.00" "H" "0" "800.00" "231"))

3. (SITE <row name> <site name> "<origin_x origin_y>" "<H|V>" "<orientation>" "<space>" "<site width>" "<number of sites>") This is the same as 2 except has additional row name.

4. (CORE_AREA <number number number number>) It has the same context as the SITE attribute.

NOTES: You can only describe one CORE AREA or SITE ARRAY in the PDEF file. One PDEF file represents one design. Therefore only one CORE AREA/SITE ARRAY for one PDEF file.

5. (LAYER_WIDTH <layer_id> <wire_width>) example: (LAYER_WIDTH 2 10.0) The layer_id is defined in the LAYER_DEF section. The wire width specified the wire width on that layer. This attribute can be in PNET or ROUTE. (PNET power_net (LAYER_WIDTH 2 10.0) (ROUTE (LAYER_WIDTH 2 3.4) (2 (100 299) (299 *))))

6. (LAYER_SPACING <layer_id> <space>) example: (LAYER_SPACE 2 10.0) The layer_id is

defined in the LAYER_DEF section. The space specified the edge-to-edge separation on that layer. This attribute is in PNET. (PNET power_net (LAYER_SPACING 2 100))

7. (LAYER_SPACING_RANGE <layer_id> <minspace> <maxspace>) example: (LAYER_SPACE 2 10.0 100.0) It is like LAYER_SPACING except here specifying a range. This attribute is in PNET. (PNET power_net (LAYER_SPACING_RANGE 2 10 100))

8. (VIA_PATTERN "<pattern_name>") example: (VIA_PATTERN "\$cut222\$cut111") This attribute is to describe a via pattern name. This attribute is in VIA. (VIA VIA0 1 (VIA_PATTERN "\$cut222\$cut111"))

9. (VIA_RECT <layer_name> "llx lly urx ury") example: (VIA_RECT METAL1 "-20 -20 20 20") This attribute is to describe a via rectangle on a specific layer. This attribute is in VIA. (VIA VIA0 1 (VIA_RECT METAL1 "-20 -20 20 20") (VIA_RECT CUT "-10 -10 10 10") (VIA_RECT METAL2 "-30 -30 30 30"))

WHAT NEXT

Edit your input PDEF file.

PDIN-4 (warning) The attribute '%s' is in relative coordinates.

DESCRIPTION

This message indicates that the attribute is under CONTENT_LOCATIONS relative effect. That means the numbers in the attribute represents relative coordinates. It is relative to the cluster origin. If there is no cluster origin then it is relative to cluster RECT/BOUNDS.

This happens specially reading SYNOPSYS defined attributes:

2. (SITE <site_name> "<origin_x origin_y>" "<H|V>" "<orientation>" "<space>" "<site width>" "<number of sites>") For Example : defining a row that is relative to cluster origin (10 10).

example 1: (CLUSTER TOP (CONTENT_LOCATIONS relative) (ORIGIN 10 10) (SITE ROW_22 tsm1site "100.00 100.00" "H" "0" "800.00" "231")) This is the same as the following description: (CLUSTER TOP (SITE ROW_22 tsm1site "110 110" "H" "0" "800.00" "231"))

4. (CORE_AREA <number number number number>) For example: defining a core area that is relative to cluster origin (10 10)

example 1: (CLUSTER TOP (CONTENT_LOCATIONS relative) (ORIGIN 10 10) (CORE_AREA 100 100 200 200)) This is the same as the following description: (CLUSTER TOP (CORE_AREA 110 110 210 210)

WHAT NEXT

They can be in CLUSTERFILE context. Then there is no relative coordinates.

PDIN-5 (warning) The attribute '%s' is in absolute coordinates.

DESCRIPTION

This message indicates that the attribute is using chip origin (0,0). That means the numbers in the attribute represents absolute coordinates.

These attributes are the following:

2. (SITE <site_name> "<origin_x origin_y>" "<H|V>" "<orientation>" "<space>" "<site width>" "<number of sites>") For example, "110 110" are absolute coordinates. This is the same as the following description: (CLUSTER TOP (SITE ROW_22 tsm1site "110 110" "H" "0" "800.00" "231"))

4. (CORE_AREA <number number number number>) For example: (110 110) (210 210) are absolute coordinates. This is the same as the following description: (CLUSTER TOP (CORE_AREA 110 110 210 210)

WHAT NEXT

Edit your input PDEF file.

