ACS

ACS-100 (error) The program cannot find all Automated Chip Synthesis (ACS) initialization files.

DESCRIPTION

You receive this message because the program did not find all files that are necessary for proper initialization. The Synopsys software installation is incomplete or corrupted.

WHAT NEXT

Reinstall the software to fix the problem. You can continue working with the current installation, although some ACS functionality is not available.

ACS-101 (error) %s

DESCRIPTION

You receive this message because an error occurs when the `acs_read_hdl` command is scanning through the source files to detect interfile dependencies. It has found either a syntax error or an unsupported construct.

WHAT NEXT

Fix the syntax error or work around the unsupported construct. Another way to avoid this error message is to run the `acs_read_hdl` command with the `-no_dependency_check` option. This omits dependency checking so you should specify all source files in the proper order. For Verilog source, this means that files included by any other file should not appear in the `hdl_source` list. VHDL files defining any library objects should be specified before any files using those objects.

SEE ALSO

`acs_read_hdl` (2).

ACS-102 (error) Internal error: The '%s' command is not

available.

DESCRIPTION

You receive this message because an internal error occurred during the initialization phase. The described Automated Chip Synthesis (ACS) command could not be registered with the shell. It is not available. This error should not occur under normal circumstances.

WHAT NEXT

Reinstall the software to fix the problem. You can continue working with the current installation, although the described ACS functionality is not available.

ACS-103 (error) Internal error: Some Automated Chip Synthesis (ACS) functions are not available.

DESCRIPTION

You receive this message because an internal error occurred during the initialization phase. An ACS command could not be registered with the shell. Some ACS functionality will not be available. This error should not occur under normal circumstances.

WHAT NEXT

Reinstall the software to fix the problem. You can continue working with the current installation, although you should not use any ACS commands.

ACS-104 (error) The above libraries are not readable.

DESCRIPTION

You receive this message because the specified design libraries are used in the design, but are not currently mapped to a valid directory name.

WHAT NEXT

Use the **define_design_lib** command to create a new design library. The directory to which the library is mapped must exist and should have read permissions set. To analyze HDL source files into a specific library, the directory to which the library is mapped should also have write permissions set.

SEE ALSO

`acs_read_hdl` (2), `analyze` (2), `define_design_lib` (2), `get_design_lib_path` (2).

ACS-105 (error) Cannot access file '%s'.

DESCRIPTION

You receive this message because an attempt failed to retrieve information about the specified file from the operating system.

WHAT NEXT

In most cases this error should not cause any problems. However, if the specified file is an include file, it may be analyzed and cause analyzer errors. If you run the command again, the error should not reoccur.

ACS-106 (information) The file '%s' appears more than once in the source file list. Ignoring all further occurrences.

DESCRIPTION

You receive this message because you specified an HDL source file more than once in the source file list of the `acs_read_hdl` command. It is analyzed only once.

SEE ALSO

`acs_read_hdl` (2).

ACS-107 (information) All use statements of the form 'use <LIB>.all' are ignored during dependency checking.

DESCRIPTION

The `acs_read_hdl` command attempts to detect interfile dependencies to analyze files in the correct order. You receive this message because the above statement creates a dependency that is too general to be of any use. Thus it is ignored.

WHAT NEXT

If the `acs_read_hdl` command cannot resolve all dependencies and analysis of the source code fails, it may help if you replace 'use <lib>.all' statements with more-specific 'use <lib>.<package>' statements in the HDL source code.

SEE ALSO

`acs_read_hdl` (2).

ACS-108 (error) Cyclic dependencies are detected in the above source files.

DESCRIPTION

The `acs_read_hdl` command attempts to detect interfile dependencies to analyze source files in the correct order. Definitions of library objects must be analyzed before the object is used.

You receive this message because this is not possible for all library objects with the current source files. The above list shows the cyclic dependency in the files.

WHAT NEXT

Change your source files and move object definitions so that the files can be analyzed correctly. The above list gives hints about the files and library objects that are involved in the cyclic dependency. There are some implicit dependencies, such as a package body that depends on its package definition or an architecture that depends on its entity. Use of a package implies a dependency on the package body.

SEE ALSO

`acs_read_hdl` (2).

ACS-109 (error) Library object(s) are multidefined.

DESCRIPTION

The list above this error message shows all library objects that are defined in more than one file and the corresponding filenames. You receive this message because it is not clear which definition to use.

WHAT NEXT

Modify the source files, deleting all definitions except one for each multidefined object, or remove the source files containing the additional definitions from the source file list.

ACS-110 (error) Multiple architectures are defined for one entity.

DESCRIPTION

The list above this error message shows all files defining architectures for each entity with multiple architectures. You receive this message because it is not clear which architecture to use.

WHAT NEXT

Modify the source files, deleting all architecture definitions except one for each entity, or remove the source files containing the extra architecture definitions from the source file list.

ACS-111 (error) You cannot specify -recursive when using the search_path as a Verilog source file list.

DESCRIPTION

You receive this message because using the **-recursive** option in conjunction with the **search_path** variable can cause unexpected behavior. For the command to recursively look for source code files in directories, you cannot use the **search_path** variable to specify the same directories.

WHAT NEXT

Use the **acs_hdl_source** variable or the **-hdl_source** option to specify the source directories (using the **-recursive** option, if needed), and include the names of all include directories in the **search_path** variable.

SEE ALSO

acs_hdl_source (3).

ACS-112 (error) Cannot detect source language of file '%s'.

DESCRIPTION

You receive this message because the specified file occurs in the HDL source list, but has none of the language-specific extensions. The **acs_read_hdl** command cannot determine the source language of the file, because the **-format** option is not set.

WHAT NEXT

Do either of the following:

- Specify the **acs_read_hdl** command with the **-format** option. A side effect of this is that it analyzes only Verilog or VHDL files (with an extension from the corresponding **acs_verilog_extensions** or **acs_vhdl_extensions** variable).
- Add the extension of the identified file to one (or both) of the **acs_verilog_extensions** and **acs_vhdl_extensions** variables to indicate the source language. This causes all files with this extension to be analyzed, not only the one specified above.

SEE ALSO

acs_read_hdl (2), **acs_verilog_extensions** (3), **acs_vhdl_extensions** (3).

ACS-113 (error) File '%s' is specified twice in the HDL source files list.

DESCRIPTION

You receive this message because you explicitly specified the mentioned file twice in the HDL source files list for the **acs_read_hdl** command. If you have symbolic links in your source directories, different paths may specify the same file.

WHAT NEXT

Remove the specified filename from the HDL source files list.

SEE ALSO

acs_read_hdl (2).

ACS-114 (warning) No source files are found for '%s'.

DESCRIPTION

You receive this message because you specified an item in the HDL source files list that could not be expanded to any filename. If the specified item is a file, that file was not found; if it is a directory, that directory does not contain any source files.

WHAT NEXT

You can ignore the warning if all of your source files have been analyzed. Remove the specified HDL source list item from the HDL source files list to eliminate this warning. If the `acs_read_hdl` command has found source files matching the expression, check the syntax of that item, and check the `acs_exclude_extensions`, `acs_exclude_list`, `acs_verilog_extensions`, and `acs_vhdl_extensions` Tcl variables.

SEE ALSO

`acs_read_hdl` (2), `acs_exclude_extensions` (3), `acs_exclude_list` (3),
`acs_verilog_extensions` (3), `acs_vhdl_extensions` (3).

ACS-115 (error) No input files specified.

DESCRIPTION

You receive this message because you specified an empty HDL source file list.

WHAT NEXT

Set the `acs_hdl_source` Tcl variable to a non-empty list of file and directory names or specify that list by using the `-hdl_source` option at the command line.

SEE ALSO

`acs_read_hdl` (3).

ACS-116 (error) No top-level module name specified.

DESCRIPTION

You receive this message because the command requires the name of the top-level module to elaborate the design.

WHAT NEXT

Specify the top-level module name at the command line. You can also set the **-no_elaborate** option, which prevents the **acs_read_hdl** command from performing elaboration.

SEE ALSO

acs_read_hdl (2).

ACS-117 (error) An error or unsupported construct is detected during the Verilog include file detection phase.

DESCRIPTION

You receive this message because an error or unsupported construct was detected during the Verilog include file detection phase. It is also possible that all specified source files are include files so no files are left to be analyzed.

WHAT NEXT

Correct all syntax errors or work around unsupported constructs, and rerun the command. Another workaround for this error message is to use the **acs_read_hdl** command with the **-no_dependency_check** option. This prevents the command from detecting Verilog include files; however, you have to manually remove all include files from the HDL source files list.

SEE ALSO

acs_read_hdl (2).

ACS-118 (warning) Mixed language designs are not automatically elaborated.

DESCRIPTION

You receive this message because the tool has implicitly set the **-no_elaborate** flag, since it cannot elaborate a design that has Verilog and VHDL source code parts.

WHAT NEXT

After the command finishes you must manually do the elaboration. Execute the **elaborate** command separately for each top-level module of each language, doing the

design top-level module last.

SEE ALSO

`acs_read_hdl` (2), `elaborate` (2).

ACS-119 (information) Automated Chip Synthesis (ACS) is analyzing Verilog file '%s'.

DESCRIPTION

You receive this message because The `acs_read_hdl` command is describing its activity.

WHAT NEXT

No action is necessary. The result is informative. Remove the-**verbose** option from the command line if you prefer not to view these messages,

SEE ALSO

`acs_read_hdl` (2), `analyze` (2).

ACS-120 (information) Automated Chip Synthesis (ACS) is analyzing VHDL file '%s' into lib '%s'.

DESCRIPTION

You receive this message because the `acs_read_hdl` command is describing its activity.

WHAT NEXT

No action is necessary. The result is informative. Remove the-**verbose** option from the command line if you prefer not to view these messages,

SEE ALSO

`acs_read_hdl` (2), `analyze` (2).

ACS-121 (error) No files have been analyzed.

DESCRIPTION

You receive this message because either you have not specified an HDL source files list or the **acs_read_hdl** command has not found any source files in the specified locations.

WHAT NEXT

Include all directories containing source files in the HDL source files list, and properly set the exclude and extensions variables.

SEE ALSO

acs_read_hdl (2).

ACS-122 (warning) Analyzer ended with errors.

DESCRIPTION

You receive this message because analyzer ended for one or more files with errors. You used the **-ignore_analyze_errors** option at the command line, so this message informs you only that one or more errors occurred and does not describe the errors.

WHAT NEXT

Ignore this message or fix the problems that generated the errors and rerun the command.

SEE ALSO

acs_read_hdl (2).

ACS-123 (information) Automated Chip Synthesis (ACS) is elaborating module '%s'.

DESCRIPTION

You receive this message because the **acs_read_hdl** command is describing its activity.

WHAT NEXT

No action is necessary. The result is informative. Remove the **-verbose** option from the command line if you prefer not to view these messages,

SEE ALSO

`acs_read_hdl` (2), `elaborate` (2).

ACS-124 (error) More than one module with name '%s' found.

DESCRIPTION

You receive this message because you specified a top-level module name that is not unique. Another design has the same name in memory. The current design cannot be set. The GTECH result of the `acs_error_user` command is still in memory.

WHAT NEXT

Ensure that the `current_design` variable is set to the top-level module of your design.

SEE ALSO

`acs_read_hdl` (2), `current_design` (3).

ACS-125 (warning) The command line argument '%s' overrides the Tcl variable '%s'.

DESCRIPTION

You receive this message because you have assigned a value to the specified Tcl variable and you are providing an option at the command line that specifies the same thing. This warning just informs you that the `acs_read_hdl` command ignores the value of the Tcl variable.

WHAT NEXT

Nothing to do, if this doesn't surprise you.

SEE ALSO

`acs_read_hdl` (2).

ACS-126 (error) Invalid file or directory name: '%s' is ignored.

DESCRIPTION

You receive this message because you specified an invalid item in a file list. The invalid expression is specified in the message. The invalid item is ignored.

WHAT NEXT

This error message may be caused by an unknown user (in a "~<user>" expression) or an inaccessible current working directory (if you specified ".."). You do not have to take any action unless you require the ignored expression as part of your specification of the source code location.

SEE ALSO

`acs_read_hdl` (2).

ACS-127 (error) Invalid extension: '%s' is Ignored.

DESCRIPTION

You receive this message because you used an invalid extension in one of the extensions lists. The invalid extension is specified in the message and is ignored. The slash character (/) and backslash character (\) are not allowed in extensions.

WHAT NEXT

Remove the invalid extension from the list. If you actually have a source code file with a slash or backslash character in the extension you must rename it.

SEE ALSO

`acs_read_hdl` (2).

ACS-128 (information) ACS is starting Verilog include file detection.

DESCRIPTION

You receive this message because the Automated Chip Synthesis (ACS) **`acs_read_hdl`** command is reporting its current activity: starting Verilog include file detection.

SEE ALSO

`acs_read_hdl (2)`.

ACS-129 (information) ACS is starting VHDL dependency extraction.

DESCRIPTION

You receive this message because the Automated Chip Synthesis (ACS) `acs_read_hdl` command is reporting its current activity: starting VHDL dependency extraction.

SEE ALSO

`acs_read_hdl (2)`.

ACS-130 (information) ACS is starting Verilog analysis.

DESCRIPTION

You receive this message because the Automated Chip Synthesis (ACS) `acs_read_hdl` command is reporting its current activity: starting Verilog analysis.

SEE ALSO

`acs_read_hdl (2)`.

ACS-131 (information) ACS is starting VHDL analysis.

DESCRIPTION

You receive this message because the Automated Chip Synthesis (ACS) `acs_read_hdl` command is reporting its current activity: starting VHDL analysis.

SEE ALSO

`acs_read_hdl (2)`.

ACS-132 (error) DC-Expert license for ACS is not enabled.

DESCRIPTION

You receive this message because the license feature DC-Expert is not available. Every Automated Chip Synthesis (ACS) command checks it.

ACS-133 (error) No additional DC-Expert licenses are available.

DESCRIPTION

You receive this message because all your licenses are already checked out. The command you executed failed to retrieve one.

Each dc_shell using an Automated Chip Synthesis (ACS) command checks out one license of the DC-Expert feature. Other commands might also be using this license feature.

WHAT NEXT

Do one of the following, and then try again to execute the command:

- Quit any other dc_shell that uses DC-Expert licenses.
- Wait until any other dc_shell that uses DC-Expert licenses is done.
- Obtain more licenses.

ACS-134 (information) Starting Design Compiler Design Budgeting.

DESCRIPTION

You receive this message to inform you that Design Compiler (DC) is reporting its current activity: starting Design Budgeting.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`acs_compile_design (2)`, `acs_refine_design (2)`.

ACS-135 (information) Starting PrimeTime Design Budgeting.

DESCRIPTION

You receive this message because PrimeTime is reporting its current activity: starting Design Budgeting.

SEE ALSO

`acs_compile_design` (2), `acs_refine_design` (2).

ACS-136 (error) Variable '%s' must be a value between 0 and 100.

DESCRIPTION

You receive this message because the variable value is not between 0 and 100.

SEE ALSO

`set_compile_partitions` (2).

ACS-137 (warning) The current design contains less than %d levels of hierarchy.

DESCRIPTION

You receive this message because you used the `-level` option to specify where to set the compile partitions on the design, but the number of hierarchy levels in the design is less than the specified value.

WHAT NEXT

Take either of the following actions:

- Specify a different hierarchy level (a lower number) that contains instances with the `-level` option.
- Use a different option to specify where to set compile partitions. For detailed information, see the `set_compile_partitions` man page.

SEE ALSO

`acs_compile_design` (2), `set_compile_partitions` (2).

ACS-138 (error) Unresolved Multiple Instances.

DESCRIPTION

You receive this message because there are multiply-instantiated modules in the design and the settings of the **MasterInstance** attribute are not correct.

WHAT NEXT

See the **MasterInstance** man page or the *Automated Chip Synthesis, User Guide* for more detailed information. If the directions you find there for resolving this problem are not acceptable, take one of the following actions:

- Uniquify the design.
- Set the **MasterInstance** attribute on exactly one instance of each multiply-instantiated design.
- Set the **dont_touch** attribute on the multiply-instantiated design.
- Set the **dont_touch** attribute on all but one instance of the multiply-instantiated design.

SEE ALSO

`remove_attribute` (2), `set_attribute` (2), `sub_designs_of` (2), `sub_instances_of` (2),
`uniquify` (2), **MasterInstance** (3).

ACS-139 (error) Design '%s' is not part of the current design.

DESCRIPTION

You receive this message because the command works only with modules that are linked to the *current design*. The **current_design** command is set to a design that, within its hierarchy, does not instantiate the specified design.

WHAT NEXT

Perform one of the following tasks:

- Call the command with a design that is part of the *current design*.
- Set the **current_design** command to a parent module of the specified design.
- Set the **current_design** command to the design itself.

SEE ALSO

current_design (2), **link** (2), **sub_designs_of** (2), **sub_instances_of** (2).

ACS-140 (warning) MasterInstance of module '%s' is not found in design '%s' children. Randomly choosing '%s' instance instead.

DESCRIPTION

You receive this message because you specified the **-master_only** command line option, but one of the following conditions applies to the instance that has the **MasterInstance** attribute set:

- It is not a child of the specified design.
- It is not in the design subtree (if the **-hierarchy** option was set).
- The master instance does not qualify with respect to the other options (for example like **-dt_only** or **-ndt_only**).

The command returns an instance representing the module, but it is not the master instance.

WHAT NEXT

Do one of the following:

- Specify a design that has the master instance of the specified module in its subtree
- Change the other command line options so that the master instance is not filtered out.
- Change the **MasterInstance** attribute settings.

SEE ALSO

find (2), **remove_attribute** (2), **report_attribute** (2), **set_attribute** (2),
sub_designs_of (2), **sub_instances_of** (2), **MasterInstance** (3).

ACS-141 (warning) Multiple master instances found for design '%S': '%S' and '%S'. Randomly choosing '%S' instance.

DESCRIPTION

You receive this message because you specified the **-master_only** command line option, and the command found two instances of the same design that have the **MasterInstance** attribute set. This compromises the concept of the master instance, which is that you can have only one.

WHAT NEXT

Remove the **MasterInstance** attribute from one of the specified instances.

SEE ALSO

find (2), **remove_attribute** (2), **report_attribute** (2), **set_attribute** (2),
sub_designs_of (2), **sub_instances_of** (2), **MasterInstance**(3).

ACS-142 (error) Multiple designs are found matching the '%S' name.

DESCRIPTION

You receive this message because you specified a name that is not unique.

WHAT NEXT

When designs with identical names are loaded into memory, the filename is added to the design name to make it unique. You can use the **find** and **get_designs** commands to determine the unique name of the design that you want to specify.

SEE ALSO

find (2), **get_designs** (2).

ACS-143 (error) No parent partition found in the current design

for design '%s'.

DESCRIPTION

You receive this message because you need to set your compile partitions in order for this command to work properly, and the current_design has to be set to a design that has partitions in its subhierarchy (or is a partition itself).

WHAT NEXT

Set the compile partitions on the current design, or set the *current design* to a design (preferably the top level module) that has partitions in its design subtree.

SEE ALSO

`current_design` (2), `report_partitions` (2), `set_compile_partitions` (2),
`sub_designs_of` (2).

ACS-144 (error) Multiply-instantiated design '%s' is not a compile partition.

DESCRIPTION

You receive this message because the specified design is a parent module in the logical hierarchy of the module for which you want to find the parent partition. It is impossible to find the parent partition as it might be different for the different instances. The design is multiply-instantiated, but is not marked as partition. This should not happen if the compile partitions are correctly set.

WHAT NEXT

Correctly set the compile partitions on the current design. This entails either of the following:

- The design must be made unique by using the `uniquify` command.
- All multiply-instantiated designs and the top level module must be partitions, and an instance must be picked as master instance.

SEE ALSO

`acs_get_parent_partition` (2), `current_design` (2), `report_partitions` (2),
`set_compile_partitions` (2), `uniquify` (2), `MasterInstance` (3).

ACS-145 (error) Directory '%s, which should contain the mapped design, does not exist.

DESCRIPTION

You receive this message because the directory which should contain the mapped designs does not exist. This is either the default directory (pass0) or a directory you specified by using the **-mapped** and **-type** options of the **acs_merge_design** command. The program cannot merge the designs in the process of being updated into the mapped designs.

WHAT NEXT

Use the **acs_merge_design** command with the **-mapped** option at the command line to specify a directory for the mapped designs.

SEE ALSO

acs_merge_design (2).

ACS-146 (error) No unique top design '%s' after merge from unmapped directory '%s'.

DESCRIPTION

You receive this message because after the merge from the directory specified by the **-unmapped** option (default: elab/db) to the design specified by the **-mapped** option (default: pass0) there does not exist a unique top design. Either there is no top design at all because the unmapped directory does not contain this design, or there are several top designs with the same name because there are several db files in the unmapped directory containing the top design.

WHAT NEXT

Ensure that in the unmapped directory there exists a complete unique design database containing exactly one version of the top design.

SEE ALSO

acs_merge_design (2).

ACS-147 (warning) Previous partition '%s' does not have

a corresponding design after the merge.

DESCRIPTION

You receive this message because the design specified by the **-mapped** option of **acs_merge_design** command contained a partition whose associated design does no longer exists in the design hierarchy after merging the updated designs. Thus, the previous partition will no longer be present in the updated design. This can happen if your design updates contains changes to the design hierarchy, e.g. if you have ungrouped or flattened some design within the updated design part.

WHAT NEXT

No action is necessary if this is what you expected. However, after major changes to the design hierarchy it is recommended to re-partition the design and map it from scratch using **acs_compile_design**.

SEE ALSO

acs_merge_design (2).

ACS-148 (error) The top design '%s' does not link after merging updates from directory '%s' specified by the **-unmapped** option (elab/db by default).

DESCRIPTION

You receive this message because the design does not link completely after the **acs_merge_design** command has merged in the updated designs from the directory specified by the **-unmapped** option (elab/db by default).

WHAT NEXT

Ensure that the specified unmapped design directory contains a complete design database for the top design which is consistent with the mapped design specified by option '**-mapped**' for **acs_merge_design**.

SEE ALSO

acs_merge_design (2).

ACS-149 (warning) Designs are merged into mapped designs

in default mapped path %s.

DESCRIPTION

You receive this message because you did not use the **-mapped** option of the **acs_merge_design** command in the command line to provide a directory for the mapped designs. This warning message informs you that the program is using the default directory for the mapped designs.

WHAT NEXT

No action is necessary, if this is what you expected.

SEE ALSO

acs_merge_design (2).

ACS-150 (warning) Using unmapped designs in default directory elab/db.

DESCRIPTION

You receive this message because you did not use the **-unmapped** option of the **acs_merge_design** command in the command line to provide a directory for the unmapped designs and designs being merged. This warning message informs you that the program is using the default directory for the unmapped designs.

WHAT NEXT

No action is necessary, if this is what you expected.

SEE ALSO

acs_merge_design (2).

ACS-151 (warning) MasterInstance of the '%s' module is not found.

Randomly choosing the '%s' instance instead.

DESCRIPTION

You receive this message because you specified the **-master_only** command line option, but the instance that has the **MasterInstance** attribute set is not found for the specified module.

WHAT NEXT

Perform one of the following tasks:

- Specify a module that has a master instance.
- Change the **MasterInstance** attribute settings on one of the instances of the specified module.

SEE ALSO

find (2), **remove_attribute** (2), **report_attribute** (2), **set_attribute** (2),
sub_instances_of (2).

ACS-152 (warning) Report for design %s might not be valid.

DESCRIPTION

You receive this message because the ACS compile flow is a bottom-up compile. At the end of the compile on the top level design, the **compile** command is run with the **-top** option, which might cause changes in subpartitions. Thus, reports generated immediately after the compile of the subpartitions might be invalid after running after **compile -top**.

WHAT NEXT

You can either choose not to use custom report scripts on subpartitions, or choose to ignore the warning message, but consider that the subpartition reports you have might be invalid.

ACS-153 (warning) No area estimation numbers are available

yet.

DESCRIPTION

You receive this message because the **report_partitions** command has been executed before any area estimation has been done. Area estimation is performed only by the "auto partitioning" command, which is the **-auto** option of the **set_compile_partitions** command. At this time the report of the design partitions shows only zeros in the percentage column.

WHAT NEXT

No action is necessary, if this is what you expected. However, if it is necessary to get useful percentage numbers, run the **set_compile_partitions** command with the **-auto** option.

SEE ALSO

report_partitions (2), **set_compile_partitions** (2).

ACS-154 (error) Cannot open file '%s' for reading.

DESCRIPTION

You receive this message from the **acs_read_hdl** command because the tool is unable to open (or read data or text from) the named file in the message.

WHAT NEXT

Verify the existence and correct spelling of the file you specified and that you have read privileges to this file and all directories leading to it. Also check to confirm that you spelled correctly the path to the file. Make any necessary corrections. Then run the **acs_read_hdl** command again.

SEE ALSO

acs_read_hdl (2).

ACS-155 (information) Expanding the search_path with '%s'.

DESCRIPTION

You receive this message from the **acs_read_hdl** command to let you know that, because

Automated Chip Synthesis (ACS) detects that HDL Analyzer might not be able to locate some of the HDL files you listed in the **search_path** variable, ACS is appending one or more paths to the variable.

If you specified the **-recurse** option of the **acs_read_hdl** command, the tool might see more Verilog include files than the **analyze** command sees, because the **analyze** command does not search recursively the directories of the files listed in the **search_path** variable.

This automatic expansion of the search path eliminates your having to enter manually into the **search_path** variable all paths to Verilog include files.

WHAT NEXT

This message is informational only and requires no action on your part.

SEE ALSO

acs_read_hdl (2), **analyze** (2); **search_path** (3).

ACS-156 (information) Found %d include files in the search_path matching '%s'.

DESCRIPTION

You receive this message from the **acs_read_hdl** command to inform you that Automated Chip Synthesis (ACS) has encountered an include Verilog preprocessor directive that gives the file name of the include file but does not specify the path to the include file.

After searching all directories in the order in which they are listed in the **search_path** variable, the tool has found more than one file with the same name as that given in the preprocessor directive. ACS is assuming that the first matching file is the one you want to include.

WHAT NEXT

This message is informational only and requires no action on your part. However, because the Design Compiler **analyze** and **read_verilog** commands will show the same behavior, and because the behavior of these commands is always implementation- and release-dependent, it is no doubt wise to identify the correct path information and add it to the preprocessor directive. Then run the **acs_read_hdl** command again.

SEE ALSO

acs_read_hdl (2), **analyze** (2); **search_path** (3).

ACS-157 (warning) Could not locate include file %s, included by file %s.

DESCRIPTION

You receive this message from the **acs_read_hdl** command because Automated Chip Synthesis (ACS) encountered an include Verilog preprocessor statement that does not specify a path to the include file.

ACS first tries to locate the file by searching all the directories listed in the **search_path** variable. If this search is not successful, ACS then searches all of the directories of all files listed in the **-hdl_source** option (if defined) of **acs_read_hdl**.

If you also specified the **-recurse** option of **acs_read_hdl**, ACS searches further all of the subdirectories of all the files listed in the **-hdl_source** option of **acs_read_hdl**.

The **-recurse** option of **acs_read_hdl** does not search all subdirectories listed in the **search_path** variable, however. (In this respect, the command mimics the behavior of the **analyze** and **read_verilog** commands.)

After searching all of these directories, ACS did not find the missing include file.

WHAT NEXT

This warning message alerts you to a possible conflict, which, if not resolved, might prevent a later **analyze** command being able to find the include file, resulting in an error.

To ensure a smooth process here, it is no doubt preferable to locate and identify the correct include file and add its path to the statement or to the **search_path** variable. Then run the **acs_read_hdl** command again.

SEE ALSO

acs_read_hdl (2), **analyze** (2); **search_path** (3).

ACS-158 (warning) Found more than one matching include file %s, wanted by file %s.

DESCRIPTION

You receive this message from the **acs_read_hdl** command because Automated Chip Synthesis (ACS) encountered an include Verilog preprocessor statement that does not specify a path to the include file.

ACS first tries to locate the file by searching all the directories listed in the **search_path** variable. If this search is not successful, ACS then searches all of the directories of all files listed in the **-hdl_source** option (if defined) of **acs_read_hdl**.

If you also specified the **-recurse** option of **acs_read_hdl**, ACS searches further all of the subdirectories of all the files listed in the **-hdl_source** option of **acs_read_hdl**.

The **-recurse** option of **acs_read_hdl** does not search all subdirectories listed in the **search_path** variable, however. (In this respect, the command mimics the behavior of the **analyze** and **read_verilog** commands.)

Although ACS could not find the include file in the directories listed in the **search_path** variable, it did locate, by searching all directories (and possibly subdirectories) listed in the **-hdl_source** option of **acs_read_hdl**, more than one include file with the same name. (The implicit assumption is that the **search_path** variable presents an ordered list of directories, but this assumption does not apply to the list of directories in the **-hdl_source** option.)

WHAT NEXT

This warning message alerts you to a possible conflict, which, if not resolved, might prevent a later **analyze** command being able to find the include file, resulting in an error.

To ensure a smooth process here, it is no doubt preferable to identify the correct include file and add its path to the **search_path** variable. Then run the **acs_read_hdl** command again.

SEE ALSO

acs_read_hdl (2), **analyze** (2); **search_path** (3).

ACS-159 (warning) Multiple Master Instances found for design '%S'. Using instance '%S'.

DESCRIPTION

You receive this message because you've specified multiple Master Instances for a multiply instantiated design. You've also specified the '-force' option with the 'set_compile_partitions' command, causing the command to pick the alphabetically smallest instance as Master Instance now.

WHAT NEXT

There is nothing to do, if the instance mentioned in the warning is the instance you want to use as Master Instance for this design. If you want to specify a different

instance as Master Instance you would need to remove the **MasterInstance** attribute on all but the desired instance of this design.

See the **MasterInstance** man page or the *Automated Chip Synthesis, User Guide* for more detailed information.

SEE ALSO

`remove_attribute` (2), `set_attribute` (2), `set_compile_partitions` (2), `sub_designs_of` (2), `sub_instances_of` (2), `uniquify` (2), `MasterInstance` (3).

ACS-160 (warning) No qualifying designs are found in level '%d'.

DESCRIPTION

You receive this message because you used the **-level** option to specify where to set the compile partitions on the design, but no design at this hierarchical level qualified to become a partition. Only standard hierarchical cells can be treated as partitions. A cell will not be treated as partition if it is not hierarchical, dont touched, or a DesignWare part.

WHAT NEXT

Take either of the following actions:

- Specify a different hierarchy level (a lower number) that contains instances with the **-level** option.
- Use a different option to specify where to set compile partitions. For detailed information, see the **set_compile_partitions** man page.

SEE ALSO

`acs_compile_design` (2), `set_compile_partitions` (2).

ACS-161 (warning) Executable '%s' does not exist.

DESCRIPTION

You receive this message because the specified executable could not be found. This is often due to a wrong setting of the ACS variable **acs_dc_exec**. If one of these variables is set, ACS will use the specified executable instead of the default ones.

WHAT NEXT

Take either of the following actions:

- Check the ACS variables listed above for typographical errors.
- Use absolute path descriptions instead of relative ones.

SEE ALSO

`acs_compile_design (2)`, **ACS-162**.

ACS-162 (warning) You do not have execute permissions for file '`%S`'.

DESCRIPTION

You receive this message because you do not have the right permissions to execute the specified file.

WHAT NEXT

Take either of the following actions:

- Try to set the execute-permission (e.g., with 'chmod' on UNIX platforms).
- Ask your system administrator for help.

SEE ALSO

`chmod (1)`, `chown (1)`, **ACS-161**.

ACS-163 (information) Starting Design Compiler Design Budgeting.

DESCRIPTION

This message indicates that ACS is using Design Compiler for slack allocation (budgeting).

ACS distinguishes between RTL budgeting and gate-level budgeting. RTL budgeting is performed, e.g., by the **acs_compile_design** command and utilizes Design Compiler's built-in design budgeting facilities.

Gate-level budgeting is performed, e.g., by the **acs_recompile_design** and **acs_refine_design** command. ACS offers three different methods for gate-level slack allocation: Design Compiler budgeting, PrimeTime budgeting, and budgeting via a user budgeting script. Design Compiler budgeting is the recommended way for design budgeting and selected by default. PrimeTime budgeting is deprecated and currently kept for backwards compatibility.

WHAT NEXT

If you wish to use a custom budgeting script for gate-level budgeting, please place a script named **budget.scr** into the directory defined by the **user_budget_script** file type.

SEE ALSO

acs_compile_design (2), **acs_recompile_design** (2), **acs_refine_design** (2),
acs_report_directories (2), **dc_allocate_budgets** (2).

ACS-164 (information) Starting PrimeTime Design Budgeting.

DESCRIPTION

This message indicates that ACS is using PrimeTime for slack allocation (budgeting).

ACS distinguishes between RTL budgeting and gate-level budgeting. RTL budgeting is performed, e.g., by the **acs_compile_design** command and utilizes Design Compiler's built-in design budgeting facilities.

Gate-level budgeting is performed, e.g., by the **acs_recompile_design** and **acs_refine_design** command. ACS offers three different methods for gate-level slack allocation: Design Compiler budgeting, PrimeTime budgeting, and budgeting via a user budgeting script. Design Compiler budgeting is the recommended way for design budgeting and selected by default. PrimeTime budgeting is deprecated and currently kept for backwards compatibility.

WHAT NEXT

If you wish to use a custom budgeting script for gate-level budgeting, please place a script named **budget.scr** into the directory defined by the **user_budget_script** file type.

SEE ALSO

```
acs_report_directories (2), dc_allocate_budgets (2).
```

ACS-165 (information) Using custom budgeting script '%s'.

DESCRIPTION

This message indicates that ACS is using a custom budgeting script for slack allocation (budgeting).

ACS distinguishes between RTL budgeting and gate-level budgeting. RTL budgeting is performed, e.g., by the **acs_compile_design** command and utilizes Design Compiler's built-in design budgeting facilities.

Gate-level budgeting is performed, e.g., by the **acs_recompile_design** and **acs_refine_design** command. ACS offers three different methods for gate-level slack allocation: Design Compiler budgeting, PrimeTime budgeting, and budgeting via a user budgeting script. Design Compiler budgeting is the recommended way for design budgeting and selected by default. PrimeTime budgeting is deprecated and currently kept for backwards compatibility.

WHAT NEXT

If you do not wish to use a custom budgeting script, please remove file **budget.scr** from the directory defined by the **user_budget_script** file type.

SEE ALSO

```
acs_compile_design (2), acs_recompile_design (2), acs_refine_design (2),  
acs_report_directories (2), dc_allocate_budgets (2).
```

ACS-166 (information) Compile design '%s' in '%s'.

DESCRIPTION

This message is issued by **acs_compile_design** and indicates the source where the specified design is loaded from.

SEE ALSO

```
acs_compile_design (2), acs_recompile_design (2), acs_refine_design (2).
```

ACS-167 (information) Compile design in memory.

DESCRIPTION

This message is issued by **acs_compile_design** and indicates that ACS is going to compile the in-memory design.

SEE ALSO

acs_compile_design (2), **acs_recompile_design** (2), **acs_refine_design** (2).

ACS-168 (information) Re-compile design '%s' in '%s'.

DESCRIPTION

This message is issued by **acs_recompile_design** and indicates the source where the specified design is loaded from.

SEE ALSO

acs_compile_design (2), **acs_recompile_design** (2), **acs_refine_design** (2).

ACS-169 (information) Re-compile design in memory.

DESCRIPTION

This message is issued by **acs_recompile_design** and indicates that ACS is going to re-compile the in-memory design.

SEE ALSO

acs_compile_design (2), **acs_recompile_design** (2), **acs_refine_design** (2).

ACS-170 (information) Refine design '%s' in '%s'.

DESCRIPTION

This message is issued by **acs_refine_design** and indicates the source where the specified design is loaded from.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`.

ACS-171 (information) Refine design in memory.

DESCRIPTION

This message is issued by `acs_refine_design` and indicates that ACS is going to refine the in-memory design.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`.

ACS-172 (information) Reading partition '%s' from '%s'.

DESCRIPTION

This message is issued whenever a partition is read into memory.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`,
`read_partition (2)`.

ACS-173 (information) Writing partition '%s' to '%s'.

DESCRIPTION

This message is issued whenever a partition is written to disc.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`,
`write_partition (2)`.

ACS-174 (information) Deriving budgets from gate-level design

in '%S'.

DESCRIPTION

This message is issued by **acs_recompile_design** and indicates the source of the gate-level design that is utilized for slack allocation (budgeting). Note that in **acs_recompile_design**, the design used for budgeting is different than the design to be compiled.

SEE ALSO

acs_recompile_design (2), **dc_allocate_budgets** (2).

ACS-175 (information) Removing designs from memory.

DESCRIPTION

This message indicates that all in-memory designs are discarded. Design deletion takes place at the end of each invocation of **acs_compile_design**, **acs_recompile_design**, and **acs_refine_design** in order to avoid confusion between the pre-compiled and the post-compiled designs. If designs were not deleted, a possible confusion could occur, e.g., if **acs_refine_design** is called right after **acs_compile_design**. The refine command would compile the design in memory which is unchanged and not the result of **acs_compile_design**. The automatic design deletion ensures that **acs_refine_design** does not find any design in memory and therefore reads the design, by default, from the destination directory of **acs_compile_design**.

SEE ALSO

acs_recompile_design (2), **dc_allocate_budgets** (2).

ACS-176 (information) Using user override procedure for command '%S'.

DESCRIPTION

This message indicates that ACS has found a user override procedure for the specified command. This procedure will be executed instead of the default one. User override procedures can be defined for the commands **acs_compile_design** (procedure **acs_compile_design_user**), **acs_recompile_design** (procedure **acs_recompile_design_user**), and **acs_refine_design** (procedure **acs_refine_design_user**). The easiest way to set up a user override procedure is to customize one of the predefined .template files **acs_compile_design.template**, **acs_recompile_design.template**, and **acs_refine_design.template**.

WHAT NEXT

If you do not wish to override the default behaviour, delete the procedures `acs_compile_design_user`, `acs_recompile_design_user`, and `acs_refine_design_user`.

SEE ALSO

`acs_compile_design` (2), `acs_recompile_design` (2), `acs_refine_design` (2).

ACS-177 (Error) ILM design '%s' is a subdesign of ILM design '%S'.

DESCRIPTION

You receive this message because you have nested ILMs in your design. This is not supported yet. ILMs are detected by testing the `is_interface_model` or the `useILM` attribute. The first indicates that a design is an ILM, the latter tells ACS to create an ILM for the design. In your current design the mentioned designs are ILMs (or are tagged to become ILMs), but the first is instantiated in the logical hierarchy of the other. This is currently not allowed.

WHAT NEXT

Make sure you don't have nested ILMs in your design and you don't set the `useILM` attribute on any design that is instantiated in the logical hierarchy of another ILM (or a design with the "useILM" attribute set). You can either remove the "useILM" attribute from the specified designs, or make sure that the full design representation of the designs is linked in, instead of the ILM representation.

SEE ALSO

`acs_refine_design` (2), `acs_set_attribute` (2), `set_attribute` (2), `remove_attribute` (2).

ACS-178 (Error) Partition '%s' is inside the ILM design '%s'.

DESCRIPTION

You receive this message because you have marked the specified design as ACS partition, but it is instantiated in the logical hierarchy of the ILM design. Part of the ILM design is or will be cut out which may lead to unexpected constraints for the partition. This is why partitions inside ILMs are not allowed.

WHAT NEXT

Make sure you only created ILMs for designs marked as partitions or designs below partitions. Also, don't set the **useILM** attribute on a design above an ACS partition.

SEE ALSO

`acs_refine_design (2)`, `acs_set_attribute (2)`, `remove_attribute (2)`, `set_attribute (2)`, `set_compile_partitions (2)`.

ACS-179 (Error) ILM design '%s' contains an unresolved reference '%s'.

DESCRIPTION

You receive this message because you have marked the specified design with the **useILM** attribute to become an ILM, but it instantiates a design that couldn't be resolved by the linker.

WHAT NEXT

Make sure your **search_path** and **link_library** are set correctly (see the man page of the **link** command).

SEE ALSO

`acs_refine_design (2)`, `acs_set_attribute (2)`, `link (2)`, `remove_attribute (2)`, `set_attribute (2)`.

ACS-180 (Error) ILM design '%s' detected in full design.

DESCRIPTION

You receive this message because you are trying to compile a design in memory with **acs_refine_design** and this design contains an ILM. The ACS flow needs the full design representation (in memory or in the source pass) in order to run a useful ILM based flow. The ILM in your design will be considered as full design representation for this partition (i.e. the "is_interface_logic" attribute will be removed). The post_compile db file created by `acs_refine_design` will contain only the functionality contained in the mentioned ILM design.

SEE ALSO

`acs_refine_design (2)`.

ACS-182 (warning) Multiple instances found for design '%s'. Using instance '%s'.

DESCRIPTION

You receive this message because the design you specified is multiply instantiated and cannot be uniquely identified with a single instance in the design. Therefore, the command you invoked has selected an arbitrary cell instance to proceed.

WHAT NEXT

There is nothing to do, if the instance mentioned in the warning is the one you want to use as instance for this design. If the wrong instance has been chosen, you might want to uniquify the design in order to eliminate multiple instances in your design.

SEE ALSO

`sub_designs_of` (2), `sub_instances_of` (2), `uniquify` (2).

ACS-183 (error) Option '%s' can be used only inside of another tool.

DESCRIPTION

This error occurs because you have used an option that is not supported in this tool. For example, physical ACS rtl2pg and gates2pg flow can be applied only inside a different tool than the one you are currently using.

SEE ALSO

`acs_compile_design`(2)
`acs_recompile_design`(2)
`acs_refine_design`(2)

ACS-184 (error) Option '%s' is not compatible with the update option.

DESCRIPTION

You receive this message because you have specified an option that cannot be combined with the 'update' feature. E.g., the physical ACS flows cannot be used inside an update flow.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`.

ACS-185 (error) Option '%s' is not compatible with physical ACS flows.

DESCRIPTION

You receive this message because you have specified an option that cannot be combined with the physical ACS flows.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`.

ACS-186 (warning) Option '-ignore_analyze_errors' of command 'acs_read_hdl' is no longer supported.

DESCRIPTION

You receive this message because you have specified an option that is no longer supported.

Even with this option set, the analyze command used by `acs_read_hdl` internally, halts upon encountering an error and forgets all data obtained during that call to analyze. As `acs_read_hdl` always tries to implicitly call analyze with as many files as possible, the result of this option is not exactly what you would expect.

Preceeding internal calls to analyze and following calls to analyze are still executed. Therefore you can still use this option for a trial analysis.

WHAT NEXT

There is nothing to do.

SEE ALSO

`acs_read_hdl (2)`.

ACS-187 (warning) false dont_touch attribute is detected on

object '%s'. It may be lost or ACS may not be able to complete successfully.

DESCRIPTION

This message indicates that there is dont_touch being set to false in your design. Right now, ACS cannot guarantee that ACS could complete successfully if your design has false dont_touch attribute and the object who has false dont_touch is a multiply instantiated design or is an instance of a multiply instantiated design. Or, the false dont_touch attribute is not be honored if the object who has false dont_touch is a singly instantiated non-partition design or its instance, and this false dont_touch attribute may cause long runtime on the upper level partitions' compile (object who has false dont_touch attribute may be re-compiled during upper level partitions' compile). Or, the false dont_touch attribute may be lost after compile by using ACS if the object who has false dont_touch is a singly instantiated partition design or its instance.

WHAT NEXT

You need to optimize/compile the design (who or whose instance has false dont_touch) independently, and remove the false dont_touch attribute on your design before ACS to make sure that ACS could run through successfully. It is not recommended to apply false dont_touch attribute on your design when you use ACS.

SEE ALSO

`acs_compile_design (2)`, `acs_recompile_design (2)`, `acs_refine_design (2)`.

ACS-188 (Error) '%s' is not an ACS supported attribute.

DESCRIPTION

This message indicates that you specified an attribute which is not currently supported by ACS.

WHAT NEXT

To see the whole list of ACS supported attributes, their valid values and their default value, please check the man page for `acs_set_attribute`.

SEE ALSO

`acs_report_attribute (2)`, `set_compile_partitions (2)`, `report_partitions (2)`.

ACS-190 (error) Top module does not link.

DESCRIPTION

This error message occurs when the the **link** command issued within the Automated Chip Synthesis auto update flow fails. The failure occurs when the GTECH library or the target Technology library is omitted or incorrectly specified.

WHAT NEXT

Ensure that the **search_path** is set correctly and that all of the source directories are specified in the **-hdl_source** option of the **acs_read_hdl** command.

SEE ALSO

[acs_read_hdl\(2\)](#)
[current_design\(2\)](#)
[link\(2\)](#)

ACS-191 (error) Corrupt elab_times table.

DESCRIPTION

This error message occurs when the design's elab_times table is corrupted.

The elab_times table is an ASCII table created during the Automated Chip Synthesis auto update flow to keep track of the update times of the designs in the design hierarchy. The default location for the table is elab/db.

WHAT NEXT

To continue, delete the design's elab_time table. Then regenerate the table using the **acs_read_hdl** command with the **-auto_update** or **-update** option.

SEE ALSO

[acs_read_hdl\(2\)](#)

ACS-192 (warning) Cell '%s' does not have reference design.

DESCRIPTION

This message is printed because ACS could not locate referencing design for the

cell.

WHAT NEXT

Take either of the following actions:

- Make sure design is properly linked.
- Make sure all design units are read properly and there are no syntax errors.

SEE ALSO

`acs_read_hdl` (2), `read_file` (2), `link` (2)

ACS-193 (error) Valid target library for cell '%s' could not be found.

DESCRIPTION

ACS issues this error when valid target library for cell could not be found. This can happen when libraries which are characterized for specified operating condition are not found. ACS also issues this message when target library subset and library set characterized for operating conditions have no common elements.

WHAT NEXT

- Make sure operating conditions and target library subset is properly specified.

SEE ALSO

`set_target_library_subset` (2), `set_operating_conditions` (2),

ACS-194 (error) Attribute '%s' is no longer supported by ACS.

DESCRIPTION

ACS issues this message when attempting to set an obsolete ACS attribute. ACS attributes become obsolete when their corresponding DC commands become obsolete.

The list of obsolete attributes and the corresponding DC commands is given below.

Attribute Name	Design Compiler Command
<hr/>	
HasArithmetic	transform_csa
PartitionDP	partition_dp

WHAT NEXT

Remove the obsolete attribute from the compilation scripts and re-run ACS.

SEE ALSO

`acs_set_attribute` (2), `transform_csa` (2), `partition_dp` (2)

ACS-195 (warning) Attribute '%s' set on partition '%s' is obsolete and will be ignored.

DESCRIPTION

ACS prints this message when it finds an obsolete attribute on a partition. Please refer to the ACS Users Guide or the `acs_set_attribute` man page for a list of supported attributes.

WHAT NEXT

Remove the obsolete attribute from the partition and run ACS again.

SEE ALSO

`acs_set_attribute` (2)

APL

APL-001 (error) Internal error.

DESCRIPTION

This error message occurs when the tool encounters an internal error and cannot continue.

WHAT NEXT

Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

APL-002 (error) Out of memory.

DESCRIPTION

This error message occurs when the tool encounters a memory allocation error and cannot continue.

WHAT NEXT

Either run the command on a machine with more internal memory, or submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

APL-003 (error) Cannot read the attached file.

DESCRIPTION

This error message occurs when the tool cannot read the external file attached to the Milkyway design and/or library. The file is unreadable if any of the following are true:

- The file does not exist.
- There is an error in the file syntax.
- You do not have read permission for the file.

WHAT NEXT

Verify that the file exists, that there are no errors in the file syntax, and that you have read permission for the design and/or library. After making your changes, rerun the command.

APL-004 (error) Cannot write the attached file.

DESCRIPTION

This error message occurs when the tool cannot write the external file attached to the Milkyway design and/or library. The cause may be that you do not have permission to write the file.

WHAT NEXT

Verify that you have write permission for the design and/or the library. After making your changes, run the command again.

APL-005 (warning) Failed to load intercell spacing constraints.

DESCRIPTION

This warning message occurs when either spacing labels are defined without defining rules, or when rules are defined without defining labels.

You must define both labels and rules, to successfully load intercell spacing constraints. If neither spacing labels nor rules are defined, no constraints are used.

WHAT NEXT

This is only a warning message. No action is required.

However, if you want the legalizer to use intercell spacing constraints, define both spacing labels and spacing label rules, and run the command again.

SEE ALSO

`set_lib_cell_spacing_label(2)`
`set_spacing_label_rule(2)`

APL-006 (warning) Lib cell %s could not be found in the design.

DESCRIPTION

You received this warning message because the lib cells passed in a collection as input to `set_lib_cell_spacing_label` command could not be found in the Milkyway database. The most likely reason for this is that the lib cell is not used in the current design. In that case this warning message can be safely ignored.

WHAT NEXT

Verify that the named lib cell exists in the Milkyway library.

SEE ALSO

`set_lib_cell_spacing_label` (2) `report_reference` (2)

APL-007 (warning) Failed to find label %s. Rule skipped.

DESCRIPTION

This warning message occurs when an intercell spacing constraint set with the `set_spacing_label_rule` command references a label that has not been set with the `set_lib_cell_spacing_label` command.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, check that the named label has been set with the `set_lib_cell_spacing_label` command and then run the initial command again.

SEE ALSO

`set_lib_cell_spacing_label`(2)
`set_spacing_label_rule`(2)

APL-008 (warning) Placement of cells %s and %s violates

intercell spacing constraints.

DESCRIPTION

This warning message occurs when intercell spacing constraints set with the `set_spacing_label_rule` and `set_lib_cell_spacing_label` commands are violated.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, run the `legalize_placement` command to fix placement violations, and then rerun the initial command.

SEE ALSO

`legalize_placement(2)`
`set_lib_cell_spacing_label(2)`
`set_spacing_label_rule(2)`

APL-009 (error) Must provide both tie-high and tie-low lib cell names.

DESCRIPTION

You received this error message because command `connect_tie_cells` requires that both tie-high and tie-low lib cell names be specified if `-tie_high_low_lib_cell` option is not used.

WHAT NEXT

See command man page. Provide correct input to command.

SEE ALSO

`connect_tie_cells (2)`

APL-010 (error) Must provide both tie-high and tie-low port

names.

DESCRIPTION

You received this error message because command `connect_tie_cells` requires that both tie-high and tie-low port names be specified if `-tie_high_low_lib_cell` option is used.

WHAT NEXT

See command man page. Provide correct input to command.

SEE ALSO

`connect_tie_cells` (2)

APL-011 (error) Lib cell %s not found.

DESCRIPTION

You received this error message because the tie-cell lib cell you provided cannot be found in the linked reference libraries.

WHAT NEXT

Verify lib cell name. Verify that the desired reference library is being linked to the design.

APL-012 (error) Lib cell %s has more than one output.

DESCRIPTION

You received this error message because the tie-cell lib cell you provided has multiple output pins. A tie-high or tie-low cell must have a single output pin.

WHAT NEXT

Specify different tie-high and/or tie-low lib cell.

APL-013 (error) Port %s is not an output port.

DESCRIPTION

You received this error message because the tie-high or tie-low port name you specified is not an output port on the tie-highlow lib cell.

WHAT NEXT

Specify different tie-high and/or tie-low port name.

APL-014 (error) Output ports for tie-highlow lib cell %s not found.

DESCRIPTION

You received this error message because the tie-high and tie-low ports for the tie-highlow lib cell you specified can not be found.

WHAT NEXT

Specify different tie-high and/or tie-low port name(s).

APL-015 (warning) New cell %s is not connected to Power/Ground nets.

DESCRIPTION

You received this warning message because the newly created could not be connected to Power/Ground nets.

WHAT NEXT

Run `derive_pg_connection`.

SEE ALSO

`derive_pg_connection` (2)

APL-016 (warning) Object %s is not a tie-high/tie-low port. Skipping.

DESCRIPTION

You received this warning message because the object is not appropriate for connect_tie_cells.

WHAT NEXT

Verify this object is a tie-off port that needs to be tied-off by connect_tie_cells. This message can be safely ignored otherwise.

APL-017 (warning) Object %s is not a cell with tie-high/tie-low ports. Skipping.

DESCRIPTION

You received this warning message because the object is not appropriate for connect_tie_cells.

WHAT NEXT

Verify this object is a cell with tie-off port that need to be tied-off by connect_tie_cells. This message can be safely ignored otherwise.

APL-018 (warning) Object %s is not a lib cell with tie-high/tie-low ports. Skipping.

DESCRIPTION

You received this warning message because the object is not appropriate for connect_tie_cells.

WHAT NEXT

Verify this object is a lib cell of cells in the design with tie-off ports that need to be tied-off by connect_tie_cells. This message can be safely ignored otherwise.

APL-019 (warning) Port %s on cell instance %s is outside core. Skipping.

DESCRIPTION

You received this warning message because connect_tie_cells detected a cell with tie-off ports that lies outside the core placement area. Connect_tie_cells only works on cells inside the core. Others are ignored.

WHAT NEXT

Verify the core placement area of the design is correct.

APL-020 (warning) Port %s on cell instance %s is disconnected. Skipping.

DESCRIPTION

You received this warning message because connect_tie_cells detected a cell with tie-off port that is not connected to any net. These ports are ignored. Connect_tie_cells is intended to run after connect_pg_nets.

WHAT NEXT

Verify the connectivity of the cell. Run connect_pg_nets.

SEE ALSO

connect_pg_nets (2)

APL-021 (warning) Port %s on cell instance %s is connected to wrong polarity. Skipping.

DESCRIPTION

You received this warning message because connect_tie_cells detected a cell with tie-off port that is connected to Power but should be tied-low, or is connected to Ground but should be tied-high. These ports are ignored.

WHAT NEXT

Verify the connectivity of the cell.

APL-022 (warning) Port %s on cell instance %s is driven by wrong cell master. Skipping.

DESCRIPTION

You received this warning message because connect_tie_cells detected a cell with tie-off port that is driven by an incorrect lib cell or bound port. These ports are ignored.

WHAT NEXT

Verify the connectivity of the cell.

APL-023 (warning) %d violations of maximum wirelength (%d microns) found.

DESCRIPTION

You received this warning message because connect_tie_cells was unable to complete without violating the maximum wirelength constraint. This is most likely caused by high cell utilization. It may also be caused by a blockage preventing insertion of a tie cell within the maximum distance.

WHAT NEXT

Verify layout.

APL-024 (error) Reference cell %s has no cell boundary.

DESCRIPTION

You received this message because no boundary has been defined for the reference cell in the database.

WHAT NEXT

Verify reference library preparation.

APL-025 (error) Overlapping rows detected in the design.

DESCRIPTION

You received this message because there are overlapping rows in this design. This is not supported.

WHAT NEXT

Verify chip layout preparation.

APL-026 (warning) Reference cell %s bounding box not multiple of tile.

DESCRIPTION

You received this warning message because the reference cell size is not a multiple of the tile. This may be caused by an error in reference cell setup, possibly because this is a multi-height cell.

WHAT NEXT

Verify reference cell preparation.

APL-027 (warning) Metal %d tracks may not cover core area at the %s side.

DESCRIPTION

You received this warning message because the metal tracks on given layer do not extend to the edge of the chip core area.

WHAT NEXT

Verify chip metal layout.

APL-028 (warning) Pin %s of reference cell %s has no physical location.

DESCRIPTION

You received this warning message because information about pin layout within the reference cell was not found in the database.

WHAT NEXT

Verify reference cell and pin layout.

APL-029 (warning) Number of metal layers defined in design %d is greater than the number defined in the tech file %d.

DESCRIPTION

You received this warning message because the number of metal layers in the design does not match the number in the tech file. The definition from the tech file will be used.

WHAT NEXT

Verify design and tech file preparation.

APL-030 (warning) Can not determine Power/Ground nets for new cells.

DESCRIPTION

You received this warning message because the tool could not determine which Power/Ground nets to use to automatically connect the newly inserted filler cells. This may happen if there are multiple Power/Ground nets in the design.

WHAT NEXT

Run connect_pg_nets.

SEE ALSO

[connect_pg_nets \(2\)](#)

APL-031 (warning) Failed to add newly created end cap instance to plan group.

DESCRIPTION

You received this warning message because the tool created a new end cap instance cell that is added to logic hierarchy but failed to update the corresponding plan group. When committing the plan group, the end caps will not be automatically pushed down.

WHAT NEXT

You may need to consult your technical support contact to further investigate why automatic plan group updating failed. Alternatively you can use `push_down_fp_objects` to push the end caps into the soft macro.

SEE ALSO

[commit_fp_plan_groups \(2\)](#) , [push_down_fp_objects \(2\)](#) , [push_up_fp_objects \(2\)](#)

APL-032 (error) IC Compiler cannot find the top-level hierarchical cell instance for MW CEL.

DESCRIPTION

You received this error message because IC Compiler cannot find the top-level hierarchical cell instance while trying to insert a filler cell.

WHAT NEXT

This is an internal error and should be reported to Synopsys.

APL-033 (warning) Ignoring spacing constraints for hard macro

%S.

DESCRIPTION

You received this warning message because the lib cell passed as input to set_lib_cell_spacing_label command is a hard macro. Inter-cell spacing constraints are only supported for standard cells.

WHAT NEXT

Remove the hard macro lib cell from input to set_lib_cell_spacing_label command.

SEE ALSO

`set_lib_cell_spacing_label` (2) `report_reference` (2)

APL-034 (warning) Incompatible multiple core areas %s and %s found in the design.

DESCRIPTION

You received this warning message because the tool detected the presence of multiple incompatible core areas in the design. A typical design only has a single core area. Multiple core areas are incompatible if the rectangles formed by their coordinates do not overlap completely.

WHAT NEXT

Verify the coordinates of the core areas.

SEE ALSO

`get_core_area` (2)

APL-035 (warning) No cells with ports for tie-off found.

DESCRIPTION

You received this warning message because there are no cells with ports that need to be tied-off to tie_high or tie_low in the design.

WHAT NEXT

Verify this design has cell(s) with tie-off port(s) that need to be tied-off by connect_tie_cells. This message can be safely ignored otherwise.

APL-036 (warning) Skip the %dth tap cell insertion at (%f, %f).

DESCRIPTION

You received this warning message because add_tap_cell_array skipped off-distance tap insertion. It may cause DRC errors in the future.

WHAT NEXT

Turn off the following option of add_tap_cell_array to insert extra off-distance tap cells for DRC-free purpose.

-at_distance_only false

APL-037 (error) Input polygon out of core area.

DESCRIPTION

You received this error message because coordinates of the polygon passed to spread_spare_cells lies entirely outside the core area.

WHAT NEXT

Correct the input and try again.

APL-038 (warning) Input rectangle out of core area.

DESCRIPTION

You received this warning message because coordinates of one of the rectangles passed to spread_spare_cells lies entirely outside the core area.

WHAT NEXT

Correct the input and try again.

APL-039 (error) offset should come with a value less than distance/2

DESCRIPTION

You received this error message because add_tap_cell_array only allows offset to be set as a value less than distance/2.

WHAT NEXT

Correct the input and try again.

APL-040 (warning) UPF: ICC can not find the power domain of top level design.

DESCRIPTION

You received this warning message because there is no power domain information for top level design.

WHAT NEXT

Apply create_power_domain to set database for UPF support.

APL-041 (warning) UPF: ICC can not find the specified voltage area(%s).

DESCRIPTION

You received this warning message because the voltage area can not be found in this design.

WHAT NEXT

Apply create_voltage_area to set database for UPF support.

APL-042 (warning) Please specify the power domain of the

voltage area(%s).

DESCRIPTION

You received this warning message because there is no power domain information set for the voltage area.

WHAT NEXT

Apply `create_voltage_area` or `update_voltage_area` to set database for UPF support.

APL-043 (warning) UPF: ICC can not find the specified power domain for the voltage area(%s).

DESCRIPTION

You received this warning message because the specified power domain of the voltage area doesn't exist in database.

WHAT NEXT

Apply `create_power_domain` to set database for UPF support.

APL-044 (warning) UPF: ICC can not find power net of power domain(%s).

DESCRIPTION

You received this warning message because the power net doesn't exist in database for power domain.

WHAT NEXT

Apply `create_supply_net` or `set_domain_supply_net` to set database for UPF support.

APL-045 (warning) UPF: User's power net(%s) doesn't match

the information(%s) from power domain(%s).

DESCRIPTION

You received this warning message because the inconsistency happens between the user input and the data from power domain.

WHAT NEXT

Either update power domain or re-enter power net of user inputs to resolve this conflict.

APL-046 (warning) UPF: ICC can not find ground net of power domain(%s).

DESCRIPTION

You received this warning message because the ground net doesn't exist in database for power domain.

WHAT NEXT

Apply `create_supply_net` or `set_domain_supply_net` to set database for UPF support.

APL-047 (warning) UPF: User's ground net(%s) doesn't match the information(%s) from power domain(%s).

DESCRIPTION

You received this warning message because the inconsistency happens between the user input and the data from power domain.

WHAT NEXT

Either update power domain or re-enter ground net of user inputs to resolve this conflict.

APL-048 (warning) UPF: No input power net. Apply (%s) for

voltage area (%s) by default.

DESCRIPTION

You received this warning message because there is no input power net for the specific voltage area. ICC UPF will retrieve power net from the associated power domain automatically.

WHAT NEXT

If the assigned power net is not correct, please check whether the voltage area is linked to the proper power domain or not.

APL-049 (warning) UPF: No input ground net. Apply (%s) for voltage area (%s) by default.

DESCRIPTION

You received this warning message because there is no input ground net for the specific voltage area. ICC UPF will retrieve ground net from the associated power domain automatically.

WHAT NEXT

If the assigned ground net is not correct, please check whether the voltage area is linked to the proper power domain or not.

APL-050 (warning) "-ignore_existing_cells" is an obsolete option. Please use "-skip_fixed_cells" instead.

DESCRIPTION

You received this warning message because option "-ignore_existing_cells" is obsolete.

WHAT NEXT

Please use "-skip_fixed_cells" instead.

APL-051 (warning) Skip the %dth tap cell insertion at (%f, %f).

DESCRIPTION

You received this warning message because add_tap_cell_array skipped off-distance tap insertion. It may cause DRC errors in the future.

WHAT NEXT

Turn off the following option of add_tap_cell_array to insert extra off-distance tap cells for DRC-free purpose.

-at_distance_only false

APL-052 (warning) Legalizer did not find a solution. Removing group %s constraint.

DESCRIPTION

You received this warning message because legalize_fp_placement failed to find a legal solution for the named group. This may be caused by very high group utilization, or other factors. The legalizer proceeds from this point with the group constraint removed.

WHAT NEXT

Review the floorplan to determine whether group constraint is valid. You may choose to run legalize_placement instead. Alternately you can try setting the following set_fp_placement_strategy -legalizer_effort low

APL-053 (Warning) %s filler abuts with %s and they are located at (%f, %f) and (%f, %f).

DESCRIPTION

You received this warning message because there are two consecutive standard-cell fillers in this design. ICC reports their corresponding coordinates for your reference.

WHAT NEXT

APL-054 (Information) %s standard-cell filler is located at (%f, %f).

DESCRIPTION

You received this message because a standard-cell filler exists in this design. ICC reports its corresponding coordinates for your reference.

WHAT NEXT

APL-055 (warning) Using classical router on a Zroute-routed design.

DESCRIPTION

You received this warning message because the command `insert_stdcell_filler -cell_with_metal` is using the classical router engine on a design that has been routed with Zroute. This may result in inconsistent behavior.

WHAT NEXT

To assure that `insert_stdcell_filler` uses the Zroute engine do the following
`set_route_mode_options -zroute true`

SEE ALSO

`insert_stdcell_filler(2)`
`set_route_mode_options(2)`

APL-056 (Information) %s

Number of filler cells with metal: %d

Number of irremovable filler cells with metal: %d

Total leakage power of filler cells with metal: %f mW

Total area of filler cells with metal: %f um^2

DESCRIPTION

You received this message because the constrained decoupling capacitor feature of insert_stdcell_filler was turned on and it is the status report of filler cells with metal for this design.

WHAT NEXT

APL-057 (error) Region #*%d* has more cell area (%.*0lf* %*s*²) than placeable area (%.*0lf* %*s*²).

DESCRIPTION

You received this error message because cells belonging to a region in the design (e.g. plangroup or voltage area) demand more placeable area than is available.

WHAT NEXT

Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

APL-058 (warning) the %*s* constraint(s) can't be fulfilled because there is no more removable filler cells with metal in the insertion area(s).

DESCRIPTION

You received this message because the constrained decoupling capacitor feature of insert_stdcell_filler was turned on and it is the final status report for this design. Please check if the metal fillers in the insertion area(s) are fixed, L/R fillers, or all deleted. If so, it is the best the tool can do for this design.

WHAT NEXT

APL-059 (error) Corrupt database. Number of objects of type

DESCRIPTION

This error message occurs when a mismatch of number of objects in DB and that seen by the tool is encountered.

WHAT NEXT

Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

APL-060 (warning) The specified lib_cell, %s is not a filler cell. report_filler_placement will not report the location of its cell instance, %s.

DESCRIPTION

You received this message because this cell was not marked as a subtype of std_filler.

WHAT NEXT

Please check the data preparation of cell masters in libraries to make sure they are all with correct subtypes before applying report_filler_placement.

APL-061 (Information) decoupling capacitor insertion has fulfilled the power and area constraints.

DESCRIPTION

You received this message because the constrained decoupling capacitor feature of insert_stdcell_filler was turned on and it is the final report for this design.

WHAT NEXT

APL-062 (warning) cannot legally place %s corner cell at (%d,%d)

DESCRIPTION

You received this warning message because corner cell cannot be legally placed at this location.

WHAT NEXT

Check design

APL-063 (warning) short vertical segment skipped : (%d,%d)-(%d,%d).

DESCRIPTION

You received this warning message because the vertical segment is too short to place corner cell.

WHAT NEXT

Check design

APL-064 (warning) no room for %s horizontal cell at (%d,%d)

DESCRIPTION

You received this warning message because horizontal cell cannot be legally placed at this location.

WHAT NEXT

Check design

APL-065 (warning) no feasible vertical end cap for location

(%f,%f)

DESCRIPTION

You received this warning message because no vertical cell can be legally placed at this location.

WHAT NEXT

Check design

APL-066 (warning) row end (%f,%f) doesn't allow mirrored pattern.

DESCRIPTION

You received this warning message because mirrored cell pattern horizontal cell cannot be legally placed at this location.

WHAT NEXT

Check design

APLUI

APLUI-001 (error) No library is open.

DESCRIPTION

This error message occurs when attempting to run a command that requires an open library.

WHAT NEXT

Open the library with the **open_mw_lib** command and run the initial command again.

SEE ALSO

[open_mw_lib\(2\)](#)

APLUI-002 (error) Incorrect command syntax.

DESCRIPTION

This error message occurs when the incorrect syntax is used for the command.

WHAT NEXT

Check the man page for the command you are attempting to run, and rerun the command with the proper syntax.

APLUI-003 (error) No object found in the collection.

DESCRIPTION

This error message occurs because the tool requires at least one object to be specified. The object(s) with the given name may not exist in the Milkyway library.

WHAT NEXT

Check that the specified object is spelled correctly, and that it exists in the library or design. Check the command man page to verify the correct syntax.

After making any changes, run the command again.

APLUI-004 (error) The %s command failed.

DESCRIPTION

This error message occurs when the tool cannot successfully complete the command.

WHAT NEXT

Check the log file to determine the cause of the failure. If necessary, check the man page for the command. After making any needed corrections, run the command again.

APLUI-005 (error) Lower value of illegal spacing range %d is beyond the maximum %d.

DESCRIPTION

You received this error message because spacing constraints apply only to spacing smaller than the maximum.

WHAT NEXT

Modify your constraint.

APLUI-006 (warning) Upper value of illegal spacing range %d is beyond the maximum %d. Reset to maximum

DESCRIPTION

You received this error message because spacing constraints apply only to spacing smaller than the maximum.

WHAT NEXT

Modify your constraint.

APLUI-007 (error) Illegal range {%-d %d}.

DESCRIPTION

You received this error message because the spacing constraints are illegal. This may be because one or both of the values is negative.

WHAT NEXT

Modify your constraint.

APLUI-008 (warning) Range in bad format {%-d %d}.

DESCRIPTION

You received this error message because the spacing constraints are incorrectly formatted. This may be because the constraints are given as {max min}. The tool interprets this as {min max}.

WHAT NEXT

Modify your constraint.

APLUI-009 (warning) Option %-s is obsolete; use %-s instead.

DESCRIPTION

You received this warning message because you used an obsolete option for the command.

WHAT NEXT

See command man page. Use correct option.

APLUI-010 (Error) can not find power switch %-s from current

scope

DESCRIPTION

This error message occurs because command fail to get UPF power switch from current scope.

WHAT NEXT

See command man page. Use correct UPF power switch name.

APLUI-011 (Error) can not find power domain %s from current scope

DESCRIPTION

This error message occurs because command fail to get UPF power domain from current scope.

WHAT NEXT

See command man page. Use correct UPF power domain name.

APLUI-012 (warning) Cannot apply built-in label %s to library cells.

DESCRIPTION

You received this warning message because you tried to apply a built-in label to a library cell.

WHAT NEXT

Please choose a different label name.

APLUI-013 (warning) Could not find power/ground net name

%s, use default.

DESCRIPTION

You received this warning message because the given power or ground net name was not found in the database. Default name is used instead.

WHAT NEXT

Verify net name.

APR

APR-001 (error) Database error.

DESCRIPTION

This error message occurs when the tool encounters a database error.

WHAT NEXT

Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

APR-002 (error) Net %d is not Power/Ground net.

DESCRIPTION

This error message occurs when connect_net or disconnect_net expects a Power/Ground net, but the input net is not Power/Ground.

WHAT NEXT

Verify the intended functionality. Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

SEE ALSO

`connect_net(2)`
`disconnect_net(2)`

APR-003 (error) Pin %d is already connected to a net.

DESCRIPTION

This error message occurs when connect_net encounters a pin that is already connected. Connect_net only operates on fully unconnected pins. It is skipped.

WHAT NEXT

Verify the intended functionality. Submit a testcase that reproduces the problem to

the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

SEE ALSO

`connect_net(2)`
`disconnect_net(2)`

APR-004 (error) Pin %d is in the wrong hierarchy.

DESCRIPTION

This error message occurs when `connect_net` encounters a pin that is in a different hierarchy than the net to which the user wants to connect it to. It is skipped.

WHAT NEXT

Verify the intended functionality. Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

SEE ALSO

`connect_net(2)`
`disconnect_net(2)`

APR-005 (warning) connect_pg_nets is no longer supported. Please use derive_pg_connection instead.

DESCRIPTION

`connect_pg_nets` does not support hierarchical PG database. So starting in 2008.09 release, `connect_pg_nets` are replaced by `derive_pg_connection`.

WHAT NEXT

Please use command `derive_pg_connection` instead.

SEE ALSO

`derive_pg_connection(2)`

ATTR

ATTR-1 (warning) Attribute '%s' has not been defined for %s

DESCRIPTION

The attribute you are referencing is not defined for the class of object(s) you are using. It is possible that the attribute is not defined at all.

Application attributes are all defined at runtime by the application. You can create user-defined attributes at any time.

WHAT NEXT

Verify that the attribute name is spelled correctly. If this is a documented application attribute, contact support. If this is a user-defined attribute, ensure that you have defined the attribute for all appropriate classes.

ATTR-2 (warning) Attribute '%s' is not user-defined for %ss; can't %s it

DESCRIPTION

The attribute you are referencing is an application attribute. These cannot be set or removed by the user using `set_user_attribute` or `remove_user_attribute`, respectively. There might be other commands which allows you to set or remove the attribute.

WHAT NEXT

Consult the documentation to determine if it is possible to set or remove this attribute.

ATTR-3 (warning) Attribute '%s' does not exist on %s '%s'

DESCRIPTION

The attribute you are trying to get is not found on the object. This is definitely a sparse attribute, and most likely user-defined. There is a way to suppress this message if you desire. For example, if this is in a loop or in a procedure (`-quiet?`)

WHAT NEXT

ATTR-4 (warning) Value '%s' is not valid for '%s' on %ss

DESCRIPTION

The value you are trying to set on the attribute cannot be converted to the data type defined for the attribute. For example, if the attribute is defined as "float", setting the attribute to "true" is not valid.

WHAT NEXT

Enter an appropriate value for the attribute.

ATTR-5 (warning) Value '%s' for '%s' is not in range (%s)

DESCRIPTION

The numeric value you are trying to set on the attribute is not in the range specified for the attribute. Ranges are either within a minimum and maximum value, greater than or equal to a minimum value, or less or equal to a maximum value. The message text indicates the violated constraint.

WHAT NEXT

Enter an appropriate value for the attribute.

ATTR-6 (warning) Value '%s' for '%s' is not valid. Specify one of: %s

DESCRIPTION

The string value you are trying to set on the attribute is not one of the valid strings defined for the attribute. The message text indicates the allowable values.

WHAT NEXT

Enter an appropriate value for the attribute.

ATTR-7 (information) Inferred definition of attribute '%s' for class '%s'
because it is imported for class '%s'

DESCRIPTION

You used the **define_user_attribute** command to define a design or port attribute, and asked for it to be imported from DB files. Since design attributes are inherited onto cells (an instance of a design) and port attributes are inherited onto pins (an instance of a port), the attribute you defined for a design/port must also be defined for a cell/pin, respectively. PrimeTime defines the attribute for you if you have not already done so, and issues this message.

WHAT NEXT

If you want to remove this message, add the appropriate class to the list of classes in your **define_user_attribute** command, or add a dedicated **define_user_attribute** command earlier in the script to define the attribute for the cell or pin class.

SEE ALSO

define_user_attribute (2).

ATTRDEF

```

ATTRDEF-026 (error) Attribute %s is user-defined.

DESCRIPTION

Specified attribute is user-defined and can not be deleted.

```
### ATTRDEF-027.n ###
```

ATTRDEF-027 (error) Attribute %s is user-defined.

DESCRIPTION

Specified attribute is user-defined. Options -width, -show|-hide, and -show_infotip|-hide_infotip are valid for this type of attribute.

```
### ATTRDEF-028.n ###
```

ATTRDEF-028 (error) Attribute group %s is system defined.

DESCRIPTION

Specified attribute group is system defined and cannot be deleted or modified.

BS

BS-1 (error) Every block in a design built for scheduling must be triggered by a clock%

DESCRIPTION

If a design is being built for scheduling, all processes must be sensitive to a clock edge. This is required to ensure that the behavior before and after synthesis matches.

WHAT NEXT

Make all blocks sensitive to a clock.

BS-2 (error) Blocks with an asynchronous reset are not supported
in designs being built for scheduling%

DESCRIPTION

Currently, scheduling does not support designs with an asynchronous reset.

WHAT NEXT

Modify the asynchronous reset into a synchronous reset.

BS-3 (error) Blocks with three state devices are not supported
in designs being built for scheduling%

DESCRIPTION

Currently, tri-state inference is not supported in designs being built for scheduling.

WHAT NEXT

Remove Z's from your hdl source.

BUDG

BUDG-001 (error) Cannot use the file format specification '%s'.

DESCRIPTION

You receive this message because the specified file format specification cannot be used for one of the following reasons:

- No permission to write in the directory extracted from the file format specification.
- More than one conversion specification is found in the file format specification.
- No conversion specification is in the file format specification.
- Bad conversion specification is in the file format specification. The '%D' and '%C' conversion specifications are the only ones allowed.

WHAT NEXT

See the man page for the **allocate_budgets** command for more information on the **-file_format_spec** option.

SEE ALSO

allocate_budgets (2).

BUDG-002 (error) Separator string must be a single character.

DESCRIPTION

You receive this message because the separator string cannot be more than one character long.

WHAT NEXT

Reduce the separator string to one character.

BUDG-003 (error) Cannot specify '%c' as a separator character.

DESCRIPTION

You receive this message because the specified character cannot be used as a separator. Single or multiple slash characters (/), backslash characters (\), and space () characters cannot be used as separator characters.

WHAT NEXT

Use characters such as the at sign (@), the underscore (_), and so on, as separator characters.

SEE ALSO

`dc_allocate_budgets(2)`.

BUDG-004 (error) Must specify only one of these options: '%s'.

DESCRIPTION

You receive this message because this command requires that only one of the options in the list be specified.

WHAT NEXT

See the man page for this command for detailed information on valid options.

BUDG-005 (warning) The user budget setting on pin %s is not valid and is ignored.

DESCRIPTION

You receive this message because a pin does not meet one of the conditions described below and is ignored. Any pin specified in the `set_user_budget` command `-from` or `-to` option must be one of the following:

- A hierarchical pin.
- A pin on a sequential element.
- A clock.

WHAT NEXT

Ensure that every pin set by the the **set_user_budget** command **-from** or **-to** option meets one of the conditions listed above.

SEE ALSO

set_user_budget (2).

BUDG-006 (error) The command is not successful due to %s.

DESCRIPTION

You receive this message because the command did not succeed.

WHAT NEXT

See the command man page for more information.

BUDG-007 (error) '%s' cannot be opened.

DESCRIPTION

You receive this message because the specified file cannot be opened.

WHAT NEXT

See the command man page for more information.

SEE ALSO

dc_allocate_budgets (2).

BUDG-008 (warning) Cannot find design for object '%s', so ignoring it.

DESCRIPTION

You specified a cell that has no design.

WHAT NEXT

Either remove the cell name from the list of cells; or, if this warning is due to a unresolved reference, you can add the design to the search_path or link_library if you want, so that the linker can resolve the reference.

SEE ALSO

`allocate_budgets` (2), `characterize` (2), `write_environment` (2).

CDNO

CDNO-1 (error) Design '%s' has no schematic.

DESCRIPTION

WHAT NEXT

CDNO-2 (error) Can't find the sheet template symbol for schematic '%s'.

DESCRIPTION

WHAT NEXT

CDNO-3 (warning) Unnamed off-sheet connector encountered--pinInstance command not written.

DESCRIPTION

WHAT NEXT

CDNO-4 (warning) Unnamed port encountered--pinInstance command not written.

DESCRIPTION

WHAT NEXT

CDNO-5 (warning) Unnamed cell encountered--instance

command not written.

DESCRIPTION

WHAT NEXT

CDNO-6 (warning) Duplicate cell name '%s' renamed to '%s'.

DESCRIPTION

WHAT NEXT

CHR

CHR-001 (error) Cannot specify '-no_timing' unless '-constraints' or '-connections' is also specified.

DESCRIPTION

The **characterize** command processes timing information only by default. The **-no_timing** option turns off characterization of timing information. This option is useful only in combination with **-constraints** or **-connections**.

WHAT NEXT

Determine what type of information you want to characterize and use the appropriate options.

CHR-002 (error) Characterize failed.

DESCRIPTION

The **characterize** command did not succeed on the given list of cells. For example, you may have used **characterize** on leaf cells.

WHAT NEXT

Check the list of cells to verify that the cells are hierarchical.

CHR-003 (error) Cannot characterize leaf cell '%s'.

DESCRIPTION

The **characterize** works only on hierarchical cells. This message indicates that a leaf cell was given to the **characterize** command.

WHAT NEXT

CHR-004 (warning) There are multiple clocks in the fanin of pin '%s' on cell '%s'. Ignoring clock '%s'.

DESCRIPTION

`characterize` will create clocks on ports of the subdesign. If a port is in the fanout of multiple clocks, `characterize` will arbitrarily choose one clock. This warning will be shown for other clocks that also fan in to the port.

WHAT NEXT

Use `check_timing` to find cases of multiple clock fanin on leaf cell clock pins. Often this will be due to multiplexed clock signals. Correct these problems with `set_disable_timing` so that only one clock is propagated.

CLE

CLE-01 (information) Command line editor mode is set to %s successfully.

DESCRIPTION

This information message confirms that the command line editor mode is set to the mode you specified. Use command **set_cle_options** to set the line editing mode to either **vi** or **emacs**.

WHAT NEXT

This is an information message only. No action is required.

SEE ALSO

`set_cle_options(2)`

CLE-02 (error) Command line editor mode cannot be set to %s. Proceeding with %s mode.

DESCRIPTION

This error message occurs when you attempt to set the line editor mode to an invalid value. The value can be either set to **vi** or **emacs**. If you attempt to set the edit mode to an invalid value, then the tool uses either the existing edit mode, if the mode is set, or the default **emacs** mode.

WHAT NEXT

Use the **set_cle_options** command to specify a valid mode.

SEE ALSO

`set_cle_options(2)`

CLE-03 (warning) Command line editor is already in %s mode.

DESCRIPTION

This warning message occurs when you specify the same value for the command line editor mode that is currently in use by the editor.

WHAT NEXT

This is a warning message only. No action is required.

However, if the result is not what you intended, use the **set_cle_options** command to set the line editing mode to either vi or emacs.

SEE ALSO

`set_cle_options(2)`

CLE-04 (warning) Variable sh_enable_line_editing can be set only in .synopsys_dc.setup file.

DESCRIPTION

This warning message occurs when you attempt to enable command line editing by setting the **sh_enable_line_editing** variable in the shell rather than in the `.synopsys_dc.setup` file.

WHAT NEXT

This is a warning message only. No action is required.

However, you can enable command line editing by setting the **sh_enable_line_editing** variable to true in the `.synopsys_dc.setup` file.

Refer to the *Design Compiler Command-Line Interface Guide* for more information.

SEE ALSO

`sh_enable_line_editing(3)`

CLE-05 (error) Command line editor is not enabled.

DESCRIPTION

This error message occurs when command line editing is not active.

WHAT NEXT

Set the **sh_enable_line_editing** variable to true in the .synopsys_dc.setup file to enable command line editing.

Refer to the *Design Compiler Command-Line Interface Guide* for more information.

SEE ALSO

`sh_enable_line_editing(3)`

CLE-06 (information) %s is currently in %s editing mode.

DESCRIPTION

This information message displays the current editing mode.

WHAT NEXT

This is only an informational message. No action is required.

However, you can use the **set_cle_options** command to set the line editing mode to either vi or emacs.

SEE ALSO

`set_cle_options(2)`

CLE-07 (information) Terminal beep is %s.

DESCRIPTION

This information message displays the current terminal beep mode.

WHAT NEXT

This is only an informational message. No action is required.

However, you can use the **set_cle_options** command to set the terminal beep to either on or off.

SEE ALSO

`set_cle_options(2)`

CLE-08 (error) Terminal beep mode value can be either on or off.

DESCRIPTION

This message occurs when you attempt to set the line editor beep mode to an invalid value. The value can be either **on** or **off**. If you attempt to set the beep mode to an invalid value, then the tool uses the existing beep mode.

WHAT NEXT

Use the **set_cle_options** command to specify a valid beep mode.

SEE ALSO

`set_cle_options(2)`

CLE-09 (warning) -defaults option will override other options.

DESCRIPTION

-defaults option will override the other options of **set_cle_options** command.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`set_cle_options(2)`

CLUS

CLUS-2 (error) Cell %s could not be assigned to a cluster.

DESCRIPTION

This message indicates that the specified new or modified cell could not be assigned to a cluster during optimization.

WHAT NEXT

CLUS-3 (info) Loading route layer data from technology library: %s.

DESCRIPTION

Indicates the library from which library routing layer data is being loaded from. This data is used to calculate delay values during optimizations which take cell locations into account.

WHAT NEXT

CLUS-4 (warning) Could not generate 'preferred' region for new cell %s in cluster %s.

DESCRIPTION

A new cell was added during location based optimization and was assumed to be at a specific location. The specific locations are supposed to be converted into 'preferred' regions because the environment variable lbo_use_cell_regions was set to 'true'. For this particular cell, it was not possible to determine a region. As a result, the PDEF for the design will indicate that the cell exists at a specific location.

WHAT NEXT

Determination of a region typically fails because it was not possible to determine the coordinates of the cell rows within the cluster. Make sure that the row orientation attribute ROW_ORIENT is set correctly for the cluster in question (default is horizontal).

CLUS-5 (error) Could not find a top cluster in the design.

DESCRIPTION

You receive this message because there is no top cluster in the design. This happens when every cluster becomes a placement obstruction. The result is that no cells can be written out in the PDEF.

WHAT NEXT

Simply add one cluster in the pdef. If you have pins, you should move them to the new cluster.

CLUS-6 (warning) Could not find rp cluster %s for cell %s.

DESCRIPTION

You receive this message because the expected cluster is not found in the design.

WHAT NEXT

Add the cluster information in the Physical Design Exchange Format (pdef) file or check the Synopsys database format (.db) design.

CMD

CMD-001 (error) Cannot specify '%s' with '%s'.

DESCRIPTION

The listed command options are exclusive. Only one of them can be specified.

WHAT NEXT

Look at the manpage for this command for more information on command options.

CMD-002 (error) Value for '%s' cannot be negative

DESCRIPTION

The value for this option must be greater than or equal to zero.

WHAT NEXT

Enter the command again with a valid option value.

CMD-003 (error) Cannot specify %s without %s.

DESCRIPTION

One command option requires another.

WHAT NEXT

Refer to the manual page for this command for detailed information on valid options.

CMD-004 (error) Must specify one of these options: %s.

DESCRIPTION

This command requires that one of the options in the list is specified.

WHAT NEXT

Refer to the manual page for this command for detailed information on valid options.

CMD-005 (error) unknown command '%s'

DESCRIPTION

The command is not recognized.

WHAT NEXT

Look for a typographical error in the command. If it is correct, make sure that the program you are running supports the command, or you have the license to use the command.

CMD-006 (error) ambiguous command '%s' matched %d commands:

(%s)

DESCRIPTION

The command does not have sufficient characters to distinguish it from other commands. The first three commands which match the abbreviation are listed. To see them all, use the help as follows: if the abbreviation is cmd, type 'help cmd*'. This lists all commands that begin with 'cmd'.

WHAT NEXT

Type enough characters so the command is unambiguous.

CMD-007 (error) Required argument '%s' was not found

DESCRIPTION

The listed argument to the command might not be omitted.

WHAT NEXT

Supply the required argument.

CMD-008 (error) value not specified for option '%s'

DESCRIPTION

The listed argument requires a value (that is, it is not a boolean option), and none were supplied.

WHAT NEXT

Supply a value for the argument.

CMD-009 (error) value '%s' for option '%s' not of type '%s'

DESCRIPTION

The value given for the listed argument is not the correct type. For example, if 'abc' is given for an integer option, this error occurs.

WHAT NEXT

Supply a compatible value for the argument.

CMD-010 (error) unknown option '%s'

DESCRIPTION

The option is not recognized.

WHAT NEXT

If this is not a simple mistake, retype the command with by the -help option. This lists all of the possible options.

CMD-011 (error) ambiguous option '%s'

DESCRIPTION

The option does not have sufficient characters to distinguish it from other options.

WHAT NEXT

Type enough characters so that the option is unambiguous.

CMD-012 (error) extra positional option '%s'

DESCRIPTION

The command expects some positional arguments and has already received enough. It might also be the case that this was intended as a dash option and is misspelled.

WHAT NEXT

Verify that the option given is not a misspelled dash option. If it is not, use -help with the command to verify which arguments are already given.

CMD-013 (error) %s

Use `error_info` for more info.

DESCRIPTION

A script or complex command failed and there is a stack trace for the failure. The trace points out the source files and loops where the error occurred. The `error_info` command is used to display this stack.

WHAT NEXT

Fix the error indicated by `error_info`.

CMD-014 (error) Invalid %s value '%s' in list.

DESCRIPTION

A list argument is expected to be a common type (like integer or float) and one or more elements cannot be converted to that format.

WHAT NEXT

Fix the offending list element.

CMD-015 (error) could not open %s file "%s

DESCRIPTION

A script or an output redirect file cannot be opened.

WHAT NEXT

Verify that the file exists or that you have write access to the directory. Write access depends on the file type.

CMD-016 (error) could not close %s file "%s

DESCRIPTION

A script or an output redirect file cannot be closed.

WHAT NEXT

CMD-017 (warning) duplicate option '%s' ignored.

DESCRIPTION

The given option is already issued. This command uses the first value of the option, and subsequent values are ignored.

WHAT NEXT

Make sure this is the option you want to use. If so, decide which value you want and verify that you get the correct one.

CMD-018 (warning) duplicate option '%s' overrides previous value.

DESCRIPTION

The given option has already been issued. This command uses the last value of the option, and previous values are ignored.

WHAT NEXT

Make sure that this is the option you want to use. If so, decide which value you want and make sure that you get the correct one.

CMD-019 (error) value '%s' for option '%s' not in range (%s).

DESCRIPTION

The value given for the listed argument is not in the allowable range. For example, if 4 is given for an integer option, which has a range of 1 to 3, this error occurs.

WHAT NEXT

Supply a compatible value for the argument.

CMD-020 (error) unknown OR extra positional option '%s'

DESCRIPTION

The dash option is not recognized. Further, all positional arguments have already been received. This is most likely a misspelled dash option.

WHAT NEXT

Check to see if the option is misspelled. Look at the entire command, as other options may have misled the interpreter.

CMD-021 (warning) invoked %s outside of a loop

DESCRIPTION

The listed control command (break or continue) was used outside of the context of control structure (such as foreach, while, and so on).

WHAT NEXT

Look for a loop that ends prematurely or for a misspelled control word.

CMD-022 (warning) Can't create alias named '%s' - %s%s.

DESCRIPTION

An attempt was made to create an alias with an invalid name. Invalid names include those which match an existing command or procedure, and those which can be converted to a decimal, hexadecimal, or octal number.

WHAT NEXT

Choose another name. Use 'help' and 'alias' (with no arguments) to see what names are in use.

CMD-023 (error) Alias loop: %s

DESCRIPTION

You have aliases that refer to one another.

WHAT NEXT

Use the alias command to look at the aliases listed in the diagnostic. Remove the loop and re-execute the command.

CMD-024 (error) can't %s "%s": %s

DESCRIPTION

You attempted an operation on a variable which failed. You may have tried to read a non-existent variable (set var). Or, you may have tried to unset a non-existent or application-owned variable. The text of the message will indicate which operation failed.

WHAT NEXT

Verify that the variable exists with the printvar command. If it's not a user variable, you cannot remove (unset) it.

CMD-025 (error) No manual entry for '%s'

DESCRIPTION

The topic for which you requested man pages does not exist.

WHAT NEXT

Verify that the topic is spelled correctly.

CMD-026 (error) %s required for the '%s' argument.

DESCRIPTION

The command is incomplete as entered. The specified argument requires a valid object or list of objects.

WHAT NEXT

Enter the command with valid values for all arguments.

CMD-027 (error) couldn't change working directory to '%s'

DESCRIPTION

The directory which you specified to the cd command is not valid.

WHAT NEXT

Verify that the directory is spelled correctly.

CMD-028 (error) couldn't get working directory name

DESCRIPTION

The pwd command was unable to access the current directory. It is most likely the case that the directory which you are in no longer exists,

WHAT NEXT

Use the cd command to get into an existing directory.

CMD-029 (warning) no aliases matched '%s'

DESCRIPTION

You specified a pattern to the unalias command, and there are no aliases which match that pattern.

WHAT NEXT

There is no adverse effect of this action. However, check the spelling of the arguments to unalias to ensure that you removed all of the aliases which you wanted to remove.

CMD-030 (warning) File '%s' was not found in search path.

DESCRIPTION

The 'which' command evaluated an filename argument and the file was not found.

WHAT NEXT

No adverse effect on the result of the command, but check spelling, etc.

CMD-031 (error) value '%s' for option '%s' is not valid. Specify one of:

%S

DESCRIPTION

The value given for the listed argument is not one of the limited allowable strings. This messages lists all of the appropriate values.

WHAT NEXT

Supply a compatible value for the argument.

CMD-032 (warning) command '%s' requires some options.

DESCRIPTION

No options were given for the command, yet some are required.

WHAT NEXT

Supply appropriate arguments.

CMD-033 (error) cannot source the current log file.

DESCRIPTION

An attempt to source the log file of the currently running interpreter is not allowed. It would cause the tool to infinitely loop.

WHAT NEXT

Copy the part of the log to be a source for another file, then source that file instead.

CMD-035 (error) Value for %s cannot be larger than the %s value.

DESCRIPTION

Some commands work in pairs, specifying a maximum and minimum value. The minimum value should be less than the maximum value. For example, never specify a **min_capacitance** which is larger than the **max_capacitance** for the same design or port.

WHAT NEXT

Remove the old value or use a different value.

CMD-036 (error) Value for list '%s' must have %s elements.

DESCRIPTION

The value given for the list argument does not have the correct number of elements. Some commands have list arguments which require either a specific number or an even number of elements. The message will indicate which it is.

WHAT NEXT

Supply a correct number of elements in the list.

CMD-037 (error) value '%s' for option '%s' is invalid: must be %s.

DESCRIPTION

The value given for the listed argument is greater than or less than the allowable limit. For example, if 4 is given for an integer option, which is required to be less than or equal to 3, this error occurs.

WHAT NEXT

Supply a compatible value for the argument.

CMD-038 (information) The '%s' option for %s is unsupported.%s

DESCRIPTION

The option which you specified is not currently supported.

WHAT NEXT

CMD-039 (information) The '%s' variable is unsupported.%s

DESCRIPTION

The variable which you specified is not supported.

WHAT NEXT

If a replacement variable is specified, use it instead of this one.

CMD-040 (information) No %s matched '%s'.

DESCRIPTION

In command or variable search functions (help and printvar), you specified a pattern that did not match any variables or commands.

Note that printvar cannot find a specific array element; it can only find the entire array by name.

WHAT NEXT

Try using more wildcards (*) or (?) in your search pattern.

CMD-041 (information) Defining new variable '%s'.

DESCRIPTION

This message is issued when a variable is set for the first time.

When combined with the **printvar** command, this message can be used to isolate spelling errors in system (application) variables. However, like many debugging features, this has significant CPU cost. Therefore, the feature should only be used interactively or when developing scripts.

This feature is enabled by setting the **sh_new_variable_message** variable to true. When combined with a true value for variables **sh_new_variable_message_in_script** or **sh_new_variable_message_in_proc**, this setting causes a warning message (CMD-042) to be issued, which indicates that the performance of scripts (or Tcl procedures) will be adversely affected. To enable the feature in Tcl procedures, set the **sh_new_variable_message_in_proc** variable to true. To enable the feature in Tcl scripts, set the **sh_new_variable_message_in_script** variable to true.

In the following example, the user has misspelled the variable **sh_continue_on_error** by making it plural. With this feature, debugging is simplified.

```
prompt> set sh_continue_on_errors true
Information: Defining new variable 'sh_continue_on_errors' (CMD-041)
true
prompt> printvar sh*
sh_arch          = "sparcOS5"
sh_continue_on_error = "false"
sh_continue_on_errors = "true"
```

```
sh_enable_page_mode = "false"
sh_new_variable_message = "true"
sh_new_variable_message_in_proc = "false"
sh_product_version = ""
sh_source_uses_search_path = "false"
prompt> unset sh_continue_on_errors
prompt> set sh_continue_on_error true
true
```

Application variables are always defined, so if this message appears, a new user-defined variable has been created.

WHAT NEXT

If attempting to set an application variable, use **printvar** with wildcards to get the correct spelling for the variable.

SEE ALSO

printvar(2), **sh_new_variable_message(3)**, **sh_new_variable_message_in_proc(3)**,
sh_new_variable_message_in_script(3), **CMD-042(n)**.

CMD-042 (warning) Enabled new variable message tracing - Tcl scripting optimization disabled.

DESCRIPTION

This message is issued when you enable new variable tracing for Tcl scripts or procedures. That occurs when you set the variable **sh_new_variable_message** to TRUE, and when you set the variables **sh_new_variable_message_in_proc** or **sh_new_variable_message_in_script** to TRUE. It warns you that the performance of the application will be negatively impacted because this feature is costly in CPU time when enabled.

This feature is intended for debugging, and should only be used interactively or when developing scripts. It should not be used in a main flow.

WHAT NEXT

Set one or more of the variables to FALSE unless you are debugging a script.

SEE ALSO

sh_new_variable_message(3), **sh_new_variable_message_in_proc(3)**,
sh_new_variable_message_in_script(3).

CMD-050 (error) Unknown procedure '%s'.

DESCRIPTION

The procedure name argument to **define_proc_attributes** is not a procedure.

WHAT NEXT

Verify that the argument is correct.

CMD-051 (error) Procedure '%s' cannot be modified.

DESCRIPTION

The procedure that you passed to **define_proc_attributes** is a permanent procedure that cannot be modified.

WHAT NEXT

The procedure might be part of the application, in which case it was correctly defined with *-permanent*. If it is not part of the application, it is possible that it was erroneously defined with *-permanent*.

CMD-052 (error) Unknown command group '%s'

DESCRIPTION

The command group referenced does not exist. For example, using the *-command_group* option with the **define_proc_attributes** command, and passing in a non-existent command group will raise this error.

WHAT NEXT

Verify that the correct command group name is being used.

CMD-053 (warning) The body of procedure '%s' is protected

DESCRIPTION

You attempted to examine the body of a procedure using **info body**. That procedure was

protected by the writer so that it's body cannot be displayed.

WHAT NEXT

No action required.

CMD-060 (error) Syntax error in argument definition %d for proc '%S'.

DESCRIPTION

Using the `-define_args` option for **define_proc_attributes**, there is some kind of syntax error, for example, an improperly formatted list.

WHAT NEXT

Use **error_info** to narrow the problem, then reenter the command.

CMD-061 (error) Need at least 2 fields in argument definition %d for proc '%S'.

DESCRIPTION

Using the `-define_args` option for **define_proc_attributes**, an argument definition had insufficient arguments. At least 2 are required: the argument name and the option help text.

WHAT NEXT

Reenter the argument definition with the correct number of fields.

CMD-062 (error) Unknown %s '%s' in argument definition %d (%s) for proc '%S'.

DESCRIPTION

Using the `-define_args` option for **define_proc_attributes**, either a data type or attribute is invalid.

The allowable data types are string, boolean, int, float, and list. The allowable attributes are required and optional.

WHAT NEXT

Correct the invalid data and reenter the command.

CMD-063 (error) Illegal name '%s' for Boolean argument definition %d for proc '%s': must begin with '-'.

DESCRIPTION

Using the `-define_args` option for **define_proc_attributes**, you attempted to create a Boolean argument with a name not preceded by a `'-'`. Boolean arguments require a leading `'-'`.

WHAT NEXT

Correct the argument name and reenter the command.

CMD-064 (warning) Value help ignored for Boolean option %s in argument definition %d for proc '%s'.

DESCRIPTION

Using the `-define_args` option for **define_proc_attributes**, you tried to add value help for a Boolean argument. Boolean arguments cannot have the value help.

WHAT NEXT

Remove the value help field for boolean arguments and reenter the command.

CMD-065 (error) Can't specify both 'optional' and 'required' in argument

definition %d (%s) for procedure '%s'

DESCRIPTION

This message indicates an attempt to specify conflicting flag values as part of the definition of a procedure argument within the **define_proc_attributes** command.

WHAT NEXT

Decide whether the argument is optional or required, and remove the opposite flag.

**CMD-066 (error) Must specify a value for attribute 'values' when using '%s'
option type as in option %d (%s) for procedure '%s'**

DESCRIPTION

This message is issued by the **define_proc_attributes** command when you attempt to define an argument whose value must be one of a set of pre-defined strings (the `one_of_string` data type), without specifying the set of valid strings.

WHAT NEXT

If the value type really needs to be `one_of_string`, pass the values in as a list within the attributes list (i.e. `{values {a b c}}`).

**CMD-067 (error) Invalid attribute specification for attribute '%s'
(%s)
in option %d (%s) for procedure '%s'**

DESCRIPTION

This message is issued by the **define_proc_attributes** command. It indicates an incorrect attempt at specifying an attribute for a procedure argument. The reason for the error is included in the message.

WHAT NEXT

Fix the syntax of the command and try again.

CMD-068 (error) Could not find procedure '%s'. Arguments can't be parsed.

DESCRIPTION

This message indicates an attempt to use the `parse_proc_arguments` command from within a procedure which has not been defined using `define_proc_attributes`.

WHAT NEXT

Define the procedure's arguments using `define_proc_attributes` and try again.

CMD-069 (error) Could not set '%s(%s)' while parsing arguments in '%s'.

DESCRIPTION

This message indicates that the `parse_proc_arguments` command was not able to set the specified Tcl array variable to hold the value of a command option.

WHAT NEXT

This typically indicates that the variable was read-only. Use a different variable and try again.

CMD-070 (error) %s can only be called from within a procedure

DESCRIPTION

This message indicates an attempt to use the given command from the interpreter command line. Calls to this command are only supported from within a Tcl procedure.

WHAT NEXT

Create a procedure and call the command from within the scope of the procedure body.

CMD-080 (error) Command '%s' is disabled.

DESCRIPTION

Although part of the application, the listed command is not currently enabled.

WHAT NEXT

Look at the user documentation to determine how various commands are enabled and disabled.

CMD-081 (information) script '%s' stopped at line %d due to %s.

DESCRIPTION

The execution of a script was terminated. This message tells you which script stopped, the line number where it stopped, and why it stopped.

If the **sh_continue_on_error** variable is false (the default), any Tcl error, either syntax or semantic, stops the script. If **sh_continue_on_error** is false and the **sh_script_stop_severity** variable is W or E, messages of that severity or higher stop the script.

If the **sh_continue_on_error** variable is true, the **sh_script_stop_severity** variable is ignored and the script continues even if there are errors or warnings.

WHAT NEXT

Use the information in this message to identify and correct the source of errors and warnings. Then reexecute the script.

SEE ALSO

sh_continue_on_error (3), **sh_script_stop_severity** (3).

CMD-082 (information) %s occurred at or before line %d in script '%s'.

DESCRIPTION

You receive this message if an error or warning occurs while a script is executing,

and the variable **sh_source_emits_line_numbers** is set to E or W. A setting of E causes this message to be issued only if an error occurs, while for a setting of W, this message is issued for both warnings and errors. This message tells you the error or warning and the line and script in which it occurred.

The setting of the **sh_script_stop_severity** variable affects the output of the CMD-082 message. If **sh_script_stop_severity** is set to E, the script stops executing if an error occurs; for a setting of W, the script stops executing if a warning or error occurs. In both cases, message CMD-081 is issued, and takes precedence over CMD-082.

WHAT NEXT

Use the information in this message to identify and correct the source of errors and warnings. Then reexecute the script.

SEE ALSO

sh_script_stop_severity (3), **sh_source_emits_line_numbers** (3); **CMD-081** (n).

CMD-085 (warning) Renaming %s %s cause %s commands which use it to fail.

DESCRIPTION

You receive this message if you rename a command which is not a user-defined Tcl procedure. Renaming commands can be dangerous. Parts of the application are written in Tcl, and if you rename a command that the application is using, it is possible that those parts of the application will not function.

The only true use for **rename** is to wrap a command. For example:

```
shell> rename command1 command1_orig
shell> \
proc command1 {args} {
    # ...
    eval command1_orig $args
    # ...
}
```

If you use **rename** in this way, it is more likely that application will continue to function correctly. Still, use **rename** with extreme care and at your own risk.

WHAT NEXT

Consider using **alias**, Tcl procedures, or a private namespace before using **rename**.

SEE ALSO

`rename` (2).

CMD-086 (error) Could not find command '%s'.

DESCRIPTION

This message indicates that the command name entered does not exist and therefore operation on associated command mode could not be performed.

WHAT NEXT

Check to make sure command name is typed correctly.

CMD-087 (error) The command requires either a command name or a command mode name.

DESCRIPTION

This command requires either a command name or a command mode name to be specified.

WHAT NEXT

Enter `set_current_command_mode` with the `-command` option flag followed by a command name or the `-mode` option flag followed by a command mode name. These options are mutually exclusive.

CMD-088 (error) Could not find command mode '%s'.

DESCRIPTION

This message indicates that the command mode name entered does not exist and therefore could not be set as the current mode.

WHAT NEXT

Check to make sure command mode name is typed correctly. `get_command_modes -all` lists all defined command mode names.

CMD-089 (error) Initialization of command '%s' failed.

DESCRIPTION

This message indicates that a failure occurred during initialization and the specified command could not be evaluated.

CMD-090 (error) Initialization of command mode '%s' failed.

DESCRIPTION

This message indicates that a failure occurred during initialization of the command mode and the specified command mode could not be made current.

CMD-100 (warning) Detected use of obsolete/unsupported feature. The following will not be available in a future release of the application: %s. Use %s instead

DESCRIPTION

You have used a feature which is no longer supported by the application, and the feature is planned to be removed at some future date. The supported method is given in the message.

WHAT NEXT

Update your command usage as indicated.

CMD-101 (error) Failed to set value of option %s for command %s.

DESCRIPTION

A run of a command such as `set_command_option_value` failed to set the default or current value of an option. The command option may not have been enabled for value-tracking or a conversion error may have occurred when attempting to set the option value.

WHAT NEXT

It may be necessary to enable the option for value-tracking.

CMD-102 (error) No such positional option %d for command %s.

DESCRIPTION

An attempt was made to find the positional option of the command at the given position. No such positional option was found. Either the given command has no positional options, or the given position is "out of range". Note that positional options are numbered 0, 1, 2, ... (N-1) where N is the number of postional options of the command.

WHAT NEXT

Retry the operation using a positional option position that is "in range" for the command.

CMD-103 (error) A Severe error has occurred. To ensure that the script does not continue, the value of shell_continue_on_error has been overridden to be false. Your script is being interrupted. To see the Tcl call stack for the part of your script which generated the Severe error use the error_info command.

DESCRIPTION

A Severe error has occurred during a command execution. To ensure that the script does not continue, the value of shell_continue_on_error has been overridden to be false. Your script is being interrupted. To see the Tcl call stack for the part of your script which generated the Severe error use the error_info command.

WHAT NEXT

For details on the Severe error please look in your log file. You can also run man on the Severe error id to learn more about the error. Study the Severe error and try to fix the error in your script.

CMD-104 (error) Variable '%s' is not an application variable.

Value will still be set in Tcl.

DESCRIPTION

The specified variable is not declared as an application variable (not returned by `get_app_var -list`). This message is only generated when the application variable `sh_allow_tcl_with_set_app_var` is true.

Please see the manpages for `get_app_var` and `set_app_var` for additional details.

WHAT NEXT

Make sure you are using the correct variable name.

CMD-105 (warn) Option '%s' is obsolete, use '%s' instead.

DESCRIPTION

This option is obsolete, you should use a different option for this command feature. The code has automatically used a compatible option setting, but in the future the old option may be removed, so you should update your scripts.

WHAT NEXT

Update your script to use the new option.

CMD-106 (warn) Option '%s' is obsolete, ignoring it.

DESCRIPTION

This option is no longer supported, specifying it has no effect.

WHAT NEXT

Update your script

CMD-999 (severe) A Severe error has occurred during testing.

DESCRIPTION

A Severe error has occurred during testing. This should never happen in production.

WHAT NEXT

CNTXT

CNTXT-001 (error) Cannot characterize context in min and max mode.

DESCRIPTION

The design has a minimum and a maximum operating condition defined on it. Context characterization requires only one operating condition be set on the design.

WHAT NEXT

Set the operating condition for which you want to characterize the context on the design.

CNTXT-002 (information) Characterizing the context for cell '%s'

DESCRIPTION

You receive this message to inform you that the `characterize_context` command is characterizing the context for the specified cell.

WHAT NEXT

This is an informational message only. No action is required on your part.

CNTXT-003 (information) Deleting the context for cell '%s'

DESCRIPTION

The internal data structures associated with the context of the cell were deleted. Therefore the context cannot be written out (`write_context`) or reported (`report_context`). This occurs when the context is deleted by `remove_context`.

WHAT NEXT

This is an information message. No action is required unless you want to use `write_context` or `report_context` on the cell for which **CNTXT-003** was issued. Otherwise context must be created by `characterize_context`.

CNTXT-004 (error) This command applies to hierarchical cells only

Cell '%s' is a leaf cell.

DESCRIPTION

You receive this message because the specified cell is a leaf cell, and the command you executed applies only to hierarchical cells.

WHAT NEXT

Re-execute the command and ensure that you do not specify a leaf cell.

CNTXT-005 (information) The design has rise/fall qualified exceptions which will not be written out.

DESCRIPTION

You receive this message to inform you that **write_context** will not write out the rise/fall qualified exceptions in your design. Rise/Fall qualified exceptions are supported only by Primetime; neither **write_context** nor **write_sdc** will write them out for either dcsh or dctcl mode.

WHAT NEXT

This is an informational message only. No action is required on your part.

CO

CO-001 (error) No design library opened.

DESCRIPTION

This error message occurs when the design library is not loaded.

WHAT NEXT

Open a design library using *open_mw_lib*.

SEE ALSO

open_mw_lib(2)

CO-002 (error) Cannot read input file %s : %s.

DESCRIPTION

This error message occurs because the stated input file could not be read. Possible reasons for this are that the file does not exist, or there is no read permission on the file.

WHAT NEXT

Check that the stated input file is available for read access.

SEE ALSO

import_design(2)

CO-003 (error) Cannot create partitioner, %s.

DESCRIPTION

This error message occurs because the partitioner could not be created. This most likely would happen because there is no free memory on the machine.

WHAT NEXT

Check that the machine has enough free memory.

SEE ALSO

`import_design(2)`

CO-004 (error) Cannot find partitioner, %s.

DESCRIPTION

This error message occurs because the partitioner specified does not exist.

WHAT NEXT

Use `create_partition -input_files <file.v>` to create a partitioner.

SEE ALSO

`create_partition(2)`

CO-005 (error) Option %s cannot be used with other options.

DESCRIPTION

This error message occurs because the option specified is mutually exclusive with all other options.

WHAT NEXT

Use specified option alone.

SEE ALSO

`create_partition(2)`

CO-006 (error) Cannot create output directory %s.

DESCRIPTION

This error message occurs because the tool could not create the specified directory.

WHAT NEXT

Check that you have write permission in the specified directory.

SEE ALSO

```
list_partition_data(2)  
create_partition(2)
```

CO-007 (error) Option -create top_level_floorplan cannot be used with %s.

DESCRIPTION

This error message occurs because of certain limitations on the -create_design top_level_floorplan option. This option will only work if there is exactly 1 top module in the design. It thus does not work with a list of modules. Also this option does not handle situation when there are multiple instantiated modules (MIMs) which are marked as physical (ie sub-block). It is ok to have MIMs as logical nodes. Finally this option requires that all sub-block have an area estimate, so that the sizes of each sub-block can be determined.

WHAT NEXT

If you have any of above situations, you can use -create_design verilog_only. Then proceed to load the verilog and create a floorplan.

SEE ALSO

```
list_partition_data(2)  
create_partition(2)
```

CO-008 (error) Option %s requires a value between %s and %s.

DESCRIPTION

This error message occurs because the specified option will only take values in a

certain range. For example, a utilization value should be between 0 and 1.

WHAT NEXT

Input values within allowable range.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-009 (error) The options %s are mutually exclusive.

DESCRIPTION

This error message occurs because the specified options are mutually exclusive and so only one of the specified options can be used at a time.

WHAT NEXT

Run the command with only one of the specified option. You can run the command multiple times each time with a different option.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`
`run_parallel_jobs(2)`

CO-010 (error) The option %s cannot be used with a list of module names.

DESCRIPTION

This error message occurs because the specified option cannot be used at the same time as specifying a list of module names. This option was meant for use at the top level.

WHAT NEXT

Do not specify the module name list.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-011 (error) No verilog files have been loaded.

DESCRIPTION

This error message occurs because you have not yet loaded any verilog files to the partitioner.

WHAT NEXT

Use `create_partition -input_files <files>` to load your verilog files.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-012 (error) Found multiple definitions of module %s.

DESCRIPTION

This error message occurs because the input verilog files contain a module that is defined more than once. When this happens, one of the modules will remain in existence while the others are ignored.

WHAT NEXT

It is best to remove the redundant modules as there is no way to tell which module survived. However, if you are certain that all the modules with the same name are actually identical, then it is safe to proceed.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-013 (error) Cannot set an %s keepout on module %s.

DESCRIPTION

This error message occurs because the specified module does not allow you to set an internal or external keepout. Internal keepouts are only allowed on logical modules, black boxes, and the top level. External keepouts are not allowed at the top level of design.

WHAT NEXT

Check the specified module. If it is a missing module, then convert it to a black box by giving it an area estimate.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-014 (error) Use -force option to set area on module %s.

DESCRIPTION

This error message occurs because the specified module does not allow you to set an area on it normally. Normal usage is to set area only on missing modules. For other modules, the area is calculated from the utilization and the cells inside the module.

WHAT NEXT

If you want to override the estimated area, then use the `-force` option.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-015 (error) Use -force option to set utilization on module %s.

DESCRIPTION

This error message occurs because the specified module does not allow you to set an utilization on it normally. This is to highlight that this module has a special consideration. One example is that this module may be multiply instantiated, so by

changing this utilization you are actually changing multiple instantiations.

WHAT NEXT

If you are sure you want to do this, then use the -force option.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-016 (error) Use -force option to set physical/logical on module %s.

DESCRIPTION

This error message occurs because the specified module did not allow you to change it between physical and logical states. This is to highlight that this module has a special consideration. The most common is that this module may be multiply instantiated. So for example, if you are marking it physical, you are actually changing multiple instantiations to be physical.

WHAT NEXT

If you are sure you want to do this, then use the -force option.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-017 (error) Cannot set utilization on leaf or IO module %s.

DESCRIPTION

This error message occurs because the specified module is a leaf or IO module. These modules have a fixed size and thus it does not make sense to set a utilization on them.

WHAT NEXT

Do not set utilization on leaf or IO modules.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-018 (error) Cannot set module %s as physical because has physical %s.

DESCRIPTION

This error message occurs because the specified module is either the child or parent of an already physical module. This is not allowed because nested physical modules is not supported.

WHAT NEXT

Determine which of the nested modules really should be physical and mark only that one as physical.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-019 (error) Cannot open file %s for %s.

DESCRIPTION

This error message occurs because the stated input file could not be opend for read or write. Possible reasons for this are that the file does not exist, or there is no read/write permission on the file or there is no disk space.

WHAT NEXT

Check that the stated input file is available for read (or write) access.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-020 (error) Internal error: %s %s.

DESCRIPTION

This error message occurs because there has been an unexpected internal error.

WHAT NEXT

Contact Synopsys support for further assistance.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`
`run_parallel_jobs(2)`
`send_flow_Status(2)`

CO-021 (error) Cannot access output directory %s.

DESCRIPTION

This error message occurs because the specified output directory either does not exist or is protected.

WHAT NEXT

Check that the output directory is available for read and write.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-022 (error) Library length unit %s not %s.

DESCRIPTION

This error message occurs because the tech file length units are in a not supported length. Typically they should be in microns.

WHAT NEXT

Change the tech file length units to microns or contact Synopsys support for further

assistance.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-023 (error) Need to close all CEL views before using %s

DESCRIPTION

This error message occurs because the command or option you are using requires that all CEL views are closed. This is because this command or option modifies certain CEL views and if they are opened while this command is executed, that may cause database consistency issues.

WHAT NEXT

Use `close_mw_cel *` to close all CEL views before rerunning the command.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-024 (error) Incorrect usage of option -parallel.

DESCRIPTION

This error message occurs because you have given an incorrect input to `run_parallel_jobs -parallel` option. The option `-parallel` takes as input either the string "all" or a positive integer.

WHAT NEXT

Look at the man page of `run_parallel_jobs` for more details.

SEE ALSO

`run_parallel_jobs(2)`

CO-025 (error) Option -job_name is required.

DESCRIPTION

This error message occurs because given the options you have specified, the option -job_name is required. There are certain option settings in which -job_name is not required, but with other option settings -job_name is required.

WHAT NEXT

Look at the man page of `run_parallel_jobs` for more details.

SEE ALSO

`run_parallel_jobs(2)`

CO-026 (error) Option %s requires a %s.

DESCRIPTION

This error message occurs because you have given an incorrect input to an option. Look at the error message for details on which option is incorrectly specified and what input is required to correct it.

WHAT NEXT

Look at the man page of the command for more details.

SEE ALSO

`run_parallel_jobs(2)`
`send_flow_status(2)`

CO-027 (error) Nested calls to run_parallel_jobs not supported.

DESCRIPTION

This error message occurs because you tried to run more than one `run_parallel_jobs` command. This is not supported. Only 1 `run_parallel_jobs` can be executed at a time.

WHAT NEXT

Look at the man page of `run_parallel_jobs` for more details.

SEE ALSO

`run_parallel_jobs(2)`

CO-028 (error) Option %s or %s environment variable is required.

DESCRIPTION

This error message occurs because the specified option must be used or the specified environment variable must be set.

WHAT NEXT

Look at the man page of `send_flow_status` for more details.

SEE ALSO

`run_parallel_jobs(2)`
`send_flow_status(2)`

CO-029 (error) Command %s has failed.

DESCRIPTION

This error message occurred because the specified command has failed. This is a generic failure message. There should be more detailed messaging on the cause of failure before this message was output.

WHAT NEXT

Look for previous error or warning messages before this message. Look at the man page of the command.

SEE ALSO

`run_parallel_jobs(2)`
`send_flow_status(2)`

CO-030 (error) Cannot find %s job(s) to %s.

DESCRIPTION

This error message occurred because the specified job(s) could not be found. They may have died unexpectedly, or the wrong jobs were specified. If the specified job(s) is "any" that means that no jobs were found.

WHAT NEXT

Check that you specified the correct jobs.

SEE ALSO

`run_parallel_jobs(2)`
`send_flow_status(2)`

CO-501 (warning) Cannot find module, %s.

DESCRIPTION

This warning message occurs because you have specified a module that does not exist in the partitioner. This module will be skipped.

WHAT NEXT

It is likely a typo, check the module name is spelled correctly.

SEE ALSO

`create_partition(2)`
`list_partition_data(2)`

CO-502 (warning) Module %s has a terminal %s which has %s.

DESCRIPTION

This warning message occurs because an issue with the specified terminal was found while loading the specified module. This issue will not stop the loading of the verilog files to the partitioner, but it implies that there may be an issue (in verilog) with this module that should be further investigated.

WHAT NEXT

Take a look at the specified verilog module and terminal to further investigate this issue.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-503 (warning) Cannot find leaf module %s in MW lib %s.

DESCRIPTION

This warning message occurs because a leaf module was found in verilog, but was not found in the MW reference libraries. This means that this cell will not have any area associated with it, ie it will be a missing module.

WHAT NEXT

If this leaf module is supposed to be missing (ie it is intended to be a black box), then there is no problem. However if this leaf module is intended to be a standard cell, a hard macro, or an IO, then it should not be missing. Check your setup to ensure all the MW reference libraries are available and this cell is included in the libraries.

SEE ALSO

`list_partition_data(2)`
`create_partition(2)`

CO-504 (warning) Need to start_gui to see partitioner window.

DESCRIPTION

This warning message occurs because you have not started the gui yet. The partitioner window will not pop up unless you have started the gui.

WHAT NEXT

Start the gui with `start_gui` command.

SEE ALSO

`create_partition(2)`

```
partition_design(2)
start_gui(2)
```

CONV

CONV-1 (error) Undefined variable on or near line %d at or near '%S'.

DESCRIPTION

CORRLIB

CORRLIB-1 (error) Required option %s NOT defined.

DESCRIPTION

This error message occurs when the required options are not defined in the command shell.

WHAT NEXT

Define the required option using the Library Compiler command shell **set_correlate_library_options** command.

SEE ALSO

`set_correlate_library_options(2)`

CORRLIB-2 (error) Failed loading library %s.

DESCRIPTION

This error message occurs when the tool cannot read the library defined with the **db_file** option.

WHAT NEXT

Make sure that the library file exists.

CORRLIB-3 (error) Library correlation failed.

DESCRIPTION

This error message because an error occurred during the library correlation flow.

WHAT NEXT

Refer to all error and warning messages issued during the correlation flow.

CORRLIB-4 (error) File %s NOT found.

DESCRIPTION

This error message occurs when the specified file is not found in the current path or the searching path.

WHAT NEXT

Make sure the file exists.

CORRLIB-5 (error) Failed reading %s.

DESCRIPTION

This error message occurs when the tool fails to read the required library.

WHAT NEXT

Check the library db file.

CORRLIB-6 (warning) Failed analysys on %s %s.

DESCRIPTION

This message occurs when reading information from db file for specific cell, port or arc.

WHAT NEXT

Please check the library and other error messages.

EXAMPLES

EXAMPLE MESSAGE

Warning: Failed analysys on cell CELL1. (CORRLIB-6)

CORRLIB-7 (error) Required information %s NOT found or

incorrectly defined.

DESCRIPTION

This error message occurs when the specified information in the library db is not found or is incorrectly defined.

WHAT NEXT

Modify the library so it contains the correct required information.

CORRLIB-8 (warning) Cell %s do NOT have required CCS Noise information for correlation.

DESCRIPTION

This message occurs when CCS Noise information does NOT exist for specific cell in .db file.

WHAT NEXT

Please use correct .db file for the specific cell.

EXAMPLES

EXAMPLE MESSAGE

Warning: Cell cell_under_test do NOT have required CCS Noise information for correlation. (CORRLIB-8)

CPFP

CPFP-001 (information) Copied %d of total %d wire tracks from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command after wire tracks have been copied. It shows the statistics of the number of wire tracks copied and the total number of wire tracks in the source cell.

CPFP-002 (information) Copied %d of total %d wire tracks from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command after wire tracks have been copied. It shows the statistics of the number of wire tracks copied and the total number of wire tracks in the source cell.

CPFP-003 (information) Copied gcell grid attachment file %s to the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command after gcell grid attachment file been copied, showing the name of the file.

CPFP-004 (information) Created macro cell '%s' in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool created a macro cell with the given name in the destination cell.

CPFP-005 (information) Created IO pad cell '%s' in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool created a IO pad cell with the given name in the destination cell.

CPFP-006 (information) Created corner pad cell '%s' in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool creates a corner pad cell with the given name in the destination cell.

CPFP-007 (information) Created filler cell '%s' in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool creates a filler cell with the given name in the destination cell.

CPFP-008 (information) Created net %s in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool creates a net with the given name in the destination cell. The net is created because it connects to one or more newly created physical cells.

CPFP-009 (information) Connected net %s to port %s of cell %s.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool creates a net and

builds its connection in the destination cell.

CPFP-010 (information) Created %d macro, %d io pad, %d corner pad, %d flip chip pad, %d filler cells in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of different types of physical cells created by the command in the destination cell.

CPFP-011 (information) Created %d new physical cells in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of physical cells created by the command in the destination cell.

CPFP-012 (information) Copied the placement of %d of total %d cells from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of cells whose placement information are copied to the destination cell.

CPFP-013 (information) Copied the routing of %d of total %d nets from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of nets whose routing are copied to the destination cell.

CPFP-014 (information) Created port %s in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool creates a top-level port with the given name in the destination cell.

CPFP-015 (information) Created pin %s in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool creates a pin with the given name in the destination cell.

CPFP-016 (information) Copied %d of total %d pins from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of pins created or whose coordinates are copied in the destination cell.

CPFP-017 (information) Copied %d of total %d variable route rules from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of variable route rules copied to the destination cell.

CPFP-018 (information) Plan group %s exists in the destination cell, skipped.

DESCRIPTION

This message occurs in the copy_floorplan command when the plan group with a given name already exists in the destination cell before copying from the source cell.

Then the data of this plan group will not be updated.

CPFP-019 (information) Copied %d of total %d plan groups from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of plan groups copied to the destination cell.

CPFP-020 (warning) Cell instance %s not found in the source cell, skipped copying its power connection.

DESCRIPTION

This warning message occurs in the copy_floorplan command. The tool finds that a cell instance is missing in the destination cell when it is trying to copy power connections.

CPFP-021 (information) The source cell does not have gcell grid info attachment file.

DESCRIPTION

This message occurs in the copy_floorplan command. It indicates that there is no attachment file of gcell grid information in the source cell, so that no gcell grid information is copied.

CPFP-022 (error) Failed to create destination cell gcell grid info attachment file, skipped copying gcell grid definition.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool failed to create the attachment file of the gcell grid information for the destination cell. Thus the gcell grid information is not correctly copied for the destination cell.

CPFP-023 (error) Cannot open destination cell gcell grid attach file.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool failed to open the gcell grid attach file of the destination cell. The gcell grid information is not copied correctly.

CPFP-024 (error) Unable to create physical cell '%s' in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command, when the tool failed to create a physical cell in the destination cell.

CPFP-025 (error) Cell %s not found in the destination cell, skipped.

DESCRIPTION

This message occurs in the copy_floorplan command, when the tool is trying to copy the coordinates of the given cell, but fails to find it in the destination cell.

CPFP-026 (error) Net %s not found in the destination cell, skipped.

DESCRIPTION

This message occurs in the copy_floorplan command, when the tool is trying to copy the wiring of the given net, but fails to find it in the destination cell.

CPFP-027 (warning) Port %s not found in the destination cell,

skipped copying its pins.

DESCRIPTION

This warning message occurs in the copy_floorplan command, when the tool is trying to copy the pins but cannot find their corresponding port in the destination cell.

CPFP-028 (warning) Cell instance %s connects to a non P/G net %s in the source cell, not creating it in the destination cell.

DESCRIPTION

This warning message occurs in the copy_floorplan command, when the tool skipped creating a missing physical cell instance in the destination cell because in the source cell, the cell instance connects to non-P/G nets.

CPFP-029 (warning) Cell inst %s not found in destination cell, not attached to power domain %s.

DESCRIPTION

This warning message occurs in the copy_floorplan command, when the tool cannot find a cell instance belonging to a power domain being copied in the destination cell and skipped attaching it to the power domain.

CPFP-031 (information) Copied %d of total %d move bounds from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of move bounds copied to the destination cell.

CPFP-032 (information) Group bound %s exists in the

destination cell, skipped.

DESCRIPTION

This message occurs in the copy_floorplan command when the group bound with the given name already exists in the destination cell before copying from the source cell. Then the data of this group bound will not be updated.

CPF-033 (information) Copied %d of total %d group bounds from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of group bounds copied to the destination cell.

CPF-034 (information) Copied %d of total %d voltage areas from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of voltage areas copied to the destination cell.

CPF-035 (information) Copied %d via rules from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of via rules copied to the destination cell.

CPF-036 (information) Copied %d of total %d power domains

from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of power domains copied to the destination cell.

CPF-037 (information) Copied %d of total %d power ground net info from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of power ground net info copied to the destination cell.

CPF-038 (information) Power ground net info %s exists in the destination cell, skipped.

DESCRIPTION

This message occurs in the copy_floorplan command when the power ground info with the given name already exists in the destination cell before copying from the source cell. Then the data of this power ground info will not be updated.

CPF-039 (information) Created power net %s in the destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command, when the tool copies a missing power net in the destination cell.

CPF-040 (information) Created flip chip pad cell '%s' in the

destination cell.

DESCRIPTION

This message occurs in the copy_floorplan command when the tool created a flip chip pad cell with the given name in the destination cell.

CPFP-041 (information) Copied %d rectangles from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of rectangles copied to the destination cell.

CPFP-042 (information) Copied %d polygons from the source cell.

DESCRIPTION

This message occurs in the copy_floorplan command giving a statistics on the number of polygons copied to the destination cell.

CPSR

CPSR-001 (warning) Total %d switches/filler cells/corner cells overlaps with existing cells or blockage.

DESCRIPTION

This warning message occurs when option "-check_overlap" is specified, the inserted switches/filler cells/corner cells overlaps with existing cells or blockage.

WHAT NEXT

The command doesn't guarantee the inserted cells will not overlap with existing cells or blockage. If you don't want that happen, please adjust cell's position.

SEE ALSO

CPSR-002 (warning) Multiple %d voltage areas or macros found.

DESCRIPTION

This warning message occurs when multiple voltage areas or macros found based on the option "-area_obj". The command will pick up the first object that matches

WHAT NEXT

Check the option "-area_obj".

SEE ALSO

CPSR-003 (error)Can not find %s lib cell %s.

DESCRIPTION

This error message occurs when the lib cell can not be found. Please check the lib cell name.

WHAT NEXT

Please check the lib cell name.

SEE ALSO

CPSR-004 (error) Can not find cell %s's dimension.

DESCRIPTION

This error message occurs when we can not get cell's dimension. Either cell name is not correct or we cell's FRAM view can not be found.

WHAT NEXT

SEE ALSO

CPSR-005 (error) Switch cell, filler cell, corner cell's height don't match.

DESCRIPTION

This error message occurs when switch cell, filler cell and corner cell can not be found or their height don't match. We have the assumption that switch cell, filler cell and corner cell should have the same height and corner cell should be square. If cell's orientation is not like the same with standard, user should specifies such option: -switch_orientation, -filler_orientation, -outer_corner_orientation, -inner_corner_orientation.

WHAT NEXT

Please check whether cell name is correct and whether set the cell to a correct orientation.

SEE ALSO

CPSR-006 Offset number %d should match the area edge

number %d!

DESCRIPTION

This error message occurs when offset number doesn't match the area edge number. If only one value is specified, the value is applied to all edges. To specify a different offset value for a different edge, a set of values can be specified. If more than one values are specified, they must match the number of edges of the voltage area or macro.

WHAT NEXT

Please check the offset number to match the area edge number.

SEE ALSO

CPSR-007 (error) Start_point or end_point in bad format.

DESCRIPTION

This error message occurs when start_point or end_point is in bad format. User should specifies the point like {x y}.

WHAT NEXT

Please check the start_point or end_point format.

SEE ALSO

CPSR-008 (error) Point %s is not on the object boundary.

DESCRIPTION

This error message occurs when the give start_point or end_point is not on the object boundary. If the option -offset is specified, the boundary is not the given voltage area or macro, it should also consider the offset.

WHAT NEXT

Please check the start_point or end_point

SEE ALSO

CPSR-009 (error) Density %f should be between the range (0.0 1.0].

DESCRIPTION

This error message occurs when user specifies a wrong density value. The density value should be between the range (0.0 1.0].

WHAT NEXT

Please check the -density option.

SEE ALSO

CPSR-010 (warning) Can not fill the gap with fillers from %s to %s.

DESCRIPTION

This warning message occurs when filler cells can not totally fill the gap between switch cells and corner cells.

WHAT NEXT

User should either connect the pin manually or choose different filler cells, start_point, end_point.

SEE ALSO

CPSR-007 (error) driver_point in bad format.

DESCRIPTION

This error message occurs when driver_point is in bad format. User should specifies the point like {x y}.

WHAT NEXT

Please check the driver_point format.

SEE ALSO

CTL

CTL-301 (warning) NameMaps inheritance not supported.

DESCRIPTION

This warning is generated when the user specifies an InheritNameMap statement in the NameMaps block. Currently the Namemaps inheritance is not supported in the NameMaps block.

WHAT NEXT

Find alternative way to reach the goal.

CTL-302 (warning) Specifying more than one TestMode in %s CTL block.

DESCRIPTION

This warning is generated when user specifies more than one TestMode in the TestMode statement in the CTL block mentioned. Currently we only recognize the first TestMode in the TestMode statement, while others will be discarded.

WHAT NEXT

Keep the TestMode desired and discard others.

CTL-303 (error) Core instance %s does not exist.

DESCRIPTION

This error is generated when an undefined CoreInstance was referenced somewhere. The CoreInstance must be defined before being used according STIL syntax.

WHAT NEXT

Define the CoreInstance before using it.

CTL-304 (error) PatternBurst %s does not exist.

DESCRIPTION

This error is generated when an undefined PatternBurst was used. It is required by the STIL syntax to define the PatternBurst before it is referenced.

WHAT NEXT

Define the PatternBurst before using it.

CTL-306 (error) %s Connection mismatch.

DESCRIPTION

This error is generated when there is a size mismatch related to the mentioned signal, core signal or scancell in the IsConnected block of CTL block.

WHAT NEXT

Find out the mismatched connection and fix it.

CTL-307 (error) Signal connection not allowed outside Internal block.

DESCRIPTION

This error is generated when user tried to define a Signal connection outside Internal block, e.g CoreInternal or ScanInternal block. CoreInternal block needs a CoreSignal connection; ScanInternal blocks needs a ScanCell connection.

WHAT NEXT

Define other types of connections in other blocks.

CTL-308 (error) Cannot find pattern matching name '%s' in

existing CTL model.

DESCRIPTION

This error is generated when user specifies a Pattern Name which is not defined previously in the PatternBurst or Pattern block. Usually, it happens in the PatternInformation block in CTL block.

WHAT NEXT

See if the Pattern name is correct or not.

CTL-309 (error) The patinfo for Pattern '%s' already existed.

DESCRIPTION

This error is generated when user tries to read in PatternInformation for the same Pattern more than once without specifying the overwrite value of the read option to truth.

WHAT NEXT

Specify the overwrite option to truth or change the Pattern name.

CTL-310 (error) CTL block %s redefined.

DESCRIPTION

This error is generated when the mentioned CTL block is defined more than once in the same Environment block. CTL block must be uniquely defined within an Environment block.

WHAT NEXT

Remove the duplicated definition of CTL block.

CTL-311 (warning) Both CTL block and TRC block are defined

in the %s Environment block.

DESCRIPTION

This warning is generated when both CTL block and TRC block are defined in the same Environment block. The latter one will be discarded. Currently we require that CTL block and TRC block to be defined in separate Environment block.

WHAT NEXT

Define the CTL block and TRC block in separate Environment block.

CTL-313 (error) Environment block %s redefined.

DESCRIPTION

This error is generated when the mentioned Environment block is defined more than once . Environment block must be uniquely defined according to STIL syntax.

WHAT NEXT

Remove the duplicated definition of Environment block.

CTL-314 (warning) Ignoring invalid characters from Mask field "%S

DESCRIPTION

This warning is generated when the Mask field contains invalid characters. The only valid characters for this field are '0' and '1'. Any other characters will be ignored and their value replaced with '0'.

WHAT NEXT

Correct the value of the Mask field.

SEE ALSO

`define_mbist_program (2)`

CTL-315 (warning) Ignoring Test %s as Algorithm %s not found

DESCRIPTION

This warning is generated when the Algorithm specified in the Test statement is not found in the current CTL.

WHAT NEXT

Correct the value of the Algorithm field or declare the Algorithm used in the Test statement before its usage.

SEE ALSO

`define_mbist_program (2)`

CTL-316 (warning) Ignoring Background %s in Test %s as not found

DESCRIPTION

This warning is generated when the Background specified in the Test statement is not found in the current CTL.

WHAT NEXT

Correct the value of the Background field or declare the Background used in the Test statement before its usage.

SEE ALSO

`define_mbist_program (2)`

CTS

CTS-000 (Error) Pin forced as Sink can not be a root

DESCRIPTION

An attempt to set the root of the clock tree on the pin on which exception has already been preset.

WHAT NEXT

Make sure which purpose given pin should serve. Depending on that you should either remove exception from that pin or specify another pin as a root of the clock tree.

CTS-001 (Error) Could not find a clock tree by that name: %s

DESCRIPTION

The clock tree name passed through option -clock_tree_name is not defined. This command needs a defined clock tree name as argument.

WHAT NEXT

Check the name for mistype or use 'set_clock_tree_options' to create the clock tree definition.

CTS-002 (Error) Unable to setup data base driver

DESCRIPTION

WHAT NEXT

CTS-003 (Error) Unable to setup timing engine driver

DESCRIPTION

WHAT NEXT

CTS-004 (Error) Unable to setup routing engine driver

DESCRIPTION

WHAT NEXT

CTS-005 (Error) Unable to link node to external DB

DESCRIPTION

WHAT NEXT

CTS-006 (Warning) Pin %s is driven by pin %s in the netlist - overriding using driving cell constraint on root pin.

DESCRIPTION

The hierarchical port specified as the root of the clock tree has a driver inside the netlist. Since a driving cell timing assertion is available on the root pin, the 'set_clock_tree_options' command will use it instead of the real netlist driver.

WHAT NEXT

If you do not want to retain this override, reset the driving cell timing assertion on the root port.

CTS-007 (Information) Driving cell %s (%s to %s) will be applied to the root pin.

DESCRIPTION

The root pin of the clock tree is a hierarchical pin. Its driver was specified using the `set_driving_cell` command.

WHAT NEXT

Use `set_driving_cell` if you want to specify another driver.

CTS-008 (Error) Could not find layer information for pin %s - clock tree definition aborted.

DESCRIPTION

The 'set_clock_tree_options' command is trying to determine the technology layer assigned to this pin, but no information on the physical terminal was found.

WHAT NEXT

Run 'assign_pins' in each of the clock tree hierarchies and make sure a layer is assigned to all the clock tree ports and pins.

CTS-009 (Error) hierarchy of pin '/%s' at {%-Id %Id} does not match the hierarchy at that location ('/%s').

DESCRIPTION

This indicates serious inconsistencies between the clock tree description and the design hierarchy. It could also be caused by a failure to find a valid legal location for one of the clock tree cell while doing synthesis, or by incorrect floorplan data. The update phase of 'compile_clock_tree' command will create ports as needed to establish the connection, but the physical location of those ports may

be outside or not near the boundary of some of the crossed hierarchy boundaries.

WHAT NEXT

Check the floorplan and redo CTS. Check that some valid locations can be found for clock tree buffers. You can also try to manually fix the problem by moving the incorrect ports and clock tree cells by hand, then update the clock tree using 'report_clock_tree'.

CTS-010 (Error) Could not find a valid placement for clock tree buffer at { %ld %ld }: this buffer will not have a legal placement.

DESCRIPTION

This error probably indicates a serious floorplan or library issue that prevents the CTS tool from finding legal placement sites for the synthesized clock tree buffers.

WHAT NEXT

Check the floorplan around the specified location.

CTS-011 (Error) Inconsistent connectivity for cell %s - buffer removal on clock domain %s aborted

DESCRIPTION

This error is raised in two cases: 1) the current clock description contains multiply instantiated buffers (i.e. the clock domain touches some non-uniquified parts of the netlist); or 2) the database is corrupted and there are serious inconsistencies between the clock domain internal description and the netlist (for instance the logical description of the cell matched with a buffer, but the cell has more than 2 connections).

WHAT NEXT

Check that all the hierarchies covered by the clock network are uniquified.

CTS-012 (Information) removing buffer or inverter: %s in cell %s

in clock tree %s

DESCRIPTION

The cell is a buffer or inverter of the specified clock tree. This cell is being removed because you perform 'remove_clock_tree_buffering' on this clock tree. Buffer and inverter are removed only if 'remove_clock_tree_buffering' can do so without changing the logic of the clock signal.

WHAT NEXT

CTS-013 (Error) could not update the definition of clock domain %s

DESCRIPTION

The connectivity of the clock network has not been preserved during buffer removal. A serious error or database corruption has occurred.

WHAT NEXT

Please contact your support.

CTS-014 (Warning) Could not find a valid timing arc matching %s to drive the specified root.

DESCRIPTION

You have passed a hierarchical port as the root of the clock tree to the **set_clock_tree_options** command, and you specified a driver timing arc using the **-timing_arc** option, but **set_clock_tree_options** cannot find a library timing arc that matches your search criteria. The command will attempt to find a driver timing arc for you using the netlist information or driving cell port constraints defined using the **set_driving_cell** command.

WHAT NEXT

Check the pin argument passed to the **-timing_arc** option is really connected to the specified root port. Check your **link_path** and **search_path** variables. Check for disabled timing arcs using **report_disable_timing**. Use **remove_disable_timing** to fix the problem.

CTS-015 (Error) Logic loop in clock network at output pin %s

DESCRIPTION

The netlist starting at the specified root traces through looping logic.

WHAT NEXT

Use the 'set_clock_tree_stop_pin' or 'set_clock_tree_exclude_pin' command to prevent reconvergence in the clock network.

CTS-016 (Error) Multiple driver on the clock network detected while tracing pin %s of cell %s

DESCRIPTION

WHAT NEXT

CTS-017 (Error) Multiple driver on the clock network detected while tracing pin %s of top level cell %s

DESCRIPTION

WHAT NEXT

CTS-018 (Error) Can not determine unique outputPin use - timing_arc

DESCRIPTION

WHAT NEXT

CTS-019 (Warning) Instance %s in design %s can be traced to

more than one output. Selecting pin %s to trace through the cell.

DESCRIPTION

Your netlist contains a gating cell along the current clock tree which contains several output pins to which the cell can be traced through. The clock tree tracing algorithm has selected the random pin reported in the message to trace through this gate.

WHAT NEXT

If the instance reported is not really part of the clock tree you want to buffer, use `set_clock_tree_exceptions` to prevent this cell to be traced through. If you want to select another pin to trace through the cell, disable all the timing arcs but the one you want to use to cross this cell using `set_disable_timing`.

CTS-020 (Warning) Non Unate cell: %s (%s) in design %s - assuming %s-unate timing arc.

DESCRIPTION

The root cell or one of the gating cells of the current clock domain is traced through using a non-unate timing arc. This is a problem as the timing analysis will not be able to assert the polarity of the clock signal behind that cell, nor balance delays and optimize skew accordingly. The polarity of the timing arc will be considered non-inverting, to allow clock tree synthesis to carry on, but the insertion delay and skew optimization will be performed considering a clock edge that may not correspond to a real functional mode of the circuit.

WHAT NEXT

Please use `set_disable_timing` to resolve the polarity of this timing arc.

CTS-021 (Error) Illegal clock tree node

DESCRIPTION

This means that clock tree data has likely been corrupted.

WHAT NEXT

Try to recreate clock tree data by issuing `set_clock_tree_options` command

CTS-022 (Error) Invalid clock tree node type

DESCRIPTION

WHAT NEXT

CTS-023 (Error) Timer not initialized

DESCRIPTION

WHAT NEXT

CTS-024 (Error) Invalid clock tree node status

DESCRIPTION

WHAT NEXT

CTS-025 (Error) Can not trace through multiple (%d) occurrences of pin %s

DESCRIPTION

Can not trace through multiple (%d) occurrences of a pin %s . Design must be uniquified or pin s property set to FLOAT.

DESCRIPTION

WHAT NEXT

CTS-028 (Information) Purging clock nets from deleted connections...

DESCRIPTION

Informs the user that clock tree synthesis is in the phase of removing obsolete nets.

WHAT NEXT

Just wait a little bit

CTS-029 (Information) Cleaned %d broken connections...

DESCRIPTION

WHAT NEXT

CTS-030 (Error) pin %s does not have a layer

DESCRIPTION

WHAT NEXT

CTS-031 (Error) Could not initialize layer information for clock %s

DESCRIPTION

WHAT NEXT

CTS-032 (Error) there is no clock tree object named %s in the database

DESCRIPTION

You receive this message because the specified clock tree name is not in the database. When the specified clock tree name is not present in the database, you must define a clock tree object by using the **set_clock_tree_options** command with the **-root** option. CTS-032 might be raised when you are attempting to define a clock tree and define an illegal clock tree root. In this case, CTC first issues a message saying the clock tree root pin was not found or is illegal, and then you might receive this error message because CTC could not find or create the clock tree and, therefore, it is not in the database.

WHAT NEXT

Provide the **-root** option the first time you define a clock tree object by using the **set_clock_tree_options** command.

SEE ALSO

`set_clock_tree_options(2)`.

CTS-033 (Error) Can not remove port %s of instance %s from

net %s in cell %s

DESCRIPTION

WHAT NEXT

CTS-034 (Error) can not remove port %s from net %s in cell %s

DESCRIPTION

WHAT NEXT

CTS-035 (Error) Can not remove net %s in cell %s

DESCRIPTION

DESCRIPTION

WHAT NEXT

CTS-039 (Information) Updating connections...

DESCRIPTION

WHAT NEXT

CTS-040 (Warning) No %s for library pin %s/%s - resetting to default (%s)

DESCRIPTION

Some gating cells or buffer cells in the logical library files (.db files) you provided do not have valid values for the following parameters needed by clock tree synthesis: input pin capacitance, output pin max_capacitance, output pin max_transition, output pin max_fanout.

WHAT NEXT

Make sure the '.db' library files for your libraries provide accurate values for input pin capacitance and other library cells parameters. If the library contains invalid (<=0) values, they will be reset to a default value as specified in the error message.

CTS-041 (Information) Updated %d new connection

DESCRIPTION

WHAT NEXT

CTS-042 (Information) Updating global routing of preserved

connections...

DESCRIPTION

WHAT NEXT

CTS-043 (Information) Updated %d preserved connection

DESCRIPTION

WHAT NEXT

CTS-044 (Error) layer %s is not a routing layer

DESCRIPTION

You have passed a layer name to the '-layer_list' option of 'set_clock_tree_options' that is not a routing layer name

WHAT NEXT

If it is a typo error, please correct. Otherwise refer to the documentation to define this layer as a routing layer.

CTS-045 (Warning) could not find pin %s on cell %s

DESCRIPTION

You have specified a pin name using the *-timing_arc* option of **set_clock_tree_options** or the *-input* or *-output* option **set_clock_tree_references** which does not exist on the specified reference.

WHAT NEXT

Those commands will attempt to find a valid pin name for you for which timing information is available in the library, but you need to provide the correct pin name if the choice is not the one you expected.

CTS-046 (Warning) Selected timing arc of cell %s (%s to %s) is not unate! Clock tree synthesis will consider it unate with a %s polarity.

DESCRIPTION

The timing arc specified to the `set_clock_tree_options`, `set_clock_tree_references` command is not unate. Those commands will choose a default unateness for you based on the timing arcs available in the library. If both inverting and non-inverting timing arcs are available, the non-inverting timing arc will be chosen.

WHAT NEXT

If you do not want the chosen timing arc polarity, use `set_case_analysis` to invalidate the unwanted timing arc on the instance. You cannot use this method if the message was raised with the `set_clock_tree_references` commands, because there is no cell which the `set_case_analysis` command could be applied to.

CTS-047 (Warning) No valid timing arc found for specified pin %s in cell %s - selected timing arc is %s to %s

DESCRIPTION

A timing arc pin was specified using option `-timing_arc` of the `set_clock_tree_options` command, or option `-input` or `-output` of the `set_clock_tree_references` commands, but no valid timing arc was found using the specified port in the timing library. The command selected another valid timing arc for you.

WHAT NEXT

Check the port name that you specified. Check the data in the timing library.

CTS-048 (Warning) Could not find a%\$ timing arc for cell %s - will use cell as %s.

DESCRIPTION

Tool cannot find a timing arc of a proper polarity in the library for the specified reference.

WHAT NEXT

Use another cell or check library data.

CTS-049 (Error) Could not find a valid library timing arc to drive clock domain root pin: %s. Clock domain definition aborted.

DESCRIPTION

Either timing information cannot be accessed or the timing arc to or from the specified root pin are disabled.

WHAT NEXT

Check your 'link_path' and 'search_path' variables. Check for disabled timing arcs using 'report_disable_timing'. Use 'remove_disable_timing' to fix the problem. If the root of the clock tree is a top-level port, it is possible that no driving timing arc can be derived if no buffer is defined for the current clock tree (or if only inverters are defined), and no valid library cells with a buffer function can be found in the library (for instance because all the buffer library cells are set as dont_touch or dont_use cells). In this case, the easiest way out is to define a driving cell for the clock port using the **set_driving_cell** command. Another way is to remove dont_touch and dont_use attributes on some buffer library cells, and rerun **set_clock_tree_options**.

CTS-050 (error) Clock tree update failed for clock %s

DESCRIPTION

This error occurs because the update phase of the **compile_clock_tree** command is not able to modify the database according to the result of a clock tree synthesis run. Possible causes are the following: the specified clock tree has not been compiled, some library information is missing, or serious inconsistencies between the compiled clock tree database and the tool's database prevent the update from running successfully.

WHAT NEXT

Ensure that a **compile_clock_tree** command has run successfully. Ensure that logical libraries are available. Remove and redefine the clock tree, and recompile it.

CTS-051 (Error) no compiled database available for clock tree

%s - please run 'compile_clock_tree' before updating

DESCRIPTION

You want to run 'compile_clock_tree' but there is currently no compiled in-memory database for the clock tree that you specified.

WHAT NEXT

Make sure that 'compile_clock_tree' has run successfully. Use 'report_clock_tree' after running 'compile_clock_tree' to retrieve information about the compiled clock tree structure and performances.

CTS-052 (Error) cell %s is not legally placed

DESCRIPTION

You want to run 'compile_clock_tree' or 'report_clock_tree' but some hierarchies covered by the current clock tree are not legally placed. Timing cannot be estimated and clock cannot be synthesized if some hierarchies are not legally placed.

WHAT NEXT

Make sure that placement has been legalized at least in all the hierarchies covered by this clock tree.

CTS-053 (Information) Removing buffers and inverter pairs in clock tree %s: %s ...

DESCRIPTION

The 'remove_clock_tree_buffering' performs buffer removal in two passes.

WHAT NEXT

CTS-054 (Error) An error occurred while setting up the routing

engine driver

DESCRIPTION

WHAT NEXT

CTS-055 (Error) An error occurred while setting up the placement legalization engine driver

DESCRIPTION

WHAT NEXT

CTS-056 (error) Could not refresh placement information for clock %s

DESCRIPTION

This error occurs because the `compile_clock_tree` or `report_clock_tree` command attempted to update the clock tree synthesis internal data structure according to the current placement of the clock tree cells, but failed to do so. Possible causes are: some of the clock tree's instances or hierarchical blocks are not legally placed. The placement information must be available prior to running the clock tree synthesis tool.

WHAT NEXT

Run `legalize_placement` in all hierarchies touched by the clock tree.

CTS-057 (Error) Could not build blockage map for clock %s

DESCRIPTION

The '`compile_clock_tree`' command failed to initialize the blockage information needed by the CTS routing engine.

WHAT NEXT

Contact your support.

CTS-058 (Error) Could not initialize buffer property tables for clock tree %s

DESCRIPTION

This indicates one of three error conditions:

- absent or incorrect buffer cell defined for the clock tree
- pin name mismatch between logical and physical library
- logic libraries unavailable

WHAT NEXT

Check the library search path. Make sure at least one buffer cell was defined using 'set_clock_tree_references' for the current clock tree. Check the consistency of physical and logical libraries.

CTS-059 (Error) Clock tree synthesis failed for clock %s

DESCRIPTION

The 'compile_clock_tree' command was not able to produce a valid buffer tree for one of the subtrees of the current clock tree. This usually happens when some clock pins is so isolated that no clustering can be made without violating the buffer design rules even using low fanouts.

WHAT NEXT

Use a different buffer with higher drive strength. Override the max_capacitance constraint of the chosen buffer cell by using 'set_clock_tree_references' with the '-max_load' option. Manually insert buffers in front of those pathological clock pins and try to find a location for that buffer as close as possible to other sinks of the same subtree.

CTS-060 (Error) Could not build placement blockage map for

clock tree %s

DESCRIPTION

The 'compile_clock_tree' command failed to initialize the blockage information needed by the CTS routing engine.

WHAT NEXT

Contact your support.

CTS-061 (Warning) Clock tree constraint modified for trees %s

- Please update clock tree definition using 'set_clock_tree_options -initialize'.

DESCRIPTION

You have used one of the commands that modify the clock tree tracing constraints, but the corresponding clock tree has already been defined. This command has modified the clock tree tracing properties on the specified object, but the clock tree definition has not been updated to reflect this change.

WHAT NEXT

You need to perform 'set_clock_tree_options' using the '-intialize' option in order to reflect these changes in the CTS database of this clock tree.

CTS-062 (Error) Could not find a valid buffering solution for the current set of %s sinks

DESCRIPTION

The current set of sinks cannot be buffered without violating the driving cell and/or buffer design rules. This usually happens when the sinks are too scattered to produce clusters that the chosen buffers or gating cell can drive.

WHAT NEXT

CTS-063 (Information) Initializing placement blockage maps...

DESCRIPTION

WHAT NEXT

CTS-064 (Warning) No gating cell or sink pin can be traced to from pin %s: pin %s will be considered a sink of the clock domain.

DESCRIPTION

The reported gating cell pin does not have any fanout in the current netlist. The input pin that correspond to this gating cell or this hierarchical pin will be forced as a sink of the current clock domain.

WHAT NEXT

CTS-065 (Warning) Could not trace to any sink pin from specified root: %s.

DESCRIPTION

In the current netlist, the specified clock root instance output is not connected to any sink or gating cell pin. Please check your netlist.

WHAT NEXT

CTS-066 (Information) Legalizing buffer positions

DESCRIPTION

WHAT NEXT

CTS-067 (Information) Searching optimized buffering scheme for subtree rooted at %s (%d sinks)...

DESCRIPTION

WHAT NEXT

CTS-068 (Information) searching buffering scheme for excluded pins of subtree rooted at %s (%d excluded pins)...

DESCRIPTION

WHAT NEXT

CTS-069 (Error) Initializing routing blockage maps...

DESCRIPTION

Information message. The CTS needs information about routing blockages because it needs to know how to route the synthesized clock nets.

WHAT NEXT

CTS-070 (Information) compiling buffer trees for clock domain

%S...

DESCRIPTION

Information message.

WHAT NEXT

CTS-071 (Information) final routing and timing clock tree graph...

DESCRIPTION

Information message. The routing and timing information in the CTS database is being updated according yo the results of placement legalization.

WHAT NEXT

CTS-072 (Information) buffering subtree rooted at %s (%d sinks) using user-defined buffer structure...

DESCRIPTION

Information message.

WHAT NEXT

CTS-073 (Information) Cleaning blockage maps...

DESCRIPTION

Information message. This is the last step of the 'compile_clock_tree' command.

WHAT NEXT

CTS-074 (Error) No buffer defined for clock tree %s

DESCRIPTION

CTS cannot be performed until a set of references are marked as available for the compilation of a given clock tree using the 'set_clock_tree_references' command.

WHAT NEXT

Use the 'set_clock_tree_references' command to define some buffers or inverters for this clock tree.

CTS-075 (Error) Could not find %s pin %s on cell %s

DESCRIPTION

This error is caused by an inconsistency between the physical and logical libraries. For instance when the timing model of the cell is missing or the pin names in the physical library do not match the pin names in the logical library.

WHAT NEXT

Check the cell and pin names for mistype. Make sure that the correct logical and physical libraries are used. Check the library search paths.

CTS-076 (Error) Loop clock logic detected at pin %s - no clock tree will be created.

DESCRIPTION

Looping logic path inside clock networks are not supported. A looping logic path was detected in the fanout of the clock network for which you attempt to define a clock tree. The 'set_clock_tree_options' command will continue the tracing of the current clock tree netlist in order to detect all loops in the clock network, but will not create a clock tree object.

WHAT NEXT

Please define stop pins, excluded pins or floatpins as needed to define cut points

in the clock network in order to exclude looping logic.

CTS-077 (Warning) Instance %s does not have any output pin that can be timed from pin %s and drives a non-empty fanout. Cannot trace through cell.

DESCRIPTION

Your clock network contains a combinatorial cell that does not have any output, lacks timing information or does not drive any pins. The 'set_clock_tree_options' command tries to make a gating cell out of the instance, but finds no timing arc to trace to valid output.

WHAT NEXT

The pin reported in the message is going to be forced as a sink of the current clock tree. If you want to change this, you have to make sure this cell has one output pin that drives some fanout and has suitable timing information. If you do not want to balance clock delays to this pin, use the **set_clock_tree_exceptions** command to exclude it from the delay balancing, and skew report.

CTS-078 (Error) capacitive load of %s%\$ pin is %.3f, while the best buffer can drive only %.3f

DESCRIPTION

Clock tree cannot be compiled because the fanout associated with one of the pins is too large to be driven by any of the buffers available from design library specified.

WHAT NEXT

Use a different buffer with higher drive strength. If this is a capacitance associated with a floatpin, then appearance of this error could mean that the capacitance value of the floatpin, specified in 'set_clock_tree_exceptions' command, is unrealistic.

CTS-079 (Warning) Delay calculation failed. Estimating delays

for the instance %s of cell %s.

DESCRIPTION

The delay calculation using Primetime timing engine did not succeed. The delays are being estimated.

WHAT NEXT

The delay values may not be as accurate.

CTS-080 (Error) Could not find a logic library pin %s on cell %s.

DESCRIPTION

Inconsistent or missing logic library data.

WHAT NEXT

Check your logic library search path and the accessibility of the logic library files.

CTS-081 (Error) Timing engine failed to time timing arc between pins %s and %s for cell %s.

DESCRIPTION

Timing environment was not properly initialized prior to CTS.

WHAT NEXT

Check your timing library search path. Check the accessibility of the timing library data.

CTS-082 (Error) Unable to find a buffering solution satisfying

design rules

DESCRIPTION

Unable to find a buffering solution which will conform to all the design rules using the buffer/inverter specified.

WHAT NEXT

Choose a buffer with a higher capacity

CTS-083 (Warning) The cell %s specified as reference does not exist in any library

DESCRIPTION

The cell specified as reference does not exist in the given libraries

WHAT NEXT

Either choose a cell which exists in the libraries or add the library which contains this cell.

CTS-084 (Error) The reference name has not been specified

DESCRIPTION

The reference name has not been specified

WHAT NEXT

Please specify a valid cell name as argument to -reference

CTS-085 (Error) Root pin of the clock tree (%s) actually drives nothing

DESCRIPTION

The external net is missing for the output pin of the clock tree (%s). This error

might be caused by either error in design file, or when PrimeTime removed several timing arcs, which also indicates potential problems with design.

WHAT NEXT

Check specified clock root and make sure it drives the clock net. Analyse the PrimeTime warning messages.

CTS-086 (Error) Pin %s is not connected - clock tree definition aborted.

DESCRIPTION

The pin specified as the clock root does not have any nets within the block. The clock pin must be connected inside for Clock tree synthesis to proceed correctly.

WHAT NEXT

Specify a clock pin which does have a internal net

CTS-087 (Warning) max_transition constraint for library pin %s/%s (%f) is not compatible with the selected max_capacitance for that cell (%f) - resetting to %f.

DESCRIPTION

Loading this pin with the selected max_capacitance leads to situations where the current max_transition constraint for that pin is violated. A new value for the max_transition constraint of that library pin will be computed to be used within CTS, so that the whole range of allowable load capacitances can be used without violating its max_transition constraint.

WHAT NEXT

Make sure that your library defines compatible values for the max_transition and max_capacitance of library cell pins.

CTS-088 (Warning) CTS and HFCTS cannot be performed

simultaneously.

DESCRIPTION

The option `-high_fanout_net` in `compile_clock_tree` tells the tool to perform HFCTS which is a high fanout net synthesis for signal nets using clock tree synthesis (CTS) techniques. When the both options `-clock_trees` and `-high_fanout_net` are given in `compile_clock_tree`, you are asking the tool to perform CTS on clock nets and HFCTS on signal nets simultaneously. Current version of `compile_clock_tree` doesn't support such kind of synthesis.

WHAT NEXT

Please specify either `-clock_trees` or `-high_fanout_net` option in `compile_clock_tree` command.

CTS-089 (Error) could not create db object for clock-tree domain %s - aborting.

DESCRIPTION

WHAT NEXT

Contact your application support.

CTS-090 (Error) could not match a db pin for %s - aborting.

DESCRIPTION

WHAT NEXT

Check the pin name passed to '`-root` '`-timing_arc`' option of '`set_clock_tree_options`

CTS-091 (Error) Could not backannotate pin-to-pin delay

between %s and %s

DESCRIPTION

WHAT NEXT

CTS-092 (Error) Could not run dplacer after finishing clock tree synthesis

DESCRIPTION

The run of dplacer has finished abnormally after compilation of buffered clock tree

WHAT NEXT

CTS-093 (Warning) Port %s has back-annotated fanout number and/or wire-load model. CTS will assume an external load of %f capacitance units for that port.

DESCRIPTION

CTS currently does not support the computing of external port load based on wire-load models and the fanout number. Only capacitance values annotated on the port using the **set_load** command will be taken into account.

WHAT NEXT

Use the **set_load** command to annotate the desired external load on the specified clock port. Remove the annotated fanout number on the port using **remove_attribute**. Make sure that annotated capacitance not only does not violate max_cap DRC constraint but also leaves enough margin for CTC to meet this constraint for the net driven by the clock tree root port.

CTS-094 (Information) Running legalizer ...

DESCRIPTION

Legalizer is running after compilation of buffered clock tree.

WHAT NEXT

CTS-095 (Error) Could not provide a report for the clock %s

DESCRIPTION

'report_clock_tree' command failed to provide a report of the clock tree

WHAT NEXT

CTS-096 (Information) Checking the legality of placement...

DESCRIPTION

Checking the legality of placement after legalizing the placement.

WHAT NEXT

CTS-097 (Error) Design is not flattened.

DESCRIPTION

Commands related to clock tree synthesis can only be run on flat designs in this release.

WHAT NEXT

Flatten the design by using the command "ungroup -flatten -all".

SEE ALSO

ungroup (2)

CTS-098 (Information) Removing clock latency on %s %s ...

DESCRIPTION

You receive this information message because the synthesized clock is set to be propagated, and clock latency, which is the attribute of an ideal clock, is removed.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-099 (Warning) CTS will use a library cell %s, which has dont_touch or dont_use attribute.

DESCRIPTION

Library cell with a dont_use or dont_touch attribute is being specified as a clock tree reference.

WHAT NEXT

If you are positive this library cell is a right choice for CTS, you can ignore this message. Otherwise, please remove this library cell from clock tree reference list.

CTS-100 (Error) No exception type has been specified for %s.

DESCRIPTION

set_clock_tree_exceptions and remove_clock_tree_exceptions commands need at least one exception to be specified.

WHAT NEXT

Specify list of stop pins and/or list of exclude pins and/or list of float pins.

CTS-101 (warning) Incomplete float pin definition. Using default

values to fill in missing parameters.

DESCRIPTION

This warning message occurs because the `set_clock_tree_exceptions` command requires a list of input pins, the appropriate values of `-float_pin_min_delay_rise`, `-float_pin_max_delay_rise` (and/or `-float_pin_min_delay_fall`, `-float_pin_max_delay_fall`), This warning indicates that maximum/minimum delay is not specified and its value is copied from the specified minimum/maximum delay with the same edge type.

WHAT NEXT

This is only a warning message. If the results are not what you intended, check that the float pin definitions meet your expectations.

SEE ALSO

`set_clock_tree_exceptions(2)`

CTS-102 (Information) Removing clock uncertainty on %s %s ...

DESCRIPTION

You receive this information message because the synthesized clock is set to be propagated, and clock uncertainty, which is the attribute of an ideal clock, is removed.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-103 (Information) Removing clock transition on %s %s ...

DESCRIPTION

You receive this information message because the synthesized clock is set to be propagated, and clock transition, which is the attribute of an ideal clock, is removed.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-104 (Error) Incorrect float pin definition

DESCRIPTION

Float pin definition has been provided for `set_clock_tree_exceptions` command without specifying a list of float pins to which this definition should be applied, or without specifying any delay value for float pin, or with specifying `min_delay(rise/fall)` value larger than `max_delay(rise/fall)` value.

WHAT NEXT

Make sure to specify a list of input pins to be treated as float pins. Make sure that at least one of `max_delay_rise`, `min_delay_rise`, `max_delay_fall` and `min_delay_fall` values should be specified. Make sure that `max_delay >= min_delay` if delay values for rise/fall are specified.

SEE ALSO

`set_clock_tree_exceptions(2)`

CTS-105 (warning) Cannot route high fanout net

DESCRIPTION

This warning occurs because noback-annotation is accepted from the core clock tree synthesis algorithm. When this occurs the tool applies its internal global router to route new nets that have appeared in the netlist as a result of clock tree synthesis. This message indicates that the net driven by the clock tree root (in the case when it is a port of the top level design), is a high-fanout net. Thus, the internal router cannot route it, and no back-annotation is applied. High-fanout nets receive special treatment during timing analysis. This might cause unreasonable delay estimations.

WHAT NEXT

You can apply the `set_port_fanout_number` command to set reasonable value (for example: 1) of fanout on the clock port used as the root of a clock tree. Then, recompile your clock tree.

CTS-106 (Warning) Clock root drives unreasonably high load

DESCRIPTION

Total load of a root pin of a clock tree does not meet design constraints. This is

likely caused by the fact that the clock net has received special treatment on earlier stages of design flow. `report_clock_tree` command will straightforwardly apply this unreasonable load while estimating path delays.

WHAT NEXT

If there is no intention to use this load on synthesized clock tree, make sure to remove 'load' and 'wire_capacitance' attributes on the clock root pin. Rerun `report_clock_tree`. Otherwise, accept the result of `report_clock_tree` command as is.

CTS-107 (Error) Cannot use library cell %s for CTS buffering as cell is not in the physical library.

DESCRIPTION

Library cells without physical description cannot be used by synthesis and CTS.

WHAT NEXT

Update the physical library or specify another library cell.

CTS-108 (Warning) No timing arc available to cross cell %s (%s) from pin % to pin %s in design %s - forcing cell as sink.

DESCRIPTION

One of the combinatorial cells in the transitive fanout of the current clock root does not have a valid timing arc that can be traced through. The input of that cell will be considered a sink of the clock-tree for the purpose of CTS and the potential clock-sinks that it drives will not be considered.

WHAT NEXT

Check disabled timing arcs on this cell using `report_disable_timing`. Check if the cell has timing information using `report_cell`.

CTS-109 (Warning) Cannot resolve timing arc %s -> %s in cell

%s (%s) to a unate timing arc - forcing cell as sink.

DESCRIPTION

One of the combinatorial cells in the transitive fanout of the current clock root does not have a timing arc that can be forced to a unate arc type. The input of that cell will be considered a sink of the clock-tree for the purpose of CTS and the potential clock-sinks that it drives will not be considered.

WHAT NEXT

Check disabled timing arcs on this cell using `report_disable_timing`. Check if the cell has timing information using `report_cell`. Check the function implemented by that cell: if all the possible transitions through that cell are not a superset of the two possible unate transition sets, then this cell cannot be considered as a gating element for the clock signal because it actually changes the waveform of the resulting signal.

CTS-110 (Warning) Specified -clock_trees did not match any clock tree, or no clock tree defined under current design. Ignoring reference list specification.

DESCRIPTION

You receive this message because there is no clock tree matching the specified criteria to which the command that generated the warning message can be applied. If no `-clock_trees` option is specified, the command defines the default buffer/inverter reference list for every clock tree in the design, regardless of whether some clock tree objects already exist at the time the command is issued. If no the `-clock_trees` option is present on the command line with a valid argument, then the error is raised in the case where the argument does not match a currently-existing clock tree object.

WHAT NEXT

No action is required on your part. However, you can ensure that you are in the right design by using the `current_design` command. Use the `set_clock_tree_options` to create an initial clock tree object in your database. If you want to apply current reference list to all the clock trees in the design, do not use `-clock_trees` option at all. Using the `set_clock_tree_references` command may produce this message.

SEE ALSO

`current_design` (2), `set_clock_tree_options` (2), `set_clock_tree_references` (2).
`options` (2), `set_clock_tree_references` (2).

CTS-111 (Warning) Incorrect range specification %s - ignored.

DESCRIPTION

Refer to the **get_clock_tree_object** man page for a description of the *-levels* option syntax.

WHAT NEXT

Check the option syntax.

CTS-112 (Information) Moved %d preexisting cells in the clock tree.

DESCRIPTION

Clock Tree Synthesis has moved some clock tree cells to get the better delay and skew.

WHAT NEXT

CTS-113 (Information) Estimating the loads and delays on the nets...

DESCRIPTION

Legalizer might move some cells to avoid the overlaps between the clock buffers and existing cells. The estimated delays and loads might not remain accurate. It is estimating the delays and loads on the nets.

WHAT NEXT

CTS-114 (Information) Estimating the loads and delays on the nets terminated abnormally.

DESCRIPTION

Estimating the loads and delays on the nets was not successful.

WHAT NEXT

CTS-115 (Error) Hierarchical pin %s found in clock domain %s.

DESCRIPTION

When a clock is defined on a hierarchical pin, the hierarchical pin will show up on the timing graph. Since hierarchical pins do not have physical location, timing information cannot be calculated correctly for CTS and CTS will skip the clock domains that contain such hierarchical pins.

If a timing constraint or exception is defined on a hierarchical pin, the hierarchical pin will also show up on the timing graph and cause CTS to skip the clock domain that contains the pin. This is often due to improper use of wild-card in SDC statements that put timing constraints/exceptions on clock networks.

WHAT NEXT

Dump out SDC, then search and remove clock definitions and timing constraints/exceptions on the hierarchical pin.

CTS-116 (Error) Cannot use library cell %s for CTS buffering as this library cell does not have exactly one input and one output pin.

DESCRIPTION

Library cells which have more than one input or output pins, or any bidirectional pins, cannot be used for CTS buffering.

WHAT NEXT

Please specify the library cell which has only one input pin and one output pin.

SEE ALSO

`set_clock_tree_references(2)`

CTS-117 (Warning) Set %s exception on a pin with %s

exception already

DESCRIPTION

Specified exception is set on a pin that already has an explicit exception on it. Explicit exceptions of pin has rule of precedence: Explicit-Nonstop > Explicit-Ignore > Explicit-Float > Explicit-Stop. Exception with higher priority can override that with lower priority. If the specified exception is lower than the former one in priority, the former will be retained and the latter is ignored.

WHAT NEXT

Make sure you are using the right exception on a specified pin. If you really want to set the latter exception but it is ignored for lower priority, please use `remove_clock_tree_exceptions` command to remove the pre-existing exception on that pin first.

SEE ALSO

```
set_clock_tree_exceptions(2)  
remove_clock_tree_exceptions(2)
```

CTS-118 (Information) Pin %s is connected to a pad net. CTS will attempt buffering behind pad cell %s.

DESCRIPTION

You receive this message because the root of the clock-tree was specified on a top-level port or an input pin of a pad cell that connects to a pad net. (A pad net is a net that connects a top-level design port to a pad cell pin.) Clock Tree Synthesis (CTS) cannot buffer such nets because they are implemented outside of the chip. CTS is attempting to use the pad cell as the real root cell for the current clock tree.

WHAT NEXT

Ensure that the reported pad cell is the correct driver for the current clock tree. If not, change the definition of the current clock tree and use an input pad output pin or a core cell pin to define the clock root.

CTS-119 (Warning) Input transition of %f and/or output capacitance %f lead to negative delay while timing %s (%s) cell

between %s and %s pins. Using zero delay value instead.

DESCRIPTION

You receive this message because the delay calculation engine returned a negative cell delay.

WHAT NEXT

No action is required on your part. However, you can ensure that you are using your library cells within their characterization range.

CTS-120 (Warning) Input transition of %f and/or output capacitance %f lead to negative output slew while timing %s (%s) cell between %s and %s pins. Using zero slew value instead.

DESCRIPTION

You receive this message because the output slew calculation engine returned a negative output transition value.

WHAT NEXT

No action is required on your part. However, you can ensure that you are using your library cells within their characterization range.

CTS-121 (Warning) Clock %s has ideal clock attributes. No timing will be reported.

DESCRIPTION

You receive this message because the `report_clock_tree` command detected that the reported clock tree is part of a clock network that carries one or more ideal clock attributes, as set by using the `set_clock_latency`, `set_clock_uncertainty`, or `set_clock_transition` command. Meaningful clock delays cannot be reported for such a clock. In this case, the `report_clock_tree` command reports only the clock tree netlist structure. For this command to report meaningful clock delays, the clock tree must be part of a clock network that is set in propagated delay mode and does not have ideal clock attributes.

WHAT NEXT

No action is required on your part. However, this message usually appears when you attempt to run **report_clock_tree** on a nonsynthesized clock. To be able to time the clock network, you must first synthesize it by using the **compile_clock_tree** command, or you must run it on a netlist that already has buffered clock networks from a third-party tool. The **compile_clock_tree** command manages any ideal attributes present on the clock, but if your goal is to report a clock tree generated from a third-party tool, you must manually remove the ideal clock attributes by using the **remove_clock_latency**, **remove_clock_uncertainty**, and **remove_clock_transition** commands.

SEE ALSO

compile_clock_tree (2), **remove_clock_latency** (2), **remove_clock_transition** (2),
remove_clock_uncertainty (2), **report_clock_tree** (2), **set_clock_latency** (2),
set_clock_transition (2), **set_clock_uncertainty** (2).

CTS-122 (Error) Cannot modify dont_touch hierarchy %s for %s/%s pin.

DESCRIPTION

You receive this message because a clock tree in your design traces to the reported pin, which is found within a subdesign protected by the **dont_touch** attribute. Clock Tree Synthesis cannot compile this clock tree because a **dont_touch** subdesign cannot be modified.

WHAT NEXT

Remove the **dont_touch** attribute from the subdesign represented by the specified hierarchical cell as follows.

1. Execute the **report_cell** command for the hierarchical cell specified by this message. This provides you with the name of the corresponding subdesign.
2. Use the **current_design** command to set this subdesign to be the *current_design*.
3. Remove the **dont_touch** attribute from the *current_design*.
4. Set the *current_design* back to the one you work on.
5. Uniquify the design.

SEE ALSO

current_design (2), **report_cell** (2).

CTS-123 (Information) Convergent clock paths in clock network at output pin %s

DESCRIPTION

You receive this message because two different clock paths in the netlist start at the specified root and trace to the same pin.

The **compile_clock_tree** command automatically infers subtrees starting from each convergence cell in the clock network and automatically compiles the inferred subtrees in a bottom-up order. When compiling the main clock tree, a `dont_touch_subtree` constraint is automatically applied on the pins of each convergence cell.

WHAT NEXT

You may choose to define a stop pin or an exclude pin exception on the pins of certain convergence cells. This might be desirable, for example, if the subtree rooted behind a reconvergence does not drive any sequential cell clock pins. In this situation, you could choose to define a stop pin or an exclude pin exception on the pins of certain convergence cells. The **compile_clock_tree** command does not automatically detect such design-specific situations, and it is the user's responsibility to set the appropriate clock tree exceptions in these cases.

SEE ALSO

compile_clock_tree (2).

CTS-124 (Warning) Convergent clock paths detected at pin %s

- Please define a clock tree rooted at that pin and compile it prior to compiling the current clock tree.

DESCRIPTION

Two different clock paths tracing to the same pin were detected in the fanout of the clock network for which you attempt to define a clock tree. The `set_clock_tree_options` command will force the subtree rooted at the reconvergence to be a `dont_touch_subtree`.

WHAT NEXT

Apply one of the following methods, depending on the desired design functionality:
1) if the clock tree does not contain any sinks behind the reconvergence, define all the input pins of the reconvergent cell that are on the clock network as stop or excluded pins. Declare them as stop pins if you want the delay at the reconvergent

cell input to be the same as other clock pins, or declare them as excluded pins if you do not care about the clock delays behind the reconvergence. 2) if the clock tree does not contain any sinks before the reconvergence, redefine the root of the clock tree at the output of the reconvergent cell. 3) if the clock tree contains sinks both before and after the reconvergence, declare a new clock tree rooted at the output of the reconvergent cell and compile it before the main clock tree. While compiling the main clock tree, the **compile_clock_tree** command will automatically force this sub-clock tree as a `dont_touch_subtree`, and will preserve existing buffering on that subtree. Make sure that you compile the any reconvergence subtree BEFORE you compile the main clock tree, otherwise this part of the clock-tree will not be properly buffered. If a reconvergent clock tree contains reconvergences, make sure that the deepest subtrees are compiled first and compile the convergence subtrees in a bottom up order.

In case 3), it is the user responsibility to ensure that a convergence subtree is compiled before compiling the clock tree that contains it.

CTS-125 (Warning) Skew values reported possibly are between exclusive clock paths behind a reconvergence in the clock network.

DESCRIPTION

You receive this message because the tool detected two different clock paths that trace to the same pin in the fanout of the clock network that you are attempting to report. The `report_clock_tree` command might have computed a skew that can be obtained only from exclusive clock paths.

WHAT NEXT

Use the `set_case_analysis` command to resolve conflicting clock paths at each reconvergence. Use the list of the reconvergences signaled by the **CTS-126** message to set appropriate case analysis conditions for verifying the clock tree timings. Run the `report_clock_tree` command for each exclusive clock propagation scenario.

SEE ALSO

CTS-126 (n); **report_clock_tree** (2).

CTS-126 (Information) reconvergence detected between pins

%S/%s and %s/%S.

DESCRIPTION

You receive this message because the two reported pins are driven from two distinct branches of the clock network and drive a shared portion of the clock network, called a reconvergence. The `report_clock_tree` may have computed a skew that can be obtained only from exclusive clock paths. It is important to set timing constraints appropriately to study the propagation of the clock signal in each of the exclusive scenarios resulting from the reconvergence.

WHAT NEXT

Use `set_case_analysis` to resolve conflicting clock paths at each reconvergence. Use the list of the reconvergences signaled by this message to set appropriate case analysis conditions in order to verify the clock tree timings. Run `report_clock_tree` for each exclusive clock propagation scenario.

SEE ALSO

`report_clock_tree` (2), `set_case_analysis` (2).

CTS-127 (warning) Possible clock tree overlap detected for %S .

DESCRIPTION

This warning occurs because the specified clock, which has not yet been compiled, includes one or more cells that either belong to one of the already-compiled clock trees or represent existing buffering.

WHAT NEXT

No action is required on your part if you want to keep preexisting buffering. Otherwise, use the `remove_buffer_tree` command to remove it.

The tool automatically handles overlapping clock paths by setting an implicit `dont_touch` subtree exception on the overlapping clock subtree after you synthesize the first clock in the overlapping clock path. For the best results, compile the most critical clock first.

SEE ALSO

`remove_buffer_tree`(2)
`set_clock_tree_exceptions`(2)

CTS-128 (Error) Non-default routing rule %s for clock tree %s does not exist in current technology database - clock routes will be implemented using default routing rule.

DESCRIPTION

The *-routing_rule* option of **set_clock_tree_options** was passed a routing rule name which cannot be matched in the technology database of the current design.

WHAT NEXT

Please check for typos and make sure that you are passing the correct routing rule name to the command **set_clock_tree_options**.

CTS-129 (Information) Specified hard constraint of %d buffer levels for %s clock.

DESCRIPTION

You receive this information message because there is a nonzero number of buffer levels either in the design database file or being passed through the *-number_of_levels* option of the **set_clock_tree_options** command for the use by the Clock Tree Compiler.

This constraint is considered for nongated clock trees only.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

set_clock_tree_options (2).

CTS-130 (Information) Specified soft constraint the structure of minimum number of buffers per level for %s clock.

DESCRIPTION

You receive this information message because the tool found the specified structure

of the minimum number of buffers and/or inverters per level in the design database file or passed through the **-number_of_instances_per_level** option of the **set_clock_tree_options** command for use by the Clock Tree Compiler (CTC).

WHAT NEXT

The CTC does not precisely follow this structure, but handles it as a soft constraint instead.

This is an informational message only. No action is required on your part.

SEE ALSO

set_clock_tree_options (2).

CTS-131 (Warning) Max_delay of %f is less than Min_delay of %f for %s clock. Min_delay value will be ignored.

DESCRIPTION

You receive this warning message because inconsistent max_delay and min_delay constraints occur in the design database file, or are passed through the **-max_delay** and **-min_delay** options of **set_clock_tree_options** command for use by the Clock Tree Compiler (CTC).

CTC cannot satisfy contradicting constraints, so min_delay is ignored.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, you can eliminate the warning message by making the referred constraints consistent.

SEE ALSO

set_clock_tree_options (2).

CTS-132 (Warning) The difference between Max_delay of %f and Min_delay of %f is less than Max_skew of %f for %s clock.

Max_skew value will be ignored.

DESCRIPTION

You receive this warning message because inconsistent max_delay, min_delay, and max_skew constraints occur in the design database file, or are passed through the **-max_delay**, **-min_delay**, and **-max_skew** options of the **set_clock_tree_options** command for the use by the Clock Tree Compiler (CTC).

CTC cannot satisfy contradicting constraints, so max_skew is ignored.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, you can eliminate the warning message by making the referred constraints consistent.

SEE ALSO

set_clock_tree_options (2).

CTS-133 (Error) Port %s of design %s cannot be a root port because it is not a port of the top-level design.

DESCRIPTION

You receive this error message because the **set_clock_tree_options** command or another Clock Tree Compiler command was passed a root port that is not a port of the top-level hierarchy. Only top-level ports or leaf-cell pins can be specified as the root of a clock tree.

WHAT NEXT

Check the root pin and root port arguments in the script. You might have passed the result of a **get_ports** command instead of the result of a **get_pins** command as a root pin or root port argument.

Make the necessary corrections and run the command again.

SEE ALSO

get_pins (2), **get_ports** (2), **set_clock_tree_options** (2).

CTS-134 (Error) Design database does not have routing grid.

DESCRIPTION

The information about the routing tracks on the metal layers is missing from the design database. Global router cannot be run for the net synthesized during clock tree synthesis. The delays and capacitances on the nets will not be backannotated. The post route results might not correlate well with the report_clock_tree.

WHAT NEXT

Update the design database with the information regarding the routing grid.

CTS-135 (Information) Setting %s clock to be propagated...

DESCRIPTION

You receive this information message because the synthesized clock is set to be propagated.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-136 (Information) Driving cell %s (%s to %s) has been found in the netlist for the root pin of the clock tree.

DESCRIPTION

You receive this information message when the tool applies the cell found in the netlist as the driver of the root of your clock tree.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, if the root is a hierarchical pin, you can use the **set_driving_cell** command to specify another driver.

SEE ALSO

set_driving_cell (2).

CTS-137 (Information) Detected an ILM block clock port %s - forcing a dont_touch_subtree

DESCRIPTION

You receive this information message because an input clock pin of an SISM hierarchy is detected on the clock tree. The clock subtree driven inside the SISM hierarchy is forced as a dont_touch_subtree.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-138 (Information) There are exceptions for %s clock tree. Use -exceptions option to get more information.

DESCRIPTION

You receive this information message because there are exceptions on the specified clock tree.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can use the **-exceptions** option for the **report_clock_tree** command to get detailed information on the pin name and type of each exception.

SEE ALSO

report_clock_tree (2).

CTS-139 (Warning) Library cell %s will not be used for CTS buffering since it carries a dont_touch or dont_use attribute.

DESCRIPTION

You receive this warning message because library cells with a **dont_use** or **dont_touch** attribute cannot be used by synthesis and CTS.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, if you are positive this library cell is a correct choice for CTS, you can remove the **dont_touch** or **dont_use** attribute on the library cell with the following commands:

```
set_dont_touch [get_lib_cell lib_name/reference_name] false  
set_attribute [get_lib_cell lib_name/reference_name] dont_use false
```

SEE ALSO

set_attribute (2), **set_dont_touch** (2).

CTS-140 (Error) Cannot find any valid reference for buffering.

DESCRIPTION

This error message indicates that none of the library cells specified in the list of available references can be used by synthesis and CTS. If your flow does not use the **set_clock_tree_references** command, this is valid for the entire list of buffers/inverters available in the target library. This error message occurs when all of the library cells have the **dont_touch** or **dont_use** attribute.

WHAT NEXT

Confirm that the library cell you specified with the **set_clock_tree_references** command is the correct choice for CTS. Use the following commands to remove the **dont_touch** or **dont_use** attribute on the library cell and then run the command again.