PDIN-6 (warning) The attribute '%s' is treated as a user attribute.

DESCRIPTION

This message indicates that this attribute will be ignored. The user attributes are simply read in and get written out.

WHAT NEXT

PDIN-7 (warning) Inherited cluster attributes are not supported.

DESCRIPTION

This message indicates that cluster will not inherit its parent cluster attributes. The location attributes (RECT, X_BOUNDS and YBOUNDS), size attributes (MAX_HALF_PERIMETER, MAX_X_PERIMETER, and MAX_Y_PERIMETER) will not be inherited from the parent cluster. The obstruction attribute will not be inherited from its child clusters.

WHAT NEXT

Add the cluster attributes to the cluster itself.

PDIN-8 (error) Duplicate EEQ_MACRO_REF '%s'.

DESCRIPTION

You receive this error message because more than one EEQ_MACRO_REF statement is defined for a cell in the PDEF file. The flow allows only one EEQ_MACRO_REF statement for a cell definition. This error message is the result of commands that read the PDEF file such as `read_pdef`.

WHAT NEXT

Delete the duplicate EEQ_MACRO_REF statement from the cell definition in the PDEF file.

PDIN-9 (error) EEQ_MACRO_REF '%s' has no definition in physical libraries.

DESCRIPTION

You receive this error message because the EEQ_MACRO_REF has no definition in the physical libraries provided. The cell should have a reference in the physical library. This error message is the result of commands that read the PDEF file such as `read_pdef`.

WHAT NEXT

Include the physical library which has the definition for the cell.

PGRT

PGRT-001 (error) Invalid pin access edge range.

DESCRIPTION

You have specified negative value in the option "--protect_pin_access_edge_within_range". The command failed.

WHAT NEXT

Check the command syntax.

SEE ALSO

`set_preroute_drc_strategy(2)`

PGRT-002 (error) Options '%s' and '%s' are mutually exclusive.

DESCRIPTION

These two options are mutually exclusive. The command failed.

PLAI-2 (error) Illegal command at line %d.

DESCRIPTION

WHAT NEXT

PLAI-3 (error) Port %s declared twice at line %d.

DESCRIPTION

WHAT NEXT

PLAI-4 (warning) Unknown value '%s' for .phase keyword.

Positive phase will be used for all outputs.

DESCRIPTION

WHAT NEXT

PLAI-5 (warning) Unknown PLA type "%s

DESCRIPTION

WHAT NEXT

PLAI-6 (warning) Unknown command "%s

DESCRIPTION

WHAT NEXT

PLAI-7 (error) Design name must be specified at line %d.

DESCRIPTION

WHAT NEXT

PLAI-8 (error) Ports incompletely specified at line %d.

DESCRIPTION

WHAT NEXT

PLAI-9 (error) Mismatched number of inputs.

DESCRIPTION

WHAT NEXT

PLAI-10 (error) Mismatched number of outputs.

DESCRIPTION

WHAT NEXT

PLAI-11 (error) No product terms for PLA found in file.

DESCRIPTION

WHAT NEXT

PLAI-12 (error) ON-set and OFF-set overlap.

DESCRIPTION

WHAT NEXT

PLAI-13 (error) Mismatched number of outputs and phase values.

Positive phase will be used for all outputs.

DESCRIPTION

WHAT NEXT

PLAI-14 (error) Invalid character on or near line %d.

DESCRIPTION

WHAT NEXT

PLAI-15 (error) Unknown port '%s' in .field statement at line %d.

DESCRIPTION

WHAT NEXT

PLAI-16 (error) Invalid order of input and output ports at '%s' at line %d.

DESCRIPTION

WHAT NEXT

PLAI-17 (error) The use of the percent operator has resulted in

an ambiguous specification.

DESCRIPTION

WHAT NEXT

PLAI-18 (warning) Ignoring row at line %d since previous row(s) containing the percent operator cover all input conditions implied by this row.

DESCRIPTION

WHAT NEXT

PLAI-19 (error) Ambiguous output values specified at lines %d and %d.

DESCRIPTION

WHAT NEXT

PLAI-20 (error) Port %s declared twice.

DESCRIPTION

WHAT NEXT

PLAO

PLAO-0 (error) Design is currently not represented as a PLA.

DESCRIPTION

WHAT NEXT

PLAO-1 (error) Cells at the current level of the design are not combinational.

DESCRIPTION

WHAT NEXT

PLMGR

PLMGR-01 (Error) The tluplus files are not set in this scenario '%s'. The RC values will be zero.

DESCRIPTION

In MCMM, you need to use `set_tlu_plus_files` in every scenario. It could be from the `set_tlu_plus_files` command or from previously setting stored in the design. If missing the setting, then your RC will be all zeros.

WHAT NEXT

Use `set_tlu_plus_files` command to set the files.

EXAMPLE MESSAGE

Warning: The tluplus files are not set in this scenario A. The RC values will be zero. (PLMGR-01)

SEE ALSO

`set_tlu_plus_files (2)`, `report_tlu_plus_files (2)`,

PLMGR-02 (Info) RCs will be annotated for scenario '%s', %s corner.

DESCRIPTION

The message is to tell you which corner(max/min) in which scenario, the RCs will be annotated on.

WHAT NEXT

Use `read_parasitics` command to read the file.

EXAMPLE MESSAGE

SEE ALSO

`read_parasitics (2)`, `report_scenario(2)`,

PLMGR-03 (Info) Scenario '%s', %s corner has not been updated yet.

DESCRIPTION

The message is to tell you which corner(max/min) in which scenario still need to be annotated.

WHAT NEXT

Use `read_parasitics` command to read the file.

EXAMPLE MESSAGE

SEE ALSO

`read_parasitics(2)`, `report_scenario(2)`,

PLMGR-04 (Error) Can not support some scenario has emulation tluplus but other not.

DESCRIPTION

The message is to tell you set emulation tluplus files in some scenario but not all scenarios. Currently we can not support partial setting.

WHAT NEXT

Use `report_tlu_plus_files` command to check the setting.

EXAMPLE MESSAGE

SEE ALSO

`set_tlu_plus_files(2)`, `report_tlu_plus_files(2)`,

PNA

PNA-001 (error) Design is not open.

DESCRIPTION

No Milkyway cell is open. The command is supposed to operate on the currently opened cell.

WHAT NEXT

Open the design you want the command to act on.

PNA-002 (error) Cannot specify this option together with '-layer', '-ring_nets', or '-global' option.

DESCRIPTION

The current option and '-layer', '-ring_nets', or '-global' option. cannot be specified together. They may be mutually exclusive or have dependency between each other.

WHAT NEXT

Specify the current option in a separate command.

PNA-003 (error) In order to use this option, %s option must be specified.

DESCRIPTION

The entered option has a dependency on the option %s.

WHAT NEXT

Please also specify option %s.

PNA-004 (error) Design name is not found.

DESCRIPTION

WHAT NEXT

PNA-005 (error) No top-level pins are connected to net %s logically.

DESCRIPTION

When the option `-use_pin_as_pads` is specified in PNA/PNS, the tool will first check the logic connectivity of the top-level P/G pins. If no P/G pins, or the P/G pins are not connected to the synthesized net(s), PNA/PNS will not be able to proceed using them as pads.

Another possible reason for this error is that the port type of the top-level pins is not "POWER" or "GROUND".

WHAT NEXT

Please set the port type of P/G pins to "POWER" or "GROUND". Then, use `derive_pg_connection` command to connect the top-level pin to the synthesized nets.

SEE ALSO

`derive_pg_connection` (2)

PNA-006 (error) All the P/G pads do not have power ports, or all the power ports are not connected to power or ground net logically.

DESCRIPTION

This error could be due to the following reasons:

- (1) the specified power/ground pad master/instance cannot be found in the design.
- (2) there is no power/ground port in the specified pads or the ports are not logically connected to the analyzed power/ground nets.

WHAT NEXT

Please use **derive_pg_connection** to make the logical connection, or use **create_fp_virtual_pad** command to specify virtual pads.