```
set_dont_touch [get_lib_cell lib_name/reference_name] false  
set_attribute [get_lib_cell lib_name/reference_name] dont_use false
```

Alternatively, you can reset the entire list of references using the **reset_clock_tree_references** command. All of the appropriate references from the library are then available for the synthesis engine.

SEE ALSO

reset_clock_tree_references (2), **set_attribute** (2), **set_clock_tree_references** (2),
set_dont_touch (2).

CTS-141 (Information) Sink pin %s has timing arcs to internal

pins and will be forced as a floatpin exception

DESCRIPTION

You receive this information message when the Clock Tree Compiler (CTC) detects timing arcs between the specified pin and internal pin of the same cell. The timing arcs are used to estimate internal clock delays in the cell.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-142 (Warning) Sink pin %s is a floatpin and has timing arcs to internal pins - overriding internal delay model with the floatpin definition

DESCRIPTION

You receive this warning message because the Clock Tree Compiler (CTC) detects timing arcs between the specified sink pin and the internal pin of the same cell. The timing arcs are ignored because there is also a floatpin attribute on that pin.

The CTC uses the floatpin attributes to evaluate the internal delays associated with this sink pin.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, if you want the CTC to use the internal delay models instead of the floatpin attributes, use the **remove_clock_tree_exceptions** command on the pin to delete the floatpin attributes.

SEE ALSO

remove_clock_tree_exceptions (2).

CTS-143 (Error) Could not find the logical or physical libraries.

DESCRIPTION

Inconsistent or missing library data.

WHAT NEXT

Check your search path and the accessibility of the library files.

CTS-144 (Warning) Some routing tracks on layer %s are outside the core area.

DESCRIPTION

Some of the routing track on the specified layer in the floorplan are outside the core area.

WHAT NEXT

Check your floorplan. Write out the PDEF file to see the core area and routing track definition, correct it and read back the modified PDEF file.

CTS-145 (Error) Port %s has back-annotated external load of %f capacitance units, which exceeds max_cap DRC constraint of %f.

DESCRIPTION

CTS currently does not support the computing of external port load based on wire-load models and the fanout number. Only capacitance values annotated on the port using the **set_load** command will be taken into account. If this capacitance exceeds max_cap DRC constraint, there is no way compiled clock tree will meet this constraint.

WHAT NEXT

Use the **set_load** command to annotate the desired external load on the specified clock port. Remove the annotated fanout number on the port using **remove_attribute**. Make sure that annotated capacitance not only does not violate max_cap DRC constraint but also leaves enough margin for CTC to meet this constraint for the net driven by the clock tree root port. One can resolve the problem in the opposite way, namely by relaxing max_cap constraint.

CTS-146 (Information) Removed %d buffers and/or inverters

DESCRIPTION

WHAT NEXT

CTS-147 (Warning) Invalid argument value for -edge: %s - resetting to default.

DESCRIPTION

Possible values for this options are {rise fall both default}.

WHAT NEXT

Check your script. Consult the **set_clock_tree_exceptions** man pages for more details on the **-active_edge** option.

CTS-148 (Error) Cannot specify **-active_edge** without **-stop_pins**.

DESCRIPTION

The **-active_edge** option was specified on the command line but there was no **-stop_pins** list.

WHAT NEXT

Check your script. Consult the **set_clock_tree_exceptions** man pages for more details on the **-active_edge** option.

CTS-149 (Error) Invalid **-priority** value specified.

DESCRIPTION

The value for **-priority** option can only include one or more items from the following list {'skew' 'delay' 'instances' 'area'}.

WHAT NEXT

Check your script. Make sure to use correct values.

CTS-150 (Warning) Tracing through sequential preexisting cell: %S.

DESCRIPTION

A latch or some other type of sequential cell is found on the clock network and considered as preexisting logic because it contains combinatorial arcs that can be traced through.

WHAT NEXT

Define a stop_pin or exclude_pin on the input pin of this preexisting cell using the **set_clock_tree_exceptions** command if you do not want to balance clock delays on clock pins beyond the reported cell. Define a stop_pin if you want to balance the delay to the input of the preexisting cell with the delays to the other clock pins. Define an exclude pin in case you do not want to balance this delay.

CTS-151 (Information) Sizing the preexisting cells in the clock tree %S.

DESCRIPTION

The tool is beginning the gate sizing stage for the specified clock tree.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, If you do not want to size gates, reissue the **compile_clock_tree** command without specifying the **-size_gates** option.

SEE ALSO

compile_clock_tree (2).

CTS-152 (Information) Replaced the library cell of %s from %s

to %s.

DESCRIPTION

The tool is pointing to the instance cell being sized. The message includes both source and destination reference cells.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-153 (Information) Sized %d preexisting cells.

DESCRIPTION

The tool is showing the number of sized cells in the clock network.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-154 (Warning) Reference %s will be ignored for compilation of %s clock tree.

DESCRIPTION

You specified a reference using -reference_per_level option of 'set_clock_tree_options' command but this reference is not in the list available for compilation of a given clock tree.

WHAT NEXT

Make sure to pass the reference through 'set_clock_tree_references' command prior to issuing 'compile_clock_tree'. Alternatively, you can rerun 'set_clock_tree_options' command where specified reference is removed from the list passed through -reference_per_level option.

CTS-155 (Warning) Specified -reference_per_level option will

be ignored to avoid bad logic in %s clock tree.

DESCRIPTION

You specified an odd number of inverters in -reference_per_level option of 'set_clock_tree_options' command, which could result in bad logic if followed strictly.

WHAT NEXT

Make sure to pass an even number of inverters through 'set_clock_tree_references' command.

CTS-156 (Warning) drive of root pin %s is incompatible with max_transition constraint %f: input transitions (%f, %f), load %f lead to (%f, %f) output transition on the root pin

DESCRIPTION

Clock Tree Compiler detects an incompatibility between the library model of the reported clock tree root cell and the specified max_transition constraint currently in use for this clock tree. Even using "reasonable" input transitions (the minimum between a typical input transition and the actual transition times on the input of the root), and a typical root net load, the transition times computed at the root pin are bigger than the reported constraint. The values of the input transitions and output load, as well as the resulting root pin transition values are reported in the message.

WHAT NEXT

Consider swapping the root cell to a logical equivalent with a higher drive. Check the timing library model of the root cell. Check that the max_transition constraint is feasible. Do not use 0 max_transition constraint as way to give a higher cost to max_transition DRC while compiling clock trees. Use instead the dedicated options of compile_clock_tree in order to control the cost trade-offs of the CTS buffering algorithm.

CTS-157 (Error) library model for root pin %s is incompatible with max_insertion_delay constraint %f: input transitions (%f,

%f), load %f lead to (%f, %f) insertion delay spent in the root cell

DESCRIPTION

Clock Tree Compiler detects an incompatibility between the library model of the reported clock tree root cell and the specified max_insertion_delay constraint used for this clock tree. Even using "reasonable" input transitions (the minimum between a typical input transition and the actual transition times on the input of the root), and a typical root net load, the delay spent in the root cell is bigger than the insertion delay allocated for the whole clock tree. The values of the input transitions and output load, as well as the resulting root cell delay values are reported in the message.

WHAT NEXT

Consider swapping the root cell to a logical equivalent with a higher drive. Check the timing library model of the root cell. Check that the insertion delay constraint is feasible. Do not use 0 as the insertion delay constraint in the hope of getting the minimum insertion delay possible. Use instead the dedicated options of compile_clock_tree in order to control the cost trade-offs of the CTS buffering algorithm.

CTS-158 (Error) transitions (%f, %f) on root cell input pin %s limit output load to %f using max_transition rule %f on the output

DESCRIPTION

The input side of the clock tree root cell is driven by a signal with the transition times reported in the message. This prevents Clock Tree Compiler from loading the root net with more than the advertised value, which seems too small with regard to the value of the gate capacitance of available clock tree buffers. Clock tree compilation is aborted because no solution to buffer the root net is feasible without violating the Design Rule Checks currently in use.

WHAT NEXT

If the input transitions are fairly close to the max_transition rule currently in use, it may result in a tight load constraint on the output. This may also be caused by the weak drive of the root cell. Consider swapping the root cell to a logical equivalent with a higher drive. If applicable, investigate the reason for the high input transition times and fix them. Available alternatives include, but are not limited to: buffering the fanin of the root cell, increasing the drive strength of the fanin net driver, removing or relaxing ideal or back-annotated clock transitions propagated to the root cell input.

CTS-159 (Warning) transitions (%f, %f) on root cell input pin %s limit output load to %f: using input transition of (%f, %f), max_capacitance of %f

DESCRIPTION

The input side of the clock tree root cell is driven by a signal with the reported transition time. Using this input transition on the root cell, a typical load on the output pin leads to a violation of the max_transition rule. The root cell was identified as the root of a convergence subtree. Therefore Clock Tree Compiler is assuming that these input transitions are likely to be reduced after the input net gets buffered. Clock Tree Compiler is using the reported transition values (rise and fall) on the input of the root cell while compiling this subtree. The max_capacitance value reported corresponds to the maximum value of the load on the root pin that can be accommodated using those input transitions.

WHAT NEXT

The violation of output transition with a typical load is an indication that the drive of the root cell of this subtree might be too weak. If you cannot meet your skew and insertion delay constraints using this cell, you need to consider using a logical equivalent of the root cell with a higher drive strength.

CTS-160 (Warning) violating transitions (%f, %f) on root cell input pin %s limit output load to %f using max_transition rule %f on the output

DESCRIPTION

The input side of the clock tree root cell is driven by a signal with a violating transition time. This prevents Clock Tree Compiler from loading the root net with more than the advertised value, which seems too small with regard to the value of the gate capacitance of available clock tree buffers. Clock tree compilation is aborted because no solution to buffer the root net is feasible without violating the Design Rule Checks currently in use.

WHAT NEXT

This condition may be only caused by the violating input transition on the input of the root cell, or may be a combination of this and a weak drive of the root cell. Consider swapping the root cell to a logical equivalent with a higher drive. Investigate the reason for the violating input transition and fix this condition. Available alternatives include, but are not limited to: buffering the fanin of the root cell, increasing the drive strength of the fanin net driver, removing or relaxing any violating ideal or back-annotated clock transitions propagated to the

root cell input.

CTS-161 (Warning) violating transitions (%f, %f) on subtree root cell input pin %s: using input transition of (%f, %f), max_capacitance of %f

DESCRIPTION

The input side of the clock tree root cell is driven by a signal with violating transition times. Using this input transition on the root cell, a typical load on the output pin leads to a violation of the max_transition rule. The root cell was identified as the root of a convergence subtree. Therefore Clock Tree Compiler is assuming that these violating input transitions are likely to disappear after the input net gets buffered. Clock Tree Compiler is using the reported transition values (rise and fall) on the input of the root cell while compiling this subtree. The max_capacitance value reported corresponds to the maximum value of the load on the root pin that can be accommodated using those input transitions.

WHAT NEXT

The violation of output transition with a typical load is an indication that the drive of the root cell of this subtree might be too weak. If you cannot meet your skew and insertion delay constraints using this cell, you need to consider using a logical equivalent of the root cell with a higher drive strength.

CTS-162 (Warning) violating transitions (%f, %f) on root cell input pin %s limit output load to %f using max_transition rule %f on the output

DESCRIPTION

The input side of the clock tree root cell is driven by a signal with a violating transition time. This does not prevent Clock Tree Compiler from buffering the clock tree, but forces it to limit the load of the root to the advertised value.

WHAT NEXT

If the value of the load limit cannot be achieved during compilation, you need to consider fixing this high transition value on the root cell input first. This may be caused by unrealistic ideal clock transition, too high back annotated transitions or capacitance on the root input net, possibly because the input net has not been buffered yet.

CTS-163 (Warning) violating transitions (%f, %f) on subtree root cell input pin %s: using input transition of (%f, %f), max_capacitance of %f

DESCRIPTION

The input side of the clock tree root cell is driven by a signal with a violating transition time. The root cell was identified as the root of a convergence subtree. Therefore Clock Tree Compiler is assuming that this violating input transition is likely to disappear after the input net gets buffered. Clock Tree Compiler is using the reported transition values (rise and fall) on the input of the root cell while compiling this subtree. The `max_capacitance` value reported corresponds to the maximum value of the load on the root pin that can be accommodated using those input transitions.

WHAT NEXT

CTS-164 (Error) drive and external load of root port of clock tree %s causes max_transition violation, even assuming 0 internal load: (%f, %f)

DESCRIPTION

The root of the clock tree is a top-level design port, and this port has back-annotated external loads and drive constraints that cause a `max_transition` violation with respect to the library, design or CTS DRC constraints you have specified. This condition effectively prevents Clock Tree Compiler from producing a clock tree buffering compliant with the DRC constraints in use.

WHAT NEXT

Either increase the drive of the driving cell associated with the root port and, if applicable, relax the design and CTS `max_capacitance` constraints to accommodate the back-annotated load on the root port; or remove or lower the value of the `load` and `wire_capacitance` attributes on the port using the `remove_attribute` or `set_load` commands.

CTS-165 (Error) root port of clock tree %s has violating external

load: %f

DESCRIPTION

The root of the clock tree is a top-level design port, and this port has a back-annotated external load that causes a max_capacitance violation with respect to the library, design or CTS DRC constraints you have specified. This condition effectively prevents Clock Tree Compiler from producing a clock tree buffering compliant with the DRC constraints in use.

WHAT NEXT

Either increase the drive of the driving cell associated with the root port and, if applicable, relax the design and CTS max_capacitance constraints to accomodate the back-annotated load on the root port; or remove or lower the value of the *load* and *wire_capacitance* attributes on the port using the **remove_attribute** or **set_load** commands.

CTS-166 (Error) Design database does not have correct routing grid.

DESCRIPTION

The information about the routing tracks on the metal layers is not correct in the design database. Global router cannot be run for the net synthesized during clock tree synthesis. The delays and capacitances on the nets will not be backannotated. The post route results might not correlate well with the report_clock_tree.

One of the following might be true, if you are seeing this warning message: - Global tracks are only defined in one (X or Y) direction. Global tracks should be defined in both the direction for a valid routing grid. - The area covered by the placement grid (site rows) is greater than the area covered by the routing grid. The distance unit for specifying the routing tracks might be different than the distance unit specifying for location of the cells and other objects in the design.

WHAT NEXT

Write out the PDEF (version 3.0 or later) file by using the command `write_pdef` and check for the abovementioned symptoms in the PDEF file. Correct the routing grid information in the design database accordingly.

CTS-167 (Warning) net driven by pin %s in clock tree %s has back-annotated load from CTS but no dont_touch_subtree

constraint: forcing a dont_touch_subtree beyond this pin

DESCRIPTION

The reported net has the `has_cts_ba` attribute - which is the sign that it has been buffered by Clock Tree Compiler - but is not in a `dont_touch_subtree` part of the clock tree. This usually happens when there are overlapping clock trees (clock trees which share part of their respective networks), and the overlapping parts of the clock trees have not been properly constrained using a `dont_touch_subtree` clock tree exception.

WHAT NEXT

Clock Tree Compiler will infer a `dont_touch_subtree` exception for you beyond this pin. Not doing so in case this part of the clock tree is also seen from the root of an already compiled clock tree will result in disrupting the balancing of delays obtained while compiling the first clock tree. If it is your intention to buffer that part of the clock tree a second time, please contact your support.

CTS-168 (Warning) net driven by pin %s in clock tree %s has back-annotated load from CTS but no dont_touch_subtree constraint: a dont_touch_subtree constraint has been propagated to this pin from an ancestor pin in the clock tree

DESCRIPTION

The reported net has the `has_cts_ba` attribute - which is the sign that it has been buffered by Clock Tree Compiler - but is not in a `dont_touch_subtree` part of the clock tree. This usually happens when there are overlapping clock trees (clock trees which share part of their respective networks), and the overlapping parts of the clock trees have not been properly constrained using a `dont_touch_subtree` clock tree exception.

WHAT NEXT

Clock Tree Compiler will infer a `dont_touch_subtree` exception for you beyond this pin. Not doing so in case this part of the clock tree is also seen from the root of an already compiled clock tree will result in disrupting the balancing of delays obtained while compiling the first clock tree. If it is your intention to buffer that part of the clock tree a second time, please contact your support.

CTS-169 (Error) net driven by pin %s in clock tree %s has back-

annotated load from CTS but no dont_touch_subtree constraint

DESCRIPTION

The reported net has the `has_cts_ba` attribute - which is the sign that it has been buffered by Clock Tree Compiler - but is not in a `dont_touch_subtree` part of the clock tree. This usually happens when there are overlapping clock trees (clock trees which share part of their respective networks), and the overlapping parts of the clock trees have not been properly constrained using a `dont_touch_subtree` clock tree exception.

WHAT NEXT

By default, Clock Tree Compiler will infer a `dont_touch_subtree` exception for you beyond this pin. Not doing so in case this part of the clock tree is also seen from the root of an already compiled clock tree will result in disrupting the balancing of delays obtained while compiling the first clock tree. But you have set a control variable that causes the `compile_clock_tree` command to abort when such inconsistencies are detected instead of attempting to repair them. If this is not your intention, revert the control variable to its default value.

CTS-170 (Warning) net driven by pin %s in clock tree %s has back-annotated load from CTS but no dont_touch_subtree constraint

DESCRIPTION

The reported net has the `has_cts_ba` attribute - which is the sign that it has been buffered by Clock Tree Compiler - but is not in a `dont_touch_subtree` part of the clock tree. This usually happens when there are overlapping clock trees (clock trees which share part of their respective networks), and the overlapping parts of the clock trees have not been properly constrained using a `dont_touch_subtree` clock tree exception.

WHAT NEXT

By default, Clock Tree Compiler will infer a `dont_touch_subtree` exception for you beyond this pin. Not doing so in case this part of the clock tree is also seen from the root of an already compiled clock tree will result in disrupting the balancing of delays obtained while compiling the first clock tree. But you have set some control variables that causes the `compile_clock_tree` command to just report such inconsistencies instead of attempting to repair them. If this is not your intention, revert the control variables to their default values.

CTS-171 (Error) net driven by pin %s in clock tree %s is beyond a dont_touch_subtree pin but does not have the has_cts_ba attribute

DESCRIPTION

The reported pin is in a `dont_touch_subtree` part of the clock tree, but it drives a net which does not hold an accurate load estimation. In this situation, Clock Tree Compiler cannot guarantee a good correlation of the skew results after detailed routing.

WHAT NEXT

By default, Clock Tree Compiler will abort the compilation when this situation is detected. Fix the condition by buffering or forcing the load estimation on the incriminated net separately. In the pre-CTS phase, clock nets are usually set in ideal mode which prevents them from being estimated by the `run_router` command. If this is the case, set the clock network rooted at that pin in propagated mode using the `set_propagated_clock` command. Then use `run_router` to provide a realistic load estimation of the nets in the fanout of this pin.

CTS-172 (Warning) net driven by pin %s in clock tree %s is beyond a dont_touch_subtree pin but does not have the has_cts_ba attribute

DESCRIPTION

The reported pin is in a `dont_touch_subtree` part of the clock tree, but it drives a net which does not hold an accurate load estimation. In this situation, Clock Tree Compiler cannot guarantee a good correlation of the skew results after detailed routing.

WHAT NEXT

By default, Clock Tree Compiler will abort the compilation when this situation is detected. You have used some control variable to ignore this inconsistency and continue compiling the clock tree. You are likely to observe a poor correlation of the skew results post-detailed route.

CTS-173 (Error) net driven by root pin %s in clock tree %s already has back-annotated load from CTS: incremental clock

tree compilation detected

DESCRIPTION

The root of the clock tree drives a net which already has the `has_cts_ba` attribute. This is a sign that `compile_clock_tree` has already been run on this clock tree. Clock tree compilation is aborted as Clock Tree Compiler does not currently support incremental compilation.

WHAT NEXT

By default, Clock Tree Compiler will abort the compilation when this situation is detected. You need to cleanup any existing clock tree using the `remove_clock_tree` command before recompiling a new clock tree with new options. If it is your intention to run of `compile_clock_tree` incrementally, please contact your support.

CTS-174 (Warning) net driven by root pin %s in clock tree %s already has back-annotated load from CTS: attempting incremental clock tree compilation

DESCRIPTION

The root of the clock tree drives a net which already has the `has_cts_ba` attribute. This is a sign that `compile_clock_tree` has already been run on this clock tree. Clock Tree Compiler does not currently support incremental compilation.

WHAT NEXT

By default, Clock Tree Compiler will abort the compilation when this situation is detected. You are supposed to cleanup any existing clock tree using the `remove_clock_tree` command before recompiling a new clock tree with new options. You have used a control variable that forces the compilation of this clock tree to continue. Do not expect improved skew and insertion delay out of such incremental run.

CTS-175 (Error) Cell %s does not have a logical or physical library cell associated with it.

DESCRIPTION

Inconsistent or missing library data.

WHAT NEXT

Check the values of the variables search_path, target_library, link_library, physical_library and the accessibility of the library files.

CTS-176 (Error) Clock tree synthesis has abnormally terminated.

DESCRIPTION

This message indicates that the compile_clock_tree has terminated and has not written the intermediate design back to the database. Because the design has not been written back to the database, the current design is unchanged.

WHAT NEXT

Please contact your Synopsys support representative.

CTS-177 (Warning) No placement site available near the root %s/%s and hence cannot fix DRC violation.

DESCRIPTION

No placement site available near the root and hence cannot fix DRC violation.

WHAT NEXT

Check placement or floorplan. Loose DRC constraints.

CTS-178 (Warning) There are %d Steiner routed nets.

DESCRIPTION

Unsufficient routing resources for the layers specified for clock tree. Reverting to using steiner routing. The steiner router does not know about routing blockages. This will cause problems in timing correlation post detail route.

WHAT NEXT

Specify more routing layers for clock tree. Check correctness of routing rules.

CTS-179 (Information) Updating connections for hierarchical design.

DESCRIPTION

Informs the user that CTC is reconnecting the netlist objects through logical hierarchy.

WHAT NEXT

Just wait.

CTS-180 (Information) clock tree %s uses Useful Skew mode.

DESCRIPTION

Informs the user that CTC has detected the presence of set_clock_useful_skew constraints in the database applying to the reported clock tree.

WHAT NEXT

Make sure you want to run CTS in Useful Skew mode on this clock tree.

CTS-181 (Information) Clock tree %s uses Zero Skew mode.

DESCRIPTION

Informs the user that CTC is set to use Zero Skew mode on this clock tree.

WHAT NEXT

If you intend to run Useful Skew synthesis on that clock, check that 'set_clock_useful_skew' constraints are properly set.

CTS-182 (Error) Must specify at least one pin, port or clock

argument

DESCRIPTION

The **set_useful_skew** command must apply to a valid collection of clock, pin or port objects. An empty or invalid collection was passed in argument to the command.

WHAT NEXT

Check the syntax of the command. Check that your arguments match valid netlist objects.

CTS-183 (Error) incorrect effort argument: %s, must be in {disable low medium high ultra}

DESCRIPTION

The **set_useful_skew** command was passed a *-tns_effort* or *-wns_effort* argument which is not in the supported set.

WHAT NEXT

Check the syntax of the command.

CTS-184 (Warning) could not derive valid floatpin constraints for Useful skew

DESCRIPTION

The Useful Skew mode is on for the current clock but no valid adjusted clock timings could be computed. No floatpin constraints will be generated and the compilation results will be identical to the Zero Skew mode.

WHAT NEXT

Contact your support.

CTS-185 (Warning) clock %s has no defined clock attributes - a

null latency will be assumed

DESCRIPTION

The Useful Skew mode is on for the current clock but no ideal clock attributes (latency, uncertainty) are available to model the ideal clock timings. The clock adjustment calculations will be done with respect to an ideal clock latency of 0 for all clock pins of the current clock tree.

WHAT NEXT

Check whether your ideal clock definitions are consistent with a CTS flow. CTS will insert buffering which will cause the clock latency to flip-flops and latches to become non-null. Timing paths versus IO ports are likely to change and new violations are likely to occur if you do not capture the CTS insertion delay budget using a clock latency statement, and the CTS skew budget using an uncertainty statement.

CTS-186 (Information) generated %d float pin constraints for Useful Skew mode (%d positive, %d negative)

DESCRIPTION

The Useful Skew mode performs clock latency adjustment based on the pre-CTS ideal clock timings and translate this automatically into float pin constraints that are passed to the CTS engine. This message provides you with information about how many such constraints were generated for the current clock tree.

WHAT NEXT

The number of float pin constraints generated in Useful Skew mode should not be too big because the QoR will typically degrade as the number of exceptions gets larger. Even though the target latency values aimed by CTS theoretically improves the timing QoR, CTS then has a harder time getting close to the targets. If you see large numbers of exceptions, try to reduce the Useful Skew efforts to generate less float pin constraints. CTS does not share buffers chains used to accomodate negative float pin constraints. If you see predominantly negative float pin values in large numbers, try to tweak the plus and minus adjust bound parameters of the `set_clock_useful_skew` command so as to reduce the number of negative float pins.

CTS-187 (Warning) CTC is performing high fanout net

synthesis. No backannotation is expected.

DESCRIPTION

-high_fanout option has been specified for **set_clock_tree_options** command for current clock tree. CTC does not backannotate pin-to-pin delays and net capacitances as well as global preroutes.

WHAT NEXT

If high fanout net synthesis is not what is expected here, reissue **set_clock_tree_options** command for current clock tree without -high_fanout option.

CTS-188 (Information) Removing buffer trees for clock domain %S...

DESCRIPTION

Information message.

WHAT NEXT

Wait a little.

CTS-189 (Information) Tracing through sequential cell of type %S to generated clock source output %s/%s

DESCRIPTION

This information message is issued during Clock Tree Tracing to notify you that the clock tree contains generated clock subtrees. This means that the clock tree synthesis will balance clock tree delays up to clock pins in the clock domain of the generated clock.

WHAT NEXT

If you do not want Clock Tree Compiler to balance generated clock with the primary clock domain, use the **-dont_trace_generated_clocks** switch on the **set_clock_tree_option** command line.

CTS-190 (Warning) Cell %s has several generated clock source output pins - pin %s was selected for clock tree tracing

DESCRIPTION

A sequential cell was traced-through during Clock Tree Tracing, but Clock Tree Compiler detected that this cell has several output pin bearing generated clock definitions. Clock Tree Compiler does not support tracing through a cell to multiple outputs, and therefore selects only one output to trace through the cell.

WHAT NEXT

If your design requires Clock Tree Compiler to balance all generated clocks at the output of this cell together with the main clock, please contact your support.

CTS-191 (Warning) Cell %s has some generated clock source output pins but combinatorial output pin %s was preferred for clock tree tracing

DESCRIPTION

The advertised cell was traced-through during Clock Tree Tracing, but Clock Tree Compiler detected that this cell has at least one output pin supporting a generated clock definition. Clock Tree Compiler does not support tracing through a cell to multiple outputs, and therefore selects only one output to trace through the cell. While doing so, it privileges outputs with combinatorial timing arcs.

WHAT NEXT

If your design requires Clock Tree Compiler to balance the generated clock(s) at the output of this cell together with the main clock, please contact your support.

CTS-192 (Warning) Clock tree %s contains generated clock source pins but was set in Useful Skew mode - resetting to Zero Skew mode

DESCRIPTION

Clock Tree Compiler detected some generated clock source pins in your clock tree, but you are also using the Useful Skew mode on this clock tree. The current Useful

Skew capability in Clock Tree Compiler does not support adjusting clock delays through multiple clock domains. Therefore your clock tree is run in Zero Skew mode.

WHAT NEXT

If your design requires Clock Tree Compiler to balance a clock tree with generated clock(s) in Useful Skew mode, please contact your support.

CTS-193 (Information) Noncritical sinks are ignored during compilation and reporting of %s clock tree.

DESCRIPTION

Compilation and reporting specified clock tree are performed according to ignore noncritical sinks mode. Skew and delay up to noncritical sinks will not be taken into account.

WHAT NEXT

If you do not want to use this mode, reissue `set_clock_tree_options` command.

CTS-194 (Warning) No driving cell found for root port %s on cell %s (%s) - using 0 delays and slews on the root port

DESCRIPTION

The root of your clock tree is a top-level port or an SLM block port. No driving cell was detected by CTC on the top-level port, or no driver was found in the SLM netlist for the SLM block port. In such a case, CTC assumes a fixed transition time of 0 on the root during compilation.

WHAT NEXT

Define a more realistic drive model of your root port using the `set_annotated_transition` command on an SLM block port root, or the `set_driving_cell` constraint on a top-level port root.

CTS-195 (Warning) No timing arc found for root pin %s of cell

%s (%s) - using 0 delays and slews on the root pin

DESCRIPTION

The specified root cell does not have a timing arc for establishing the drive model of the specified root pin. The clock tree compilation assumes a fixed transition time of 0 on the root cell output in this case, and a null delay through the root cell independent of the capacitive load on the root net.

WHAT NEXT

There is no timing information available to derive the drive model of this net. After clock tree synthesis, you need to back annotate a realistic transition time on the root cell output pin using the **set_annotated_transition** command. Not doing so may result in an unrealistic estimation of the transition time on the root net.

CTS-196 (Error) Insufficient free sites to place buffer.

DESCRIPTION

No empty space was found for buffer inserted during clock tree compilation, so **compile_clock_tree** failed and clock tree synthesis was not completed for this reason.

WHAT NEXT

Please check placement obstructions.

CTS-197 (Warning) Undefined transition at the input of the root of the clock tree occurred. Assuming zero value.

DESCRIPTION

CTC faced undefined transition at the starting pin of the root timing arc. To resolve the issue CTC assumes zero slew at that point.

WHAT NEXT

Beware of possible inconsistencies of **report_clock_tree** and **report_timing** as the latter command assumes zero transition at the output of the root cell regardless of the load.

CTS-198 (Warning) Subtree driven by %s/%s will be buffered to meet %s constraint.

DESCRIPTION

The specified subtree has satisfied delay and fanout requirements for avoiding buffering. However, it will be buffered anyway, since not buffering it would cause design rule checking (DRC) violations as described in the message you have received.

WHAT NEXT

No action is required on your part.

However, if you want to avoid buffering the net, you can relax the DRC constraints. You can also see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

CTS-199 (Warning) Net '%s' is not %sconnected and will be ignored.

DESCRIPTION

The `retime_clock_tree` command has detected a net that is not fully connected by global routing segments. Hence, it is not possible to recalculate the delay and capacitance of this net. The `retime_clock_tree` command ignores the net and currently-annotated delay and capacitance values are preserved.

WHAT NEXT

No action is required on your part.

However, if you want, you can examine the **CTS-178** error message warning regarding Steiner routed nets. You can also see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

SEE ALSO

`compile_clock_tree` (2), `retime_clock_tree` (2); **CTS-178** (n).

CTS-200 (Error) Nonexisting routing layer '%s' has been

specified for %s clock tree.

DESCRIPTION

You receive this error message because no layer ID can be found in design database for the layer specified.

WHAT NEXT

Check layer names existing in the design database. Then issue `set_clock_tree_options` command for the specified clock tree with the names of valid layers only.

CTS-201 (Warning) There are no suitable routing layers. The Steiner tree algorithm will be used for net delay estimation.

DESCRIPTION

The `compile_clock_tree` command has determined that there are no unoccupied routing layers specified by the `set_clock_tree_options` command. All specified routing layers appear to be completely utilized by routing obstructions. Hence, it is not possible to use global routing for net delay and capacitance estimation. The `compile_clock_tree` command uses the Steiner tree algorithm for routing estimation and does not annotate any global routing to the design database.

WHAT NEXT

Check the layers specified by the `set_clock_tree_options` command. Examine the routing obstructions in the design database. After making the necessary changes, run the command again.

SEE ALSO

`compile_clock_tree` (2), `set_clock_tree_options` (2); **CTS-178** (n).

CTS-202 (Warning) Incorrect routing rule specified for clock nets.

DESCRIPTION

The `compile_clock_tree` command has detected that the number of routing tracks required to place one global segment exceeds the capacity of the global cell. Hence, it is not possible to use global routing for net delay and capacitance estimation.

The **compile_clock_tree** command uses the Steiner tree for routing estimation.

WHAT NEXT

This is a warning message only, and no action is required on your part. However, you can check the routing rule specified by the **set_clock_tree_options** command. After making any changes, rerun the command.

SEE ALSO

compile_clock_tree (2), **set_clock_tree_options** (2), **CTS-178** (n).

CTS-203 (Error) Design database does not have routing layers.

DESCRIPTION

The information about the routing layers is missing from the design database.

WHAT NEXT

Update the design database with information regarding the routing layers.

SEE ALSO

read_db (2), **write** (2), **write_pdef** (2).

CTS-204 (warning) Incompatible direction of hierarchical pins. Ignoring %s.

DESCRIPTION

This warning message occurs when the tool traces through the hierarchical design and finds two hierarchical pins driving the same local net.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by checking the clock network and removing the duplicate pins that are driving the same local net.

CTS-205 (Warning) Option -use_default_routing_for_sinks will be applied to all clocks.

DESCRIPTION

Option `-use_default_routing_for_sinks` of `set_clock_tree_options` will be applied globally.

WHAT NEXT

Synthesize one clock at a time if different values needs to be used for different clocks.

CTS-206 (Error) User max_cap constraint (%f fF) is too small.

DESCRIPTION

`Set_clock_tree_options` assumes that the given constraint values are in main library units. The error is usually arised when the main library unit is smaller than that is assumed.

WHAT NEXT

Convert the constraint values into main library units and re-apply constraints again.

CTS-207 (Error) User max_tran constraint (%f ps) is too small.

DESCRIPTION

`Set_clock_tree_options` assumes that the given constraint values are in main library units. The error is usually arised when the main library unit is smaller than that is assumed.

WHAT NEXT

Convert the constraint values into main library units and re-apply constraints again.

CTS-208 (Error) User target_early_delay constraint (%f ps) is

too small.

DESCRIPTION

`Set_clock_tree_options` assumes that the given constraint values are in main library units. The error is usually arised when the main library unit is smaller than that is assumed.

WHAT NEXT

Convert the constraint values into main library units and re-apply constraints again.

CTS-209 (Warning) Either the driven net has been synthesized previously or clock path overlaps/reconverges at pin %s.

DESCRIPTION

Either the net driven by the pin has been synthesized or the pin is reachable from multiple clock paths that belong to either different clocks or the same clock.

WHAT NEXT

CTS-210 (Information) %s is a don't size cell instance, skip sizing.

DESCRIPTION

The cell instance is specified in `set_clock_tree_exception -dont_size_cell`. Such cells will not be sized during CTS and CTO.

WHAT NEXT

If sizing is needed to improve QoR, please remove the exception setting.

CTS-211 (information) Pin %s is ignored. Cannot set

cts_synthesized on net %s.

DESCRIPTION

This information message advises you that when a driving pin is an ignore pin, the net may not be DRC clean and the **cts_synthesized** attribute is not set.

WHAT NEXT

This is only an information message. No action is required. However, the net can be handled by optimization for DRC.

CTS-212 (Information) Adding delay cell %s after driving pin %s.

DESCRIPTION

A delay cell, buffer or inverter, is added to reduce the global skew.

WHAT NEXT

If no delay insertion is desired, it can be turned off through command options.

CTS-213 (Warning) Adding buffer will cause capacitance constraint violation on the net %s.

DESCRIPTION

This message tries to give the reason on why delay cells can not be added, the tool sees adding any cell would cause capacitance violation. It is possible the net is violating capacitance constraint before adding cell and adding a cell can not remove the violation.

WHAT NEXT

Please check the root net or the first bufferable net capacitance.

CTS-214 (Warning) Adding buffer will cause transition constraint

violation on the net %s.

DESCRIPTION

This message tries to give the reason on why delay cells can not be added, the tool sees adding any cell would cause transition violation. It is possible the net is violating transition constraint before adding cell and adding a cell can not remove the violation.

WHAT NEXT

Please check the root net or the first bufferable net transition and capacitance.

CTS-215 (Warning) Adding buffer will cause skew degradation on the net %s.

DESCRIPTION

This message tries to give the reason on why delay cells can not be added, the tool sees adding any cell would cause skew degradation.

WHAT NEXT

Select balanced buffer list for delay insertion using `set_clock_tree_reference -ref {list of lib cells} -delay_insertion` may help.

CTS-216 (Warning) No buffer can fit the delay gap on net %s.

DESCRIPTION

This message tries to give the reason on why delay cells can not be added, the tool sees adding any cell would be over the target insertion delay.

WHAT NEXT

Provide small delay buffer list for delay insertion using `set_clock_tree_reference -ref {list of lib cells} -delay_insertion` may help.

CTS-217 (Warning) option -sync_phase will be ignored in CTS.

DESCRIPTION

The option -sync_phase in compile_clock_tree is for HFCTS only. That is, the option must be specified with option -high_fanout_net.

WHAT NEXT

If you intend to perform HFCTS, please specify -high_fanout_net option in compile_clock_tree command. If you intend to perform CTS, you don't need to care about the message.

CTS-218 (Warning) unknow sync_phase %s. Set to default.

DESCRIPTION

The command compile_clock_tree -sync_phase takes only 3 options, rise (default), fall or both. If none of those is given, you will see the message. The tool will assume rise phase. The -sync_phase tells the tool how to calculate skew for the inserted buffer tree. If rise is given, the rising edge arrival time at buffer tree's end points are used for skew calculation.

WHAT NEXT

If the default (rise) is not what you want, please specify fall or both option for command.

CTS-219 (Warning) %s is neither a net nor a pin

DESCRIPTION

The tool cannot find neither a net nor a pin from the name specified in command line.

WHAT NEXT

Please make sure the name specified in command line is correct. For example, use get_nets or get_pins commands to check.

CTS-220 (Error) HFCTS failed

DESCRIPTION

HFCTS failed due to timing analysis failed, buffer tree construction failed or buffer tree optimization failed. Please check the log file before this message for details on which part failed.

WHAT NEXT

Check the log file before the message and fix those errors.

CTS-221 (Information) DRC violations at pin %s cannot be fixed since there is a huge pin cap at its load pin %s. (load pin cap [rise,fall] = [%f %f]; constraint [rise,fall] = [%f,%f])

DESCRIPTION

This message explains why the DRC violation at the pin cannot be fixed. When the input cap of a load pin exceeds max cap constraint, even the tool places a driving cell near by the load pin, the DRC violation still cannot be fixed.

WHAT NEXT

Ignore this message if you are sure the constraint specified in your libraries, SDC files, set_clock_tree_options are less than the pin cap specified in your libraries.

CTS-222 (Warning) No boundary cell insertion on dont_buffer net %s.

DESCRIPTION

When a boundary net has dont_buffer_net attribute, boundary cell insertion will not be performed on the net.

WHAT NEXT

Remove dont_buffer_net attribute on the boundary net if boundary cell needs to be inserted on the net.

CTS-223 (Warning) No boundary cell insertion on boundary net %s.

DESCRIPTION

There is no boundary cell insertion on the net because it is either a PAD net or a boundary cell has been inserted.

WHAT NEXT

CTS-224 (Warning) Distance between boundary cell %s and clock port %s is larger than three row height.

DESCRIPTION

A boundary cell may be placed away from the input port. This might be due to placement blockages near the port. In multi-voltage designs, boundary cell may be placed away from the port if default voltage area is far away from the port.

WHAT NEXT

Check for placement blockages and voltage areas near the clock port.

CTS-225 (Information) DRC violations at pin %s cannot be fixed since there is no buffer zone in region (x0=%d,y0=%d) (x1=%d,y1=%d)

DESCRIPTION

This message explains why the DRC violation at the pin cannot be fixed. When the region (given in the message) is a no buffer zone, the tool cannot place a buffer close to the load pin(s). As a result, the DRC violations cannot be fixed.

WHAT NEXT

Remove the blockage on the region. Place the load pin on other side of the region. Relax the constraint specified in your libraries, SDC files, set_clock_tree_options. Ignore the DRC violation.

CTS-226 (Information) DRC violations at pin %s cannot be fixed since it is connected to the dont_buffer_net %s

DESCRIPTION

This message explains why the DRC violation at the pin cannot be fixed. The tool doesn't touch the net with dont_buffer_net

WHAT NEXT

Remove dont_buffer_net on the net. Ignore the DRC violation

CTS-227 (Information) no DRC fixing for ILM net %s

DESCRIPTION

The net shown in the message is a net inside an ILM block. The ILM block cannot be modified since it is a timing view for top level design.

WHAT NEXT

Open the cell view of ILM block and fix DRC violations using the same commands.

CTS-228 (Information) no DRC fixing for dont_buffer_net %s

DESCRIPTION

The net shown in the message is a dont_buffer_net defined by users. It cannot be modified by the tool.

WHAT NEXT

Remove dont_buffer_net on the net. Ignore the DRC violation

CTS-229 (Information) DRC violations at pin %s cannot be fixed

since it is connected to net %s inside ILM

DESCRIPTION

This message explains why the DRC violation at the pin cannot be fixed. The ILM block cannot be modified since it is a timing view for top level design.

WHAT NEXT

Open the cell view of ILM block and fix DRC violations using the same commands.

CTS-230 (Warning) Ignore cell %s since it has %d timing arcs.

DESCRIPTION

Clock tree synthesis generates this warning message for each cell in the clock tree reference list (as set by `set_clock_tree_references`) that have more than one timing arc from input pin to output pin.

These types of cells are typically used for multithreshold or MTCMOS designs. IC Compiler does not currently support MTCMOS scenarios.

WHAT NEXT

To disable this message, set the `cts_use_multi_input_buffer` variable to true before running clock tree synthesis.

CTS-231 (Warning) Ignore net %s since it has no synchronous pins.

DESCRIPTION

CTS cannot find any synchronous pin (e.g. float pin, stop pin or regular clock pin) on the net and will not synthesize this net.

WHAT NEXT

If a pin on the net should be treated as a synchronous pin, make sure it is not an implicit or explicit ignore pin.

CTS-232 (Warning) Net %s has been marked as synthesized.

DESCRIPTION

CTS found a net that has been synthesized. This message is usually found when CTS reaches an overlapping clock domain the second time. CTS also issues this warning when the net is synthesized in previous CTS session.

WHAT NEXT

Use `remove_clock_tree` to remove synthesized clock tree before re-synthesizing the net.

CTS-233 (Warning) Stop to insert buffers to fix DRC on net %s (current buffer levels = %d, constraint = %d).

DESCRIPTION

CTS cannot insert more buffers to fix DRC violations on the net due to buffer level constraint. The default maximum buffer level is 20, which is sufficient for most of the designs.

For blockage-dominant designs, block-mode CTS may not be able to avoid blockage with given maximum buffer level constraint. In this case, consider using top-mode CTS to build the clock tree.

Note that the constraint is automatically increased until the receiving pin with the largest phase delay has been selected for clustering.

WHAT NEXT

Find out why CTS cannot fix DRC with the given maximum buffer level constraint. Either relax the constraint or switch to top-mode CTS.

CTS-234 (Error) Root clock net %s has been marked as synthesized.

DESCRIPTION

CTS found a root clock net that has been synthesized and no clock tree for this root net will be re-built.

WHAT NEXT

Use `remove_clock_tree` to remove synthesized clock tree.

CTS-235 (Information) DRC violations at pin %s cannot be fixed since it is defined as dont_touch_subtree

DESCRIPTION

This message explains why the DRC violation at the pin and beyond cannot be fixed. The tool doesn't touch any net beyond the pin with `dont_touch_subtree` defined.

WHAT NEXT

Remove `dont_touch_subtree` at the pin. Ignore the DRC violation

CTS-236 (Error) Cannot move cell %s to location (%d, %d).

DESCRIPTION

Clock tree synthesis generates this error message when it can not place a clock buffer or gate around the location (x, y) .

The usual cause of this error message includes: over-utilization of chip area, floorplan which has narrow channels, voltage area caused placement blockages, and other floorplan constraints, e.g. placement bound.

WHAT NEXT

Check the cell utilization ratio, adjust floorplan if needed.

CTS-237 (error) Cannot find a legal clock reference for the boundary cell at port %s.

DESCRIPTION

This error message occurs when CTS cannot find a clock reference that is characterized for the voltage area of the specified port, and so it does not insert a boundary cell for the port.

WHAT NEXT

Add a buffer or an inverter that is characterized for the default voltage area into the boundary cell clock reference list, and run the command again.

CTS-238 (warning) The %s exception is not defined on %s.

DESCRIPTION

This warning message occurs when attempting to remove the specified exception from an object (such as a pin, cell, or net), but the exception does not exist on that object.

WHAT NEXT

Make sure that an exception is defined on the object and run the command again.

SEE ALSO

`remove_clock_tree_exceptions(2)`
`set_clock_tree_exceptions(2)`

CTS-239 (information) A new version of set_clock_tree_exceptions is enabled by default.

DESCRIPTION

This warning message occurs because the `set_clock_tree_exceptions` command is rewritten in the z2007.03-SP2 release. The new version supports float pins and stop pins with active_edge, and supports the pin exceptions precedence.

WHAT NEXT

This is an information message only. You can suppress this message to avoid seeing it in the future.

SEE ALSO

`set_clock_tree_exceptions(2)`

CTS-240 (warning) The %s exception is overridden by the %s

exception on %s.

DESCRIPTION

This warning message occurs when the former exception on the object is deleted and the latter exception is set. The two exceptions conflict and the latter exception has higher priority.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`set_clock_tree_exceptions(2)`

CTS-241 (warning) Former exception %s is retained on %s, and %s exception is ignored.

DESCRIPTION

This message warns you that the specified exception is not set on the object because a former exception already exists on the object, and the former exception has a higher priority.

WHAT NEXT

This is only a warning message. No action is required.

However, if you want to set the specified exception on the object, first remove the preexisting exception using the `remove_clock_tree_exceptions` command.

SEE ALSO

`remove_clock_tree_exceptions(2)`
`set_clock_tree_exceptions(2)`

CTS-242 (warning) Some cells in the design are not legal.

DESCRIPTION

This error message occurs when the current design has floorplan or placement problems. CTS continues, but these problems may cause CTS failure, unacceptable QoR,

or QoR correlation issues.

WHAT NEXT

Run the **check_legality -verbose** command for details about the error. Correct the problems with a command such as **legalize_placement**, and then rerun the initial command.

SEE ALSO

`check_legality(2)`
`legalize_placement(2)`

CTS-243 (warning) Internal pin %s found in clock domain %s.

DESCRIPTION

This warning message occurs when CTS encounters a macro with an internal pin. CTS may not synthesize clock nets beyond the macros with internal pins.

WHAT NEXT

This is only a warning message. No action is required.

However, to ensure that the clock nets beyond a macro with internal pins are synthesized, either move the clock definition to its output pin, or create a generated clock at its output pin.

CTS-244 (Warning) dont_touch_subtree is defined at clock source %s.

DESCRIPTION

This message reminds you that the source pin/port of certain clock domain is defined as `dont_touch_subtree` by `set_clock_tree_exceptions`. Thus this clock domain will not be synthesized by CTS.

WHAT NEXT

If you want to do CTS on the clock domain rooted from this source pin/port, please remove `dont_touch_subtree` exception by using `remove_clock_tree_exceptions` first.

SEE ALSO

`set_clock_tree_exceptions(2)`
`remove_clock_tree_exceptions(2)`

CTS-245 (warning) Please specify at least one attribute or constraint to move from specified clock network.

DESCRIPTION

This warning message occurs when no option related to attribute or constraint is specified with `mark_clock_tree` command. So `mark_clock_tree` will not have any operation.

WHAT NEXT

Make sure to specify at least one attribute or constraint, such as `-clock_synthesized`, `-clock_net`, and run the command again.

SEE ALSO

`mark_clock_tree(2)`

CTS-246 (warning) root net %s is global routed.

DESCRIPTION

This warning message occurs before `mark_clock_tree` will change the routing rule or layer list on a global routed clock tree.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`mark_clock_tree(2)`

CTS-247 (warning) root net %s is detail routed.

DESCRIPTION

This warning message occurs before mark_clock_tree will change the routing rule or layer list on a detail routed clock tree.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`mark_clock_tree(2)`

CTS-248 (warning) Cell %s cannot be removed since it is in dont_touch hierarchy.

DESCRIPTION

If `remove_clock_tree -honor_dont_touch`, cells within dont_touch hierarchy will be retained.

WHAT NEXT

This is only a warning message. If you want this cell to be removed, either remove the dont_touch attribute from the logical hierarchy of this cell first or do not specify `-honor_dont_touch`.

SEE ALSO

`remove_clock_tree(2)`

CTS-250 (Information) Adding delay cell %s after driving pin %s.

DESCRIPTION

A buffer as a delay cell is added to reduce the global skew.

WHAT NEXT

If no delay insertion is desired, it can be turned off through command options.

CTS-251 (Information) Adding inverter delay cell %s after driving pin %s.

DESCRIPTION

An inverter as a delay cell is added to reduce the global skew.

WHAT NEXT

If no delay insertion is desired, it can be turned off through command options. If no inverter is desired for delay insertion, put buffers only in set_clock_tree_reference for delay insertion.

CTS-252 Clock %s defined in multiple options with conflict.

DESCRIPTION

Optimization options or inter-clock delay balance options defined on the clock have conflicts. For example, a clock is defined in different balance group in set_inter_clock_delay_options.

WHAT NEXT

Check and correct conflicting options.

CTS-253 ICC only supports pre-route inter clock delay balance in this release.

DESCRIPTION

Command balance_inter_clock_delay finds the db is routed or partial routed, however, this command only supports pre-route stage balancing.

WHAT NEXT

Move the balancing command before nets get routed.

CTS-254 (Warning) Inter-clock delay balance failed to find a

bufferable net from source %s Clock

DESCRIPTION

Inter-clock delay balance adds buffers on root clock net or the next bufferable net from the root. This message means the clock tree has no bufferable net before it fanouts to multiple clock gates with clock sinks. This message also shows up when a clock has no clock sink.

WHAT NEXT

Check and remove dont_buffer_net on clock root net or the next few levels, or clock tree exceptions.

CTS-255 Clock %s defined in balance group not found in the design or the clock has no bufferable net or sinks.

DESCRIPTION

Clock defined in the balance group either cannot be found in the design or the clock has no bufferable net. In some cases, the clock has no sinks which leads to no bufferable net. No bufferable net here means there is no net from clock root net and down until it fanouts from multiple clock gates.

WHAT NEXT

Check and correct constraints or exceptions on the clock.

CTS-256 (Information) Offset from clock %s will not be balanced.

DESCRIPTION

During inter clock delay balance, when offset is defined, clock from is a reference clock and clock to will be balanced to clock from clock with an offset. Reference clock (from clock) will not be changed.

WHAT NEXT

If this clock needs to be balanced, use other clock as reference clock in offset definition.

SEE ALSO

`set_inter_clock_delay_options(2)`
`balance_inter_clock_delay(2)`

CTS-257 Cannot insert buffer for multiple ilm output port net %s.

DESCRIPTION

Found multiple ILM output ports on a clock net, no clock buffer insertion on such net.

WHAT NEXT

If this clock needs to be balanced, use other clock as reference clock in offset definition.

SEE ALSO

`balance_inter_clock_delay(2)`

CTS-258 Clock %s defined in multiple balance groups.

DESCRIPTION

A clock is found defined in multiple balance group for inter-clock delay balance.

WHAT NEXT

Correct the balance group specification.

SEE ALSO

`set_inter_clock_delay_options(2)`
`balance_inter_clock_delay(2)`

CTS-259 Clock %s in the script for inter-clock delay balance

option is not found in the design.

DESCRIPTION

Clock for inter-clock delay balance options cannot be found in the design.

WHAT NEXT

Correct the clock from specification.

SEE ALSO

`set_inter_clock_delay_options(2)`
`balance_inter_clock_delay(2)`

CTS-260 (Warning) Net %s is an Ideal Net, Removing the attribute.

DESCRIPTION

You receive this message because incoming netlist to CTS has some nets marked as Ideal.

WHAT NEXT

No action is required on your part. CTS will remove the Ideal Net attribute to ensure correct load and transition delay calculation for the given net.

CTS-261 (Warning) Cell %s is a fixed cell instance.

DESCRIPTION

You receive this message because the cell in question is marked as fixed.

WHAT NEXT

If a cell is marked as fixed, CTS optimization mainly sizing and relocation will not work on it. If you think Optimization should work on this cell please remove the `is_fixed` attribute from the cell.

CTS-262 (Warning) No LEQ library cell found for cell %s library cell %s.

DESCRIPTION

You receive this message because the tool cannot find a Logically Equivalent (LEQ) library cell for a given cell

WHAT NEXT

This happens sometimes when the LEQs cells in the library are marked as dont_use. CTS optimization does not find these cells available for sizing. You might want to remove the dont_use attribute on the cells in the library.

CTS-263 (Warning) invalid phase delay at pin %s.

DESCRIPTION

This debugging message tells you that the timer had difficulty calculating the phase delay at a certain pin in the clock network. This can cause clock tree synthesis to not balance the clock tree properly. This message is displayed in the log only when debug mode is on.

WHAT NEXT

Determine whether the pin has the proper timing characteristics or should be set as ignore pin, stop pin, or float pin.

CTS-264 (Error) Clock tree synthesis error, aborted.

DESCRIPTION

This message indicates that clock tree synthesis could not build a clock tree. A possible cause of this problem is an error in the clock definitions. For example, if you define the clock on an internal check pin of an ETM model, clock tree synthesis cannot build a tree and you get this message.

WHAT NEXT

Check your clock definitions and rerun clock tree synthesis.

CTS-265 (Error) Timer initialization failed.

DESCRIPTION

This message, Error: Timer initialization failed, indicates that clock tree synthesis cannot find the capacitance model TLU, TLU+, or Synopsys design constraints (SDC) in your design. If any of this information is missing in your design, clock tree synthesis will fail.

WHAT NEXT

Load the capacitance model and load SDC in your design

CTS-266 (Warning) Net % has been marked for synthesis

DESCRIPTION

This warning message indicates that the specified clock net has already been processed by clock tree synthesis. Clock tree synthesis will not process the specified clock net, but will continue to process other clock nets that have not been previously been processed. This happens in two scenarios. First, there are overlapping clock domains. Second, given net has already been synthesized by some previous run of CTS.

WHAT NEXT

If you do not want clock tree synthesis to resynthesize this clock net, use the `set_clock_tree_exceptions -dont_touch_subtrees` command to define this clock net as a don't touch subtree. If you want to resynthesize this clock net, use the `remove_clock_tree` command to remove the clock tree on this net before running clock tree synthesis.

CTS-267 (Error) get capacitance on net %s failed.

DESCRIPTION

This message indicated that CTS was unable to calculate capacitance for a given net. The common reasons being the following: a. Net has been marked as Ideal. b. Net has high fanouts (usually > 1000) c. Net has some illegal connection (mainly open). d. Net is a logic constant. e. Net has multiple driver.

WHAT NEXT

You should check the given net for ideal net attribute or illegal connection.

CTS-268 (Warning) No delay insertion for hard configuration tree on net %s

DESCRIPTION

The mentioned clock net has a hard configuration defined in the configuration file specified with `set_clock_tree_options -config_file_read`. Inserting delay cells to this clock tree would conflict with the specified configuration. Clock tree optimization will not perform delay cell insertion on this net.

WHAT NEXT

If you do not want to preserve the manually specified clock tree configuration for the net remove the entry for this net from the configuration file. If you want to preserve the net configuration no action is required.

CTS-269 (warning) Buffer count (%d) specified for current buffer level on net %s is too small.

DESCRIPTION

This warning message occurs when the specified clock net has a hard configuration defined in the configuration file, and the number of buffers specified is too small. Therefore, some buffers in the current buffer level are driving more fanouts than they should, which causes DRC violations.

WHAT NEXT

Increase the buffer count for the current buffer level, or use a soft configuration for the current buffer level, and run the command again.

CTS-270 (information) Stopped growing cluster due to %s.

DESCRIPTION

This information message occurs when RC constraints are enabled using the `cts_enable_rc_constraints` switch. Clock tree synthesis stops adding a pin to a cluster if it creates maxRC or maxRCSkew constraints.

WHAT NEXT

This is only an information message. No action is required.

CTS-271 (Warning) RC delay (%f) and skew (%f) exceed target on net %s.

DESCRIPTION

When RC constraints are enabled (through `cts_enable_rc_constraints` switch) and a net has hard configuration, there could have maxRC violation at driving cell output.

WHAT NEXT

Consider adding extra buffer levels for the net in config file.

CTS-272 (Warning) Ignoring Clock Tree Configuration for net %s as it is marked as dont_touch, dont_buffer or ignore net.

DESCRIPTION

This message means a net has a clock tree configuration defined in configuration file. It is also marked as `dont_buffer` or `dont_touch` net. In this case CTS will ignore the configuration file for this net. This message can also appear for net which is a PAD net and hence being ignored by CTS.

WHAT NEXT

Consider removing the `dont_touch` or `dont_buffer` attribute. PAD nets will be ignored by CTS, irrespective of configuration file.

CTS-275 Clock %s defined in multiple offset option.

DESCRIPTION

A clock is found defined in multiple offset options for inter-clock delay balance.

WHAT NEXT

Correct the offset specification.

SEE ALSO

```
set_inter_clock_delay_options(2)  
balance_inter_clock_delay(2)
```

CTS-276 Clock %s and its subtree can not be balanced together, exclude them for balancing.

DESCRIPTION

Inter-clock delay balance can only balance independent clocks.

WHAT NEXT

Correct the balance clock specification.

SEE ALSO

`set_inter_clock_delay_options(2)`
`balance_inter_clock_delay(2)`

CTS-277 Update Phase Delay Failed.

DESCRIPTION

Update phase delay failed, check your setup/script.

WHAT NEXT

Check design setup.

SEE ALSO

`compile_clock_tree(2)`
`optimize_clock_tree(2)`
`balance_inter_clock_delay(2)`

CTS-278 Cannot find any clock definition for clock tree optimization or balance.

DESCRIPTION

During clock tree optimization or inter-clock delay balance initialization, no clock is found.

WHAT NEXT

Check design setup.

SEE ALSO

`optimize_clock_tree(2)`
`balance_inter_clock_delay(2)`

CTS-279 Inter-clock delay balance cannot handle multiple fanout when it traverses to lower level net %s for balancing.

DESCRIPTION

Inter-clock delay balance cannot handle multiple fanout when it traverses to lower level net %s for balancing.

WHAT NEXT

Check root net attribute.

SEE ALSO

`balance_inter_clock_delay(2)`

CTS-280 (error) Wrong input for `routed_clock_stage` option: %s, use none, global, track or detail.

DESCRIPTION

This error message occurs when an invalid value is used for the `-routed_clock_stage` option. Accepted values for this option are `none` for preroute, and `global`, `track`, or `detail` for different stages of postroute.

WHAT NEXT

Rerun the command, specifying the value for the `-routed_clock_stage` option as either `none`, `global`, `track`, or `detail`.

See the command man page for further information.

SEE ALSO

`optimize_clock_tree(2)`

CTS-281 (warning) CTO delay insertion is not supported in postroute mode.

DESCRIPTION

This warning message indicates that clock tree optimization delay insertion is not performed in postroute mode. When the `-routed_clock_stage` option is specified for a postroute `optimize_clock_tree` command, only buffer sizing and gate sizing are supported.

WHAT NEXT

This is only a warning message. However, if delay insertion is the only optimization specified in the postroute stage, the tool skips the optimization. Remove delay insertion from the script for best results and to avoid this warning message.

SEE ALSO

`optimize_clock_tree(2)`

CTS-282 (warning) CTO buffer relocation is not supported in postroute mode.

DESCRIPTION

This warning message indicates that clock tree optimization buffer relocation is not performed in postroute mode. When the `-routed_clock_stage` option is specified for a postroute `optimize_clock_tree` command, only buffer sizing and gate sizing are supported.

WHAT NEXT

This is only a warning message. However, if buffer relocation is the only optimization specified in the postroute stage, the tool skips the optimization. Remove buffer relocation from the script for best results and to avoid this warning message.

SEE ALSO

`optimize_clock_tree(2)`

CTS-283 (warning) CTO gate relocation is not supported in postroute mode.

DESCRIPTION

This warning message indicates that clock tree optimization gate relocation is not performed in postroute mode. When the **-routed_clock_stage** option is specified for a postroute **optimize_clock_tree** command, only buffer sizing and gate sizing are supported.

WHAT NEXT

This is only a warning message. However, if gate relocation is the only optimization specified in the postroute stage, the tool skips the optimization. Remove gate relocation from the script for best results and to avoid this warning message.

SEE ALSO

`optimize_clock_tree(2)`

CTS-284 (warning) The **-no_clock_eco_route** and **-search_repair_loop** options are only valid with postroute CTO.

DESCRIPTION

This warning message advises you that the **-no_clock_eco_route** and **-search_repair_loop** options are ignored because they are only valid with postroute clock tree optimization. When the **-routed_clock_stage** option is set to **none** (the default), clock tree optimization performs only preroute optimization and ignores **-no_clock_eco_route** and **-search_repair_loop**.

WHAT NEXT

If you intended to perform preroute clock tree optimization, the ignored options have no impact on the result.

If you intended to perform postroute clock tree optimization, rerun the command, specifying the correct value for **-routed_clock_stage**.

SEE ALSO

`optimize_clock_tree(2)`

CTS-285 (warning) CTO is in postroute mode, but net %s is not routed.

DESCRIPTION

This warning message occurs when clock tree optimization is in postroute mode, but the specified net is not routed. No routing is performed.

WHAT NEXT

If you intended to run clock tree optimization in postroute mode with the net routed, then route the clock nets and run the command again.

If you do not want to route the clock nets, run the **optimize_clock_tree** command in preroute mode.

SEE ALSO

`optimize_clock_tree(2)`

CTS-286 (warning) CTO is in preroute mode, but the .ddc file is global routed.

DESCRIPTION

This warning message occurs when the **optimize_clock_tree** command is run in preroute optimization mode, but the .ddc file is (partially) global routed. No routing is performed.

WHAT NEXT

Rerun the command with the correct routing mode. See the command man page for routing mode information.

SEE ALSO

`optimize_clock_tree(2)`

CTS-287 (warning) CTO is in preroute mode, but the .ddc file is

(partially) detail routed.

DESCRIPTION

This warning message occurs when the **optimize_clock_tree** command is run in preroute optimization mode, but the .ddc file is (partially) detail routed. No routing is performed.

WHAT NEXT

Rerun the command with the correct routing mode. See the command man page for routing mode information.

SEE ALSO

`optimize_clock_tree(2)`

CTS-288 CTO is in postroute mode, but no routing is performed.

DESCRIPTION

This warning message occurs when the **optimize_clock_tree** command is in postroute optimization mode, but the .ddc file is not routed. No routing is performed.

WHAT NEXT

Rerun the command with the correct routing mode. See the command man page for routing mode information.

SEE ALSO

`optimize_clock_tree(2)`

CTS-289 (Information) Removing clock source latency on %s
%S ...

DESCRIPTION

You receive this information message because the synthesized clock is set to be propagated, and clock source latency, which is the attribute of an ideal clock, is removed.

WHAT NEXT

This is an informational message only. No action is required on your part.

CTS-290 (Warning) Clock %s is partially synthesized

DESCRIPTION

You receive this warning message because the multi-source clock is partially synthesized. The clock latency value applied to its related virtual clock may be incorrect.

WHAT NEXT

Make sure all clock nets from every source pin of the clock are synthesized correctly and rerun update_clock_latency command again.

SEE ALSO

`update_clock_latency(2)`
`set_latency_adjustment_options(2)`

CTS-291 (Warning) Cell %s has clock definition on it. It will not be sized.

DESCRIPTION

You receive this message because CTO is trying to size a cell with clock definition defined on one of its pins.

WHAT NEXT

If a cell has clock definition defined on one of its pins, Sizing cannot size this cell in Standalone CTO. If you want to size this cell you might want to remove the clock definiton.

CTS-292 (error) Wrong input for routed_clock_stage option: %s,

use none, track or detail.

DESCRIPTION

This error message occurs when an invalid value is used for the **-routed_clock_stage** option. Accepted values for this option are **none** for preroute, and **track**, or **detail** for different stages of postroute.

WHAT NEXT

Rerun the command, specifying the value for the **-routed_clock_stage** option as either **none**, **track**, or **detail**.

See the command man page for further information.

SEE ALSO

`optimize_clock_tree(2)`

CTS-295 Inter-clock delay balance cannot handle clock %s defined at input pin and it goes to multiple output pins.

DESCRIPTION

No buffer/inverter's LEQ classes in the library used for clock tree optimization or inter-clock delay balance.

WHAT NEXT

Check library setup.

SEE ALSO

`optimize_clock_tree(2)`
`balance_inter_clock_delay(2)`

CTS-300 (Error) Invalid CTS operating condition %s.

DESCRIPTION

This error occurs when the operating condition specified by `-operating_condition` option.

WHAT NEXT

Please specify one of the following options for `-operating_conditions` 1.`min` 2.`max` (default) 3. `min_max`

CTS-301 Need only one offset from clock.

DESCRIPTION

Clock from is the reference clock and only one clock can be the reference clock.

WHAT NEXT

Correct clock from specification in the script.

SEE ALSO

`set_inter_clock_delay_options(2)`
`balance_inter_clock_delay(2)`

CTS-302 No clock from found when clock to is given for inter-clock delay balance options.

DESCRIPTION

A clock should be given as reference clock (clock from) when offset clock to is given in inter-clock delay balance options.

WHAT NEXT

Correct clock from specification in the script.

SEE ALSO

```
set_inter_clock_delay_options(2)  
balance_inter_clock_delay(2)
```

CTS-310 (Error) %d coincident fanout pins at (%d,%d), including %s

DESCRIPTION

When doing clustering, all the pins (sink and hookup) are collected and sorted geometrically. The sorted list should not include multiple pins coincide on a same location. When such a condition is found, although CTS will continue, this is usually a sign of some problem in design.

WHAT NEXT

Check for connection errors in the clock net list.

CTS-311 (Warning) cell %s has inverting timing arc but is modeled as a buffer.

DESCRIPTION

Timing arc found on a cell has different logic polarity from the functional model of it.

WHAT NEXT

Check if the functional model of the cell is correct.

SEE ALSO

CTS-312 (n)

CTS-311 (Warning) cell %s has non-inverting timing arc but is modeled as an inverter.

DESCRIPTION

Timing arc found on a cell has different logic polarity from the functional model of it.

WHAT NEXT

Check if the functional model of the cell is correct.

SEE ALSO

CTS-311 (n)

CTS-313 (Error) Class not found <%d> for cell <%s>.

DESCRIPTION

The function of the cell is not registered as any class.

WHAT NEXT

Check the LEF library.

CTS-314 (Warning) The VA id got from plan group is invalid.

DESCRIPTION

The voltage area ID got from plan group is either smaller than 0 or larger than allowed.

WHAT NEXT

Check the voltage area setting and plan group creation/setting in the design.

CTS-315 (Error) Error found in clock net %s during clustering!

DESCRIPTION

Clustering process meets error when working on the clock net.

SEE ALSO

CTS-316 (n)

CTS-316 (Error) %d clusters { bufferlevel %s} > %d pins

DESCRIPTION

During clustering, the number of cluster generated (for the given buffer level) is larger than the number of pins being generated.

SEE ALSO

CTS-315 (n)

CTS-317 (Error) Found pin connection problem at buffer(%d) of level(%d)

DESCRIPTION

The given buffer at the given buffer level has problem in its output pin or output net.

CTS-318 (Warning) %s is not a buffer

DESCRIPTION

A cell used as clock buffer is found to be not a buffer cell.

CTS-319 (Warning) A clock tree defined on the don't-touch net %s.

DESCRIPTION

A clock tree is marked as don't touch net and CTS will skip working on the don't touch net.

WHAT NEXT

Check the clock tree definition and definition of don't touch net in your design.

CTS-320 (Warning) No buffer level specified for net %s.

DESCRIPTION

When loading clock tree configuration file, a clock net does not have a buffer level defined for it.

WHAT NEXT

Check the clock tree configuration file.

CTS-321 (Warning) No clock tree synthesis on the %s net (net name: %s)

DESCRIPTION

A clock net is found to be one of several net-types that cause CTS to skip synthesizing it. The possible types include: -HTV net -bi-direction net -ILM net - cts_dont_buffer_internal net -routed net

WHAT NEXT

Verify that the clock tree definition and net type are what the design intended.

CTS-350 (Error) No enabled buffers were found in the library.

Aborting.

DESCRIPTION

Clock tree optimization requires buffers or inverters for optimization. All candidate cells have been disallowed, and optimization cannot continue.

WHAT NEXT

Supply more target libraries, remove dont_use attributes from library cells, or explicitly supply a valid buffer list with set_clock_tree_references.

SEE ALSO

`set_clock_tree_references` (2),

CTS-351 (Warning) The cts integrated global router has not been activated. Using virtual route estimation.

DESCRIPTION

Clock tree optimization is designed to predict routing by creating actual global routes. By disabling the global router, the accuracy of skew estimation of the optimizer will be lessened.

WHAT NEXT

Turn on the integrated router by using "optimize_clock_tree -effort high".

SEE ALSO

CTS-352 (Warning) `set_delay_calculation` is currently set to 'elmore'. 'clock_arnoldi' is suggested.

DESCRIPTION

Clock tree optimization will use the timing analysis engine specified by `set_delay_calculation`. In modern technologies, elmore delay calculation may lead to inferior accuracy in skew estimation.

WHAT NEXT

Turn on arnoldi delay calculation for the clocks by using "set_delay_calculation clock_arnoldi".

SEE ALSO

`set_delay_calculation (2)`,

CTS-353 (Warning) Skew target %.3f ns is too high. Using %.3f ns.

DESCRIPTION

The specified skew target is ridiculously high and is probably specified with the wrong units. A more reasonable target is being assumed.

WHAT NEXT

Specify a lower target, and make sure that you use the units of the first target library.

SEE ALSO

`set_clock_tree_options (2)`,

CTS-354 (Error) Skew target %.3f is not legal. Using %.3f ns.

DESCRIPTION

The target skew must be a positive number.

WHAT NEXT

Specify a correct target.

SEE ALSO

`set_clock_tree_options (2)`,

CTS-355 (Warning) Skew target %.3f ns is very low for global

optimization. Using %.3f ns.

DESCRIPTION

Global clock optimization works on every cell in the tree. Very aggressive skew targets cause it to over-optimize. Your skew target will only be used in operations which work specifically on problem clock paths.

WHAT NEXT

Consider setting a higher skew target by using the -target_skew or -corner_target_skew options of set_clock_tree_options.

SEE ALSO

`set_clock_tree_options` (2),

CTS-356 (Warning) Max transition will cause the default target of %.3f ns to be lowered.

DESCRIPTION

By default, clock tree optimization chooses a very aggressive transition target for most nets. You have set your transition so that the target needs to be set even lower. There may be cases where optimization will be blocked by transitions that cannot be met. Degradation of skew and insertion delay may result.

WHAT NEXT

Consider setting a higher max_transition.

SEE ALSO

`set_clock_tree_optimization_options` (2),

CTS-357 (Warning) Max transition will override the default target of %.3f ns.

DESCRIPTION

You have chosen to loosen max_transition. This also has the effect of loosening the internal transition target of clock tree optimization. In some cases this will help

clock tree optimization achieve smaller gate areas. However, loosening max_transition too much may degrade insertion delays, skews, and immunity to noise.

WHAT NEXT

Make sure that the benefit of loosening max_transition outweighs the costs. In particular, very high max_transition is almost never worthwhile.

SEE ALSO

`set_clock_tree_optimization_options (2)`,

CTS-358 (Warning) Cell '%s' is not legally placed and will not be optimized.

DESCRIPTION

The specified cell was not placed legally prior to clock tree optimization. Clock tree optimization will correctly optimize around the cell. But the cell itself will not be considered for sizing, relocation, splitting, or deleting.

WHAT NEXT

Try using `legalize_placement` prior to clock tree optimization.

SEE ALSO

`legalize_placement`
`check_placement`

CTS-359 (Warning) Cell '%s' cannot be legally moved and will not be optimized.

DESCRIPTION

The specified cell is currently placed legally, but cannot now be replaced legally near its original location. Clock tree optimization will correctly optimize around the cell. But the cell itself will not be considered for sizing, relocation, splitting, or deleting.

WHAT NEXT

Remove the restriction that keeps the cell from being moved.

SEE ALSO

`legalize_placement`
`check_placement`

CTS-360 (Warning) Library cell '%s' cannot be legally placed in this block.

DESCRIPTION

The specified library cell has no legal site in the block. The cell will not be used for optimization.

WHAT NEXT

Remove the restriction that keeps the cell from being used.

SEE ALSO

`legalize_placement`
`check_placement`

CTS-361 (Warning) Net '%s' has more than %d fanouts. Treating as ideal.

DESCRIPTION

The given net has a very large fanout. The timing of the net will be ideal, and all cells connected to the nets will be don't touched.

WHAT NEXT

The net should be buffered using `compile_clock_tree` or some other high-fanout synthesis.

SEE ALSO

`compiler_clock_tree`

CTS-362 (Warning) Library cell '%s' is not optimizable used in

voltage region '%s' (target_library_subset='%'s').

DESCRIPTION

One or more cells in the given region have the given library cell. These cells are not currently optimizable in this region -- possibly because of set_target_library_subset. These cells may be relocated, but will not be sized.

WHAT NEXT

Use the check_mv_design command to get a better understanding of the library constraints within the given region.

SEE ALSO

`set_target_library_subset`
`check_mv_design`

CTS-363 (Error) Cell '%s' cannot be sized to '%s' and placed legally. Optimization will be adversely effected.

DESCRIPTION

An attempt was made to size the given cell to the given lib_cell. After sizing, the cell could not be legally placed in the block. The cell has left in its original location, without legal placement. Also the lib_cell is being marking as "dont_use" for the remainder of the optimization run.

WHAT NEXT

Resolve the issue that keeps this lib_cell from being placed. If that is not possible, you should exclude this lib_cell from the optimization run by either updating your set_clock_tree_references command or by manually setting dont_use on the lib_cell before optimization begins.

SEE ALSO

`set_clock_tree_references`

CTS-364 (Error) Source pin '%s/%s' is in the fanout of another source pin which which is being simultaneously optimized.

Optimization aborted.

DESCRIPTION

If you are trying to balance the subtrees of several clock sources against each other, one clock source may not be in the subtree of another source.

WHAT NEXT

Define clock sources which are not in each other's fanout.

SEE ALSO

CTS-365 (Error) Library cells %s and %s have mismatched pins.
Swapping will be disabled in the clock tree.

DESCRIPTION

The two clock-tree cells are not compatible and cannot be resized to one another.

WHAT NEXT

Cells must have the same number of pins to be swapped in the clock tree.

SEE ALSO

CTS-366 (Warning) Clock tree cells %s and %s have mismatched pin names.

DESCRIPTION

The two clock-tree cells have different pin names. Resizing between the two cells is handled correctly.

WHAT NEXT

Mismatched pin names are not a serious problem. But you should check the library just to make sure that the cells are actually compatible.

SEE ALSO

CTS-367 (Warning) Clock tree cells %s and %s have pins in differing order. Cells will be swapped based on pin names.

DESCRIPTION

The two clock-tree cells have different pin orders. Resizing between the two cells is allowed, based on the names of the pins. This should preserve functionality.

WHAT NEXT

Check the library to make sure that the cells are actually compatible. If the only difference between the cells is pin order, then you are OK.

SEE ALSO

CTS-368 (Error) Scenario '%s' is not defined.

DESCRIPTION

You must specify corners as "scenario:max" or "scenario:min". The scenario must be defined. You may use "default:max" or "default:min" if there are no scenarios defined.

WHAT NEXT

Define the desired scenarios or use "default".

SEE ALSO

CTS-369 (Error) Misformatted corner spec '%s'. Must be 'scenario:max' or 'scenario:min'

DESCRIPTION

You must specify corners as "scenario:max" or "scenario:min". The scenario must be defined. You may use "default:max" or "default:min" if there are no scenarios defined.

WHAT NEXT

Define the desired scenario or use "default".

SEE ALSO

CTS-370 (Information) Not optimizing corner '%s' because it has identical characteristics as '%s'.

DESCRIPTION

The two corners listed have identical process, voltage, temperature and wire characteristics. Only one of the corners is needed. The other corner is being skipped to save redundant CPU usage.

WHAT NEXT

No action is required.

SEE ALSO

CTS-371 (Warning) 'clock_arnoldi' delay calculation will be activated during optimize_clock_tree.

DESCRIPTION

You have selected multicorner optimization for your clock tree optimization. Yet your current timing mode, by default or as selected by set_delay_calculation, is 'elmore'. Elmore delay calculation is too inaccurate for multicorner clock optimization. (And in fact, elmore delay is generally too inaccurate for *any* clock optimization in modern technologies.)

When clock optimization is performed by optimize_clock_tree, your timing mode will automatically be changed to "clock_arnoldi".

WHAT NEXT

No action is required. Resetting of the timing mode is automatic. To avoid this warning message in the future, you can manually call "set_delay_calculation clock_arnoldi" yourself.

SEE ALSO

```
set_delay_calculation (2),  
optimize_clock_tree (2),
```

CTS-372 (Error) You must use set_lib_scaling_group along with your scenario definitions.

DESCRIPTION

As of the 2007.12 release, the set_lib_scaling_group command is recommended for associating libraries with the "max" and "min" corners of a scenario. Your defined scenarios require you to use set_lib_scaling_group. Failure to do so will cause incorrect timing calculation in future processing.

WHAT NEXT

Check the documentation, and then add set_lib_scaling_group to each of your scenario definitions.

SEE ALSO

```
set_delay_calculation (2),  
optimize_clock_tree (2),
```

CTS-373 (Error) The corner specification '%s' is not valid. Ignoring constraint setting.

DESCRIPTION

The given corner is either improperly formatted or is not currently selected for optimization. Corner specifications must be in one of the following forms:

```
default:max  
default:min  
secanrio_name:max  
scenario_name:min  
RC
```

WHAT NEXT

Make sure you are using one of the accepted corner formats. Make sure your scenario name is spelled correctly. Make sure the corner is currently selected for optimization in the set_clock_tree_optimization_options command.

SEE ALSO

```
set_clock_tree_optimization_options (2),  
optimize_clock_tree (2),
```

CTS-374 (Error) Constraint specification '%s' is illegal.

DESCRIPTION

The given constraint specification is improperly formatted. A proper specification is of the following form:

```
corner_specification=value
```

A corner specification has one of the following forms:

```
default:max  
default:min  
secanrio_name:max  
scenario_name:min
```

RC

WHAT NEXT

You probably either forgot the equal sign (=) in the specification or you inserted extra spaces. You should only use spaces between constraint specifications, not with a specification. A correct example would be:

```
"default:max=0.050 default:min=0.030"
```

An incorrect example would be:

```
"default:max = 0.050 default:min = 0.030"
```

SEE ALSO

```
set_clock_tree_options (2),  
optimize_clock_tree (2),
```

CTS-375 (Information) Float pin scale factor for the '%s' operating condition of scenario '%s' is set to %.3f

DESCRIPTION

In the given corner, float pin delay values will be scaled by the given amount. Refer to the `set_clock_tree_exception` man page for more details.

WHAT NEXT

This setting may have been derived automatically. If you wish to use a different value, use the `set_clock_tree_exceptions` command before calling optimization.

SEE ALSO

`set_clock_tree_exceptions` (2),
`optimize_clock_tree` (2),

CTS-376 (Warning) Float pin scale factor is not set for the '%s' operating condition of scenario '%s'. Skews may be inaccurate.

DESCRIPTION

When timing clocks in multiple process corners, you need to scale float pin values appropriately. Failure to do so may cause unrealistic skews to be reported.

WHAT NEXT

If you have no float pin settings, then no action is required. If you are reporting in your primary CTS corner, then the skews may be OK. Otherwise, you need scale factors. Scale values may be set manually or automatically. Refer to the `set_clock_tree_exceptions` man page for more details.

SEE ALSO

`set_clock_tree_exceptions` (2),
`optimize_clock_tree` (2),

CTS-377 (Warning) Clock tree cells %s and %s have pins in differing order. Order will be honored.

DESCRIPTION

The two clock-tree cells have different pin orders. For example, one AND gate might have pins A and B. Another might have B and A. Resizing between the two cells is allowed, and the first pin of one cell will be swapped for the first pin of the other cell. This means that the pin names will change when cell sizing occurs. The tool only allows this situation when two pins have identical function. So the functionality of your circuit will be preserved.

WHAT NEXT

Check the library to make sure that the cells are actually compatible. If the only difference between the cells is pin order, then you are OK.

SEE ALSO

CTS-378 (Error) Clock net '%s' is not legally routed or extracted. Using ideal parasitics.

DESCRIPTION

The given net is either not routed, cannot be cleanly extracted, or has user-annotated parasitics. Post-route optimization will continue, but the parasitics of this net will be estimated based on lumped or annotated values. This may cause timing inaccuracies.

WHAT NEXT

Make sure you've routed all of your clock nets. The usual command for clock routing is "route_group -all_clocks". Also, run "extract_rc" and check for warning messages such as RCEX-060 which indicate routes that are not fully connected. Also check for user annotated parasitics.

SEE ALSO

CTS-379 (Information) Primary corner '%s:max' is from the %s scenario.

DESCRIPTION

The given "primary" corner is used for querying all CTS constraints, such as clock definitions, exclude pins, stop pins, and float pins. Float pin values will be scaled for use in other corners.

The given "primary" corner is used for some operations that are not multicorner-aware. So the corner should be the worst case of all corners that you specify. This will generally be a corner with slow gates and high-resistance wires.

The primary corner is taken from the "cts scenario", if specified. Otherwise, the "current scenario" is used. If the primary corner is currently taken from the "current scenario", you may want to consider defining a cts scenario to make sure that the selection of the primary corner is always the same.

WHAT NEXT

Make sure a worst-case corner is defined. Use `set_cts_scenario` to single out that case to the algorithms.

SEE ALSO

`set_cts_scenario`

CTS-380 (Error) Cannot process hierarchical clock source '%s' of clock '%s'.

DESCRIPTION

When a clock source is declared on a logical hierarchy port, it is required that that port be driven by a physical cell -- such as a buffer or clock gate. If the hierarchical port is undriven, it is not possible to properly process the fanout clock tree. Optimization of the tree will be skipped.

WHAT NEXT

Modify your netlist to ensure that the hierarchy port has a cell driving it.

SEE ALSO

CTS-381 (Warning) Multicorner clock tree optimization will use high effort.

DESCRIPTION

When you use `set_clock_tree_optimization_options` to set `-enable_multicorner_optimization` to any value other than "none", the value of `-effort` will implicitly be set to "high". Manually setting the `-effort` switch to another value will have no effect.

WHAT NEXT

If you want low effort clock tree optimization, you cannot use multicorner optimization.

SEE ALSO

CTS-382 (Warning) Max capacitance %f on lib_cell %s is very constraining. Your max_transition suggests that %f would be more appropriate.

DESCRIPTION

One of the outputs of the given lib_cell has a very low max_capacitance constraint. This restricts the cell from being used in situations where it could easily meet your max_transition constraint.

WHAT NEXT

Reconsider whether your max_capacitance constraint is appropriate. If not, you should patch your synthesis library.

SEE ALSO

`set_cts_scenario`

CTS-383 (Warning) Delta delays have not been activated for clock optimization.

DESCRIPTION

When performing post-route clock tree optimization, it is desirable to take crosstalk into account. Crosstalk may cause undesired skew by inducing both "push out" and "pull in" of clock net delays. Post-route clock optimization can be used to offset this effect. Post-route optimization for crosstalk has not been activated.

WHAT NEXT

You need to activate SI delta delays. This is done with the following command:

```
set_si_option -delta_delay true -min_delta_delay true
```

SEE ALSO

`set_delay_calculation`
`set_si_options`

CTS-384 (Warning) Arnoldi delay has not been activated for clock optimization.

DESCRIPTION

When performing post-route clock tree optimization, it is desirable to be as accurate as possible. Your current setting for elmore delays may lead to timing problems during signoff.

WHAT NEXT

You need to activate arnoldi delta delays. This is done with the following command:

```
set_delay_calculation -arnoldi
```

SEE ALSO

```
set_delay_calculation  
set_si_options
```

CTS-385 (Warning) Min delta delay has not been activated for clock optimization.

DESCRIPTION

When performing post-route clock tree optimization, it is desirable to take crosstalk into account. Crosstalk may cause undesired skew by inducing both "push out" and "pull in" of clock net delays. Post-route clock optimization can be used to offset this effect.

You are currently only optimizing for clock push out, but it is often the case that clock pull in is an even more severe effect.

WHAT NEXT

You need to activate SI delta delays for both push out and pull in. This is done with the following command:

```
set_si_option -delta_delay true -min_delta_delay true
```

SEE ALSO

```
set_delay_calculation  
set_si_options
```

CTS-386 (Warning) Can only check max_length constraint when the CTS router is activated.

DESCRIPTION

The max_length constraint requires routing to be performed during CTO. If routing is disabled, the no check is performed.

WHAT NEXT

Use high effort for optimize_clock_tree to turn on router and activate the max_length check.

SEE ALSO

`optimize_clock_tree`

CTS-387 (Error) Clock tree routing initialization failed.

DESCRIPTION

This error occurs when clock tree routing initialization failed in the hidden command `optimize_clock_global_routing`.

WHAT NEXT

CG and DB may not be in sync, or timer initialization failed. Look for CTS-265 error.

CTS-389 (Error) Clock tree routing% failed.

DESCRIPTION

This error occurs when clock tree routing failed in the hidden command `optimize_clock_global_routing`. It is likely that no clock nets are specified.

WHAT NEXT

Please specify the list of clock names.

CTS-389 (Error) report net routing error: no nets specified.

DESCRIPTION

This error occurs when no clock nets or valid clock nets are specified for the hidden command `lr_report_net_routing`.

WHAT NEXT

Please specify the net names for reporting.

CTS-390 (Error) Report net routing error: no valid clocks specified.

DESCRIPTION

This error occurs when no valid clock nets are specified for the hidden command `lr_report_clock_routing`.

WHAT NEXT

Please specify the clock names for reporting.

CTS-400 (Warning) Top mode will be applied to all clocks.

DESCRIPTION

Top mode currently is a global setting.

WHAT NEXT

Synthesize the clocks that require top mode separately from the rest. Turn on top mode for the clocks that require top mode, and turn off top mode for the rest.

CTS-401 (Error) Could not process %s.

DESCRIPTION

This error message occurs when the arguments specified are incorrect. Either the

arguments to the option do not exist or there were incorrect number of arguments given.

WHAT NEXT

Please refer to the command man page for information about the valid arguments to the option.

CTS-402 (Warning) Could not transfer wires from net %s to net %s.

DESCRIPTION

This warning message occurs when the transfer of mesh wires from sending net to receiving net fails.

WHAT NEXT

Please check whether valid sending and receiving nets have been specified.

CTS-403 (Error) Bad layer.

DESCRIPTION

This error message occurs when the layer which is specified is incorrect.

WHAT NEXT

Try get_layers to get proper layer name.

CTS-404 (Error) More than one %s specified.

DESCRIPTION

This error message occurs when the option which requires only one object(pin or net etc) is supplied with more than one object in the command.

WHAT NEXT

Please refer to the command man page for information about the valid arguments to

the various options and also try object specific get* commands to get the proper objects.

CTS-405 (Error) Could not create proper premesh tree structure.

DESCRIPTION

This error message occurs because either the level configuration is wrong with respect to buffer grid or no appropriate buffer was found.

WHAT NEXT

Please check the configuration specified.

CTS-406 (Warning) Preferred direction for layer %s is not %s.

DESCRIPTION

Each metal, on which the routes are created, has a direction which is preferred for the routing tracks on it. The direction is either horizontal or vertical. In case the direction of the route doesn't match with the preferred direction of the metal, the routes might not be optimal or might result into some other side issues. It is advisable that the routes follow the preferred direction on a metal when created.

WHAT NEXT

Please check the preferred direction of the metal to be used for the routes.

CTS-407 (Info) Cell %s predicted move exceeds max displacement limit (%s > %s). Suppressing cell.

DESCRIPTION

When a cell needs to be added in the pre-mesh tree for the mesh , there should enough placeable area near the derived location for that cell. The location of the cell is derived mainly based on the loads' locations. However, the actual placement location depends on existence of placement blockages, cell overlapping, allowable maximum displacement etc. If there is no suitable place for the cell to be placed honoring the given maximum displacement constraint, the tool will not instantiate and place that cell.

WHAT NEXT

Please check the value of the maximum allowable displacement.

CTS-408 (Warning) %d cells were added, %d cells could not be added. Unable to connect %d buffers.

DESCRIPTION

When a cell needs to be added in the pre-mesh tree for the mesh , there should enough placeable area near the derived location for that cell and also its driver cell and load cell(s) must also be instantiated from proper libraries and placed. The location of the cell is derived mainly based on the loads' locations. However, the actual placement location depends on existence of placement blockages, cell overlapping, allowable maximum displacement etc. If there is no suitable place for the cell to be placed * or in case its driver and/or load cells are not properly instantiated in the tree, this cell will not be connected to its driver or loads and will result into a distorted/unconnected pre-mesh tree.

WHAT NEXT

Please check the placement blockages in the floorplan, the mesh load distribution, the value of maximum allowable displacement, properly characterized library from which the cells will be instantiated.

CTS-409 (Error) No library cell defined for buffer %s.

DESCRIPTION

This error occurs when no appropriate cell is found in the given library for the particular buffer.

WHAT NEXT

Please check the target library or target library subset specified for the hierarchy in which the driver is expected. Also check and the driver name if specified or operating condition for the cell.

CTS-410 (Error) Could not annotate : No clocks found at pin

'%S'.

DESCRIPTION

This error occurs when a pin on a non-clock net is encountered during timing annotation where it is expected to be on clock net.

WHAT NEXT

Please check the clock network.

CTS-411 (Warning) Please use -clock_trees instead of -root.

DESCRIPTION

This warning occurs because the option -root is no longer support in the command set_clock_tree.

WHAT NEXT

Please use -clock_trees instead of -root.

CTS-412 (Error) No cell can be added at level %d.

DESCRIPTION

This error occurs when no cells in a certain level in the tree can be added due to placement bloackage or due to the violation of maximum displacement constraint.

WHAT NEXT

Please check the floorplan to know the location of placement blockages and may try to re-plan the load distribution and/or change the constraint values that affects the placement of the buffers in the tree.

CTS-413 (Warning) Detect an invalid timing data: %S

DESCRIPTION

The corrupt or syntactically incorrect input file containing timing data to be used in analyze_subcircuit results in this warning condition.

WHAT NEXT

Please rectify the file contents.

CTS-414 (Error) Cannot instantiate %s object on pre-mesh tree inside the voltage area '%s'

DESCRIPTION

In multi-voltage design this error happens when the optimal hierarchy selected for the newly created object on pre-mesh tree doesn't fall inside the voltage area of the mesh loads.

WHAT NEXT

Please check the mesh loads' hierarchies and the voltage area information.

CTS-415 (Error) Mesh loads are in different voltage areas.

DESCRIPTION

In multi-voltage design this error happens when the loads of a single mesh is spread over multiple voltage areas. For a single mesh, loads must be in the same voltage area.

WHAT NEXT

Please check the mesh loads' positions.

CTS-416 (Error) Mesh loads are belonging to hierarchies of

different operating conditions.

DESCRIPTION

In multi-voltage design this error happens when the loads of a single mesh is spread over multiple hierarchies of different operating conditions. For a single mesh, loads must be of same operating conditions.

WHAT NEXT

Please check the mesh loads' operating conditions.

CTS-418 (Error) Bounding box narrower than vertical wire pitch, %S < %S.

DESCRIPTION

This error message occurs when the width of the bounding box specified in the command is less than the horizontal pitch. Horizontal pitch is the horizontal distance between vertical straps of the mesh.

WHAT NEXT

Please check the bounding box and the pitch value specified in the command.

CTS-419 (Error) Bounding box shorter than horizontal wire pitch, %S < %S.

DESCRIPTION

This error message occurs when the bounding box height specified in the command is less than the vertical pitch. Vertical pitch is the vertical distance between horizontal straps of the mesh.

WHAT NEXT

Please check the bounding box and the pitch value specified in the command.

CTS-420 (Error) To use -ring, must have >= 2 straps in

horizontal and vertical dimensions.

DESCRIPTION

This error message occurs when you specify the "-ring" option in "create_clock_mesh" when there are less than 2 straps specified for the mesh. The -ring option puts a rectangular ring around the entire mesh. This will connect the ends of the horizontal and vertical straps. So a minimum of 2 horizontal and vertical straps is required.

WHAT NEXT

Please check the number of straps you have specified and refer to the command man page.

CTS-421 (Error) Cannot support multiple nets on load pins. The actual load net is %s, but pin %s has net %s.

DESCRIPTION

This error message occurs when the load pins are on 2 different net groups which is not supported. The mentioned pin belongs to a different net group than the specified load net.

WHAT NEXT

Please check the load pins specified and check the command man-page.

CTS-422 (Error) Cannot use prefix %s, conflicts with %s: %s.

DESCRIPTION

This error message occurs when the name given in "-prefix" option in add_clock_drivers conflicts with the name of an existing object. The prefix should be unique.

WHAT NEXT

Please provide a valid prefix in the command.

CTS-423 (Error) Bad MW cellID on mesh net.

DESCRIPTION

This error message occurs when the milkyway cellID for the mesh-net is not does not match with the top cellID.

WHAT NEXT

Please check the mesh-net specified in the command.

CTS-424 (Error) No placeable area found for cells to be placed. Mesh creation has been aborted.

DESCRIPTION

The error occurs when placeable area is not found in the command `create_clock_mesh`.

WHAT NEXT

Please check the bounding box specified in the command and the placeable area available.

CTS-425 (Error) Could not write shell file '%s'.

DESCRIPTION

Command `analyze_subcircuit` could not write the above mentioned shell file. This is needed to invoke Star-RCXT.

WHAT NEXT

Check if the file already exists and if so check if you have UNIX write permissions on this file.

SEE ALSO

`analyze_subcircuit`

CTS-426 (Error) Failed to mark the shell-control-file '%s'

executable. extraction.

DESCRIPTION

Command **analyze_subcircuit** could not "chmod +x" the above specified file.

WHAT NEXT

Check if the file already exists and if so check if you have appropriate UNIX permissions on this file.

SEE ALSO

[analyze_subcircuit](#)

CTS-427 (Error) Extractor path test failed, check '%s' and '%s', and look at your 'path' and other UNIX variables.

DESCRIPTION

Command **analyze_subcircuit** could not find Star-RCXT in the path.

WHAT NEXT

Check if Star-RCXT is in the path and can be executed.

SEE ALSO

[analyze_subcircuit](#)

CTS-428 (Error) Could not re-open the log file '%s' for reading.

DESCRIPTION

Command **analyze_subcircuit** could not re-open the log file used for testing Star-RCXT executable.

WHAT NEXT

Check if the extractor is in the path and can be executed and also check the permissions for the mentioned file.

SEE ALSO

`analyze_subcircuit`

CTS-429 (Error) Could not find Star-RCXT path in logfile %s.

DESCRIPTION

Command `analyze_subcircuit` could not find the Star-RCXT executable.

WHAT NEXT

Check if the extractor is in the path and can be executed.

SEE ALSO

`analyze_subcircuit`

CTS-430 (Error) Could not run Star-RCXT for extraction.

DESCRIPTION

Star-RCXT could not be invoked for extraction in "analyze_subcircuit". This may be due to several reasons such as permissions or else wrong executable path.

WHAT NEXT

SEE ALSO

`analyze_subcircuit`

CTS-431 (Error) Could not open the SPEF file %s in analyze_subcircuit.

DESCRIPTION

The above mentioned file could not be opened for read. This may be due to lack of necessary permissions.

WHAT NEXT

Please check the file path and the permissions.

SEE ALSO

`analyze_subcircuit`

CTS-432 (Error) Could not verify the SPEF file %s in `analyze_subcircuit`.

DESCRIPTION

The SPEF file could not be verified. This could be because the SPEF file is in an improper format, is unreadable or is not written properly .

WHAT NEXT

Please check whether the SPEF file is generated properly by the extractor.

SEE ALSO

`analyze_subcircuit`

CTS-435 (Error) Could not write Star-RCXT command file %. Extraction will be done by "extract_rc" command instead of Star-RCXT.

DESCRIPTION

Command `analyze_subcircuit` could not write the command file needed for Star-RCXT to run. Hence `analyze_subcircuit` will continue with "extract_rc" command for extraction.

WHAT NEXT

Check permissions for the filename mentioned.

SEE ALSO

`analyze_subcircuit`

CTS-436 (Error) Could not find library path for Star-RCXT command file. Extraction will be done by "extract_rc" command instead of Star-RCXT .

DESCRIPTION

Command **analyze_subcircuit** could not find the library path to be specified for Star-RCXT command file. Hence Star-RCXT cannot be invoked and extract_rc will be used for extraction.

WHAT NEXT

Check the library path given.

SEE ALSO

[analyze_subcircuit](#)

CTS-437 (Error) Could not create Star-RCXT working directory. Extraction will be done by "extract_rc" command instead of Star-RCXT.

DESCRIPTION

Command **analyze_subcircuit** could not create the working directory for Star-RCXT. Extract_rc will be used for extraction.

WHAT NEXT

Check the permissions to create the working directory.

SEE ALSO

[analyze_subcircuit](#)

CTS-438 (Error) Could not save the milkyway cell to be used by Star-RCXT. Extraction will be done by "extract_rc" command

instead of Star-RCXT.

DESCRIPTION

Command **analyze_subcircuit** could not save milkyway cell to be used by Star-RCXT. So Star-RCXT cannot be invoked and hence "extract_rc" command will be used for extraction.

WHAT NEXT

SEE ALSO

[analyze_subcircuit](#)

CTS-439 (Warning) Bounding_box is not a subset of placeable area.

DESCRIPTION

This warning message occurs when the bounding box specified in "create_clock_mesh" command is not contained within a placeable area.

WHAT NEXT

Please check the bounding box specified for the command and refer to command man-page.

CTS-440 (Error) The location assigned to cell %s is not in VA.

DESCRIPTION

This Error message occurs when the mentioned cell is not found to be within the legal voltage area.

WHAT NEXT

CTS-441 (Error) Bad simulator name '%s' specified.

DESCRIPTION

The simulator name mentioned is invalid in command `analyze_subcircuit`.

WHAT NEXT

Check the simulator name specified.

SEE ALSO

`analyze_subcircuit`

CTS-442 (Error) Could not rename SPEF file generated based on the name of the scenario for scenario : %s.

DESCRIPTION

The command `analyze_subcircuit` cannot rename the SPEF file generated based on the name of the scenario in case of multiple active scenarios. This maybe because you dont have the write permissions for the directory or the SPEF file was not generated.

WHAT NEXT

Check the extractor log files to check if extraction was successful and check the permissions.

SEE ALSO

`analyze_subcircuit`

CTS-443 (Error) Could not set %s as current scenario in

command **analyze_subcircuit**.

DESCRIPTION

The command **analyze_subcircuit** cannot set the above mentioned scenario as current scenario.

WHAT NEXT

Check if the scenario exists and is active..

SEE ALSO

[current_scenario](#)

CTS-444 (Error) Could not duplicate cell instance to drive the float pins.

DESCRIPTION

This error occurs in split_clock_net when -isolate_float_pins option is specified and the command fails to duplicate the cell instance to drive the separated float pins.

WHAT NEXT

CTS-445 (Error) The spice subcircuit model not found in case of scenario %s.

DESCRIPTION

This Error message occurs when the command analyze_subcircuit does not find the spice subcircuit models for the above mentioned scenario. This maybe because proper subcircuit files were not specified in the -config option.

WHAT NEXT

CTS-446 (Error) No wires found for net %s on pin %s.

DESCRIPTION

This error occurs when analyze_subcircuit command finds a net which is not routed. The command expects a routed clock circuit which is to be simulated.

WHAT NEXT

Check if the routing was run properly on this net.

CTS-447 (Error) Could not find spice model for lib %s.

DESCRIPTION

This error occurs when analyze_subcircuit command is unable to find the SPICE model for the given library cell.

WHAT NEXT

Check if the proper SPICE settings are specified for the command.

CTS-448 (Error) Command should be run with the -premesh option only after analyze_subcircuit annotates the delay on the isolation buffer.

DESCRIPTION

This error occurs when adjust_premesh_connection command is run with the -premesh option before running the analyze_subcircuit. A correct phase delay needs to be annotated on the isolation buffer for the command to optimize the clock path for skew.

WHAT NEXT

Check if the command analyze_subcircuit was run successfully before invoking this command, or if the analyze_subcircuit was run from the output pin of the isolation buffer.

CTS-449 (Error) More than one untied input for cell %s.

DESCRIPTION

This error occurs when analyze_subcircuit command when the tool finds that more than one input pin of a multi input cell is untied. For the multi input cells the pins other than the clock pin need to be tied either high or low for the clock to propagate. If this is not done then the simulation will fail.

WHAT NEXT

Check if the non clock pins of the multi input gates are sensitized properly.

CTS-450 (Warning) Incorrect circuit structure found for pin %s.

DESCRIPTION

This error occurs when analyze_subcircuit command finds a incorrect circuit structuure in design. It may occur if multi input gates have untied input pins.

WHAT NEXT

Check if the connectivity of the pins is proper.

CTS-451 (Warning) Negative cell delay %f found for pin %s. It will be ignored.

DESCRIPTION

This warning occurs when analyze_subcircuit command finds a negative cell delay for the cell mentioned. Typically the related cell resides in the last level of the premesh tree. It might happen for the cases when the premesh skew is large. In that case, at the output pin of the cell on a faster path, clock reaches earlier compared the output pins of some other mesh drivers on the slower paths. Since those output pins are shorted by the clock-mesh net, the output pins of the slower drivers might see the clock signal earlier than the input pins of the corresponding drivers see the clock. This causes analysize_subcircuit to see the negative delay on those slower cells. This is called short-circuit effect of clock-mesh. The command ignores this negative delay and continues.

WHAT NEXT

Check if the premesh skew is too large. Try to minimize the premesh skew. Delay

cells can be added on the paths which results in faster arrival of the clock.

CTS-452 (Warning) Net %s is not of clock type.

DESCRIPTION

This warning occurs when the specified net is not of type clock. The command requires a clock net to be specified.

WHAT NEXT

Check if the net specified is a valid clock net and the clock type attribute is set on it.

CTS-453 (Error) Bad timing values in simulation output file. %d lines had proper measurement values and %d had zero timing value.

DESCRIPTION

This error occurs when the simulation output file has too many lines with zero timing values. This may have occurred because of improper circuit. Hence some part of the circuit was not triggered during simulation. The various reasons for this may be : a. SPICE models may be incorrect (such as missing VDD or VSS). b. There may be disconnects in the circuit. c. It may have happened that starting from the root and moving towards the loads the clock pulse got progressively narrower at each stage and by the time clock reached the mesh it was not transitioning. Insufficient number of buffer levels in the premesh tree may be the reason. d. The mesh may not be capable of driving the loads.

WHAT NEXT

1. Check if the circuit is fully connected and the SPICE models specified have all the pins included.
2. Check if enough levels of buffers were put so that the transition time can be within constraints. Try increasing the clock period.
3. If premesh is unable to drive the mesh then try constructing a logic level balanced tree or a tree with proper drive capability.
4. Add appropriate number of cells below the mesh so that the clock propagates properly.
5. Appropriate mesh loads and mesh drivers can be added.

CTS-455 (Error) Could not find the given clock %s for clock-

mesh analysis.

DESCRIPTION

This error occurs when the clock mesh analyzer doesn't find the given clock for the circuit to be analyzed.

WHAT NEXT

Please ensure that the given clock is correct.

CTS-456 (Error) Exactly one clock should be specified for the mesh analysis.

DESCRIPTION

This error occurs when multiple clocks are given for one clock-mesh analysis.

WHAT NEXT

Specify only one valid clock.

CTS-460 (Error) The -max_rc_delay_constraint option cannot be used together with -max_rc_scale_factor.

DESCRIPTION

Both options can turn on the maximum RC delay constraint. The -max_rc_delay_constraint option directly sets a maximum RC delay in the main library unit, while the -max_rc_scale_factor option specifies a scale factor, which multiplied by an internal derived RC delay gives the maximum RC delay constraint.

WHAT NEXT

Choose the one which fits the design and re-apply the constraint again.

CTS-461 (Error) User max_rc_scale_factor (%f) is too small.

DESCRIPTION

The `-max_rc_scale_factor` option turns on the maximum RC delay constraint by setting a scale factor, which multiplied by an internal derived RC delay gives the maximum RC delay constraint. A small scale factor (< 0.1) can bring the constraint out of the appropriate range.

WHAT NEXT

Adjust the scale factor and re-apply the constraint again.

CTS-462 (Error) User max_rc_delay_constraint (%f ps) is too small.

DESCRIPTION

`Set_clock_tree_options` assumes that the given constraint values are in main library units. The error is usually arised when the main library unit is smaller than that is assumed.

WHAT NEXT

Convert the constraint values into main library units and re-apply constraints again.

CTS-463 (Error) Could not get source for clock %s.

DESCRIPTION

This error occurs when the source for the given clock could not be found.

WHAT NEXT

Check if the clock definition is proper.

CTS-464 (Error) Could not delete route for net %s.

DESCRIPTION

This error occurs when the command `remove_clock_mesh` could not remove all the routes of the premesh tree.

WHAT NEXT

Check if the command inputs are correct and also that the nets are properly routed.

CTS-465 (Error) First level premesh tree buffers are in different hierarchies.

DESCRIPTION

This error occurs when the command `remove_clock_mesh` finds that the first level cells of the premesh tree are in different hierarchies. Such a structure may give incorrect connectivity after `remove_clock_mesh`. Hence command returns.

WHAT NEXT

Check if the circuit structure has been properly build.

CTS-466 (Error) Premesh tree or the clock mesh has not been removed, aborting postmesh removal.

DESCRIPTION

This error occurs when the command `remove_clock_mesh` is run with `-postmesh` option before the premesh tree and the clockmesh both have been removed. For the `-postmesh` to work both premesh tree and clock mesh need to be removed.

WHAT NEXT

Run `remove_clock_mesh` to remove the premesh tree and clock mesh and then try postmesh removal.

CTS-467 (Warning) Multiple use of -trans_wires_from. Will be

ignored.

DESCRIPTION

This warning occurs when -transfer_wires_from is specified multiple times. It should be specified for the last level. The option specified in other levels will be ignored.

WHAT NEXT

Check the -transfer_wires_from usage.

CTS-468 (Warning) Tech problem. Could not find steps for hor layer %d.

DESCRIPTION

This warning occurs in create_clock_mesh command when the tool cannot find steps for the mentioned layer when the -no_snap option is specified.

WHAT NEXT

Check if proper layer has been specified and also check the command man page.

CTS-469 (Error) Could not perform %s. Aborting command.

DESCRIPTION

This warning occurs in the command because the mentioned operation could not be performed. Check the log files for more details about why the failure occurred.

WHAT NEXT

Check if proper arguments are given to the command.

CTS-470 (Warning) The output pin of cell instance %s is an

open pin.

DESCRIPTION

This warning occurs in when the tool finds a cell which has an open output pin.

WHAT NEXT

Check the connectivity in the design.

CTS-471 (Warning) Cell %s has multiple output pins.

DESCRIPTION

This warning occurs in when the command finds a cell which has more than one output pins.

WHAT NEXT

CTS-472 (Error) Net %s is an ideal net. Cannot proceed with extraction.

DESCRIPTION

This error occurs when the command finds that one of the nets is an ideal net. Extraction canot be done on an ideal net.

WHAT NEXT

Please check why the ideal net attribute is there and whether it can be removed.

CTS-473 (Warning) no clock tree synthesis on the HTV net %s.

DESCRIPTION

Tool would not do clock tree synthesis on the HTV net, for it can not insert buffers or inverts on HTV net. This is only a warning message.

WHAT NEXT

Check this HTV net.

CTS-474 (Error) Clock tree initialization failed.

DESCRIPTION

This error indicates that the clock tree synthesis could not initialize. This may be because the tool did not find the appropriate clock root.

WHAT NEXT

CTS-475 (Error) The given input pins and load pins do not belong to the same clock.

DESCRIPTION

This error indicates that the inputs and loads provided to the command do not belong to the same clock and hence the command could not proceed.

WHAT NEXT

Check if the input pins and load pins specified are proper. Also refer to the command man page.

CTS-501 (Error) Invalid usage of command set_latency_adjustment_options.

DESCRIPTION

This error occurs when none of the options are specified : -from_clock, -latency, -exclude_clock

WHAT NEXT

Please specify one of the options : -from_clock, -latency, -exclude_clock

CTS-502 (Error) Invalid usage of command set_latency_adjustment_options. The -latency option must be accompanied by the -to_clock option.

DESCRIPTION

Please note that the -latency option must be accompanied by the -to_clock option.

WHAT NEXT

Please use the -to_clock option together with the -latency option.

CTS-503 (Error) Invalid usage of command set_latency_adjustment_options. -from_clock %s must be a real clock, cannot be a virtual clock.

DESCRIPTION

The clock specified in the -from_clock option of the command must be a real clock

WHAT NEXT

Please make sure that the clock specified in the -from_clock option is a real clock.

CTS-504 (Error) Invalid usage of command set_latency_adjustment_options. -from_clock cannot be accompanied by -latency option.

DESCRIPTION

Please note that the -from_clock option cannot be accompanied by the -latency option.

WHAT NEXT

Please remove the -latency option if you want to use the -from_clock option.

CTS-505 (Error) Invalid usage of command set_latency_adjustment_options. -from_clock must be accompanied by -to_clock option.

DESCRIPTION

Please note that the -from_clock option must be accompanied by the -to_clock option.

WHAT NEXT

Please add the -to_clock option if you want to use the -from_clock option.

CTS-506 (Error) Invalid usage of command set_latency_adjustment_options. Clock %s cannot be in the -from_clock option and also in the -exclude_clock list at the same time.

DESCRIPTION

There is a conflicting specification on a clock.

WHAT NEXT

Please remove the affected clock from either -from_clock or the -exclude_clock list.

CTS-510 (Warning) -latency was set for clock %s. Using -from_clock will override the previous setting.

DESCRIPTION

WHAT NEXT

CTS-511 (Warning) -from_clock was set for clock %s. Using -

latency will override the previous setting.

DESCRIPTION

WHAT NEXT

CTS-512 (Warning) -from_clock was set for clock %s. Using -from_clock again will override the previous setting.

DESCRIPTION

WHAT NEXT

CTS-513 (Warning) -latency was set for clock %s. Using -

latency again will override the previous setting.

DESCRIPTION

WHAT NEXT

CTS-520 (Error) -from_clock %s is not synthesized.

DESCRIPTION

WHAT NEXT

CTS-521 (Warning) clock %s is not synthesized.

DESCRIPTION

WHAT NEXT

CTS-530 (Information) Latency computed from clock %s will be applied on clock %s.

DESCRIPTION

WHAT NEXT

CTS-531 (Information) Updating the latency of clock %s to %f

(max) %f (min).

DESCRIPTION

WHAT NEXT

CTS-532 (Information) Latency of clock %s has not been changed.

DESCRIPTION

The latency of the clock is not updated by update_clock_latency. Possible scenarios include: 1) the clock is excluded from update 2) cannot find its from clock 3) its from clock is not synthesized

WHAT NEXT

CTS-533 (Information) Updating the latency of clock %s to %.6f based on user-specified latency.

DESCRIPTION

The user-specified latency (by previous set_latency_adjustment_options -latency) was applied to the clock.

WHAT NEXT

CTS-534 (Warning) Clock %s does not have any boundary register related to %s. Using full boundary register set to update %s's network latency.

DESCRIPTION

update_clock_latency cannot find any boundary register driven by from-clock related to virtual clock to-clock, so it will use the full boundary register set of from-clock to update to-clock's network latency&.

WHAT NEXT

This is only a warning message&. Check the correct relation beteen from-clock and to-clock&. Then use set_latency_adjustment_options to update the relation if necessary&.

SEE ALSO

update_clock_latency(2), set_latency_adjustment_options(2)

CTS-535 (Warning) Clock %s does not drive any boundary register. Using full fanout set to update %s's network latency.

DESCRIPTION

update_clock_latency cannot find any boundary register driven by from-clock, so it will use the full fanout register set of from-clock to update to-clock's network latency&.

WHAT NEXT

This is only a warning message&. Check the correct relation beteen from-clock and to-clock&. Then use set_latency_adjustment_options to update the relation if necessary&.

SEE ALSO

update_clock_latency(2), set_latency_adjustment_options(2)

CTS-536 (Warning) user specified a positive float pin delays but negative logic level on the pin %s. The logic level assignment will be ignored.

DESCRIPTION

An inconsistent assignment of set_clock_tree_exceptions -float_pins command has been found. The delays of the float pin are positive but the logic level is a negative value, so the logic level assignment will be ignored.

WHAT NEXT

This is only a warning message&. Please check the set_clock_tree_exceptions -

float_pins command on this pin and fix the conflict between delays and logic level.

SEE ALSO

`set_clock_tree_exceptions(2)`

CTS-540 (Warning) Turning off -logic_level_balance since is not compatible with -top_mode.

DESCRIPTION

Top mode algorithm does not honor level balancing constraint.

WHAT NEXT

Use either `-top_mode` or `-logic_level_balance` for clock tree synthesis.

CTS-541 (Warning) Turning off -delay_insertion since it is not compatible with -logic_level_balance true.

DESCRIPTION

Delay insertion will create unbalanced clock tree and needs to be turned off.

WHAT NEXT

Some unbalanced clock structures require delay insertion to achieve good QoR. If the final QoR is not within the target, consider re-synthesize the clock tree with delay insertion turned on and logic level balance turned off.

CTS-542 (Warning) Logic level difference among clock paths is large (%d).

DESCRIPTION

The clock paths from current net have very different logic levels. For example, there may be many gate levels on one clock path but no gates on another clock path. It is also possible that one subtree is significantly larger than others. Logic level balance is not suitable for these designs.

WHAT NEXT

Use regular CTS to synthesize this clock net, or refine the initial clock tree structure and re-synthesize this clock net.

CTS-543 (Warning) Level balance violation, (maxLevel, minLevel) = (%d, %d), on don't touch subtree of pin (%s).

DESCRIPTION

The don't touch subtree defined at the given pin is not level balanced.

WHAT NEXT

CTS cannot fix level balance violations in don't touch subtrees. It will use the maximum logic level of the don't touch subtree to build the rest of the clock tree.

CTS-544 (Warning) Clock tree (%s) does not have complete logic level information.

DESCRIPTION

Some of the float pins / subtrees contain logic level information while others don't.

WHAT NEXT

Define logic level on all float pins and re-run CTS.

CTS-545 (Warning) Top buffer level converged to clock tree driver prematurely.

DESCRIPTION

CTS stops building buffer levels when all buffers have been placed near clock tree driver. CTS might not be able to improve skew or fix DRC at the driver output.

WHAT NEXT

Check the design and CTS constraints if QoR is not within target.

CTS-546 (Warning) Skew among same logic level pins is large.

DESCRIPTION

When pins with same logic level have large skew, CTS might not be able to compensate the skew.

WHAT NEXT

This is likely caused by unbalanced initial clock tree structure or because difference on number of gate levels for two clock paths is large. Try to create a more balanced initial clock tree for CTS.

CTS-547 (Warning) On net (%s), ratio of sink pins among subtrees is too large (> %d).

DESCRIPTION

When subtrees are disproportional in size, CTS might not be able to achieve good skew under level balance constraint.

WHAT NEXT

Try to create a more balanced initial clock tree for CTS, or turn off logic level balance.

CTS-548 (Warning) Logic level balance mode will be applied to all clocks.

DESCRIPTION

Logic level balance mode currently is a global setting.

WHAT NEXT

Synthesize the clocks that require logic level balance separately from the rest.

Turn on logic level balance for the clocks that require logic level balance, and turn off logic level balance for the rest.

CTS-549 (Warning) Turning off -logic_level_balance since is not compatible with -config_file_read.

DESCRIPTION

Logic level balance CTS does not support -config_file_read.

WHAT NEXT

Use either -config_file_read or -logic_level_balance for clock tree synthesis.

CTS-550 (Warning) Turning off -insert_boundary_cell since is not compatible with -config_file_read.

DESCRIPTION

Boundary cell insertion is not compatible with -config_file_read.

WHAT NEXT

Use either -config_file_read or -insert_boundary_cell for clock tree synthesis.

CTS-551 (Warning) There is a clock called %s and a net called %s that is not a root net of clock %s. CTS will synthesize clock %s.

DESCRIPTION

The specified clock object name corresponds to a clock name and a net name. In addition, the net is not the root net for the clock. In this case, CTS will synthesize the clock instead of the net.

WHAT NEXT

To force CTS to synthesize the net instead of the clock, specify the driving pin of the net with -clock_trees option.

CTS-552 (Error) Skipping net %s because it does not have a driver.

DESCRIPTION

CTS cannot synthesize a clock tree for a net that does not have a driver.

WHAT NEXT

Check the connectivity of the net.

CTS-553 (Error) Cannot find clock object called %s, skipping...

DESCRIPTION

There is no clock domain, clock net, or clock pin with the given name in current design.

WHAT NEXT

Find the correct clock object name and re-run CTS. You can report all the clocks in your design using the command `report_clocks`.

CTS-554 (Error) Skipping pin %s because it is a hierarchical port.

DESCRIPTION

CTS does not support clocks defined on hierarchical ports. This is because hierarchical ports do not have physical location that is required for calculating clock timing values.

WHAT NEXT

Move the clock definition to a physical pin or port and re-run CTS.

CTS-555 (Error) Skipping pin %s because it is not on clock

network.

DESCRIPTION

The pin or the driving pin of the given net is outside clock network, or it does not drive any clock sinks. The latter can happen when there are set_case_analysis or set_disable_timing at the fanout cone of the pin. This is because set_case_analysis or set_disable_timing may cause the clock sinks in the fanout cone to be disconnected in the timing graph, causing the pin to become an implicit ignore pin.

WHAT NEXT

Check to see if there are set_case_analysis or set_disable_timing settings in the fanout cone of the output pin. If there are, make sure they are intended for CTS. Otherwise, specify a pin or a net within clock network and re-run CTS.

CTS-556 (Error) Skipping open pin %s.

DESCRIPTION

The pin or the driving pin of the given net is an open pin.

WHAT NEXT

Fix the pin connectivity problem and re-run CTS.

CTS-557 (Error) Skipping pin %s because its output net %s is inside ILM.

DESCRIPTION

CTS does not support clock defined inside ILM.

WHAT NEXT

Move the clock definition to the outside of ILM and re-run CTS.

CTS-558 (Warning) Skipping output pin %s (from pin %s)

because it is not on clock network.

DESCRIPTION

When a clock is defined on the input pin of a clock gate, CTS will iterate through all the output pins of the clock gate to find root clock nets. This message indicates that the output pin does not drive any clock sinks, which is normal for multiple-output gates with some output pins driving data network. It is best to check whether there are set_case_analysis at the fanout cone of the output pin. This is because set_case_analysis may cause the clock sinks in the fanout cone to be disconnected in the timing graph, causing the output pin to become an implicit ignore pin.

WHAT NEXT

Check to see if there are set_case_analysis settings in the fanout cone of the output pin. If there are, make sure they are intended for CTS.

CTS-559 (Warning) Skipping output net %s of pin %s because it is inside ILM.

DESCRIPTION

When a clock is defined on the input pin of a clock gate, CTS will iterate through all the output pins of the clock gate to find root clock nets. CTS will skip the output nets that are inside ILM.

WHAT NEXT

CTS-560 (Warning) Skipping output pin %s (from pin %s) because it is open.

DESCRIPTION

When a clock is defined on the input pin of a clock gate, CTS will iterate through all the output pins of the clock gate to find root clock nets. This message indicates that the output pin is open, which is normal for multiple-output gates with some dangling output pins.

WHAT NEXT

Check to see if the connectivity of the output pin is broken unintentionally.

CTS-561 (Error) Skipping pin %s because there is no valid clock net for CTS to work on at its fanout cone.

DESCRIPTION

When a clock is defined on the input pin of a clock gate, CTS will iterate through all the output pins of the clock gate to find root clock nets. This message indicates that all the output nets of the clock gate are not valid root clock net.

A clock defined on an internal pin of a macro will also trigger this message because CTS currently does not go through macros with internal pins. In this case, consider moving the clock definition to the output pin of the macro, or create a generated clock at the output pin of the macro.

WHAT NEXT

Exclude this clock from CTS if there is no clock net for CTS to work on.

CTS-562 (Warning) Cell %s is not an ICG cell, Skipping...

DESCRIPTION

Since the cell is not an ICG, it will not be duplicated in `split_clock_net`. In order not to skip ICG cloning, user can set `cts_split_any_gate` as true.

WHAT NEXT

The cell wont be cloned.

CTS-563 (Warning) Cell %s is not an ICG cell, split anyway.

DESCRIPTION

When `cts_split_any_gate` is set to true, a non-ICG cell can be cloned in `split_clock_net`.

WHAT NEXT

The cell will be cloned.

CTS-564 (Warning) No clock gates to duplicate.

DESCRIPTION

This warning occurs when there no clock gates that can be duplicated are found from the object list specified for the split_clock_net command.

WHAT NEXT

This is only a warning message.

Please double-check if there are any clock tree exceptions defined on the specified nets or cells in the object list.

SEE ALSO

`split_clock_net(2)`

CTS-565 (Warning) Skip cell instance %s since it is a macro.

DESCRIPTION

Skip to clone the instance in split_clock_net since it is a macro.

WHAT NEXT

The cell wont be cloned.

CTS-566 (Warning) Skip cell instance %s since it is a pad.

DESCRIPTION

Skip to clone the instance in split_clock_net since it is a pad.

WHAT NEXT

The cell wont be cloned.

CTS-567 (Warning) Boundary cell insertion will be applied on all

clocks.

DESCRIPTION

Boundary cell insertion currently is a global setting.

WHAT NEXT

Synthesize the clocks that require boundary cell insertion separately from the rest. Turn on -insert_boundary_cell for the clocks that require boundary cell, and turn off -insert_boundary_cell for the rest.

CTS-568 (Warning) Input pin(s) of cell instance %s has ignore/float/stop exception specified.

DESCRIPTION

Input pin(s) of cell instance %s has ignore/float/stop exception specified.

WHAT NEXT

N/A.

CTS-569 (Warning) Skip cell instance %s since its input pin has don_touch_subtree attribute.

DESCRIPTION

Skip to clone the instance in split_clock_net since its input pin has don_touch_subtree attribute.

WHAT NEXT

The cell wont be cloned.

CTS-570 (Warning) Skip cell instance %s since its output pin

has don_touch_subtree attribute.

DESCRIPTION

Skip to clone the instance in split_clock_net since its output pin has don_touch_subtree attribute.

WHAT NEXT

The cell wont be cloned.

CTS-571 (Warning) Skip cell instance %s since its pin has clock source definition.

DESCRIPTION

Skip cell instance %s since its pin has clock source definition.

WHAT NEXT

The cell wont be cloned.

CTS-572 (Warning) Net %s is a MVDD dont touch net.

DESCRIPTION

Net %s is a MVDD dont touch net.

WHAT NEXT

N/A.

CTS-573 (Warning) Input pin(s) of cell instance %s has non-stop exception specified.

DESCRIPTION

Input pin(s) of cell instance %s has non-stop exception specified.

WHAT NEXT

N/A.

CTS-574 (Warning) Input net of cell instance %s has dont_buffer_net specified.

DESCRIPTION

Input net of cell instance %s has dont_buffer_net specified.

WHAT NEXT

The cell wont be cloned.

CTS-575 (Warning) Output net of cell instance %s has dont_buffer_net specified.

DESCRIPTION

Input pin(s) of cell instance %s has dont_buffer_net specified.

WHAT NEXT

The cell wont be cloned.

CTS-576 (Warning) Cell %s has dont_size_cell specified.

DESCRIPTION

CTS-581 (Warning) Cell %s has size_only_cell specified.

DESCRIPTION

Cell %s has size_only_cell specified.

WHAT NEXT

The cell wont be cloned.

CTS-582 (Warning) cell %s cannot be removed since it has size_only_cell specified.

DESCRIPTION

Cell %s cannot be removed since it has size_only_cell specified.

WHAT NEXT

N/A

CTS-587 (Warning) ILM %s of port %s was created by ICC with version earlier than 2007.03-SP1.

DESCRIPTION

The ILM was created using an ICC with version earlier than 2007.03-SP1. The options that were used to create the ILM were not stored in the database. CTS may see incorrect clock timing at the port if the ILM was not created with -keep_full_clock_tree option.

WHAT NEXT

Make sure the ILM is created with -keep_full_clock_tree option or re-create ILM with -keep_full_clock_tree option.

SEE ALSO

CTS-588 (n) .

CTS-589 (Warning) Boundary cell insertion will be applied on all clocks.

DESCRIPTION

Boundary cell insertion currently is a global setting.

WHAT NEXT

Synthesize the clocks that require boundary cell insertion separately from the rest. Turn on -insert_boundary_cell for the clocks that require boundary cell, and turn off -insert_boundary_cell for the rest.

CTS-590 (Information) Inserted a guide buffer %s for ILM input port %s.

DESCRIPTION

CTS inserts a guide buffer to isolate the ILM input port from top-level clock tree. CTS will not insert any buffer between the guide buffer and the ILM port, but may size or relocate the guide buffer to improve QoR.

WHAT NEXT

This is an informational message only. No action is required.

CTS-591 (Information) Inserted a guide buffer %s for ILM output port %s.

DESCRIPTION

CTS inserts a guide buffer to isolate the ILM output port from top-level clock tree. CTS will not insert any buffer between the guide buffer and the ILM port, but may size or relocate the guide buffer to improve QoR.

WHAT NEXT

This is an informational message only. No action is required.

CTS-592 (Error) Config file entry for ILM boundary net %s found.

DESCRIPTION

CTS inserts guide buffers on ILM boundary nets to isolate ILMs from top-level clock tree. If the boundary net goes into an ILM, its config file entry should not contain ILM port or pins inside ILM. If the boundary net goes out of an ILM, the config file entry will become invalid because the net name will change after guide buffer insertion.

WHAT NEXT

If the boundary net goes into an ILM, make sure the config file entry does not contain ILM port or pins inside ILM. If the boundary net goes out of an ILM, remove the config file entry before CTS.

CTS-593 (Error) Cannot insert a guide buffer for ILM input port %s.

DESCRIPTION

CTS fails to insert a guide buffer to isolate the ILM input port from top-level clock tree. Possible scenarios include:

- 1) The ILM port is driven by a level shifter and the output net of a level shifter is not bufferable. 2) There is `cts_dont_buffer` attribute on the ILM boundary net. 3) The ILM port is directly driven by another macro or abutted ILM port. 4) The ILM is inside another ILM.

Note that CTS might still be able to synthesize top-level clock tree correctly.

WHAT NEXT

Check to see if the ILM boundary net is synthesized by CTS correctly.

CTS-594 (Error) Cannot insert a guide buffer for ILM output port

%S.

DESCRIPTION

CTS fails to insert a guide buffer to isolate the ILM output port from top-level clock tree. Possible scenarios include:

- 1) There is `cts_dont_buffer` attribute on the ILM boundary net.
- 2) The ILM port is directly driving another macro or abutted ILM port.
- 3) The ILM is inside another ILM.

Note that CTS might still be able to synthesize top-level clock tree correctly.

WHAT NEXT

Check to see if the ILM boundary net is synthesized by CTS correctly.

CTS-595 (Warning) Cannot place guide buffer %s near ILM port %S.

DESCRIPTION

CTS cannot place the guide buffer near the ILM port. This may cause DRC violation on the ILM boundary net.

A guide buffer may be placed far away from the ILM port due to placement blockages near the port. In multi-voltage designs, a guide buffer may be placed away from the port if its voltage area is far away from the port.

WHAT NEXT

Check the placement, voltage area and total cap of the net inside ILM near the port if there is DRC violation on the ILM boundary net.

CTS-596 (Warning) The shortest path under %s operating condition for clock %s of root pin %s ends on pin %s inside ILM.

DESCRIPTION

When a shortest path ends inside an ILM, CTS may not be able to produce good skew. This is because CTS cannot insert clock buffers inside ILM to increase shortest path delay and improve skew.

WHAT NEXT

If the skew is not within target, run `optimize_clock_tree` or re-synthesize the clock network inside ILM with proper constraints.

CTS-597 (warning) Cell %s is a hierarchical ICG cell that cannot be split because there are other cells in the hierarchy.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters a hierarchical integrated clock gating cell (ICG) with other cells in the hierarchy. A hierarchical ICG cell consists of an ICG captured inside a level of hierarchy. The ICG cell should be the only cell in the hierarchy. The hierarchy is marked with the `clock_gating` attribute.

WHAT_NEXT

This is only a warning message.

However, if you want the clock gate to be duplicated, then please check your flow to determine how the additional cell(s) were added inside the hierarchy.

SEE ALSO

`split_clock_net(2)`

CTS-598 (warning) Cell %s is inside of ILM and cannot be split.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters a cell inside of ILM.

WHAT_NEXT

Please specify clock nets or gates outside of ILM for `split_clock_net`.

SEE ALSO

`split_clock_net(2)`

CTS-599 (Warning) Cell %s has clock tree exceptions specified on all of its input pins, so it will not be split.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters a clock gate with clock tree exceptions (ignore, float, stop) defined on all of its input pins.

WHAT NEXT

This is only a warning message.

However, if you want the clock gate to be duplicated, then please check your clock tree exception settings.

SEE ALSO

`split_clock_net(2)`

CTS-600 (Warning) Turning off -ocv_clustering since is not compatible with -config_file_read.

DESCRIPTION

OCV-aware clustering is not compatible with `-config_file_read`.

WHAT NEXT

Use either `-config_file_read` or `-ocv_clustering` for clock tree synthesis.

CTS-601 (Warning) Turning off -ocv_clustering since is not compatible with -logic_level_balance.

DESCRIPTION

OCV-aware clustering is not compatible with `-logic_level_balance`.

WHAT NEXT

Use either `-logic_level_balance` or `-ocv_clustering` for clock tree synthesis.

CTS-602 (Warning) OCV-aware clustering will be applied on all clocks.

DESCRIPTION

OCV-aware clustering currently is a global setting.

WHAT NEXT

Synthesize the clocks that require OCV-aware clustering separately from the rest. Turn on `-ocv_clustering` for the clocks that require OCV-aware clustering, and turn off `-ocv_clustering` for the rest.

CTS-603 (warning) Cell %s is an intermediate level clock gate with an unsynthesized subtree, so it will not be split.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters an intermediate level clock gate with an unsynthesized subtree. By default, this command will not split such cells because splitting cells which have unsynthesized subtrees in their fanout will result in bad skew and insertion delay. It is recommended that users process the nets in the clock tree starting from the lowest level nets. If, however, you would like to override this check, you can run the `split_clock_net` command with the `-split_intermediate_level_clock_gates` option. Now you will have a clock structure which has some nets that are marked as synthesized at the intermediate level. When you subsequently run `compile_clock_tree` on the related clock, it will stop traversal at these nets that have been marked as synthesized. As a result you will have an incorrect clock tree, with some still unsynthesized subtrees. To workaround this, that is, to ensure that `compile_clock_tree` traverses through all the subtrees in the clock structure, you can run the `remove_clock_tree` command prior to `compile_clock_tree`. The `remove_clock_tree` command will remove the attribute that indicates that a net has been synthesized.

WHAT_NEXT

You can force the `split_clock_net` command to split this instance by running it with the `-split_intermediate_level_clock_gates` option. However, it is not recommended to split intermediate level clock gates without first processing the lower level nets as this may result in bad skew and insertion delay

SEE ALSO

`split_clock_net(2)`

CTS-604 (warning) Splitting cell %s, even though it is an intermediate level clock gate with an unsynthesized subtree.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters an intermediate level clock gate with an unsynthesized subtree, and `cts_split_intermediate_level_clock_gates` is set to true, thereby forcing the gate to be split.

WHAT_NEXT

This is only a warning message.

SEE ALSO

`split_clock_net(2)`

CTS-605 (warning) Cell %s has implicit ignore pin.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters a clock gate to be duplicated that has a pin considered as implicit ignore by the timer.

WHAT_NEXT

This is only a warning message.

SEE ALSO

`split_clock_net(2)`

CTS-606 (warning) All pins driven by cell %s are inside of ILM, so it will not be split.

DESCRIPTION

This warning message occurs when the `split_clock_net` command encounters a cell inside of ILM.

WHAT_NEXT

Please specify clock nets or gates whose fanout is outside of ILM for split_clock_net.

SEE ALSO

split_clock_net(2)

CTS-607 (Warning) Pin %s has ideal network defined. Removing the attribute.

DESCRIPTION

This warning message occurs when the split_clock_net command encounters a gate with ideal network defined on one of its pins.

WHAT NEXT

This is only a warning message. The ideal network designation is removed, in order to ensure correct load and transition delay calculation for the related net.

SEE ALSO

split_clock_net(2)

CTS-608 (Warning) Turning off -top_mode since is not compatible with -config_file_read/write.

DESCRIPTION

Top mode is not compatible with -config_file_read/write.

WHAT NEXT

Use either -config_file_read/write or -top_mode for clock tree synthesis.

CTS-610 (Warning) no DRC fixing on the net %s inside ILM.

DESCRIPTION

In general, ILM is a read only cell. CTS doesn't insert any buffer to fix DRC violations for the nets inside ILM.

WHAT NEXT

Open the ILM cell and run `compile_clock_tree` with DRC fixing beyond exception pins or ignore this warning.

CTS-611 (Information) no clock tree synthesis on the net %s inside ILM.

DESCRIPTION

This message shows that the tool see the ILM net while it traverses clock paths. CTS doesn't synthesize the nets inside ILM because they are supposed synthesized nets.

WHAT NEXT

If the net inside ILM is not a synthesized net, open the ILM cell and run `compile_clock_tree`.

CTS-612 (Warning) no delay insertion on the net %s inside ILM.

DESCRIPTION

In general, ILM is a read only cell. CTS doesn't insert any buffer for the nets inside ILM.

WHAT NEXT

Open the ILM cell and run `compile_clock_tree` with delay balance. You may have to set correct sync pin phase delay for all clock output ports on ILM in order to balance delays.

CTS-613 (Information) no clock tree optimization on the net %s

inside ILM.

DESCRIPTION

This message shows that the tool see the ILM net while it traverses clock paths. CTO doesn't optimize the nets inside ILM.

WHAT NEXT

Open the ILM cell and run optimize_clock_tree.

CTS-614 (Information) no clock tree synthesis on don't touch net %s.

DESCRIPTION

The net is either a PAD net, a dont_buffer net, a net inside ILM or a net beyond dont_touch_subtree exception. Therefore, CTS will not synthesize the net.

WHAT NEXT

CTS-615 (Information) no clock tree synthesis on hier don't touch net %s.

DESCRIPTION

The net is an input/output net of a level shifter. Therefore, CTS will not synthesize the net.

WHAT NEXT

CTS-616 (Warning) cannot fix transition violation at pin/port %s.

DESCRIPTION

WHAT NEXT

CTS-617 (Warning) cannot fix capacitance violation at pin/port %s.

DESCRIPTION

WHAT NEXT

CTS-618 (Warning) No LEQ library cell found for cell %s (%s).

DESCRIPTION

The cell does not have any LEQ cell and CTS will not size the cell to improve QoR.

WHAT NEXT

Check to see if the LEQ cells are included in the target library and they do not have dont_use or dont_touch attributes.

CTS-619 (Warning) too small maximum %s (=%f) defined at library cell %s.

DESCRIPTION

The value of the listed constraint for the library cell is too small. The constraint comes from SDC or library. It can cause CTS to use excessive number of buffers to build clock trees.

WHAT NEXT

Relax the listed constraint from SDC and/or library.

CTS-620 (Warning) too small maximum %s (=%f) defined at pin %S.

DESCRIPTION

The value of the listed constraint for the clock tree at the pin is too small. The value comes from either per-clock or global clock tree options. It can cause CTS to use excessive number of buffers to build the clock tree. Also, the constraints may not be feasible at all and can lead to many DRC violations.

WHAT NEXT

Relax the listed per-clock or global constraint.

CTS-621 (Warning) no global maximum %s constraint defined, set it to 9999.

DESCRIPTION

The listed global maximum constraint is an invalid value and CTS automatically sets it to a large number.

WHAT NEXT

Set a proper global maximum constraint if necessary.

CTS-622 (Warning) The Tcl variable cts_push_down_buffer is obsolete.

DESCRIPTION

The variable is obsolete.

WHAT NEXT

Use `split_clock_net -drive_ungated_registers` to enable the feature.

CTS-623 (warning) Marking clock pin %s on enable of discrete clock gating cell as exclude pin.

DESCRIPTION

This warning message will be triggered for designs with discrete clock gating cells during initialization of the clock tree synthesis and optimization commands. For latch-based discrete clock gating cells, in order to prevent the clock pin on the latch delaying the clock gating enable signal from being balanced with the other registers in the design, it is automatically marked with an exclude pin clock tree exception. These latch clock pins will then also be reported as explicit ignore pins by `report_clock_tree -exceptions`, along with any other exclude pins specified by the user.

WHAT_NEXT

This is only a warning message.

SEE ALSO

`compile_clock_tree` (2)
`optimize_clock_tree` (2)
`report_clock_tree` (2)

CTS-624 (Information) no delay cells inserting on hier don't touch net %s.

DESCRIPTION

The net is an input/output net of a level shifter. Therefore, CTS will not insert delay cells in the net.

WHAT NEXT

CTS-650 (Error) Proper power options have not been enabled

for `optimize_pre_cts_power`.

DESCRIPTION

The `optimize_pre_cts_power` command has not found any valid power options. At least one of `low_power_placement` and `clock_gating` options should be turned on.

WHAT NEXT

User should use `set_power_options` command to specify `low_power_placement` and/or `clock_gating` for power optimization, before running `optimize_pre_cts_power`.

SEE ALSO

`set_power_options` (2),
`set_optimize_pre_cts_power_options` (2),

CTS-651 (Warning) Found no clock gates to optimize.

DESCRIPTION

Clock gate optimization has been enabled, but the `optimize_pre_cts_power` command was unable to find any optimizable clock gates. Clock gate optimization will be skipped.

WHAT NEXT

If needed, please check clock gates with `identify_clock_gating` command.

SEE ALSO

`set_power_options` (2),
`identify_clock_gating` (2),

CTS-652 (Error) Cannot read the constraint file %s.

DESCRIPTION

The `optimize_pre_cts_power` cannot correctly read the constraint file given by `set_optimize_pre_cts_power_options`.

WHAT NEXT

Check the name and location of the constraint file, and make sure you can 'source'

the file.

SEE ALSO

`set_optimize_pre_cts_power_options` (2),

CTS-653 (Warning) Found a clock that already has been synthesized, so all existing clock trees will be removed.

DESCRIPTION

`optimize_pre_cts_power` encountered a clock on which CTS already has been applied. All the clock trees will be removed to ensure pre-CTS stage. If `-honor_dont_touch` flag was set in `set_optimize_pre_cts_power_options`, `dont_touch` attributes will be honored during the clock tree removal.

WHAT_NEXT

Please run `optimize_pre_cts_power` on a pre-CTS stage. Or, use `remove_clock_tree` command to remove current clock trees before running it.

SEE ALSO

`set_optimize_pre_cts_power_options` (2),
`remove_clock_tree` (2),

CTS-654 (Warning) Transition to Capacitance Conversion Failed.

DESCRIPTION

This message is a debug message. This message indicates that the transition to capacitance conversion for a given library arc did not succeed. CTS in this case will use the default values.

WHAT_NEXT

If the conversion does not succeed, tool will use the default target values.

SEE ALSO

CTS-655 (Warning) The `cts_enable_rc_constraints` Tcl variable is obsolete. Please use the `set_clock_tree_options` command to enable the maximum RC constraint.

DESCRIPTION

This message indicates that the `cts_enable_rc_constraints` Tcl variable is not supported. To enable the maximum RC constraint, please use the `set_clock_tree_options` command with `-max_rc_delay_constraint` or `-max_rc_scale_factor` option.

WHAT_NEXT

Please do not use the `cts_enable_rc_constraints` variable. Instead, run the `set_clock_tree_options` command with `-max_rc_delay_constraint` or `-max_rc_scale_factor` option.

SEE ALSO

`set_clock_tree_options(2)`

CTS-656 (Warning) `cts_size_clock_gate` is no longer supported. Clock gates will be sized automatically.

DESCRIPTION

Tcl variable `cts_size_clock_gate` is outdated. Clock gates are now being sized automatically. To turn off this behavior please use Tcl variable `cts_prects_upsize_gates`.

WHAT_NEXT

This variable is not needed. CTS will size up the clock gates automatically.

SEE ALSO

CTS-657 (Error) Cannot open file %s to write.

DESCRIPTION

CTS cannot open the given file for writing.

WHAT_NEXT

Please check the ownership and permissions for the given file.

SEE ALSO

CTS-658 (Warning) Ignoring net <%s> since its driving pin is ignored.

DESCRIPTION

CTS is ignoring the given net for synthesis, since its driver is ignored. This happens when the driver does not have a valid connection or invalid phase delay.

WHAT_NEXT

Please check the connections. If driver has an open pin or invalid phase delay, this might lead to the driving pin being ignored.

SEE ALSO

CTS-659 (Warning) Check configuration file at line %d: no such routing rule: %s .

DESCRIPTION

This message indicates an error in user input in config file. Tool is unable to find the non-default routing rule defined at the given line.

WHAT_NEXT

Please check the non-default routing rule specified at the given line.

SEE ALSO

CTS-660 (Warning) Check configuration file at line %d: invalid min_layer constraint: %s.

DESCRIPTION

This message indicates an error in user input in config file. Tool is unable to find the minimum layer constraint defined at the given line.

WHAT_NEXT

Please check the minimum layer constraints specified at the given line.

SEE ALSO

CTS-661 (Warning) Check configuration file at line %d: invalid max_layer constraint: %s.

DESCRIPTION

This message indicates an error in user input in config file. Tool is unable to find the maximum layer constraint defined at the given line.

WHAT_NEXT

Please check the maximum layer constraints specified at the given line.

SEE ALSO

CTS-662 (Warning) No %s found for opcond %s.

DESCRIPTION

This message indicates that tool is unable to find an inverter or buffer for a given operating condition. This happens when the library specified for the given operating condition does not contain the inverters or buffers specified. The library might have the inverters or buffers but they can be marked as dont_use or dont_touch.

WHAT_NEXT

Please check the library to see if it contains buffers or inverters. If library has the specified cells, please check if these cells have dont_touch or dont_use attribute defined on them.

SEE ALSO

CTS-670 (Warning) No delay insertion for target early delay on dont_buffer_net %s.

DESCRIPTION

Target_early_delay is set on this clock and the net has dont_buffer_net attribute and the tool will skip the net for adding delay cells to meet the target.

WHAT_NEXT

Check target_early_delay constraint or the dont_buffer_net attribute on the net.

SEE ALSO

CTS-671 Inter-clock delay balance cannot handle a cell drives multiple clock nets %s and %s.

DESCRIPTION

To balance inter-clock delay, delay cells are added on clock root net or downstream

net if root net is not bufferable. If it traces to a cell with multiple output cell with valid clock sink from each output, the tool fails to do the balancing and skip this clock.

WHAT_NEXT

Re-define the clock with multiple sources at each output of the cell to use the inter-clock balance command. Or use other clock tree target delay constraints to build the clock tree.

SEE ALSO

CTS-680 (error) Clock has already been synthesized! Please remove the clock tree before using this command.

DESCRIPTION

This message occurs when user tries to call `split_clock_gates` command after clock tree synthesis. `Split_clock_gates` will remove all synthesized clock trees in the end.

WHAT_NEXT

Please call `split_clock_gates` on a pre-CTS stage. Or use `remove_clock_tree` to remove current clock trees before it.

SEE ALSO

`split_clock_gates`(2)

CTS-681 (warning) No clock gating cells found. Splitting is not performed.

DESCRIPTION

This message indicates that tool is unable to find any clock gating cells, when running the `split_clock_gates` command. Clock gates splitting will be skipped.

WHAT_NEXT

If needed, please check clock gates with `identify_clock_gating` command.

SEE ALSO

`split_clock_gates` (2),
`identify_clock_gating` (2),

CTS-700 (Error) net %s is marked as a dont_buffer_net.

DESCRIPTION

This error message is triggered when an interactive CTS netlist editing command tries to insert a buffer on a net with the `dont_buffer_net` clock tree_exception specified. This applies to buffer insertion and reparenting.

WHAT NEXT

`remove_clock_tree_exceptions -dont_buffer_nets` can be used to remove the attribute from the net. The user should pay close attention to the reason why clock tree synthesis was restricted from buffering the net. `report_clock_tree -exceptions` can be used to report clock nets marked with the `dont_buffer_net` attribute.

SEE ALSO

`remove_clock_tree_exceptions` (2)
`report_clock_tree` (2)

CTS-701 (Error) %s is in dont_touch_subtree.

DESCRIPTION

This error message is triggered when an interactive CTS netlist editing command tries to make a netlist change to a part of the clock network designated as `dont_touch_subtree` using the `set_clock_tree_exceptions`.

WHAT NEXT

`remove_clock_tree_exceptions -dont_touch_subtrees` can be used to remove the attribute from the net. The user should pay close attention to the reason why clock tree synthesis was restricted from buffering the subtree. `report_clock_tree -exceptions` can be used to report pins to which the `dont_touch_subtree` exception applies.

SEE ALSO

`remove_clock_tree_exceptions` (2)
`report_clock_tree` (2)

CTS-702 (Warning) no interactive CTS changes to undo!

DESCRIPTION

This warning message is triggered when the user invokes interactive CTS (iCTS) undo when no uncommitted iCTS changes have been made.

WHAT NEXT

This is only a warning message.

CTS-750 (Error) Can not open file (%s) for Writing Nets.

DESCRIPTION

Open file error.

WHAT NEXT

Check the accessibility of this file.

CTS-755 (Warning) no clock tree synthesis on the bi-direction net %s.

DESCRIPTION

Tool would not do clock tree synthesis on the bi-direction net, for it can not insert buffers or inverts on bi-direction net. This is only a warning message.

WHAT NEXT

Check this bi-direction net.

CTS-757 (Warning) no clock tree synthesis on the routed net

%s.

DESCRIPTION

Tool would not do clock tree synthesis on routed net. This is only a warning message.

WHAT NEXT

Remove the routing information of this net.

CTS-759 (Error) Unable to hookup pin.

DESCRIPTION

This error occurred because buffer level exceed the limitation (1000) when bulid the clock tree based on target load capacitance.

WHAT NEXT

CTS-760 (Warning) net %s: the estimated number of buffer levels (= %d) exceed the maximum buffer levels constraint (= %d) due to the big delay in its sub-trees.

DESCRIPTION

This warning caused by the big delay in sub-trees when bulid clock tree with budged delay.

WHAT NEXT

CTS-761 (Warning) stop to insert buffers to fix DRC on net %s (current buffer levels = %d, constraint = %d).

DESCRIPTION

This warning caused by the big delay in sub-trees when bulid clock tree with budged delay.

WHAT NEXT

CTS-762 (Warning) Exceeded maximum buffer levels on net '%s' in order to fix DRC violations current buffer levels = %d; constraint = %d.

DESCRIPTION

WHAT NEXT

CTS-810 (Warning) There is a clock-tree exception on the hierarchical pin '%s'.

DESCRIPTION

The `check_clock_tree` command has encountered a hierarchical pin with one or more clock-tree exceptions on it. Clock-tree synthesis will ignore exceptions on hierarchical pins.

WHAT NEXT

Clock-tree exceptions can be removed with the `remove_clock_tree_exceptions` command or if required, exception should be moved to the leaf pin driving the hierarchical pin.

SEE ALSO

`check_clock_tree` (2),
`remove_clock_tree_exceptions` (2).

CTS-811 (Warning) The clock '%s' is defined on the hierarchical pin '%s'.

DESCRIPTION

The `check_clock_tree` command has encountered a clock or generated-clock with its source defined on a hierarchical pin. Clock-tree synthesis will ignore such clocks.

WHAT NEXT

The clock should be removed with the `remove_clock` or `remove_generated_clock` command as appropriate and then redefined with the respective `create_clock` or `create_generated_clock` command using a non-hierarchical pin or port as the clock source.

SEE ALSO

```
check_clock_tree (2),  
remove_clock (2),  
remove_generated_clock (2),  
create_clock (2),  
create_generated_clock (2).
```

CTS-812 (Error) The clock source of net %s is defined at a hierarchical port and drives sink/load pins in multiple voltage areas.

DESCRIPTION

The `compile_clock_tree` command cannot insert guide buffer when the clock source at a hierarchical port drives sink/load pins in multiple voltage areas.

WHAT NEXT

Please create the clock at the output of a valid drive cell when driving sink/load pins in multiple voltage areas.

SEE ALSO

CTS-813 (Error) No always on buffer available for net '%s'.

DESCRIPTION

The `compile_clock_tree` command need to insert always on buffer for a clock net, but no always on buffer available in the library.

WHAT NEXT

Please create always on buffer in the library or create power guides in the corresponding power down domain.

SEE ALSO

CTS-814 (Error) Net '%s' needs always on buffer and there is no always on buffer available.

DESCRIPTION

The **compile_clock_tree** command need to insert always on buffer for a clock net, but no always on buffer available in the library.

WHAT NEXT

Please create always on buffer in the library or create power guides in the corresponding power down domain.

SEE ALSO

CTS-821 (Warning) The master-clock '%s' does not propagate to the generated-clock '%s' defined at the %s '%s'.

DESCRIPTION

The **check_clock_tree** command has encountered a generated-clock whose master-clock does not propagate to it. Although the master-clock is only used as a waveform reference, and propagation to the generated-clock source pin is not strictly required, in most designs a path between master and generated clock is intended. Often the user has specified either the wrong master-clock or the wrong generated-clock source pin.

WHAT NEXT

The clock should be removed with the **remove_generated_clock command and redefined with the create_generated_clock command using the correct master-clock and/or generated-clock source pin.**

If there is no problem with the generated-clock specification, then use the **report_case_analysis and/or report_disable_timing commands to see if pins within the clock-tree are affected. Use the report_timing command to verify there is a path from the master-clock source pin to the generated-clock source pin.**

SEE ALSO

check_clock_tree (2),

```
remove_generated_clock (2),  
create_generated_clock (2),  
report_case_analysis (2),  
report_disable_timing (2),  
report_timing (2).
```

CTS-822 (Warning) The generated-clock '%s' defined at the %s '%s' has an improperly specified master-clock.

DESCRIPTION

The `check_clock_tree` command has encountered a generated-clock with an improperly specified master-clock. The most common cause of this is incorrectly specifying the master-clock and/or the master-clock source pin for the `create_generated_clock command`.

WHAT NEXT

The `report_clock` command can be used to verify that the generated-clock has an improper specification, and to see what master-clock and master-clock source pin were used in the specification. The `report_clock_tree` command can be used to verify that the master-clock source pin is within the master-clock domain.

SEE ALSO

```
check_clock_tree (2),  
create_generated_clock (2),  
report_clock (2),  
report_clock_tree (2).
```

CTS-823 (Warning) The clock '%s' terminates at the multi-clock %s '%s' without a corresponding generated-clock.

DESCRIPTION

The `check_clock_tree` command has encountered a generated-clock source pin that has one or more unrelated master-clocks terminating at it. Hence this pin will be treated as a non-stop pin for the generated-clock and as a stop-pin for the unrelated master-clock(s). This inconsistency will cause large skew for clocks having the second kind of treatment to be synthesized.

Please note that the shell variable `timing_enable_multiple_clocks_per_reg` must be set true in order for the timing-engine to propagate multiple clocks per register. If this variable is set false, `check_clock_tree` will perform an additional check to see if the design has overlapping clock domains (CTS-834).

WHAT NEXT

For each master-clock at the pin with no related generated-clock, the **create_generated_clock** command can be used to create enough additional generated-clocks so that the pin is treated consistently for all clocks. Alternatively, generated-clocks can be removed with the **remove_generated_clock** command. The user should double-check the desireability of the incoming and outgoing clocks to support the design intention.

SEE ALSO

check_clock_tree (2),
timing_enable_multiple_clocks_per_reg (3),
CTS-834 (n),
create_generated_clock (2),
remove_generated_clock (2).

CTS-831 (Information) The clock '%s' defined at %s '%s' has no synchronous pins.

DESCRIPTION

The **check_clock_tree** command has encountered a clock tree with no synchronous pins. Clock-tree synthesis will skip such clocks unless they connect to a dependent and valid generated-clock which does have synchronous pins. There are some subtleties to this:

- A generated-clock may be invalid if it has an improperly specified master clock (CTS-822).
- Synchronous pins with explicit exclude clock-tree exceptions are ignored.
- Stop, float, and exclude clock-tree exceptions block downstream synchronous pins.

The number of synchronous pins is not necessarily the number of "sink" pins reported by the **report_clock_tree** command, because that includes exclude-pins and any subordinate generated-clock sink pins.

The number of synchronous pins is not necessarily the number reported by the **report_clock_timing** command, because that ignores clock-tree exceptions.

WHAT NEXT

This message is informational only. If synchronous pins for the clock were intended for the design, the user should double-check that there are synchronous pins in the netlist fanout of the clock source, and that clock-tree exceptions, case-analysis, and/or disable-timing have not been set in a way that block or ignore them. The **report_clock_timing** latency report can be used to see the synchronous pins for each clock. The **report_clock_tree** command can be used to see the clock-tree exceptions on synchronous pins.

```

CTS-832 (Warning) The clock '%s' defined at %s '%s' loops to itself.

DESCRIPTION

The **check_clock_tree** command has encountered a clock tree with a path that loops from the clock source to itself.

Please note that a loop can exist for clock-tree synthesis where it does not for timing-analysis. In particular, timing-analysis will consider loops to be broken at clock and generated-clock source or sink pins, whereas clock-tree synthesis will jump across implicit and explicit non-stop pins and see a problematic loop.

It is possible that **check_clock_tree** will not see a loop through a non-unate (e.g. exclusive-or) cell in a clock-tree, but the timing-engine will issue warning message TIM-052.

WHAT NEXT

If there are no sequential elements within the looping path, it is very likely the looping path can be seen by using **report_timing** from the clock source to itself. If the user does not manually set a clock-tree exclude exception to break the loop, such simple loops will be automatically detected and broken during clock-tree synthesis (but without user choice).

However, if there are sequential elements within the looping path, it is very likely the looping path cannot be seen by using **report_timing**, and such complex loops will not be automatically handled by clock-tree synthesis. The user will have to manually

set a clock-tree exclude exception to break the loop.

At this time we know of complex loops which require clock-specific clock-tree exceptions to support correctly; a future version of IC Compiler will include support for that. In the interim, **check_clock_tree** can be used to catch these loops.

SEE ALSO

check_clock_tree (2),
TIM-052 (n),
report_timing (2),
set_clock_tree_exceptions (2).

CTS-833 (Information) The clock '%s' defined at %s '%s' should be synthesized before the clock '%s' defined at %s '%s'.

DESCRIPTION

The **check_clock_tree** command has encountered cascaded clocks which require a particular sequence of clock-tree syntheses to achieve the best results.

This informational message is triggered during the traversal of the upper-level clock tree when a lower-level clock is encountered that satisfies these criteria:

-- not a generated-clock -- defined on a driver pin -- not synthesized yet

If the upper-level clock is synthesized before the lower-level clock, the driver of the lower-level clock will see an unrealistic load. This can cause improper cell sizes to be used to fix the bogus design-rule problem in the upper-level clock tree at the expense of global-skew and/or insertion-delay.

WHAT NEXT

Synthesize the clock trees in the specified order using the **compile_clock_tree** command.

SEE ALSO

check_clock_tree (2),
compile_clock_tree (2).

CTS-834 (Warning) The shell variable `timing_enable_multiple_clocks_per_reg` is false but multiple

clocks fan-into %S '%S'.

DESCRIPTION

The **check_clock_tree** command has encountered overlapping clock trees, but the shell variable **timing_enable_multiple_clocks_per_reg** is false, thus preventing the timing-engine from propagating multiple clocks per register. This will prevent **check_clock_tree** from seeing potential problems specific to overlapping clocks (e.g. CTS-823).

This check works by detecting when two clocks on different from-pins are incident upon the same to-pin. Only one warning is issued per to-pin, so if there are more than two clocks overlapping at the pin, only the first pair encountered will be warned about. This check is not performed if the shell variable **timing_enable_multiple_clocks_per_reg** is set true.

WHAT NEXT

The user can set the shell variable **timing_enable_multiple_clocks_per_reg** true, or they can use the **set_clock_tree_exceptions**, **set_case_analysis**, and/or **set_disable_timing** commands to prevent overlapping clocks.

SEE ALSO

```
check_clock_tree (2),  
timing_enable_multiple_clocks_per_reg (3),  
CTS-823 (n),  
set_clock_tree_exceptions (2),  
set_case_analysis (2),  
set_disable_timing (2).
```

CTS-835 (Warning) There is a %s clock-tree exception on the output pin '%S'.

DESCRIPTION

The **check_clock_tree** command has encountered a stop or float clock-tree exception on an output pin. If the total capacitance seen at that pin is larger than the max-capacitance design rule for clock-tree synthesis, design-rule fixing may degrade the clock-tree quality after the clock-tree is synthesized.

WHAT NEXT

Unless you are certain the total load seen at the output pin is less than the max-capacitance design rule specified with the **set_clock_tree_options** command, the exception should be moved to an input pin within the same clock domain. You can remove exceptions with the **remove_clock_tree_exceptions** command and set them with

the **set_clock_tree_exceptions** command. You can list clock-tree settings and exceptions with the **report_clock_tree** command.

SEE ALSO

check_clock_tree (2),
set_clock_tree_options (2),
remove_clock_tree_exceptions (2),
set_clock_tree_exceptions (2),
report_clock_tree (2).

CTS-836 (Warning) The following unclocked sink pins were found while tracing clock '%s' from %s '%s':

DESCRIPTION

The **check_clock_tree** command has encountered one or more unclocked sink pins in the specified clock domain while tracing from the specified clock source pin.

An unclocked sink pin is one that is associated with a clock tree for the purposes of clock tree synthesis, but it is not associated with any clock object for the purposes of constraining timing.

Unclocked sink pins are unconstrained and not in any path-group. They are not present in the output of the **report_clock_timing** command. **set_clock_latency** commands on clock objects do not affect unclocked sink pins.

Unclocked sink pins are caused by having a sequential arc within the clock tree that is not detected as part of a clock-gating cell or a generated-clock source. The sequential arc blocks the association of the clock object with the sink pins, but it does not affect the association of the clock tree with the sink pins for the purpose of clock tree synthesis.

WHAT NEXT

Review the intention of the unclocked sink pins and any blocking sequential arc(s).

If the unclocked sink pins are to be clocked, then often an additional generated-clock definition is required to convert a blocking sequential arc into a non-blocking one.

If the intention is to have the sink pins in question be unclocked, then the pins should be marked with explicit exclude clock tree exceptions via the **set_clock_tree_exceptions** command. If the **skew_opt** command is used to create useful-skew, unclocked sink pins will be automatically given exclude clock tree exceptions.

SEE ALSO

check_clock_tree (2),

```
report_clock_timing (2),  
set_clock_latency (2),  
set_clock_tree_exceptions (2),  
skew_opt (2).
```

CTS-840 (Warning) There are multiple clock-tree exceptions on %s '%s' for clock '%s' defined at %s '%s'.

DESCRIPTION

The **check_clock_tree** command has encountered a pin or port with multiple clock-tree exceptions on it. This can potentially lead to inconsistent treatment throughout the flow and/or across releases of IC Compiler.

WHAT NEXT

For a given pin or port, the user should use the **remove_clock_tree_exceptions** command to remove an existing exception before using the **set_clock_tree_exceptions** command to set a new one. The exceptions on clock-tree pins can be reported with the **report_clock_tree** command.

SEE ALSO

```
check_clock_tree (2),  
remove_clock_tree_exceptions (2),  
set_clock_tree_exceptions (2),  
report_clock_tree (2).
```

CTS-841 (Warning) The clock '%s' defined at %s '%s' has ignored exceptions along a path through %s '%s'.

DESCRIPTION

The **check_clock_tree** command has encountered a path within a clock-tree where one clock-tree exception blocks another.

Only one warning is given for each blocking exception. If an exception blocks more than one exception in its fanout, only the first blocked exception will be warned about. This prevents a flood of messages in case there are many clock-tree exceptions in the design (e.g. when useful-skew is applied).

WHAT NEXT

The user should use the **remove_clock_tree_exceptions** command to remove either the

blocking or blocked exception. Clock-tree exceptions can be set with the **set_clock_tree_exceptions** command. The exceptions on clock-tree pins can be reported with the **report_clock_tree** command.

SEE ALSO

```
check_clock_tree (2),  
remove_clock_tree_exceptions (2),  
set_clock_tree_exceptions (2),  
report_clock_tree (2).
```

CTS-842 (Warning) library cell '%s' is marked with dont_use attribute.

DESCRIPTION

This warning message occurs when an interactive CTS command (**insert_buffer** or **size_cell** with -interactive_cts option) is being invoked using a library cell with the dont_use attribute.

WHAT NEXT

Interactive CTS allows for buffer insertion and cell sizing to use library cells even if they are marked with dont_use, so no further action is required.

SEE ALSO

```
insert_buffer(2)  
size_cell(2)
```

CTS-843 (Error) cell '%s' is inside ILM.

DESCRIPTION

This warning message occurs when an interactive CTS command (**insert_buffer**, **remove_buffer**, or **size_cell** with -interactive_cts option, or **icts_move_cell**) is being called for a cell inside of an ILM.

WHAT NEXT

Changes cannot be made to cells inside ILM.

SEE ALSO

`insert_buffer(2)`
`remove_buffer(2)`
`size_cell(2)`
`icts_move_cell(2)`

CTS-844 (Warning) no clock nets found.

DESCRIPTION

This warning message occurs when an interactive CTS command (`insert_buffer`, `remove_buffer`, or `size_cell` with `-interactive_cts` option, or `icts_move_cell`) is being called before CTS.

WHAT NEXT

The interactive CTS commands do not support pre-CTS designs. Please run `compile_clock_tree` first.

SEE ALSO

`insert_buffer(2)`
`remove_buffer(2)`
`size_cell(2)`
`icts_move_cell(2)`
`compile_clock_tree(2)`

CTS-845 (Error) failed to find cell %s to move.

DESCRIPTION

This error message occurs when the interactive CTS `icts_move_cell` command is called with a cell that cannot be found in the current design.

WHAT NEXT

Please double-check whether or not the specified cell exists using `get_cells`.

SEE ALSO

`icts_move_cell(2)`

CTS-846 (Error) number of sets of coordinates (%d) does not match with number of cells (%d)

DESCRIPTION

This error message occurs when the number of locations and number of cells specified for the interactive CTS `icts_move_cell` command are not the same.

WHAT NEXT

Please double-check that each cell to be moved has a corresponding location specified.

SEE ALSO

`icts_move_cell(2)`

CTS-847 (Error) Clock tree initialization failed

DESCRIPTION

This error message occurs when the `optimize_clock_tree` command fails during initialization.

WHAT NEXT

Please check for previous error messages in the log file for related details.

SEE ALSO

`optimize_clock_tree(2)`

CTS-848 (Information) no optimization on the bi-direction net %S.

DESCRIPTION

The `optimize_clock_tree` will skip bi-directional nets.

WHAT NEXT

This is only a informational message.

SEE ALSO

`optimize_clock_tree(2)`

CTS-849 (Information) no optimization on the routed net %s.

DESCRIPTION

The `optimize_clock_tree` command will skip routed nets when post-route clock tree optimization is not enabled.

WHAT NEXT

This is only a informational message.

SEE ALSO

`optimize_clock_tree(2)`

CTS-850 (Warning) No buffer available: library cell %s has dont_use/dont_touch attribute set on it.

DESCRIPTION

When user does not set clock tree reference list by using `set_clock_tree_references` command, CTS can not use the buffer with `dont_use/dont_touch` attribute for clock tree synthesis.

WHAT NEXT

If user want to use those buffers, she/he needs to remove the `dont_use` attribute set on the buffer

SEE ALSO

`set_clock_tree_references (2)`,

CTS-851 (Warning) There are multiple arcs between input and output pins for buffer %s.

DESCRIPTION

The `check_clock_tree` command has detected duplicate timing arc on a buffer. Duplicate arc may cause inherent skew and increase the CTS runtime.

WHAT NEXT

User should remove this buffer from the reference list specified with `set_clock_tree_references` command.

SEE ALSO

`check_clock_tree` (2),
`set_clock_tree_references` (2),
`report_clock_tree` (2).

CTS-852 (Warning) There is case analysis set on pin '%s' .

DESCRIPTION

The `check_clock_tree` command has detected a case analysis set on a pin of a clock cell on the clock path. Case analysis setting may affect the clock structure seen by the tool. It is recommended for user to double check if those settings are intended for clock networks.

WHAT NEXT

Remove the unnecessary case analysis settings with the `remove_case_analysis` command.

SEE ALSO

`check_clock_tree` (2),
`set_case_analysis` (2),
`remove_case_analysis` (2),
`report_clock_tree` (2).

CTS-853 (Warning) There is disable timing set on pin '%s' .

DESCRIPTION

The **check_clock_tree** command has detected a disable timing set on a pin on the clock path. Disable timing setting may affect the clock structure seen by the tool. It is recommended for user to double check if those settings are intended for clock networks.

WHAT NEXT

Remove the unnecessary disable timing settings with the **remove_disable_timing** command.

SEE ALSO

check_clock_tree (2),
set_disable_timing (2),
remove_disable_timing (2),
report_clock_tree (2).

CTS-854 (Error) Clock tree optimization failed

DESCRIPTION

This error message occurs when the **optimize_clock_tree** command fails.

WHAT NEXT

Please check for previous error messages in the log file for related details.

SEE ALSO

optimize_clock_tree(2)

CTS-855 (Warning) CTS reference list defined but no reference can be used.

DESCRIPTION

The **check_clock_tree** found user-specified reference list, but none of these user-specified references can be used. Please check if the references are set to dont_use or dont_touch.

WHAT NEXT

User should check and make sure that the buffers in the reference list are not marked as dont_use or dont_touch after the CTS reference list definition.

CTS-954 (warning) Invalid tree. Error at %d

DESCRIPTION

Invalid tree

WHAT NEXT

Please check config file.

CTS-955 (warning) Check configuration file at line number %d . Attempt to reassign buffer level %s

DESCRIPTION

Attempt to reassign buffer level routing constraints

WHAT NEXT

Please check config file.

CTS-956 (error) Unrecognized statement at line %d in config file %s

DESCRIPTION

Unrecognized statement in config file.

WHAT NEXT

Please check config file syntax.

CTS-957 (error) Pin name %s does not exist

DESCRIPTION

Unable to find mentioned pin

WHAT NEXT

Please check config file settings.

CTS-958 (error) invalid buffer level, more buffers than sinks on net %s

DESCRIPTION

More buffer than sink pin on mentioned net.

WHAT NEXT

Please check config file.

CTS-959 (warning) Ignoring net %s

DESCRIPTION

Ignored net as its driving pin is ignored

WHAT NEXT

Please check config file.

CTS-960 (error) Ignoring statement %s at line number %d from

config file

DESCRIPTION

Statement is ignored as it is not a valid buffer master

WHAT NEXT

Please check config file settings.

CTS-960 (error) Ignoring statement %s at line number %d from config file %s

DESCRIPTION

Statement ignored because there is no current tree

WHAT NEXT

Please check config file settings.

CTS-962 (error) Incorrect placement of begin_clock_subtree at line number %d for config file %s

DESCRIPTION

begin_clock_subtree makes no sense if more than one clock tree is being constructed

WHAT NEXT

Please check config file settings.

CTS-963 (error) Incorrect usage of begin_clock_subtree statement at line number %d in config file at %s

DESCRIPTION

begin_clock_subtree statement ignored because there is no current tree

WHAT NEXT

Please check config file settings.

CTS-1050 (Error) Net has %d load pins, it can't make a route of shape %s.

DESCRIPTION

This error message occurs when the number of load pins on a net does not correlate to the route shape to be obtained on that net. For a net with 2 load pins, the possible route shape is either I or rotated-I (I_90). For such a net, H or rotated-H shaped route is not possible. Similarly for a net with 4 load pins, the possible route shape is either H or rotated H (H_90).

WHAT NEXT

Check the net connection details.

CTS-1051 (Error) Couldn't find any suitable %s track for the route to connect the points (%g %g) and (%g %g).

DESCRIPTION

While connecting two points through wire, the tracks should be available to do the connection within the proximity. This error comes when no suitable tracks are found in the proximity for making such a connection.

WHAT NEXT

Check the physical design to verify if the tracks are available around that part of the design. In case, if only tried to route using the tracks aligned with the grids, may now be tried with off-grid tracks.

CTS-1052 (Error) Couldn't create the H (or H_90) or I (or I_90) shaped route topology for the given net.

DESCRIPTION

This error message comes when for the given net, H or H_90 or I or I_90 route

topology generation is not possible due to some reasons.

The topology generation may not be possible when the load pins can't be connected using a route or the driver pin can't be connected to the route. The unavailability of suitable tracks, existence of blockages on the path might be the possible reasons.

WHAT NEXT

Check the physical design.

CTS-1053 (Error) Couldn't create the H (or H_90) or I (or I_90) shaped route for the given net.

DESCRIPTION

This error message comes when for the given net, H or H_90 or I or I_90 the actual route generation is not possible due to some reasons.

The actual route generation may not be possible when the wires or vias can't be instantiated in the required places due to blockages, routing rules etc.

WHAT NEXT

Check the physical design.

CTS-1054 (Warning) %s-shaped route is not possible for %d nets.

DESCRIPTION

This error message comes when for the given net is not suitable to have H or H_90 or I or I_90 shaped routes.

WHAT NEXT

Check the net connectivity and/or physical design constraints.

DB

DB-1 (error) File is not a DB file.

DESCRIPTION

The identified file was not in the DB file format.

WHAT NEXT

Check to see what format the file is in, and read it with the appropriate command. For example, edif files can be read into `dc_shell` with the `read -format edif <filename>` command.

DB-3 (warning) Can't locate file '%s'.

DESCRIPTION

This warning message will be printed out the first time if we can not resolve a link to a given file. In the absense of the given file, there will be some unresolved references.

WHAT NEXT

Check the `link_library` and the `search_path` variables and set their value accordingly.

DB-4 (error) Open gen_state (0x%x) -- %s object '%s' (0x%x) attach '%s' id = %d

DESCRIPTION

WHAT NEXT

DB-5 (error) Limit exceeded: Cannot create attribute %s for

class %s, so program cannot continue.

DESCRIPTION

This message appears when the internal limit of 32k attributes per database object is exceeded. Once this limit is exceeded, work in progress cannot be saved and the program cannot continue.

WHAT NEXT

Check the scripts to see if an excessive number of **create_attribute** commands are run with unique attribute names. Try to reuse names where possible. If many scripts are run in one large session, attempt to break up the single long run into a number smaller runs, saving your work each time.

DB-6 (error) Limit exceeded: Cannot create attach %s for class %s, so program cannot continue.

DESCRIPTION

This message appears when the internal limit of 32k types of attaches per database object is exceeded. Once this limit is exceeded, work in progress cannot be saved and the program cannot continue.

WHAT NEXT

If many scripts are run in one large session, attempt to break up the single long run into a number smaller runs, saving your work each time.

DBCK

DBCK-1 (error) Line is not connected to anything - Sheet: %s.

DESCRIPTION

WHAT NEXT

DBCK-2 (error) Endpoint of a line touches a line of another net
- Sheet: %s.

DESCRIPTION

WHAT NEXT

DBCK-3 (error) Schematic has coexistent lines of different nets
- Sheet: %s.

DESCRIPTION

WHAT NEXT

DBCK-4 (information) Input cell/pin (%s) is not driven, assumed to be shorted to logic 0.

DESCRIPTION

All unconnected input pins that are not driven are assumed to be shorted to logic 0. This assumption applies only to cells explicitly named by the designer. Unconnected inputs to cells that are allocated during the synthesis process are shorted to logic 0, but this message is suppressed. This situation can cause the results of synthesis to differ from those of simulation.

WHAT NEXT

DBR

DBR-001 (error) Cannot read file '%s'.

DESCRIPTION

The file you specified either does not exist or you do not have read access to the file.

WHAT NEXT

Check the `search_path` or use the `file` command to verify the existence and other attributes of the file.

DBR-002 (information) Errors reading file '%s'.

DESCRIPTION

Errors occurred while reading the specified file.

WHAT NEXT

Check previous messages, which indicate what went wrong and what action you can take to correct the problem. If there are no messages preceding DBR-002, then the file is most likely corrupt.

DBR-003 (warning) Design '%s' (file '%s') is already registered. Remove the design before rereading.

DESCRIPTION

While reading a design from a file, that design/file combination was found in memory. This means that the file was read previously.

WHAT NEXT

If the file has changed and you want to reread it, remove the design using the `remove_design` command, then reread the file.

DBR-004 (warning) Library '%s' (file '%s') is already registered.

DESCRIPTION

While reading a DB file, a library/file combination that is already in memory was found. This means that the file was read previously.

WHAT NEXT

If the file has changed and you want to reread it, you can remove the library using the `remove_lib` command, then reread the file. However, in the process, if a linked design references this library, that design will need to be unlinked and will need to be completely rebuilt.

DBR-005 (information) Design '%s' not loaded.

DESCRIPTION

While reading in a design, some inconsistencies were found, so the design was not loaded. It's likely that the db file has errors, such as multiple nets with the same name on a single design.

WHAT NEXT

Check previous messages which will indicate what went wrong, and what action you can take to correct the problem. Usually, the application which created the db is the cause.

DBR-006 (error) Unknown pin '%s' makes instance '%s' of '%s' in design '%s' inconsistent with previous instances.

DESCRIPTION

While reading in a design, an instance of a design is inconsistent with previous instances because a pin is not found.

WHAT NEXT

Make sure that the DB is valid.

DBR-007 (warning) Found unsupported LSI reference '%s' to '%s' in design '%s'.

The linker will not be able to resolve this reference.

DESCRIPTION

While reading in a design, an instance of a design was found to be derived from an LSI netlist. This tool only supports fully name-based references from LSI netlists. Order-based or mixed order and name based references are not supported.

WHAT NEXT

Use another Synopsys tool to read the DB, link it, and write it out to a new DB file. This will resolve the naming issue.

DBR-008 (error) Cannot remove library '%s':

DESCRIPTION

The library contains objects which are being referenced. For example, some cells may be used in the current design, or a wire load model may be in use. If a QTM model is being created, and it is referencing the library, then it must be saved before the library can be removed.

Each reason why the library cannot be removed is listed.

WHAT NEXT

Remove the designs with the `remove_design` command before using `remove_lib`, since a design is the source of most library references. Other causes, like QTM model creation, may require other actions.

DBR-009 (warning) Found name-based LSI reference '%s' to '%s' in design '%s'.

The linker might not be able to resolve this reference.

DESCRIPTION

While reading in a design, an instance of a design was found to be derived from an

LSI netlist. The reference is fully name-based. However, even in the case of name-based references, the linker might not be able to resolve references. The LSI netlist allows unconnected pins to be omitted from the reference, so, for example, an FD1 with D, CP, and Q pins connected, would be represented with the QN pin missing. The linker will indicate that the reference has too few ports.

WHAT NEXT

Use another Synopsys tool (like Design Compiler) to read the DB, link it, and write it out to a new DB file. This will resolve the missing pins issue.

DBR-010 (error) Cannot access temp directory '%s'%s.

DESCRIPTION

The read process utilizes a temporary directory to create transient files. These files are deleted when the read process completes. The name of the directory is found in the variable 'pt_tmp_dir'. In this case, the program was unable to create files in that directory.

WHAT NEXT

Verify that the specified directory exists, is writeable, and that the disk has some space available. If no space is available, try setting pt_tmp_dir to an alternate directory.

DBR-011 (error) Problem in read_%s: %s.

DESCRIPTION

The read process detected an error, which is detailed in the message. Some are intermediate file problems (see DBR-010); others are process related. For example, if the message indicates "invalid access", it means that the command is not being used correctly.

WHAT NEXT

Action based on the message text.

DBR-012 (error) Cannot read design db files. A db file must be

a library.

DESCRIPTION

Reading designs in the db format is not supported. Reading of db files is supported for libraries only.

WHAT NEXT

Do not read files containing designs in db format. Use other supported formats for reading design files.

DBR-013 (error) read_min_max_lib can only merge libraries.

DESCRIPTION

The **read_min_max_lib** can only be used to read and merge two library DBs - one min library, and one max library.

WHAT NEXT

Check the arguments provided to command `read_min_max_lib`.

DBR-014 (error) multiple libraries in a single DB not supported.

DESCRIPTION

Command `read_min_max_lib` can only be used on a DB file which contains multiples libraries.

WHAT NEXT

Check the arguments provided to command `read_min_max_lib`.

DBR-015 (warning) Ignoring degenerated cell '%s' from library

'%S'.

DESCRIPTION

This message warns you that PrimeTime has found a degenerated cell in the library and is ignoring it.

WHAT NEXT

This is a warning message only. No action is required on your part.

DBR-016 (error) Cannot find port '%s' for cell '%s' in all libraries.

DESCRIPTION

You receive this message because PrimeTime has found the specified port in either the min or max condition library db file but not the other. The ports of the library cells in the min and max condition libraries must be identical.

WHAT NEXT

Examine the min and max condition libraries and ensure that they contain the same set of library cells with the same ports.

DBR-017 (error) Cannot find %s '%s' in all libraries.

DESCRIPTION

You receive this message because PrimeTime has found the specified cell in either the min or max condition library db file but not the other. The library cells in the min and max condition libraries must be identical.

WHAT NEXT

Examine the min and max condition libraries and ensure that they contain the same set of library cells.

DBR-018 (error) %s value '%g' of operating condition '%s' is

different from the nominal %s value '%g'.

DESCRIPTION

You receive this message if PrimeTime finds the specified operating condition value in either the min or max condition library db file and that value is different from the nominal value.

WHAT NEXT

Ensure that all operating conditions in the min and max library db files are nominal.

DBR-019 (error) Cannot find operating condition '%s' in library '%s'.

DESCRIPTION

You receive this message because the operating condition you specified cannot be found in the specified library.

WHAT NEXT

Use the **report_lib** command to list the operating conditions in the specified library. Then re-execute the command, using only the available operating conditions.

DBR-020 (information) Renamed scalar %s '%s' to '%s' in design '%s'.

DESCRIPTION

While reading a Verilog file with PrimeTime's native Verilog reader, two net or port names were found to be in conflict, requiring one of the objects to be renamed. This can occur for one of two reasons: an ambiguous bus naming style or escaped names.

Given a bus_naming_style of "%s%d" and the following verilog port declarations:

```
output z1;  
output [1:0] z;
```

the bus reference z[1] infers a port named z1. This conflicts with the scalar port

`z1`, declared with the first output statement.

The second case can be shown with the following verilog wire declarations:

```
wire \z[1];
wire [1:0] z;
```

Assuming the default bus_naming_style of "%s[%d]", the problem here is that bus reference `z[1]` infers a net named `z[1]`, and so does the scalar declaration.

WHAT NEXT

No action is required. This is an informational message.

DBR-021 (warning) Library file '%s' is already registered.

DESCRIPTION

You tried to read a library DB file which has already been loaded into memory.

WHAT NEXT

If the file has changed and you want to reread it, you can remove the library using the `remove_lib` command, then reread the file. However, in the process, if a linked design references this library, that design will need to be unlinked and will need to be completely rebuilt. If you were using `read_min_max_lib`, then using the -force option will do all of this for you.

DBR-022 (error) Template %s is not the same in min and max libraries.

DESCRIPTION

The two libraries given to command `read_min_max_lib` contain a template of the same name but different content. Two templates must be the same to allow use of the cell lookup tables from two libraries as one min-max table. This is both an implementation limitation and a feature to improve performance of delay calculation. Two templates are considered same if the variables and indices have same name and same order, same size of the array for each index, and each index value is the same.

WHAT NEXT

Check the libraries provided to command `read_min_max_lib`. They should contain same templates. The easiest way to achieve this is to do textual difference on the two `.lib` files and make sure that the sections describing templates are absolutely the same (excluding blanks and formating). In case when the templates differ you will have to choose one of the sets of templates, put it into the other `.lib` file, and manually or using a script recalculate all cell delay tables in that library to conform to the new templates. Another way is to set options in the characterization tool that generates `.lib` files to use a fixed template for both libraries if such option is available.

DBR-023 (error) Duplicate reference port '%s/%s' in module %s ending at line %d in %s

DESCRIPTION

While reading a Verilog file with PrimeTime's native Verilog reader, an instance was found where a scalar port and a bus port in the terminal list are in conflict because of the `bus_naming_style`. For example:

```
BOX i0 (.DATA1(a), .D({c ,d}), .\D[1] (b), .Z(z));
```

Here, the scalar port `D[1]` and the bus port `D[1]` are in conflict if the `bus_naming_style` is `%s[%d]`. If the `bus_naming_style` is `%d(%d)`, there is no conflict. This is an error because renaming reference ports is unpredictable, and therefore, not supported.

WHAT NEXT

Either change the `bus_naming_style` or investigate how such a conflict was introduced into your netlist.

DBR-024 (warning) Can't connect pin '%s' to net '%s' in design '%s': already connected to net '%s'

DESCRIPTION

An attempt was made to connect a pin to a net and the pin is already connected to a net. This is typically an error in the netlist, such as a duplicated connection. For example, this message would be generated when reading an EDIF file which has a construct similar to this:

```
(net d  
  (joined
```

```
(portRef d)
(portRef D (instanceRef n1))
(portRef D (instanceRef n1))
)
)
```

WHAT NEXT

This is a warning indicating that the connection was ignored, so no specific action is necessary.

DBR-026 (error) Unable to create '%s' '%s' in design '%s'

DESCRIPTION

While reading in a design, an object (such as a port, cell, or net) could not be created. It's likely that the db file has errors, such as multiple nets with the same name on a single design. The object name and design name are given in the message. Such an error will cause the loading of the design to fail, although other designs in the file which do not exhibit problems will be loaded.

WHAT NEXT

Usually, the application which created the db is the cause.

DBR-030 (error) Invalid global reference '%s' - %s in module ending at line %d in %s

DESCRIPTION

You receive this message if PrimeTime finds an invalid global reference while reading a Verilog file with PrimeTime's native Verilog reader. A global reference is a connection to a wire in another module. PrimeTime's native Verilog reader puts several restrictions on the use of global references. For a reference of the form **module.wire**, all of the following must be true:

- The module must exist in the file being read.
- The module must precede the module that is making the reference.
- The wire must exist in the module.

- The wire must be a logic constant.

Any deviation from these rules generates this error message.

WHAT NEXT

There is no other support for global signals. You must remove them from your netlist.

DBR-031 (error) Attribute '%s' cannot be imported: You defined it as %s; db defines it as '%s'.

DESCRIPTION

You receive this error message because while reading an attribute from db, there was a mismatch between the type (integer, string, etc.) that db defines for the attribute and the type that PrimeTime defines for the attribute. Usually, this is a user-defined attribute, defined with the **-import** option on **define_user_attribute**, and the types do not match.

WHAT NEXT

Rerun PrimeTime and define the attribute correctly. You might need to use other Synopsys applications to determine the actual type of the attribute.

DBR-032 (information) Ignoring library cell '%s' which does not have any pins defined on it.

DESCRIPTION

This message indicates that while reading the library, PrimeTime detects that the named library cell does not have any pins defined on it. Library cells without pins are ignored and not loaded because they do not have any effect in the timing analysis.

WHAT NEXT

There is no user actions required unless you think the indicated cell should have pins. If so, you need to go back to the original source of the library in order to fix it.

DBR-033 (warning) Found bad bus definition for '%s' - %s.

DESCRIPTION

This message indicates that while reading the DB file, PrimeTime detected that the named bus definition is wrong or not consistent. PrimeTime may not be able to properly link the design due to this problem.

WHAT NEXT

Normally, this indicates errors in the DB file. Please fix the bus definition in the DB file by going back to the source of the DB file and regenerate it from the tools originally created this DB file.

DBR-040 (error) Design '%s' was not found in '%s'

DESCRIPTION

You receive this message because **swap_cell** loaded the file you specified using the **-file** option, but did not find the specified design in the file. This error could be caused by a misspelling or typo in the design name or filename, or both; or by inadvertently specifying a file that does not contain the intended design.

WHAT NEXT

Examine the file, verify that the intended design name is contained in the file, and note the spelling of the design name. Then re-execute **swap_cell** using the correct design and file names.

DBR-050 (warning) Number of state table inputs for %s/%s/%s (%d) exceeds %d.

DESCRIPTION

During the reading of a sequential cell from a DB library, an output pin was found with a state table for more than 16 inputs. This message warns you that the presence of this cell with its large state table will degrade read performance, because processing is exponential.

WHAT NEXT

This is a warning message only. No action is required on your part.

DBR-051 (error) Too many table inputs for %s/%s/%s (%d). State table information ignored in this case.

DESCRIPTION

During the reading of a sequential cell from a DB library, an output pin was found with a state table for more than 30 inputs. PrimeTime cannot load state table information for more than 30 inputs, and is ignoring this information.

WHAT NEXT

Consult the Library Compiler documentation for alternatives to storing state tables.

DBR-060 (error) Can't set min library to %s.

DESCRIPTION

You receive this message if the min library you passed to `set_min_library` is invalid. For example, the min library you specified might have been the same as the max library, or it might have already been used as the max library in a `set_min_library` command. The max and min libraries must be different. The message text will indicate the condition.

WHAT NEXT

Re-execute `set_min_library` and specify a valid min library.

DBR-061 (information) '%s' already has '%s' as its min library.

DESCRIPTION

The min library you passed to `set_min_library` has already been related to the max library using `set_min_library`.

WHAT NEXT

This is an informational message only; no action is required on your part. However,

if you intended to change the relationship of the max library to a different min library, check the spelling of the min library argument and re-execute the command if necessary.

DBR-062 (warning) Cannot create max/min library cell relationship for '%s':

%S.

DESCRIPTION

The **set_min_library** command found a library cell in the min library that matches the library cell in the max library. However, some aspect of the two library cells is different. For example, one might have more pins than the other; the pins might be in a different order; or the timing arcs might be different. The text of the message states the most serious difference. To create a max/min library cell relationship, both cells must have the same timing arcs and the same pins, with the same order and direction.

For cells where the max/min relationship fails, as in the current situation, the command uses a minimum condition delay calculation based on the max library. If even one of the library cell pairs matches and compares correctly, the **set_min_library** command continues executing and succeeds.

WHAT NEXT

This is a warning message; no action is required on your part. However, you should read the message text to determine why the cells are different, and ensure that the max and min libraries are compatible.

DBR-063 (warning) No match for %s/%s in library '%s'.

DESCRIPTION

The **set_min_library** command could not find a library cell in the min library that matches the specified library cell in the max library. Therefore, a max/min library cell relationship cannot be created for that cell.

For cells where the max/min relationship fails, as in the current situation, the command uses a minimum condition delay calculation based on the max library. If even one of the library cell pairs matches and compares correctly, the **set_min_library** command continues executing and succeeds.

WHAT NEXT

This is a warning message; no action is required on your part. However, you should

determine why there is not a match for the specified cell, and ensure that the max and min libraries are compatible.

DBR-100 (information) Ignoring external links found in design

'%s'

(file '%s')

because dbr_ignore_external_links is set to true.

DESCRIPTION

You receive this message if your design contains external links but the **dbr_ignore_external_links** variable is set to *true*. In this case, the application ignores the external links and instead searches for an object by name only in the libraries in the **link_path**.

External links are created by Design Compiler in certain situations when writing a DB file; for example, when there is a link from a design to a wire load model in a library. The external link records information about the library to which the wire load was linked. Operating conditions can also have external links created for them.

You would set the **dbr_ignore_external_links** variable to *true* if you wanted to use a different library in PrimeTime than was used in Design Compiler.

WHAT NEXT

If you intended for the external links to be ignored, no action is required on your part. Otherwise, set the **dbr_ignore_external_links** variable to *false* and reexecute the application.

DBR-101 (warning) Pin '%s' is not found on library cell '%s'.

Generated clock defined on this pin will not be created.

DESCRIPTION

While reading in a design, a generated clock definition has been found for a library cell, but the source pin of the generated clock does not exist on that library cell. Thus, the generated clock will not be created if this was the only source pin of the generated clock.

WHAT NEXT

The Synopsys database format (.db) appears to be incorrect. Please recreate the database with the correct source pin name for the generated clock.

DBR-200 (warning) Cannot read DDC attribute %s for design %s.

DESCRIPTION

The specified attribute could not be read for the given design. The attribute is ignored.

WHAT NEXT

Modify the design in the tool that generated the DDC file so that it does not generate this attribute.

DBR-201 (warning) Unknown pin direction in DDC for pin %s

DESCRIPTION

The DDC file has a pin direction that PrimeTime does not recognize. It uses the internal direction for such pins.

WHAT NEXT

Change the design so that the tool that generates the DDC file does not generate the bad pin direction.

DBR-202 (error) Scenario name %s supplied when no scenarios stored

DESCRIPTION

A `read_ddc` command was issued with a scenario name argument, but there were no scenarios stored in the DDC file.

WHAT NEXT

Either re-generate the DDC file with the scenario, re-issue the `read_ddc` command as `-netlist_only` to ignore all constraints, or re-issue the `read_ddc` command without the scenario to pick up the non-scenario constraints.

DBR-203 (error) Scenario name %s did not match an available

scenario %s.

DESCRIPTION

A **read_ddc** command was issued with a scenario name that did not match any of the scenarios in the DDC file. A list of available scenarios is listed.

WHAT NEXT

Choose one of the available scenarios and re-issue the **read_ddc** command with the chosen scenario.

DBR-204 (error) File %s is not in DDC format.

DESCRIPTION

The **read_ddc** command was issued for the given file, but the file is not in DDC format.

WHAT NEXT

Either remove the file from the **read_ddc** command, or generate the file as a DDC file.

DBR-205 (error) File %s has too old a version for PrimeTime to read.

DESCRIPTION

PrimeTime cannot read the given file because the DDC version number is too old.

WHAT NEXT

Convert the DDC file to a new version. Simply read the file into a tool that can write DDC (such as DC), then write the file out again. The tool will write it out as a new version.

DBR-206 (Warning) The library has non-continuous base curves and can have a negative impact on PrimeTime's

performance and memory.

DESCRIPTION

The base-curve ids for the CCS library that is used is not numbered continuously. For eg, the curve_y ids for the base curves in the library are (1, 2, 5, 6, 7 ..) instead of the recommended sequential ordering (1, 2, 3, 4, 5, ...). Such libraries can cause a negative impact on performance and memory of PrimeTime.

WHAT NEXT

Use the latest version of Library Compiler to get a compatible version of the library.

DBRBO

DBRBO-1 (error) Attribute '%s' does not have valid values.

DESCRIPTION

This might have occurred because you incorrectly set this attribute or is internal to the program. Regardless, the attribute is considered as "not set", and its effect is nil.

WHAT NEXT

DBSEC

DBSEC-1 (error) Can't read %s; it contains protected data generated by %s.

DESCRIPTION

The information in the database file is protected and cannot be read by the tool that issued this error message.

WHAT NEXT

Check the manual of the tool that generated the protected data to determine which Synopsys tools may access it.

DBVH

DBVH-1 (warning) Time units are not specified in the '%s' library.

DESCRIPTION

This message is given if the technology library does not have the **time_unit** attribute specified.

The optional **time_unit** attribute is used by the VHDL library generator to identify the physical time unit used in the generated library.

The physical time unit defaults to 1 nanosecond.

WHAT NEXT

Add the **time_unit** attribute to the technology library to explicitly specify the physical time units of the library.

```
library(dbvh1) {
    time_unit : "10ns";
    ...
}
```

EXAMPLE MESSAGE

Warning: Time units are not specified in the 'dbvh1' library. (DBVH-1)

DBVH-2 (error) The '%s' library contains no valid library cells.

DESCRIPTION

A correct VHDL model could not be created for any one of the library cells. There is at least one VHDL generation error for each library cell. Because the resulting VHDL files are of no use, all generated VHDL files are deleted.

This error is issued when all VHDL models generated for the specified architectures are incorrect.

WHAT NEXT

Correct the invalid library cells.

EXAMPLE MESSAGE

```
Results summary:  
Total cells in library = 1  
Error: The 'dbvh2' library contains no valid library cells. (DBVH-2)
```

DBVH-3 (warning) The '%s' pin on the '%s' cell has duplicate timing constraints.

Only one of them is used.

DESCRIPTION

The pin on the library cell has more than one timing constraint of the same **timing_type** with the same related pins.

The VHDL generator warns that an error might have been made. Only the first unique constraint is accepted, while all following constraints are ignored.

This warning pertains only to the full-timing structural, optimized gate-level, and VITAL models. The unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning.

Otherwise, include only the timing arc that belongs in the simulation model in the technology library. If possible, remove all duplicates.

DBVH-4 (warning) The '%s' pin on the '%s' cell has duplicate timing arcs.

Only one of the timing arc is used.

DESCRIPTION

The pin on the library cell has, with the same related pins, more than one timing arc of the same **timing_type**.

Although the synthesis tools support multiple timing arcs, the VHDL generator does not.

The VHDL generator warns the user that an error might have been made. Only the first unique timing arc is accepted, while all following ones are ignored.

This warning pertains only to full-timing structural, optimized gate-level, and

VITAL models. Unit-delay structural models ignore timing.

During the **read_lib** command, a similar warning (LBDB-242) gives you the line numbers of the duplicate timing arcs.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, include in the technology library only the timing arc that belongs in the simulation model. If possible, remove all duplicates.

EXAMPLES

```
cell(dbvh4) {
area : 7
pin(D P CP) {
    direction : input;
    capacitance : 1;
}
ff ("IQ","IQN") {
    next_state : "D";
    clocked_on : "CP P";
}
pin(QN) {
    direction : output;
    function : "IQN";
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 4.0000;
        intrinsic_fall : 2.0000;
        rise_resistance : 0.1000;
        fall_resistance : 0.1000;
        related_pin : "CP";
    }
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 3.0000;
        intrinsic_fall : 3.0000;
        rise_resistance : 0.1000;
        fall_resistance : 0.1000;
        related_pin : "CP P";
    }
}
}
```

In this case, the 'rising_edge' timing_type is defined twice. During the VHDL generation, only the first occurrence is used.

EXAMPLE MESSAGE

Warning: The 'QN' pin on the 'dbvh4' cell has duplicate timing arcs.
Only one of them is used. (DBVH-4)

DBVH-5 (warning) The '%s' pin has an invalid timing type related to '%s'.

The invalid timing arc is ignored.

DESCRIPTION

This warning is given for any one of the following conditions:

- The pin is an input and has a timing arc.
- The pin is an output and has a timing constraint.
- The pin is a non-tristatable pin and has a disable timing group.
- The pin has a timing arc with an unrecognized timing type.

This warning is issued if any of the above conditions occur. As a result, the VHDL generator ignores the illegal timing arc or constraint.

This warning pertains only to full-timing structural, optimized gate-level, and VITAL models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, correct the illegal timing arc or timing constraint.

EXAMPLES

```
cell(dbvh5) {  
    area : 9;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
        timing() {  
            timing_type : preset;  
            intrinsic_rise : 0.9;  
            intrinsic_fall : 0.9;  
            related_pin : "CP";  
        }  
    }  
    pin(CP) {  
        direction : input;  
        capacitance : 1;  
        min_period : 3.0  
    }  
}
```

```
}
```

In this case, 'D' is an input pin and has a 'preset' timing_arc.

EXAMPLE MESSAGE

Warning: The 'D' pin has an invalid timing type related to 'CP'.
The invalid timing arc is ignored. (DBVH-5)

DBVH-6 (error) The '%s' pin is unused in the '%s' sequential cell.

DESCRIPTION

An input pin in the sequential library cell is not part of the function of any output.

If an input pin to a sequential library cell is unused, Library Compiler forces the library cell to become a black box. As a result, the VHDL generator cannot determine the function for this cell and can only generate a black box template.

Therefore, the VHDL generator creates a black box template for the optimized gate-level and VITAL simulation models, and an empty cell for both the unit-delay and full-timing structural models.

WHAT NEXT

Either remove the unused pin or use it in an output function.

EXAMPLES

```
cell(dbvh6) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
        timing() {
            timing_type : preset;
            intrinsic_rise : 0.9;
            intrinsic_fall : 0.9;
            related_pin : "CP";
        }
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
        min_period : 3.0
    }
}
```

EXAMPLE MESSAGE

Error: The 'D' pin is unused in the 'dbvh6' sequential cell. (DBVH-6)

DBVH-7 (error) Missing timing arc between '%s' and '%s' pins in the '%s' cell.

DESCRIPTION

An output pin lacks a timing arc related to an input pin, which is in the output pin's function.

Synthesis allows output pins in sequential library cells to lack timing arcs to asynchronous inputs. For example, you can omit clear-to-output arcs for a flip-flop, and data-to-output arcs for a latch. Simulation requires a timing arc between each output pin and all its functionally dependent input pins.

A full-timing structural model always makes a best guess for the missing timing arc and continues.

This warning pertains only to full-timing structural models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, add the missing timing arc to the technology library.

EXAMPLES

```
cell(dbvh7) {
area : 16;
bundle( D ) {
members( D_1 D_2 );
capacitance : 1.0;
direction : input;
}
pin( CLK ) {
capacitance : 1.0;
direction : input;
}
bundle( Q ) {
members( Q_1 Q_2 );
direction : output;
function : "IQ";
}
ff_bank( IQ, IQN, 2) {
next_state : "D";
clocked_on : "CLK";
}
```

```
}
```

EXAMPLE MESSAGE

```
Error: Missing timing arc between 'D_1' and 'Q_1' pins in the 'dbvh7' cell. (DBVH-7)
```

DBVH-8 (warning) The '%s' pin on the '%s' cell has no 'function' attribute.

DESCRIPTION

The pin on the library cell is missing a **function** attribute. It is not a pull-up or pull-down pin, it does not have a three_state attribute, and it does not have any related timing arcs.

As a result, the output pin is at a constant logic state of unknown X. The pin is initialized to the constant logic state during the entity declaration.

This message pertains to all architectures.

WHAT NEXT

If the output pin is not at a constant logic state, define a **function** attribute for the pin in the technology library.

EXAMPLES

```
cell(dbvh8) {
area : 3;
pin(A) {
    direction : input;
    capacitance : 2;
}
pin(Z) {
    direction : output;
    timing() {
        intrinsic_rise : 0.1;
        intrinsic_fall : 0.1;
        rise_resistance : 0.1;
        fall_resistance : 0.1;
        related_pin : "A";
    }
}
}
```

EXAMPLE MESSAGE

Warning: The 'Z' pin on the 'dbvh8' cell has no 'function' attribute. (DBVH-8)

DBVH-9 (warning) The '%s' pin on the '%s' cell has an unknown direction.

The direction defaults to inout.

DESCRIPTION

The VHDL generator must be able to recognize the direction of each pin. The pin on this library cell has an unknown direction, and the VHDL generator assumes the direction to be **inout** (the most flexible choice).

This message pertains to all architectures.

WHAT NEXT

Clearly define the direction of every pin in the technology library.

DBVH-10 (warning) The '%s' function on the '%s' pin in the '%s' cell is not recognized.

DESCRIPTION

The pin's function in the library cell is not internally recognized. Either the **function** attribute is an empty string or a sequential output does not follow one of the internal variables.

The format of the **function** attribute is not clear to the VHDL generator, which assumes that the library cell passed Library Compiler.

The **function** attribute is ignored; the pin is unknown.

This message pertains to all architectures: full-timing structural, unit-delay structural, optimized gate-level, and VITAL models.

WHAT NEXT

Modify the **function** attribute to follow the syntax the VHDL generator accepts. It must be a non-empty string and, if sequential, must follow one of the internal variables.

DBVH-11 (warning) The '%s' pin has an unsupported constraint related to '%s'.

The invalid timing arc is ignored.

DESCRIPTION

The library cell is a flip-flop with one of the following invalid conditions:

- * A pin has a timing constraint related to a clock input.
- * A pin has a non-recovery timing constraint related to an asynchronous input.
- * A pin has a recovery timing constraint related to a non-asynchronous input.

The timing constraint is thus invalid, and the VHDL generator checks for invalid timing constraints. Either you were trying to use a timing constraint for an unsupported purpose, or the timing constraint was incorrectly identified. In either case, the invalid timing constraint is ignored.

This warning pertains only to full-timing structural, optimized gate-level, and VITAL models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, either remove the invalid timing constraint from the technology library or correctly identify it.

EXAMPLES

```
cell(dbvh11) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    timing() {
        timing_type : recovery_rising;
        intrinsic_rise : 1.17;
        intrinsic_fall : 0;
        related_pin : "D";
    }
}
ff("IQ", "IQN") {
    next_state : "D";
    clocked_on : "CP";
}
```

```

    pin(Q) {
direction : output;
function : "IQ";
    }
}

```

In this case, The clock input pin 'CP' has a timing constraint.

EXAMPLE MESSAGE

Warning: The 'CP' pin has an unsupported constraint related to 'D'.
The invalid timing arc is ignored. (DBVH-11)

DBVH-12 (warning) The '%s' cell has constraints with both rise and fall edges.

DESCRIPTION

The library cell has a timing constraint related to both the rising edge and the falling edge of the same related input.

The VHDL generator recognizes a pin to be related to only one edge of another pin. The activation edge of the related input can be either the rising edge or the falling edge, but not both.

The trigger edge is assumed to be the last one encountered. The previous rising or falling edge constraints are ignored. The generated VHDL code is commented to indicate the choice.

This warning pertains only to the full-timing structural, optimized gate-level, and VITAL models. The unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, correct the technology library to reflect a consistent activation timing edge. Make alltiming arcs for each related input consistently rising or consistently falling.

EXAMPLES

```

cell(dbvh12) {
    area : 5;
    pin(D) {
direction : input;
capacitance : 1;
timing() {
    timing_type : setup_rising;
    intrinsic_rise : 0.5;
    intrinsic_fall : 0.5;
}
}
}

```

```

    related_pin : "G";
}
timing() {
    timing_type : hold_falling;
    intrinsic_rise : 0.4;
    intrinsic_fall : 0.4;
    related_pin : "G";
}
    }
    pin(G) {
direction : input;
capacitance : 1;
    }
    pin(CD) {
direction : input;
capacitance : 1;
    }
    latch ("IQ","IQN") {
data_in : "D" ;
enable : "G" ;
clear : "CD'" ;
    }
    pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.07;
    intrinsic_fall : 0.94;
    rise_resistance : 0.1523;
    fall_resistance : 0.0718;
    related_pin : "G";
}
timing() {
    intrinsic_rise : 1.07;
    intrinsic_fall : 0.94;
    rise_resistance : 0.1523;
    fall_resistance : 0.0718;
    related_pin : "D";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_rise : 1.07;
    intrinsic_fall : 0.94;
    rise_resistance : 0.1523;
    fall_resistance : 0.0718;
    related_pin : "CD";
}
    }
}

```

In this example, the 'G' pin is related to the 'D' pin in two timing constraint groups: setup_rising and hold_falling.

EXAMPLE MESSAGE

Warning: The 'dbvh12' cell has constraints with both rise and fall edges. (DBVH-12)

DBVH-13 (error) Could not open '%s' file for writing.

DESCRIPTION

An error is encountered when the VHDL generator tried to open a file for writing. This problem might be caused by

1. Writing to a directory for which you do not have write permission
2. Writing to an existing file for which you do not have write permission
3. An output file name that specifies a non-existing path
4. The file system being full

As a result, the VHDL generator fails and exits.

WHAT NEXT

First, check the correctness of the file name and path name. If the file system is full, provide more disk space. If permission is denied, either change the access permission or target the output files elsewhere.

EXAMPLES

```
write_lib -format vhdl -output /etc/dbvh13.vhd dbvh13
```

In this example, you do not have permission to write to /etc directory.

EXAMPLE MESSAGE

Error: Could not open '/etc/dbvh13_components.vhd' file for writing. (DBVH-13)

DBVH-14 (warning) The '%s' pin in the '%s' cell is related to more than one output.

DESCRIPTION

The inout/output pin in the sequential library cell is related, timing-wise, to more than one output.

The condition is unusual and probably a mistake. Therefore, the VHDL generator flags it as a warning.

The VHDL generator tries to create the correct full-timing structural model with the

pin related to more than one output. The generator, however, creates a full-timing gatesim model, with the pin related to only one output, while ignoring all other outputs that are also related timing-wise to the pin.

This warning pertains only to full-timing structural, and full-timing gatesim models. Unit-delay structural models ignore timing, and the VITAL model does not support output-to-output delays.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, verify the questionable timing arcs.

EXAMPLES

```
cell(dbvh14) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }

    ff("IQ", "IQN") {
        next_state : "D";
        clocked_on : "CP";
    }
    pin(Q) {
        direction : output;
        function : "IQ";
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.00;
            intrinsic_fall : 1.00;
            rise_resistance : 0.1000;
            fall_resistance : 0.1000;
            related_pin : "CP";
        }
    }
    pin(Q2) {
        direction : output;
        function : "IQ";
        timing() {
            intrinsic_rise : 2.0;
            intrinsic_fall : 3.0;
            rise_resistance : 0.1458;
            fall_resistance : 0.0523;
            related_pin : "Q";
        }
    }
    pin(Q3) {
```

```

direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 2.0;
    intrinsic_fall : 3.0;
    rise_resistance : 0.1000;
    fall_resistance : 0.1000;
    related_pin : "Q Q2";
}
}
}

```

EXAMPLE MESSAGE

Warning: The 'Q3' pin in the 'dbvh14' cell is related to more than one output. (DBV H-14)

DBVH-15 (warning) The '%s' cell contains circular timing arcs.
The '%s' pin
is in one of the cycles.

DESCRIPTION

The pin in the library cell has circular timing arcs. A circular timing arc occurs when an inout/output pin is related to itself through other inout/output pins. A change in one pin belonging to a circular timing arc loops around and around.