SEE ALSO

derive_pg_connection (2)
create_fp_virtual_pad (2)

PNA-007 (error) No existing core rings for net %s. Power network synthesis fails to extend straps to existing core ring.

DESCRIPTION

By default if -skip_ring option in the command **set_fp_rail_constraints** was set, PNS extends synthesized straps to existing core ring. However, if there is no core ring in the design, PNS is unable to extend the straps.

WHAT NEXT

Please apply any of the followings. (1) Synthesize also the core ring by using **set_fp_rail_constraints -set_ring** (2) Extends synthesized straps to boundary or pad ring by using **set_fp_rail_constraints -extend_strap boundary** or **set_fp_rail_constraints -extend_strap pad_ring** (3) Create core ring by using the Preroute command **create_rectangular_rings**

SEE ALSO

set_fp_rail_constraints (2)
synthesize_fp_rail (2)
create_rectangular_rings (2)

PNA-008 (error) Cannot find net %s in the design.

DESCRIPTION

There is no specified net in the design. You can also use the following command and option to check if the net is in the design.

get_net -all net_name

WHAT NEXT

Please apply any of the followings.

- (1) Add the specified net in the database
- (2) Specify the correct PG net name.

SEE ALSO

`get_net` (2)

PNA-009 (error) Cannot obtain technology information.

DESCRIPTION

PNA/PNS is unable to get technology information in the MilkyWay database.

WHAT NEXT

Please check if the technology file was set by using

```
write_mw_lib_files -technology -output tech_file_name library_name
```

Please set technology file by using

```
set_mw_technology_file
```

SEE ALSO

`set_mw_technology_file` (2)
`write_mw_lib_files` (2)

PNA-010 (error) All synthesized straps are removed due to blockage.

DESCRIPTION

During DRC checking stage, all the synthesized straps are removed. Please check the following:

- (1) Any big routing blockages in the design?
- (2) Any existing power/ground straps in the design that use different routing direction than the synthesized ones?

(3) The die size is too small for the given strap layer constraints?

WHAT NEXT

Reduce the strap number, or change strap width/direction/layer, use the global constraints '-ignore_blockages', resize the region for PNS.

SEE ALSO

`set_fp_rail_constraints` (2)

PNA-011 (error) Power network synthesis cannot synthesize more than two nets.

DESCRIPTION

PNS synthesizes only one power and one ground nets.

WHAT NEXT

Please specify one power and/or one ground nets for power network synthesis.

SEE ALSO

`synthesize_fp_rail` (2)

PNA-012 (error) Cannot find any power/ground nets in the design.

DESCRIPTION

The net names are missing for setting MVDD PNS constraints.

WHAT NEXT

Please set the net names by using

```
set_fp_rail_voltage_area_constraints -voltage_area VA_name -voltage_supply supply_voltage -nets net_names
```

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)

PNA-013 (error) Layer %s has zero resistance.

DESCRIPTION

There is zero unit resistance defined in the technology file, causing PNA/PNS is unable to perform PG extraction.

WHAT NEXT

PNA-014 (error) Cannot find layer %s from the technology file.

DESCRIPTION

The specified layer is not defined in MilkyWay database.

WHAT NEXT

Please use the command "get_layer" to list all the layers and check if the specified layer in in the list.

SEE ALSO

`get_layer` (2)

PNA-015 (error) Cannot find layer %d from the technology file.

DESCRIPTION

The specified layer ID is not defined in MilkyWay database.

WHAT NEXT

Please use the command "get_layer" to list all the layers and check if the layer with the specified layer Id is in the list.

SEE ALSO

`get_layer` (2)

PNA-016 (error) No power/ground port of %s is connected to net %s logically.

DESCRIPTION

Before running PNA/PNS, instances in the design should be connected to the synthesized P/G nets logically. In this error, no P/G port of standard cell instance or hard macro is connected to the synthesized net(s).

WHAT NEXT

Please use `derive_pg_connection` command to connect instances to the synthesized P/G net(s).

SEE ALSO

`derive_pg_connection` (2)

PNA-017 (error) Cannot load power network analysis results for net %s.

DESCRIPTION

After PNA or PNS is done, highlight files named <design_name>.<net_name>.pw_hl.pna will be created in the ./pna_output directory. These file are used for displaying IR/EM map. This error message shows that PNA or PNS failed such that the highlight files was not created.

WHAT NEXT

Please check the error message in the ICC log file, and then correct them accordingly.

SEE ALSO

`synthesize_fp_rail` (2)
`analyze_fp_rail` (2)
`analyze_fp_rail` (2)
`set_fp_rail_constraints` (2)
`set_fp_rail_region_constraints` (2)

```
set_fp_rail_strategy (2)
set_fp_rail_voltage_area_constraints (2)
```

PNA-018 (error) Not enough disk space for file %.

DESCRIPTION

By default PNA or PNS creates several files in the ./pna_output directory. The message means not enough disk space for storing these files.

WHAT NEXT

The directory used by PNA/PNS can be reset using the option -output_directory in the analyze_fp_rail (PNA) or synthesize_fp_rail (PNS) command. Please make sure the specified dierctory exists or can be created before running PNA or PNS.

SEE ALSO

```
analyze_fp_rail (2)
synthesize_fp_rail (2)
```

PNA-019 (error) Cannot open file %s.

DESCRIPTION

The specified file does not exist or is not readable.

WHAT NEXT

Please check if the correct file name was specified, or make the file readable.

PNA-020 (error) %s is not writable.

DESCRIPTION

The file cannot be written.

WHAT NEXT

Please make sure files can be created under ./pna_output directory. If not, users can change the output directory by usig the option -output_directory in the

`analyze_fp_rail` (PNA) or `synthesize_fp_rail` (PNS) command. Please make sure the specified directory exists or can be created before running PNA or PNS.

SEE ALSO

`analyze_fp_rail` (2)
`synthesize_fp_rail` (2)

PNA-021 (error) Cannot create directory %s.

DESCRIPTION

If the `./pna_output` directory does not exist, PNA/PNS will create one. This message shows that the directory cannot be created.

WHAT NEXT

Please make sure that `./pna_output` directory can be created. Users can also change the directory to be created by using the option `-output_directory` in the `analyze_fp_rail` (PNA) or `synthesize_fp_rail` (PNS) command.

SEE ALSO

`analyze_fp_rail` (2)
`synthesize_fp_rail` (2)

PNA-022 (error) Out of memory.

DESCRIPTION

There is not enough memory for PNA to solve matrix during IR drop simulation.

WHAT NEXT

Please switch the default matrix solver to ultra matrix solver by using `set_fp_rail_strategy -pna_ultra_solver true`. Note that ultra matrix solver uses less memory but longer CPU time.

SEE ALSO

`set_fp_rail_strategy` (2)
`analyze_fp_rail` (2)

PNA-023 (error) PNS region is not correctly defined.

DESCRIPTION

The PNS synthesis region defined in the region file or through mouse-click is not correct. The region can be rectangle or rectilinear region, but not self-slicing or disjoint region.

WHAT NEXT

Please redefine the region with GUI or Tcl command `set_fp_rail_region_constraints`.

SEE ALSO

`set_fp_rail_region_constraints` (2)
`synthesize_fp_rail` (2)

PNA-024 (error) Cannot fine voltage area %s in the design.

DESCRIPTION

The specified voltage area does not exist in the design.

WHAT NEXT

Please use the command `get_voltage_areas` to list all the voltage areas and check if the specified voltage area is in the list. If not, please either specify the correct voltage area name or create voltage area by the command `create_voltage_area`.

SEE ALSO

`get_voltage_areas` (2)
`create_voltage_area` (2)

PNA-025 (error) %s is not specified.

DESCRIPTION

The information %s is required for PNS/PNA to proceed.

WHAT NEXT

Please specify %s.

PNA-026 (error) The specified offset from pad to ring %.3f microns is larger than half of the design width.

DESCRIPTION

The specified ring offset is unreasonable large.

WHAT NEXT

Please use a smaller ring offset by the command and option `set_fp_rail_constraints -set_ring -ring_offset value`

SEE ALSO

`set_fp_rail_constraints` (2)