Circular timing arcs do not make sense and are probably mistakes. Therefore, the VHDL generator flags them with warnings and tries to create the correct model.

This warning pertains only to full-timing structural, optimized gate-level, and VITAL models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, verify the questionable circular timing arcs.

EXAMPLES

```

cell(dbvh15) {
    area : 9;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(CP) {
direction : input;

```

```

capacitance : 1;
}

ff("IQ", "IQN") {
next_state : "D";
clocked_on : "CP";
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
}
pin(Q2) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q3";
}
}
pin(Q3) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q2";
}
}
}
}

```

EXAMPLE MESSAGE

Warning: The 'dbvh15' cell contains circular timing arcs. The 'Q2' pin
is in one of the cycles. (DBVH-15)

DBVH-16 (warning) The '%s' pin in the '%s' cell is related to an
output and

the '%s' input pin.

DESCRIPTION

An inout/output pin is related both to another output pin and a non-enabled input pin.

Having an output pin related to both another output pin and a non-enabled input pin can lead to problems in the generated simulation models.

For the optimized gate-level model, if a sequential output pin is related to another output pin, it must be either unrelated to all asynchronous clear/preset inputs or related to them all.

For the full-timing structural model, if a sequential output pin is related to another output, it cannot be related to any asynchronous clear/preset inputs.

The VITAL model does not support output-to-output timing arcs.

This warning pertains only to full-timing structural, optimized gate-level, and VITAL models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, verify that the generated simulation model is correct.

EXAMPLES

```
cell(dbvh16) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    pin(CD) {
        direction : input;
        capacitance : 2;
    }

    ff("IQ", "IQN") {
        next_state : "D";
        clocked_on : "CP";
        clear : "CD'";
    }

    pin(Q) {
        direction : output;
    }
}
```

```

function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.00;
    intrinsic_fall : 1.00;
    rise_resistance : 0.1000;
    fall_resistance : 0.1000;
    related_pin : "CP";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
pin(Q2) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 2.0;
    intrinsic_fall : 3.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
}
}

```

EXAMPLE MESSAGE

Warning: The 'Q2' pin in the 'dbvh16' cell is related to an output and the 'CD' input pin. (DBVH-16)

DBVH-17 (warning) The '%s' cell has two opposite output pins, '%s' and '%s', with the same '%s' value. The '%s' pin should not be related

to the opposite '%s' output.

DESCRIPTION

This is a sequential library cell with two or more outputs and both clear and preset functions defined. The current output is related to a functionally opposite output pin. In addition, the values of the **clear_preset_var1** and **clear_preset_var2** attributes are the same.

It is not possible for one output to be the opposite of another output and yet be forced to the same value.

The generated full-timing models override the **clear_preset_var1** and **clear_preset_var2** declarations and always maintain the output pins opposite of each other.

This warning pertains to unit-delay structural models, full-timing structural, optimized gate-level, and VITAL models.

WHAT NEXT

Change the value of `clear_preset_var1` or `clear_preset_var2`, or remove the output-to-output timing arc.

EXAMPLES

```
cell(dbvh17) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    pin(CD) {
        direction : input;
        capacitance : 2;
    }
    pin(SD) {
        direction : input;
        capacitance : 2;
    }
    ff("IQ", "IQN") {
        next_state : "D";
        clocked_on : "CP";
        clear : "CD'";
        preset : "SD'";
        clear_preset_var1 : L;
        clear_preset_var2 : L;
    }
}
```

```

    pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.00;
    intrinsic_fall : 1.00;
    rise_resistance : 0.1000;
    fall_resistance : 0.1000;
    related_pin : "CP";
}
timing() {
    timing_type : preset;
    timing_sense : negative_unate;
    intrinsic_rise : 0.1;
    rise_resistance : 0.1;
    related_pin : "SD";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
    }
pin(QN) {
direction : output;
function : "IQN";
timing() {
    intrinsic_rise : 2.0;
    intrinsic_fall : 3.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q";
}
}
}

```

EXAMPLE MESSAGE

Warning: The 'dbvh17' cell has two opposite output pins, 'Q' and 'QN', with the same 'L' value. The 'QN' pin should not be related to the opposite 'Q' output. (DBVH-17)

DBVH-18 (error) The '%s' pin is missing.

DESCRIPTION

The pin is part of a **function** string, but it is not defined in the library cell.

The VHDL generator cannot continue without a definition of the pin. All VHDL models fail.

This error is never displayed since the missing pin is caught during the **read_lib** command.

WHAT NEXT

Either define the missing pin, or remove it from the **function** string.

DBVH-19 (error) The '%s' cell has more than %d pins.

DESCRIPTION

The library cell has more than 127 pins.

The VHDL generator supports up to 127 pins.

All models fail.

WHAT NEXT

There is no simple workaround. Create the model by hand.

DBVH-20 (warning) The '%s' pin is unused in the '%s' cell.

DESCRIPTION

An input pin in the combinational library cell is not part of the function of any output.

If an input pin to a combinational library cell is unused, the VHDL generator leaves the input pin unconnected.

A correct VHDL model is created but, since there is no reason for an unused input, a warning is given.

WHAT NEXT

Verify that the unused pin is not a mistake.

EXAMPLES

```
cell(dbvh20) {  
    area : 9;
```

```

pin(D) {
    direction : input;
    capacitance : 1;
}
pin(CP) {
    direction : input;
    capacitance : 1;
    min_period : 3.0
}
}

```

EXAMPLE MESSAGE

Warning: The 'D' pin is unused in the 'dbvh20' cell. (DBVH-20)

DBVH-21 (warning) The '%s' time is a nonpositive setup or hold constraint.

DESCRIPTION

A setup or hold timing constraint is a negative or zero value.

The VHDL simulator does not support nonpositive setup or hold timing constraints.

The full-timing structural model gets zero timing constraints instead. The Optimized gate-level simulation model keeps the nonpositive constraint values, which are also ignored during simulation. The current VITAL simulation model does not support negative setup or hold constraints.

This warning pertains only to full-timing structural, optimized gate-level, and VITAL simulation models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, you can ignore this warning. Otherwise, edit the generated models to support setup and hold checkers.

EXAMPLES

```

cell(dbvh21) {
    area : 14;
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    pin(J) {
        direction : input;
        capacitance : 1;
        timing() {

```

```

        timing_type : hold_rising;
        intrinsic_rise : 0.0;
        intrinsic_fall : 0.0;
        related_pin : "CP";
    }
}
}

```

EXAMPLE MESSAGE

Warning: The 'thold_J_CP' time is a nonpositive setup or hold constraint. (DBVH-21)

DBVH-22 (error) The '%s' cell is overwriting the '%s' cell in the '%s' library.

DESCRIPTION

A library cell has the same VHDL name as another library cell.

Library cell names are case-sensitive in Library Compiler and case-insensitive in VHDL. Therefore, two unique names in Library Compiler can be identical in VHDL. For example, VDD and vdd are two different names in Library Compiler, but the same name in VHDL.

The VHDL generator overwrites previous library cells with the same VHDL library name. Only one unique VHDL named library cell is created per library.

WHAT NEXT

Give identical VHDL named library cells unique VHDL names.

DBVH-23 (warning) The minimum period attribute is allowed only on clock pins.

The '%s' port has a minimum period constraint and is not a clock.

The constraint is ignored.

DESCRIPTION

A minimum-period attribute is placed on a nonclock pin.

The VHDL generator recognizes minimum-period constraints only on clock pins. Thus, the illegal minimum-period constraint is ignored.

This warning pertains only to full-timing structural, full-timing gate-level, and VITAL simulation models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, either remove the minimum period constraint or make the pin a clock pin.

EXAMPLES

```
cell(dbvh23) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
        min_period : 3.0;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    ff(IQ, IQN) {
        next_state : "D";
        clocked_on : "CP";
    }
    pin(Q) {
        direction : output;
        function : "IQ";
        timing() {
            timing_type : falling_edge;
            intrinsic_rise : 4;
            intrinsic_fall : 2.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "CP";
        }
    }
}
```

EXAMPLE MESSAGE

Warning: The minimum period attribute is allowed only on clock pins.
The 'D' port has a minimum period constraint and is not a clock.
The constraint is ignored. (DBVH-23)

DBVH-24 (warning) The driver_type attribute on the '%s' pin is

ignored.

DESCRIPTION

This warning is given for any one of the following reasons:

- * A pull_up pin has a function of '0', or a pull_down pin has a function of '1'.
- * The output pin has no three_state attribute, the output is driven by input pins, and the output has a pull_up or pull_down **driver_type** attribute.

The invalid **driver_type** attribute is ignored.

WHAT NEXT

Correct the conflicting invalid **driver_type** either by removing it or by changing the output pin.

EXAMPLES

```
cell(dbvh24) {
    area : 2;
    pin(A) {
        direction : input;
        capacitance : 1.0;
    }
    pin(Z) {
        direction : output;
        function : "A";
        driver_type : pull_up;
        timing() {
            intrinsic_rise : 0.1;
            intrinsic_fall : 0.1;
            related_pin : "A";
        }
    }
}
```

The output pin 'Z' has no three_state attribute. It is driven by the input pin 'A' and has a pull_up **driver_type** attribute.

EXAMPLE MESSAGE

Warning: The driver_type attribute on the 'Z' pin is ignored. (DBVH-24)

DBVH-25 (error) Cannot read the '%s' file.

DESCRIPTION

The **vhdlmacro** library technology database **vhdlmacro.db** could not be found in the search path or could not be read. Both the unit-delay and the full-timing structural models require reading in the **vhdlmacro.db** file. The file defines the simulation primitives of the targeted simulator. This error message is specific to structural models, because no structural models can be created without **vhdlmacro.db** first being read in.

The optimized gate-level, and VITAL models do not require this file and ignore the error.

WHAT NEXT

If you are creating a structural library, place the **vhdlmacro.db** file in the search path and make it readable.

EXAMPLES

```
lc_shell> read_lib dbvh25.lib
lc_shell> search_path = {}
lc_shell> write_lib -format vhdl dbvh25
```

EXAMPLE MESSAGE

Error: Cannot read the 'vhdlmacro.db' file. (DBVH-25)

DBVH-26 (warning) Unknown '%s' architecture in vhndllib_architecture.

The unknown architecture is ignored.

DESCRIPTION

The architecture name identified in the **dc_shell** or **lc_shell** environment variable **vhndllib_architecture** is not recognized.

The following architecture names are recognized:

- * FTGS (optimized gate-level model)
- * VITAL (VITAL model)

Unrecognized architecture names are ignored. Recognized architecture names are processed.

WHAT NEXT

Use only the architecture names listed previously. For example,

```
vhdllib_architecture = {FTGS,VITAL}
```

EXAMPLES

```
lc_shell> vhdllib_architecture = "dbvh26_arch"
lc_shell> write_lib -format vhdl dbvh26
```

EXAMPLE MESSAGE

Warning: Unknown 'dbvh26_arch' architecture in vhdllib_architecture.
The unknown architecture is ignored. (DBVH-26)

DBVH-27 (error) The '%s' cell component is not in vhdlmacro library.

DESCRIPTION

The cell component could not be removed from the structural netlist of the library cell, and the translation failed.

A library cell that the VHDL generator expected it could create a structural model for could not be compiled. Therefore, even though **report_lib** lists the library cell as removable, it is not.

This error message is specific to the structural model. A black box is created for the structural models.

WHAT NEXT

Verify that the library cell is correctly specified in the technology library. If it is correct, then you cannot automatically generate the structural models.

EXAMPLE MESSAGE

```
Error: The 'dbvh27' cell component is not in vhdlmacro library. (DBVH-27)
```

DBVH-28 (warning) The 'U%d' component instance has open

pins.

DESCRIPTION

The component instance in the generated unit-delay or full-timing structural model has open (unconnected) output pins.

The structural netlist is not fully optimized. Open output pins means that the structural netlist has unused simulation primitives.

This warning message is specific to structural models.

WHAT NEXT

You can further hand-optimize the generated structural models to use fewer simulation primitives.

EXAMPLES

```
cell(dbvh28) {
area : 6.0;
pin(CLK) {
direction : input;
capacitance : 1.0;
}
pin(SET) {
direction : input;
capacitance : 3.0;
}
ff("IQ","IQN") {
next_state : "IQ'";
clocked_on : "CLK";
preset : "SET'";
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
timing_type : rising_edge;
intrinsic_rise : 0.1;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CLK";
}
timing() {
timing_type : preset;
timing_sense : negative_unate;
intrinsic_rise : 0.1;
rise_resistance : 0.1;
related_pin : "SET";
}
}
```

```

}
pin(QN) {
direction : output;
function : "IQN";
timing() {
timing_type : rising_edge;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "CLK";
}
timing() {
timing_type : clear;
timing_sense : positive_unate;
intrinsic_fall : 0.1;
fall_resistance : 0.1;
related_pin : "SET";
}
}
}
}

```

In this case, the generated full-timing structural model has 'open' associated with the 'Q' port in the U7 instance.

```
-- Netlist U7 : DFFSRL_00MAC port map( D => QN_net3_1, CLK => prop_QN(1), CLR => n1,
PRE => prop_QN( 0), Q => open, QN => QN_net3_1);
```

EXAMPLE MESSAGE

Warning: The 'U7' component instance has open pins. (DBVH-28)

**DBVH-29 (error) Cell cannot have both force_00 and force_11.
Try another force combination.**

DESCRIPTION

The sequential library cell has both a **force_00** and a **force_11** declared.

The translation algorithm cannot handle library cells with both of these declarations.

This warning message is specific to structural models.

WHAT NEXT

Declare instead either a pair of **force_10** and **force_01**, **force_10** and **force_11**, **force_00** and **force_01**, **force_00** and **force_10**, or **force_01** and **force_11**.

DBVH-30 (warning) Missing timing arc between '%s' and '%s' pins in the '%s' cell.

A timing arc is estimated.

DESCRIPTION

An output pin lacks a timing arc that is related to an input pin that is in the output pin's function.

Synthesis allows output pins in sequential library cells to lack timing arcs to asynchronous inputs. For example, clear-to-output for a flip-flop and data-to-output for a latch can be omitted. But for simulation, a timing arc is required for every output pin to every functionally-dependent input pin.

A full-timing structural model always makes a best guess for the missing timing arc and then continues.

This warning pertains only to full-timing structural, optimized gate-level, and VITAL structural models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, add the missing timing arc to the technology library.

DBVH-31 (warning) A pull-up or pull-down on the '%s' input pin is not visible outside the cell. Make the pin an inout pin.

DESCRIPTION

An input pin has a **driver_type** attribute of pull-up or pull-down.

If an output pin driving the input pin has a three_state attribute, the pull-up or pull-down pulls the input pin to a resistive high or low. The driving output pin should also be affected by the pull-up or pull-down and go to a resistive high or low. However, because the pull-up or pull-down is on an input pin, the driving output pin cannot see the effect of the pull-up or pull-down.

This warning is given, but the pull-up or pull-down is still placed on the input pin. It is not visible outside the library cell.

WHAT NEXT

If the pull-up or pull-down should be visible outside of the library cell, change

the pulled input pin to an inout pin.

DBVH-32 (warning) '%s' to '%s' %s input delay ranges %0.3f to %0.3f.

The maximum input delay %0.3f is chosen.

DESCRIPTION

For the full-timing structural model, the worst-case timing arc has to be selected for an input buffer. This warning message specifies the matching timing arc, the range of timing delays possible, and the input delay chosen.

The VHDL generator must fit the library cell's pin-to-pin timing onto the library cell's structural netlist by lumping delays onto input buffers and output pins. Whenever the fit does not match perfectly and an estimate is required, this warning is given to notify the user of the degree of error of the estimate.

WHAT NEXT

If the delay range is wide, you need to hand-modify the full-timing structural model.

EXAMPLES

```
cell(dbvh32) {
    area : 9;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(CP) {
direction : input;
capacitance : 1;
    }
    pin(CD) {
direction : input;
capacitance : 2;
    }
    ff("IQ", "IQN") {
next_state : "D";
clocked_on : "CP";
clear : "CD' ";
    }
    pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.00;
```

```

intrinsic_fall : 2.00;
rise_resistance : 0.1000;
fall_resistance : 0.1000;
related_pin : "CP";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_rise : 3.0;
    intrinsic_fall : 4.0;
    fall_resistance : 0.1;
    related_pin : "CD";
}
}
}
}

```

EXAMPLE MESSAGE

Warning: 'CP' to 'Q' rise/fall input delay ranges 1.000 to 2.000.
 The maximum input delay 2.000 is chosen. (DBVH-32)

DBVH-33 (warning) Could not lump all the timing related to the '%S' pin.

DESCRIPTION

For the full-timing structural model, the library cell's pin-to-pin delays could not be lumped onto the library cell's structural netlist.

There are many causes of this problem but it should rarely occur. Delays can be lumped only on the inputs or outputs, and not on internal nodes. In some cases, it is not possible to lump all the timing on the inputs or the outputs.

The full-timing structural model is generated, but the unlumped timing delays are ignored.

WHAT NEXT

For better accuracy, hand-modify the generated full-timing VHDL structural model. You can add missing lumped timing to the internal netlist.

EXAMPLES

```

cell(dbvh33) {
    area : 9;
    pin(D) {
direction : input;
capacitance : 1;
    }
}

```

```

    pin(CP) {
direction : input;
capacitance : 1;
}
pin(CD) {
direction : input;
capacitance : 2;
}
ff("IQ", "IQN") {
next_state : "D";
clocked_on : "CP";
clear : "CD'";
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
}
pin(Q2) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 2.0;
    intrinsic_fall : 3.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
}
}

```

In this case, since the output pin Q2 is related to the output pin Q, and the input pin CD and the output pin Q is related to CD, the Q2 and CD pin-to-pin delay could not be lumped.

EXAMPLE MESSAGE

Warning: Could not lump all the timing related to the 'CD' pin. (DBVH-33)

DBVH-34 (warning) Timing arcs related to the '%s' pin have inconsistent timing sense. The pin is chosen to be active %s in the recovery checker.

DESCRIPTION

The asynchronous input pin is specified to be both active-high and active-low. There are two recovery timing constraints related to the same input pin. In one, the input pin is active-high, and in another the input pin is active-low.

For full-timing structural models, the recovery asynchronous input must be consistently active-high or active-low.

The input pin is assumed to be active-high.

WHAT NEXT

Correct the recovery timing constraints in the technology library.

DBVH-35 (warning) The '%s' pin is related to an output and only some asynchronous inputs. All asynchronous inputs are ignored.

DESCRIPTION

An inout or output pin is related to another output pin and to some, but not all, of the asynchronous inputs.

Having an output pin related to another output pin and to only some of the asynchronous inputs can lead to problems in the generated simulation models.

For the full-timing structural model, if a sequential output pin is related to another output, it cannot be related to any asynchronous clear/preset inputs.

The VITAL model does not support output-to-output timing arcs. As a result, all of the related asynchronous inputs are ignored.

This warning pertains only to full-timing structural, and optimized gate-level

models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, verify that the generated simulation model is correct.

EXAMPLES

```
cell(dbvh35) {
    area : 9;
    pin(D) {
direction : input;
capacitance : 1;
timing() {
    timing_type : setup_rising;
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    related_pin : "CP";
}
timing() {
    timing_type : hold_rising;
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    related_pin : "CP";
}
    }
    pin(CP) {
direction : input;
capacitance : 1;
    }
    pin(CD) {
direction : input;
capacitance : 2;
    }
    pin(SD) {
direction : input;
capacitance : 2;
    }
    ff("IQ","IQN") {
next_state : "D";
clocked_on : "CP";
clear : "CD'";
preset : "SD'";
clear_preset_var1 : L;
clear_preset_var2 : L;
    }
    pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
}
}
```

```

    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
timing() {
    timing_type : preset;
    timing_sense : negative_unate;
    intrinsic_rise : 0.1;
    rise_resistance : 0.1;
    related_pin : "SD";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
pin(Q2) {
direction : output;
function : "IQ";
timing() {
    intrinsic_rise : 2.0;
    intrinsic_fall : 3.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Q";
}
timing() {
    timing_type : clear;
    timing_sense : positive_unate;
    intrinsic_fall : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
}
}
}

```

EXAMPLE MESSAGE

Warning: The 'Q2' pin is related to an output and only some asynchronous inputs. All asynchronous inputs are ignored. (DBVH-35)

DBVH-36 (warning) The '%s' pin is a clock, and bundled clocks

are not supported.

DESCRIPTION

The sequential library cell has a bundled clock declared in the **ff**, **latch**, **ff_bank**, or **latch_bank** groups.

For the optimized gate-level, and VITAL models, bundled clocks are unsupported. Instead, all the banked outputs share a single set of clocks. As a result, only the first member of the bundled clock is valid. The other members are ignored.

This warning pertains only to the optimized gate-level, and VITAL models. Structural models fully support bundled clocks.

WHAT NEXT

If you are generating structural models, ignore this warning. Otherwise, edit the VHDL model.

EXAMPLES

```
cell(dbvh36) {
    area : 16;
    bundle( D ) {
members( D_1 D_2 );
capacitance : 1.0;
direction : input;
    }
    pin( CLK ) {
capacitance : 1.0;
direction : input;
    }
    bundle( Q ) {
members( Q_1 Q_2 );
direction : output;
function : "IQ";
    }
    ff_bank( IQ, IQN, 2 ) {
next_state : "CLK";
clocked_on : "D";
    }
}
```

In this case, there is a mistake where D and CLK are switched in the ff_bank group.

EXAMPLE MESSAGE

Warning: The 'D' pin is a clock, and bundled clocks are not supported. (DBVH-36)

DBVH-37 (error) Unknown logic system '%s' in
vhllib_logic_system.

Use the logic system 'IEEE-1164'. Aborting the execution.

DESCRIPTION

This message indicates that the **dc_shell/lc_shell** environment variable **vhllib_logic_system** is currently set to the name of an invalid logic system. The default logic system, IEEE-1164 (IEEE standard none-logic-state) is the only logic system currently supported. An invalid logic system causes Library Compiler to quit.

This error message pertains to all architectures.

WHAT NEXT

Set the **dc_shell** or **lc_shell** environment variable **vhllib_logic_system** to **IEEE-1164**

DBVH-38 (error) The '%s' pin on the '%s' cell has a timing arc whose
related_pin '%s' is not functionally related.

DESCRIPTION

This error pertains to full-timing structural, optimized gate-level, and VITAL models. Unit-delay structural models ignore timing.

The pin on the library cell has one timing arc whose **related_pin** is not functionally related to the pin.

Simulation models require both timing and functional information to be defined between inputs and outputs.

The VHDL generator reports to the user that an error might have been made. Remove functionally unrelated timing arcs from the library description file.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, include only the timing arcs that are also functionally related to the output port in the technology library. Remove all functionally unrelated timing arcs.

EXAMPLES

```
cell(dbvh38) {
```

```

area : 3;
pin(A) {
direction : input;
capacitance : 2;
}
pin(Z) {
direction : output;
timing() {
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "A";
}
}
}

```

EXAMPLE MESSAGE

Error: The 'Z' pin on the 'dbvh38' cell has a timing arc whose related_pin 'A' is not functionally related. (DBVH-38)

DBVH-39 (error) The '%s' pin on the '%s' cell has duplicate delay paths from the '%s' related pin.

DESCRIPTION

This error message pertains to full-timing structural, optimized gate-level, and VITAL models. Unit-delay structural models ignore timing.

The pin on the library cell has more than one delay path of the same **timing_type** with the same related pins.

Simulation models are not generated if either of these situations occur: (1) If multiple delay paths of the same **timing_type** with the same related pins are specified. (2) If timing-arc redundancy occurs. For example, consider a cell with the timing arcs - A->X, X->Y, and A->Y. An error message is issued on pin Y even though pin Y does not have any duplicate timing arcs directly defined.

The VHDL generator warns that an error might have been made. Remove the unwanted delay path from the technology library.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, remove all duplicates from the technology library.

DBVH-40 (error) The '%s' pin on the '%s' cell has 5 or more parameters in the 'three_state' function.

DESCRIPTION

VHDL generator supports **three_state** functions with no more than four inputs parameters.

This error message pertains to only full-timing gatesim models, since this restriction is due to a limitation on the current sequential generic component (SEQGEN) for sequential cells.

WHAT NEXT

Change your library to meet the restriction of the input parameter number.

EXAMPLES

```
cell(dbvh40) {
    area : 3;
    pin(A) {
        direction : input;
        capacitance : 1;
    }
    pin(EN EN1 EN2) {
        direction : input;
        capacitance : 2;
    }
    pin(TN TN1 TN2) {
        direction : input;
        capacitance : 2;
    }
    pin(IO) {
        direction : inout;
        function : "A";
        three_state : "! (TN EN' TN1 EN1' TN2 EN2')";
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
        timing() {
            intrinsic_fall : 1.0;
            intrinsic_rise : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "EN EN1 EN2 TN TN1 TN2";
        }
    }
}
```

```

}
timing() {
    timing_type : three_state_disable;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "EN EN1 EN2 TN TN1 TN2";
}
}
}

```

EXAMPLE MESSAGE

Error: The 'IO' pin on the 'dbvh40' cell has 5 or more parameters
in the 'three_state' function. (DBVH-40)

**DBVH-41 (error) The '%s' function on the '%s' sequential cell
has
more than 5 parameters.**

DESCRIPTION

Due to limitations on the current sequential generic component (SEQGEN) for sequential cells, the FTGS generator does not support sequential cells with more than five synchronous/asynchronous inputs.

This error message pertains only to full-timing gatesim models.

WHAT NEXT

Change your library to meet the restriction of the input parameter number.

EXAMPLES

```

latch (IQ, IQN) {
clear : "CLR' + (GN' * CLR * D' * D1 * D2 * D3)" ;
preset : "GN' * CLR * D * D1 * D2 * D3" ;
clear_preset_var1 : L;
clear_preset_var2 : H;
}

```

In this case, 'clear' has 6 input parameters in the string.

EXAMPLE MESSAGE

Error: The 'clear' function on the 'dbvh41' sequential cell has

more than 5 parameters. (DBVH-41)

DBVH-42 (error) The functionally unrelated output timing arc is defined in the '%s' pin group with the '%s' related pin on the '%s' cell.

DESCRIPTION

If a OUTPUT1-to-OUTPUT2 timing arc is defined, OUTPUT2 must be a function of OUTPUT1 and perhaps other input parameters. For example,

```
if      OUTPUT1 = A + B  
OUTPUT2 = A' * B' * C'  
then    OUTPUT2 = (OUTPUT1)' * C'
```

An error message is issued if OUTPUT2 is not a function of OUTPUT1. For example,

```
OUTPUT1 = A + B  
OUTPUT2 = A * B
```

WHAT NEXT

Correct the error in OUTPUT2 function or OUTPUT1 function.

EXAMPLES

```
cell(dbvh42) {  
    area : 2;  
pin(A B ) {  
direction : input;  
capacitance : 1;  
}  
  
    pin(Z) {  
direction : output;  
function : "A + B";  
timing() {  
    intrinsic_rise : 0.1;  
    intrinsic_fall : 0.1;  
    rise_resistance : 0.1;  
    fall_resistance : 0.1;  
    related_pin : "A B";  
}  
}  
pin(W) {
```

```

direction : output;
function : "A B";
timing() {
    timing_sense : positive_unate;
    intrinsic_rise : 0.1;
    intrinsic_fall : 0.1;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "Z ";
}
}
}

```

EXAMPLE MESSAGE

Error: The functionally unrelated output timing arc is defined in the 'W' pin group with the 'Z' related pin on the 'dbvh42' cell. (DBVH-42)

DBVH-43 (error) An obsolete 'state' group is found in the '%s' sequential cell.

Use the 'ff' group or 'latch' group instead.

DESCRIPTION

The **state** group is not supported after v3.0. Instead, the sequential function is now described in the **ff** or **latch** group.

VITAL architecture supports only **ff** and **latch** groups. It does not support the **state** group.

This message is issued when the **liban** Library Analyzer reads in .db files generated by Library Compiler 3.3a or an earlier version.

WHAT NEXT

If you have access to the technology library source file change the **state** group to the **ff** or **latch** group. Otherwise, contact the vendor and inform them about the problem.

EXAMPLE MESSAGE

Error: An obsolete 'state' group is found in the 'dbvh43' sequential cell.
Use the 'ff' group or 'latch' group instead. (DBVH-43)

DBVH-44 (error) The '%s' master-slave cell is currently not

supported.

DESCRIPTION

This message is issued when the **liban** Library Analyzer reads a db file that was generated by Library Compiler v3.3a or an earlier version.

VITAL architecture supports only **ff** and **latch** groups. It does not support the **state** group.

WHAT NEXT

Generate a db file using a version later than 3.3a of Library Compiler.

EXAMPLE MESSAGE

Error: The 'dbvh44' master-slave cell is currently not supported. (DBVH-44)

DBVH-45 (error) Neither the 'next_state' nor 'data_in' function is defined in the '%s' cell.

DESCRIPTION

A sequential cell has to define either the **next_state** function or the **data_in** function when the **clocked_on** function or the **enable** have been specified. Only in cases where the **next_state** function is missing when **clocked_on** has been specified, or when **data_in** is missing when **enable** has been specified can this error message occur.

WHAT NEXT

If this error occurs, correct the technology library by adding the appropriate **next_state** function or **data_in** function. Also, when this construct is missing, Library Compiler does not compile a library. Contact Synopsys Support Center to indicate a problem with Library Compiler.

DBVH-46 (error) Neither the 'clocked_on' nor 'enable' function is defined in the '%s' cell.

DESCRIPTION

A sequential cell has to define either the **clocked_on** function or the **enable**

function when the **next_state** function or the **data_in** have been specified. Only in cases where the **clocked_on** function is missing when **next_state** has been specified, or when **enable** is missing when **data_in** has been specified can this error message occur.

WHAT NEXT

If this error occurs, correct the technology library by adding the appropriate **clocked_on** function or **enable** function. Also, when this construct is missing, Library Compiler does not compile a library. Contact Synopsys Support Center to indicate a problem with Library Compiler.

DBVH-47 (warning) The '%s' input pin active edge is unknown in the '%s' sequential cell.

DESCRIPTION

A clock or enable pin needs to be **unate** in **clock** or **enable** function to have a consistently active edge level. Library Compiler requires **clock** or **enable** functions to be unate to perform pulse width and minimum period constraint checking. An example of non-unate **enable** function is

```
enable : "EN1 ^ EN2";
```

A warning message is given if a non-unate **enable** function is detected, and FTGS model assumes positive active edge in pulse width and minimum period constraint checking.

Sometimes the **enable** function of a latch cell is implicitly expressed in **clear** and **preset** functions. In such a case, **timing_type** of all timing arcs related to the input pin is used to determine the active edge of the enable pin. If the active edges implied in **timing_type** are inconsistent Library Compiler issues a warning when reading in the library - LIBG-40. The FTGS generator assumes a positive active edge.

This error can also occur when minimum period or minimum pulse width constraints have been specified for nonclock pins.

WHAT NEXT

Change the technology library by either specifying consistent edges or removing the constraints specified for non_clock pins.

EXAMPLES

```

cell(dbvh47) {
    area : 2.1 ;
    pin(CLK) {
        direction : input;
        capacitance : 0.1;
        clock : true ;
    }
    pin(D) {
        direction : input;
        capacitance : 0.1;
    }
    pin(SET) {
        direction : input;
        capacitance : 0.1;
    }
    pin(CLEAR) {
        direction : input;
        capacitance : 0.1 ;
        min_pulse_width_low : 1.0;
    }
    ff(IQ,IQN) {
        clocked_on : "CLK" ;
        next_state : "D" ;
        clear : "SET" ;
        preset : "!CLEAR" ;
        clear_preset_var1 : "L" ;
        clear_preset_var2 : "H" ;
    }
    pin(Q1) {
        direction : output;
        function : "IQ" ;
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "Q2";
        }
    }
    pin(Q2) {
        direction : output;
        function : "IQN" ;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "CLK";
        }
        timing() {
            timing_type : preset;
            timing_sense : positive_unate;
        }
    }
}

```

```

        intrinsic_rise : 1.0;
        rise_resistance : 1.0;
        related_pin : "SET";
    }
    timing() {
        timing_type : clear;
        timing_sense : positive_unate;
        intrinsic_fall : 1.0;
        fall_resistance : 1.0;
        related_pin : "CLEAR";
    }
}
}

```

In this case, the 'CLEAR' pin has a pulse width constraint attribute.

EXAMPLE MESSAGE

Warning: The 'CLEAR' input pin active edge is unknown in
the 'dbvh47' sequential cell. (DBVH-47)

DBVH-48 (warning) Unknown pulse handling algorithm '%s' in
the
vhdllib_pulse_handle. Use the default value
"use_vhdllibrary_glitch_handle".

DESCRIPTION

The pulse-handling algorithm defined in the **dc_shell** environment variable **vhdllibrary_pulse_handle** is not recognized.

The following pulse-handling algorithms are recognized:

use_vhdllibrary_glitch_handle (use **vhdllibrary_glitch_handle** variable value)
inertial (use inertial algorithm)
glitch (use glitch algorithm)
spike (use spike algorithm)

Unrecognized pulse-handling name is ignored, and the default value is used instead.

WHAT NEXT

Check the value of the **vhdllibrary_pulse_handle** variable, and make the necessary change.

EXAMPLES

```
dc_shell> vhdlLib_pulse_handle = "use_wrong_handle"
```

EXAMPLE MESSAGE

Warning: Unknown pulse handling algorithm 'use_wrong_handle' in the vhdlLib_pulse_handle. Use the default value "use_vhdlLib_glitch_handle". (DBVH-48)

DBVH-49 (warning) Unable to properly associate timing with the '%s' function.

All related timing arcs defined in the '%s' output pin group of the '%s' cell are ignored.

DESCRIPTION

This is a sequential library cell with two or more outputs. The current output has a timing arc related to another output and one or more timing arcs related to asynchronous inputs (clear or preset).

If the current output has a timing arc related to an asynchronous clear pin, it must define timing arcs related to all clear pins. If at least one of the timing arcs required is not defined, all other timing arcs related to asynchronous clear pins are ignored and a warning message is issued.

If the current output has a timing arc related to an asynchronous preset pin, it must define timing arcs related to all preset pins. If at least one of the timing arcs required is not defined, all other timing arcs related to asynchronous preset pins are ignored and a warning message is issued.

This warning pertains only to the FTGS model.

WHAT NEXT

If you are not generating an FTGS model, ignore the warning. Otherwise, either remove the asynchronous timing arcs from the output pin group or insert missing asynchronous timing arcs to the output pin group.

DBVH-50 (warning) The 'clear_preset_var1'/'clear_preset_var2' value is incompatible with the asynchronous timing arcs in the '%s' output pin group of the '%s' cell.

One or more asynchronous timing arcs are ignored.

DESCRIPTION

This is a sequential library cell with two or more outputs and both **clear** and **preset** functions defined. The current output has a timing arc related to another output and one or more timing arcs related to asynchronous inputs (clear or preset).

If the current output has timing arcs related to asynchronous clear pins only, its corresponding **clear_preset_var** (**clear_preset_var1** for non-inverting output and **clear_preset_var2** for inverting output) must be "L". Otherwise, this warning message is issued and all asynchronous timings are ignored.

If the current output has timing arcs related to asynchronous preset pins only, its corresponding **clear_preset_var** (**clear_preset_var1** for non-inverting output, and **clear_preset_var2** for inverting output) must be "H". Otherwise, this warning message is issued and all asynchronous timings are ignored.

If the current output has timing arcs related to both asynchronous clear and preset pins, both **clear_preset_var1** and **clear_preset_var2** must be "H" or "L". Otherwise, this warning message is issued and all asynchronous timings are ignored.

This warning pertains only to FTGS models.

WHAT NEXT

Ignore this warning if you are not generating an FTGS model. Otherwise, correct the asynchronous timings defined in the current output pin group, or change **clear_preset_var1** or **clear_preset_var2** attribute values.

DBVH-51 (error) The '%s' output pin on the '%s' sequential cell with an output timing arc has 5 or more asynchronous timing arcs. Currently, this is not supported.

DESCRIPTION

The output pin of this sequential cell has an output timing arc and asynchronous timing arcs. The full-timing **gatesim** model supports, with output timing arc, only one to four asynchronous timing arcs on an output pin.

This error message pertains only to optimized gate-level simulation models.

WHAT NEXT

This model cannot be generated automatically. It has to be generated manually.

EXAMPLES

```
cell(dbvh51) {
    area : 2.1 ;
    pin(CLK) {
        direction : input;
        capacitance : 0.1;
        clock : true ;
    }
    pin(D) {
        direction : input;
        capacitance : 0.1;
    }
    pin(SD SD1 SD2 SD3 SD4) {
        direction : input;
        capacitance : 0.1;
    }
    pin(CD) {
        direction : input;
        capacitance : 0.1 ;
    }
    ff(IQ,IQN) {
        clocked_on : "CLK" ;
        next_state : "D" ;
        clear : "SD SD1 SD2 SD3 SD4" ;
        preset : "!CD" ;
        clear_preset_var1 : "L" ;
        clear_preset_var2 : "H" ;
    }
    pin(Q1) {
        direction : output;
        function : "IQ" ;
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "Q2";
        }
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "CLK";
        }
        timing() {
            timing_type : preset;
            timing_sense : positive_unate;
            intrinsic_rise : 1.0;
        }
    }
}
```

```

        rise_resistance : 1.0;
        related_pin : "SD SD1 SD2 SD3 SD4";
    }
    timing() {
        timing_type : clear;
        timing_sense : positive_unate;
        intrinsic_fall : 1.0;
        fall_resistance : 1.0;
        related_pin : "CD";
    }

}

pin(Q2) {
    direction : output;
    function : "IQN" ;
    timing() {
        timing_type : rising_edge;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        rise_resistance : 1.0;
        fall_resistance : 1.0;
        related_pin : "CLK";
    }
    timing() {
        timing_type : preset;
        timing_sense : positive_unate;
        intrinsic_rise : 1.0;
        rise_resistance : 1.0;
        related_pin : "SD SD1 SD2 SD3 SD4";
    }
    timing() {
        timing_type : clear;
        timing_sense : positive_unate;
        intrinsic_fall : 1.0;
        fall_resistance : 1.0;
        related_pin : "CD";
    }
}
}

```

EXAMPLE MESSAGE

Error: The 'Q1' output pin on the 'dbvh51' sequential cell with an output timing arc has 5 or more asynchronous timing arcs.
Currently, this is not supported. (DBVH-51)

DBVH-52 (error) Incomplete functional and/or timing information is

specified for the '%s' cell. The cell is a black box.

DESCRIPTION

The cell becomes a black box in either of these situations: (1) The pin on the library cell is missing a **function** attribute. (2) The pin is not a pull-up or pull-down pin and has no related timing arcs. or (3) The pin has no three_state attribute and has no related timing arcs.

As a result, the FTGS model generation fails.

This message pertains only to optimized gate-level models.

WHAT NEXT

If the output pin is not at a constant logic state, define a **function** attribute for the pin in the technology library.

EXAMPLES

```
cell(dbvh52) {  
    area : 0;  
    pin (D) {  
        direction : input;  
    }  
    pin (Q) {  
        direction : output;  
    }  
}
```

EXAMPLE MESSAGE

Error: Incomplete functional and/or timing information is specified for the 'dbvh52' cell. The cell is a black box. (DBVH-52)

DBVH-53 (warning) The '%s' pin on the '%s' cell has duplicate '%s' timing arcs from the same related_pin. Only one of them is used.

DESCRIPTION

The pin on the library cell has more than one timing arc of the same **timing_type** and **timing_sense** with the same related pins. One of the timing arcs is of the state dependent type.

Simulation models are not generated if either of these situations occur: (1) If

multiple delay paths of the same **timing_type** with the same related pins are specified. (2) If timing-arc redundancy occurs. For example, consider a cell with the timing arcs - A->X, X->Y, and A-> Y. An error message is issued on pin Y even though pin Y has no duplicate timing arcs directly defined.

The VHDL generator warns the user that an error might have been made. Only the first unique timing arc is accepted; all the following timing arcs are ignored.

This warning pertains only to full-timing gatesim models.

WHAT NEXT

Include in the technology library only the timing arc that belongs in the simulation model. Remove all duplicates if possible.

EXAMPLES

```
cell(dbvh53) {
    area : 2;
    pin(A) {
direction : input;
capacitance : 1;
    }
    pin(B) {
direction : input;
capacitance : 1;
    }
    pin(Z) {
direction : output;
function : "A^B";
timing() {
when : "B'";
sdf_cond : "!B";
timing_sense : positive_unate;
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "A";
}
timing() {
timing_sense : non_unate;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "A";
}
timing() {
timing_sense : non_unate;
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
```

```
    related_pin : "A";
}
}
}
```

EXAMPLE MESSAGE

Warning: The 'Z' pin on the 'dbvh53' cell has duplicate 'non_unate' timing arcs from the same related_pin. Only one of them is used. (DBVH-53)

DBVH-55 (warning) The inertial algorithm is chosen as the pulse handling algorithm for FTGS models.

DESCRIPTION

The inertial algorithm is chosen as the pulse-handling algorithm because both **Timing_mesg** and **Timing_xgen** are set to false.

This warning pertains only to optimized gate-level simulation models.

WHAT NEXT

If you want to use either the glitch or spike algorithm for hazard detection, set **Timing_mesg** or **Timing_xgen** to true.

EXAMPLES

```
dc_shell> vhdllib_timing_mesg = "false"
dc_shell> vhdllib_timing_xgen = "false"
```

EXAMPLE MESSAGE

Warning: The inertial algorithm is chosen as the pulse handling algorithm for FTGS models. (DBVH-55)

DBVH-57 (error) The '%s' cell component is not in the testsimmacro library.

DESCRIPTION

The cell component could not be removed from the structural netlist of the library cell, and the translation failed.

A library cell that the VHDL generator expected, it could create a structural model for could not be compiled. Therefore, even though **report_lib** lists the library cell as removable, it is not.

This error message is specific to the fault simulation structural model. A black box is created for the fault simulation structural models.

WHAT NEXT

Verify that the library cell is correctly specified in the technology library. If it is correct, you cannot automatically generate the fault simulation structural models.

EXAMPLE MESSAGE

Error: The 'dbvh57' cell component is not in the testsimmacro library. (DBVH-57)

DBVH-58 (error) Unable to find a nonscan equivalent cell in the current library.

DESCRIPTION

The library cell is a black box. Its normal nontest behavior is not matched by any cell in the current library.

This error message is specific to the fault-simulation structural model. A blackbox is created for the fault-simulation structural models.

WHAT NEXT

Verify that the library cell is correctly specified in the technology library. Check if a nonscan equivalent cell should be defined in the same library. If it is correct, you cannot automatically generate the fault simulation structural models.

EXAMPLES

```
cell(dbvh58) {
    area : 10;
    pin(D C SI SE) {
direction : input;
capacitance : 1;
    }
    pin(Q SO) {
direction : output;
    }
    test_cell()
pin(D C) {
    direction : input;
```

```

}
pin(SI) {
  direction : input;
  signal_type : "test_scan_in";
}
pin(SE) {
  direction : input;
  capacitance : 1;
  signal_type : "test_scan_enable";
}
state ("IQ", "IQN") {
  force_01 : "C D'";
  force_10 : "C D";
}
pin(Q) {
  direction : output;
  function : "IQ";
}
pin(SO) {
  direction : output;
  signal_type : "test_scan_out";
}
}
}
}

```

EXAMPLE MESSAGE

Error: Unable to find a nonscan equivalent cell in the current library. (DBVH-58)

DBVH-59 (warning) A minimum pulse-width constraint on '%s' is only allowed on clock and asynchronous clear/preset pins. The constraint is ignored.

DESCRIPTION

A minimum pulse-width attribute is placed on a data pin.

The VHDL generator allows only minimum pulse-width constraints on clock pins and asynchronous clear/preset pins.

As a result, the illegal minimum pulse-width constraint is ignored.

This warning pertains to full-timing structural, optimized gate-level, and VITAL simulation models. Unit-delay structural models ignore timing.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, either remove the minimum pulse-width constraint or make the pin a clock pin.

EXAMPLES

```
cell(dbvh59) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
        min_pulse_width_high : 1.5;
        min_pulse_width_low : 1.6;
    }
    pin(CP) {
        direction : input;
        capacitance : 1;
    }
    pin(CD) {
        direction : input;
        capacitance : 2;
    }
    ff("IQ", "IQN") {
        next_state : "D";
        clocked_on : "CP";
        clear : "CD'";
    }
}
```

EXAMPLE MESSAGE

Warning: A minimum pulse-width constraint on 'D' is only allowed on
clock and asynchronous clear/preset pins. The constraint is ignored. (DBVH-
59)

DBVH-60 (warning) Using the nonscan equivalent cell, the fault simulation structural model will model the nonscan behavior only.

DESCRIPTION

The library cell is a black box. Only its normal nontest behavior is being used to build the fault-simulation structural model.

This error message is specific to the fault-simulation structural model when executing the **write_testsim_lib** command with the **-depends** flag.

WHAT NEXT

Fault simulation of circuits using these library cells should be performed on functional vectors and parallel load scan vectors only. Fault simulation cannot correctly simulate vectors that exercise the scan path.

EXAMPLES

```
cell(dbvh60) {
    area : 12;
    pin_opposite("Q", "XQ");
    pin(D) {
        direction : input;
        capacitance : 1;
    }
    pin(A,B, CK, IH) {
        direction : input;
        capacitance : 2;
        clock : true;
    }
    pin(SI) {
        direction : input;
        capacitance : 1;
    }

}
pin(XQ){
    direction : output;
    function : "IQN";
    signal_type : "test_scan_out_inverted";
}
        }
    }
}

```

EXAMPLE MESSAGE

Warning: Using non-scan equivalent cell. The fault simulation structural model will model the non-scan behavior only. (DBVH-60)

DBVH-61 (error) MVL7 is not an acceptable logic system in the VITAL architecture, so VITAL architecture is not generated.

DESCRIPTION

The VITAL architecture allows only the IEEE-1164 logic system. If the **vhdl1lib_architecture** variable has "VITAL" and **vhdl1lib_logic_system** is set to "mvl7", Library Compiler ignores the VITAL architecture and generates FTGS as defined in the **vhdl1lib_architecture** variable.

This error message is specific to the VITAL simulation model.

WHAT NEXT

To generate VITAL architecture, set **vhdl1lib_logic_system = "IEEE-1164"**.

DBVH-62 (warning) The '%s' output pin has an output-related timing arc from the '%s' output. All timing arcs of the '%s' pin are ignored.

DESCRIPTION

The VITAL architecture does not support output-to-output delay. If a 'Q1' output pin has a timing arc related to another output, Library Compiler ignores this arc, and 'Q1' is left unconnected.

The model results in incorrect simulation.

This error message is specific to VITAL simulation models.

WHAT NEXT

Remove the output-to-output timing arcs in the technology library, and regenerate VHDL libraries.

EXAMPLES

```
cell(dbvh62) {
    area : 2.1 ;
    pin(CLK) {
        direction : input;
        capacitance : 0.1;
        clock : true ;
    }
    pin(D) {
        direction : input;
        capacitance : 0.1;
    }
    pin(SET) {
        direction : input;
        capacitance : 0.1;
    }
    pin(CLEAR) {
        direction : input;
        capacitance : 0.1 ;
    }
    ff(IQ,IQN) {
        clocked_on : "CLK" ;
        next_state : "D" ;
        clear : "SET" ;
        preset : "!CLEAR" ;
        clear_preset_var1 : "L" ;
        clear_preset_var2 : "H" ;
    }
    pin(Q1) {
        direction : output;
        function : "IQ" ;
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "Q2";
        }
    }
    pin(Q2) {
        direction : output;
        function : "IQN" ;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "CLK";
        }
    }
}
```

```

        timing() {
            timing_type : preset;
            timing_sense : positive_unate;
            intrinsic_rise : 1.0;
            rise_resistance : 1.0;
            related_pin : "SET";
        }
        timing() {
            timing_type : clear;
            timing_sense : positive_unate;
            intrinsic_fall : 1.0;
            fall_resistance : 1.0;
            related_pin : "CLEAR";
        }
    }
}

```

EXAMPLE MESSAGE

Warning: The 'Q1' output pin has an output-related timing arc from the 'Q2' output . All timing arcs of the 'Q1' pin are ignored. (DBVH-62)

DBVH-63 (warning) The '%s' output pin has undefined value if both clear and preset are active. Force the output value to X.

DESCRIPTION

There is an error in the library cell function description. The **clear_preset_var1** or **clear_preset_var2** attribute is missing from the **ff** or **latch** group description. As a result, if both clear and preset pins are active, VITAL model generator cannot determine the output behavior. VITAL generator assigns X value to the output.

The model results in incorrect simulation.

This error message is specific to VITAL simulation models.

WHAT NEXT

Check the cell description in the technology library, and fix the error.

DBVH-64 (error) Cannot write the library to the '%s' file.

DESCRIPTION

An attempt to write out a testsim library (**db**) file with **write_testsim_lib** failed. The common causes of this failure are no write permission with the target directory; or not enough disk space for the file.

As a result, the TESTSIM model generator exits abnormally.

WHAT NEXT

Check disk space and permissions of the target directory. Make sure you have enough disk space, and write permission before using **write_testsim_lib**.

DBVH-65 (error) Design compiler does not recognize the cell's function.

DESCRIPTION

Design Compiler does not recognize the following cell's functions: (1) Xilinx CLBs; (2) Xilinx IOBs; (3) complex UNIGEN function with internal pins and functions.

Therefore, the VHDL generator creates an empty cell for both the unit-delay and full-timing structural models.

WHAT NEXT

Verify that the library cell is correctly defined in the technology library. If it is correct, you cannot automatically generate the structural models.

EXAMPLE MESSAGE

Error: Design compiler does not recognize the cell's function. (DBVH-65)

DBVH-66 (error) The vhllib_logic_system is set to the obsolete 'MVL7' logic system.

Use the 'IEEE-1164' logic system. Quitting execution.

DESCRIPTION

This message indicates that the **dc_shell/lc_shell** environment variable

vhdl1lib_logic_system is currently set to **mv17**, which is obsolete. The default logic system, IEEE-1164 (IEEE standard none-logic-state), is the only one currently supported. A value of **mv17** causes Library Compiler to quit.

This error message pertains to all architectures.

WHAT NEXT

Set the **dc_shell** environment variable **vhdl1lib_logic_system** to **IEEE-1164**. ~

EXAMPLES

```
lc_shell> vhdl1lib_logic_system = MVL7
```

EXAMPLE MESSAGE

```
Error: The vhdl1lib_logic_system is set to the obsolete 'MVL7' logic system.  
      Use the 'IEEE-1164' logic system. Quitting execution.(DBVH-66)
```

DBVH-67 (warning) The internal timing arc between the '%s' and '%s' pins is ignored.

DESCRIPTION

The VHDL generator in Library Compiler only supports the pin-to-pin delay model. All timing arcs related to internal pins are ignored. The generated models have incorrect timing behavior and possibly incorrect logic behavior during simulation.

This warning pertains to full-timing structural, optimized gate-level (FTGS), and VITAL models.

WHAT NEXT

If you are generating unit-delay structural models, ignore this warning. Otherwise, modify the technology library to define only pin-to-pin timing arcs.

EXAMPLES

```
cell(dbvh67) {  
    area : 10;  
    pin(D) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(CP) {  
        direction : input;  
        capacitance : 1;  
    }  
}
```

```

statetable ( "D CP", "Q QB") {
table : "L/H R  : - - : L/H H/L,
          -   ~R : - - : N   N";
}

pin(Q1) {
direction : internal;
internal_node : "Q";
timing() {
  timing_type : rising_edge;
  intrinsic_rise : 1.0;
  intrinsic_fall : 1.0;
  rise_resistance : 0.1;
  fall_resistance : 0.1;
  related_pin : "CP";
}
}

pin(Q) {
direction : output;
state_function : "Q1";
}
}

```

EXAMPLE MESSAGE

Warning: The internal timing arc between the 'CP' and 'Q1' pins is ignored. (DBVH-67)

DBVH-68 (error) The '%s' output pin has more than 16 pins in the function.

DESCRIPTION

The VITAL generator in Library Compiler only supports sequential output port with up to 16 input pins in its function. Output functions with large numbers of input ports yield huge truth tables in the generated VITAL models and simulation performance suffers as a result.

This error message pertains only to VITAL models.

WHAT NEXT

If you are not generating VITAL models, ignore this warning. Otherwise, modify the technology library to define output functions using no more than 16 pins. Internal pins can be used to break a large table into several smaller tables.

EXAMPLES

```
cell(dbvh68) {
    area : 10;
    pin(D D1 D2 D3 D4 D5 D6 D7 D8 D9 D10 D11 D12 D13 D14 D15 D16) {
direction : input;
capacitance : 1;
    }
    pin(CP) {
direction : input;
capacitance : 1;
    }

    statetable ("D D1 D2 D3 D4 D5 D6 D7 D8 D9 D10 D11 D12 D13 D14 D15 D16 CP", "Q QB
") {
        table : "L/H - H - L - H - L - H - L - R : - - : L/H H/L,\n
L/H L - L - H - L - H - L - H - L - R : - - : L/H H/L,\n
- - - - - - - - - - - - - - - - - - - - - ~R : - - : N N";
    }

    pin(Q) {
direction : output;
internal_node : "Q";
inverted_output : TRUE;
    }
}
```

EXAMPLE MESSAGE

Error: The 'Q' output pin has more than 16 pins in the function. (DBVH-68)

DBVH-69 (error) The state table function fails to transform into an FTGS netlist.

DESCRIPTION

The FTGS generator cannot successfully map the state table description into an FTGS netlist. This cell becomes a black box.

This error message pertains only to FTGS models.

WHAT NEXT

If you are not generating FTGS models, ignore this warning. Otherwise, verify the technology library to define output functions.

EXAMPLES

```
cell(dbvh69) {
    area : 13;
    pin(D) {
direction : input;
capacitance : 1;
    }
    pin(C) {
direction : input;
capacitance : 2;
    }
    pin(SDI) {
direction : input;
capacitance : 1;
    }
    pin(SE) {
direction : input;
capacitance : 2;
    }
    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C";
}
    }
    pin(SDO) {
direction : output;
timing() {
    timing_type : falling_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C";
}
    }
}

test_cell() {
pin(D) {
    direction : input;
}
pin(C) {
    direction : input;
}
pin(SDI) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(SE) {
```

```

direction : input;
capacitance : 2;
signal_type : "test_scan_enable";
}
state ("IQ","IQN") {
  force_01 : "C D'";
  force_10 : "C D";
}
pin(Q) {
  direction : output;
  function : "IQ";
}
pin(SDO) {
  direction : output;
  signal_type : "test_scan_out";
}
}
}
}

```

EXAMPLE MESSAGE

Error: The state table function fails to transform into an FTGS netlist. (DBVH-69)

DBVH-70 (error) Test cell related pin '%s' has unknown unateness.

DESCRIPTION

A test_scan_in or test_scan_enable pin must have known unateness, or the cell becomes a black box.

This error message pertains only to FTGS models.

WHAT NEXT

Verify the technology library.

DBVH-71 (error) Cannot handle multiple clocks in a single state.

DESCRIPTION

Sequential cells with more than one clock in a single state, such as a cell with a system clock and a test scan clock, cannot be transformed into FTGS models successfully. A black box cell is generated.

This error message pertains only to FTGS models.

WHAT NEXT

Verify the technology library.

EXAMPLES

```
cell(FFCS) {
    area : 13;
    pin(D D2) {
direction : input;
capacitance : 1;
    }
    pin(C C2) {
direction : input;
capacitance : 2;
    }
    pin(Q) {
direction : output;
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "C C2";
}
    }
    test_cell() {
pin(D) {
    direction : input;
}
pin(C) {
    direction : input;
}
pin(D2) {
    direction : input;
    signal_type : "test_scan_in";
}
pin(C2) {
    direction : input;
    signal_type : "test_scan_clock";
}
state ("IQ","IQN") {
    next_state : "D";
    clocked_on : "C";
}
pin(Q) {
    direction : output;
    function : "IQ";
    signal_type : "test_scan_out";
}
    }
}
```

In this case, there are two clocks, 'C' and 'C2' defined by the test_scan_clock

type.

EXAMPLE MESSAGE

Error: Cannot handle multiple clocks in a single state. (DBVH-71)

DBVH-72 (error) Error in the library db file.

DESCRIPTION

An error in the library db file is detected. A black box cell is generated.

This error pertains only to FTGS models.

WHAT NEXT

Verify the technology library. It might be a Library Compiler problem.

EXAMPLES

```
cell(dbvh72) {
    area : 10;
    pin(force11) {
direction : input;
capacitance : 1;
    }
    pin(force10) {
direction : input;
capacitance : 1;
    }
    pin(force01) {
direction : input;
capacitance : 1;
    }
    pin(force00) {
direction : input;
capacitance : 2;
    }
    pin(ck) {
direction : input;
capacitance : 2;
    }
    pin(next) {
direction : input;
capacitance : 2;
    }
    statetable ("next ck ck* force00 force01 force10 force11", "out") {
table : " - - - L H L L : - : L, \
         - - - L H L L : L/H : L, \
```

```

- - - L L H L : - : H,\

- - - L L L H : - : H,\

L/H H L L L L L : - : L/H,\

- L L L L L L : - : N,\

- L H L L L L : - : N,\

- L L L L L L : - : N,\

- - - - - - - : - : X";
}
}

pin(Q) {
internal_node : "out";
direction : output;
inverted_output : FALSE;
}
}

```

EXAMPLE MESSAGE

Error: Error in the library db file. (DBVH-72)

DBVH-73 (error) Cannot derive the output state when clear and preset are both active.

DESCRIPTION

Library Generator fails to derive clear_preset_var1 from a state table function. clear_preset_var1 can be L, H, T, N, or X.

A black box cell is generated.

This error message pertains only to FTGS models.

WHAT NEXT

Verify the technology library.

EXAMPLES

```

cell(dbvh73) {
    area : 2.1 ;
    pin(CLK) {
        direction : input;
        capacitance : 0.1;
        clock : true ;
    }
    pin(D) {
        direction : input;
        capacitance : 0.1;
    }
    pin(SET) {
        direction : input;
        capacitance : 0.1;
    }
    pin(CLEAR) {
        direction : input;
        capacitance : 0.1 ;
    }
    ff(IQ,IQN) {
        clocked_on : "CLK" ;
        next_state : "D" ;
        clear : "SET" ;
        preset : "!CLEAR" ;
        clear_preset_var1 : "X" ;
        clear_preset_var2 : "H" ;
    }
    pin(Q1) {
        direction : output;
        function : "IQ" ;
        timing() {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "Q2";
        }
    }
    pin(Q2) {
        direction : output;
        function : "IQN" ;
        timing() {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 1.0;
            fall_resistance : 1.0;
            related_pin : "CLK";
        }
        timing() {
            timing_type : preset;
            timing_sense : positive_unate;
            intrinsic_rise : 1.0;
        }
    }
}

```

```

        rise_resistance : 1.0;
        related_pin : "SET";
    }
    timing() {
        timing_type : clear;
        timing_sense : positive_unate;
        intrinsic_fall : 1.0;
        fall_resistance : 1.0;
        related_pin : "CLEAR";
    }
}
}

```

In this case, the 'CLEAR' pin has a pulse-width constraint attribute.

EXAMPLE MESSAGE

Error: Cannot derive the output state when clear and preset are both active. (DBVH-73)

DBVH-74 (warning) The cell is in the state table format. Only FTGS and VITAL models might be generated.

DESCRIPTION

The Library Generator only supports FTGS and VITAL generation for the state table format.

WHAT NEXT

If you are generating optimized gate-level models (FTGS) or VITAL models, ignore this warning. Otherwise, change the technology library to modify the description of the cell functionality.

EXAMPLE MESSAGE

Warning: The cell is in the state table format. Only FTGS and VITAL models might be generated. (DBVH-74)

DBVH-75 (warning) The timing check between the '%s' and '%s'

pins is ignored.

DESCRIPTION

The timing check cannot be modeled in the FTGS model due to the following reasons:

- * One or both pins are not in any sequential function.
- * The timing check is a recovery or removal check, and there are more than 5 asynchronous clear pins and more than 5 asynchronous preset pins in a sequential function.

As a result, the timing check is ignored in FTGS models.

This warning message pertains only to optimized gate-level models.

WHAT NEXT

Change the technology library to remove any unnecessary timing checks.

EXAMPLES

```
cell(dbvh75) {
    area : 7;
    pin(D) {
direction : input;
capacitance : 1;
timing() {
    timing_type : setup_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "CP2";
}
timing() {
    timing_type : hold_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "CP2";
}
timing() {
    timing_type : setup_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "CP";
}
timing() {
    timing_type : hold_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "CP";
}
    }
pin(CP CP2) {
```

```

direction : input;
capacitance : 1;
}
ff ("IQ","IQN") {
next_state : "D";
clocked_on : "CP";
clocked_on_also : "CP2";
}
pin(Q) {
direction : output;
function : "IQ";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.10;
    fall_resistance : 0.1;
    related_pin : "CP";
}
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP2";
}
}
pin(QN) {
direction : output;
function : "IQN";
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP";
}
timing() {
    timing_type : rising_edge;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CP2";
}
}
}

```

EXAMPLE MESSAGE

Warning: The timing check between the 'D' and 'CP2' pins is ignored. (DBVH-75)

DBVH-76 (information) A black box TESTSIM model is created for the '%s' cell.

DESCRIPTION

This error message is specific to the fault-simulation structural model when executing the **write_testsim_lib** command with the **-depends** flag.

A black box TESTSIM model is created for this library cell because a model representing the full functionality could not be generated.

WHAT NEXT

All instances of this cell will be black boxes during fault simulation. If this is not what you want, modify your library so that Library Compiler understands the functionality of this cell and can create a good TestSim model.

EXAMPLE MESSAGE

Information: A black box TESTSIM model is created for the 'dbvh76' cell. (DBVH-76)

DBVH-77 (information) Black box TESTSIM models are created for all cells that failed.

DESCRIPTION

This error message is specific to the fault-simulation structural model when executing the **write_testsim_lib** command with the **-depends** flag.

Black box models are created for all failed library cells because models representing the full functionality could not be generated.

WHAT NEXT

All instances of these cells are black boxes during fault simulation.

If this is not what you want, modify your library so that Library Compiler understands the functionality of these cells and can create a good TestSim model for them.

EXAMPLE MESSAGE

Information: Black box TESTSIM models are created for all cells that failed. (DBVH-77)

DBVH-78 (error) A different bus/bundle size is found between bus/bundle ports '%s' and '%s'.

DESCRIPTION

The Library Generator cannot handle bank cells with an inconsistent bus/bundle width. The bank cell must have only one bus/bundle width.

This error message pertains to all simulation models.

WHAT NEXT

Verify the technology library and make sure all bus ports on a bank cell have the same bus/bundle width.

EXAMPLES

```
cell (dbvh78) {
    area : 1.0;
    pin (WEN) {
direction : input ;
capacitance : 1.0;
    }
    bundle (RA) {
members (RA0, RA1, RA2);
direction : input ;
capacitance : 1.0;
    }
    bundle (WA) {
members (WA0, WA1, WA2, WA3);
direction : input ;
capacitance : 1.0;
    }
    bundle (D) {
members (D0,D1,D2,D3);
direction : input ;
capacitance : 1.0;
    }
    latch_bank (m1, m2, 4) {
enable: "!WEN";
data_in : "D ^ (WA0 ^ WA1 ^ WA2 ^ WA3)";
    }
    bundle (Q) {
members (Q0,Q1,Q2,Q3);
direction : output ;
function : "m1";
timing () {
related_pin : " D WEN RA0 RA1 RA2 WA0 WA1 WA2 WA3";
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
```

```
    fall_resistance : 0.1;  
}  
}  
}
```

EXAMPLE MESSAGE

Error: Different bus/bundle size is found between
bus/bundle ports 'RA' and 'WA'. (DBVH-78)

DBVH-79 (error) A RAM cell with more than %d write ports is unsupported.

DESCRIPTION

This error message is specific to the fault-simulation structural model when executing the **write_testsim_lib** command.

The TestSim does not support RAMs with more than two write ports. The RAM cell is modeled as a black box cell.

WHAT NEXT

No action is required.

EXAMPLES

```
cell (dbvh79) {  
    area : 1000.0;  
    interface_timing : TRUE;  
  
    memory() {  
        type : ram;  
    }  
    address_width : 10;  
    word_width : 8;  
}  
  
    bus (RA) {  
bus_type : "bus10_1";  
direction : input;  
capacitance : 1.0;  
}  
    bus (WA1) {  
bus_type : "bus10_1";  
direction : input;  
capacitance : 1.0;  
}  
    bus (WA2) {  
bus_type : "bus10_1";
```

```

direction : input;
capacitance : 1.0;
}
bus (WA3) {
bus_type : "bus10_1";
direction : input;
capacitance : 1.0;
}
bus (DI1) {
bus_type : "bus8_1"
direction : input;
capacitance : 1.0;
memory_write() {
    address : WA1;
    enable : WE;
}
}
bus (DI2) {
bus_type : "bus8_1"
direction : input;
capacitance : 1.0;
memory_write() {
    address : WA2;
    enable : WE;
}
}
bus (DI3) {
bus_type : "bus8_1"
direction : input;
capacitance : 1.0;
memory_write() {
    address : WA3;
    enable : WE;
}
}
pin (WE) {
    direction : input;
    capacitance : 1.0;
    clock : true;
}
bus(QO){
bus_type : "bus8_1";
direction : output;
memory_read() {
    address : RA;
}
timing () {
    timing_sense : non_unate;
    intrinsic_rise : 1.0;
    rise_resistance : 0.1;
    intrinsic_fall : 1.0;
    fall_resistance : 0.1;
    related_bus_pins : "RA";
}
}
}

```

```
}
```

EXAMPLE MESSAGE

Error: A RAM cell with more than 2 write ports is unsupported. (DBVH-79)

DBVH-80 (error) The '%s' RAM is edge-triggered and level sensitive.

TestSim does not support it.

DESCRIPTION

TestSim cannot support RAMs specified as having both edge-triggered and level-sensitive enable types. This cell is modeled as a black box cell.

WHAT NEXT

Use either edge-triggered or level-sensitive RAMs.

EXAMPLES

```
cell (dbvh80) {
    area : 8000.0;
    interface_timing : TRUE;

    memory() {
        type : ram;
    address_width : 4;
    word_width : 8;
    }

    bus (RA1) {
        bus_type : "bus4";
        direction : input;
        capacitance : 1.0;
    }

    bus (RA2) {
        bus_type : "bus4";
        direction : input;
        capacitance : 1.0;
    }

    bus (WA1) {
        bus_type : "bus4";
        direction : input;
        capacitance : 1.0;
    }
}
```

```

bus (WA2) {
    bus_type : "bus4";
    direction : input;
    capacitance : 1.0;
}

bus (DI1) {
    bus_type : "bus8_1"
    direction : input;
    capacitance : 1.0;
    memory_write() {
        address : WA1;
        enable : WCLK1;
    }
}

bus (DI2) {
    bus_type : "bus8_1"
    direction : input;
    capacitance : 1.0;
    memory_write() {
        address : WA2;
        clocked_on : WCLK2;
    }
    timing () {
        timing_type : setup_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "WE2";
    }
    timing () {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "WE2";
    }
}

pin (WE1 WE2 CLK ) {
direction : input;
capacitance : 1.0;
clock : true;
}
pin (WCLK1) {
direction : internal;
capacitance : 1.0;
clock : true;
state_function : "WE1 * CLK";
}

pin (WCLK2) {
direction : internal;
capacitance : 1.0;
}

```

```

    clock : true;
    state_function : "WE2 * CLK";
}

bus(Q01) {
    bus_type : "bus8_1";
    direction : output;
    memory_read() {
        address : RA1;
    }
}

bus(Q02) {
    bus_type : "bus8_1";
    direction : output;
    memory_read() {
        address : RA2;
    }
}

}
}

```

EXAMPLE MESSAGE

Error: The 'dbvh80' RAM is edge-triggered and level sensitive.
TestSim does not support it. (DBVH-80)

DBVH-81 (error) Cannot find the '%s' cell in the testsimmacro.db TestSim library.

DESCRIPTION

The appropriate RAM primitive cannot be found in the testsimmacro.db library in your search_path.

This message is also issued if your RAM cell has more than 24 address lines. RAM cells with more than 24 address lines are not supported. Support can be added on request. Contact the Synopsys Support Center to login this request.

WHAT NEXT

Check that your search_path has v3.4a or later version of testsimmacro.db.

EXAMPLES

```

type(bus25) {
    base_type : array;
    data_type : bit;
    bit_width : 25;
}

```

```

    bit_from : 0;
    bit_to : 24;
    downto : false;
}
type(bus2) {

}

```

EXAMPLE MESSAGE

Error: Cannot find the 'RAM25_LEVEL_SENSITIVE_MACRO' cell in the testsimmacro.db library TestSim. (DBVH-81)

DBVH-82 (error) The '%s' RAM contains complex sequential devices in the wrapper network.

DESCRIPTION

TestSim does not support RAMs with wrapper logic containing complex sequential devices. You must be able to map the sequential devices in the RAM wrapper logic to D flip-flops or D latches. Anything more complex, such as a multiport device, is not supported.

The RAM cell is modeled as a black box cell.

WHAT NEXT

Use simple sequential devices in the input and output wrapper logic network of the RAM.

EXAMPLES

```
cell (dbvh82) {
    area : 5000.000;
    interface_timing : TRUE;

    memory() {
        type : ram;
    address_width : 2;
    word_width : 2;
    }

    statetable ( " RA1 RA2 RE1 RE2", "RQ") {
table : "    L/H -      R ~R : - : L/H , \
          - L/H ~R   R : - : L/H , \
          - - ~R ~R : - : N ";
    }

    bus (RA1) {
bus_type : "bus2";
direction : input;
capacitance : 1.0;
timing () {
    timing_type : setup_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "RE1";
}
    }

    timing () {
    timing_type : hold_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "RE1";
}
    }

    bus (RA2) {
bus_type : "bus2";
direction : input;
capacitance : 1.0;
timing () {
    timing_type : setup_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
}
```

```

    related_pin : "RE2";
}
timing () {
    timing_type : hold_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "RE2";
}
}

bus (RQ) {
bus_type : "bus2";
direction : internal;
capacitance : 1.0;
pin (RQ[0]) {

direction : output;
memory_read() {
    address : RQ;
}
}

timing () {
    timing_sense : non_unate;
    intrinsic_rise : 1.0;
    rise_resistance : 0.1;
    intrinsic_fall : 1.0;
    fall_resistance : 0.1;
    related_pin : "RA1";
}
}
}
}

```

EXAMPLE MESSAGE

Error: The 'dbvh82' RAM contains complex sequential devices in the wrapper network.
(DBVH-82)

DBVH-83 (error) Testsim does not support bundles. The '%s' RAM contains bundle ports.

DESCRIPTION

TestSim does not support RAMs with bundles (bundled ports). The RAM cell will be modeled as a black box cell.

WHAT NEXT

Do not use bundled ports in the RAM cell's description. Buses are supported so use buses.

EXAMPLES

```
cell(dbvh83) {
    area : 800.0;
    interface_timing : TRUE;

    memory() {
        type : ram;
    address_width : 4;
    word_width : 2;
    }

    bundle(RA) /* not supported */
members(RA1 RA2);
direction : input;
capacitance : 1.0;
timing () {
    timing_type : setup_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}
timing () {
    timing_type : hold_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}
}

bus (DI) {
bus_type : "bus2";
direction : input;
capacitance : 1.0;
memory_write() {
    address : RA;
    enable : WR;
}
timing () {
    timing_type : setup_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}
timing () {
    timing_type : hold_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}
```

```

        }

    pin (WR) {
direction : input;
capacitance : 1.0;
clock : true;
    }

    bus (DO) {
bus_type : "bus2";
direction : output;
capacitance : 1.0;
memory_read() {
    address : RA;
}
timing () {
    timing_sense : non_unate;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_bus_pins : "RA";
}
    }
}

```

EXAMPLE MESSAGE

Error: Testsim does not support bundles. The 'dbvh83' RAM contains bundle ports. (DB VH-83)

DBVH-84 (error) An undriven '%s' net is found in the '%s' cell.
RAM modeling failed.

DESCRIPTION

There is at least one undriven (internal) net in the TestSim generated RAM model. The RAM cell is modeled as a black box cell.

WHAT NEXT

Fix all pertinent warnings and errors generated when reading the RAM library description file.

DBVH-85 (error) A no fanout '%s' net is found in the '%s' cell.

The RAM modeling failed.

DESCRIPTION

There is at least one (internal) net with no fanout in the TestSim generated RAM model. The RAM cell is modeled as a black box cell.

WHAT NEXT

Fix all pertinent warnings and errors generated when reading the RAM library description file.

DBVH-86 (error) An unconnected '%s' port is found in the '%s' cell.

The RAM modeling failed.

DESCRIPTION

There is at least one unconnected port in the Testsim generated RAM model. The RAM cell will be modeled as a black box cell.

WHAT NEXT

Fix all pertinent warnings and errors generated when reading the RAM library description file.

EXAMPLES

```
cell (dbvh86) {
    area : 8000.0;
    interface_timing : TRUE;
    memory() {
        type : ram;
    }
    address_width : 4;
    word_width : 8;
}

bus (RA1) {
    bus_type : "bus4";
    direction : input;
    capacitance : 1.0;
}

bus (RA2) {
    bus_type : "bus4";
    direction : input;
```

```

        capacitance : 1.0;
    }

bus (WA1) {
    bus_type : "bus4";
    direction : input;
    capacitance : 1.0;
}

bus (DI1) {
    bus_type : "bus8_1"
    direction : input;
    capacitance : 1.0;
    memory_write() {
        address : WA1;
        enable : WCLK1;
    }
}

pin (WE1 WE2 CLK ) {
direction : input;
capacitance : 1.0;
clock : true;
}
pin (WCLK1) {
direction : internal;
capacitance : 1.0;
clock : true;
state_function : "WE1 * CLK";
}

bus(Q01){
    bus_type : "bus8_1";
    direction : output;
    memory_read() {
        address : RA1;
    }
}

bus(Q02){
    bus_type : "bus8_1";
    direction : output;
    memory_read() {
        address : RA2;
    }
}
}

```

EXAMPLE MESSAGE

Error: An unconnected 'WE2' port is found in the 'dbvh86' cell.
The RAM modeling failed. (DBVH-86)

DBVH-87 (information) The worst-case timing arc is used for non-unate inputs.

DESCRIPTION

The TestSim library generator fits the library cell's pin-to-pin timing onto the TestSim structural netlist for the library cell by lumping delays onto input buffers and output pins.

This can be handled precisely for unate inputs (both positive unate and negative unate). However, for non-unate inputs and for inputs for which the timing sense is unknown, the worst-case timing arc is used.

WHAT NEXT

No action is required.

EXAMPLES

```
cell(async_single) {
    area : 800.0;
    interface_timing : TRUE;

    memory() {
        type : ram;
    address_width : 4;
    word_width : 2;
    }

    bus (RA) {
bus_type : "bus4";
direction : input;
capacitance : 1.0;
timing () {
    timing_type : setup_falling;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}
    timing () {
        timing_type : hold_rising;
        intrinsic_rise : 1.0;
        intrinsic_fall : 1.0;
        related_pin : "WR";
    }
}

    bus (DI) {
bus_type : "bus2";
direction : input;
```

```

capacitance : 1.0;

memory_write() {
    address : RA;
    enable : WR;
}

timing () {
    timing_type : setup_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}

timing () {
    timing_type : hold_rising;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    related_pin : "WR";
}

pin (WR) {
direction : input;
capacitance : 1.0;
clock : true;
}

bus(DO){
bus_type : "bus2";
direction : output;
capacitance : 1.0;

memory_read() {
    address : RA;
}

timing () {
    timing_sense : non_unate;
    intrinsic_rise : 1.0;
    intrinsic_fall : 1.0;
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_bus_pins : "RA";
}
}
}

```

EXAMPLE MESSAGE

Information: The worst-case timing arc is used for non-unate inputs. (DBVH-87)

DBVH-88 (warning) The FTBM architecture is obsolete with 1997.01 release.
The architecture is ignored.

DESCRIPTION

The full-timing behavioral model (FTBM) architecture name identified in the **dc_shell** or **lc_shell** environment variable **vhndlarchitect**ure is not supported anymore.

This architecture is supported up to 1996 but not for subsequent releases.

The following architecture names are recognized:

- * FTGS (optimized gate-level model)
- * VITAL (VITAL model)

The FTBM architecture name is ignored. Recognized architecture names are processed.

WHAT NEXT

Use only the architecture names listed previously. For example,

```
vhndlarchitect = {FTGS,VITAL}
```

EXAMPLES

```
lc_shell> vhndlarchitect = "dbvhd26_arch"  
lc_shell> write_lib -format vhdl dbvh26
```

EXAMPLE MESSAGE

Warning: The FTBM architecture is obsolete with 1997.1 release.
The architecture is ignored. (DBVH-88)

DBVH-89 (warning) Pin name '%s' on cell '%s' contains underscore characters.

The generated VITAL model will not be VITAL-compliant.

DESCRIPTION

IEEE1076.4 (VITAL) standard disallows underscore characters in pin names. The pin name on the library cell contains one or more underscore characters. The generated VITAL model will not be VITAL level0 compliant.

WHAT NEXT

Remove underscore characters from the pin name.

DBVH-90 (error) DCM delay model is used in library '%s'.

DESCRIPTION

Library Compiler does not generate any VHDL models for libraries using DCM delay model.

WHAT NEXT

Use only non-DCM delay models.

EXAMPLES

```
lc_shell> write_lib -format vhdl dbvh90
```

EXAMPLE MESSAGE

```
Warning: DCM delay model is used in library 'dbvh90'. (DBVH-90)
```

DBVH-92 (warning) The '%s' pin has no invalid timing type for statement "period".

The verilog generator will use "posedge" for default.

DESCRIPTION

This warning is given for the following conditions: Liberty file has a simple attribute "minimum_period" in pin group. When verilog generator find this attribute, there is no way to identify edges for period checks from the attribute itself. We may look up in output pin groups, for a timing group with timing_type = rising_edge or falling_edge, where related_pin is same clock pin as in period checks. Rising edge denotes posedge, falling edge denotes negedge.

In case a timing group like this can not be found, verilog generator will issue this warning and assume a posedge for period check.

WHAT NEXT

If you have the proper timing type of this pin, rising_edge or falling_edge. Add the timing type in liberty file for this pin. constraint.

DBVH-93 (error) Could not parse the html file '%s'

DESCRIPTION

An attempt to parse a html file has failed. This problem might be caused by the html file doesn't follow HTML 4.01 standard.

Trying to check whether the html file conforming to HTML 4.01 standard.

WHAT NEXT

check the html file conforming to HTML 4.01 standard.

DBVH-94 (warning) The %s data table in html template does not supported by html datasheet generator.

DESCRIPTION

An attempt to check html table has failed. This problem might be caused by the html table does not follow HTML datasheet generator standard.

Trying to check whether the html table conforming to HTML datasheet generator standard.

WHAT NEXT

check the html table conforming to HTML datasheet generator standard.

DBVH-95 (error) initialize htmlparser module failed.

DESCRIPTION

System error occurs.

WHAT NEXT

Please contact developper of Library Compiler.

DCDDEFR

**DCDDEFR-1 (error) Netlist Input Mode: Reset & Import;
Physical Input Mode: Incremental. This is not supported. Please
select again.**

DESCRIPTION

This error message occurs when Netlist Input Mode is Reset & Import and Physical Input is Incremental. DEF reader support following 5 type input modes:

Netlist Input Mode Physical Input Mode

Incremental	Incremental	Incremental	Reset & Import	Reset & Import
No Change	Incremental	No Change	Reset & Import	Reset & Import

WHAT NEXT

Please select again.

**DCDDEFR-2 (error) No "LEF File Name" specified (for
incremental importing rotated vias and nonDefaultRule).**

DESCRIPTION

This error message occurs when no 'LEF File Name' is specified.

WHAT NEXT

Please specify the lef file name.

DCDDEFR-3 (error) Cannot advance cell version.

DESCRIPTION

WHAT NEXT

DCDDEFR-4 (error) Detect %s near token '%s' at line %d.

DESCRIPTION

This error message occurs when unexpected syntax has been parsed.

WHAT NEXT

Please change your DEF file according to the DEF manual.

DCDDEFR-5 (warning) NAMECASESENSITIVITY always assumed to be ON.

DESCRIPTION

The read_def parser always assume name case sensitivity to be ON.

WHAT NEXT

Check if the input DEF file is case insensitive.

DCDDEFR-6 (error) Illegal value %d for UNIT specified in input DEF.

DESCRIPTION

The only legal values for UNIT in DEF are 100, 200, 1000, 2000, 10000, 20000. The values of 10000 and 20000 are only supported in DEF 5.6.

WHAT NEXT

Regenerate the DEF file to have correct UNIT.

DCDDEFR-7 (error) The Milkyway database precision (%d) is not a multiple of the input DEF unit (%d), this might cause roundoff error.

DESCRIPTION

This might cause roundoff error.

WHAT NEXT

To continue reading in the input DEF regardless of possible roundoff error, please select the option 'Force Scaling' or use the switch -enforce_scaling.

DCDDEFR-8 (error) Unable to find definition for via %s.

DESCRIPTION

This error message occurs when the definition for this via is neither in the input DEF nor in the reference libraries.

WHAT NEXT

Please make sure that all vias referred in the input DEF are either defined in reference libraries or in the input DEF.

DCDDEFR-9 (warning) The blockage coordinate (%d %d) is out of bound, the coordinates for the die area are (%d %d) (%d %d).

DESCRIPTION

This warning message occurs when the blockage coordinate is out of bound with respect to the die area.

WHAT NEXT

No action is required on your part.

DCDDEFR-10 (warning) Version is a required statement.

Assume version to be 5.5.

DESCRIPTION

This warning message occurs when no VERSION is specified in def file.

WHAT NEXT

No action is required on your part if DEF reader can parse this file, otherwise please specify the correct version.

DCDDEFR-11 (warning) BusBitChars is a required statement.
Assume BusBitChars to be '[]'.

DESCRIPTION

This warning message occurs when no BusBitChars is specified in def file.

WHAT NEXT

Please specify your BusBitChars if '[]' is not expected.

DCDDEFR-12 (warning) DividerChar is a required statement.
Assume DividerChar to be '/'.

DESCRIPTION

This warning message occurs when no DividerChar is specified in def file.

WHAT NEXT

Please specify your DividerChar if '/' is not expected.

DCDDEFR-13 (warning) Failed to match via layer (%d) for via

(%s) of net %s (%d).

DESCRIPTION

This error message occurs when current layer can not match the via upper or lower layer.

For example, this error will occur when proceed to VIA34. 1) + ROUTED METAL1 (100 200) VIA34 2) + ROUTED METAL1 (100 200) VIA12 (* 300) (200 *) VIA34

WHAT NEXT

Regenerate the DEF file to have correct routing data.

DCDDEFR-14 (error) This scan-in/scan-out pin pair of adjacent components in the ordered list have different owning net.

DESCRIPTION

This error message occurs when scan-in/scan-out pin pair of adjacent components in the ordered list have different owning net.

WHAT NEXT

Regenerate the DEF file to have correct scan-in/scan-out pin pair.

DCDDEFR-15 (error) The scanchain %s is incomplete.

DESCRIPTION

This error message occurs when the scanchain is a broken chain.

WHAT NEXT

Regenerate the DEF file to have complete scanchain.

DCDDEFR-16 (error) Failed to set shape for pin %s.

DESCRIPTION

The error message occurs when the specified layer is not defined in the technology file.

WHAT NEXT

Check the layer name of the pin, make sure it is defined in the technology file.

DCDDEFR-17 (warning) Please execute "auSetLayerPreferDir layerNum #t" to make the preferred wire track direction be vertical for alternating layers. If you don't use auSetLayerPreferDir, the default preferred wire track direction for all layers is horizontal.

DESCRIPTION

The preferred wire track direction for all layers is horizontal. This may cause problem when you run Astro routing.

WHAT NEXT

There are 3 solutions to solve this problem: 1) Select the option "Set Layer Preferred Direction" in read_def GUI, or the option "-h_layer <list_of_h_layers>" in tcl mode. 2) Execute "auSetLayerPreferDir layerNum #t" to make the preferred wire track direction be vertical for alternating layers. 3) Use axgDefineWireTracks to set the WireDirection objects of "unitTile" cell in design library or reference libraries, which can be used to set preferred wire track direction by read_def.

DCDDEFR-18 (error) The placed pin (%s) does not contain layer information.

DESCRIPTION

If you specify a placement status for a pin, you must also include a LAYER statement.

WHAT NEXT

Regenerate the DEF file to have LAYER statement for the placed pin.

DCDDEFR-19 (error) The spacing between the tracks is less than "min width + min spacing" of the routing layer(Line %d).

DESCRIPTION

This error message occurs when "STEP space" is less than "min width + min spacing" of the specified routing layer(s). Astro router need metal TRACKS to be larger or equal than metal "min width + min spacing".

WHAT NEXT

Manually edit the input DEF file to meet the minimum requirements of our tool flow. Or select option "Adjust Tracks" to recondition the tracks to meet minimum requirements automatically.

DCDDEFR-20 (error) Cannot create rectangle for FILL on layer "%S".

DESCRIPTION

This error message occurs when the specified layer is not defined in the technology file..

WHAT NEXT

Check the layer name of the FILL, make sure it is defined in the technology file.

DCDDEFW

DCDDEFW-1 (error) No "LEF File Name" specified (for incremental exporting rotated vias and nonDefaultRule).

DESCRIPTION

This error message occurs when no "LEF File Name" is specified.

WHAT NEXT

Please specify a LEF file's name.

DCDDEFW-2 (warning) Failed to insert layer '%s' in hash table.

DESCRIPTION

The write_def command creates a hash table for all the layers present in a design. This message means that write_def failed to insert the layer into the hash table. This could mean that either the name or the id for the layer is invalid.

WHAT NEXT

Please verify if the layer name and id are correct within the DB.

DCDDEFW-3 (warning) Failed to insert via '%s' ('%d') in hash table.

DESCRIPTION

The write_def command creates a hash table for all the vias present in a design. This message means that write_def failed to insert the via into the hash table. This could mean that either the name or the id for the via is invalid.

WHAT NEXT

Please verify if the via name and id are correct within the DB.

DCDDEFW-4 (warning) Undefined layer id '%d'.

DESCRIPTION

Within DB all layers are referenced with their unique id's. This message means that the layer id, which write_def encountered in the DB, does not correspond to any of the layers in DB.

WHAT NEXT

Please verify how this layer id is referenced in the DB. This could be in any of the DEF sections that have layer references.

DCDDEFW-5 (warning) Undefined via id '%d'.

DESCRIPTION

Within DB all vias are referenced with their unique id's. This message means that the via id, which write_def encountered in the DB, does not correspond to any of the vias in DB.

WHAT NEXT

Please verify how this via id is referenced in the DB. This could be in any of the DEF sections that have via references.

DCDDEFW-6 (information) Creating dummy net '%s' for unconnected port '%s'.

DESCRIPTION

There are unconnected ports in the design. For each port of such kind, write_def command will dump a dummy net in the PINS section as well as in the NETS section.

WHAT NEXT

Please verify whether the port(s) are really unconnected.

DCDDEFW-7 (warning) Illegal value for unit (%s) specified.

DESCRIPTION

The value specified does not match the allowed values. The only valid values for DEF UNIT are 100, 200, 1000, 2000, 10000 and 20000. 10000 and 20000 are only supported in DEF 5.6. When an invalid value is specified in the write_def command, the tool uses the conversion factor of main library.

WHAT NEXT

No action is required on your part.

However, if you want, you can specify one of the valid values. You can also see the man page for the write_def command for detailed information on specifying optional or required parameters.

DCDDEFW-8 (warning) Rectangle:(%d %d) (%d %d) edges are on grid, but center point is off-grid. Ignore it in DEF file.

DESCRIPTION

This error is caused by insufficient database unit.

WHAT NEXT

Specify the DEF output unit to be double length resolution of technology file.

Note: when read this DEF file back into the original library, you need to select 'Force Scaling' option (-enforce_scaling switch).

DCFPGA

DCFPGA_PART-1 (Error) Invalid step value '%s' for the device '%S'.

DESCRIPTION

You receive this message because the step value specified for the target part is invalid.

DCFPGA_UISN-1 (warning) partition_dp command is disabled for fpga technology.

DESCRIPTION

partition_dp command is not applicable while targeting fpga technology.

WHAT NEXT

DCFPGA_UEGI-1 (error) Clearbox path not defined.

DESCRIPTION

This error message occurs when Design Compiler FPGA cannot find the path to Altera's Clearbox loader (External logic generator).

WHAT NEXT

Set the UNIX **CLEARBOX_EXEC_PATH** environment variable to the absolute path to the Clearbox loader.

DCFPGA_TRI-1 (warning) Three-state bus %s is connected to the black-box inout pin %s(%s). Three-state to mux conversion

cannot happen.

DESCRIPTION

This warning message occurs when the specified three-state bus is connected to a black box cell. Since there can be three-state drivers inside the black box, Design Compiler FPGA cannot convert this bus to MUX logic. This results in unmapped three-state elements in the netlist.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Try setting the Boolean **fpga_blackbox_inout_as_bus_load** variable to **TRUE**. Design Compiler FPGA converts three-state buses to MUX logic by considering the black box pins as input pins. Make this setting only if you are sure that the bus under consideration is not driven by any more three-state elements from inside the black box.

SEE ALSO

[fpga_blackbox_inout_as_bus_load\(3\)](#)

DCFPGA_ROM-1 (information) Unable to implement constant MUX_OP cell '%s' using architecture specific ram blocks.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks.

DCFPGA_RAM-1 (error) RAM operators in design cannot be expanded.

DESCRIPTION

The RAM operators that are inferred for this design cannot be expanded. This may be because RAM Inference is not supported for this technology or the synthetic libraries provided do not describe how to implement the RAM operator.

WHAT NEXT

Make sure that RAM Inference is supported for this technology, by referring to the RAM Inference Application Notes.

Make sure that you have enabled **Tornado Module Generator** since RAM implementations are only provided for this particular flow.

DCFGA_BUFG-1 (warning) BUFG resource '%s' being removed from design '%s' to be redeployed"

DESCRIPTION

You receive this message because the DCFGA has removed a BUFG that does not have a dont_touch attribute on it. The removed BUFGs will be redeployed by the clock buffer insertion algorithm at the higher fanout clock nets.

WHAT NEXT

DCFGA_COUNTER-1 (information) Inferred Counter '%s' of width '%d' in design '%s'

DESCRIPTION

WHAT NEXT

DCFGA_CMD-1 (warning) This command is not applicable to Design Compiler FPGA.

DESCRIPTION

This warning message occurs when you use a command that is not supported for Design Compiler FPGA synthesis.

WHAT NEXT

Enable this command using the **fpga_enable_commands** variable.

SEE ALSO

fpga_enable_commands(3)

DCFPGA_DEATOM-1 (warning) Invalid %s '%s' is detected.
Skipping deatomization.

DESCRIPTION

You receive this message because the library complex cell under deatomization is detected as an invalid one.

DCFPGA_PMCD-1 (information) Propagating clocks through cell '%s' instantiated from design '%s'.

DESCRIPTION

This information message occurs when the tool is generating output clocks for special cells, such as PMCD.

WHAT NEXT

This is only an information message. No action is required.

DCFPGA_PLL-1 (information) Propagating clocks through cell '%s' instantiated from design '%s'.

DESCRIPTION

This information message occurs when the tool is generating output clocks for special cells, such as ALTPLL.

WHAT NEXT

This is only an information message. No action is required.

DCFPGA_DCM-1 (information) Propagating clocks through cell

'%s' instantiated from design '%s'.

DESCRIPTION

Generate output clocks for special cells such as DLL/DCM.

DCFPGA_FM-1 (warning) You need to perform set_svf to enable generation of setup information for formality.

DESCRIPTION

Use set_svf to generate a Formality setup information file to ensure efficient compare point matching in Formality.

WHAT NEXT

To avoid receiving this message, perform a set_svf prior to issuing set_fpga_defaults -formality

SEE ALSO

[set_svf\(2\)](#).

DCFPGA_LPM-1 (error) LPM library (lpm.sldb) required for technology mapping not found in synthetic library set.

DESCRIPTION

You receive this message because Design Compiler FPGA requires lpm.sldb in the synthetic_library set to perform some technology mapping for the target architecture you have chosen.

WHAT NEXT

Add lpm.sldb (provided as part of Design Compiler FPGA installation), to the "synthetic_library" and "link_library" and try again.

DCFPGA_LUT7-1 (warning) Invalid lut_mask '%s' is detected.

Place and Route may fail for this 128 bit lut_mask.

DESCRIPTION

You receive this message because the LUT7 lut_mask for stratixii_lcell_comb is detected as an invalid one. You need to convert this 128 bit INIT value to 64 bit lut_mask.

DCFPGA_MULT18X18S-1 (information) Multiplier %s not considered for MULT18X18S inference.

DESCRIPTION

One of the output nets(%s) of multiplier cell drives multiple loads. DCFPGA neglects such multipliers for MULT18X18S inference.

WHAT NEXT

DCFPGA_PAD-1 (information) 'dont_touch' on cell %s (%s) has been ignored for pad mapping.

DESCRIPTION

This information message occurs when your FPGA vendor no longer supports the named primitive, but supports unified primitives instead. Design Compiler FPGA ignores the don't touch attribute to replace the old primitive with the newer primitive.

WHAT NEXT

This is only an information message. No action is required.

DCFPGA_MUX-1 (information) MUX_OP: '%s' extracted.

DESCRIPTION

You receive this message because a SELECT_OP cell is converted into a MUX_OP cell.

DCFPGA_BUFG-2 (warning) Can not insert global buffer '%s' at pin '%s'. The maximum permissible resource limit '%d' for this PART has reached.

DESCRIPTION

You receive this message because all the resources of the type mentioned in the message for this PART have been completely utilized and there no global clock buffers of the type mentioned above are available for insertion at this pin.

WHAT NEXT

DCFPGA_DCM-2 (information) The clock '%s' with period '%s' generated on pin '%s'.

DESCRIPTION

Generate a clock for output pin of special cells such as DLL/DCM.

DCFPGA_CMD-2 (warning) No command matched the name '%s'.

DESCRIPTION

This warning message occurs when none of the commands match this command specified in the **fpga_enable_commands** list.

WHAT NEXT

To view all of the disabled commands that can be enabled using the **fpga_enable_commands** variable, invoke the **list_commands** Tcl command from the Design Compiler FPGA shell. The **list_commands** command displays a group of commands that are disabled for Design Compiler FPGA.

SEE ALSO

`fpga_enable_commands(3)`

DCFPGA_MULT18X18S-2 (information) Register driven by net %s, is not pulled in.

DESCRIPTION

Net has multiple loads. DCFPGA does not pull in any register driven by such net and also neglects any other registers present at the same level.

WHAT NEXT

DCFPGA_ADDABC-2 (information) Cell %s is not considered for ADD_ABC inference.

DESCRIPTION

Some of the output pins of the cell are not connected. DCFPGA neglects such cells for ADD_ABC inference.

WHAT NEXT

DCFPGA_ROM-2 (information) The select or output lines of constant MUX_OP cell '%s' contains "infer_rom" attribute with value '%s'.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks as the output or the select lines of the constant MUX_OP cell contains "infer_rom" attribute with value other than "block".

WHAT NEXT

You can remove the "infer_rom" attribute from the select or output lines or you can set the value as "block".

DCFPGA_MUX-2 (warning) Cell : '%s' can not be converted into

MUX_OP.

DESCRIPTION

You receive this message because the SELECT_OP cell can not be converted into a MUX_OP cell.

DCFPGA_PLL-2 (information) The clock '%s' with period '%s' generated on pin '%s'.

DESCRIPTION

Generate a clock for output pin of special cells such as ALTPLL.

DCFPGA_PMCD-2 (information) The clock '%s' with period '%s' generated on pin '%s'.

DESCRIPTION

This information message occurs when the tool generates a clock for an output pin of special cells, such as PMCD.

WHAT NEXT

This is only an information message. No action is required.

DCFPGA_RAM-2 (information) Converting Dual Port RAM %s to Single Port RAM.

DESCRIPTION

The Dual Port RAM is being converted to Single Port RAM. This is done if, the data_out_a port is unused and both the ports share the same address lines.

DCFPGA_RAM-3 (information) RAMs %s and %s are merged.

DESCRIPTION

Two RAM operators are merged to form a single operator to improve area.

DCFPGA_ROM-3 (information) The number of address lines '%d' of constant MUX_OP cell '%s' is less than the minimum width '%d' specified by user.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks as the number of address lines is less than the minimum number of address lines specified by the user.

WHAT NEXT

Incase you want the architecture specific ram block for this constant MUX_OP, decrease the minimum value by using the variable fpga_block_rom_min_addr_width.

DCFPGA_MULT18X18S-3 (information) Register %s is not similar to register %s.

DESCRIPTION

DCFPGA neglects any register level from pulling into pipelined multiplier, if any of the registers in that level is not similar to the registers in the previous level.

WHAT NEXT

DCFPGA_CMD-3 (warning) Command '%s' is already enabled in Design Compiler FPGA.

DESCRIPTION

This error message occurs when you try to enable a command that is already available in the Design Compiler FPGA shell.

WHAT NEXT

Remove the command name from the **fpga_enable_commands** list.

SEE ALSO

[fpga_enable_commands\(3\)](#)

DCFPGA_MULT18X18S-4 (information) Suitable pipelined multiplier not found. You may need to add Designware Foundation to synthetic_library.

DESCRIPTION

WHAT NEXT

DCFPGA_CMD-4 (information) Ultra optimizations applicable to FPGA are already incorporated into the Design Compiler FPGA flow.

DESCRIPTION

This information message occurs because Ultra compiler optimizations that apply to FPGA synthesis is already a part of the standard FPGA synthesis flow. There is no need to invoke any Ultra commands to perform these tasks.

WHAT NEXT

This is only an information message. No action is required.

SEE ALSO

[fpga_enable_commands\(3\)](#)

DCFPGA_ADDABC-4 (information) Cell %s is already

considered for ADD_ABC inference.

DESCRIPTION

This cell is already a part of another ADD_ABC module.

WHAT NEXT

DCFPGA_ROM-4 (information) The number of address lines '%d' of constant MUX_OP cell '%s' is greater than the maximum width '%d' specified by user.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks as the number of address lines is greater than the maximum number of address lines specified by the user.

WHAT NEXT

Incase you want the architecture specific ram block for this constant MUX_OP, increase the maximum value by using the variable fpga_block_rom_max_addr_width.

DCFPGA_RAM-4 (information) Pulled in registers at port %s for RAM %s.

DESCRIPTION

The registers at the given port have been pulled into the RAM operator.

DCFPGA_ADDABC-5 (information) Cell %s is not the first valid

cell for ADD_ABC inference.

DESCRIPTION

WHAT NEXT

DCFPGA_MULT18X18S-5 (information) Pipelined multiplier not inferred. %d registers expected, but only %d are found.

DESCRIPTION

WHAT NEXT

DCFPGA_RAM-5 (information) No read operation at Port A for Dual Port RAM %s.

DESCRIPTION

DCFPGA_ROM-5 (information) The total number of rom bits '%d' of constant MUX_OP cell '%s' is less than the minimum number of rom bits '%d' specified by the user.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks as the total number of rom bits is less than the minimum number of rom bits specified by the user.

WHAT NEXT

Incase you want the architecture specific ram block for this constant MUX_OP, decrease the minimum value by using the variable fpga_block_rom_min_total_bits.

DCFPGA_MULT18X18S-6 (information) Suitable pipelined

multiplier not found. Cell %s(DW02_mult) has variable TC port and drives registers with Sync Clear/Enable.

DESCRIPTION

WHAT NEXT

DCFPGA_ADDABC-6 (information) Cell %s is not considered for ADD_ABC inference.

DESCRIPTION

One of the output nets of the cell drives multiple loads. DCFPGA neglects such cells for ADD_ABC inference.

WHAT NEXT

DCFPGA_ROM-6 (information) There is no valid register bank at the address or output lines of constant MUX_OP cell '%s'.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks as there is no valid register bank at the address or output lines of the constant MUX_OP cell. The registers at the address lines can have only clock and clock enable signals and the registers at the output lines can have asynchronous signals.

WHAT NEXT

Incase you want the architecture specific ram block for this constant MUX_OP, place valid register banks at the address or output lines.

DCFPGA_RAM-6 (information) Read operation at Ports A and B are not of the same type. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s"

using Block RAMs.

DESCRIPTION

DCFPGA_RAM-7 (information) Read operation at Port B is not synchronous. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s" using Block RAMs.

DESCRIPTION

DCFPGA_ADDABC-7 (information) Cannot infer ADD_ABC.

DESCRIPTION

The cells doesn't have compatible output widths. DCFPGA neglects such cells for ADD_ABC inference.

WHAT NEXT

DCFPGA_MULT18X18S-7 (information) Inferred %d stage multiplier for cell %s.

DESCRIPTION

WHAT NEXT

DCFPGA_ROM-7 (information) The register bank at the address or output lines of constant MUX_OP cell '%s' has a

fanout greater than one.

DESCRIPTION

You receive this message because DCFPGA could not implement the constant MUX_OP cell using architecture specific ram blocks as the registers at the address or output lines has a fanout greater than one.

DCFPGA_RAM-8 (information) Read operation at Port B has a data enable. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s" using Block RAMs.

DESCRIPTION

DCFPGA_ADDABC-9 (information) Suitable ADD_ABC module not found in the synthetic_library.

DESCRIPTION

WHAT NEXT

DCFPGA_RAM-9 (information) Read and Write operations are from different clocks%. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s" using Block RAMs.

DESCRIPTION

DCFPGA_RAM-10 (information) Read operation has an enable%. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s" using Block

RAMs.

DESCRIPTION

DCFPGA_RAM-11 (information) Only write first mode is supported for VIRTEXE technology. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s" using Block RAMs.

DESCRIPTION

DCFPGA_RAM-12 (information) Data or address width is too small. Unable to implement RAM %s of configuration "Address width: %d, Data width: %d, Type: %s" using Block RAMs. Set the variables fpga_ramb_min_address_width and fpga_ramb_min_total_bits appropriately to infer BLOCK RAM.

DESCRIPTION

DCFPGA_RAM-13 (information) Choosing %s implementation for RAM %s.

DESCRIPTION

The HDL specified implementation for this RAM is not valid. So, a new appropriate implementation is chosen.

DCFPGA_RAM-14 (information) RAM %s is implemented using %s RAM primitives.

DESCRIPTION

DCM

DCM-100 (warning) Unable to load DCM library for '%s'.
Using the default delay model as specified in the .db library.

DESCRIPTION

The program is unable to load the DCM library corresponding to the .db library as specified in the error message. This happens because of one of the following reasons:

- * One or more of the following shell environment variables are not set or are incorrectly set:
DCMRULEPATH (or CDCRULEPATH)
DCMRULESPATH (or CDCRULESPATH)
DCMTABLEPATH (or CDCTABLEPATH)
- * The DCM library does not exist in the location specified or it does not have the proper file permissions.
- * Your installation is not authorized for the DCM-Delay-Calculation feature.

When this error is encountered, the program treats the library as a non-DCM library and derives the delay model as though it were a .db library.

WHAT NEXT

The error messages preceding this one should make the exact cause of the problem clear. Make sure that the aforementioned shell environment variables are set correctly and the DCM library exists as specified with the correct file permissions. Make sure your Synopsys key file includes the DCM-Delay-Calculation license.

DCM-101 (error) Errors found during rule_init() - library '%s' will be unloaded.

DESCRIPTION

The PI function rule_init() of the Delay Calculation System (DCS) standard returned an error code. Typically, the DCS itself issues the diagnostic messages that display before this message. When this message is issued, the program cannot load the remaining DCM subrules and link the EXPOSE and EXTERNAL functions correctly.

WHAT NEXT

Please contact the library provider or Synopsys if you encounter this message.

DCM-102 (warning) No DCM model for cell '%s' of library '%s'.

DESCRIPTION

This error message is issued when the DCM library returns a nonzero error status

WHAT NEXT

Check the error messages issued by the DCM prior to this error message and correct any problems. Verify that you have matching versions of the DCM timing and auxiliary cell libraries. Contact your library provider for more information.

DCM-103 (error) Unable to load DCM EXPOSE function '%s' from the DCM library. This library cannot be used by this program without the specified EXPOSE function.

DESCRIPTION

This message is issued when the program tries to load the specified DCM EXPOSE function from the specified DCM library and cannot locate a matching function. Because this EXPOSE function is considered critical for the proper calculation of delay values, this library cannot be used by this program for timing calculations.

WHAT NEXT

Please contact your library provider for more information.

DCM-104 (error) The following feature of the DCL language is not (yet) supported by this program: %s.

DESCRIPTION

The current implementation of the program does not fully support the specified

feature of the Delay Calculation System (DCS) standard specification. This can result in this particular DCM library being unsuitable for use for delay calculations by this program.

WHAT NEXT

You cannot use this DCM library for timing calculations until this restriction is removed. Please contact your library provider to see if a version of the library without the specific feature is available.

**DCM-105 (error) Error while processing DCL external function
'%s' - passed pin '%s' is
not part of the current timing arc.**

DESCRIPTION

The DCL-PI standard defines a number of functions that request the netlist information from the timer application using the pin name rather than the pin pointer. The current implementation of the program supports this feature only as long as the referenced pin name is part of the timing arc currently under consideration. That is, you can substitute the external call with the equivalent byPin() call.

by the equivalent byPin() call.

WHAT NEXT

If you have access to the DCM library source, modify it such that the equivalent byPin() function is used instead of the named external function. Otherwise, please contact your library vendor. equivalent byPin() function is used instead of the named external function. Otherwise, please contact your library vendor.

DCM-106 (warning) The DCL-PI function '%s' returned a nonzero error code %d while processing the timing segment '%s'.

DESCRIPTION

This message appears when the program calls one of the CALCULATION functions as defined in the DCS standard specification and that function returns a bad error code. This typically indicates a problem in the DCM library itself.

WHAT NEXT

If you have access to the DCL source code of the library, modify please contact your library provider.

DCM-107 (warning) Unsupported test type or edge propagation pair '%s' specified for the arc '%s'. This arc will be ignored.

DESCRIPTION

This message is displayed when the program loads the timing arc and detects that test type or the edge propagation characteristics specified for this arc types and edge propagation pairs, please consult your documentation.

WHAT NEXT

If you have access to the DCL source code of the library, change program. Otherwise, please contact your DCM library provider.

DCM-108 (warning) Internal timing pin '%s' of cell '%s' in library '%s' is not defined in the corresponding .db library. Any timing arcs connecting to or from this pin will be ignored.

DESCRIPTION

This message is displayed when the program loads the timing arcs and detects that the DCM has requested the creation of a new timing point, but no of the library cell's pins, including the internal timing points, must be defined in the technology library .db file before they can be referenced in the DCM.

WHAT NEXT

If you have access to the source code of the Synopsys technology library (.lib) corresponding with the DCM being loaded, you can add a new internal timing pin for the corresponding cell in the library. Note that current limitations of the Library Compiler product dictate that a "timing()" group must be present for each internal timing pin. However, when using the DCM library, all the each internal timing pin. However, when the DCM library is used, all the timing information comes from the DCM

library and any timing data specified in the .db library is ignored.

DCM-109 (warning) %s '%s' is invalid. The valid values are '%s' and '%s'

DESCRIPTION

This message is displayed when an invalid version is set.

WHAT NEXT

Change the version to one of the valid values and re-run the design.

DCM-110 (warning) DPCM expose dpcmAddWireLoadModel not supported in DPCL library. Therefore DB/custom wireload models are not supported.

DESCRIPTION

This message is displayed when the expose dpcmAddWireloadModel is not supported in the DPCM Procedural Interface.

WHAT NEXT

Use DPCM wireloads. If db wireload has to be used support the expose in DPCM.

DCM-111 (warning) The design %s read in has wireload %s, which is not present in the current DPCM. Changing to default DPCM wireload %s.

DESCRIPTION

You receive this warning message when the current wireload attached to the design is not present in one of the DPCM libraries.

WHAT NEXT

Use a wireload that is in one of the DPCM libraries. To see a list of wireloads in

the DPCM libraries, use the **report_lib** command.

DCM-112 (warning) The design %s read in has a DCPM wireload %s. Deleting the dpcm wireload.

DESCRIPTION

This message is displayed when the current wireload attached to the design is from a DPCM library and not db.

WHAT NEXT

Use DB wireloads. List DB wireloads by doing report lib.

DCM-113 (information) Propagating clocks through cell '%s' instantiated from design '%s'.

DESCRIPTION

Generate output clocks for special cells such as DLL/DCM.

DCM-114 (information) The clock '%s' with period '%s' generated on pin '%s'.

DESCRIPTION

Generate a clock for output pin of special cells such as DLL/DCM.

DCM-115 (information) Please check CLKFX_DIVIDE value: '%s'.

DESCRIPTION

CLKFX_DIVIDE value is not valid.

DCM-116 (information) Please check CLKFX_MULTIPLY value: '%S'.

DESCRIPTION

CLKFX_MULTIPLY value is not valid.

DCM-117 (information) Please check CLKDV_DIVIDE value: '%S'.

DESCRIPTION

CLKDV_DIVIDE value is not valid.

DCM-118 (warning) During the polynomial reduction procedure, the '%s' variable is saturated from %f to %f.

DESCRIPTION

This warning message occurs when a boundary value instead of the original variable value is used for polynomial reduction.

WHAT NEXT

A polynomial is reduced before final calculation if its parameters contain one of the following variables defined in the operating conditions: *temperature*, *parameter1*, *parameter2*, *parameter3*, *parameter4*, *parameter5*, *voltage*, *voltage1*, ..., *voltage99*.

If the variable value defined in the operating conditions is out of the boundary defined in the polynomial, then the closest boundary value for the variable will be used for polynomial reduction.

For example, if the *temperature* variable defined in the current operating condition is 20, while the range of the *temperature* in the polynomial is [25, 40], then 25 instead of 20 is used to reduce this polynomial.

DCSH

DCSH-1 (fatal) %s is not enabled.

DESCRIPTION

You don't have the given license available.

WHAT NEXT

Check and get the desired license by invoke the **get_license** command.

DCSH-3 (fatal) System ".synopsys

DESCRIPTION

WHAT NEXT

DCSH-7 (fatal) Error in .synopsys file. Cannot continue.

DESCRIPTION

If there is an error is issued during reading the .synopsys file from the synopsys root, the Design Compiler will exits.

Fatal in reading .synopsys file includes syntax errors found.

Sample errors are

```
Error: Undefined operator on or near line %d at or near '%s'. (EQN-2) Error:  
Previous error has stopped reading include file '%s'. (UI-21)
```

WHAT NEXT

Run Design Compiler with -no_init option will eleminate this error.

Identify and correct the cause of the fatal in reading .synopsys file and reinvoke the dc_shell or design_analyzer.

DCSH-9 (fatal) %s: could not connect to parent '%s'.

DESCRIPTION

WHAT NEXT

DCSH-10 (fatal) At least one of the following must be enabled : %S.

DESCRIPTION

WHAT NEXT

DCSH-11 (error) Can't read Tcl file %s in your working directory because
you read the default format in home init.

DESCRIPTION

In default dc_shell (dcsh) mode, the program just read default dcsh format in home init. Now it can't read Tcl file in your working directory. In default dcsh mode, the setup files are supported as follow:

```
Synopsys RootHome Working Directory -----
- Tcl-subset dcsh dcsh Tcl-subset Tcl-subset Tcl-subset Tcl-subset Tcl-subset dcsh
Tcl-subset dcsh Tcl-subset NON SUPPORT
```

WHAT NEXT

Convert your Tcl file into the default format in your current working directory and rerun the program. Or you may continue the program.

DCSH-12 (error) No additional DC-XG licenses are available.

DESCRIPTION

You receive this message because all your DC-XG licenses are already checked out or your site is not enabled for DC-XG license feature.

This license feature is required while DesignCompiler is in xg-mode.

As soon as DC switches to xg-mode one token of DC-XG license feature is checked out. Upon leaving xg-mode the token is checked in again.

WHAT NEXT

Do one of the following, and then try again to enter xg-mode:

- Use command `license_users` to check who else is working with XG mode.
- Quit any other `dc_shell` that uses DC-XG licenses.
- Wait until any other `dc_shell` that uses DC-XG licenses is done.
- Obtain more license tokens.

SEE ALSO

`list_licenses` (2), `license_users` (2)

DCSH-13 (information) Checking out DC-XG license token.

DESCRIPTION

You receive this message because you have entered XG mode.

As soon as DC switches to xg-mode one token of DC-XG license feature is checked out. Upon leaving xg-mode the token is checked in again.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`list_licenses` (2), `license_users` (2)

DCSH-14 (information) Successfully checked out feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable `SNPSLMD_QUEUE` to TRUE in `dc_shell`.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

DCSH-15 (information) Started queuing for feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE in dc_shell.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

DCSH-16 (information) Still waiting for feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE in dc_shell.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

DCSH-17 (information) Timeout while waiting for feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE in dc_shell.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

DCSH-18 (information) License queuing is enabled.

DESCRIPTION

You receive this message because you have enabled licensing queuing.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

DCT

DCT-001 (Error) Hierarchical cell %s is an ILM, cannot set as a physical hierarchy.

DESCRIPTION

You receive this error message because a hierarchical cell cannot be a physical hierarchy if it is already an ILM.

WHAT NEXT

To have this cell as a physical hierarchy, please provide the full netlist of the hierarchy at the top level, instead of an ILM.

SEE ALSO

`set_physical_hierarchy` (2), `create_ilm` (2)

DCT-002 (Error) Cell %s is not a hierarchical cell placed by DCT, thus cannot be set as a physical hierarchy.

DESCRIPTION

You receive this error message because for a cell to be set as a physical hierarchy, it has to be a hierarchical cell placed by DCT.

WHAT NEXT

To have this cell as a physical hierarchy, please make sure the cell is a hierarchical cell and provide DCT placed full netlist of the hierarchy at the top level.

SEE ALSO

`set_physical_hierarchy` (2), `create_ilm` (2)

DCT-003 (Info) Cell %s is a physical hierarchy already. The

command is ignored.

DESCRIPTION

You receive this information message because for a cell has been set as a physical hierarchy by a previous `set_physical_hierarchy` command. The currently issued command is ignored.

WHAT NEXT

To avoid getting this message, dont issue `set_physical_hierarchy` on the same cell more than once.

SEE ALSO

`set_physical_hierarchy` (2)

DCT-004 (warning) The newly created cell does not have location. Timing will be inaccurate.

DESCRIPTION

This warning message occurs when you create a new cell in DC topographical mode by using the command `create_cell`. In topographical mode, DC uses cell locations to estimate net delays. Since the new cell does not have a location, the timing information for the nets connected to this cell will not be accurate.

WHAT NEXT

You can assign cell locations by running `compile_ultra -incremental`, which also updates the timing information for the nets. You can also set cell location using `set_cell_location -fixed`, and then call `update_timing` or `report_timing` to update the net delays.

SEE ALSO

`report_timing(2)`
`set_cell_location(2)`

DCT-005 (Error) Cannot run `compile_ultra incremental` in congestion mode.

Design was not compiled with DC-Topographical congestion

optimizations.

DESCRIPTION

You receive this error message because **compile_ultra** incremental in congestion mode cannot be used with designs that were compiled in DC-Topographical non-congestion mode.

WHAT NEXT

Rerun **compile_ultra** in non-incremental congestion mode to get the benefits of DC-Topographical congestion optimization.

SEE ALSO

DCT-006 (Warning) Some checks cannot be performed because of previous errors.

DESCRIPTION

You receive this error message because **compile_ultra -check_only** meets some errors before some checks are executed.

WHAT NEXT

Make sure your target library is not empty and physical layer data is sufficient.

SEE ALSO

DCT-007 (Information) Total fixed/moveable cell area and utilization are not completely calculated because the design contains unmapped logic.

DESCRIPTION

You receive this message because the design contains unmapped logic.

WHAT NEXT

Compile the design, then apply `report_area -physical`.

SEE ALSO

DCT-008 (Information) Core area and utilization/aspect ratio were not calculated because there are no site rows.

DESCRIPTION

You receive this message because no site rows are applied during `extract_physical_constraints`.

WHAT NEXT

Check the DEF contains legal site rows, then use `extract_physical_constraints` to apply them.

SEE ALSO

DCT-009 (Error) Failed to generate intermediate file used to extract physical constraints.

DESCRIPTION

You receive this error message because `extract_physical_constraints` failed to generate an intermediate file, which is used to save the physical constraints extracted from DEF.

WHAT NEXT

Make sure you have write permissions on the following place: (1) the place of the env variable TMPDIR, if you set it. (2) the current directory ".", if env variable TMPDIR is not set. (3) the default "/tmp";

SEE ALSO

DCT-010 (Error) Failed to apply physical constraints.

DESCRIPTION

You receive this error message because `extract_physical_constraints` failed to apply the physical constraints extracted from the DEF.

WHAT NEXT

Make sure the intermediate file was not modified.

SEE ALSO

`extract_physical_constraints` (2)

DCT-011 (Error) at line: %d, failed to apply the physical constraints command:

`%s`

DESCRIPTION

You receive this error message because `extract_physical_constraints` failed to apply the command printed out.

WHAT NEXT

Make sure the intermediate file was not modified.

SEE ALSO

`extract_physical_constraints` (2)

DCT-012 (Error) Inconsistent number of physical constraints:

%d extracted while %d applied

DESCRIPTION

You receive this error message because the number of extracted commands is not consistent with the applied one in `extract_physical_constraints`.

WHAT NEXT

Make sure the intermediate file was not modified.

SEE ALSO

`extract_physical_constraints` (2)

DCT-016 (Error) Failed to recognize the type of net shape.

DESCRIPTION

You receive this error message because `create_net_shape` cannot recognize the type of net shape from the specified options.

WHAT NEXT

Please check: (1) "-points", "-bbox" or "-origin" cannot be specified together, and at least one of them should be specified. (2) "-points" should be specified with "-type path", "-bbox" should be specified with "-type rect|bbox", "-origin" should be specified with "-type rect".

SEE ALSO

`extract_physical_constraints` (2)

DCT-017 (Error) Only horizontal or vertical net shapes allowed.

DESCRIPTION

You receive this error message because invalid value of option '-points' is specified in `create_net_shape`.

WHAT NEXT

Please check the values specified in "-points", ensure that segment in the path should be vertical or horizontal.

SEE ALSO

`extract_physical_constraints` (2)

DCT-018 (Error) net shape geometry style '%s' should be specified in option '%s'.

DESCRIPTION

You receive this error message because invalid value of option specified in `create_net_shape`.

WHAT NEXT

SEE ALSO

`extract_physical_constraints` (2)

DCT-019 (Error) mutually exclusive options: '-points', '-origin' and '-bbox'.

DESCRIPTION

You receive this error message because '-points', '-origin' and '-bbox' cannot be used together in `create_net_shape`.

WHAT NEXT

SEE ALSO

`extract_physical_constraints` (2)

DCT-020 (Information) net shape with type %s will be created

during compile.

DESCRIPTION

You receive this message because the physical information of `create_net_shape` is recorded, and the real net shape will be created in compile.

WHAT NEXT

SEE ALSO

`extract_physical_constraints` (2)

DCT-021 (Information) %d net shapes were created from physical constraints.

DESCRIPTION

You receive this message because real net shapes were created from the physical information recorded from the command `create_net_shape`.

WHAT NEXT

SEE ALSO

`extract_physical_constraints` (2)

DCT-022 (Error) Failed to transfer current design to MW database.

DESCRIPTION

This error occurs when the tool failed to transfer the DC design into Milkyway CEL database. The command you are using requires that the design will be saved as an intermediate CEL in the current Milkyway library. For this command to work properly, it is required that you use Milkyway library for the physical data of the design.

WHAT NEXT

Use `open_mw_lib` command to open an existing Milkyway library. Use `create_mw_lib`

command to create a Milkyway library if one does not exist. Run the command again.

DCT-023 (Warning) %s in command %s is not supported in topographical mode.

Adding %s to the command.

DESCRIPTION

You receive this message because the command `create_net_shape` does not support snapping on the geometries, it is the same with the situation that "-no_snap" is added to the command.

WHAT NEXT

SEE ALSO

`create_net_shape` (2)

DCT-024 (Error) should specify '-net_type' for invalid physical net %s.

DESCRIPTION

You receive this message because an invalid net name is specified in the command `create_net_shape`, in this case, '-net_type' should be specified.

WHAT NEXT

SEE ALSO

`create_net_shape` (2)

DCT-025 (Error) should avoid option '-net_type' for existing physical net %s.

DESCRIPTION

You receive this message because the value of option '-net_type' is not consistent

with the type of the existing nets.

WHAT NEXT

Remove the option '-net_type'.

SEE ALSO

`create_net_shape` (2)

DCT-026 (Information) Turning on congestion optimizations for '%S'.

DESCRIPTION

Design Compiler Topographical has detected that the design was optimized for reduced routing related congestion. The command being executed has the ability to further optimize for reduced routing related congestion and this is being enabled automatically. Congestion optimization and reporting is available with Design Compiler Graphical.

WHAT NEXT

SEE ALSO

DCT-027 (Error) The version of DC-Topographical %s data stored in the design is newer than your executable.

DESCRIPTION

You received this message because the tool version you used to save DC-Topographical data is newer than the tool version you are using to read it. The indicated data will be ignored.

WHAT NEXT

Use the same or newer tool version to read the design.

SEE ALSO

DCT-028 (Information) net shapes on net %s are being ignored and removed.

DESCRIPTION

You receive this message because DC-Topographical has identified that the net shapes associated with the indicated net should not be created during `compile_ultra`. net shape information for a net is maintained if one of the following conditions is met: (1) Net is defined as Power or Ground by `create_net_shape`. (2) The net does not exist in the logical netlist and did not exist when the `create_net_shape` command was called for it. (3) Net is a "physical only" net.

SEE ALSO

`create_net_shape` (2) `compile_ultra` (2)

DCT-029 (Warning) Using pdb file(s) for physical library information in DC-Topographical flow is not supported.

DESCRIPTION

You received this message because .pdb format is not supported in DC-Topographical for physical library information. Milkyway format should be used for physical library information.

WHAT NEXT

Setup your flow to use Milkyway library and rerun.

SEE ALSO

`create_mw_lib` (2) `open_mw_lib` (2)

DCT-030 (Error) Arnoldi-based delay calculation is not

supported in '%s'.

DESCRIPTION

You received this message because your RC delay calculation is set to use post-route Arnoldi model. DC-Topographical does not support Arnoldi-based delay calculation in the given command. Arnoldi-based delay calculation is usually set using the command `set_delay_calculation -arnoldi`.

WHAT NEXT

Modify your script to avoid setting post-route delay calculation mode and rerun.

SEE ALSO

`set_delay_calculation` (2)

DCT-031 (Error) design %s contains %d net shapes but only %d were restored.

DESCRIPTION

You received this message because DC-Topographical failed to restore some or all of the net shapes associated with the design. This may be due to missing physical information when linking the design. Specifically, this issue is commonly caused by incomplete physical layer information when the design is linked.

WHAT NEXT

Fix your script to correctly setup DC-Topographical physical data and rerun.

SEE ALSO

`compile_ultra` (2)

DCT-032 (Warning) Preroute extraction is disabled since no Milkyway library is open.

DESCRIPTION

You received this message because `extract_physical_constraints` command requires a

Milkyway library to be open in order to extract pre-route data correctly. Since DC-Topographical could not find any open Milkyway library, extraction of pre-routes is being automatically disabled.

WHAT NEXT

If pre-route extraction is desired, modify your script to setup and open a Milkyway library and rerun.

SEE ALSO

`extract_physical_constraints` (2) `create_mw_lib` (2) `open_mw_lib` (2)

DCT-033 (warning) Failed to derive preferred routing direction for the design routing layers.

DESCRIPTION

This warning message occurs when Design Compiler topographical fails to automatically derive the preferred routing direction for the design layers. The cause may be that the tool could not find `unitTile` in the Milkyway main and reference libraries, or that `WireDirection` is missing in the `unitTile` library.

WHAT NEXT

Set the preferred routing direction for layers with the `set_preferred_routing_direction` command.

SEE ALSO

`set_preferred_routing_direction`(2)

DCT-034 (warning) No TLUPlus file identified.

DESCRIPTION

This warning message occurs when Design Compiler topographical is not set up to use TLUPlus files for RC extraction. For better accuracy specify a TLUPlus file using the `set_tlu_plus_files` command.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, set up the flow to use TLUPlus files for RC extraction and run the command again.

SEE ALSO

`report_tlu_plus_files(2)`
`set_tlu_plus_files(2)`

DCT-035 (information) No preferred routing direction is found for design layer %s. Automatically deriving direction %s.

DESCRIPTION

This information message occurs when the routing direction is missing for the specified layer. Design Compiler topographical automatically derives a preferred routing direction for the layer.

WHAT NEXT

This is an information only message. No action is required.

SEE ALSO

`set_preferred_routing_direction(2)`

DCT-036 (warning) Components '%s' associated with the blockage are ignored.

DESCRIPTION

You receive this warning message because components associated with the blockage are ignored in the `extract_physical_constraints` command.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`extract_physical_constraints(2)`

DCT-037 (warning) 'POLYGON' blockage is not supported.

DESCRIPTION

You receive this warning message because 'POLYGON' blockage is not supported in the **extract_physical_constraints** command.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`extract_physical_constraints(2)`

DCT-041 (information) Core area not specified.

DESCRIPTION

This information message occurs because the core area is not specified for this design. The floorplan information will be automatically generated when the **compile_ultra** command is run. This may not correlate with the ICC runs.

WHAT NEXT

This is only an information message. No action is required.

However, to set the core area, use the **extract_physical_constraints** command and ensure that the placement area is specified.

SEE ALSO

`compile_ultra(2)`
`extract_physical_constraints(2)`
`report_physical_constraints(2)`

DCT-042 (information) The port %s does not have a user-defined location.

DESCRIPTION

This information message occurs when the port does not have a user-specified location. The port will be assigned a location when the **compile_ultra** command is

run. The information may not correlate with the ICC run.

WHAT NEXT

This is only an information message. No action is required.

However, if you want to set the port location, use either the **set_port_location** or the **extract_physical_constraints** command.

SEE ALSO

```
compile_ultra(2)
extract_physical_constraints(2)
report_physical_constraints(2)
set_port_location(2)
```

DCT-043 (information) The %s %s does not have a user-defined location.

DESCRIPTION

This warning message occurs when the macro or pad does not have a user-specified location. The macro will be assigned a location when the **compile_ultra** command is run. The information may not correlate with the ICC run.

WHAT NEXT

This is only a warning message. No action is required.

However, if you want to set the macro or pad location, use either the **set_cell_location** or the **extract_physical_constraints** command.

SEE ALSO

```
compile_ultra(2)
extract_physical_constraints(2)
report_physical_constraints(2)
set_cell_location(2)
```

DCT-044 (information) The cell %s is a black box.

DESCRIPTION

This information message occurs when the tool will generate a physical size for the black box. The information may not correlate with ICC.

WHAT NEXT

This is only an information message. No action is required.

However, you can update the target libraries and physical libraries to include the specified cell.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

DCT-046 (information) The ILM %s does not have a user-specified location.

DESCRIPTION

This information message occurs when the ILM does not have a user-specified location. The ILM will be assigned a location when the `compile_ultra` command is run. The information may not correlate with the ICC run.

WHAT NEXT

This is only information message. No action is required.

However, you can avoid this message by placing the ILM.

SEE ALSO

`compile_ultra(2)`
`extract_physical_constraints(2)`
`report_physical_constraints(2)`

DCT-047 (information) The physical block %s does not have a user-specified location.

DESCRIPTION

This information message occurs when because the specified physical block is not placed. The `compile_ultra` command run will place this physical block.

WHAT NEXT

This is only an information message. No action is required.

However, to avoid this message, place the physical block.

SEE ALSO

`compile_ultra(2)`
`extract_physical_constraints(2)`
`report_physical_constraints(2)`

DCT-048 (error) Unable to find location for port %s of ILM or physical block %s.

DESCRIPTION

This error message occurs when the port location cannot be found for the ILM or physical block.

WHAT NEXT

Ensure that all ports for the ILM or physical blocks have legal locations and run the command again.

SEE ALSO

`compile_ultra(2)`

DCT-049 (error) Unable to find location for cell %s of ILM or physical block %s.

DESCRIPTION

This error message occurs because the locations cannot be found for the specified cells of the ILM or physical block.

WHAT NEXT

Ensure that all cells of the ILM or physical blocks have legal locations and run the command again.

SEE ALSO

`compile_ultra(2)`

DCT-050 (error) Option %s is no longer supported in the %s command.

DESCRIPTION

This error message occurs because the specified option to the command is obsolete. You can no longer use this option with this command.

WHAT NEXT

Modify your script to use only the current options and rerun the command.

DCT-051 (Information) The port %s has internally generated location.

DESCRIPTION

This information message occurs when the port does not have a user-specified location. The port is assigned a location when the **compile_ultra** command is run. This information may not correlate with the ICC run.

WHAT NEXT

This is only an information message. No action is required.

However, if you want to set the port location use either the **set_port_location** or the **extract_physical_constraints** command.

SEE ALSO

`extract_physical_constraints(2)`

DDB-7 (warning) Consistency problem: net %s is not owned by any design.

DESCRIPTION

WHAT NEXT

DDB-8 (warning) Consistency problem: a pin was found without a corresponding port.

DESCRIPTION

WHAT NEXT

DDB-9 (warning) Consistency problem: cell %s was found

without a corresponding reference.

DESCRIPTION

WHAT NEXT

DDB-10 (warning) Consistency problem detected in design '%s'
 %s

DESCRIPTION

WHAT NEXT

DDB-11 (warning) Internal error
 %s

DESCRIPTION

WHAT NEXT

DDB-12 (warning) Removed duplicate cell '%s'.

DESCRIPTION

WHAT NEXT

DDB-13 (warning) The name of net '%s' in design '%s' can't be changed

to the name of both ports '%s' and '%s' to which it's connected.

DESCRIPTION

WHAT NEXT

DDB-14 (warning) The net '%s' in design '%s' is connected to both ports '%s' and '%s'.

DESCRIPTION

Two ports can only be connected to a net if they are inout ports or if they drive wired logic. Connecting two input ports to a net can limit the optimization that can be performed by Design Compiler on the net.

WHAT NEXT

Disconnect one of the ports from the net using the **disconnect_net** command.

DDB-21 (error) Conflict between logic 0 and 1. Can't %s.

DESCRIPTION

The two specified ports were set previously as logic 0 and 1. They might not have been directly set, but could have been implicitly set by a sequence of **set_equal** and **set_opposite** commands.

WHAT NEXT

If the ports were directly set as logic 0 and 1, the next steps are as follows:

Use **report_attributes** commands on the two ports. They will have the driven_by_logic_zero and driven_by_logic_one attributes set.

Remove one of these two attributes, one of which is incorrect, using the **remove_attribute** command

Reissue the original command.

If the ports were implicitly set as logic 0 and 1 through a sequence of **set_equal** and **set_opposite** commands, the next step is as follows:

Use the **reset_design** command to remove the setting of 0 and 1 on the ports. This command removes all other constraints on the design and should be used with caution.

DDB-22 (error) Can't set equal ports opposite in design '%s': '%s' '%s'.

DESCRIPTION

The two ports were set as equal ports previously. They might not have been directly set, but could have been implicitly set by a sequence of **set_equal** and **set_opposite** commands.

WHAT NEXT

The two specified ports were set previously as equal ports. The only way to revert back this setting is to reset the design using the **reset_design** command. This command removes all other constraints on the design and should be used with caution.

DDB-23 (error) Can't set opposite ports equal in design '%s': '%s' '%s'.

DESCRIPTION

The two ports were set as opposite ports previously. They might not have been directly set, but could have been implicitly set by a sequence of **set_equal** and **set_opposite** commands.

WHAT NEXT

The two specified ports were previously set as opposite ports. The only way to revert back this setting is to reset the design using the **reset_design** command. This command removes all other constraints on the design and should be used with caution.

DDB-24 (warning) Overwriting design file '%s/%s'.

DESCRIPTION

Overwriting the specified version of the design with more recent version.

WHAT NEXT

Warning only. No action is required.

DDB-27 (error) '%s' value must be positive.

DESCRIPTION

A negative value was entered. Constraint values must be positive (or 0).

WHAT NEXT

Please enter a non-negative value.

DDB-28 (error) '%s' cannot be set on %s pin '%s'.

DESCRIPTION

The specified constraint cannot be set on a pin of the specified direction. The constraint command will be ignored.

WHAT NEXT

Please enter a correct constraint command.

DDB-29 (error) '%s' cannot be set on %s port '%s'.

DESCRIPTION

The specified constraint cannot be set on a port of the specified direction. The constraint command will be ignored.

WHAT NEXT

Please enter a correct constraint command.

DDB-30 (error) Can't specify output port '%s' as a path

startpoint.

DESCRIPTION

Output ports are not valid as path startpoints. There are no timing paths from such ports.

WHAT NEXT

Examine the design to determine the correct startpoint for the path.

DDB-31 (error) Can't specify input port '%s' as a path endpoint.

DESCRIPTION

Input ports are not valid as path endpoints. There are no timing paths to such ports.

WHAT NEXT

Examine the design to determine the correct endpoint for the path.

DDB-32 (error) Can't specify hierarchical cell '%s' as a path '%s'.

DESCRIPTION

Hierarchical cell names are not valid as path startpoints or endpoints.

WHAT NEXT

Use a clock, port, pin (leaf or hierarchical), or cell (leaf only) as the path startpoint or endpoint.

DDB-33 (error) Pin '%s' does not have a library hold time.

DESCRIPTION

None.

WHAT NEXT

Check the target library.

DDB-34 (error) %s '%s' is in design '%s', but %s '%s' is in design '%s'.

DESCRIPTION

None.

WHAT NEXT

None.

DDB-35 (error) '%s' does not exist in library '%s'.

DESCRIPTION

The listed key in the error message does not exist in the library.

WHAT NEXT

Check the key file.

DDB-38 (error) Can't open security file '%s' for protected library '%s'.

DESCRIPTION

Cannot open security file.

WHAT NEXT

Check the security file.

DDB-39 (error) Bad security key in file '%s' for library '%s'.

DESCRIPTION

You are trying to invoked **read_lib** on a protected library.

WHAT NEXT

If a nodelocked library, check and correct these attributes: key_file, key_seed, and key_bit. If a network licensing library, check and correct these attributes: key_feature, key_version, and key_seed. Then reinvode the **read_lib** command.

DDB-40 (error) Can't read protected library '%s'.

DESCRIPTION

You are trying to invoked **read_lib** on a protected library.

WHAT NEXT

If a nodelocked library, check and correct these attributes: key_file, key_seed, and key_bit. If a network licensing library, check and correct these attributes: key_feature, key_version, and key_seed.

DDB-41 (error) Incomplete library protection attributes.

DESCRIPTION

WHAT NEXT

DDB-43 (warning) Could not create attribute '%s' for %s objects.

DESCRIPTION

WHAT NEXT

DDB-44 (error) Can't read unprotected library '%s'.

DESCRIPTION

WHAT NEXT

DDB-45 (error) A design with name '%s' already exists in the same design file as design '%s'.

DESCRIPTION

WHAT NEXT

DDB-46 (error) A reference with name '%s' already exists in

design '%s'.

DESCRIPTION

WHAT NEXT

DDB-47 (error) A cell with name '%s' already exists in design '%s'.

DESCRIPTION

WHAT NEXT

DDB-48 (warning) Creating port '%s' on design '%s' with direction unknown.

DESCRIPTION

WHAT NEXT

DDB-51 (warning) In the value of %s,
the characters separating the "%s" and "%d" those
separating each "%d"

DESCRIPTION

WHAT NEXT

DDB-52 (error) The value of %s

DDB-52 (error) The value of %s
must include one "%s" and two "%d

DESCRIPTION

WHAT NEXT

DDB-53 (error) The value of %s
must include one "%s" and one "%d

DESCRIPTION

The message is printed out when the current command found invalid value in the indicated variable.

WHAT NEXT

Check the value of the given variable and provide the valid value.

DDB-54 (error) The value of %s
must include only one "%s" and only two "%d

DESCRIPTION

The error message is printed out when the current command found invalid value in the indicated variable.

WHAT NEXT

Provide the valid value for this variable.

DDB-55 (error) The value of %s
must include only one "%s" and only one "%d

DESCRIPTION

The error message is printed out when the current command found invalid value for the indicated variable name included in the message.

WHAT NEXT

Provide the valid value for this variable.

DDB-56 (error) In the value of %s,
there are no characters separating %s.

DESCRIPTION

This error message is printed out when the current command found that there are no character separators.

WHAT NEXT

Provide the valid value for the command.

DDB-57 (error) In the value of %s,
the %s of the characters separating
%s must not be %s a digit.

DESCRIPTION

This error message is printed out when the current command found digit in the character separators.

WHAT NEXT

Provide the valid value for the command.

DDB-58 (warning) In the value of %s,
there are no characters separating the "%s" and "%d be
ambiguous).

DESCRIPTION

If no characters separate the array name from the member number, the bus names will be ambiguous for arrays whose names end in a digit. For example, with **bus_naming_style** set to "%s%d", the name of the third member of array "A1" and the thirteenth element of array "A" would both have the name "A13".

WHAT NEXT

Most likely you should change the value of the bus naming style to contain some characters between the "%s" and "%d". See the help page for **bus_naming_style** for details.

DDB-60 (error) Could not find library pin for pin '%s'.

DESCRIPTION

The back-annotation failed because the pin does not have a corresponding pin in the link library.

WHAT NEXT

Verify that the design is fully linked with the 'link' command. Verify that all link and target library search paths are valid.

DDB-66 (warning) Removing group '%s'.

DESCRIPTION

The path group is being removed because the operation being performed has removed the last path from the group.

WHAT NEXT

Be aware that any subsequent attempts to use this path group will fail because the group has been deleted. If you think the group should not have been deleted, identify at least one path you think should still be in the group and trace back to find which action deleted that path.

DDB-67 (warning) Removing %s from group '%s'.

DESCRIPTION

WHAT NEXT

DDB-68 (warning) Removing external delay related to clock %s.

DESCRIPTION

When a clock source is deleted from the design using the 'remove_clock' command, all input and output delay values that were specified relative to that clock are also deleted from the design. For example, consider the following script:

```
create_clock -name CLK -period 10 set_input_delay 2 -clock CLK all_inputs()  
set_output_delay 2 -clock CLK all_outputs()  
  
remove_clock CLK
```

The 'remove_clock' command will also have the effect of removing the input and output delay values that were specified relative to CLK.

WHAT NEXT

No action is required, this is merely an informational warning.

DDB-70 (error) None of the selected cells were grouped.

DESCRIPTION

When using the 'group' command on an hdl design that has not been compiled yet, it is possible that the cells you specified to be grouped cannot be grouped because they need to stay with thier neigboors until the design has gone through resource sharing in compile.

WHAT NEXT

Use the 'group' command after the design has been compiled.

DDB-71 (error) Design '%s' requires one of the following

licenses: '%s'.

DESCRIPTION

The specified design is licensed and requires one of the listed licenses to be available. An error has occurred because none of the licenses could be obtained.

WHAT NEXT

Verify that your site has at least one of the specified licenses. If it does not, then one must be purchased. If your site does have one of the licenses, try again when the license is available.

DDB-72 (information) Added key list '%s' to design '%s'.

DESCRIPTION

Indicates that the listed set of licenses have been associated with the specified design. Accessing the design will require that one of the listed licenses can be successfully checked out.

WHAT NEXT

No action is required since this is just an information message.

DDB-73 (warning) License '%s' contains the illegal character '%C'.

It was ignored.

DESCRIPTION

One of the licenses associated with a design contains an invalid character. That license will be dropped from the list of licenses which can be used to access the design.

WHAT NEXT

If a design is associated with multiple licenses, it may be possible to access the design via a different, valid license. In any case the license name should be updated so that it does not contain any invalid characters. Invalid characters include: ',', '}', '{', '**', ''.

DDB-74 (warning) Design '%s' inherited license information from design '%s'.

DESCRIPTION

All of the licenses associated with one design have now been associated with another design. This typically happens when a design is ungrouped. In that situation, the parent design will inherit all licensing information from the ungrouped design.

WHAT NEXT

Although this is classified as a warning, it is essentially just an information message. No action is required.

DDB-75 (warning) Design '%s' is being converted to a limited design.

DESCRIPTION

This message indicates that the indicated design has been converted into a limited design. A limited design is a design which can be compiled and analyzed, but whose contents may not be examined or written out.

A design gets converted into a limited design in two situations. In the first case you have only an evaluation license for the design (obtained by manually setting synlib_disable_limited_licenses = "FALSE"), and the design will remain limited because the intent of an evaluation license is for the design data to be restricted. In the second case the design was derived from a DesignWare part and has not yet been run through the **compile** command. In this latter case the design remains limited only until after it has been compiled, at which point the limitation is removed. The intent of this latter limitation is to protect the technology-independent structure of the design.

WHAT NEXT

If you have only an evaluation license for the limited design, then the only way to gain access to the internals of that design is through the use of a full license for that part; if a full license is subsequently obtained then the first **compile** command will remove the 'limited design' restrictions. If the design has already been compiled, it is sufficient to run the **get_license** command to convert the limited design back to a regular, unrestricted format.

If you already have a full license for the limited design, then after the first **compile** command you can expect the design to be converted back to a regular, unrestricted format.

DDB-76 (error) Cannot load design '%s'.

DESCRIPTION

The named design cannot be loaded into Design Compiler's internal data structures. This can happen if certain synthetic parts cannot be found.

WHAT NEXT

Attempt to link the design with the command `link -all`. If this fails, check that the software is correctly installed.

DDB-77 (error) License '%s' is a Synopsys internal key and should not have a seed associated with it.

DESCRIPTION

When license names are set on a design, third party keys must have a seed associated with them. It is an error, however, for Synopsys internal keys to have seeds.

WHAT NEXT

When creating your own license names, make sure that they do not clash with the Synopsys internal license names.

DDB-78 (error) No seed provided for the third-party license '%s'.

DESCRIPTION

When adding a third-party license, you must specify both a license name and a non-zero seed. This prevents third party vendors from creating keys for each other's licenses.

WHAT NEXT

Specify the license name as `name/seed`. For example: "MY_LIC/1234"

DDB-79 (error) The license '%s' has an invalid seed associated

with it.

DESCRIPTION

This error occurs when the `set_design_license` command is used to store a third party license and a seed, and the seed that is specified is not consistent with the seed that was used to create the key.

WHAT NEXT

Either generate a new key with the correct seed, or change the `set_design_license` command line so that the seeds are consistent.

DDB-80 (error) The seed '%s' specified for license '%s' is not a valid 32-bit integer.

DESCRIPTION

Licenses can be specified in the from '<license>/<seed>' where <seed> is supposed to be a valid integer which can be represented in 32 bits. In this case the <seed> specified was either not an integer, or was too large to be represented in 32 bits.

WHAT NEXT

The <seed> associated with the license needs to be corrected such that it is a valid integer which can be stored in at most 32 bits.

DDB-81 (warning) Unable to find specified driving_cell for port '%s'.

DESCRIPTION

The driving_cell attributes indicate that a port should inherit its drive capability from a certain library cell. This error means that the tool was unable to locate a matching library cell or pin on that library cell. This may happen if the link_library does not contain the library for that cell, or if the cell name or pin name was incorrect. The driving cell information can be seen using `report_port -drive`. It may have been set by either `set_driving_cell` or `characterize`.

WHAT NEXT

If the driving cell requires a library that has not been identified in the

link_library, the **link_library** should be changed to include that library. Otherwise, check the information for errors in **cell_name**, library name, or pin names using **report_port -drive -only port_name**.

DDB-84 (error) Only ports of the same direction can be grouped.

DESCRIPTION

WHAT NEXT

DDB-85 (error) Objects must be either all ports or all nets.

DESCRIPTION

This error message is issued if a mixture of objects of different types is given as input to a command that requires a homogenous set of ports or nets as input.

WHAT NEXT

Re-issue the command specifying only ports or only nets as input.

DDB-86 (error) Bus name '%s' conflicts with existing names.

DESCRIPTION

This error message is issued when an attempt is made to create a bus with a name that conflicts with the name of an existing bus.

WHAT NEXT

Re-issue the command with a non-conflicting name for the bus.

DDB-87 (error) All objects must be from the same design.

DESCRIPTION

This error message is issued if a command that requires a set of objects belonging to the same design is invoked with objects that belong to different designs.

WHAT NEXT

Re-issue the command with a set of objects that belong to the same design.

DDB-88 (error) At least one of the port objects specified is already a member of a bus.

DESCRIPTION

This error message is displayed if an attempt is made to insert a port that belongs to a bus into a new bus.

WHAT NEXT

Re-issue the command with ports that do not belong to an existing bus.

DDB-89 (error) Type name '%s' conflicts with existing type.

DESCRIPTION

This error message is issued if an attempt to create a type for a new bus object is made with a type name that is already used for another bus object with a different width.

WHAT NEXT

Change the name of the new bus type.

DDB-90 (error) specified range is different from number of objects to be bussed.

DESCRIPTION

WHAT NEXT

DDB-91 (error) only designs or references can have busses

created in them.

DESCRIPTION

WHAT NEXT

DDB-92 (error) Cannot load design '%s' for an HDL embedded command.

DESCRIPTION

The named design cannot be loaded for the current command embedded in an HDL file. The current embedded command is not legal within an embedded script. See the HDL Compiler Manual for details.

WHAT NEXT

Change the embedded script so that it does not use the offending command.

DDB-95 (warning) Unable to find net instance '%s' in design '%s'.

DESCRIPTION

Back-annotation, such as a set_load or set_resistance value, was stored on a net instance within the design, but that instance can no longer be found. This can occur if a lower-level design containing the net instance was modified but the top-level design was unaware of this change. Commands which could modify lower level designs include **ungroup**, **change_names**, and **compile**.

WHAT NEXT

Perform **ungroup** and **change_names** at the top level so that the top level design will have a chance to update its back-annotation records. Use **characterize** to move annotation to a subdesign before running **compile** or **reoptimize_design** on that subdesign.

DDB-100 (warning) Unable to find minimum version of library

cell '%s/%s' in library '%s'.

DESCRIPTION

The **set_min_library** command has been used to indicate that timing data for minimum analysis must use a particular library, but this library cell cannot be found in that minimum library. Design Compiler will use the maximum version of the cell for both maximum and minimum analysis in this case.

WHAT NEXT

Check that the **set_min_library** command specified the correct library for minimum analysis. See if the indicated library cell was accidentally left out of the minimum analysis library.

DDB-101 (warning) Unable to find minimum version of library pin '%s/%s' in library '%s'.

DESCRIPTION

The **set_min_library** command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has conflicting pin descriptions between the maximum and minimum libraries. In this case, a pin exists on the library cell in the maximum library, but that pin does not exist in the minimum library. Design Compiler will use the maximum version of the library pin for both maximum and minimum analysis in this case.

WHAT NEXT

Check that the **set_min_library** command specified the correct library for minimum analysis. See if the indicated library pin was accidentally left out of the minimum analysis library.

DDB-102 (warning) Conflicting timing arc descriptions between maximum library '%s' and minimum library '%s' to pin '%s/%s'.

DESCRIPTION

The **set_min_library** command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has conflicting timing arc descriptions between the maximum and minimum libraries. In this case, a timing arc exists on the library cell in the maximum library, but a corresponding timing arc does not exist in the minimum library. Design Compiler will

use the maximum version of the timing arc for both maximum and minimum analysis in this case.

In order to consider timing arcs as compatible between minimum and maximum libraries, they must have the same sense (for example, positive unate, or clear), they must have the same SDF condition, and there must be the same number of arcs of each type between a pair of pins.

WHAT NEXT

Check that the **set_min_library** command specified the correct library for minimum analysis. See if timing arcs to the indicated library pin were accidentally left out of the minimum analysis library.

DDB-103 (warning) Pin %s of lib cell %s exists in maximum library %s but not in minimum library %s. Assuming min delay for pin to be same as max delay.

DESCRIPTION

The **set_min_library** command has been used to indicate that timing data for minimum analysis must use a particular library, but the indicated library cell has some pins in the max library which don't exist in the minimum libraries. Design Compiler will use the maximum version of the timing arc for both maximum and minimum analysis in this case.

In order to be compatible between minimum and maximum libraries, the library cells must have the same pins and same timing arcs (same sense (for example, positive unate, or clear), they must have the same SDF condition), and there must be the same number of arcs of each type between a pair of pins.

WHAT NEXT

Check that the **set_min_library** command specified the correct library for minimum analysis. See if the specified pins of the specified library cell were accidentally left out of the minimum analysis library.

DDB-105 (warning) Design '%s' requires one of the following licenses: '%s'.

Waiting for license to become available, press <ctrl>-C to

terminate.

DESCRIPTION

The specified design is licensed and requires one of the listed licenses to be available. None of the licenses could be obtained. Design Compiler will wait for one of the licenses to become available and then continue.

WHAT NEXT

Verify that your site has at least one of the specified licenses. If it does not, then one must be purchased. If you wish to terminate the command instead of waiting for the license to become available, set synlib_wait_for_design_license = {}

DDB-107 (warning) Deleted or recreated %d internal pin(s) on cell '%s'. All attributes and attaches on it(them) are lost.

DESCRIPTION

The **access_internal_pins** variable controls creation and deletion of internal pins and user access to them. Because of the source of internal pins, they are created or deleted during link time, depending on the setting of this variable. You can use the **find** and **get_pins** commands to show internal pins, if such pins exist. Certain timing commands can also set constraints on internal pins.

WHAT NEXT

If this is what you intended to do, no action is necessary.

SEE ALSO

find (2), **get_pins** (2), **link** (2); **access_internal_pins** (3).

DDC

DDC-1 (error) Unable to open DDC file '%s' for writing.

DESCRIPTION

dc_shell encountered an I/O error when it attempted to open the specified DDC file for writing.

WHAT NEXT

Check that the file name is correct, that the directory exists and is writable, and that the filesystem is not full. If the target file already exists it must be writable in order for **dc_shell** to overwrite it.

DDC-2 (error) Unable to open file '%s' for reading.

DESCRIPTION

The tool encountered an error when it attempted to open the specified DDC file for reading.

WHAT NEXT

Check that the path to the file is correct and that the file is readable by the current user. Also verify that the file was written in DDC format.

SEE ALSO

`write_file(2)`

DDC-3 (error) DDC internal write error in design '%s'.

DESCRIPTION

dc_shell encountered an internal error while attempting to write the specified design. No DDC file was produced.

WHAT NEXT

Please contact the Synopsys Support Center for assistance.

DDC-4 (error) DDC internal read error in file '%s'.

DESCRIPTION

dc_shell encountered an internal error while attempting to read the specified file. No designs were read.

WHAT NEXT

Please contact the Synopsys Support Center for assistance.

DDC-5 (error) Design data is corrupt in DDC file.

DESCRIPTION

The file being read has been modified or corrupted since it was originally written by **dc_shell**.

WHAT NEXT

The DDC file must be re-created from the original design source. Note that DDC files cannot be edited by the user.

DDC-6 (error) DDC file version is not compatible. The DDC file was written with dc_shell version %s dated %s.

DESCRIPTION

The file being read is an incompatible version of DDC that cannot be read with this release of **dc_shell**.

WHAT NEXT

If the DDC file was written with an older release of **dc_shell**, you can run that version of **dc_shell** to read the file and write it out in DB format. The current version of **dc_shell** should be able to read the DB file and convert it to the current DDC format.

If a newer release of **dc_shell** was used to write the DDC file, you must use that version to read it back in.

DDC-7 (error) File is not in DDC format.

DESCRIPTION

dc_shell has determined that the file being read is not a DDC format file.

WHAT NEXT

Verify that the correct format option has been provided to the `read_file` command, and that the file path is correct.

DDC-8 (error) Attempt to write duplicate design name '%s' to DDC file.

DESCRIPTION

dc_shell detected an attempt to write multiple designs with the same name to a DDC file, which is not allowed by the DDC format.

WHAT NEXT

Check the list of designs provided to the `write` command. It is possible, although unusual, for duplicate design names to have been read from different files, such as multiple .db files. If the duplicate design names must be preserved, they must be written to separate DDC files.

DDC-9 (warning) The DDC format cannot be used to store physical data. Any physical information that is present will not be written to the DDC file.

DESCRIPTION

You receive this warning message when you write out a DDC file that contains physical data. The DDC file format is not capable of representing physical data. Only the logical representation will be written to the DDC file.

WHAT NEXT

It is considered best practice to use the Milkyway storage format for designs that contain physical information. You can use the `write_milkyway` command to write the design to a Milkyway database.

SEE ALSO

`write_milkyway(2)`

DDC-10 (error) Scenario '%s' does not exist.

DESCRIPTION

The specified scenario, which was provided with the `-scenarios` option to the `write` command, does not exist.

WHAT NEXT

Check that the scenario name is correct, and that any scenarios which are to be written to the DDC file have been created.

SEE ALSO

`write(2)`
`create_scenario(2)`

DDC-11 (error) DDC file contains packed command syntax that cannot be processed by this version of dc_shell. Please use a current version of dc_shell to read this file.

DESCRIPTION

The current DDC file contains embedded commands (constraints) which were written by a newer version of `dc_shell` and utilize a syntax which cannot be parsed by the current executable.

WHAT NEXT

Use the same (or newer) version of `dc_shell` to read the file as was used to write it.

SEE ALSO

`ddc_allow_unknown_packed_commands(3)`
`read_file(2)`

DDC-12 (warning) DDC file was written with a newer version of `dc_shell`.

Some embedded commands may be ignored.

DESCRIPTION

You are trying to read a DDC file which was written by a newer version of `dc_shell`, and the DDC file contains some packed commands (constraints) which are not recognized by the older version of `dc_shell`. Normally this would result in a DDC-6 error; however, if the variable `ddc_allow_unknown_packed_commands` is set to "true" then `dc_shell` will attempt to read the file, but any unrecognized packed commands will be ignored. (A DDC-13 warning message will be printed when each such command is first encountered.)

WHAT NEXT

To avoid losing potentially important information, always read the DDC file with the same (or newer) version of `dc_shell` as was used to write it.

SEE ALSO

`DDC-13(n)`
`ddc_allow_unknown_packed_commands(3)`
`read_file(2)`

DDC-13 (warning) Ignoring unknown packed command #%d:
%S

DESCRIPTION

`dc_shell` attempted to unpack an embedded command which it does not recognize. This can happen when a DDC (or Milkyway) file which was written with a newer version of `dc_shell` is read with an older version of the product, while the variable `ddc_allow_unknown_packed_commands` is set to "true". The unrecognized command is simply discarded.

WHAT NEXT

To avoid losing potentially important information, always read the DDC file with the same (or newer) version of `dc_shell` as was used to write it.

SEE ALSO

`ddc_allow_unknown_packed_commands(3)`

DDC-14 (information) This file contains data for the following %d scenarios:

%s

DESCRIPTION

The DDC or Milkyway reader prints this message if the file being read contains any scenario-specific constraint data. The message will report the name of each scenario for which the file contains data. If the scenario was inactive when the file was written, an asterisk (*) appears after the scenario name.

WHAT NEXT

This is an informational message. No action is required.

SEE ALSO

```
read_file(2)
read_milkyway(2)
create_scenario(2)
current_scenario(2)
all_scenarios(2)
all_active_scenarios(2)
```

DDC-15 (warning) Ignoring %s attribute %s on %s object(s):
Attribute type conflicts with existing attributes.

DESCRIPTION

An attribute contained in the DDC file conflicts in type with an attribute that is already registered with the tool. The conflicting attribute is ignored by the DDC reader.

An attribute saved in a DDC file must have the same type as an existing attribute of the same name on the same netlist object class (e.g., string attribute on design objects).

This message is most likely seen when reading in DDC files written by the X-2005.09 release or earlier. Attribute conflicts from more-recent files are silently discarded.

WHAT NEXT

This message could appear if there happens to be a user-defined attribute that has the same name (but different type) as a built-in attribute that was added in a later

version of the tool. It is good practice to use a prefix for user-defined attributes, such as your company's name, that is unlikely to be used by Synopsys in the future.

DDC-16 (error) ddc file contains no scenario-specific data.
Cannot specify
-scenarios option for this file.

DESCRIPTION

The `-scenarios` option to the `read_file` command can only be used to read files that contain scenario-specific constraint data.

WHAT NEXT

See `read_file(2)` for more information on controlling which scenarios' constraints are read from the ddc file.

SEE ALSO

`read_file(2)`
`read_ddc(2)`

DDC-17 (error) ddc file contains no data for any of the requested scenarios

DESCRIPTION

The specified ddc file does not contain any constraint data for any of the scenarios specified to the `-scenarios` option to the `read_file` command.

WHAT NEXT

Check the list of scenario names supplied to the `read_file -scenarios` option. See `read_file(2)` for more information on controlling which scenarios' constraints are read from the ddc file.

SEE ALSO

DESCRIPTION

WHAT NEXT

DEFIN

DEFIN-1 (error) Failed to read file '%s'.

DESCRIPTION

The file might not exist in your path.

WHAT NEXT

Check if the file exist or rerun the program.

DEFIN-2 (warning) Ignore '%s' at line %d.

DESCRIPTION

The DEF syntax has been ignored. The reader will not store any information for this line, but continue to read the rest of the file.

WHAT NEXT

Check if this line can be ignored. If not, edit the PDEF output file according to the IEEE PDEF syntax.

DEFIN-3 (warning) Extract the pin location from this section, assuming pin name is matching netlist port name.

DESCRIPTION

The reader does not read logical netlist information therefore, it assumes all the pins in this section will match with the ports in the logical netlist.

WHAT NEXT

Examine the output PDEF and check with the logical netlist to make sure the pin is not in logical netlist.

DEFIN-4 (warning) Probably the DIEAREA statement has

unexpected syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following: DIEAREA <pt pt> ; <pt pt> is the corner points of the bounding rectangle for the design. For example: The following design uses a rectangle with lower left corner (100 100) and upper right corrner (900 900). DIEAREA 100 100 900 900

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-5 (warning) Probably inside the COMPONENTS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the COMPONENTS section are the following : [+ {FIXED | COVER | PLACED | UNPLACED } <pt> <orient>] where <pt> is the location for the component <orient> is the orientation for the component

For example: + FIXED (199 199) N

[+ REGION { <pt> <pt> | <regionName> }] where the first <pt> is the lower left corner of the region. the second <pt> is the upper right corner of the region. <regionName> is the name defined in the REGIONS section.

For example: + REGION (10 10) (500 500) or + REGION region1

If other plus statements than above has syntax error then you can ignore. But if they are one of above statements, you need to follow the 5.1 DEF manual, corect them.

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-6 (error) Failed to read file '%s' because of missing PINS

section.

DESCRIPTION

The program only takes the DEF with the pins section.

WHAT NEXT

add the pins section in your DEF.

DEFIN-7 (error) Require to read pdb which contains macro class definition to tell which components are PAD, so the program can take that as port location.

DESCRIPTION

The version of this DEF file is 4.x, it requires PINS section and library in pdbformat which contains io/dummy macro definition.

WHAT NEXT

Generate pdb using library compiler.

DEFIN-8 (warning) Can not find macro type for this component '%S'.

DESCRIPTION

This information is needed to tell which component is an IO.

WHAT NEXT

make sure pdb include every component used in DEF.

DEFIN-9 (error) Only support 5.1 version. Ignore the Site

statement at line %d.

DESCRIPTION

The Site statements indicate there this DEF may not use 5.1 version syntax. Please regenerate your DEF in 5.1 version using your floorplan tool. The correct syntax to define the site array information to the tool is the following DEF 5.1 syntax :

The correct syntax to define the site array information to the tool is the following DEF syntax :

```
ROW <row_name> <site_name> <X> <Y> <orientation> { DO <N> BY 1 STEP <spaceX> 0 | DO  
1 by <N> STEP 0 <spaceY> };
```

where <row_name> is a unique string identifying this particular row. <site_name> is a site used for the row. The site is defined in the LEF. <X> <Y> is the coordinates of the row's starting point <orientation> Orientation of all sites in the row. { DO <N> BY 1 STEP <spaceX>0 | DO 1 by <N> STEP 0 <spaceY> } Horizontal or vertical step pattern to create the row.

For Example : The row_1 is using site CORE starting -10000 -10000. There are 222 sites in this row and the space between lower left corner of a site to the next lower left corner is 84. ROW row_1 CORE -10000 -10000 N DO 222 BY 1 STEP 84 0 ;

WHAT NEXT

Use the floorplan tool to regenerate the DEF file.

DEFIN-10 (error) The program requires reading pdb.

DESCRIPTION

This pdb is a library pdb which contains library technology information. The reader needs to read library pdb to find out which site in DEF belongs to the CORE, and layer and via definitions.

WHAT NEXT

The library pdb can be generate using library compiler.

DEFIN-11 (warning) Pin '%s' does not have location.

DESCRIPTION

The pin locations are part of floorplan information. Lossing pin locations will have

incomplete floorplan information.

WHAT NEXT

Add pin location for it to make floorplan constraints complete.

DEFIN-12 (warning) Only extract the first rectangle as boundary at line '%d'.

DESCRIPTION

Currently multiple rectangles are not supported for move bounds. This message issued when reader tries to extract region constraints. Only the first rectangle will be used.

WHAT NEXT

If there are multiple rectangles then merge the multiple rectangles into one rectangle.

DEFIN-13 (warning) Only support regions in GROUPS at line '%d'.

DESCRIPTION

Currently we do not extract perimeter attributes from GROUPS. Only REGIONS information will be extracted. Ignore all other soft fence attribute.

WHAT NEXT

If soft fence attribute is needed then translate them into REGIONS.

DEFIN-14 (warning) Only support regular expressions '*', '%', '-' in GROUPS

DESCRIPTION

The '*' means any sequence of characters. The '%' means any single character. The '-' means any sequence of characters up to the next period '..'. Currently the reader

only can understand the regular expression described using the characters from above.

WHAT NEXT

Expand the unsupprted regular expression.

DEFIN-15 (error) This layer %s is not defined in the library. The PDEF file will be incorrect.

DESCRIPTION

This layer is missing in the physcial library.

WHAT NEXT

Add the layer to your physcial library (a plib file) and use read_lib and write_lib to write out the library.

DEFIN-16 (warning) Detect %s near token '%s' at line %d. Continue to parse until the next correct rule can be applied.

DESCRIPTION

This happens when unexpect syntax has been parsed. It contines to read the file until the next syntax can be applied in the grammar rules.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-17 (warning) Probably the UNITS statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following: UNITS DISTANCE MICRONS <DEFconvertFactor> For example: UNITS DISTANCE MICRONS 1000 ;

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-18 (warning) Probably the ROW statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax to define the site array information to the tool is the following DEF syntax :

```
ROW <row_name> <site_name> <X> <Y> <orientation> { DO <N> BY 1 STEP <spaceX> 0 | DO  
1 by <N> STEP 0 <spaceY> };
```

where <row_name> is a unique string identifying this particular row. <site_name> is a site used for the row. The site is defined in the LEF. <X> <Y> is the coordinates of the row's starting point <orientation> Orientation of all sites in the row. { DO <N> BY 1 STEP <spaceX> 0 | DO 1 by <N> STEP 0 <spaceY> } Horizontal or vertical step pattern to create the row.

For Example : The row_1 is using site CORE starting -10000 -10000. There are 222 sites in this row and the space between lower left corner of a site to the next lower left corner is 84. ROW row_1 CORE -10000 -10000 N DO 222 BY 1 STEP 84 0 ;

WHAT NEXT

Edit the DEF file to change the ROW statement or use the floorplan tool to regenerate the DEF file.

DEFIN-19 (warning) Probably inside the SPECIALNETS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the SPECIALNETS section are the following : [+ WIDTH <layername> <width>] where <layername> is the layer defined in LEF. <width> is the width used in for this specail route. For example: + WIDTH layer1 0.9

```
[ + SPACING <layername> <spacing> [ RANGE <minwidth> <maxwidth> ] ] where <layername>  
is the lyser defined in LEF <spacing> is the spacing used for this special route.  
<minwidth> <maxwidth> defines the range of the wire width
```

For example: + SPACING layer1 .05 RANGE 0.01 0.08

If other plus statements than above has syntax error then you can ignore. But if they are one of above statements, you need to follow the 5.1 DEF manual, correct them. Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-20 (warning) Probably the special wiring continue point has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. They are have to be one of the following forms: 1. (X *) means the Y is from the previous point. 2. (* Y) means the X is from the previous point. 3. <viaName> means the use this via to connect the wire. The via location is decirbed previously. For example : use the previus Y and 1000 connect to via 1 with location = 1000 1000 (1000 *) (* 1000) vial You need to follow the 5.1 DEF manual, correct them. Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-21 (warning) Probably the special wiring section has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
{ROUTED| FIXED | COVER} <layername> <width> [+ SHAPE {RING|STRIPE}] ( x y ) [ ( x * ) | ( * y ) | <viaName> ] ... where: <layername> is a layer name defined in LEF. <width> is the wire width.
```

For example : a wire on layer1 with width .01 from (200 200) to connect to (1000 200)connect to via 1 with location = 1000 1000

```
ROUTED layer1 .01 +SHAPE STRIPE (200 200 ) ( 1000 * ) ( * 1000 ) vial
```

You need to follow the 5.1 DEF manual, correct them. Please refer to the 5.1 DEF manual for the detailed explanation.

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-22 (warning) Probably the new special wiring statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
[NEW <layername> <width> [+ SHAPE {RING|STRING}] ( x y ) [ ( x * ) | ( * y ) | <viaName> ] ...
```

where: <layername> is a layer name defined in LEF. <width> is the wire width.

For example : a wire on layer1 with width .01 from (200 200) to connect to (1 000 200)connect to via 1 with location = 1000 1000

```
NEW layer1 .01 +SHAPE STRIPE (200 200 ) ( 1000 * ) ( * 1000 ) via1
```

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-23 (warning) Probably the regular wiring section has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
{ROUTED| FIXED | COVER} <layername> [TAPER] ( x y ) [ ( x * ) | ( * y ) | <viaName> ] ... where <layername> is a layer defined in the LEF.
```

For example : a wire on layer1 from (200 200) to connect to (1 000 200)connect to via 1 with location = 1000 1000

```
ROUTED layer1 (200 200 ) ( 1000 * ) ( * 1000 ) via1
```

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-24 (warning) Probably the new regular wiring statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
[NEW <layername> [TAPER] [+ SHAPE {RING|STRING}] ( x y ) [ ( * * ) | ( * y ) | <viaName> ] ...
```

where: <layername> is a layer name defined in LEF.

For example : a wire on layer1 with width .01 from (200 200) to connect to (1 000 200)connect to via 1 with location = 1000 1000

```
NEW layer1 (200 200 ) ( 1000 * ) ( * 1000 ) via1
```

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-25 (warning) Probably inside the PINS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following: [- <pinName> + NET <netName>] where <netName> is a net this pin connected to and is defined in the NETS section.

```
[ + SPECIAL ] [ + DIRECTION { INPUT | OUTPUT | INOUT | FEEDTHRU } ] [ + USE [ SIGNAL | POWER | GROUND | CLOCK | TIEOFF | ANALOG ] ] [+ {FIXED | PLACED | COVER} <pt> <orient> ] where <pt> is the location for the pin. <orient> is the orientation for this pin. For example: + FIXED ( 199 199 ) N
```

```
[+ LAYER <layername> <pt> <pt> ] where <layername> is a layer which this pin is on
```

and defined in LEF. <pt> <pt> defines the pin geometry on that layer. For example: + LAYER layer1 (100 100) (200 200)

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-26 (warning) Probably inside the REGIONS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the REGIONS section are the following: [- <regionName> <pt> <pt> [pt pt]...] where one pair of <pt> defines one rectangle. Currently it only take the first rectangle and ignore the rest of rectangles. If other plus statements than above has syntax error then you can ignore. But if they are one of above statements, you need to follow the 5.1 DEF manual, corect them.

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-27 (warning) Probably inside the GROUPS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the GROUPS section are the following: [- groupName compNameRegExpr... where compNameRegExpr contains the regular expression like '*', '%' or '--' For example: create a group called group1 containing all the cells with INST as the prefix. - group1 INST*

[+ REGION { <pt> <pt> | regionName }] where <pt> <pt> define the a rectangle. <regionName> is defined in the REGIONS section

For example: group1 is with (100 100) and (200 200) + group1 INST* - REGION (100 100)(200 200)

If other plus statements than above has syntax error then you can ignore. But if they

are one of above statements, you need to follow the 5.1 DEF manual, correct them.

Please refer to the 5.1 DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFIN-28 (error) Duplicate EEQ macro %s defined at line %d.

DESCRIPTION

You receive this error message because there is more than one EEQ macro defined in the DEF file. Only one EEQ macro can be defined for a cell.

WHAT NEXT

Edit the DEF file so there is only one EEQ macro defined for the cell.

DEFIN-29 (error) EEQ macro %s defined at line %d is not present in the physical library.

DESCRIPTION

The EEQ macro defined in the Design Exchange Format (DEF) file is not defined in the Synopsys physical library database (.pdb) files.

WHAT NEXT

Include the physical library that has the definition for the cell.

DEFR

DEFR-1 (error) Failed to read file '%s'.

DESCRIPTION

The file might not exist in your path.

WHAT NEXT

Check if the file exist or rerun the program.

DEFR-2 (warning) Ignore '%s' at line %d.

DESCRIPTION

The DEF syntax has been ignored. The reader will not store any information for this line, but continue to read the rest of the file.

WHAT NEXT

Check if this line can be ignored. If not, edit the PDEF output file according to the IEEE PDEF syntax.

DEFR-3 (warning) Extract the pin location from this section, assuming pin name is matching netlist port name.

DESCRIPTION

The reader does not read logical netlist information therefore, it assumes all the pins in this section will match with the ports in the logical netlist.

WHAT NEXT

Examine the output PDEF and check with the logical netlist to make sure the pin is not in logical netlist.

DEFR-4 (warning) Probably the DIEAREA statement has

unexpected syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following: DIEAREA <pt pt> ; <pt pt> is the corner points of the bounding rectangle for the design. For example: The following design uses a rectangle with lower left corner (100 100) and upper right corrner (900 900). DIEAREA 100 100 900 900

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-5 (warning) Probably inside the COMPONENTS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the COMPONENTS section are the following : [+ {FIXED | COVER | PLACED | UNPLACED } <pt> <orient>] where <pt> is the location for the component <orient> is the orientation for the component

For example: + FIXED (199 199) N

[+ REGION { <pt> <pt> | <regionName> }] where the first <pt> is the lower left corner of the region. the second <pt> is the upper right corner of the region. <regionName> is the name defined in the REGIONS section.

For example: + REGION (10 10) (500 500) or + REGION region1

If other plus statements than above has syntax error then you can ignore. But if they are one of above statements, you need to follow the 5.x DEF manual, corect them.

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-6 (error) Failed to read file '%s' because of missing PINS

section.

DESCRIPTION

The program only takes the DEF with the pins section.

WHAT NEXT

add the pins section in your DEF.

DEFR-7 (error) Require to read pdb which contains macro class definition to tell which components are PAD, so the program can take that as port location.

DESCRIPTION

The version of this DEF file is 4.x, it requires PINS section and library in pdbformat which contains io/dummy macro definition.

WHAT NEXT

Generate pdb using library compiler.

DEFR-8 (warning) Can not find macro type for this component '%S'.

DESCRIPTION

This information is needed to tell which component is an IO.

WHAT NEXT

make sure pdb include every component used in DEF.

DEFR-9 (error) Only support 5.x version. Ignore the Site

statement at line %d.

DESCRIPTION

The Site statements indicate there this DEF may not use 5.x version syntax. Please regenerate your DEF in 5.x version using your floorplan tool. The correct syntax to define the site array information to the tool is the following DEF 5.x syntax :

The correct syntax to define the site array information to the tool is the following DEF syntax :

```
ROW <row_name> <site_name> <X> <Y> <orientation> { DO <N> BY 1 STEP <spaceX> 0 | DO  
1 by <N> STEP 0 <spaceY> };
```

where <row_name> is a unique string identifying this particular row. <site_name> is a site used for the row. The site is defined in the LEF. <X> <Y> is the coordinates of the row's starting point <orientation> Orientation of all sites in the row. { DO <N> BY 1 STEP <spaceX> 0 | DO 1 by <N> STEP 0 <spaceY> } Horizontal or vertical step pattern to create the row.

For Example : The row_1 is using site CORE starting -10000 -10000. There are 222 sites in this row and the space between lower left corner of a site to the next lower left corner is 84. ROW row_1 CORE -10000 -10000 N DO 222 BY 1 STEP 84 0 ;

WHAT NEXT

Use the floorplan tool to regenerate the DEF file.

DEFR-10 (error) The program requires reading pdb.

DESCRIPTION

This pdb is a library pdb which contains library technology information. The reader needs to read library pdb to find out which site in DEF belongs to the CORE, and layer and via definitions.

WHAT NEXT

The library pdb can be generate using library compiler.

DEFR-11 (warning) Pin '%s' does not have location.

DESCRIPTION

The pin locations are part of floorplan information. Lossing pin locations will have

incomplete floorplan information.

WHAT NEXT

Add pin location for it to make floorplan constraints complete.

DEFR-12 (warning) Only extract the first rectangle as boundary at line '%d'.

DESCRIPTION

Currently multiple rectangles are not supported for move bounds. This message issued when reader tries to extract region constraints. Only the first rectangle will be used.

WHAT NEXT

If there are multiple rectangles then merge the multiple rectangles into one rectangle.

DEFR-13 (warning) Only support regions in GROUPS at line '%d'.

DESCRIPTION

Currently we do not extract perimeter attributes from GROUPS. Only REGIONS information will be extracted. Ignore all other soft fence attribute.

WHAT NEXT

If soft fence attribute is needed then translate them into REGIONS.

DEFR-14 (warning) Only support regular expressions '*', '%', '-' in GROUPS

DESCRIPTION

The '*' means any sequence of characters. The '%' means any single character. The '-' means any sequence of characters up to the next period '..'. Currently the reader

only can understand the regular expression described using the characters from above.

WHAT NEXT

Expand the unsupprted regular expression.

DEFR-15 (error) This layer %s is not defined in the library. The DEF file will be incorrect.

DESCRIPTION

This layer is missing in the physcial library.

WHAT NEXT

Add the layer to your physcial library (a plib file) and use read_lib and write_lib to write out the library.

DEFR-16 (warning) Detect %s near token '%s' at line %d.
Continue to parse until the next correct rule can be applied.

DESCRIPTION

This happens when unexpect syntax has been parsed. It contines to read the file until the next syntax can be applied in the grammar rules.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-17 (warning) Probably the UNITS statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following: UNITS DISTANCE MICRONS <DEFconvertFactor> For example: UNITS DISTANCE MICRONS 1000 ;

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-18 (warning) Probably the ROW statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax to define the site array information to the tool is the following DEF syntax :

```
ROW <row_name> <site_name> <X> <Y> <orientation> { DO <N> BY 1 STEP <spaceX> 0 | DO 1 by <N> STEP 0 <spaceY> };
```

where <row_name> is a unique string identifying this particular row. <site_name> is a site used for the row. The site is defined in the LEF. <X> <Y> is the coordinates of the row's starting point <orientation> Orientation of all sites in the row. { DO <N> BY 1 STEP <spaceX> 0 | DO 1 by <N> STEP 0 <spaceY> } Horizontal or vertical step pattern to create the row.

For Example : The row_1 is using site CORE starting -10000 -10000. There are 222 sites in this row and the space between lower left corner of a site to the next lower left corner is 84. ROW row_1 CORE -10000 -10000 N DO 222 BY 1 STEP 84 0 ;

WHAT NEXT

Edit the DEF file to change the ROW statement or use the floorplan tool to regenerate the DEF file.

DEFR-19 (warning) Probably inside the SPECIALNETS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the SPECIALNETS section are the following : [+ WIDTH <layername> <width>] where <layername> is the layer defined in LEF. <width> is the width used in for this specail route. For example: + WIDTH layer1 0.9

```
[ + SPACING <layername> <spacing> [ RANGE <minwidth> <maxwidth> ] ] where <layername> is the lyser defined in LEF <spacing> is the spacing used for this special route. <minwidth> <maxwidth> defines the range of the wire width
```

For example: + SPACING layer1 .05 RANGE 0.01 0.08

If other plus statements than above has syntax error then you can ignore. But if they are one of above statements, you need to follow the 5.x DEF manual, correct them. Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-20 (warning) Probably the special wiring continue point has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. They are have to be one of the following forms: 1. (X *) means the Y is from the previous point. 2. (* Y) means the X is from the previous point. 3. <viaName> means the use this via to connect the wire. The via location is decirbed previously. For example : use the previus Y and 1000 connect to via 1 with location = 1000 1000 (1000 *) (* 1000) vial You need to follow the 5.x DEF manual, correct them. Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-21 (warning) Probably the special wiring section has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
{ROUTED| FIXED | COVER} <layername> <width> [+ SHAPE {RING|STRIPE}] ( x y ) [ ( x * ) | ( * y ) | <viaName> ] ... where: <layername> is a layer name defined in LEF. <width> is the wire width.
```

For example : a wire on layer1 with width .01 from (200 200) to connect to (1000 200)connect to via 1 with location = 1000 1000

```
ROUTED layer1 .01 +SHAPE STRIPE (200 200 ) ( 1000 * ) ( * 1000 ) vial
```

You need to follow the 5.x DEF manual, correct them. Please refer to the 5.x DEF manual for the detailed explanation.

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-22 (warning) Probably the new special wiring statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
[NEW <layername> <width> [+ SHAPE {RING|STRING}] ( x y ) [ ( x * ) | ( * y ) | <viaName> ] ...
```

where: <layername> is a layer name defined in LEF. <width> is the wire width.

For example : a wire on layer1 with width .01 from (200 200) to connect to (1 000 200)connect to via 1 with location = 1000 1000

```
NEW layer1 .01 +SHAPE STRIPE (200 200 ) ( 1000 * ) ( * 1000 ) via1
```

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-23 (warning) Probably the regular wiring section has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
{ROUTED| FIXED | COVER} <layername> [TAPER] ( x y ) [ ( x * ) | ( * y ) | <viaName> ] ... where <layername> is a layer defined in the LEF.
```

For example : a wire on layer1 from (200 200) to connect to (1 000 200)connect to via 1 with location = 1000 1000

```
ROUTED layer1 (200 200 ) ( 1000 * ) ( * 1000 ) via1
```

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-24 (warning) Probably the new regular wiring statement has incorrect syntax.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following:

```
[NEW <layername> [TAPER] [+ SHAPE {RING|STRING}] ( x y ) [ ( * * ) | ( * y ) | <viaName> ] ...
```

where: <layername> is a layer name defined in LEF.

For example : a wire on layer1 with width .01 from (200 200) to connect to (1 000 200)connect to via 1 with location = 1000 1000

```
NEW layer1 (200 200) ( 1000 * ) ( * 1000 ) via1
```

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-25 (warning) Probably inside the PINS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The correct syntax is the following: [- <pinName> + NET <netName>] where <netName> is a net this pin connected to and is defined in the NETS section.

```
[ + SPECIAL ] [ + DIRECTION { INPUT | OUTPUT | INOUT | FEEDTHRU } ] [ + USE [ SIGNAL | POWER | GROUND | CLOCK | TIEOFF | ANALOG ] ] [+ {FIXED | PLACED | COVER} <pt> <orient> ] where <pt> is the location for the pin. <orient> is the orientation for this pin. For example: + FIXED ( 199 199 ) N
```

```
[+ LAYER <layername> <pt> <pt> ] where <layername> is a layer which this pin is on
```

and defined in LEF. <pt> <pt> defines the pin geometry on that layer. For example: + LAYER layer1 (100 100) (200 200)

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-26 (warning) Probably inside the REGIONS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the REGIONS section are the following: [- <regionName> <pt> <pt> [pt pt]...] where one pair of <pt> defines one rectangle. Currently it only take the first rectangle and ignore the rest of rectangles. If other plus statements than above has syntax error then you can ignore. But if they are one of above statements, you need to follow the 5.x DEF manual, corect them.

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-27 (warning) Probably inside the GROUPS section, the plus statement is incorrect.

DESCRIPTION

This happens when unexpect syntax has been parsed. The important plus statements inside the GROUPS section are the following: [- groupName compNameRegExpr... where compNameRegExpr contains the regular expression like '*', '%' or '--' For example: create a group called group1 containing all the cells with INST as the prefix. - group1 INST*

[+ REGION { <pt> <pt> | regionName }] where <pt> <pt> define the a rectangle. <regionName> is defined in the REGIONS section

For example: group1 is with (100 100) and (200 200) + group1 INST* - REGION (100 100)(200 200)

If other plus statements than above has syntax error then you can ignore. But if they

are one of above statements, you need to follow the 5.x DEF manual, correct them.

Please refer to the 5.x DEF manual for the detailed explanation.

WHAT NEXT

To remove this warning simple change your DEF file according to the DEF manual.

DEFR-28 (error) Duplicate EEQ macro %s defined at line %d.

DESCRIPTION

You receive this error message because there is more than one EEQ macro defined in the DEF file. Only one EEQ macro can be defined for a cell.

WHAT NEXT

Edit the DEF file so there is only one EEQ macro defined for the cell.

DEFR-29 (error) EEQ macro %s defined at line %d not present in physical library.

DESCRIPTION

You receive this error message because the EEQ macro defined in the DEF file is not defined in pdb files.

WHAT NEXT

Include the physical library which has the definition for the cell.

DEFR-30 (warning) Site '%s' has no type defined in physical library, ignored.

DESCRIPTION

The site definition

WHAT NEXT

Check if the physical_library variable is set correctly.

DEFR-31 (warning) Clusters exist in netlist, will be deleted.

DESCRIPTION

Clusters are present in the netlist. All the existing clusters will be deleted before annotating any data from the input DEF file.

WHAT NEXT

Please make sure that the input netlist is a pure logical netlist.

DEFR-32 (warning) Reference to undefined region '%s' in GROUPS section.

DESCRIPTION

The region referenced in the GROUPS section has not been defined in the REGION section.

WHAT NEXT

Please provide a definition of the undefined region referenced.

DEFR-33 (info) Adding spare cell '%s'.

DESCRIPTION

The spare cell present in DEF is being added into the netlist.

WHAT NEXT

DEFR-34 (info) Adding physical only cell '%s'.

DESCRIPTION

The physical only cell present in input DEF is being added into the netlist, because `read_def` command was called with `-allow_physical_cells` switch.

WHAT NEXT

If this is not desired, please call the `read_def` command without the `-allow_physical_cells` switch.

DEFR-35 (warning) Cell instance '%s' does not correspond to a real cell.

DESCRIPTION

The identified cell instance cannot be found in the logical hierarchy beneath **current_design**. The instance will be ignored unless the `-allow_physical_cells` switch of `read_def` is used.

WHAT NEXT

Check to see why the instance identified in the message was included in the DEF file. If the instance is meant to be in the DEF file as a physical-only cell, such as a filler cell or endcap cell, re-run `read_def` with the `-allow_physical_cells` option.

DEFR-36 (warning) The cell intance '%s' is not linked. It's presence within the cluster will be ignored.

DESCRIPTION

This message indicates that the specified cell instance is not linked. Each cell instance defined within a cluster must refer to a fully linked leaf cell. You cannot define a cell in a cluster that is not fully linked.

WHAT NEXT

Find the design or library cell to which this cell instance should be linked, and include it in the **search_path** or **link_library**.

DEFR-37 (warning) Attribute found on hierarchical cell '%s', will be ignored.

DESCRIPTION

The input DEF file has had an attribute defined for a hierarchical cell. Attributes are not currently supported on hierarchical cells.

WHAT NEXT

Remove the attributes from the hierarchical cell or else put leaf cells in the DEF file instead, and set the attributes on the leaf cells.

DEFR-38 (warning) The cell instance '%s' has already been listed under cluster '%s'. The previous classification will be overwritten.

DESCRIPTION

This message indicates that the identified cell instance was previously listed as part of another cluster. The previous association is ignored. Only the most recent cluster association (that is, the cluster association furthest down in the file) will be preserved.

WHAT NEXT

Investigate the reason why the cell instance was listed in more than one cluster, and correct any errors.

DEFR-39 (warning) The pin '%s' does not exist.

DESCRIPTION

The identified pin/port cannot be found in the **current_design**. The pin/port will be ignored.

WHAT NEXT

Check to see why the pin identified in the message was listed in the DEF file.

DEFR-40 (info) Input DEF version is '%1.1f.'

DESCRIPTION

This message prints out the version of the input DEF file.

WHAT NEXT

DEFR-41 (warning) DEF design '%s' is different from current design '%s'.

DESCRIPTION

The design name in the input DEF file is different from the design specified using -design switch in the read_def command. The design in the netlist with the same name as DEF design will be annotated.

WHAT NEXT

Provide the same design name in -switch option as in the input DEF file.

DEFR-42 (warning) DEF design '%s' is different from current_design '%s'.

DESCRIPTION

The design name in the input DEF file is different from the current_design. The design in the netlist with the same name as DEF design will be annotated.

WHAT NEXT

Please set the current_design to the same as design in input DEF file.

DEFR-43 (info) Annotating design '%s'.

DESCRIPTION

This message prints the name of the design which is being annotated.

WHAT NEXT

DEFR-44 (warning) NAMECASESENSITIVITY always assumed to be ON.

DESCRIPTION

The read_def parser always assume name case sensitivity to be ON.

WHAT NEXT

Check if the input DEF file is cases insensitive.

DEFR-45 (warning) DIVIDERCHAR always assumed to be '/'.

DESCRIPTION

The read_def parser always assumes the hierarchy divider to be '/'.

WHAT NEXT

Check if the input DEF uses a different character for hierarchy divider. If so, it needs to be replaced by '/'.

DEFR-46 (warning) BUSBITCHAR will be converted to '[]'.

DESCRIPTION

The input DEF file contains BUSBITCHAR other than '[]'. The read_def parser is capable of parsing DEF files with different busbit characters. But the parser internally converts it to '[]' before storing in db.

WHAT NEXT

Please note that even though the input DEF is allowed to have a different bus bit character, the output DEF file will always use '[]'.

DEFR-47 (warning) Unsupported DEF construct '%s' parsed. Will be ignored.

DESCRIPTION

The read_def command does not support the identified DEF construct, and will ignore it. The related information will not be stored within db.

WHAT NEXT

Please note that all the information pertaining to unsupported DEF constructs will be lost.

DEFR-48 (warning) Conversion factor < 1, will result in loss of accuracy.

DESCRIPTION

The read_def command computes the conversion factor based on the distance unit in the input DEF file and variables 'physopt_scaling_factor' & 'pdef_scale_location_by'. Since all the distances in an input DEF file are multiplied by this conversion factor before storing within db, there will be a loss of accuracy if this value is less than one.

WHAT NEXT

Please set the variables 'physopt_scaling_factor' & 'pdef_scale_location_by' appropriately such that the conversion factor is greater than or equal to one.

DEFR-49 (info) DEF DISTANCE UNIT %.0f.

DESCRIPTION

This message indicates the value of distance unit read from the input DEF file.

WHAT NEXT

DEFR-50 (info) DIE AREA: '(%d, %d) (%d, %d)'

DESCRIPTION

This message indicates the value of DIE AREA read from the input DEF file.

WHAT NEXT

DEFR-51 (info) Annotating '%s' information in netlist.

DESCRIPTION

This message indicates that the identified section from input DEF file is currently being annotated into the netlist.

WHAT NEXT

DEFR-52 (info) Annotating via information from pdb in netlist.

DESCRIPTION

This message indicates that the via information from physical library is being annotated into the netlist.

WHAT NEXT

DEFR-53 (warning) Top level cluster was not created, skipping nets.

DESCRIPTION

This message indicates that the read_def command was not able to find out the top level cluster while annotating nets. The nets section will be skipped.

WHAT NEXT

The probable cause of the top level cluster not being created would be a syntax error in the input DEF. Please remove syntax errors if any from the input DEF file.

DEFR-54 (info) Skipping signal nets.

DESCRIPTION

This message indicates that the read_def command is skipping the signal nets section. This is because the read_def command was called with the -skip_signal_nets switch.

WHAT NEXT

If signal nets are desired to be annotated, please call the read_def command without the -skip_signal_nets switch.

DEFR-55 (warning) Missing UNITS DISTANCE in DEF, assuming 1000.

DESCRIPTION

This message indicates that the input DEF file does not have the UNITS DISTANCE section. A default value of 1000 is assumed by the read_def command.

WHAT NEXT

Please add the distance unit in the input DEF file.

DEFR-56 (info) Reading input def file '%s'.

DESCRIPTION

This message indicates that the identified DEF file is being read.

WHAT NEXT

DEFR-57 (error) This version of read_def cannot read version

1.2 of pdb. Please use version 2.0 of pdb.

DESCRIPTION

This message indicates that the version of pdb is not supported by the read_def command.

WHAT NEXT

Please regenerate version 2.0 or above of the pdb.

DEFR-58 (error) Unable to find definition for via %s.

DESCRIPTION

The via named in the message was referenced without being defined. The read_def command looks for via definitions in the input DEF and in the pdb. The definition for this via was not found in either places.

WHAT NEXT

Please make sure that all vias referred in the input DEF are either defined in pdb's or in the input DEF.

DEFR-59 (warning) Illegal value %d for UNIT specified in input DEF, using 1000.

DESCRIPTION

The only legal values for UNIT in DEF are 100, 200, 1000, 2000. If a value other than these is specified, read_def will use a value of 1000, and scale all the numerical values accordingly. Please be aware that there could be a loss of accuracy if UNIT value in input DEF is greater than 1000. So it is always advisable to use legal value for UNIT in the input DEF.

WHAT NEXT

Please modify the input DEF to use correct UNIT value.

DEFR-60 (error) The current system DEF unit (%d) is not a

multiple of the input DEF unit (%d), possibly causing a roundoff error.

DESCRIPTION

The DEF writer generates this error message when a roundoff error might occur due to an incorrect UNIT value.

The DEF writer checks for the input DEF unit and compares it with the current system DEF unit. If the input DEF unit is not a whole number multiple of the current DEF unit in the system, the tool generates this message.

WHAT NEXT

To continue reading in the input DEF regardless of a possible roundoff error, use the **-enforce_scaling** switch.

To avoid a possible roundoff error, regenerate the DEF file with the correct unit value.

DEFR-61 (warning) The blockage coordinate (%d %d) is out of bound; the coordinates for the die area are (%d %d) (%d %d).

DESCRIPTION

The DEF writer generates this error message when the blockage coordinate is out of bound with respect to the die area.

WHAT NEXT

Regenerate the DEF file with correct values for blockages.

DEFR-62 (information) The design is reloaded for syncing from Milkyway.

DESCRIPTION

This message informs you that the tool is reloading the design data from the Milkyway database. This is done internally so that the physical data from the input DEF file is consistent in the memory.

WHAT NEXT

This is an informational message only. No action is required.

DEFR-63 (error) The `read_def` command failed because the Milkyway executable version is outdated. The `read_def` command failed.

DESCRIPTION

You receive the error message when the Milkyway executable is not compatible for `read_def` and `write_def` actions.

WHAT NEXT

Install the latest Milkyway executable prior to running `read_def` or `write_def` commands.

SEE ALSO

`read_def(2)`
`write_def(3)`

DEFR-64 (error) The Milkyway executable cannot be found. The `read_def` command failed.

DESCRIPTION

You receive this error message when the Milkyway executable cannot be found at the installed location.

WHAT NEXT

Install the latest Milkyway executable prior to running the `read_def` command.

SEE ALSO

`read_def(2)`

DEFR-65 (warning) Using .pdb for the physical library is not

recommended. Use FRAM for the physical library.

DESCRIPTION

This warning message occurs when attempting to use the physical library database (.pdb) for the physical library.

WHAT NEXT

Use the following commands and variable settings for the FRAM physical libraries:

```
set use_pdb_lib_format FALSE
set mw_reference_library "..."
set mw_design_library string
create_mw_design ...
max_tluplus_file_name ...
```

For example:

```
prompt> set use_pdb_lib_format FALSE

prompt> set mw_reference_library "./ref/mw_lib/sc ./ref/mw_lib/io \
/ref/mw_lib/ram16x128"

prompt> set mw_design_library design_lib_orca

prompt> create_mw_design -tech_file tech_file_name
        -max_tluplus Bmax_tluplus_file_name \
        -min_tluplus min_tluplus_file_name \
        tf2itf_map tf2itf_map_file_name
```

SEE ALSO

create_mw_design(2)

DEFR-100 (Warning) Site '%s' is not defined in physical library, ignored.

DESCRIPTION

The site used in ROW in DEF needs to be defined in physical library so that the site size can be used to compute core area. Without definition in physical library, the ROW will be ignored and the computed core area may be wrong.

WHAT NEXT

Check whether the design is using FRAM library but the site in DEF is not unit. If

this is the case, for example, the site in DEF is CORE, use set mw_site_name_mapping "CORE unit"

DEFR-101 (Error) No site in DEF can be found in physical library. No core area is generated.

DESCRIPTION

The site used in ROW in DEF needs to be defined in physical library so that the site size can be used to compute core area. Without matching site definition in physical library, all ROWs are ignored and no core area can be generated.

WHAT NEXT

Check whether the design is using FRAM library but the site in DEF is not unit. If this is the case, for example, the site in DEF is CORE, use set mw_site_name_mapping "CORE unit"

DEFR-102 (Warning) Use the default site 'unit' to compute placement area, since the site '%s' and its mapped one '%s' are not defined in physical library.

DESCRIPTION

The site used in ROW in DEF needs to be defined in physical library so that the site size can be used to compute core area. If the site in ROW is not defined in physical library, then the mapped site will be used. If neither the site in the ROW nor its mapped one is defined in the physical library, then the default site "unit" is used.

WHAT NEXT

Check whether the design is using FRAM library but the site in DEF is not unit. If this is the case, for example, the site in DEF is CORE, use set mw_site_name_mapping "CORE unit"

DEFR-103 (Warning) Unmapped cell '%s' in DEF is ignored to

extract physical constraints.

DESCRIPTION

Locations cannot be set for unmapped cells. The extract_physical_constraints command will ignore any such cells in the DEF.

WHAT NEXT

SEE ALSO

`set_cell_location (2)`, `extract_physical_constraints (2)`,

DEFR-104 (Warning) Use the default site 'unit' to compute placement area, since the site '%s' is not defined in physical library.

DESCRIPTION

The site used in ROW in DEF needs to be defined in physical library so that the site size can be used to compute core area. If the site in ROW is not defined in physical library, then the mapped site will be used. If neither the site in the ROW nor its mapped one is defined in the physical library, then the default site "unit" is used.

WHAT NEXT

Check whether the design is using FRAM library but the site in DEF is not unit. If this is the case, for example, the site in DEF is CORE, use set mw_site_name_mapping "CORE unit".

DEFR-105 (Warning) Section %s count doesn't match.
Expected count is %d, Actual count is %d.

DESCRIPTION

In DEF, each section has a count at its begining to indicate the number of the items to appear in this section, this warning shows that it doesn't match the actual number of the items in this section.

WHAT NEXT

Nothing to be done.

DEFR-106 (warning) The '%s' hierarchical cell in DEF is omitted from the extract physical constraints process.

DESCRIPTION

This warning message occurs when attempting to set the location on a hierarchical cell that is not an IC Compiler or Design Compiler topographical ILM, or a Design Compiler topographical placed hierarchy.

The location is ignored in the extract physical constraints process.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, you can modify the DEF to provide a location to a valid hierarchy, and run the command again.

SEE ALSO

`extract_physical_constraints(2)`
`set_cell_location(2)`

DEL

DEL-001 (error) You cannot mix an LCD operating condition with a non LCD operating condition.

DESCRIPTION

A operating condition is detected to be an LCD operating condition, while another specified operating condition is not an LCD operating condition. The ability to specify two different types of operating conditions is not supported.

WHAT NEXT

Supply a consistent min and max operating conditions. Either two non-LCD operating conditions or two LCD operating conditions.

DEL-002 (error) You cannot specify a single LCD operating condition.

DESCRIPTION

LCD operating conditions can be specified in min-max mode only.

WHAT NEXT

You need to use the min-max mode with LCD operating conditions.

DEL-003 (warning) Library '%s' has time unit of %gns but the main library unit is %gns

DESCRIPTION

If multiple libraries are used in analysis, they must have the same units. This restriction will be removed in a future version of PrimeTime.

WHAT NEXT

Convert the units in the .lib and regenerate a library .db file using Library Compiler if possible.

DEL-004 (warning) Library '%s' has capacitive_load unit of %gpF
but the main library unit is %gpF

DESCRIPTION

If multiple libraries are used in analysis, they must have the same units. This restriction will be removed in a future version of PrimeTime.

WHAT NEXT

Convert the units in the .lib and regenerate a library .db file using Library Compiler if possible.

DEL-005 (error) Cannot remove operating_condition from cell '%s': Power rails inherited from '%s' would not match rails of cell '%s'.

DESCRIPTION

Removing rail voltages or an operating condition from a hierarchical cell, may cause a lower level leaf cell to inherit a new set of power rails from a higher level hierarchical cell. Such a removal is disallowed unless the power rails in the library of the leaf cell are a subset of the newly inherited rails.

WHAT NEXT

Ensure that appropriate rail voltages/ operating conditions have been previously set on such leaf cells.

DEL-006 (warning) The operating condition does not define all rails
of cell '%s'.

DESCRIPTION

The operating condition or rail voltage does not contain all power rails therefore default voltages will be used on the remaining power rails. The default voltages are defined in power_supply section of the .lib.

WHAT NEXT

Ensure that the power rails specified in the library of the cell are same as (or a subset of) the rails in the operating condition.

DEL-007 (warning) Setting of multi-rail operating condition or rail voltage on hierarchical cell '%s' may result in incomplete assignment of power rails.

DESCRIPTION

Assignment of voltages to power rails on multi-rail cells is based on matching rail names in the operating conditions and power_supply definition in library description of the cell.

When setting operating condition or rail voltages on hierarchical cell this information is inherited by all cells in the hierarchy unless they have their explicit operating condition or rail voltage. Since rails in two different libraries can have same name then the effect of setting operating condition or rail voltage with multiple rails on hierarchical cell may result in unintended or incomplete voltage assignment.

WHAT NEXT

Set an operating condition or rail voltages on any lower level cells that require different power rail voltages.

DEL-008 (warning) Default %s operating conditions per library resulted in cells having different temperature, e.g., %s has %g but %s has %g.

DESCRIPTION

This warning message tells you that default operating conditions assigned to cells may not represent actual operating environment because temperature is not same for all cells in the design.

This message is displayed during update_timing.

WHAT NEXT

If the temperature difference is intentional and you are trying to model temperature variation on the chip then no action is required. If not intentional then use set_operating_conditions to explicitly set operating conditions on the design or individual blocks.

SEE ALSO

`set_operating_conditions` (2). `report_cell` (2). `default_oc_per_lib` (3).

DEL-009 (error) Cannot set single rail voltage on multirail cell '%S'.

DESCRIPTION

You may not set a single rail voltage on a cell using set_rail_voltage -rail_rvalue if that cell has multiple power rails defined in the library.

WHAT NEXT

Use set_rail_voltage -rail_list.

DEL-010 (Error) Unable to parse input/output_voltage in lib '%s': ('%s' = '%s').

DESCRIPTION

When parsing the input_voltage or output_voltage attribute of a library, PrimeTime has encountered a string that it cannot parse. Note that PrimeTime can only parst binary expressions for input/output_voltage.

WHAT NEXT

Ensure that the input/output_voltage attributes of you library contain only binary expressions.

DEL-011 (information) The most constraining rise and fall values of the '%s'

constraint arc occur for different input conditions.

DESCRIPTION

Due to non-monotonicity in arc data, the most constraining rise and fall delay values arise from different computation input parameters. In most libraries, constraint arcs are characterized with respect to the transition time at the clock or reference pin as well as the transition time at the data or related pin. In min-max analysis modes, the arc delay can be computed in two libraries, with min and max values on the input transitions. Specifically, in on-chip-variation (OCV) mode, up to eight calculations may be necessary to identify the most constraining value of the arc delay.

Given that the delay is a potential permutation of various input parameters, it is possible that the most constraining, or maximum, rise and fall delays arise from different permutations of the input parameters. This scenario has occurred for the specific constraint arc delay being reported.

WHAT NEXT

This is an advisory message as no further action is necessary.

DEL-012 (error) The desired operating-condition or rail-voltage or temperature for cell '%s' is outside the domain covered by the applicable scaling library group.

DESCRIPTION

You may not set an operating-condition or rail-voltage or temperature that goes outside the domain covered by an applicable scaling library group. If the **define_scaling_lib_group** command was used to setup a group of libraries that includes the specified cell, any operating-condition or rail-voltage set on the cell must be within the process, voltage, and temperature domain covered by the group.

WHAT NEXT

Correct either the operating condition or the scaling library group.

SEE ALSO

define_scaling_lib_group (2), **create_operating_conditions** (2),
set_operating_conditions (2), **set_rail_voltage** (2). **set_temperature** (2).

DEL-013 (information) Assuming the default level shifter strategy '%S'

DESCRIPTION

The commands without any arguments resets the level shifter strategy to the default 'all'. Default strategy is to reports all driver and load signal signal level mismatches.

WHAT NEXT

To set a specific startegy use **set_level_shifter_strategy -rule <strategy>**.

SEE ALSO

set_level_shifter_strategy (2), **check_timing (2)**, **set_level_shifter_threshold (2)**.

DEL-014 (information) The operating conditions set are outside the conditions defined by the libraries in the scaling group for atleast one instance in the design, so extrapolation is being done.

DESCRIPTION

If you set an operating-condition that goes outside the domain covered by an applicable scaling library group, extrapolation will be done for the given operating condition if the scaling libraries are defined for atleast two different operating conditions. If the **define_scaling_lib_group** command was used to setup a group of libraries that includes the specified cell, any operating-condition or rail-voltage set on the cell must be within the process, voltage, and temperature domain covered by the group to avoid any extrapolation.

WHAT NEXT

Correct either the operating condition or the scaling library group if extrapolation is not desirable.

SEE ALSO

define_scaling_lib_group (2), **create_operating_conditions (2)**,
set_operating_conditions (2),

DEL-015 (warning) The operating conditions set are far outside the conditions defined by the libraries in the scaling group for atleast one instance in the design, so extrapolation far beyond the safe range is being done.

DESCRIPTION

If you set an operating-condition that is outside the domain covered by an applicable scaling library group, extrapolation will be done for the given operating condition if the scaling libraries are defined for atleast two different operating conditions. If the `define_scaling_lib_group` command was used to setup a group of libraries that includes the specified cell, any operating-condition set on the cell must be within the process, voltage, and temperature domain covered by the group to avoid any extrapolation. The accuracy of results may not be good if the operating conditions are set far outside the domain of the scaling group.

WHAT NEXT

Correct either the operating condition or the scaling library group if extrapolation is not desirable.

SEE ALSO

```
define_scaling_lib_group (2), create_operating_conditions (2),  
set_operating_conditions (2),
```

DEL-016 (information) PrimeTime did not compute a valid '%s' transition at input;
report_delay_calculation will use zero instead.

DESCRIPTION

Transition times at the output of disabled arcs or non-driven transitions of half unate arcs are considered invalid and are propagated as such in PrimeTime so as not to merge with valid signal transitions downstream. For the purposes of delay calculation, a zero slew is used to perform the cell arc calculation. Even though using a zero input slew could result in a corresponding non-zero output slew, this output slew is in turn marked invalid.

WHAT NEXT

This is an advisory message as no further action is necessary.

DEL-017 (information) The minimum values of the '%s' constraint arc are not used by timing analysis.

DESCRIPTION

For the evaluating the worst possible conditions for a timing violation and given that timing constraint senses implicitly encode minimum versus maximum conditions such as hold and setup, PrimeTime strictly uses the maximum computed constraint arc delay values for computing endpoint slack.

PrimeTime computes and preserves the minimum delay values for constraint arcs for two reasons. First, these minimum values are exported through attributes off the timing_arc object for general use. Second, other applications dependent on PrimeTime delay calculation through SDF generation do require minimum values to be present.

WHAT NEXT

This is an advisory message as no further action is necessary.

DES

DES-001 (error) Current design is not defined.

DESCRIPTION

The current design is not defined. Many commands require that the current design is set.

WHAT NEXT

You must read a design database file and link a design.

DES-002 (error) Cannot find %s '%s' in design '%s'

DESCRIPTION

The specified object cannot be found in the given design. This is sometimes seen while reading SDF and parasitics files. In those cases, it could indicate a file which is out of sync with the design.

WHAT NEXT

If reading SDF or parasitics, verify that the file matches the design.

DES-003 (error) '%s' cannot be used on %s %s '%s'.

DESCRIPTION

Certain commands are valid only for input or output objects.

WHAT NEXT

Enter the command with a valid list of objects.

DES-004 (error) Cannot find design '%s'.

DESCRIPTION

There is no design with that name is in memory.

WHAT NEXT

Read in the design or reenter the command with a different name.

DES-005 (error) Cannot set current instance to leaf cell '%s'.

DESCRIPTION

The current instance must be a hierarchical cell.

WHAT NEXT

DES-006 (error) Cannot find pin '%s' on cell '%s'.

DESCRIPTION

The pin does not exist on the specified cell.

WHAT NEXT

Use `query_objects [select_pin -of_object [select_cell cell_name]]` to list pin names on the cell.

DES-007 (warning) '%s' is not a valid object type.

DESCRIPTION

When -from or -to option is used with set_disable_timing or remove_disable_timing , the object list can only be a cell or a lib cell. This warning is generated for objects of type port and pin.

WHAT NEXT

Don't use -from or -to option to disable pins or ports.

DES-008 (error) Cannot find %s '%s' in library '%s'.

DESCRIPTION

The specified object cannot be found in the given library.

WHAT NEXT

Enter the command again with a valid object name.

DES-009 (error) Cannot find pin '%s' on library cell '%s'.

DESCRIPTION

The pin does not exist on the specified library cell.

WHAT NEXT

Enter the command again with a valid object name.

DES-010 (error) Cannot find %s '%s'.

DESCRIPTION

The specified object cannot be found.

WHAT NEXT

Enter the command again with a valid object name.

DES-011 (error) Cell '%s' is not hierarchical.

DESCRIPTION

The command only works on hierarchical cells.

WHAT NEXT

Enter the command again with a hierarchical cell.

DES-012 (error) Cannot use '%s' command on %s '%s'.

DESCRIPTION

The command works only on ports of a specific direction.

WHAT NEXT

DES-013 (error) Current design is not in min-max mode.

DESCRIPTION

Most of the -min and -max options of commands work only when the design is in min-max mode. The design is considered in min-max mode when 2 operating conditions are specified, such as "set_operating_condition -min OCbest -max OCworst". The design can also be in min-max mode after reading an SDF file with the -min_max option (for example, read_sdf -min_max mydesign.sdf).

WHAT NEXT

DES-014 (error) Object '%s' is not in the current design.

DESCRIPTION

You attempted an operation on an object that is outside of the scope of current design. For example, if you select a cell from one design, and attempt to set the current instance to that cell in a different (current) design, this error is generated.

WHAT NEXT

DES-015 (error) Cannot use '%s' command on %s '%s' because it is a limited design.

DESCRIPTION

Access to a design is limited because it requires a license and the only license available was a limited license. As a result, the internals of the design are hidden. Some reports are able to work around limited designs (and instances of them), but some cannot.

WHAT NEXT

If the design is licensed for full access, ensure that you can check out that license before reading the design. Some designs will always be limited.

DES-016 (error) Cannot use '%s' command on %s '%s' because it contains instances of limited designs%s.

DESCRIPTION

Access to a design is limited because it requires a license and the only license available was a limited license. As a result, the internals of the design are hidden. Some reports are able to work around limited designs (and instances of them), but others cannot.

WHAT NEXT

If the design is licensed for full access, ensure that you can check out that license before reading the design. Some designs will always be limited.

DES-017 (information) Could not auto-link design '%s'.

DESCRIPTION

You executed a command that tried to link the current design. The design could not be linked or it already failed to link. The design now has unresolved references.

WHAT NEXT

Determine the reason for the unresolved references. This might require changing the value of the search_path or link_path variables. If these references are not yet defined, you can make the linker create black-boxes for them by setting the variable link_create_black_boxes to true. Finally, relink the design using the **link_design** command.

DES-018 (error) There is already an operating condition named '%S' in library '%S'.

DESCRIPTION

The **create_operating_condition** command cannot overwrite an existing operating condition.

WHAT NEXT

Choose a new name for the operating condition. To list the existing operating conditions in the specified library, use **report_lib**.

DES-019 (warning) Library '%s' has been generated with an old version of the Library Compiler. It needs to be rebuilt to support case analysis on sequential cells.

DESCRIPTION

You receive this message if the current library DB is out of date. The library DBs have detailed functional information generated by Library Compiler from the library .lib file. Information generated by Library Compiler prior to version 2000.11 is not supported.

WHAT NEXT

Use Library Compiler to regenerate your library DB. Follow these steps:

1. Read in the .lib file.

```
dc_shell> read_lib mylibrary.lib
```

2. Write out the .db file.

```
dc_shell> write mylibrary.db
```

DES-020 (warning) No operating condition is specified, assuming a voltage value of %s volts for RC delay calculation.

DESCRIPTION

No operating condition is specified for the current library, so PrimeTime does not know what is the voltage value when performing RC delay calculation

WHAT NEXT

Specify the operating condition of the current library with **set_operating_condition**. To get a list of the operating conditions of your library, use **report_library**.

```
pt_shell> report_library my_lib.db
```

Name	Process	Temp	Voltage	Tree Type
WCCOM	3.00	115.00	3.00	balanced_case

```
pt_shell> set_operating_condition WCCOM
```

DES-021 (warning) These environment variables need to be set for accurate RC delay calculation:

Variable name Default

```
-----  
rc_slew_lower_threshold_pct_rise 20  
rc_slew_lower_threshold_pct_fall 20  
rc_slew_upper_threshold_pct_rise 80  
rc_slew_upper_threshold_pct_fall 80  
rc_input_threshold_pct_rise 50  
rc_input_threshold_pct_fall 50  
rc_output_threshold_pct_rise 50  
rc_output_threshold_pct_fall 50  
rc_slew_derate_from_library 1
```

DESCRIPTION

When parasitics are annotated on a design, timing calculations use these variables to compute delays and transition times. The values can be set by either a cell library or equivalent shell variables. If one of these approaches does not set all of the values, this warning message is issued to alert the user. If both approaches set the values, the shell variables take precedence.

WHAT NEXT

Either set all of the above values in a cell library or set them all with shell variables. See the man page for each variable for more info.

DES-022 (warning) Some of the following settings have an incorrect value less than or equal to 1, or they are equal to 100. The proper range for these values is exclusively between 1 and 100. Here are the fallback values that will be used:

Setting Fallback

```
rc_slew_lower_threshold_pct_rise %d
rc_slew_lower_threshold_pct_fall %d
rc_slew_upper_threshold_pct_rise %d
rc_slew_upper_threshold_pct_fall %d
rc_input_threshold_pct_rise %d
rc_input_threshold_pct_fall %d
rc_output_threshold_pct_rise %d
rc_output_threshold_pct_fall %d
```

DESCRIPTION

These values are used by delay-calculation with annotated parasitics. They should be set by libraries, but if not, shell variables with the same names can be set to provide the values. In either case, the values represent percentages, not decimal fractions. If a value less than or equal to 1 is encountered, it will be interpreted

as a decimal fraction and this warning will be issued.

If a zero value is encountered, it will be changed to 5%; if 1 or 100 value is encountered, it will be changed to 95%. We suggest the user to set the delay and slew trip point thresholds in the library directly, and suggest the user to keep them in the range of 10 to 90.

Please note that this warning message is only shown for either the main library (i.e. first in link_path) or the shell variables.

WHAT NEXT

Set a percentage value between 1 and 100 (exclusive) to specify the characterization thresholds of the Synopsys library.

SEE ALSO

```
lib_thresholds_per_lib (3), rc_input_threshold_pct_fall (3),
rc_input_threshold_pct_rise (3), rc_output_threshold_pct_fall (3),
rc_output_threshold_pct_rise (3), rc_slew_lower_threshold_pct_fall (3),
rc_slew_lower_threshold_pct_rise (3), rc_slew_upper_threshold_pct_fall (3),
rc_slew_upper_threshold_pct_rise (3).
```

DES-023 (warning) Net '%s' is multi-driven.

DESCRIPTION

The specified net is multi-driven by non-three-state cells. PrimeTime will try to perform multi-driven delay calculation for all switching scenarios defined by the networks attached to the drivers' from-pins. In order for such scenarios to be valid, a given from-net must uniquely cover all of the strong drivers attached to the multi-driven to-net.

If a from-net does not cover all of the strong drivers, or if a from-net is attached to more than one pin on a specific driver, detailed RC delay calculation cannot be performed. Instead, fractional lumped analysis will be used; the load will be assumed to be the total capacitance of the multi-driven net divided by the number of drivers.

WHAT NEXT

Verify that you indeed want the indicated net to be multi-driven. This capability is commonly used to wire cells in parallel to achieve greater drive strength.

SEE ALSO

```
RC-002 (n), RC-003 (n).
```

DES-024 (warning) Net '%s' has an incomplete RC network.

DESCRIPTION

The specified net has an incomplete RC network. This means that some RC elements are dangling, or that all drivers and loads of the nets are not connected by all the RC elements.

WHAT NEXT

The RC network annotation is ignored for the specified net.

DES-025 (error) Pin '%s' is not connected to net '%s'.

Ignoring annotation on net '%s'.

DESCRIPTION

You receive this message if the **read_parasitics** command has found the specified pin in the parasitics file but not in the design file; therefore, **read_parasitics** cannot annotate the associated net. Possible causes for this error could include spelling errors or typos, or writing the parasitics file and the design file from different versions of the design.

WHAT NEXT

Verify that the specified pin is connected to the specified net in both the parasitics file and the design file, and that both are spelled correctly. Regenerate the files if necessary, then reexecute **read_parasitics**.

SEE ALSO

read_parasitics (2).

DES-026 (error) %s pin '%s' is not connected to the RC network of

net '%s'. Ignoring the incomplete RC network of the net.

DESCRIPTION

You receive this message if **report_annotated_parasitics** detects an incompletely back-annotated RC network in the current design. The message informs you that the RC network on the specified net is being ignored, because it is incomplete; the specified pin is not physically connected to the RC network.

An incomplete RC network might be caused by errors in the parasitics file, or by missing information from the tool that generated the parasitics file. For example, a parasitics file generated by a place and route tool that has parasitics only for the top level (between the blocks) would generate this error, because PrimeTime requires the RC network to connect all leaf drivers to all leaf nodes.

WHAT NEXT

Examine the SPF or SPEF file to determine why the specified RC network is incomplete. If the error is caused by a valid incomplete network, you can complete it using the parasitics completion feature **read_parasitics -complete_with** or **complete_net_parasitics**. For other errors, you must correct the parasitics file manually. You might need to estimate the missing segments and manually add them. After you have corrected the SPF or SPEF file, reexecute **read_parasitics**.

To determine whether the parasitics file contains a valid incomplete RC network, start from a driver and try to reach all loads through resistances. If all missing segments of a net are between two pins, you can complete them using the parasitics completion feature; otherwise, you must correct the SPF or SPEF file manually.

SEE ALSO

complete_net_parasitics (2), **read_parasitics** (2), **report_annotated_parasitics** (2).

**DES-027 (warning) net '%s' has too many (%d) RC elements.
Lumped capacitance is used.**

DESCRIPTION

The specified net has too many RC elements (more than 10,000). RC delay calculation using AWE technique cannot handle such large RC networks.

WHAT NEXT

The very large RC network of the net needs to be reduced to a smaller number of RC elements to be handled by PrimeTime.

DES-028 (info) Derived library resistance unit is %f Kohm (Time unit is %.f ns, and Capacitance unit is %f pF).

DESCRIPTION

The library resistance unit is implicit in the synopsys library, it is derived from the library time and capacitance units which are explicit.

WHAT NEXT

DES-029 (error) Library '%s' has no voltage rails defined.

DESCRIPTION

An attempt was made to define rail voltages to a library which does not have defined rail voltages. It is usually because the library is not a DPCM library, or that the DPCM library does not have pre-defined rail voltages.

WHAT NEXT

DES-030 (error) cannot find rail voltage '%s' in library '%s'.

DESCRIPTION

The specified rail voltage is not declared in the DPCM library. It may be because of a typo.

WHAT NEXT

Report the specified rail voltage names specified in the DPCM library by executing command report_lib for the specified library. report_lib reports all specified rail voltage names declared in DPCM.

DES-031 (error) Upper threshold must be greater than lower threshold for variables rc_slew_lower_threshold_pct_* and

rc_slew_upper_threshold_pct_*.

DESCRIPTION

The variable `rc_slew_upper_threshold_pct_rise` must be strictly greater than `rc_slew_lower_threshold_pct_rise`. Similarly, variables `rc_slew_upper_threshold_pct_fall` must be strictly greater than `rc_slew_lower_threshold_pct_fall`.

WHAT NEXT

Set variables `rc_slew_lower_threshold_pct_rise`, `rc_slew_upper_threshold_pct_rise`, `rc_slew_lower_threshold_pct_fall`, `rc_slew_upper_threshold_pct_fall`.

DES-032 (warning) Failed to compute %s RC net delay from '%s' to '%s'.

DESCRIPTION

The delay calculation failed to compute the delay for the given detailed RC network, hence the lump model will be used for delay calculation.

WHAT NEXT

Simplify the RC network and check if the RC environment variables are set correctly.

DES-033 (warning) Failed to compute C-effective for the following timing arc:

(%s) %s/%s-->%s (%s %s)

DESCRIPTION

The cell delay calculation failed to compute the effective capacitance of the detailed RC network driven by a specific timing arc, so the total capacitance will be used.

The two most common reasons for this failure are (1) an unrealistically large input transition time or output capacitance has occurred, and/or (2) the RC threshold environment variables are set incorrectly.

Another frequent reason is that library data for the specific sense of timing arc in question is missing or invalid. The timing arc is displayed by the warning message

in the following manner:

```
(<reference-name>) <instance-name>/<from-pin>--><to-pin> (<sense-name>)
```

The sense name has two parts: a rising/falling direction on the to-pin and a sense description.

WHAT NEXT

You may have to annotate transition times with **set_annotated_transition** to circumvent unrealistic loading conditions (e.g. like those which you might later solve with buffer trees). Also, be sure the RC threshold environment variables are set correctly, and that valid library data exists for the desired sense of timing arc through the cell of interest.

SEE ALSO

```
set_annotated_transition (2), rc_slew_lower_threshold_pct_rise (3),  
rc_slew_lower_threshold_pct_fall (3), rc_slew_upper_threshold_pct_rise (3),  
rc_slew_upper_threshold_pct_fall (3), rc_input_threshold_pct_rise (3),  
rc_input_threshold_pct_fall (3), rc_output_threshold_pct_rise (3),  
rc_output_threshold_pct_fall (3), rc_slew_derate_from_library (3).
```

DES-034 (warning) subckt '%s' defined multiple times.

DESCRIPTION

The SPICE deck and all its include files that define the pin order for the SPICE output of the critical has define a sub-circuit multiple times.

DES-035 (error) out of memory at file %s line %d.

DESCRIPTION

Run out of memory during SPICE pin order deck parsing.

DES-036 (warning) pin '%s' defined multiple times in subckt '%s'.

DESCRIPTION

A pin is defined multiple time on the SPICE subckt header. Only the first one is used.

DES-037 (warning) No SPICE pin order info for cell type '%s'.

DESCRIPTION

You receive this message if `write_spice_deck` cannot find the specified cell type in the file you specified using the `-sub_circuit_file` option.

WHAT NEXT

Examine the subcircuit file and verify that it contains the subcircuit description of the specified library cell. Make any corrections necessary, then re-execute `write_spice_deck`.

DES-038 (error) Library pin '%s' for cell '%s' is not in the SPICE sub-circuit definition.

DESCRIPTION

You receive this message if `write_spice_deck` finds the specified cell in the file you specified using the `-sub_circuit_file` option, but does not find the specified pin.

WHAT NEXT

Examine the subcircuit file and verify that it contains the specified pin and is consistent with the PrimeTime library. Make any corrections necessary, then re-execute `write_spice_deck`.

DES-039 (warning) SPICE pin '%s' for cell '%s' is not in the library.

DESCRIPTION

You receive this message if `write_spice_deck` finds the specified pin in the subcircuit file but cannot find it in the library. If the pin is a power or ground pin, PrimeTime might still be able to do the analysis.

WHAT NEXT

If the pin is not a power or ground pin, examine the subcircuit file and verify that it is consistent with the PrimeTime library. Make any corrections necessary, then re-execute `write_spice_deck`.

DES-040 (warning) The driver waveform %s is bad and will be ignored.

DESCRIPTION

While reading the driver waveform, the application found that waveform is bad. For example, the number of voltage points in the waveform are less than two.

WHAT NEXT

Examine your waveform is according to the liberty syntax for driver waveforms. Correct the waveform and re-execute it.

DES-050 (error) Too many %ss matched '%s' in design '%s'

DESCRIPTION

While searching for an object by name, the application found multiple objects that match the name. This usually occurs after some flattening of the design, when the hierarchy character becomes embedded in the names. For backannotation, this is an ambiguous situation, because the application cannot determine which object to annotate.

This situation occurs rarely, during the reading of parasitics files, and could be caused by a design error. Multiple objects in the flat space should not have the same name.

WHAT NEXT

Examine your design to determine why multiple objects in the flattened file have the same name. Correct the design, then re-execute the application.

DES-051 (Error) Command requires a linked design but linking is blocked because auto_link_disable is TRUE.

DESCRIPTION

You receive this message if you execute a command that requires a linked design, your design is not linked, and the **auto_link_disable** variable is set to true. By default, many PrimeTime commands automatically attempt to link the current design for you (for example, **set_load** invokes the linker if the current design is not

linked). Setting **auto_link_disable** to true disables the default auto-link process.

WHAT NEXT

If you intend for auto linking to be disabled, you must link the design manually before executing any commands that require a linked design. Setting **auto_link_disable** to true is intended to be used in conjunction with a manual link step. For more information, see the manual page for the **auto_link_disable** variable.

Alternatively, if you want to enable auto linking, set the **auto_link_disable** variable to false.

DES-060 (warning) Ignoring retain library timing arc from '%s' to '%S'.

DESCRIPTION

You receive this message if the current library DB is out of date. Retain arcs generated by Library Compiler prior to version 2000.11 are not supported.

WHAT NEXT

Use Library Compiler to regenerate your library DB. Follow these steps:

1. Read in the .lib file.

```
dc_shell> read_lib mylibrary.lib
```

2. Write out the .db file.

```
dc_shell> write mylibrary.db
```

DES-061 (warning) Found duplicate instantiation of cell '%s' when flattening the hierarchical netlist.

DESCRIPTION

You receive this message while outputting a hierarchical netlist in a flattened manner. When flattening the netlist, two instances are being mapped to same name. For example, you may have a cell by name "a/b" at top level and a cell named "b" inside a hierarchy named "a". The name of the cell under conflict is given in this message.

WHAT NEXT

You should uniquify the names of the cells under conflict before doing the current operation.

DES-062 (warning) '%s' unit specified as '%s' does not match with the main library unit '%s%s'.

DESCRIPTION

set_units command can only check the consistency of the specified units with the main library units. Actual setting of units are not allowed.

WHAT NEXT

If the units of sdc scripts are different, change the sdc scripts so that the units are same as the main library units. It is also possible to select a different library as the main library, which has consistent units as that of sdc scripts.

DES-063 (warning) '%s' unit should be specified in '%s'.

DESCRIPTION

WHAT NEXT

DES-064 (warning) Power unit cannot be checked.

DESCRIPTION

Power unit cannot be checked since no power unit available.

WHAT NEXT

Enable power analysis mode by setting power_enable_analysis to true, and running power related commands, such as update_power, read_vcd, read_saif, set_switching_activity, etc.

DES-065 (warning) '%c' is an unsupported scale.

DESCRIPTION

Valid scales are f|p|n|u|m|k|M.

WHAT NEXT

Scale the value to the supported scale.

DES-066 (error) Command requires a linked design but linking is blocked because of existing collections.

DESCRIPTION

You receive this message if you execute a command that requires a linked design, your design is not linked, and there are some collections with this design.

WHAT NEXT

Perform a link first and re-issue the command.

DES-067 (error) Design is already linked.

DESCRIPTION

You are attempting to link a design that is already fully linked. If you want PT to relink, please use -force option.

WHAT NEXT

No need of any action.

DES-068 (error) Could not find library cell '%s'.

DESCRIPTION

You are attempting to use a library cell in a command and the library cell could not

be located in any of the loaded libraries.

WHAT NEXT

Re-issue the command with the correct library cell.

DFI

DFI-1 (error) Could not open viewpoint '%s'

DESCRIPTION

WHAT NEXT

DFI-18 (error) Can't connect '%s' to '%s' net

DESCRIPTION

WHAT NEXT

DFI-19 (warning) Could not add bus port '%s' for design '%s' because %s

DESCRIPTION

WHAT NEXT

DFTSCHD

DFTSCHD-001.n

DFTSCHD-001 (warning) No schematic support for DFT violation (%s).

DESCRIPTION

Check the man page for %s DRC violation.

DMWDB

DMWDB-1 (warning) Milkyway database does not contain hierarchy information.

DESCRIPTION

There is no hierarchy information in the Milkyway database. DEF/PDEF uses this info to decide if the hierarchy delimiter (usually '/') contained in the instance name needs to be escaped or not, as different inputs source might use different approaches. Consequently, DEF/PDEF will use the full name in the database, which might not be escaped correctly.

WHAT NEXT

If you do not use the special hierarchy character '/' in the instance name, you can ignore this message. Otherwise, you need to consider to preserve the hierarchy in the flow.

See Also

DP

DP-1 (information) Datapath optimization is enabled.

DESCRIPTION

This message informs you that datapath optimization is enabled (the default).

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

DP-2 (error) You have requested datapath optimization but the DesignWare license is not accessible.

DESCRIPTION

This error message occurs when the DesignWare or DesignWare-Foundation-Ultra license is not accessible. A license is required in order to enable built-in datapath optimization in the **compile** command.

WHAT NEXT

You can either obtain a DesignWare license, or disable datapath optimization by setting the **hlo_disable_datapath_optimization** DC variable to *true*.

SEE ALSO

`hlo_disable_datapath_optimization(3)`

DP-3 (information) Datapath optimization is limited for '%s'.

DESCRIPTION

This message notifies you that limited datapath optimization is enabled in the **compile** flow when the **set_datapath_optimization_effort** command has set the datapath_optimization_effort attribute to **medium** or **low** for the specified design or instance.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

```
compile(2)
compile_ultra(2)
set_datapath_optimization_effort(2)
set_ultra_optimization(2)
hlo_disable_datapath_optimization(3)
```

DP-4 (warning) '%s' is an invalid argument for variable/attribute '%S'.

DESCRIPTION

This warning message occurs when an invalid argument is set for the specified variable or attribute. The valid arguments are as follows:

- all - to duplicate all common subexpression (cse) in datapath block
- critical - to duplicate only common subexpressions on critical paths
- none - no cse duplication.

WHAT NEXT

The current common subexpression duplication is reset to **none**. If this is not what you intended, reset to another valid argument.

SEE ALSO

```
compile_ultra(2)
set_ultra_optimization(2)
hlo_datapath_duplicate_cse(3)
hlo_datapath_optimization(3)
```

DP-5 (warning) The duplicate_csa and dont_duplicate_csa

attributes are not supported in the built-in datapath optimization.

DESCRIPTION

This warning message occurs when the **duplicate_csa** or **dont_duplicate_csa** attributes are set. These attributes are not supported in the built-in datapath optimization function of the **compile** command. The attributes are ignored in the current datapath flow.

WHAT NEXT

This is only a warning message and no action is required. However, if you want to selectively set common subexpression (cse) duplication on particular design blocks, set the following attribute on the designs:

```
set_attribute design_list "datapath_duplicate_cse" <plain  
[none | critical | all]
```

SEE ALSO

```
compile_ultra(2)  
set_ultra_optimization(2)  
hlo_datapath_duplicate_cse(3)  
hlo_disable_datapath_optimization(3)
```

DP-6 (warning): Missing datapath expression on datapath cell '%S'.

DESCRIPTION

This warning message occurs when the tool encounters a datapath cell with missing expressions. Implementation selection is disabled on this cell to avoid expected behavior. This may result in less optimal QoR for the datapath block.

The datapath expression is removed if the datapath design is modified by other command, e.g. `remove_unconnected_ports`.

WHAT NEXT

Do not modify the datapath design if you want the datapath to be regenerated.

SEE ALSO

```
compile_ultra(2)  
set_ultra_optimization(2)  
hlo_disable_datapath_optimization(3)
```

DP-7 (warning) Internal error: Missing datapath common subexpression on datapath cell '%s'.

DESCRIPTION

This warning message occurs when you encounter an internal error that results in missing the datapath common subexpressions for the current DP cell.

WHAT NEXT

Submit a testcase that reproduces the problem to the Synopsys Customer Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

SEE ALSO

```
compile_ultra(2)
set_ultra_optimization(2)
hlo_disable_datapath_optimization(3)
```

DP-8 (warning) Datapath cell '%s' will be skipped during implementation selection due to missing expressions.

DESCRIPTION

This warning message occurs when the tool encounters a datapath cell with missing expressions. Implementation selection is disabled on this cell to avoid expected behavior. This may result in less optimal QoR for the datapath block.

WHAT NEXT

Do not modify the datapath design if you want the datapath to be regenerated.

SEE ALSO

```
compile_ultra(2)
set_ultra_optimization(2)
hlo_disable_datapath_optimization(3)
```

DPB

DPB-001 (error) No design %.s.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command before loading the design. Please load the design before running the budgeting command.

WHAT NEXT

Please load the design by reading verilog or loading Milkyway database. command.

SEE ALSO

`allocate_fp_budgets(2)`, `check_fp_timing_environment(2)`,

DPB-002 (error) No DC Design.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command without linking the design.

WHAT NEXT

Please run the `link` command to link the design. If you have already run `link` command, please check if there were any errors during linking.

SEE ALSO

`allocate_fp_budgets(2)`, `check_fp_timing_environment(2)`,

DPB-003 (error) No master or instance name defined in the file format spec. The file format spec should be <directory>/<m/

i>.<extension>.

DESCRIPTION

You received this message when you run *allocate_fp_budgets* command with incorrect *-file_format_spec* option. Please note format of the option and provide *-file_format_spec* option again.

WHAT NEXT

Please change the file format spec given in *-file_format_spec* option by calling *allocate_fp_budgets* command again. It accepts <directory>/<m/i>.<extension>, where <directory>: Name of the output directory, where SDC files are created <m/i>: Whether to use instance name or master of the block <extension>: Suffix of the SDC files

SEE ALSO

allocate_fp_budgets(2)

**DPB-004 (warning) There are no hierarchical pin locations.
Please run analyze routing by running "analyze_fp_routing**

DESCRIPTION

You received this message when you run *allocate_fp_budgets* command without running the Pin Cutting Flow. If the design has plan groups, and the plan groups have no pins assigned, then you will receive this message.

WHAT NEXT

Please run the Pin Cutting Flow to have the pins assigned on the plan groups. Running Pin Cutting Flow will improve the QoR of the Budgeter.

SEE ALSO

allocate_fp_budgets(2)

DPB-005 (error) Can not attach a file to the CEL.

DESCRIPTION

You received this message when you run *allocate_fp_budgets* command and the Budgeter is unable to create budgeting information.

WHAT NEXT

Please check the disk space on the design directory.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-006 (error) Budgeting has not been run.

DESCRIPTION

You received this message when you run *check_fp_budget_result* command without running *allocate_fp_budgets* command before. The *check_fp_budget_result* will only work if *allocate_fp_budgets* command has been run before in the same ICC session.

WHAT NEXT

Please run the Budgeter by calling *allocate_fp_budgets* command, before calling *check_fp_budget_result* command.

SEE ALSO

`allocate_fp_budgets(2), check_fp_budget_result(2)`

DPB-007 (warning) -blocks and -pins options are mutually exclusive.

-blocks option will be ignored.

DESCRIPTION

You received this message when you run *check_fp_budget_result* command with both *-blocks* and *-pins* options. These two options are mutually exclusive.

WHAT NEXT

Please use either `-blocks` or `-pins` option to `check_fp_budget_result` command.

SEE ALSO

`check_fp_budget_result(2)`

DPB-008 (error) No file name is provided.

DESCRIPTION

You received this message when you run `check_fp_budget_result` command without `-file_name` option. The file option is the location of the output of `check_fp_budget_result` command.

WHAT NEXT

Please provide the file name by providing `-file_name` option to `check_fp_budget_result` command.

SEE ALSO

`check_fp_budget_result(2)`

DPB-009 (error) Cannot open file %s.

DESCRIPTION

You received this message when you run `check_fp_budget_result` command and the command is unable to open the file provided in `-file_name` option.

WHAT NEXT

Please check the disk space and permissions of file provided in `-file_name` option.

SEE ALSO

`check_fp_budget_result(2)`

DPB-010 (warning) No option to check_timing_environment has

been specified. No report file will be generated.

DESCRIPTION

You received this message when you run *check_fp_timing_environment* command with no valid options. No Check Timing report file will be generated.

WHAT NEXT

Please check the syntax of the *check_fp_timing_environment* command. Please correct the errors on the command-line options.

SEE ALSO

`check_fp_timing_environment(2)`

DPB-011 (warning) Cannot find budgeted %s cell for cell '%s'.

DESCRIPTION

You received this message when you run *check_fp_timing_environment* command and the tool is unable to locate a plan group in the design.

WHAT NEXT

Please check if the link has been called before calling the *check_fp_timing_environment* command. Please check if there are any errors in the log file, before calling *check_fp_timing_environment* command.

SEE ALSO

`check_fp_timing_environment(2)`

DPB-012 (warning) The command fp_allocate_budgets is obsolete. Please use allocate_fp_budgets instead.

DESCRIPTION

You received this message when you run *fp_allocate_budgets* command. This command is obsolete and has been replaced by *allocate_fp_budgets* command. The *allocate_fp_budgets* command has exactly the same options as *fp_allocate_budgets* command. The *fp_allocate_budgets* may be removed in the future release of IC

Compiler.

WHAT NEXT

Please use the `allocate_fp_budgets` command, instead of `fp_allocate_budgets` command.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-013 (error) Must specify one of '%S', '%S' or '%S' Check Timing Environment GUI options.

DESCRIPTION

You received this message when you run the Check Timing Environment GUI, with more than one of the three mutually exclusive options. The Check Timing Environment GUI has exited.

WHAT NEXT

Please call Check Timing Environment GUI with one out of the three options, at one time.

SEE ALSO

`check_fp_timing_environment(2)`

DPB-014 (warning) No source latency info stored by CP on pin %S.

DESCRIPTION

You receive this message when you run budgeting after clock planning and the clock source latency information for the blocks cannot be retrieved by budgeting.

WHAT NEXT

Please re-run clock planning to synthesize all the clocks. If you run clock planning with the option to keep the clock trees in the blocks, please use `set synthesized_clocks true` before budgeting.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-015 (warning) No network latency info stored by CP on pin %S.

DESCRIPTION

You receive this message when you run budgeting after clock planning and the clock network latency information for the blocks cannot be retrieved by budgeting.

WHAT NEXT

Please re-run clock planning to synthesize all the clocks. If you run clock planning with the option to keep the clock trees in the blocks, please use **set synthesized_clocks true** before budgeting.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-016 (warning) No anchor cell found for clock source %s.

DESCRIPTION

You receive this message when you run budgeting after clock planning and there is a clock source in a block that does not have an anchor cell inserted after it.

WHAT NEXT

Please re-run clock planning to synthesize all the clocks. Please check that the clock nets do not have dont_touch attribute defined on them. If you run clock planning with the option to keep the clock trees in the blocks, please use **set synthesized_clocks true** before budgeting.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-017 (error) Cannot open CEL %s for write.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command on a design with ILMs, and the CEL views corresponding to the ILMs cannot be opened for write. In this cases the budgeted timing constraints cannot be stored with the CEL view.

WHAT NEXT

Please check your milkyway library to make sure that your CEL views are not marked read-only.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-018 (error) Cannot find CEL %s.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command on a design with ILMs, and the CEL views corresponding to the ILMs cannot be found. In this cases the budgeted timing constraints cannot be stored with the CEL view.

WHAT NEXT

Please check your milkyway library to make sure that it contains the CEL views corresponding to the ILMs.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-019 (warning) There are propagated and non-propagated clocks co-existing in the design.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command on a design with both propagated and non-propagated clocks. In this case, the budgeted input/output delays might not be accurate enough for block implementation.

WHAT NEXT

Please check top level SDC constraints. If you are calling the *allocate_fp_budgets* command before clock tree synthesis, it is recommended not to have propagated clocks in the top level SDC as it would give unrealistic clock latency numbers. If you are calling *allocate_fp_budgets* command after clock tree synthesis, please set *synthesized_clock* variable to true.

SEE ALSO

`allocate_fp_budgets(2)` `set_propagated_clock(2)` `remove_propagated_clock(2)`

DPB-020 (warning) Pin %s is not a block pin.

DESCRIPTION

You received this message when you run *allocate_fp_budgets* command with the option *-fixed_delay_objects*, and the specified pin you passed through the option is not a block pin. In this case, this pin is not considered by the command as fixed delay pin.

WHAT NEXT

Check if the pin name is correctly given in the command line.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-021 (warning) Pin %s has too much fixed delay on path from %s to %s.

DESCRIPTION

You received this message when you run *allocate_fp_budgets* command. The tool issues this warning message when it detects too much fixed delay in a path and there is no room to budget the adjustable delays.

WHAT NEXT

Check if there are too many pins/blocks/cells specified as fixed delay objects. If so, try to see if some of them can be removed. If not, and if you are running incremental budgeting, it means the block implementations are having a hard time to meet timing. It might be hard to meet top level timing closure.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-022 (error) Incremental budgeting stopped because there is no ILM pin with block level timing violation.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command with `-incremental` option. The tool issues this error message when it detects no pin of any ILM blocks in the design has timing violation at the block level when ILM model for the block was created. Then incremental budgeting stops.

WHAT NEXT

Check if all the block pins meet timing when ILM for the block is created. If there is no interface path violation, there is no need to run incremental mode budgeting. If there is interface path violation when the ILM is created, check if the ILM is created using IC Compiler release 2009.06 or later.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-023 (info) Incremental budgeting found critical pin %s.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command with `-incremental` option. The tool issues this informational message when it finds a pin on an ILM block that was hard to meet timing at the block level.

WHAT NEXT

Too many critical pins can cause budgeting to over-constrain the related blocks.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-024 (info) Time given to startpoint %s is %.6f(r) and %.6f(f) for block pin %s.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command with the variable `jtb_print_time_borrowing_info` set to true. The tool issues this informational message when it finds that a path used to calculate the input delay of the specified block pin starts from a transparent latch and that time borrowing is not zero at this latch.

WHAT NEXT

SEE ALSO

`allocate_fp_budgets(2)`

DPB-025 (info) Time borrowed from endpoint %s is %.6f(r) and %.6f(f) for block pin %s.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command with the variable `jtb_print_time_borrowing_info` set to true. The tool issues this informational message when it finds that a path used to calculate the output delay of the specified block pin ends in a transparent latch and that time borrowing is not zero at this latch.

WHAT NEXT

SEE ALSO

`allocate_fp_budgets(2)`

DPB-026 (info) Budgets on pin %s may be tightened.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command with the option `-incremental`. The tool issues this informational message when it finds that a budgeting block pin's budget is affected by the critical pins the tool identified

automatically. If options `-fixed_delay_objects` and/or `-no_interblock_logic` is also specified, this message could mean that the pin's budget is affected by the objects given in the options.

WHAT NEXT

This is a informational message. No action needed.

SEE ALSO

`allocate_fp_budgets(2)`

DPB-027 (info) Fixed delays on path from %s to %s are changed to adjustable to calculate input/output delay for pin %s.

DESCRIPTION

You received this message when you run `allocate_fp_budgets` command with the option `-incremental`. The tool prints this informational message when it decides to ignore some fixed delays in the design and treat them as adjustable delays to calculate the input/output delay for the specified pin. This happens when the tool finds too much fixed delay in the specified path and there is no room to budget the adjustable delays.

WHAT NEXT

Check if there are too many pins/blocks/cells specified as fixed delay objects. If so, try to see if some of them can be removed. If not, it means the block implementations are having a hard time to meet timing. It might be hard to meet top level timing closure.

SEE ALSO

`allocate_fp_budgets(2)`

DPI

DPI-001 (information) All of the movable filler cells will be removed!

DESCRIPTION

This message indicates that ICC detail placer has detected that there are some movable filler cells inside this design while performing the detail placement. ICC detail placer will remove all of the movable filler cells and perform the detail placement. Later on, Users need to insert filler cells again.

WHAT_NEXT

DPI-002 (warning) Cell %s is violating "Via-Spacing" Rule.

DESCRIPTION

This warning informs you that the named cell is violating the "Via-Spacing" rule in the design. The placement of the cell is not valid.

WHAT NEXT

To make the placement valid, use the **legalize_placement** command.

SEE ALSO

legalize_placement (2).

DPI-003 (error) The input scan chain %s is broken between pin %s and pin %s, which come from different logical hierarchies!

DESCRIPTION

This message indicates that ICC has detected that the input scan chain is broken between two different logical hierarchies. Command **connect_dft_eco** can not support this.

WHAT_NEXT

Users need to make sure that the scan chain is not broken between two different logical hierarchy boundaries.

DPI-004 (error) NO SCAN_IN/SCAN_OUT pin for scan chain %s!

DESCRIPTION

This message indicates that ICC can not find the SCAN_IN/SCAN_OUT pins for the given scan chain. Command connect_dft_eco requires that both SCAN_IN pin and SCAN_OUT pin should be present for a scan chain.

WHAT_NEXT

User needs to double check the scan chain data, and make sure that both SCAN_IN and SCAN_OUT pins are present.

DPI-005 (error) new scan cell %s does not belong to the logical hierarchy which the input scan chain %s resides. Therefore this new cell will not be added into the scan chain!

DESCRIPTION

This message indicates that command connect_dft_eco has detected that the new cell does not belong to the logical hierarchy where the scan chain resides. Therefore, this new cell can not be added into the given scan chain.

WHAT_NEXT

Command connect_dft_eco can support this situation at this moment. Users need to use other way to add this new cell into the scan chain.

DPI-006 (error) skip scan chain %s since it has some errors.

Command connect_dft_eco failed!

DESCRIPTION

This message indicates that command connect_dft_eco has detected that the input scan chain has some errors, and command connect_dft_eco can not proceed.

WHAT_NEXT

Users need to fix the input scan chain problem before they run command connect_dft_eco.

DPI-007 (information) pin %s was disconnected during ECO reconnection operation!

DESCRIPTION

This message indicates that command connect_dft_eco has disconnected this pin because it will be connected to a different scan cell which is inside the SCANDEF. By default, command connect_dft_eco will reconnect the scan chain based on the scan cell order which is from SCANDEF. You are seeing this message may also because of the fact that with some new cells being added into the scan chain, some existing connection will be disconnected and reconnected to some different cells.

WHAT_NEXT

If users want to control the order of the scan chain after this command, users can update their SCANDEF with the desired order before they run command connect_dft_eco.

DPI-008 (information) skip net %s (connecting to port %s) because the net is dont_touch!

DESCRIPTION

This message indicates that command insert_port_protection_diodes can not add port_protection_diode cell to the net because this net is a "dont_touch" net.

WHAT_NEXT

Double-check the net/port setting, remove the dont_touch attribute before you want to use command insert_port_protection_diodes to add port_protection_diodes to this net/port.

DPI-009 (warning) port %s has already connected to one port_protection_diode %s!

DESCRIPTION

This message indicates that command `insert_port_protection_diodes` has detected that this port has connected to at least one `port_protection_diode` already.

WHAT_NEXT

There may be a chance that users have added multiple `port_protection_diodes` for the same port by mistake. Although command `insert_port_protection_diodes` is issuing this warning message, it will still insert a new `port_protection_diode` for this port. However, users need to double-check the `port_protection_diode` creation for this port.

DPI-010 (information) port %s is not connecting to any port_protection_diode!

DESCRIPTION

This message indicates that command `report_port_protection_diodes` has detected that this port is not connecting to any `port_protection_diode`.

WHAT_NEXT

One `port_protection_diode` may need to be added for this port since it does not have any. Users can use command `insert_port_protection_diodes` to do so.

DPI-011 (Error) %s

DESCRIPTION

This is a general message indicates that some errors are happenning during the current command execution.

WHAT_NEXT

Correct the error, and try again.

DPI-012 (Error) %s

DESCRIPTION

This is a general internal error message indicates that some internal errors are happenning during the current command execution. Please pay attention to the detail message.

WHAT_NEXT

Correct the error, and try again.

DPI-013 (warning) port %s is connecting to multiple port_protection_diodes %s !

DESCRIPTION

This message indicates that command report_port_protection_diodes has detected that this port has connected to at least two port_protection_diode already.

WHAT_NEXT

There may be a chance that users have added multiple port_protection_diodes for the same port by mistake. Users may need to double-check the port_protection_diode creation for this port.

DPI-014 (warning) port_protection_diode %s is not connecting to any port!

DESCRIPTION

This message indicates that command report_port_protection_diodes has detected that this port_protection_diode does not connect to any port. It is expected that one port_protection_diode should connect to one port. However this port_protection_diode does not.

WHAT_NEXT

There may be a chance that users have added some new logic in between the port_protection_diode and the port which the diode should protect. Users may need to double-check the connection of the port_protection_diode and take some proper action for this.

DPI-015 (information) %d port_protection_diodes have been added, legalized and marked as FIXED!

DESCRIPTION

This message indicates that command insert_port_protection_diodes has added some port_protection_diodes into the netlist. Moreover, the newly added port_protection_diodes have been legalized and marked as FIXED.

WHAT_NEXT

This message indicates that command insert_port_protection_diodes has added some new port_protection_diodes into the design.

DPI-016 (error) Can not find any proper driver for all the specified ECO cells!

DESCRIPTION

This message indicates that command derive_eco_cell_locations can not find any proper driver cell which are driving the specified "ECO cells" when the "-driver_neighbour" has been specified. This message may indicate that there is an issue with the specified "ECO cells": they may not have any connection, or may not connect to any proper driver.

WHAT_NEXT

Users need to double-check the connectivity of the specified "ECO cells", make sure that there are some proper driver cells which are connecting to the ECO cells when "-driver_neighbour" has been specified.

DPI-017 (error) The specified library cell %s has a problem and can not be added into the current design!

DESCRIPTION

This message indicates that command insert_port_protection_diodes has detected that the specified library cell is not the correct type of library cell which may not match the current operating condition or current voltage area specification. In addition, there is also a chance that this user-specified library cell has been marked as "dont_use" with the library setting.

This message may indicate that there is an issue with the specified library cell.

WHAT_NEXT

There may be multiple types of library cells inside different target libraries, yet they have the same library cell name. Users need to double-check the specified library cell, make sure that the specified library cell match the current operating condition and voltage area specification (P, V, T). In addition, the user needs to double-check whether this library has a "dont_use" marking with the current library setting.

DPI-018 (information) a port protection diode has been added into net %s which is only connecting to port %s !

DESCRIPTION

This message indicates that command insert_port_protection_diodes has detected that the specified port is the only connection of the net. However, a port protection diode is still being inserted into such a net. This message may indicate that the user need to check the specified ports.

WHAT_NEXT

User may need to check their specified ports, and make sure that a port protection diode needs to be added even though the port is the only connection of the corresponding net.

DPI-019 (information) "Treat %s as physical-only since it has IS_PHYSICAL_ONLY flag!"

DESCRIPTION

This message indicates that the above cell instance will be treated as "physical-only" cells due to the IS_PHYSICAL_ONLY flag.

WHAT_NEXT

DPI-020 (information) "Treat %s as physical-only since it has no

signal connection!"

DESCRIPTION

This message indicates that the above cell instance will be treated as "physical-only" cells because it has no signal connection.

WHAT_NEXT

Check your design and make sure the netlist is correct.

DPI-100 (Error) This design does not have floorplan.

DESCRIPTION

The command `insert_spare_cells` require designs to have floorplan to continue.

WHAT_NEXT

`read_def` to create floorplan or `initialize_floorplan`.

DPS

DPS-001 (Warning) The module %s does not have any hierarchy below. It has %d violating paths and will be set as a separate partition.

DESCRIPTION

This Warning message is generated if the given module does not have any submodules below it. It also specifies the number of violating paths present in the module.

WHAT NEXT

Check the partition_list

DPS-002 (Warning) The module %s does not have any hierarchy below. It has %d leaf cells and will be set as a separate partition.

DESCRIPTION

This Warning message is generated if the given module does not have any submodules below it. It also specifies the number of leaf cells present in the module.

WHAT NEXT

Check the partition_list

DPS-003 (Error) There is no hierarchy in the design. The design cannot be partitioned.

DESCRIPTION

This Error message is generated if the given design does not have any modules and submodules below it.

DPS-004 (Error) The value for -max_size is very large for the design. The design does not require partitioning.

DESCRIPTION

This Error message is generated if the -max_size value specified is very large as compared to the number of leaf cells present in the given design .Hence the given design does not require partitioning.

WHAT NEXT

Free the autopartition info elements

DPS-005 (Error) Must specify the path to %s executable with variable dps_%s_path.

DESCRIPTION

This Error message is generated if the path of the given executable is not specified.

WHAT NEXT

Exit the process.

DPS-006 (Warning) No architecture specified for %s, default architecture is %s.

DESCRIPTION

This Warning message is generated if the architecture is not specified for the process.

WHAT NEXT

Set the architecture to its default value.

DPS-007 (Error) Unable to %s file %s %s.

DESCRIPTION

This Error message is generated if a file cannot be opened for reading or writing. This message is also generated if the file cannot be created or if the file is already opened for reading or writing.

WHAT NEXT

Exit the process.

DPS-008 (Error) No clocks founds in this design. Please apply clock constraints .

DESCRIPTION

This Error message is generated if no clocks are found in the design.

WHAT NEXT

Apply the clock constraints.

DPS-009 (Error) Unable to parse host information, the format is hostname:arch.

DESCRIPTION

This Error message is generated if there is an error in parsing the host information i.e. the hostname and the architecture.

WHAT NEXT

Check the various cases of the host error.

DPS-010 (Error) Please load the AHFS optimized design for -

skip_setup option.

DESCRIPTION

This Error message is generated if AHFS optimized design is not loaded for - skip_setup option.

WHAT NEXT

Load the optimized design for skip setup option.

DPS-011 (Error) Unable to find host by name %s.

DESCRIPTION

This Error message is generated if no host exists which has the specified name.

WHAT NEXT

Check the various cases of the host error.

DPS-012 (Error) No architecture specified with host %s, format is <hostname>:<architecture>.

DESCRIPTION

This Error message is generated if no architecture is specified for the given host.

WHAT NEXT

Check the various cases of the host error.

DPS-013 (Error) Invalid host %s specified, host name is ignored.

DESCRIPTION

This Error message is generated if invalid host is specified.

WHAT NEXT

Ignore the hostname.

DPS-014 (Error) Unable to find out nhost path.

DESCRIPTION

This Error message is generated when nhost path is not found.

WHAT NEXT

Check the nhost path.

DPS-015 (Warning) In DPS both "-effort high" and - "timing_driven_congestion" cannot be used. The option "-effort high" is ignored.

DESCRIPTION

DPS does not support the options "-effort high" and -"timing_driven_congestion" togather. You can use each one of them independently. If both the options are specified, DPS will ignore the option "-effort high".

WHAT NEXT

Check the physopt options specified in the set_dps_options or set_dps_module_options command and avoid using both these options togather.

DTC

DTC-1 (warning) The scaling factor given for %s is invalid. Using default value of 1.0.

DESCRIPTION

This message occurs if you have tried to scale derived constraints by a nonpositive number. Constraints cannot be scaled by a negative number, or by zero.

WHAT NEXT

Rerun `derive_timing_constraints` without the bogus scaling factor.

DTC-2 (warning) Unable to create clock on pin '%s' (%s).

DESCRIPTION

This warning can be issued by the `derive_clocks` command or the `derive_timing_constraints` command. It can happen if the command is issued before some synthetic cells are built.

WHAT NEXT

Use `compile` before issuing the `derive_clocks` or `derive_timing_constraints` command to build synthetic parts.

DVI

DVI-3 (warning) view_script_submenu_items variable exists but is invalid.

DESCRIPTION

You receive this message if the **view_script_submenu_items** variable, which defines the user-definable menu, exists but has an invalid value. The variable must contain a homogeneous list of strings.

WHAT NEXT

Change the value of the **view_script_submenu_items** variable so that it is a homogeneous list of strings. Then reexecute the command.

SEE ALSO

view_script_submenu_items (3).

DVI-4 (error) Script menu overflow.

DESCRIPTION

You receive this message if the user-definable menu has more than (%d) entries. (%d) is the maximum capacity for the menu.

WHAT NEXT

Adjust the **view_script_submenu_items** variable so that it contains no more than (%d) items. Then re-execute the command.

SEE ALSO

view_script_submenu_items (3).

DVI-5 (error) The current design is not constrained; cannot

create histogram.

DESCRIPTION

You receive this message if you issue a command to create a histogram, but the current design is not constrained. A histogram cannot be created unless the current design is constrained.

WHAT NEXT

Apply constraints to the current design, then create the histogram.

SEE ALSO

`current_design` (2).

DVI-6 (error) No current design, or current design not constrained; cannot create histogram.

DESCRIPTION

You receive this message if you issue a command to create a histogram, but there is no current design or the current design is not constrained. You cannot create a histogram unless there is a current design defined, and that current design is constrained.

WHAT NEXT

Ensure that a design is currently loaded and constrained.

SEE ALSO

`current_design` (2).

DVI-7 (warning) Design has been modified or removed. Closing Timing Analysis views.

DESCRIPTION

You receive this message because you have changed or removed the *current design* while one or more Timing Analysis windows are active. This message warns you that

these windows are being closed. When the *current design* is modified or deleted, Timing Analysis Windows (for example, Histogram View and Path Schematics) are invalidated.

WHAT NEXT

Regenerate the histogram with the changed *current design*.

SEE ALSO

`current_design (2)`, `remove_design (2)`.

DVI-8 (warning) Timing information in design has changed. Closing Timing Analysis views.

DESCRIPTION

You receive this message because you have changed timing information for the *current design* while one or more Timing Analysis windows are active. This message warns you that these windows are being closed. When the *current design* is modified or deleted, Timing Analysis Windows (for example, Histogram View and Path schematics) are invalidated.

WHAT NEXT

Regenerate the histogram with the changed *current design*.

SEE ALSO

`current_design (2)`, `reset_design (2)`.

DVI-9 (warning) The current design has changed. Closing Timing Analysis views.

DESCRIPTION

You receive this message because the *current design* has changed while one or more Timing Analysis windows are active. This message warns you that these windows are being closed. When the *current design* is modified or deleted, Timing Analysis Windows (for example, Histogram View and Path schematics) are invalidated.

WHAT NEXT

Regenerate the histogram with the changed *current design*.

SEE ALSO

`current_design` (2), `show_path_slack_histogram` (2).

DVI-10 (warning) Cannot perform this operation. Selected objects must be at the same hierarchical level.

DESCRIPTION

You receive this message because you have attempted to perform a group operation on objects at different hierarchical levels. For a group operation, all objects must be at the same hierarchical level.

WHAT NEXT

Execute the group operation again, using only cells from the same hierarchical level.

SEE ALSO

`group` (2), `ungroup` (2).

DVI-11 (warning) Cannot perform this operation. Selected nets must be at the same hierarchical level.

DESCRIPTION

You receive this message because you have attempted to perform this operation on nets in different hierarchical levels. For this operation, all nets must be at the same hierarchical level.

WHAT NEXT

Execute the command again using only nets from the same hierarchical level.

SEE ALSO

`report_port` (2), `report_timing` (2).

DWSC

DWSC-2 (error) Port number %d of implementation '%s' of synthetic module '%s' should be '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the ports in your netlist or hdl description match your module declaration exactly, both in name and order.

DWSC-3 (error) Direction of port '%s' in implementation '%s' does not match the declared synthetic module '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the netlist or hdl description has the correct direction for the named port.

DWSC-4 (error) Width of port '%s' in implementation '%s' does not match the declared synthetic module '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the netlist or hdl description has the correct width for the

named port. The width must match for all possible parameter values.

DWSC-5 (error) Port '%s' in implementation '%s' is not declared in the synthetic module '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the netlist or hdl description has the same ports as the synthetic module.

DWSC-6 (warning) The dont_touch on the synthetic library implementation '%s' (module '%s') will be ignored during model generation.

DESCRIPTION

A dont_touch attribute on a top-level design is ignored. When a synthetic library implementation is modelled, it is treated as a top-level design. Later in the compile process, the implementation is a sub-design and the dont_touch will be adhered to.

WHAT NEXT

Remove the dont_touch on the design and apply the dont_touch to the cells in the implementation that the user wants to be dont_touched.

DWSC-7 (error) Design hierarchy is not allowed inside a synthetic library part. The module '%s' implementation '%s' has hierarchy in it.

DESCRIPTION

We support only hierarchy that is a technology library or a synthetic library module or operator.

WHAT NEXT

If the hierarchy is a technology library or a synthetic library, check the *synthetic_library* and *link_library* variables and the *set_local_link_library* directive.

DWSC-8 (error) The synthetic library module '%s' implementation '%s' failed to link.

DESCRIPTION

This error occurred when linking a synthetic part. One possible problem is that the part has illegal hierarchy (eg: a level of hierarchy that is not a synlib part). Another possible problem is that there one synlib part contains another part (or technology cell) and both part's .sldb files are not in the synthetic_library variable. Another possible problem is that the subpart is not mentioned as a contained operator/module/implementation of the parent part, so the license for the subpart was not checked out and the subpart was not considered an authorized synthetic library part. Another possible problem is the local_link_library variable was not set correctly.

WHAT NEXT

Make sure the parts linked are synlib parts, technology cells, or GTECH cells. Add the subpart's .sldb file to the synthetic_library variable. Ensure that the subpart is listed as a contained operator/module/implementation of the parent part in the parent part's .sl file.
Make sure the local_link_path is set correctly.

DWSC-9 (information) Modeled %s(%s). (Wire load = %s Operating Conditions = %s)

DESCRIPTION

The named synthetic design was optimized to obtain representative timing and area numbers for the part. These numbers will be used to model the part in subsequent optimizations.

Once a part is modeled, it can be stored in a synthetic cache. Thus, subsequent compiles will not have to recreate the model. Use the variables *cache_read* and *cache_write* to set up your cache. You can also use the **create_cache** command to store parts in your cache.

WHAT NEXT

Store in a synthetic cache the synthetic implementations you use often. For more details, refer to the DesignWare reference manual.

DWSC-10 (information) The synthetic model '%s' was read from a cache.

DESCRIPTION

WHAT NEXT

DWSC-11 (information) Read %s as a cache element.

DESCRIPTION

Indicates that the specified design was read from the current Synopsys cache.

WHAT NEXT

No action is required as this is just an information message.

DWSC-12 (information) The cache entry '%s' is out of date with respect to the information in the design library or the generator '%s' (module '%s', implementation '%s').
The cache entry has been removed.

DESCRIPTION

A cache entry is tagged with timestamps from the design library entry or the generator's executable that it was created from.
If the design library or the generator's executable is updated, then the cache entry may not be valid, so it is removed.

WHAT NEXT

DWSC-13 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed. The entry is either out of date or corrupted with respect to its entry in the design library or the generator '%s' (module '%s', implementation '%s').

DESCRIPTION

A cache entry is tagged with a timestamp from the design library entry or the generator's executable that it was created from. When the design library or the generator executable is updated, then the cache entry may not be valid and so it is removed. This warning indicates that the attempt to remove it failed. If the cached item is not removed manually, the cached entry may cause the compile command to require more time generating netlist for that synthetic library part.

WHAT NEXT

DWSC-14 (information) The cache entry '%s' is out of date with respect to its target library '%s'. The cache entry has been removed.

DESCRIPTION

A cache entry is tagged with a timestamp from the target library that it was created from. If the target library is updated, then the cache entry may not be valid, so it is removed.

WHAT NEXT

DWSC-15 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed. The entry should be removed because either it is corrupted

or it is out of date due to newer target library '%s'.

DESCRIPTION

A cache entry is tagged with a timestamp from the target library that it was created from. If the target library is updated, then the cache entry may not be valid, so it is removed.

The attempt to remove it failed.

If it is not removed manually, it may cause the compile command to take more time generating netlist for that synthetic library part.

WHAT NEXT

DWSC-16 (information) The v3.3b cache element format has changed.

The cache entry, '%s', is being removed.

DESCRIPTION

A new cache element will be built and cached.

WHAT NEXT

Nothing needs to be done.

DWSC-17 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed.

The entry should be removed because it is written in the older format, v3.3b.

DESCRIPTION

The cache entry is written in the older format which does not have required information for further optimizations. The attempt to remove it failed.

If it is not removed manually, it may cause the compile command to take more time while it optimizes that synthetic library part.

WHAT NEXT

Manually remove the cache element.

DWSC-18 (information) The cache entry '%s' has been corrupted, so it is being removed.

DESCRIPTION

The cache is a directory structure and the files in it have a predefined format. The entry listed above does not conform to the format.

WHAT NEXT

No action is necessary; the file has been removed.

DWSC-19 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed. The entry should be removed because it is either corrupted or obsolete.

DESCRIPTION

The cache is a directory structure and the files in it have a predefined format. The entry listed above does not conform to the format.

WHAT NEXT

DWSC-20 (warning) Improper octal value for variable cache_file_chmod_octal or cache_dir_chmod_octal: %s

DESCRIPTION

The value specified for either cache_file_chmod_octal or cache_dir_chmod_octal was invalid. These values are used to set the directory and file permissions on directories and files created inside of a Synopsys cache. The values must be octal numbers and less than 0777 for file permissions and less than 01777 for directory

permissions.

WHAT NEXT

Check the values of these two variables and update them so that they have valid values.

DWSC-21 (warning) Cannot set protections on the cache directory %s.

DESCRIPTION

After creating the specified directory, an attempt was made to chmod it to the permissions specified by the cache_dir_chmod_octal variable. The chmod system call failed.

WHAT NEXT

Fix the problem that prevented the chmod from succeeding if possible. Otherwise try creating the directory and setting the permissions manually.

DWSC-22 (information) Wrote %s as cache element.

DESCRIPTION

Indicates that the specified design was written to the current Synopsys cache.

WHAT NEXT

No action is required as this is just an information message.

DWSC-23 (warning) Cannot set protections on the cache file %s.

DESCRIPTION

After creating the cache file, an attempt was made to chmod it to the permissions specified by the cache_file_chmod_octal variable. The chmod system call failed.

WHAT NEXT

Fix the problem that prevented the chmod from succeeding if possible. Otherwise try creating the directory and setting the permissions manually.

DWSC-24 (warning) Cache element %s could not be written.

DESCRIPTION

An error occurred while trying to write a cache element to the specified file. This is most likely due to file permissions problems or a full disk.

WHAT NEXT

Resolve the problem with the specified file/directory and try the failing command again.

DWSC-25 (error) Unable to resolve environment variable %s for generator %s.

DESCRIPTION

The environment variable which defines the location of the generator is not defined.

WHAT NEXT

Set the generator's executable environment variable to point to a valid location

DWSC-26 (information) User interrupted execution of generator.

DESCRIPTION

WHAT NEXT

DWSC-27 (error) Synthetic library '%s'

is from an incompatible version of the software.

DESCRIPTION

You cannot use the given synthetic library with this version of the software. If you are worried about obtaining "standard.sldb", do not worry. An up-to-date version of standard.sldb is automatically used, regardless of the contents of the synthetic_library variable. The correct default setting for synthetic_library is {}.

WHAT NEXT

DWSC-28 (warning) Inout port type on port %s is currently not supported.

DESCRIPTION

WHAT NEXT

DWSC-29 (warning) Unknown input oper_pin '%s' specified as permutable.

DESCRIPTION

WHAT NEXT

DWSC-30 (warning) Input oper_pin '%s' multiply specified as

permutable.

DESCRIPTION

WHAT NEXT

DWSC-31 (error) Unable to find the generator at '%s'.

DESCRIPTION

The pathname to the generator executable which is defined by the environment variable in the synthetic library is invalid.

WHAT NEXT

Reset the generator's environment variable to point to a valid executable.

DWSC-32 (error) %s.

DESCRIPTION

This message may have several different outputs. Below is information on each one:

No formula or specified value for parameter '%s' in library specification for module '%s', implementation '%s'. The synthetic module or implementation requires the given parameter. When instantiating the module, the parameter was not specified.

Remember, synthetic library parameter names are case-sensitive. Keep in mind that the offending part instantiation might be nested inside another synthetic implementation.

WHAT NEXT

No formula or specified value for parameter '%s' in library specification for module '%s', implementation '%s'. Make sure you specify the required parameter. If you are using DesignWare developer, you can modify the module/implementation definition in your *.sl file so that the parameter is derived automatically (via a formula attribute).

DWSC-33 (error) Parameter '%s' does not evaluate to a numeric

value %s.

DESCRIPTION

WHAT NEXT

DWSC-34 (information) The cache entry '%s' is out of date with respect to the information in the synthetic library '%s' (module '%s', implementation '%s'). The cache entry has been removed.

DESCRIPTION

A cache entry is tagged with timestamps from the synthetic library entry that it was created from. If the synthetic library is updated, then the cache entry may not be valid, so it is removed.

WHAT NEXT

DWSC-35 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed. The entry is either out of date or corrupted with respect to its entry in the synthetic library '%s' (module '%s', implementation '%s').

DESCRIPTION

A cache entry is tagged with timestamps from the synthetic library entry that it was created from. If the synthetic library is updated, then the cache entry may not be valid, so it is removed.

The attempt to remove it failed.

If it is not removed manually, it may cause the compile command to take more time generating netlist for that synthetic library part.

WHAT NEXT

DWSC-36 (warning) Could not find port '%s' in implementation %s
of synthetic module '%s'.

DESCRIPTION

Each port defined in a synthetic library implementation must exist in the netlist used to instantiate the implementation.

WHAT NEXT

DWSI

DWSI-1 (error) Parameter '%s' does not evaluate to a positive value %s.

DESCRIPTION

WHAT NEXT

DWSI-2 (info) Re-generating implementation '%s' for '%s' with timing context.

DESCRIPTION

During second pass iis, if the mentioned part is the only choice for incremental implementation selection, and this part is from mce generator, it is forced to be re-generated with timing context.

WHAT NEXT

DWSI-3 (warning) Power optimization feature in DesignWare generator is disabled because the required '%s' license is not available.

DESCRIPTION

The DesignWare build in power optimization feature requires DesignWare-LP license. This license can not be checked out. Therefore, this feature is disabled.

WHAT NEXT

EA

EA-001 (error) Estimate_fp_area component failure.

DESCRIPTION

This error message occurs when one of the major components of command fails. Major component include die creation, placement, power network synthesis and routing.

WHAT NEXT

Check in the log file before this message and see what errors occurred.

EA-002 (error) File %s not found.

DESCRIPTION

This error message occurs during the loading of user defined scripts. It indicates that the script could not be found.

WHAT NEXT

Check if the script is available, and that the spelling is correct. Try putting script in run directory and loading it from that location.

EA-003 (error) The options %s and %s are mutually exclusive.

DESCRIPTION

This error message occurs when you use two options which are mutually exclusive.

WHAT NEXT

Check the man page of the command to determine why these options are mutually exclusive. Do not use one of the two options.

EA-004 (error) The value given for option %s must be less or

equal to option %s.

DESCRIPTION

This error message occurs when you have two options which have a relationship such that one option value must be less than or equal to the other. For example, setting a minimum and maximum value, the minimum value must be less than or equal to the maximum value.

WHAT NEXT

Change the input option values to satisfy the above constraint.

EA-005 (error) No design is loaded.

DESCRIPTION

This error message occurs if there is no design loaded and a loaded design is needed.

WHAT NEXT

Load a design.

SEE ALSO

`open_mw_cel(2)`
`open_mw_lib(2)`

EA-006 (error) Failure in Power Network Synthesis.

DESCRIPTION

This error message occurs when you are using power network synthesis (PNS) and there was an error while running PNS.

WHAT NEXT

Look at log file to see what was error in PNS. Try changing how you are using PNS, or do not use PNS to see if that will work.

EA-007 (error) Failed to get cell/core boundary.

DESCRIPTION

This error message occurs when there is no die and/or core in the design.

WHAT NEXT

Use initialize_floorplan to create the die and core before running this command.

SEE ALSO

initialize_floorplan(2)

EA-008 (error) Unfixed hard macros outside core boundary.

DESCRIPTION

This error message occurs when you have unfixed hard macros that are outside or partially outside the core.

WHAT NEXT

Take a look at the macros which are outside or partially outside the core. If they are intended to be that way, then mark them as fixed. If they are not intended to be outside the core, then move them to be inside the core.

EA-009 (error) Failed to get design utilization.

DESCRIPTION

This error message occurs when the tool is unable to calculate the design utilization. Design utilization consists of two parts, the area of the cells in the design and the area of the core. If either of these two parts cannot be calculated, then this error will result.

WHAT NEXT

If there is no core in design, create one with initialize_floorplan.

SEE ALSO

initialize_floorplan(2)

EA-010 (error) Missing the required license, %s.

DESCRIPTION

This error message occurs because you have accessed a command or feature that requires a license which is not available.

WHAT NEXT

Check if there are any licenses available or if there is any problem with the license server.

EA-011 (error) Fixed HM/SM overlaps detected.

DESCRIPTION

This error message occurs because you have fixed (in location) hard macros or soft macros which are overlapping. This is not supported in estimate_fp_area.

WHAT NEXT

Determine which are the overlapping macros, and remove the overlap. You can use report_fp_placement to determine which are the overlapping macros.

SEE ALSO

`report_fp_placement(2)`

EA-012 (error) Core BBox is not inside cell BBox.

DESCRIPTION

This error message occurs because the bounding box of the core is not inside the bounding box of the cell. It is allowed for the core boundary to be rectangular while the cell boundary is rectilinear, but the bounding box of the core must be inside the bounding box of the cell.

WHAT NEXT

Change the core or cell boundary to satisfy this constraint.

SEE ALSO

initialize_floorplan(2)

EA-013 (error) Overlapping placement constraints detected

DESCRIPTION

This error message occurs because the design contains overlapping (or nested) placement constraints. These constraints include plan groups, hard movebounds, exclusive movebounds, and voltage areas. None of these constraints can overlap for this command to work properly.

WHAT NEXT

Determine what are the overlapping constraints. Remove or delete the constraints as appropriate.

EA-014 (error) Large pin %s (%lf %lf %lf %lf) detected.

DESCRIPTION

This error message occurs because the design contains very large pins which will limit the shrink that can be done because pins are not shrunk. Typically these pins are power pins.

WHAT NEXT

Find these large pins either by the name or by the dimensions given. Remove all these large pins before using estimate_fp_area.

EA-015 (error) Failed to save design.

DESCRIPTION

This error message occurs when **estimate_fp_area** tries to save the design but fails. **estimate_fp_area** needs to save a copy of the design to keep a backup copy of the design while it is changing the original design.

WHAT NEXT

Make sure you have write permission on disk and that disk is not full.

EA-016 (error) Failed to load TDF constraints.

DESCRIPTION

This error message occurs when there is a problem in loading TDF constraints.

WHAT NEXT

Check the TDF constraints to make sure they are correct. The TDF constraints are in the file "io_temp.tdf".

SEE ALSO

```
write_io_constraints(2)  
read_io_constraints(2)
```

EA-017 (error) Design contains both pins and IO pads.

DESCRIPTION

This error message occurs because the design contains both pins and IO pads. This situation is not supported by this command. The design should have only pins or only IO pads.

WHAT NEXT

Delete the pins or the IO pads as appropriate.

EA-018 (error) The option %s is required when using option %s.

DESCRIPTION

This error message occurs when you use two options which depend on each other. The first option is required when you are using the second option.

WHAT NEXT

Check the man page of the command to determine why these options are related. Add the required option or remove the second option.

EA-019 (error) The -power_net_names string format is not

correct.

DESCRIPTION

This error message occurs when there is a problem in parsing the -power_net_names string. It is expected that the string will be of the form {VDD net name> <VSS net name>}.

WHAT NEXT

Fix the -power_net_names string as specified by the format above.

ECO

ECO-1 (error) The subdesign '%s' has %d %s cells.

DESCRIPTION

During `eco_implement`, all the cells in the old implementation and new implementation must be mapped, not generic cells or unmapped DesignWare parts.

WHAT NEXT

Compile or map the implementation designs. Try again.

ECO-2 (error) Current design pair is not defined.

DESCRIPTION

This error is generated when current design pair is not defined in the dc_shell.

WHAT NEXT

Use `list_designs` command to see whether there are any designs in the memory or use `read` command to read a design in. Then invoke `eco_current_design_pair` command to set the desired current design pair.

ECO-3 (error) Cannot set a design in current design pair to library design '%s'.

DESCRIPTION

WHAT NEXT

ECO-4 (error) Some black box cells cannot be handled

in design '%s'.

DESCRIPTION

The listed cells are most likely cells within DesignWare cells whose library cell reference cannot be found. ECO Compiler cannot handle cells without library references inside DesignWare cells.

Note: ECO Compiler can handle some cells with unresolved references: user instantiated cells from the link library as well as user-defined subdesigns whose underlying DB reference design has been removed. However, the cells must be in pairs, one in the old netlist and one in the new netlist, with the same cell name and pin names.

Such cell pairs are treated as aligned black boxes during the ECO process. No changes to black box cells or subdesigns are made. The cell pair input pins are treated as endpoints and their output pins are treated as sourcepoints. Cells that are mentioned in the **set_eco_reuse** command are treated in the same way.

WHAT NEXT

Attempt to resolve all unresolved references related to the cells listed and run **eco_implement** again.

ECO-5 (error) The current design pair is inappropriate for the command.

DESCRIPTION

Most likely you tried to do **eco_analyze_design** or **eco_implement** and the options to the last **eco_current_design_pair** were inappropriate.

Suppose that the following four top-level DB designs are involved in an ECO process:

Design Name	Role in ECO process
-----	-----
OH	old HDL
ON	old netlist
NH	new HDL
NN	new netlist

For these top-level designs, there are only four valid combinations of the options:

- 1) **eco_current_design_pair -old_hdl OH -new_hdl NH**

- Use this for **eco_align_design** and **eco_analyze_design**.
- 2) **eco_current_design_pair -old_hdl OH -old_netlist ON**
Use this for **eco_align_design** of the two old designs.
 - 3) **eco_current_design_pair -new_hdl NH -new_netlist NN**
Use this for **eco_align_design** of the two new designs.
 - 4) **eco_current_design_pair -old_netlist ON -new_netlist NN.**
Use this for **eco_align_design** and **eco_implement** on the netlists.
eco_current_design_pair is irrelevant during **eco_recycle** and has no effect if it is set.

WHAT NEXT

Choose one of the aforementioned options and rerun command.

ECO-6 (error) Design %s is a limited design and can not be processed by ECO Compiler.

DESCRIPTION

WHAT NEXT

ECO-7 (error) Do not use on cell '%s' attributes **eco_spare** and **eco_obsolete** together with **set_eco_unique**, **set_eco_align**, and **set_eco_reuse**.

DESCRIPTION

The **eco_implement** and **eco_recycle** commands identify spare cells using the **eco_spare** and **eco_obsolete** DB attributes. Do not apply any directives, such as **set_eco_unique**, **set_eco_align** or **set_eco_reuse** to such cells.

The **set_eco_align** command is unnecessary because spare cells in the new netlist are not utilized. Instead, spare cells in the old netlist are copied into the new netlist and (possibly) connected to other design cells.

WHAT NEXT

If you have a spare register in the old netlist (named `old_reg`), and you want it to replace a unique register in the new netlist (`new_reg`) do the following:

- Set `current_design` to the old netlist.
- Remove the `eco_spare` attribute from the register, thereby converting it into part of the old netlist design.
- Set `eco_current_design_pair` to the old netlist and new netlist.
- Use `set_eco_align` so that the name `old_reg` will be put on the register `new_reg` during `eco_implement`.

This cannot be done for a combinational cell.

ECO-8 (information) In design '%s' cell '%s' has unique name to avoid collision.

DESCRIPTION

The cell mentioned was copied from the old implementation to the new implementation, but its name collided with a sequential cell name in the new implementation.

`eco_implement` gave the copied old cell a unique name so that the sequential cell name did not have to change. One reason for doing this is that `compare_design` requires sequential cell names to be the same in order to verify two designs. With this naming rule the new specification can be compared with the result of `eco_implement` without name conflicts.

WHAT NEXT

The user will have to resolve the naming conflicts between combinational and sequential cells in the new implementation.

ECO-9 (error) Exactly one target must be specified to set_eco_target.

DESCRIPTION

You either specified no target or more than one target to `set_eco_target`. You can only specify exactly one target.

WHAT NEXT

Specify one target point and rerun.

ECO-10 (error) Missing library cell '%s' for cell '%s' in '%s'. Make sure the dont_use attribute is not on target_library cell.

DESCRIPTION

The **target_library** does not contain the type of cell needed to copy a cell from the old implementation to the new implementation.

WHAT NEXT

Make sure the **target_library** contains all cells that are present in the old implementation and rerun **eco_implement**.

ECO-11 (information) The verification limit was reached for some ECO endpoints:

DESCRIPTION

The listed (aligned) endpoints cannot be verified during **eco_implement** using the same formal verification techniques that are used in **compare_design**.

eco_implement treats these endpoints as changed endpoints in the new implementation, because verification could not establish that the endpoint functions are unchanged from the old implementation.

If the endpoints are in reality functionally unchanged, some new cells can be needlessly introduced by **eco_implement**.

(Endpoints that have identical fanin logic between the old specification and new specification are never listed by this message and are not submitted to formal verification; the old implementation is used in its entirety.)

WHAT NEXT

Currently, there is no directive for you to indicate that an endpoint is functionally unchanged and must be reused from the old implementation.

Try to rewrite the new specification so that only endpoints that need to change functionally are rewritten. Other endpoints are then most likely to be determined to have identical fanin logic and the old implementation logic can be used in its entirety (without any need for formal verification).

ECO-12 (error) The designs of the current design pair have

incongruent hierarchies.

DESCRIPTION

You called **eco_implement** for a design pair, the designs of which have incongruent hierarchies. The **eco_implement** command cannot handle incongruent hierarchies. Run **eco_align_design** for that particular design pair to get more information about those hierarchies.

WHAT NEXT

You might need to use the **ungroup** command to partially flatten one or both of the design hierarchies.

ECO-14 (warning) The library cells of cell %s and %s have the same names but have different functionality.

DESCRIPTION

Two library cells with identical names but different functionality have been found. The reason for this might be that they are from different libraries. The cells linked to these library cells are treated as different in functionality.

WHAT NEXT

If using multiple libraries check for consistency. You shouldn't have library cells with different functionality but identical names.

ECO-15 (warning) Specifying high effort level for the **eco_implement** command may lead to excessive run-times.

DESCRIPTION

This message indicates that you have set the **eco_implement_effort_level** variable to the value of "high". When this variable is set to "high" **eco_implement** tries harder in verifying end-points between the old and new netlists.

WHAT NEXT

Try setting the **eco_implement_effort_level** variable to "low" before running the

`eco_implement` command.

SEE ALSO

`eco_implement_effort_level` (3)

ECO-16 (info) If you would like `eco_implement` to work harder on these endpoints, try setting the `eco_implement_effort_level` variable to 'high'.

DESCRIPTION

This message follows the **ECO-11** information message. If the `eco_implement` command is run in the low effort mode (default mode) and the verification limit is reached for some endpoints, then this message indicates that you can try running `eco_implement` in high effort mode by setting the `eco_implement_effort_level` variable to "high". In high effort mode, `eco_implement` tries harder in identifying endpoints that are functionally identical between the old and new netlists.

Note on excessive run-time in the `eco_implement` command: Setting this variable to "high" can lead to excessive run-times in the `eco_implement` command. You should only set this variable to "high" if the `eco_implement` command issues a '**ECO-11**' information message indicating that verification limit was reached for some endpoints.

Even in this case, you should first examine the list of endpoints following this message as well as `eco_implement` command's quality of reuse before setting this variable to "high". If that list includes endpoints that you believe have not changed as the result of the ECO, and you are not satisfied with the number of old and new cells in the ECO implementation generated by the `eco_implement` command, then you can try setting this variable to "high" in your ECO script. You should then repeat the ECO implementation process.

WHAT NEXT

Set the `eco_implement_effort_level` variable to the value "high".

SEE ALSO

`eco_implement` (2), `eco_implement_effort_level` (3), **ECO-11**.

ECO-17 (information) Uniquifying design %s in order to change

the reference design of cell %s/%S.

DESCRIPTION

When applied to hierarchical cells, the **set_eco_reuse** command changes the reference design of the new netlist cell to the DB design of the old netlist cell.

If the new and old netlist cells have the same reference design names (although different implementations), and you perform the **link** command on the new design after the **set_eco_reuse** command, the new netlist cell may be linked to its original reference design, effectively undoing the intent of the **set_eco_reuse** command.

In order to avoid this problem, ECO Compiler checks the names of the reference designs of the new and old cells mentioned in the **set_eco_reuse** command. If the names match, then ECO Compiler uniques the parent design of the old cell before changing the reference design of the new cell to the uniquesified reference design of the old cell. This resolves the name collision since the name of the old cell's reference design (and all of its sub-designs, if any) is made unique in the dc_shell database.

ECO Compiler uses the **uniquify_naming_style** dc_shell variable in creating the new design names.

WHAT NEXT

Make sure that the specified designs are unique. Refer to the **uniquify** man page for more information on how to make designs unique within dc_shell.

SEE ALSO

set_eco_reuse, **uniquify**, **uniquify_naming_style**

ECO-18 (error) Identical DB reference '%s' for the instances '%S' and '%S'.

DESCRIPTION

The designs specified in the command have the same DB reference. The designs in the command are expected to be distinct designs.

WHAT NEXT

Make sure that the specified designs are unique. Refer to the **uniquify** man page for more information on how to make designs unique within dc_shell.

ECO-19 (error) The following DesignWare designs are instantiated in both hierarchies.

DESCRIPTION

The same DesignWare design is referenced in both the new as well as the old design hierarchies. Instances of DesignWare designs in the new and old hierarchies must refer to distinct designs.

WHAT NEXT

Make sure that the new and old design hierarchies are linked correctly and that the specified designs are unique. Refer to the **uniquify** manual page for more information on how to make designs unique within dc_shell. Also refer to the *ECO Compiler User Guide* for information related to linking designs. If you are certain that two DesignWare instances are identical in the old and new designs, and want them to refer to the same DesignWare design, you can use the **set_eco_reuse** command prior to **set_eco_align** and **set_eco_implement** commands.

SEE ALSO

uniquify, set_eco_reuse

ECO-20 (error) The following DesignWare designs are instantiated more than once in the %s.

DESCRIPTION

The same DesignWare design is referenced more than once in the new (or old) design hierarchy. DesignWare instances in the design hierarchy must refer to distinct designs. This message refers to the new, old, or current design hierarchy depending on the ECO Compiler command that issues the message.

WHAT NEXT

Make sure that the new (or old or current) design hierarchies are linked correctly and that the specified designs are unique. Refer to the **uniquify** man page for more information on how to make designs unique within dc_shell. Also refer to the *ECO Compiler User Guide* for information related to linking designs.

SEE ALSO

uniquify

ECO-21 (error) Do not apply both set_eco_align and %s attribute on cell '%s'.

DESCRIPTION

Never apply **set_eco_align** or **set_eco_reuse** to a cell with either the *eco_spare* or *eco_obsolete* DB attributes. Spare and obsolete cells do not need to be aligned or identified as unique.

WHAT NEXT

If the reported cell is intended to be a spare cell, remove any **set_eco_align** or **set_eco_reuse** that mention it. If the reported cell is not intended to be a spare cell, remove any *eco_spare* or *eco_obsolete* DB attributes from the cell. Do not use **reset_design** because it removes these DB attributes from all cells.

Recommended flow:

- 1) Instantiate spare cells in the old netlist only. Put the *eco_spare* attribute on each cell. Do not apply any directives to the spare cells.
- 2) Perform all alignment after instantiating spare cells.

ECO-22 (error) Design '%s' has '%d' black boxes but design '%s' has '%d' black boxes.

DESCRIPTION

Because all the black boxes of a design have to be aligned, different numbers of black boxes in two related designs are not allowed, although **eco_align_design** results in a dc_shell status of 0.

WHAT NEXT

A missing library might cause the black boxes. Check for proper linking of the design, or make sure that all the black boxes can be pairwise aligned. If there are library cells with the black box attribute, remove this attribute and try again.

ECO-23 (error) cell '%s"%s' is a unalignable black box.

DESCRIPTION

All Black Boxes have to be aligned. Unique Black Boxes are not allowed. Though **eco_align_design** will result in a dc_shell status of 0.

WHAT NEXT

Use **set_eco_align** to pairwise align all the black boxes or check for correct linking of the design. The cause for black boxes may be a missing library.

ECO-24 (warning) The following hierarchical cells of the old netlist have the same DB reference as some cells in the new netlist due to the **set_eco_reuse** command. This can cause inaccuracies in the output.

DESCRIPTION

The designs specified in the warning have the same DB reference as a result of a previously issued **set_eco_reuse** command. This can cause inaccuracies in the output of the **eco_netlist_diff** command.

WHAT NEXT

Make sure that **set_eco_reuse** command is not issued before the **eco_netlist_diff** command.

ECO-25 (error) set_eco_reuse applies only to netlist design pair.

DESCRIPTION

The user has attempted to use **set_eco_reuse** on an **eco_current_design_pair** other than the old_netlist and new_netlist. This is not permitted. It is not necessary to use **set_eco_reuse** to indicate that HDL sub-designs should be reused.

WHAT NEXT

Check that the **eco_current_design_pair** is properly set or remove the **set_eco_reuse**

command if it applies to another pair.

ECO-26 (information) Ignoring eco_spare attribute on hierarchical cell %s of %s:%s

DESCRIPTION

This message indicates that ECO Compiler is ignoring the 'eco_spare' attribute on a hierarchical cell. This attribute is intended for leaf-level library cell instances. ECO Compiler will treat this cell just as any other hierarchical cell in the design.

WHAT NEXT

If you want ECO Compiler to use the cells in this block as spare cells, then set your current_design to the design associated with this block and apply the 'eco_spare' attribute to the library cell instances of that design.

ECO-40 (error) Remapping of registers failed.

DESCRIPTION

eco_implement tries to remap each aligned register in the new implementation so that it has the same library cell type as the aligned register in the old implementation.

If the remapping cannot be performed, possibly due to changes in clocking or asynchronous behavior, **eco_implement** tries to remap the register in the old implementation to the type in the new implementation.

If this remapping fails, this error message is issued and **eco_implement** terminates.

WHAT NEXT

If you set the **dc_shell** environment variable "eco_allow_register_type_difference = TRUE", **eco_implement** continues without pin-compatibility.

ECO-41 (warning) Some registers in old implementation could

not be re-mapped:

DESCRIPTION

eco_implement has failed to remap the registers in the old implementation to have the same type as the aligned registers in the new implementation.

The default behavior of **eco_implement** is to terminate execution in this case, so that the user can review whether these register incompatibilities reflect intended and necessary changes to the new specification. Changes in asynchronous properties of the registers are the most common cause of remapping failure.

WHAT NEXT

If you set the **dc_shell** environment variable "eco_allow_register_pin_difference = TRUE", **eco_implement** continues without pin-compatibility.

ECO-42 (information) Some new register types were used to remap some old registers:

DESCRIPTION

This message indicates that **eco_implement** has achieved pin-compatibility for some aligned register pairs; for example, reg_old and reg_new in the old and new netlists, respectively.

eco_implement has successfully remapped reg_old in the old netlist, so that it has the same library cell type as reg_new in the new netlist.

WHAT NEXT

No further user action required.

ECO-43 (information) Continuing with some non-pin-compatible registers.

DESCRIPTION

By setting the **dc_shell** environment variable "eco_allow_register_pin_difference = TRUE" the user has opted to continue **eco_implement** without pin-compatibility between aligned registers.

Pin-compatibility is a highly desirable property to achieve between pairs of

sequential cells (say reg_old and reg_new) in order to maximize cell reuse.

The user should be aware that cell reuse may be reduced.

Output pins of incompatible registers may not be alignable, thus causing **eco_implement** to introduce new cells in the fanout of new_reg.

WHAT NEXT

If the type of reg_new is not used anywhere in old netlist, then the user may apply **set_dont_use** to that type in the library, thus preventing its use in the new netlist. This may cause the compile process of the new HDL to map reg_new to the type of reg_old.

ECO-44 (information) Some old register types were used to remap some new registers:

DESCRIPTION

This message indicates that **eco_implement** has achieved pin-compatibility for some aligned register pairs, say old_reg and new_reg, in the old and new netlists, respectively.

eco_implement has successfully re-mapped new_reg, in the new netlist, so that it has the same library cell type as old_reg, in the old netlist.

WHAT NEXT

No further user action required.

ECO-45 (warning) Some registers in new implementation could not be re-mapped:

DESCRIPTION

eco_implement failed to achieve pin-compatibility for some aligned register pairs, say reg_old and reg_new.

Re-mapping of reg_new may or may not be possible, depending on the nature of the design change to the new specification.

Changes in the new specification to clocking or asynchronous set and reset conditions are common causes of re-mapping failure.

eco_implement automatically tries to re-map old_reg to be pin-compatible with

`new_reg`, thus changing the old implementation.

WHAT NEXT

Pin-compatibility is a highly desirable property to achieve between the implementations in order to maximize cell reuse.

If the user sets the **dc_shell** environment variable "eco_allow_register_type_difference = TRUE" then **eco_implement** will continue without pin-compatibility.

The user should be aware that cell reuse may be reduced.

Output pins of incompatible registers may not be alignable, thus causing **eco_implement** to introduce new cells in the fanout of `new_reg`.

ECO-46 (information) Because, the reference type associated with the corresponding aligned register in the %s implementation is not present in the target library.

DESCRIPTION

This message supports warning messages that are issued during the register re-mapping phase of the **eco_implement** command.

It indicates that some of the register types necessary for register re-mapping are not present in the list of target library registers visible to **eco_implement**.

This can occur when you forget to specify a technology library in the **target_library** list (although the library may be in the **link_library** list). It can also occur if the target library cell has the **dont_use** attribute.

WHAT NEXT

If the problem is due to a missing library in the **target_library**, then add that library to the list.

If the problem is due to a **dont_use** attribute on the library cell, then remove that attribute using the **remove_attribute** command. For example:

```
dc_shell> remove_attribute <lib_name>/<reg_type_name> dont_use
```

If you would like **eco_implement** to continue without pin-compatibility between aligned registers in the old and new implementations, then set the **dc_shell** environment variable "eco_allow_register_pin_difference = TRUE"

You should be aware that cell reuse may be reduced.

SEE ALSO

ECO-45, ECO-41, `eco_implement`, `remove_attribute`, `dont_use`

ECO-70 (info) Accepting logic in the transitive fan-in of object '%s' in design '%s'.

DESCRIPTION

WHAT NEXT

ECO-71 (error) Can't set `eco_accept_endpoint` directive on unique object '%s'.

DESCRIPTION

Setting `eco_accept_endpoint` directive on an end-point in the old design directs ECO Compiler to freeze the logic in the transitive fan-in of that end-point in the old design, and copy that logic into the ECO design in the transitive fan-in of the corresponding aligned end-point in the new design. This directive is ignored if the specified end-point is unique to the old design (does not exist in the new design, therefore does not exist in the ECO design).

WHAT NEXT

ECO-72 (error) Can't set object '%s' unique because it has the `eco_accept_endpoint` directive.

DESCRIPTION

Setting `eco_accept_endpoint` directive on an end-point in the old design directs ECO Compiler to freeze the logic in the transitive fan-in of that end-point in the old design, and copy that logic into the ECO design in the transitive fan-in of the corresponding aligned end-point in the new design. You can not set an end-point unique if that end-point already has the `eco_accept_endpoint` directive.

WHAT NEXT

ECO-73 (warning) Ignoring eco_accept_endpoint directive on %s %s.

DESCRIPTION

This message indicates that ECO Compiler is ignoring an eco_accept_endpoint directive. This occurs when you apply this directive to an invalid design object. For example this directive cannot be applied to combinational cell pins or input ports.

WHAT NEXT

ECO-74 (information) Because, parent DesignWare cell has the set_eco_reuse directive.

DESCRIPTION

This message supports the ECO-73 warning message and explains the reason for ECO Compiler ignoring an eco_accept_endpoint directive.

WHAT NEXT

ECO-75 (information) Because, pin '%s' in level hierarchy '%s' can not be found.

DESCRIPTION

This message supports the ECO-73 warning message and explains the reason for ECO Compiler ignoring an eco_accept_endpoint directive. In this case, the specified pin can not be found in the hierarchy. This can occur, for example, when the eco_accept_endpoint is specified on a pin of a DesignWare cell which is instantiated inside another DesignWare cell, and the parent DesignWare cell is not aligned.

WHAT NEXT

ECO-76 (information) Because, endpoint is not aligned.

DESCRIPTION

This message supports the ECO-73 warning message and explains the reason for ECO Compiler ignoring an `eco_accept_endpoint` directive. In this case, the `eco_accept_endpoint` is specified on an endpoint in the old netlist, which is not aligned with any endpoints in the new netlist.

WHAT NEXT

Align the endpoint with an endpoint in the new netlist.

ECO-77 (information) Because, the `eco_accept_endpoint` directive is also applied to the corresponding aligned endpoint "%s" in the new netlist.

DESCRIPTION

This message supports the ECO-73 warning message and explains the reason for ECO Compiler ignoring an `eco_accept_endpoint` directive. In this case, the `eco_accept_endpoint` is specified on an endpoint in the old netlist. However, the `eco_accept_endpoint` is also applied to the corresponding aligned endpoint in the new netlist. This is contradictory.

WHAT NEXT

Remove the `eco_accept_endpoint` directive from one of the endpoints or check the alignment between endpoints in the old and new netlists.

ECO-78 (information) Because the following startpoints in the support of end-point "%s" in the old netlist are not aligned with any startpoints in the support of endpoint "%s" in the new netlist.

DESCRIPTION

This message supports the ECO-73 warning message and explains the reason for ECO

Compiler ignoring an eco_accept_endpoint directive. In this case, the eco_accept_endpoint is specified on an endpoint in the old netlist. However, some of the startpoints in the transitive fanin of that endpoint are not aligned with the startpoints in the transitive fanin of the corresponding aligned endpoint in the new netlist.

WHAT NEXT

If you apply the eco_accept_endpoint to an endpoint in the old netlist, make sure that all startpoints in the transitive fanin of that endpoint are aligned with startpoints of the new netlist in the transitive fanin of the corresponding aligned endpoint.

ECO-79 (information) The following start-points in the support of end-point "%s" in the new netlist are not aligned with any start-points in the support of frozen end-point "%s" in the old netlist.

DESCRIPTION

ECO Compiler issues this message if the eco_accept_endpoint is specified on an endpoint in the old netlist ("old netlist accepted end-point"), and some of the start-points in the transitive fan-in of the corresponding aligned end-point in the new netlist are not aligned with any start-points in the transitive fan-in of the endpoint in the old netlist.

WHAT NEXT

ECO Compiler does allow for start-points that are unique to the cone of logic driving the end-point which is aligned with an old netlist accepted end-point. This message is issued so that you are aware of this situation just in case the set_eco_accept_endpoint command was used on an end-point unintentionally.

ECO-82 (error) Error encountered during unique directives processing.

DESCRIPTION

An error has occurred during processing of unique directives.

WHAT NEXT

Please refer to previous error messages for more information.

ECO-83 (error) Complete alignment of all ports and registers not satisfied.

DESCRIPTION

eco_analyze, **eco_implement**, and **eco_recycle** require complete alignment of all input ports, output ports and registers between the two (hierarchical) designs in **eco_current_design_pair**.

WHAT NEXT

Use **eco_align_design** on the same **eco_current_design_pair** to determine a complete alignment.

eco_align_design uses exact name alignment as well as other heuristics to determine a complete alignment of input ports, output ports, and registers.

A report is given of all alignments that are not by exact name.

The user should always review these heuristic alignments; if some are incorrect the user should apply **set_eco_align** to establish the correct alignments and re-run **eco_align_design**.

set_eco_unique must be used to indicate ports or registers that exist in only one design in **eco_current_design_pair** and thus do not align with any other port or register.

ECO-84 (info) %s objects '%s' and '%s' in designs '%s' and '%s'.

DESCRIPTION

This message indicates that ECO Compiler is "Aligning" or "Re-using" a pair of design objects. An example is:

Aligning objects 'reg_old' and 'reg_new' in designs (ECO-84)
'/system/eco/old_netlist.db' and
'/system/eco/new_netlist.db'.

WHAT NEXT

This informational message can be turned off by setting environment variable **eco_directives_verbose** = false.

ECO-85 (info) Object '%s' will be considered unique in design '%s'.

DESCRIPTION

This message indicates that a port or register will be treated as unique to the given design and hence not present in the other design of the **eco_current_design_pair**.

Uniqueness is a property of a port or register with respect to a given design pair. The port or register might not be unique when the design is paired with another design. For instance, an output port of the new HDL design can be unique when paired with the old HDL design, but not when paired with the new netlist design.

WHAT NEXT

This informational message can be turned off by setting environment variable **eco_directives_verbose** = false.

ECO-86 (info) Performing %s on object '%s'.

DESCRIPTION

This message indicates that an ECO Compiler command is being performed on a design object. The commands issuing this message are **set_eco_target** and **set_eco_unique**.

WHAT NEXT

This informational message can be turned off by setting environment variable **eco_directives_verbose** = false.

ECO-87 (info) No DB reference designs for cells: '%s' and '%s'.

DESCRIPTION

The ECO Compiler command **set_eco_align** issues this message to alert you that the two mentioned cells do not have corresponding DB reference designs.

This can happen when there is an unresolved reference during **link**, or because you intentionally removed some subdesigns from dc_shell, knowing that they did not

change from the old netlist to the new netlist. In either case, ECO Compiler performs the alignment and the two cells are treated during **eco_implement** and **eco_recycle** as aligned black boxes, whose internal functions are unknown.

WHAT NEXT

See the man page for **eco_implement** for a discussion of black boxes.

ECO-88 (error) No DB reference design for %s cell '%s'.

DESCRIPTION

This error is issued by ECO Compiler command **set_eco_align**. The two arguments of **set_eco_align** must be of the same type (port, cell, register, or subdesign instance) and they must either both have DB reference designs or both not have DB reference designs. This error occurs when one argument has a DB reference and the other does not.

WHAT NEXT

Make sure that the cells with unresolved references, if any, in the **eco_current_design_pair** can be put into one-to-one correspondence. Use **set_eco_align** to identify pairs of cells with unresolved references if they do not have the same names already.

ECO-89 (error) set_eco_reuse cannot change link of unresolved reference.

DESCRIPTION

set_eco_reuse cannot handle cells with unresolved references.

WHAT NEXT

set_eco_align may be what the user intended to do if both command arguments are cells with unresolved references.

If only one command argument has an unresolved reference, then the user needs to stop the ECO process and make sure that the cells with unresolved references, if any, in the **eco_current_design_pair** can be put into one-to-one correspondence.

Use **set_eco_align** to identify pairs of cells with unresolved references if they do not have the same names already.

ECO-90 (error) Must align DesignWare cell '%s' before aligning its pins.

DESCRIPTION

ECO Compiler requires that DesignWare cells be aligned before any of their pins are aligned.

WHAT NEXT

Use **set_eco_align** to align the DesignWare cells prior to the command that issued this error message.

ECO-91 (error) The design cells are from different libraries.

DESCRIPTION

set_eco_align or **set_eco_reuse** issues this error when the two command arguments are from different libraries or are incompatible DesignWare cells. ECO Compiler is unable to verify that the cell in the old netlist can replace the cell in the new netlist.

This error prevents the possibility of logical errors occurring in the ECO result due to an erroneous replacement of one cell by another.

WHAT NEXT

set_eco_reuse can be used only on a pair of cells from the same technology library with the same DB reference design, unless both cells are DesignWare cells.

If both cells are DesignWare cells, then the following must be true:

- the input ports match by name;
- the output ports match by name;
- the inout ports match by name;
- the cells have the same DesignWare implementation.

set_eco_align can be used to align DesignWare cells that have different ports and implementations, but in this case the two cells are treated as subdesigns and all cell reuse within the new subdesign is formally verified. Cell reuse may be less than 100 percent within the subdesign. Align the cells first, then align any misnamed pin pairs, and then use **set_eco_unique** to identify any unique pins on each cell.

ECO-92 (error) One cell is Designware and the other is not.

DESCRIPTION

set_eco_align and **set_eco_reuse** cannot be used to align a DesignWare cell with a cell from a technology library.

These commands can be applied to two DesignWare cells from different libraries, as long as the following is true of the DesignWare cells:

```
the input ports match by name;  
the output ports match by name;  
the inout ports match by name;  
the cells have the same DesignWare implementation.
```

WHAT NEXT

If you plan to use **set_eco_reuse** on DesignWare cells, read the serious warning in the Man Page first.

ECO-93 (error) Some pins on cell '%s' are not alignable by name on cell '%s':

DESCRIPTION

If both cell arguments to **set_eco_reuse** are DesignWare cells, then the following must be true:

```
the input ports match by name;  
the output ports match by name;  
the inout ports match by name;  
the cells have the same DesignWare implementation.
```

WHAT NEXT

If the two cells are do not meet the criteria above, the user may consider using **set_eco_align** instead. **set_eco_align** can be used to align DesignWare cells that have different pins and implementations, but in this case the two cells are treated as subdesigns and all cell reuse within the new subdesign is formally verified. Cell reuse may be less than 100 percent within the subdesign.

Align the cells first, then align any misnamed pin pairs, and then use **set_eco_unique** to identify any unique pins on each cell.

ECO-94 (warning) Combinational feedback loops found in

design
'%".

DESCRIPTION

The **eco_analyze_design** command cannot handle designs with combinational feedback loops. No identical endpoints will be determined between the two designs in **eco_current_design_pair**. The ECO process can continue without knowledge of identical endpoints, but **eco_implement** might now take longer while functionally comparing endpoint pairs.

Also, during **eco_implement**, endpoints driven by combinational feedback loops are temporarily set to logic zero during the functional analysis process, because the underlying verification procedures cannot handle loops.

IMPORTANT: By default, if a new endpoint is aligned with an old endpoint and both are driven by loops, both are set to logic zero, and thus considered logically equivalent. This implies that the old cone of logic is copied into the new netlist, even though there might be functional design changes. Therefore, by default, ECO compiler does not expect functional design changes to affect endpoints driven by loops.

WHAT NEXT

If you know that there are changes from the old HDL to the new HDL for one of the endpoints, you must disconnect the endpoints in the old HDL and old netlist, using **disconnect_net**, so that the old and new endpoints are not, erroneously, considered equivalent.

After disconnecting the old endpoints, the new endpoints driven by loops will be treated as design changes.

Cell reuse can be reduced, but the result will be logically correct.

ECO-95 (error) Alignment not complete. Must use eco_align_design command.

DESCRIPTION

eco_implement cannot align all sourcepoints and endpoints, or there are some unique points that were not identified using **set_eco_unique**.

WHAT NEXT

The user must rerun **eco_align_design -out bad.align** for **eco_current_design** and examine the generated file, **bad.align**. There may be some suggested alignments and

some unalignable points that the user must either align or indicate to be unique with **set_eco_unique**. Then **eco_implement** can be run again.

ECO-96 (warning) ECO target '%s' not found in design instance '%S'.

DESCRIPTION

The *target_object* argument to **set_eco_target** could not be found. **eco_implement** will continue without any directives set for the target.

WHAT NEXT

The **current_design** should be the old netlist when applying **set_eco_target**. The target pin or port mentioned by the **set_eco_target** command should be in the old netlist. The taps mentioned may be pins or ports in the old netlist or may be input ports, register output pins, or hierarchical cell output pins in the new netlist.

Make sure the **current_design** is the old netlist before applying **set_eco_target**.

Check that the rules above are followed and re-run the command.

ECO-97 (warning) ECO tap '%s' not found in design '%S'.

DESCRIPTION

One of the objects in the *tap_objects* argument to **set_eco_target** cannot be found. The **eco_implement** command will continue as if that tap were not in the list.

WHAT NEXT

The **current_design** should be the old netlist when applying **set_eco_target**. The target pin or port mentioned by the **set_eco_target** command should be in the old netlist. The taps mentioned may be pins or ports in the old netlist or may be input ports, register output pins, or hierarchical cell output pins in the new netlist.

Make sure the **current_design** is the old netlist before applying **set_eco_target**.

Check that the rules above are followed and re-run the command.

ECO-98 (info) Boundary optimization prevents identical

endpoints computation in '%S'.

DESCRIPTION

The subdesign mentioned has the boundary optimization attribute. This means that the new netlist and old netlist versions of the subdesign might have been optimized differently with respect to their boundaries. For instance, different constants might have been propagated down the hierarchies during **compile - boundary_optimization**. Unfortunately, no record is kept during optimization of any boundary optimizations.

The possibility of this happening prevents the utilization of Identical Endpoint information derived from the HDL designs by **eco_analyze_design**. In this case, it is not true that identical endpoints in the HDL imply equivalent implementations in the netlists, and so **eco_implement** cannot safely take advantage of such information.

Consequently, **eco_implement** might take longer to perform its various verification tasks; but the result will be logically correct.

WHAT NEXT

If you anticipate many ECOs in the future, consider not using the *boundary_optimization* option on **compile**. This ensures computation of identical endpoints during **eco_analyze_design**.

ECO-99 (info) Changing ECO subdesign instance name from %S to %s.

DESCRIPTION

During **eco_implement** the names of registers and subdesign instances are changed in the new netlist to agree with names in the old netlist. This enables incremental place and route tools that perform a netlist difference in which cells are considered the same if they have the same name.

However, you also might want to perform **compare_design** between the new HDL and the ECO netlist to ensure logical correctness of the ECO process. To handle the name changes gracefully, **eco_implement** annotates DB attributes on some cells and designs in the new netlist: "eco_inst_name," "eco_reg_name," "eco_nn_path." Later, **compare_design** reads these attributes in order to restore the original register and subdesign names, and verification proceeds as usual, with complete name agreement between sourcepoints and endpoints.

The user does not need to consider these DB attributes further.

WHAT NEXT

If verification failures occur, the user will have to interpret the failures as if the names of all registers are from the new HDL.

ECO-100 (error) -struct, -functional, -big_fish and -reusableflags are exclusive.

DESCRIPTION

Only one of -struct, -functional, -big_fish, or -reusable can be used with `eco_correspond`.

WHAT NEXT

Use only one of -struct, -functional, -big_fish, or -reusable with `eco_correspond`.

ECO-101 (error) Four designs expected as arguments.

DESCRIPTION

`eco_compile` expects four designs as its argument: old and new specifications and old and new implementations. For more information on the arguments to `eco_compile`, please refer to the man page for the command.

WHAT NEXT

Re-execute `eco_compile` with the proper arguments.

ECO-102 (error) Design '%s' is specified twice in the argument list.

DESCRIPTION

Design '%s' is specified more than once for `eco_compile`. Arguments to `eco_compile` must be distinct designs.

WHAT NEXT

You might want to `uniquify` the designs or specify each with a file name prefix so

that they are interpreted as distinct designs.

ECO-103 (error) Two or zero designs expected as an argument.

DESCRIPTION

`eco_write_script` expects as its argument zero or two designs. If no designs are specified, designs in current design pair (set through `eco_current_design_pair`) are used as arguments.

WHAT NEXT

Specify two distinct designs as arguments.

ECO-104 (error) Can't specify -all along with designs.

DESCRIPTION

For `eco_write_script`, -all and designs are exclusive options. If -all is specified, designs cannot be specified, and if designs are specified, -all cannot be specified.

WHAT NEXT

Specify either -all or the designs.

ECO-105 (error) No directives has been specified. No script written.

DESCRIPTION

If no directives have been specified during `eco_write_script`, no script is written. At least one directive must be specified before a script is written.

WHAT NEXT

Specify directives before attempting to write out the script.

ECO-106 (error) Hierarchical names are not allowed: '%s'

DESCRIPTION

Hierarchical names are not allowed while specifying the directives.

WHAT NEXT

You must specify the designs (using `eco_current_design_pair`) before specifying the design objects.

ECO-107 (error) Parent design for object '%s' not found.

Please report this message to Synopsys immediately.

DESCRIPTION

While processing the directives, parent design for object '%s' was not found. In order to associate the directives with the designs, parent design must be found. This error message identifies the need for stricter object classification.

WHAT NEXT

Please report this message to Synopsys immediately.

ECO-108 (error) Parent designs '%s' and '%s' of the specified objects have the same DB references.

DESCRIPTION

Parent designs of the objects specified (while setting the directives for ECO Compiler) have the same DB references. The parent designs must be unique designs. This problem should have been identified during other commands.

WHAT NEXT

Please report this problem to Synopsys.

ECO-109 (error) Objects '%s' and '%s' have the same DB reference, corresponding designs %s are:

'%s' and '%s'. Please notify Synopsys.

DESCRIPTION

Objects specified in the message have the same DB references. This can occur if the specified objects belong to the same design. This message identifies a need for stricter checks in other commands.

WHAT NEXT

Please notify Synopsys.

ECO-110 (error) Ports/pins '%s' and '%s' have different direction types.

DESCRIPTION

Pins or ports specified in the directives for ECO Compiler have different directions. Both the pins or both the ports must have the same direction type.

WHAT NEXT

Check the objects and their direction types and reenter the command.

ECO-111 (error) Ports/pins are not of the required type.

DESCRIPTION

There is a discrepancy between the specified direction type and the actual direction type of the specified objects.

WHAT NEXT

ECO-112 (error) Number of input/outputs are different for the specified objects.

DESCRIPTION

Objects which have different numbers of inputs or outputs cannot be reused. In order

for the objects to be reused, they must have the same number of inputs and outputs.

WHAT NEXT

Make sure that the objects to be reused have the same number of inputs and outputs.

ECO-113 (error) '%s' is an invalid category. It must be either 'first' or 'second'.

DESCRIPTION

For `set_eco_unique`, the category must be either 'first' or 'second'. For more information, please refer to the manual page for `set_eco_unique`.

WHAT NEXT

ECO-114 (error) Object '%s' not found in the design of eco pair.

DESCRIPTION

The object specified in the `set_eco_unique` command is expected to be found in the design specified by the category field (first or second). This error message indicates that the object was not found in the specified design.

WHAT NEXT

Make sure the object name and the design names are consistent in the command.

ECO-115 (error) Port '%s' is not an input port.

DESCRIPTION

Input port is expected as an argument to this command.

WHAT NEXT

ECO-116 (error) Pin '%s' is not an output pin of a cell.

DESCRIPTION

Output pin of a cell is expected as an argument to this command.

WHAT NEXT

ECO-117 (error) Object '%s' is not a pin or a port.

DESCRIPTION

A port or a pin is expected as an argument to this command.

WHAT NEXT

ECO-118 (warning) Discarding set_eco_target command not pertaining to old netlist,
but to design '%s'.

DESCRIPTION

The **current_design** should be the old netlist when applying **set_eco_target**. The target pin or port mentioned by the **set_eco_target** command should be in the old netlist. The taps mentioned may be pins or ports in the old netlist or may be input ports, register output pins, or hierarchical cell output pins in the new netlist.

WHAT NEXT

Make sure the **current_design** is the old netlist before applying **set_eco_target**.

Check that the rules above are followed and re-run the command.

ECO-119 (error) The two designs have the same DB reference.

DESCRIPTION

The designs specified in the command have the same DB reference. The designs in the command are expected to be distinct designs.

WHAT NEXT

Make sure that the specified designs are unique. Refer to the **uniquify** manual page for more information on how to make designs unique within **dc_shell**.

ECO-120 (error) In the %s hierarchy, object '%s' could not be found in design

'%S'.

DESCRIPTION

The mentioned object could not be found in the first (or second) design of **eco_current_design_pair**.

WHAT NEXT

The **set_eco_unique** command should only be applied to input ports, output ports, or sequential cells. The recommended methodology is to set the **eco_current_design_pair** to refer to the top-level designs of two design hierarchies and to use instance pathnames to refer to objects within subdesigns.

ECO-121 (error) Attribute not set on any object.

DESCRIPTION

While specifying directives for ECO Compiler, attributes are set on the objects specified in the commands (**set_eco_***). While processing the objects, an error was encountered and as a result the attribute was not put on any of the objects.

WHAT NEXT

ECO-122 (error) No tap points were specified to `set_eco_target`.

DESCRIPTION

No tap points were specified to `set_eco_target`. See the man page for a complete description of acceptable tap points.

WHAT NEXT

Add tap points to the `set_eco_target` command and rerun.

ECO-200 (warning) The design '%s' is hierarchical; no sharing of cells among different levels of hierarchy possible.

DESCRIPTION

In a hierarchical design, `eco_recycle` treats each level of hierarchy separately. In order to substitute some new cells in one level of the logical hierarchy, only spare or obsolete cells within the same level of hierarchy are considered.

WHAT NEXT

Use `ungroup -all -flatten` to get a flat design. Then run `eco_recycle` again.

ECO-201 (warning) The design '%s' has no physical information (pdef) available.

DESCRIPTION

In order to optimize the result of `eco_recycle` with respect to cell locations physical design information is necessary. If no physical information is available the choice of cells during the recycling process is arbitrary.

WHAT NEXT

Annotate the physical information onto the design by using `read_clusters`.

ECO-202 (error) Cannot use respect_physical_hier or respect_distance without annotated pdef information.

DESCRIPTION

You only can use the options `respect_physical_hier` or `respect_distance` of `eco_recycle` if physical design information (pdef) is available.

WHAT NEXT

Annotate the physical information onto the design by using `read_clusters` and try again, or run `eco_recycle` whithout these options.

ECO-203 (error) Cannot find library cell of cell %s in the target library.

DESCRIPTION

During `eco_recycle` a cell without a library cell has been detected. This cell is excluded from the further recycling process.

WHAT NEXT

Make sure that the library cell of the mentioned cell is present in the target library. Check for target library load errors.

ECO-204 (warning) No location information for cell %s available.

DESCRIPTION

Although the design has physical information available, the location information for the mentioned cell could not be found.

WHAT NEXT

Make sure the cell name mentioned in the warning message can be found in the pdef file. Watch out for warnings or errors during `read_clusters`.

ECO-205 (error) Current_design has not been set.

DESCRIPTION

`eco_recycle` works on the current design. The current design has not been set.

WHAT NEXT

Use `current_design` to set the design you want `eco_recycle` to work on.

ECO-206 (error) Cell %s is not a valid resource cell.

DESCRIPTION

By evaluating the resource cells of the design `eco_recycle` found a resource cell that drives a nonresource cell. Because the recycling process might pull this cell out of its current environment in order to replace a new cell, this can cause bad logic. Thus, each resource cell that drives a nonresource cell is invalidated.

WHAT NEXT

Make sure that resource cells are not within the transitive fanin of a nonresource cell.

ECO-207 (error) Missing distance value to option respect_distance.

DESCRIPTION

You specified the `respect_distance` option to `eco_recycle` without giving a value argument to this option.

WHAT NEXT

Call `eco_recycle` again with the appropriate distance value added right after the `respect_distance` option.

ECO-208 (error) Resource cell %s is driving a non-resource cell.

DESCRIPTION

By evaluating the resource (spare and obsolete) cells of the design a resource cell has been found that drives a non-resource cell. This case is currently not supported for the **eco_implement** command. Please see the user manual for a more detailed description how to use the eco_spare and eco_obsolete attributes.

WHAT NEXT

Make sure that resource cells are not within the transitive fanin of a non-resource cells. Use the **remove_attribute** command to remove eco_spare and/or ecoObsolete attributes from the mentioned cell. Then run **eco_implement** again.

ECO-220 (error) The given directive will be ignored because it already is specified.

DESCRIPTION

The given **set_eco_recycle** or **set_eco_obsolete** directive already is specified. It doesn't make any difference to specify it a second time. In order to avoid duplicates in the set of directives, it is ignored.

WHAT NEXT

In order to find out which directives are already set, use the print options to the commands **set_eco_recycle** and **set_eco_obsolete**.

ECO-221 (error) The specified directive cannot be removed because it is not in the set of already stored directives.

DESCRIPTION

The specified **set_eco_recycle** or **set_eco_obsolete** directive cannot be found in the list of already set directives. Hence, the given remove command cannot be performed.

WHAT NEXT

To find out which directives are currently set, use the print options to the commands **set_eco_recycle** and **set_eco_obsolete**.

ECO-222 (error) The specified directive cannot be applied because the cell %s is not found in the current design.

DESCRIPTION

The cell specified by the **set_eco_recycle** or **set_eco_obsolete** directive is not found in the current design. The specified directive cannot be set.

WHAT NEXT

Use the **find** command to check whether the specified cell can be found in the design.

ECO-223 (error) The recycle directive for cell %s and cell %s cannot be applied because the cells are in different categories.

DESCRIPTION

The cells specified by the **set_eco_recycle** directive are of different categories. **eco_recycle** distinguishes cells into the three categories: combinational, sequential and special cells. (For a detailed discussion about cell categories, see the user manual.) It is only possible to substitute cells in the same category. For instance, one cell of the pair you specified might be a sequential cell the other a combinational one.

WHAT NEXT

Check the type of the specified cells and make sure they are within the same category.

ECO-224 (error) The specified cell %s is not a resource cell.

DESCRIPTION

set_eco_recycle -set requires two cell names as arguments. The first name needs to point to a new cell, the second two a resource cell. The second name of the specified **set_eco_recycle** command doesn't point to a resource cell.

WHAT NEXT

Check the db_cell attributes of the resource cell; it needs to have either the **eco_spare** or the **eco_obsolete** attribute attached. (For further requirements for resource cells see the user manual.)

ECO-225 (error) The specified cell %s is not a new cell.

DESCRIPTION

The **set_eco_recycle -set** requires two cell names as arguments. The first name needs to point to a new cell, the second two a resource cell. The first name of the specified **set_eco_recycle** command doesn't point to a new cell.

WHAT NEXT

Check the db_cell attributes of the new cell; it can't have an *eco_spare*, an *eco_obsolete*, or an *eco_old* attribute attached to it.

ECO-226 (error) The specified cell %s is not an old or a recycled cell.

DESCRIPTION

The **set_ecoObsolete -set** command requires as arguments a name of an old or a recycled cell and optionally a new name for this cell. The specified name for the old or recycled cell doesn't actually point to an old or recycled cell.

WHAT NEXT

Check the db_cell attributes of the old or recycled cell, it should have the *eco_old* or *eco_recycle* attribute attached.

ECO-227 (warning) The **set_ecoObsolete doesn't provide a new name. A new name will be automatically generated.**

DESCRIPTION

The specified **set_ecoObsolete -set** command doesn't provide a new name as an argument to the command. At runtime of **eco_recycle**, a new name for the new cell is automatically generated.

WHAT NEXT

If you want to refer to the new cell in following directives, use the new name option to specify a name to give to the new cell.

ECO-228 (warning) The specified new name %s is not unique in the design.

DESCRIPTION

The directive couldn't be accepted because the specified new name of the **set_ecoObsolete -set** command is not unique in the current design. There is already a cell with this name present.

WHAT NEXT

Use the **find** command to check whether a name is unique to the design. Retry the command with a unique name.

ECO-229 (warning) Skipping directive because specified resource cell %s is already used.

DESCRIPTION

The resource cell specified by the recycle directive is already used. The reason for this might be a previous directive for the same resource cell which has been successfully applied already.

WHAT NEXT

ECO-230 (warning) Skipping directive because the specified new cell %s is already mapped.

DESCRIPTION

The new cell specified by the recycle directive is already mapped. The reason for this might be a previous directive for the same new cell which has been successfully applied already.

WHAT NEXT

ECO-231 (error) The directive couldn't be applied because the new cell %s and the resource cell %s are not in the same level

of the hierarchy

DESCRIPTION

The new and the resource cell specified by the recycle directive are not within the same level of the logical hierarchy. Cells cannot be recycled across different levels of the hierarchy.

WHAT NEXT

If the user wants to recycle cells among different levels of the hierarchy the hierarchy needs to be flattened up to the common root level of both hierarchies.

ECO-232 (Warning) The new cell %s couldn't be mapped to the resource cell %s because it has more inputs than the resource cell.

DESCRIPTION

To force map a new cell to a resource cell the number of inputs of the resource cell must be at least as high as the number of inputs of the new cell. For a more detailed discussion about force mapping technology see the user manual

WHAT NEXT

ECO-233 (error) The directive couldn't be applied because the directive specified multiple output gates.

DESCRIPTION

WHAT NEXT

ECO-234 (Warning) The new cell %s couldn't be mapped to the resource cell %s because there are not enough inverters

available.

DESCRIPTION

Force mapping tries to use inverters at the inputs or the outputs of the resource cell in order to reproduce the functionality of the new cell. In this case, the desired functionality can be reproduced, but the inverters are not available. The substitution cannot be performed.

WHAT NEXT

Give another directive that doesn't require that many inverters to perform the force mapping, or, if possible, instantiate more inverters in the pool of resource cells.

ECO-235 (error) Force mapping of the resource cell %s to the new cell %s is impossible.

DESCRIPTION

The new and the resource cell specified by the recycle directive cannot be force mapped into each other. (To get a more detailed description about the capabilities of the force mapping see the user manual).

WHAT NEXT

ECO-236 (Warning) The specified new cell %s could not be found.

DESCRIPTION

The specified new cell of the **set_eco_recycle** command could not be found in the design. At runtime of **eco_recycle** this directive will cause an error and the command to terminate unless a further **set_eco_obsolete** directive would create a new cell of the given name.

WHAT NEXT

Make sure that the specified name is correct and a cell with that name can be found in the design. If you plan to issue an **set_ecoObsolete** command which will generate a new cell with the specified name you can ignore this error message.

ECO-237 (Warning) The specified new cell %s is not a new cell.

DESCRIPTION

The specified new cell of the **set_eco_recycle** command is either a resource cell or an already reused cell. Only new cells are allowed as the second string argument of **set_eco_recycle**. At runtime of **eco_recycle** this directive will cause an error and the command to terminate.

WHAT NEXT

Check the db_attributes on the specified cell. It is not allowed to have an *eco_old*, an *eco_spare*, or an *eco_obsolete* attribute. You might want to use the **set_ecoObsolete** command in order to turn an already reused cell into a new cell. You might use the remove option to **set_eco_recycle** in order to remove an incorrect directive.

ECO-238 (Warning) The specified resource cell %s could not be found.

DESCRIPTION

The specified resource cell of the **set_eco_recycle** command could not be found in the design. At runtime of **eco_recycle**, this directive will cause an error, and the command will terminate unless a further **set_ecoObsolete** directive creates a resource cell of the given name.

WHAT NEXT

Make sure that the specified name is correct and that a cell with that name can be found in the design. If you plan to apply an **set_ecoObsolete** command that will generate a resource cell with the specified name, then you can ignore this error message.

ECO-239 (Warning) The specified resource cell %s is not a resource cell.

DESCRIPTION

The specified resource cell of the **set_eco_recycle** command is either a new cell or an already reused cell. Only resource cells are allowed as the first string argument of **set_eco_recycle**. At runtime of **eco_recycle**, this directive will cause an error, and the command will terminate unless a further **set_ecoObsolete** directive creates a

resource cell of the given name.

WHAT NEXT

Make sure that the specified name is correct and that a cell with that name can be found in the design. If you plan to apply an **set_ecoObsolete** command that will generate a resource cell with the specified name, then you can ignore this error message. You might also use the remove option of **set_ecoObsolete** to remove incorrect directives.

ECO-240 (Error) The specified cell %s is not a reused cell.

DESCRIPTION

The specified reused cell of the **set_ecoObsolete** command is not a reused cell. Only reused cells are allowed as the first string argument of **set_ecoObsolete**.

WHAT NEXT

Make sure that the specified cell is a reused cell and is marked with the *eco_old* attribute.

ECO-241 (Error) The specified new name %s is already used.

DESCRIPTION

The given new name for the new cell is not unique, it is already used for another cell in the design.

WHAT NEXT

Use the find command to check whether a specific name is already used in the design. By omitting the new name argument, a unique new name is automatically generated.

ECO-242 (Error) The set_ecoObsolete command requires a cell name as an option .

DESCRIPTION

The command **set_eco_recycle** requires the user to give the cell name of a reused or an already recycled cell as an option. This cell name has not been given as an

argument to the command.

WHAT NEXT

Specify the name of a reused or recycled cell as an argument to the **set_ecoObsolete** command.

ECO-243 (Error) The **set_eco_recycle** command requires as arguments the name of a new cell as well as the name of a resource cell.

DESCRIPTION

The **set_eco_recycle** command has been invoked without giving the cell name arguments. The command requires as arguments first the name of a new cell and second the name of a resource cell. At least one of those arguments is missing.

WHAT NEXT

Specify the name of a new cell as well as the name of a resource cell as arguments to the **set_eco_recycle** command.

ECO-300 (warning) Removing dont_touch attribute from design '%S'.

DESCRIPTION

If eco_recycle sees a dont_touch attribute on a design it automatically removes it. This avoids generation of inconsistent designs after writing the design to db after finishing the eco_recycle command. In general the ECO commands don't respect dont_touches.

WHAT NEXT

If you want to exclude a design or a single cell from the recycling process you can use the eco_dont_recycle attribute on the design or on a single cell instance.

EDFN

EDFN-1 (warning) Line %d: A port is declared without a name. Using "DUMMY_NAME_xx".

DESCRIPTION

You receive this warning message to inform you that the specified line in the EDIF input file contains a port declaration without a name. In such a case, the system automatically generates a dummy name "DUMMY_NAME_xx".

WHAT NEXT

You can accept the dummy name temporarily, but for correctness and to avoid receiving this warning message in the future, edit your EDIF input file so that the specified line contains a port delcaration with a name.

EDFN-2 (error) Line %d: Too few elements in %s form.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and detects the required elements for the specified EDIF construct are missing.

WHAT NEXT

The EDIF file is probably corrupted. The recommended solution is to regenerate the EDIF file. However, if you know EDIF and the design well, refer to the line number in the error message and fill in the missing information.

EXAMPLES

```
...
5   (library DESIGN (edifLevel 0) (technology (numberDefinition))
6     (cell size1 (cellType GENERIC)
7       (view Netlist_representation (viewType NETLIST)
8         (contents
      ...
```

EXAMPLE MESSAGE

```
Error: Line 7: Too few elements in 'view' form. (EDFN-2)
```

In the above example, the required interface form is missing from the view form. Below is an example of a complete view form.

```
...
(library DESIGN (edifLevel 0) (technology (numberDefinition))
6   (cell size1 (cellType GENERIC)
7     (view Netlist_representation (viewType NETLIST)
      (interface
        (port a (direction INPUT)))
      ...
18   (contents
      ...
```

EDFN-3 (error) Line %d: Incorrect number of elements in %s form.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and detects that the number of required elements for a certain EDIF construct is incorrect.

WHAT NEXT

The EDIF file is probably corrupted due to manual editing. The recommended solution is to regenerate the EDIF file. However, if you know EDIF and the design well, refer to the line number in the error message and change the number of required elements to the correct number.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0 0)
2   (edifLevel 0)
  ...
```

EXAMPLE MESSAGE

```
Error: Line 1: Incorrect number of elements in 'edifVersion' form. (EDFN-3)
```

In the above example, the edifVersion construct on line has 5 elements total. Only four elements are required (edifVersion 2 0 0). Below is a correct example.

```
1 (edif Synopsys_edif (edifVersion 2 0 0)
2   (edifLevel 0)
...
```

EDFN-4 (error) Line %d: Expected a list.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-5 (warning) Line %d: Unknown function is being ignored.

DESCRIPTION

The EDIF reader is not able to verify the function on the line specified in the error message.

WHAT NEXT

Fix the EDIF input file and make sure all of the functions are properly defined.

EDFN-6 (error) Line %d: Expected a parenthesis.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a syntax error.

WHAT NEXT

Refer to the line number in the error message and locate the missing parenthesis. You can fix the problem by regenerating the EDIF file and reimport, or if you know EDIF well, you can correct the problem.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
```

```
2 (keywordMap (keywordLevel 0)) status)
...
```

EXAMPLE MESSAGE

Error: Line 2: Expected a parenthesis (EDFN-6)

In the above example, the parenthesis which marks the beginning of the "status" construct is missing.

EDFN-7 (error) Line %d: Expected a non-empty list.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a set of parenthesis () with nothing inside.

WHAT NEXT

The edif file is probably corrupted. You can regenerate the EDIF input file or take out the empty set of parenthesis in the EDIF file. Reimport the EDIF input file into dc_shell.

EXAMPLES

```
(edif Synopsys_edif (edifVersion 2 0 0) () (edifLevel 0)
  (keywordMap (keywordLevel 0)) (status)
  ..
```

EXAMPLE MESSAGE

Error: Line 1: Expected a non-empty list. (EDFN-7)

In the above example, there is an empty set of parenthesis after the edifVersion construct on line one.

EDFN-8 (warning) Line %d: Multiple views not supported. View '%s' of cell '%s' ignored.

DESCRIPTION

The EDIF reader does not support cells with multiple views. The reader processes the first view it finds and ignores the rest of the views.

WHAT NEXT

Fix the EDIF input file so that it does not contain cells with multiple views.

EDFN-9 (error) Line %d: Can not add the design to the root.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-10 (error) Line %d: Instance specified without cell ref in view ref.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an EDIF cell-instantiated construct that fails to specify its reference.

WHAT NEXT

The recommended solution is to locate the construct that instantiates the cell. Fix the construct at the source and regenerate the EDIF file. If you know EDIF and the design well, locate the construct that instantiates the cell, and include the correct cell references for the design.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
...
4   (cell or2 (cellType GENERIC)
5     (view Netlist_representation (viewType NETLIST)
      ...
15  (library DESIGNS (edifLevel 0) (technology (numberDefinition))
16    (cell sizer1 (cellType GENERIC)
      ...
24    (contents
25      (instance pcell2
26        (portInstance YA (property PIN_PR (string "better"))))
      ...
))))
```

EXAMPLE MESSAGE

Error: Line 25: Instance specified without cell ref in view ref. (EDFN-10)

In the above example (line 25), the instance pcell2 is instantiated, but its reference is not specified. Below is a correct example of an instantiated instance. You should instantiate an instance with its source, which includes a view reference (line 26 below), cell reference (line 27 below), and library reference (line 28 below).

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
...
4   (cell or2 (cellType GENERIC)
5     (view Netlist_representation (viewType NETLIST)
6      ... ))
14  )
15  (library DESIGNS (edifLevel 0) (technology (numberDefinition))
16    (cell size1 (cellType GENERIC)
...
24    (contents
25      (instance pcell2
26        (viewRef Netlist_representation
27          (cellRef or2
28            (libraryRef size1_lib)
29          )
30        )
...
...
```

EDFN-11 (error) Line %d: Can not find the design %s of the cell.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a reference to a non-existing design. This usually happens when the user set the edifin_view_identifier_property_name to a non-existing design , and have cell instantiation whose property name is the same as the edifin_view_identifier_property_name.

WHAT NEXT

To get pass this problem, you can either do not use the edifin_view_identifier_property_name flag or regenerate the EDIF file. Or if you know EDIF and the design well, you can include a property id (should have the same id as the edifin_view_identifier_property_name) to the interface of the desired design.

EXAMPLES

```
>dc_shell edifin_view_identifier_property_name = "COMP"
```

```

"COMP"
read -format edif view2.iedif

...
55  (cell (rename CASE_TEST "case_test") (cellType GENERIC)
56  (view ONE (viewType SCHEMATIC)
57  (interface
...
200    (property (rename COMP2 "COMP2") (string "COMP2_ALREADY_DEFINED"))
...
300    (instance test (viewRef ONE (cellRef CASE_TEST))
...
350    (property (rename COMP "COMP")
351      (string (stringDisplay "COMP_ALREADY_DEFINED"
...

```

EXAMPLE MESSAGE

Error: Line 1214: Can't find the design COMP_ALREADY_DEFINED of the cell. (EDFN-11)

In the above example, the flag edifin_view_identifier_property_name is set to "COMP", and view ONE (line 56) of cell CASE_TEST (line 55) has a property id of COMP2 (line 200). Later, when cell "test" is instantiated (line 300), it references the property id "COMP" (line 350). Below is a fix to this problem. Change the property id on line 200 to "COMP".

```

... 55 (cell (rename CASE_TEST "case_test") (cellType GENERIC) 56 (view ONE
(viewType SCHEMATIC) 57 (interface ... 200 (property (rename COMP "COMP") (string
"COMP_ALREADY_DEFINED")) ... 300 (instance test (viewRef ONE (cellRef CASE_TEST))
... 350 (property (rename COMP "COMP") 351 (string (stringDisplay
"COMP_ALREADY_DEFINED" ...

```

EDFN-12 (error) Line %d: Cannot add the cell reference to the design.

DESCRIPTION

The system is not able to find the reference of the cell.

WHAT NEXT

Make sure the cell reference exists.

EDFN-13 (error) Line %d: Cell ref specified that is not defined in

this file.

DESCRIPTION

WHAT NEXT

Obsolete

WHAT NEXT

Obsolete

EDFN-14 (warning) Line %d: Duplicate instance '%s' renamed as '%s' in design '%s'.

DESCRIPTION

The system detected duplication of cell instances, and it renamed the second instance "instanceName_xx".

WHAT NEXT

Fix the EDIF input file so that it does not contain any duplicate identifiers.

EDFN-15 (error) Line %d: Can not add the instance to the design.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters either memory issue or there are duplicate instance names in the design.

WHAT NEXT

Refer to the line number in the error message and locate the problem by looking for the instance name. First, make sure all of the instance names in your design are unique. If the instance names in your design are not unique, fix your design so that all of the instance names are unique within your design. Reimport the EDIF file. If the problem persists, please contact Synopsys help line.

EDFN-16 (error) Line %d: Cannot build the array specification.

DESCRIPTION

The system is not able to build an array specification.

WHAT NEXT

Check the syntax of the array on the line specified in the error message.

EDFN-17 (error) Line %d: Cannot build the symbol specification.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-18 (error) Line %d: Cannot add the nets.

DESCRIPTION

The system is not able to create an object for the bussed net due either to a memory issue, incorrect syntax on the bussed net construct, or incorrect syntax on the construct prior to the specified bussed net.

WHAT NEXT

Re-execute the command, or check the syntax of the EDIF input file.

EDFN-19 (error) Line %d: Cannot add the net.

DESCRIPTION

The system is not able to build an object for the net on the line specified in the error message due to incorrect syntax of the specified net construct, or incorrect syntax of the constructs prior to the net.

WHAT NEXT

Check the syntax of the EDIF input file.

EDFN-20 (error) Line %d: Cannot add the net to the design.

DESCRIPTION

The system is not able to create a db net object due to a memory issue or a conflict in the net name.

WHAT NEXT

Check to make sure there is no conflict in the net name, or re-execute the command to see if the system is able to create a db net object.

EDFN-21 (error) Line %d: Cannot connect the object to the net.

DESCRIPTION

The system is not able to connect design objects in a netlist.

WHAT NEXT

Check the schematic of the design to see if the objects are from two different designs.

EDFN-22 (error) Line %d: Port or instance reference count exceeds net array size.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF file and encounters a net array joining a list of ports or instances bigger than its size.

WHAT NEXT

Refer to the line number in the error message and locate the error. Regenerate and re-import the EDIF input file.

EXAMPLES

```
...
150  (net (array (rename u3_B_3_0_ "u3/B[3:0]" ) 4)
151    (joined (portRef B_3_0_ (instanceRef u3)))
152    (portList
153      (portRef (member bus_end 0) (instanceRef Ripper_1))
154      (portRef (member bus_end 1) (instanceRef Ripper_1))
155      (portRef (member bus_end 2) (instanceRef Ripper_1))
156      (portRef (member bus_end 3) (instanceRef Ripper_1))
157      (portRef (member bus_end 3) (instanceRef Ripper_1)))
...
...
```

EXAMPLE MESSAGE

Error: Line 157: Port or instance reference count exceeds net array size. (EDFN-22)

In the above example, net u3_B_3_0 is a net array of size 4, but the portList it is joining is a list of 5 ports.

EDFN-23 (error) Line %d: Port is not an array member.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a port member reference, which is previously defined as a symbol port. Port member referencing is only used with port array. The referenced port is part of a cell whose type is GENERIC.

WHAT NEXT

Refer to the line number in the error message and locate the incorrect port reference. Fix the problem in the source, regenerate and reimport the EDIF input file. However, if you know EDIF and your design well, you can take a look at the port definition and reference and fix the problem.

EXAMPLES

```
...
50 (cell Test (cellType GENERIC)
51   (view Netlist_representation (viewType NETLIST)
52     (interface (port CI (direction INPUT)) (port CO (direction OUTPUT)))
53     (port (array (rename DIFF_6_0_ "DIFF[6:0]" ) 7) (direction OUTPUT)))
54     (port tmp (direction OUTPUT)))
...
100  (net n5
101    (joined (portRef (member DIFF_6_0_ 6)) (portRef P20 (instanceRef U3))
102      (portRef (member tmp 0))))
...
...
```

EXAMPLE MESSAGE

```
Error: Line 102: Port is not an array member. (EDFN-23)
```

In the above example, cell "Test" is of type GENERIC (line 50), it contains a port "tmp" of symbol type. Line 102, the symbol type port "tmp" is being reference through a member construct.

```
... 50 (cell Test (cellType GENERIC) 51 (view Netlist_representation (viewType NETLIST) 52 (interface (port CI (direction INPUT)) (port CO (direction OUTPUT))) 53 (port (array (rename DIFF_6_0_ "DIFF[6:0]" ) 7) (direction OUTPUT)) 54 (port tmp (direction OUTPUT)) ... 100 (net n5 101 (joined (portRef (member DIFF_6_0_ 6)) (portRef P20 (instanceRef U3)) 102 (portRef (member tmp 0)))) ...
```

EDFN-24 (error) Line %d: Port reference %s count of %d exceeds net size.

DESCRIPTION

The EDIF reader issues this error message when it reads the EDIF input file with the old_ripper_reading flag set to true, and encounters a ripper with difference size pins. Synopsys EDIF reader only support ripper with two of the same size pins.

WHAT NEXT

Locate the problem by referring to the line number in the error message. You might need to change you source so that your design only contains rippers with two pins of the same width. Regenerate and reimport the EDIF input file.

EXAMPLES

```
...
(cell (rename rip_1x1 "rip_1x1") (cellType RIPPER)
(view (rename Schematic_representation "Schematic_representation")
(viewType SCHEMATIC)
(interface (port (array (rename bundle "bundle") 512))
(port (array (rename wire "wire") 513))
(joined (portRef bundle) (portRef wire)))
...
...
```

EXAMPLE MESSAGE

```
dc_shell > edifin_old_ripper_reading = t dc_shell > read -f edif size1.edif Loading
edif file 'size1.edif' Error: Line 161: Port reference wire count of 513 exceeds net
size. (EDFN-24)
```

In the above example, a ripper with two pins of different widths 512 and 513 is defined.

EDFN-25 (warning) Line %d: The net %s is not an array.

DESCRIPTION

The EDIF reader detected that the design contains a connection between a bussed port and a single net.

WHAT NEXT

Fix the EDIF input file, and make sure that the connections are properly made.

EDFN-26 (error) Line %d: Instance is not an array member.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters an array member referencing of an instance, which is previously defined as a symbol instance. Instance member referencing is only used with instance array.

WHAT NEXT

Refer to the line number in the error message and locate the incorrect instance reference. Fix the problem in the source, regenerate and reimport the EDIF input file. However, if you know EDIF and your design well, you can take a look at the instance definition and reference and fix the problem.

EXAMPLES

```
...
50  (instance (rename Ripper_2 "Ripper_2")
51    (viewRef Schematic_representation
52     (cellRef rip_1x1 (libraryRef genlib_rip1x1)))
...
100   (net (rename out0)
101     (joined (portRef (member wire 0) (instanceRef (member Ripper_2 0))) (port
Ref out0))
...
...
```

EXAMPLE MESSAGE

Error: Line 101: Instance is not an array member. (EDFN-26)

In the above example, instance Ripper_2 is an instantiation of cell rip_1x1, and it is a symbol type instance (line 50). The instance Ripper_2 is referenced in line 101 with the member construct. Below is an correct example of cell instantiation and instance reference.

```
... 50 (instance (rename Ripper_2 "Ripper_2") 51 (viewRef Schematic_representation  
52 (cellRef rip_1x1 (libraryRef genlib_rip1x1)) ... 100 (net (rename out0) 101  
(joined (portRef (member wire 0) (instanceRef Ripper_2 )) (portRef out0)) ...
```

EDFN-27 (error) Line %d: Instance reference count exceeds net array size.

DESCRIPTION

The EDIF reader issues this error when it reads the EDIF input file and encounters a net array referencing an instance array of bigger size.

WHAT NEXT

Refer to the line number in the error message and check out the array sizes of the net array and the referenced instance array. Fix the source, regenerate and reimport the EDIF input file. However, if you know EDIF and your design well, you can fix the problem by changing to the correct array size.

EXAMPLES

```
...  
50 (instance (array (rename Ripper_2 "Ripper_2") 2)  
51 (viewRef Schematic_representation  
...  
100 (net  
101 (array (rename in_0_1_) 1)  
102 (joined (portRef bundle (instanceRef Ripper_2))  
103 (portRef bundle (instanceRef Ripper_1)) (portRef in)  
...
```

EXAMPLE MESSAGE

Error: Line 102: Instance reference count exceeds net array size. (EDFN-27)

In the above example, (line 102) the net array of size 1 "in_0_1_" is referencing an instance an instance array of size 2. The array instance is defined in line 50.

EDFN-28 (error) Line %d: Nets cannot be connected to an array of ports on an array of instances.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters

nets which connect to an array of ports on an array of instances. Nets can only connect to an array of ports on individual member of an instance array. See the below example.

WHAT NEXT

Refer to the line number in the error message and locate the net(s) which have the illegal connections, fix the source and regenerate the EDIF file. Alternatively, if you know EDIF and the design well, you can fix the problem by fixing the EDIF input file. Instead of referencing the whole instance array, you can individually reference each member of the instance array.

EXAMPLES

```
...
50  (cell ripper (cellType RIPPER)
51    (view Schematic_representation (viewType SCHEMATIC)
52      (interface (port (array bus_end 4)) (port (array w 4))
53        (joined (portRef bus_end) (portRef w)))
...
100   (instance (array Ripper_1234 4)
101     (viewRef Schematic_representation
102       (cellRef ripper (libraryRef generic_sdb)))
...
150   (net (array (rename SUM_0_3_ "SUM") 4)
151     (joined (portRef SUM_0_3_)
152       (portRef bus_end (instanceRef Ripper_1234)))
)
...
...
```

ERROR MESSAGE

Error: Line 152: Nets cannot be connected to an array of ports on an array of instances. (EDFN-28)

In the above example, net array SUM_0_3_ is referencing port array bus_end of instance array Ripper_1234 (line 152). Instead of referencing the whole array, you can reference each member of the instance array.

```
... 50 (cell ripper (cellType RIPPER) 51 (view Schematic_representation (viewType
SCHEMATIC) 52 (interface (port (array bus_end 4)) (port (array w 4)) 53 (joined
(portRef bus_end) (portRef w)) ... 100 (instance (array Ripper_1234 4) 101 (viewRef
Schematic_representation 102 (cellRef ripper (libraryRef generic_sdb)) ... 150 (net
(array (rename SUM_0_3_ "SUM") 4) 151 (joined (portRef SUM_0_3_) 152 (portRef
bus_end (instanceRef (member Ripper_1234 0))) 153 (portRef bus_end (instanceRef
(member Ripper_1234 1))) 154 (portRef bus_end (instanceRef (member Ripper_1234 2))) 155
(portRef bus_end (instanceRef (member Ripper_1234 39))) ) ...
```

EDFN-29 (error) Line %d: Can not find the pin on the cell.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a pin reference in a design with multiple views. The EDIF reader only processes the first view and ignore other views. The system will not be able to find the pins on the views which are being ignored.

WHAT NEXT

Regenerate the EDIF input file so that each design contains only one view, and re-import.

EXAMPLES

```
...
100  (cell case_test
...
105   (view ONE (viewType SCHEMATIC
106     (interface
107       (port A (direction INPUT))
108       (port B (direction OUTPUT))
109       (property (rename COMP "COMP"
110         (string "ALREADY DEFINED COMP")))
111     (view TWO (viewType SCHEMATIC
112       (interface
113         (port C (direction INPUT))
114         (port D (direction OUTPUT))
115         (property (rename COMP "COMP"
116           (string "ALREADY DEFINED COMP"))
...
150     (instance test (viewRef ONE (cellRef case_test)))
...
172     (net a (joined
173       (portRef C (instanceRef test
...

```

EXAMPLE MESSAGE

```
dc_shell > edifin_view_identifier_property_name = "COMP" "COMP"
read -f edif size1.edif Loading edif file '/remote/dtg245/anguyen/Test/Temp/
size1.edif' Error: Line 173: Can not find the pin on the cell. (EDFN-29)
```

In the above example, pin C of cell case_test view TWO is referenced in line 172, the system ignores the second view, therefore it cannot find pin C.

EDFN-30 (error) Line %d: Port (on instance) reference count

exceeds net array size.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a net array which has a reference to a port array of bigger size.

WHAT NEXT

Refer to the line number in the error message, and locate the net array which caused the EDIF reader to issue this error message, and see what port array(s) it is referencing. Check out the size of the net array and the referenced port array(s). You can regenerate and reimport the EDIF input file, or if you know EDIF and your design well, you can change the array size to the correct size.

EXAMPLES

```
... 50 (interface (port (array (rename bundle "bundle") 2)) 51 (port (array (rename  
wire "wire") 2)) 52 (joined (portRef bundle) (portRef wire) ... 250 (net (array  
in_0_1_ 1) 252 (joined (portRef bundle (instanceRef Ripper_1)) 253 (portRef bundle  
(instanceRef Ripper_2)) (portRef in) ...
```

EXAMPLE MESSAGE

Error: Line 251: Port (on instance) reference count exceeds net array size. (EDFN-30)

In the above example, net array in_0_1_ of size 1 (line 250) is referencing the port array bundle which is defined to be a port array of size 2 (line 50), in this case, it is probably a typo. The correct example would be:

```
... 50 (interface (port (array (rename bundle "bundle") 2)) 51 (port (array (rename  
wire "wire") 2)) 52 (joined (portRef bundle) (portRef wire) ... 250 (net (array  
in_0_1_ 2) 252 (joined (portRef bundle (instanceRef Ripper_1)) 253 (portRef bundle  
(instanceRef Ripper_2)) (portRef in) ...
```

EDFN-31 (error) Line %d: Net array size exceeds port reference count.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a net array which has a reference to a port array of smaller size.

WHAT NEXT

Refer to the line number in the error message, and locate the net array which caused the EDIF reader to issue this error message, and see what port array(s) it is referencing. Check out the size of the net array and the referenced port array(s). You can regenerate and reimport the EDIF input file, or if you know EDIF and your design well, you can change the array size to the correct size.

EXAMPLES

```
... 50 (interface (port (array (rename bundle "bundle") 2)) 51 (port (array (rename  
wire "wire") 2)) 52 (joined (portRef bundle) (portRef wire) ... 250 (net (array  
in_0_1_ 3) 252 (joined (portRef bundle (instanceRef Ripper_1)) 253 (portRef bundle  
(instanceRef Ripper_2)) (portRef in) ...
```

EXAMPLE MESSAGE

Error: Line 250: Net array size exceeds port reference count. (EDFN-31)

In the above example, net array in_0_1_ of size 3 (line 250) is referencing the port array bundle w hich is defined to be a port array of size 2 (line 50), in this case, it is probably a typo. The c orrect example would be:

```
... 50 (interface (port (array (rename bundle "bundle") 2)) 51 (port (array (rename  
wire "wire") 2)) 52 (joined (portRef bundle) (portRef wire) ... 250 (net (array  
in_0_1_ 2) 252 (joined (portRef bundle (instanceRef Ripper_1)) 253 (portRef bundle  
(instanceRef Ripper_2)) (portRef in) ...
```

EDFN-32 (error) Line %d: Can not add the port.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters problem with port definition.

WHAT NEXT

Refer to the line in the error message, and pay attention to the errors or warnings regarding the port mentioned in the error message. Regenerate the EDIF input file or fix the port definition, and reimport the EDIF input file.

EXAMPLES

```
... 50 (cell EO (cellType GENERIC) 51 (view Schematic_representation (viewType  
SCHEMATIC) 52 (interface (port A (direction INPUTA)) (port B (direction INPUT)) 53  
(port Z (direction OUTPUT)) ...
```

EXAMPLE MESSAGE

Error: Line 52: unrecognized port direction: INPUTA. (EDFN-33) Error: Line 52: Can not add the port. (EDFN-32)

In the above example, the direction for port A is incorrectly defined "INPUTA" (line 52). The port direction can only be "inout", "input", or "output". The system is not able to create a port object, and issue an error.

EDFN-33 (error) Line %d: unrecognized keyword: %s.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a non EDIF keyword after a left parenthesis.

WHAT NEXT

Refer to the line number in the error message and locate the incorrect EDIF keyword. You can either regenerate the EDIF input file and reimport, if you know what keyword it is supposed to be, then fix it and reimport the EDIF input file.

EXAMPLES

```
(edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
  (keywordMap (keywordLevela 0)) (status)
    (library (rename generic_sdb "generic.sdb") (edifLevel 0)
      (technology (numberDefinition (scale 1 (e 496094 -11)
      ...
```

EXAMPLE MESSAGE

Error: Line 2: unrecognized keyword: keywordLevela. (EDFN-33)

In the above example, there is a typo in "keywordLevela" (line 2), the correct keyword should be "keywordLevel".

EDFN-34 (error) Line %d: Can not add the port to the design.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem persists please contact Synopsys' help line.

EDFN-35 (error) Line %d: Cannot add the power or ground cell to the design.

DESCRIPTION

The EDIF reader issues this error when the system is not able to create a power or ground db object.

WHAT NEXT

Check to see if the reference for power and for the ground cell exists.

EDFN-36 (error) Line %d: Cannot add the power or ground net to the design.

DESCRIPTION

The EDIF reader issues this error when the system is not able to create a power or ground db net object.

WHAT NEXT

Re-execute the command.

EDFN-37 (error) Line %d: Cannot add the array.

DESCRIPTION

The system is not able to create an array object due to an unknown bus type or illegal range.

WHAT NEXT

Go to the line number in the error message and check the array, its type, and its range.

EDFN-38 (error) Line %d: Index array value exceeds bounding array value.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a port member reference with the index bigger than the array size. If the array size is 8, its port member indexes should be from 0:7.

WHAT NEXT

Refer to the line number in the error message, and locate the port member index which causes the EDIF reader to issue this error. You can either regenerate the EDIF input file, or if you know EDIF and your design well, fix the port member index, and reimport the EDIF file.

EXAMPLES

```
...
50  (cell ripper (cellType RIPPER)
51    (view Schematic_representation (viewType SCHEMATIC)
52      (interface (port (array bus_end 4)) (port (array w 4))
53        (joined (portRef bus_end) (portRef w)))
...
100 (instance (array Ripper_1234 4)
101   (viewRef Schematic_representation
102     (cellRef ripper (libraryRef generic_sdb)))
...
150 (net (array (rename SUM_0_3_ "SUM") 4)
151   (joined (portRef SUM_0_3_)
152     (portRef bus_end (instanceRef (member Ripper_1234 4))))
)
...

```

ERROR MESSAGE

Error: Line 152: Net array size exceeds port reference count. (EDFN-31)

In the above example, instance Ripper_1234 is an array of 4, therefore its indexes should go from 0 to 3. There is a reference to the instance Ripper_1234 on line 125 with the index of 4.

EDFN-39 (error) Line %d: multiple definition of %s '%s' in %s '%s', or there is a missing construct prior to the specified EDIF

construct.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and detects multiple definitions of libraries, cells, ports, pages, or other constructs within the same scope. The system also issues this error message when there is a missing construct. For instance, the edifLevel and technology constructs are the required constructs for the EDIF library construct, and if the technology construct is missing, the system will issue this error.

WHAT NEXT

The recommended solution is to find the line referenced in the error message and see what is defined multiple times. Or check to make sure all of the required constructs prior to the specified construct are present. Correct the error at the source, and regenerate the EDIF file. If you know EDIF and the design well, correct the error at the source, and correct all of the appropriate references in the rest of the EDIF file.

EXAMPLES

```
...
(external size1_lib (edifLevel 0) (technology (numberDefinition))
5 (cell or2 (cellType GENERIC)
6   (view Netlist_representation (viewType NETLIST)
7     (interface
8       (port A (direction INPUT ))
...
11     )
12   )
13 )
14 (cell or2 (cellType GENERIC)
15   (view Netlist_representation (viewType NETLIST)
16     (interface
17       (port X (direction INPUT ))
...
...
```

EXAMPLE MESSAGE

Error: Line 14: multiple definition of cell 'or2' in library 'size1_lib'. (EDFN-39)

In the above example, the cell "or2" is defined twice (one on line 5 and one on line 14) in the library "size1_lib". Below is a correct example:

```
...
(external size1_lib (edifLevel 0) (technology (numberDefinition))
5 (cell or2 (cellType GENERIC)
6   (view Netlist_representation (viewType NETLIST)
7     (interface
8       (port A (direction INPUT ))
```

```
11      )
12      )
13  )
14 (cell or3 (cellType GENERIC)
15   (view Netlist_representation (viewType NETLIST)
16     (interface
17       (port X (direction INPUT ))
...
...
```

EDFN-40 (warning) Line %d: Ending %s name space with %s name space (mismatch).

DESCRIPTION

The EDIF reader detected a syntax error on or near the line number indicated in the error message.

WHAT NEXT

Check the parentheses around the major constructs.

EDFN-41 (error) Line %d: Cannot find %s '%s' in definition of %s '%s'.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and cannot find the specified reference in the specified scope. For example, during cell instantiation, a cell reference is specified along with the library which contains the cell definition.

WHAT NEXT

Refer to the line number in the error message and locate the error. The recommended solution is to regenerate the EDIF file and rerun the program. However, if you know EDIF and the design well, check that the reference is appropriate for the definition. If not, include the appropriate references.

EXAMPLES

```
...
5  (external lib1 (edifLevel 0) (technology (numberDefinition))
6    (cell or2 (cellType GENERIC)
```

```

7   (view Netlist_represenatation (viewType NETLIST)
8     (interface
9       (port A (direction INPUT))
10      (port B (direction OUTPUT))))))
11 (library DESIGNS (edifLevel 0) (technology (numberDefinition)))
12 (cell or2 (cellType GENERIC)
13   (view Netlist_represenatation (viewType NETLIST)
14     (interface
15       (port X (direction INPUT))
16       (port Y (direction OUTPUT)))
17     (contents
18       (instance pcell2 (viewRef Netlist_representation
19         (cellRef or2A (libraryRef lib1)))))
...

```

EXAMPLE MESSAGE

Error: Line 18: Cannot find cell 'or2A' in definition of library 'lib1'. (EDFN-41)

In the above example (line 18), the cell "or2A" is not defined in the external library "lib1". Below is the correct example:

```

...
5 (external lib1 (edifLevel 0) (technology (numberDefinition)))
6   (cell or2 (cellType GENERIC)
7     (view Netlist_represenatation (viewType NETLIST)
8       (interface
9         (port A (direction INPUT))
10        (port B (direction OUTPUT))))))
11 (library DESIGNS (edifLevel 0) (technology (numberDefinition)))
12 (cell or2 (cellType GENERIC)
13   (view Netlist_represenatation (viewType NETLIST)
14     (interface
15       (port X (direction INPUT))
16       (port Y (direction OUTPUT)))
17     (contents
18       (instance pcell2 (viewRef Netlist_representation
19         (cellRef or2 (libraryRef lib1)))))
...

```

EDFN-42 (error) Line %d: The %s reference has a missing or invalid name.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-43 (error) Line %d: The %s reference has a missing or invalid %s reference.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF file and encounters an incomplete reference. For example, during cell instantiation, a view reference is always specified along with a cell reference. If you instantiate a cell and only specify the view reference, you will receive this error message.

WHAT NEXT

Refer to the line number in the error message and locate the error. The recommended solution is to regenerate the EDIF file and rerun the program. However, if you know EDIF and the design well, you can go to the spot specified in the error message and include the appropriate references.

EXAMPLES

```
...
5  (library lib1 (edifLevel 0) (technology (numberDefinition))
6    (cell or2 (cellType GENERIC)
7      (view Netlist_represenatation (viewType NETLIST)
...
16      (contents
17        (instance pcell2 (viewRef Netlist_representation))
...
...
```

EXAMPLE MESSAGE

Error: Line 18: The view reference has a missing or invalid cell reference. (EDFN-43)

In the above example, (line 17) the cell "pcell2" is instantiated only with the view reference. Below is an example of cell instantiation with complete references.

```
...
5  (library lib1 (edifLevel 0) (technology (numberDefinition))
6    (cell or2 (cellType GENERIC)
7      (view Netlist_represenatation (viewType NETLIST)
...
16      (contents
17        (instance pcell2 (viewRef Netlist_representation (cellRef or2 ))
```

...

EDFN-44 (error) Line %d: Cannot find the current %s symbol specification.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an incomplete construct which might put subsequent constructs out of scope. This will cause problems later on in the EDIF file during library, cell, or page referencing.

WHAT NEXT

To fix this problem, refer to the line number in the error message, and check to see what is being referenced. The recommended solution is to regenerate the EDIF file and rerun the program. If you know EDIF and the design well, locate the symbol and the symbol definition and see what is missing from the symbol definition.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType GENERIC )
...
25 (library DESIGNS (edifLevel 0) (technology (numberDefinition))
26 (cell size1 (cellType GENERIC)
27 (view Netlist_representation (viewType NETLIST)
...
35 (contents
36 (instance pcell2
37 (viewRef Netlist_representation
38 (cellRef or2 (libraryRef size1_lib))
...
...
```

EXAMPLE MESSAGE

Error: Line 38: Cannot find the current edif symbol specification. (EDFN-44)

In the above example, the left parenthesis is missing from line 3, at the beginning of an external library definition. This caused the other constructs to be out of scope. To fix this, add the left parenthesis at the beginning of line 3.

EDFN-45 (error) Line %d: Value of %s:%s not successfully interpreted.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and detects an invalid cell type (cellType) or view type (viewType). EDIF only support cell types of: TIE, GENERIC, and RIPPER, and view types of: BEHAVIOR, DOCUMENT, GRAPHIC, LOGICMODEL, MASKLAYOUT, NETLIST, PCBLAYOUT, SCHEMATIC, STRANGER, and SYMBOLIC.

WHAT NEXT

Refer to the line number in the error message and locate the error. The recommended solution is to regenerate the EDIF input file and reimport the file. However, if you know EDIF and the design well, you can go to the error line and specify the correct viewType or cellType.

EXAMPLES

```
...
5  (library lib1 (edifLevel 0) (technology (numberDefinition))
6    (cell or2 (cellType GENERICAA)
7      (view Netlist_represenatation (viewType NETLIST)
...
16      (contents
17        (instance pcell2 (viewRef Netlist_representation))
...
...
```

EXAMPLE MESSAGE

Error: Line 6: Value of cellType:GENERICAA not successfully interpreted. (EDFN-45)

To fix the above example, go to line 6 change cellType from GENERICAA to GENERIC.

EDFN-46 (error) Line %d: unmatched right parenthesis.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an extra right parenthesis after parsing a complete construct.

WHAT NEXT

If you receive this message, proceed as follows:

1. Locate the line referenced in the error message. This line contains the unmatched right parenthesis.
2. Working backwards in the file from the unmatched right parenthesis, examine each line until you identify the location where the missing left parenthesis should be added.
3. Correct the EDIF file and re-read it.

EXAMPLES

```
1 (edif Synopsys_edif
...
25     library lib1
...
87     )
```

EXAMPLE MESSAGE

Error: Line 87: unmatched right parenthesis. (EDFN-46)

In this example, line 87 contains unmatched right parenthesis. Working backwards from line 87, you find the matching right parenthesis missing from line 25. The corrected example is as follows:

```
1 (edif Synopsys_edif
...
25     (library lib1
...
87     )
```

EDFN-47 (error) Line %d: missing left parenthesis.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an EDIF construct without a left parenthesis.

WHAT NEXT

To fix this problem, refer to the line number in the error message, and start from there to look for the missing left parenthesis.

EXAMPLES

```
1 edif Synopsys_edif
...
```

```
25     library lib1
...
87     )
```

EXAMPLE MESSAGE

Error: Line 1: missing left parenthesis. (EDFN-47)

In the above example, the left parenthesis at the beginning of the "edif" construct is missing. Below is the correct example:

```
1 (edif Synopsys_edif
...
25     (library lib1
...
87     )
```

EDFN-48 (error) Line %d: misplaced '%%'.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a to incorporate ASCII characters into a string token.

WHAT NEXT

To fix the problem, refer to the line referenced in the error message and see if the % symbol is the right place. If it is supposed to be part of a string token, it needs to be in double quotes.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType %%GENERIC)
```

EXAMPLE MESSAGE

Error: Line 4: misplaced '%'. (EDFN-48)

In the above example, the %% symbols in line 4 are misplaced. Below is a correct example:

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
```

```
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType GENERIC)
```

EDFN-49 (error) Line %d: unrecognized token.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a % sign when it is expecting an identifier.

WHAT NEXT

To fix the problem, refer to the line in the error message and take out the % sign.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType %%GENERIC)
```

EXAMPLE MESSAGE

Error: Line 4: unrecognized token. (EDFN-49)

In the above example, the %% signs in line 4 are misplaced. Below is an correct example:

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType GENERIC)
```

EDFN-50 (error) Line %d: missing right parenthesis.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and finds missing right parenthesis. It normally parses until the end of the file to match left parentheses to right parentheses, so the line number shown in the error message is usually not correct.

WHAT NEXT

Go through the EDIF file and look for the missing parenthesis, or you can regenerate the EDIF file.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2   (keywordMap (keywordLevel 0)) (status)
3     (external size1_lib (edifLevel 0) (technology (numberDefinition))
4     ...
86   )
87 )
```

EXAMPLE MESSAGE

Error: Line 88: missing right parenthesis. (EDFN-50)

In the above example, there are only 87 lines in this file. The missing right parenthesis occurs in line 85, but the error message refers to line 88. The EDIF reader reads until the EOF mark to find the matching right parenthesis. This is why you get the error message referring to line 88.

EDFN-51 (error) Line %d: No edif design encountered.

DESCRIPTION

The EDIF reader issues this error if the input file is empty.

WHAT NEXT

Make sure you specified the correct input file.

EDFN-52 (error) Line %d: ASCII character is not between 0 and 127.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a non-readable character. Your ASCII EDIF file is probably corrupted or it is not an ASCII file.

WHAT NEXT

Refer to the line referenced in the error message and see if there is an incorrect character in this line.

EDFN-53 (error) Line %d: invalid string token.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an invalid specification string. A string is surrounded by quotes, and you can use the % symbol as part of a string to specify an embedded ASCII character. The EDIF reader expects an integer after the % symbol in a string.

WHAT NEXT

Refer to the line number in the error message and take out the % symbol in the string if it is not used to specify an embedded ASCII character. If the % symbol is used to specify an embedded ASCII character, it needs to be followed by an integer.

EXAMPLES

```
...
10    (port VDD (direction INPUT)
11      (property implicitPortClass (string "%abc") (owner "Schematic_TSC"))
...

```

EXAMPLE MESSAGE

Error: Line 10: invalid string token. (EDFN-53)

In the above example, the string "%abc" causes the EDIF reader to issue the error because the EDIF reader expects an integer after the % symbol. The following example has the correct syntax for a string token:

```
...
10    (port VDD (direction INPUT)
11      (property implicitPortClass (string "abc") (owner "Schematic_TSC"))
...

```

EDFN-54 (error) Line %d: Expected an arc or point.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an EDIF construct that is out of scope. The curve construct only supports the arc and

point constructs.

WHAT NEXT

Refer to the line number in the error message, and locate the illegal EDIF construct within the scope of the curve construct. You need to regenerate and reimport the EDIF input file.

EXAMPLES

```
...
25 (portImplementation A
26     (connectLocation (figure cell_layer (dot (pt -2653 -1024))))
27 )
28 (figure cell_layer
29     (openShape
30         (curve (rectangle (pt -3071 2047) (pt -2523 -1) (pt -3072 -2048)))
...
...
```

EXAMPLE MESSAGE

Error: Line 30: Expected an arc or point. (EDFN-54)

In the above example, a curve is define (line 30), and it is followed by a rectangle construct. After a curve construct, only an arc or a point construct can be used.

```
... 25 (portImplementation A 26 (connectLocation (figure cell_layer (dot (pt -2653 -1024)))) 27 ) 28 (figure cell_layer 29 (openShape 30 (curve (pt -3071 2047) (pt -2523 -1) (pt -3072 -2048))) ...
```

EDFN-55 (error) Line %d: Expected a rectangle.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an out of scope EDIF construct. A rectangle construct is expected after the boundingBox and Page constructs.

WHAT NEXT

Refer to the line number in the error message and locate the error by looking for the construct immediatly after the boundingBox or Page construct. You need to regenerate and reimport the EDIF input file.

EXAMPLES

```
...
55 (symbol (boundingBox (curve (rectangle (pt -3858 -2048) (pt 2597 2048))))
```

...

EXAMPLE MESSAGE

Line 21: Expected a rectangle. (EDFN-55)

In the above example, after the boundingBox construct is the curve construct, this causes the error. The curve construct needs to be removed.

EDFN-56 (error) Line %d: Expected a curve.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters an EDIF construct which is in the wrong scope. After the openShape and shape constructs, the only supported construct is the curve construct.

WHAT NEXT

Refer to the line number in the error message and locate the error by looking for the shape construct. Regenerate and reimport the EDIF input file.

EXAMPLES

```
...
21  (openShape (boundingBox (curve (rectangle (pt -3858 -2048) (pt 2597 2048)))
...
...
```

EXAMPLE MESSAGE

Error: Line 21: Expected a curve. (EDFN-56)

In the above example, after the openShape construct, the boundingBox construct is read. This caused the error, because the EDIF reader is expecting a curve construct.

EDFN-57 (error) Line %d: Expected a point.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an EDIF construct which is out of scope.

WHAT NEXT

Regenerate the EDIF input file and reimport it into dc_shell.

EXAMPLES

```
...
35  (figure cell_layer
36    (openShape (curve (arc (arc (pt -950 2048) (pt 1098 1499) (pt 2597 0))
...
...
```

EXAMPLE MESSAGE

Error: Line 36: Expected a point. (EDFN-57)

In the above example, after the curve construct, a pt construct is expected, but reader is reading an arc construct.

EDFN-58 (error) Line %d: Expected a number.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a non-numeric character when it expecting a numeric character. For example, the reader expects a numeric character for array size, EDIF version number, EDIF level, EDIF keyword level, or other constructs.

WHAT NEXT

Refer to the line number in the error message to see if any alpha character is misplaced, or regenerate the EDIF file.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion a2 0 0) (edifLevel 0)
2  (keywordMap (keywordLevel 0)) (status)
...
...
```

EXAMPLE MESSAGE

Error: Line 1: Expected a number. (EDFN-58)

In the above example, the edif version number is a2 0 0 (edifVersion a2 0 0). The correct syntax would be (edifVersion 2 0 0).

EDFN-59 (error) Line %d: Expected a name.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF input file and encounters a non-string name used to defy a unit definition.

WHAT NEXT

Refer to the line number in the error message, and locate the unit construct. Understand the problem, and you can either regenerate the EDIF input file, or if you know the unit defintion and fix the problem. Reimport the EDIF input file.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2   (keywordMap (keywordLevel 0)) (status)
3   (library (rename generic_sdb "generic.sdb") (edifLevel 0)
4     (technology (numberDefinition (scale 1 (e 496094 -11) (unit 3333)))
5       (figureGroup fat_layer (color 99 0 0))
      ...
```

EXAMPLE MESSAGE

Error: Line 4: Expected a name. (EDFN-59)

In the above example, the unit is defined to be 3333 (line 4), the reader is expecting a name not an integer. If the unit definition changed from 3333 to DISTANCE, the EDIF reader will accept it.

EDFN-60 (error) Could not open file '%s'.

DESCRIPTION

The EDIF reader issues this error when it cannot open the EDIF input file.

WHAT NEXT

Make sure the EDIF input file exists and is readable.

EDFN-61 (warning) Line %d: Edifin_lib_%s_symbol '%s' not

found in library '%s'.

DESCRIPTION

The EDIF reader is not able to find the specified symbol in any of the libraries.

WHAT NEXT

Specify the library that contains the symbol shown in the error message.

EDFN-62 (error) Line %d: 'DISTANCE' scale not defined for library '%s'.

DESCRIPTION

The EDIF reader issues this error when it is used in conjunction with the **read_lib** command to create a synopsys library and the DISTANCE scale is not specified in the EDIF input file.

WHAT NEXT

To fix this problem, you need to regenerate the EDIF input file and specify the EDIF writer to write out the DISTANCE scale.

EXAMPLES

```
...
7   (library LIBRARYNAME
8     (EDIFLevel 0)
9     (technology
10       (numberDefinition)
11         (figureGroup BODY_FGP
12           (color 0 89 89)
13           (textHeight 43)
14           (visible
15             (true)))
...
...
```

EXAMPLE MESSAGE

```
dc_shell> read_lib size1.edif -f EDIF
```

```
Error: Line 11: 'DISTANCE' scale not defined for library 'LIBRARYNAME'. (EDFN-62) In
the above example, the DISTANCE scale is not defined. Below is an example with the
DISTANCE scale defined.
```

```
7   ...
8   (library LIBRARYNAME
9     (EDIFLevel 0)
10    (technology
11      (numberDefinition
12        (scale 240
13          (e 254 -4)
14            (unit DISTANCE)))
15    (figureGroup BODY_FGP
16      (color 0 89 89)
17      (textHeight 43)
18      (visible
19        (true)))
20  ...
```

EDFN-63 (information) Line %d: Could not find port connect location. Using derived connect location from '%s' viewRef, '%s' cellRef, or '%s' libraryRef.

DESCRIPTION

This message informs you that the system could not find the port connect location, and is using the derived connect location from the cell, library, or view reference.

WHAT NEXT

Modify the design so that it contains the connect locations for all ports.

EDFN-64 (error) Line %d: Connect location derived for '%s' viewRef of '%s' cellRef of '%s' libraryRef is not equal to previously derived location.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF input file and encounters a design with incorrect connect location.

WHAT NEXT

Regenerate and re-import the EDIF input file.

EXMAMPLES

EXAMPLE MESSAGE

Error: Line 296: Connect location derived for 'Graphic_representation' viewRef of 'in_port' cellRef of 'generic_sdb' libraryRef is not equal to previously derived location. (EDFN-64)

EDFN-65 (warning) Line %d: No connect location found for '%s' viewRef, '%s' cellRef, or '%s' libraryRef.

DESCRIPTION

The EDIF reader is not able to find the port connect location for the specified references.

WHAT NEXT

Modify the design so that it contains the connect locations for all ports.

EDFN-66 (warning) Line %d: Derived connect location rejected for '%s' viewRef, '%s' cellRef, and '%s' libraryRef.

DESCRIPTION

The EDIF reader could not find the connect location for the specified objects. It uses the connect location from the specified references, but the connect location from the references is not valid.

WHAT NEXT

Modify the EDIF input file, and make sure the connect location is valid.

EDFN-67 (error) Line %d: The %s element within the '%s' construct must be %s.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and finds missing

required EDIF constructs for the specified EDIF construct. For example, the cell construct requires the cell name and the cellType (cell cellName, cellType GENERIC).
...

WHAT NEXT

Refer to the line number in the error message and see what caused the problem. The recommended solution is to regenerate the EDIF input file. However, if you know EDIF and the design well, you can fix the problem by following the error message.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2   (keywordMap (keywordLevel 0)) (status)
3   (external size1_lib (edifLevel 0) (technology (numberDefinition))
4     (cell or2
5       (view Netlist_representation (viewType NETLIST)
       ...
```

EXAMPLE MESSAGE

Error: Line 4: The 3rd element within the 'cell' construct must be the 'cellType' construct. (EDFN-67)

In the example above, the declaration of a cell (line 4) fails to specify the cell type. Below is a correct example:

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2   (keywordMap (keywordLevel 0)) (status)
3   (external size1_lib (edifLevel 0) (technology (numberDefinition))
4     (cell or2 (cellType GENERIC)
5       (view Netlist_representation (viewType NETLIST)
       ...
```

EDFN-68 (error) Line %d: The keywordAlias construct is only valid in keywordLevel 1 or higher.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a keyword alias specification for the keywordLevel 0 construct. The keywordAlias construct can only be used with keywordLevel 1, 2, or 3.

WHAT NEXT

The recommended solution is to regenerate the EDIF file. However, if you know EDIF and the design well, look at the rest of the file and see if and how the keyword

alias is used. Change the keyword level accordingly. If the keyword alias is not used, change the keyword level to 0.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0) (keywordAlias p pt)) (status)
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType GENERIC)
...

```

EXAMPLE MESSAGE

Error: Line 2: The keywordAlias construct is only valid in keywordLevel 1 or higher.
(EDFN-68)

In the example above (line 2), the keywordLevel is 0, yet the keywordAlias construct is used. Since there is no keyword alias used in this file, the keywordAlias construct can be taken out. Here is a correct example.

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType GENERIC)
...

```

EDFN-69 (error) Line %d: Expected an identifier.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters an incorrect keywordAlias definition (keywordAlias identifier).

WHAT NEXT

To fix this problem, refer to the line number in the error message, and check the keyword alias definition. If you know the keyword alias, then you can fix it. If you do not know the keyword alias, you can regenerate the EDIF input file.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 1) (keywordAlias "p" "pt")) (status)
3 (external size1_lib (edifLevel 0) (technology (numberDefinition))
4 (cell or2 (cellType GENERIC)
5 (view Netlist_representation (viewType NETLIST)
...

```

EXAMPLE MESSAGE

Error: Line 2: Expected an identifier. (EDFN-69)

In the above example (line 2), the keywordAlias contract contains two strings, "p" and "pt", instead of two identifiers. Below is the fix the above example.

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2   (keywordMap (keywordLevel 1) (keywordAlias p pt)) (status)
3   (external size1_lib (edifLevel 0) (technology (numberDefinition))
4     (cell or2 (cellType GENERIC)
5       (view Netlist_representation (viewType NETLIST)
...)
```

EDFN-70 (warning) Could not find template symbol '%s' for sheet size '%s' or orientation '%s' in library '%s'.

DESCRIPTION

The EDIF reader is not able to find the template symbol for the specified sheet, size, and orientation in the specified library.

WHAT NEXT

Include the correct library which contains the template symbol for the specification in the error message.

EDFN-71 (error) Line %d: The points defining the arc are not distinct.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an incorrect definition of an arc.

WHAT NEXT

Regenerate and reimport the EDIF input file.

EXAMPLES

```
...
34  (figure cell_layer
```

```
35      (openShape (curve (arc (pt -950 2048) (pt 2597 1499) (pt 2597 1499))))  
...
```

EXAMPLE MESSAGE

Error: Line 35: The points defining the arc are not distinct. (EDFN-71)

In the above example, the second and third points defining the arc are identical.

EDFN-72 (error) Line %d: Can not create attribute '%s' on the cell instance.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem persists please contact Synopsys' help line.

EDFN-73 (error) Line %d: Can not set attribute '%s' on the cell instance.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem persists please contact Synopsys' help line.

EDFN-74 (error) Line %d: There is no pin named '%s' on the cell instance.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-75 (error) Line %d: Can not create attribute '%s' on pin '%s'.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem still occurs please contact Synopsys' help line.

EDFN-76 (error) Line %d: Can not set attribute '%s' on pin '%s'.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem still occurs please contact Synopsys' help line.

EDFN-77 (error) Line %d: Can not create attribute '%s' on port '%s'.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem still occurs please contact Synopsys' help line.

EDFN-78 (error) Line %d: Can not set attribute '%s' on port '%s'.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters some internal problem.

WHAT NEXT

Restart the command, if the problem still occurs please contact Synopsys' help line.

EDFN-79 (error) Line %d: The attribute 'disabled' may not be set on power or ground port '%s'.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-80 (error) Line %d: Duplicate view property name in library '%s'.

View '%s' of cell '%s' has the same view identifier '%s' property value of '%s' as view '%s' of cell '%s'.

DESCRIPTION

The EDIF reader issues this error when it detects duplicating view property names in the same design.

WHAT NEXT

Synopsys EDIF reader only support single view design. As for multiple view design, it only reads and process the first view in the design and ignore the rest. Therefore, it highly recommended that you regenerate the EDIF input file with single view design.

EXAMPLES

```
...
200  (cell case_test (cellType GENERIC)
201    (view &_ONE (viewType SCHEMATIC)
202      (interface
...
350      (property
351        (rename COMP "COMP")
352        (string "COMP_ALREADY_DEFINED"))
...
400  (view &_TWO (viewType SCHEMATIC)
401    (interface
...
451      (property
452        (rename COMP "COMP")
453        (string "COMP_ALREADY_DEFINED"))
...
...
```

EXAMPLE MESSAGE

```
>dc_shell edifin_view_identifier_property_name = "COMP" "COMP"

Error: Line 401: Duplicate design name in library 'LIBRARYNAME'. View '_TWO_' of
cell 'case_test' has the same view identifier 'COMP' property value of
'COMP_ALREADY_DEFINED' as view '_ONE_' of cell 'case_test'. (EDFN-80)
```

In the above example, view _ONE and _TWO has the sampe property name "COMP".

**EDFN-81 (error) Line %d: Duplicate design name in library '%s'.
View '%s' of cell '%s' already has a view
identifier '%s' property value of '%s'.**

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF input file and encounters a view property whose name is the same as the edifin_view_identifier_property_name and a design whose name is the same as the value of the view property.

WHAT NEXT

Locate the problem by refering to the line number in the error message. Regenerate and reimport the EDIF input file, or do not use the edifin_view_identifier_property_name flag.

EXAMPLES

```
...
(cell test_case
...
  (property
    (rename COMP "COMP")
    (string "COMP_ALREADY_DEFINED"))
...
(cell
  COMP_ALREADY_DEFINED
  (cellType GENERIC)
...
...
```

EXAMPLE MESSAGE

```
dc_shell > edifin_view_identifier_property_name = "COMP" "COMP" dc_shell > read -f
edif size1.edif Loading edif file 'size1.edif' Error: Line 363: Duplicate design
name in library 'LIBRARYNAME'. View '_ONE_' of cell 'case_test' already has a view
identifier 'COMP' property value of 'COMP_ALREADY_DEFINED'. (EDFN-81)
```

In the above example, the variable `edifin_view_identifier_property_name` is set to "COMP". The EDIF input file has a view property whose name is COMP and value is "COMP_ALREADY_DEFINED", the input file also has a design whose name is "COMP_ALREADY_DEFINED".

EDFN-82 (error) The value of variable '%s' isn't valid.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF file and use a bus related variable incorrectly set in `dc_shell`.

WHAT NEXT

Refer to the line number in the error message, and locate the error. Go to the `dc_shell` command window and re-set the variable to the correct value.

EXAMPLES

```
dc_shell > bus_extraction_style = "%s(%d-%d)"
"%s(%d-%d)"
read -f edif s13884_3.iedif
Loading edif file '/remote/qel/test/unit/designs/edif/stars/s13884_3.iedif'
```

EXAMPLE MESSAGE

Error: In the value of variable 'bus_extraction_style', the last (rightmost) of the characters separating each "%d" must not be a plus or minus sign or a digit. (DDB-

57) Error: The value of variable 'bus_extraction_style' isn't valid. (EDFN-82)

In the above example, the bus_extraction-style variable was set incorrectly. It should be: bus_extraction_style = "%d[%s:%s]"

EDFN-83 (error) Line %d: The range from %d to %d of array '%s' does not match its width.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF file and encounter an array whose width does not match its range. An array is defined with a range and the size, e.g. (port (array (rename DUMMY "IN<_15...0_>")16)). The array DUMMY has a range from 15 to 0, and the size is 16.

WHAT NEXT

Refer to the line number in the error message, and locate the array with the incorrect definition. If you know EDIF and the design well, you can change the array size and range to the correct number, or regenerate the EDIF input file.

EXAMPLES

```
...
21 (port (rename &1_DUMMY "A<_15...0_>"))
22 (port (Array (rename &2_DUMMY "IN<_15...0_>") 16))
23 (port (Array (rename &3_DUMMY "OUT<_15...0_>") 15))
...

```

EXAMPLE MESSAGE

Error: Line 23: The range from 15 to 0 of array 'OUT<_15...0_>' does not match its width. (EDFN-83)

In the above example, array 3_DUMMY has a range from 15 to 0, so its size should be 16 instead of 15.

EDFN-84 (error) Line %d: Multiple cells of the same name are not supported.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters multiple cells of the same name in the EDIF input file.

WHAT NEXT

Regenerate your EDIF file and make sure the cell names are unique.

EXAMPLES

```
...
1000  (library A
      ...
1010  (cell TT
      ...
1300  (library A
      ...
1329  (cell TT
      ...
```

EXAMPLE MESSAGE

Error: Line 1329: Multiple cells of the same name are not supported. (EDFN-84)

In the above example, cell TT is defined twice (line 1010 and 1329) in library A.

EDFN-85 (warning) Line %d: Cannot create attribute '%s' on net '%s'.

DESCRIPTION

The EDIF reader is not able to create the specified attribute of the specified net due to an invalid attribute definition.

WHAT NEXT

Fix the EDIF input file and make sure that all of the attributes in the design are properly defined.

EDFN-86 (warning) Line %d: Cannot set attribute '%s' on net '%s'.

DESCRIPTION

The EDIF reader is not able to set an attribute on the specified net due to an invalid attribute definition.

WHAT NEXT

Modify the EDIF input file and make sure the specified attributes are properly defined.

EDFN-87 (warning) Line %d: Cannot create attribute '%s' on design '%s'.

DESCRIPTION

The EDIF reader is not able to create an attribute on the design due to an invalid attribute definition.

WHAT NEXT

Fix the EDIF input file, and make sure all of the attributes in the design are properly defined.

EDFN-88 (warning) Line %d: Cannot set attribute '%s' on design '%s'.

DESCRIPTION

The EDIF reader is not able to set an attribute on the design due to an invalid attribute definition.

WHAT NEXT

Check the EDIF input file to make sure all of the attributes are properly defined.

EDFN-89 (error) Line %d: Library '%s' is corrupted. Not all view identifier properties of cell '%s' are found.

DESCRIPTION

The EDIF reader issues this error message when the system cannot find the specified view identifier property. The EDIF reader does not support cells with multiple views.

WHAT NEXT

Fix the design so it only contains cells with single view.

EDFN-90 (error) Line %d: The port '%s' on instance '%s' isn't an array.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a reference to a simple port using the member construct. Member construct can only be used to reference an array port.

WHAT NEXT

Refer to the line number in the error message and locate the incorrect port reference. You can either fix the source, regenerate and reimport the EDIF input file. Or, if you know EDIF and your design well, you can check the port definition and fix the port reference.

EXAMPLES

```
...
50  cell FULL_ADDER (cellType GENERIC)
51    (view Schematic_representation (viewType SCHEMATIC)
52      (interface (port A (direction INPUT)) (port B (direction INPUT)))
...
100 (instance (rename U1_1_ "U1[1]")
101   (viewRef Schematic_representation
102     (cellRef FULL_ADDER (libraryRef ADDER_db)))
...
150   (joined
151     (portRef (member w 1) (instanceRef (member Ripper_5678 1)))
152     (portRef (member B 0) (instanceRef U1_1_)))
...
...
```

EXAMPLE MESSAGE

Error: Line 152: The port 'B' on instance 'U1[1]' isn't an array. (EDFN-90)

In the above example, port B is defined to be a simple port (line 52), but it is referenced (line 152) using the member construct. Below is an example:

```
... 50 cell FULL_ADDER (cellType GENERIC) 51 (view Schematic_representation
(viewType SCHEMATIC) 52 (interface (port A (direction INPUT)) (port B (direction
INPUT))) ... 100 (instance (rename U1_1_ "U1[1]") 101 (viewRef
Schematic_representation 102 (cellRef FULL_ADDER (libraryRef ADDER_db)) ... 150
(joined 151 (portRef (member w 1) (instanceRef (member Ripper_5678 1)))) 152 (portRef
```

```
B (instanceRef U1_1_) ...
```

EDFN-91 (warning) Line %d: The value '%s' of the duplicate %s property '%s' is ignored.

DESCRIPTION

The EDIF reader detected duplicate properties with different values. It processed and kept the first set of values.

WHAT NEXT

Modify the EDIF input file, and make sure the property values are properly set.

EDFN-92 (warning) Line %d: Cannot create attribute '%s' on the cell instance.

DESCRIPTION

The EDIF reader is not able to create an attribute on the cell instance due to an invalid attribute definition.

WHAT NEXT

Check the EDIF input file to make sure all of the attributes are properly defined.

EDFN-93 (warning) Line %d: Cannot set attribute '%s' on the cell instance.

DESCRIPTION

The EDIF reader cannot set the specified attribute on the cell instance, because the attribute has an invalid setting or type.

WHAT NEXT

Check the EDIF input file to make sure all of the attributes are properly defined.

EDFN-94 (warning) Line %d: Cannot create attribute '%s' on pin '%s'.

DESCRIPTION

The EDIF reader is not able to create an attribute on the design due to an invalid attribute definition.

WHAT NEXT

Check the EDIF input file to make sure all of the attributes are properly defined.

EDFN-95 (warning) Line %d: Cannot set attribute '%s' on pin '%s'.

DESCRIPTION

The EDIF reader is not able to set the attribute on the design due to an invalid attribute definition.

WHAT NEXT

Check the EDIF input file to make sure all of the attributes are properly defined.

EDFN-96 (warning) Line %d: Cannot create attribute '%s' on port '%s'.

DESCRIPTION

The EDIF reader is not able to create the specified attribute due to an invalid attribute definition.

WHAT NEXT

Check the EDIF input file and make sure all of the attributes are correctly defined.

EDFN-97 (warning) Line %d: Cannot set attribute '%s' on port

'%S'.

DESCRIPTION

The EDIF reader is not able to set an attribute on a design object due to an invalid attribute definition.

WHAT NEXT

Check the EDIF input file to make sure all of the attributes are properly defined.

EDFN-98 (warning) Line %d: Net bus not added to the design because a net's connections to the previously added net).

DESCRIPTION

The EDIF reader detected that there is a net or a bussed net with the same name that has already been added to the system. The first net will be used to make the connection.

WHAT NEXT

Fix the EDIF input file, or make sure that all of the net connections are correct.

EDFN-99 (warning) Line %d: Port array connected to a net that is not an array.

DESCRIPTION

The EDIF reader detects that there is a bussed port connected to a single net in the design.

WHAT NEXT

Fix the EDIF input file.

EDFN-100 (warning) Line %d: Port (on instance) array

connected to a net that is not an array.

DESCRIPTION

The system has encountered a connection of a single net to an array of ports. An array of ports can only connect to an array nets.

WHAT NEXT

Fix the input file so that the connections are made correctly.

EDFN-101 (error) Line %d: The portBundle is not supported.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters an EDIF portBundle construct, which is currently not supported by the Synopsys EDIF reader.

WHAT NEXT

The recommended solution is to regenerate the EDIF file, specifying that the EDIF writer is not to write out the portBundle constructs. As an alternative, if you know EDIF and the design well, you can remove the portBundle construct and all references to it from the EDIF file.

EXAMPLE:

With portBundle:

```
...
40  (portBundle Clocks
41    (listOfPorts
42      (port clk1)
43      (port clk2)
44    )
45  )
...
80  (net clock
81    (joined
82      (portRef clk1 (portRef Clocks))
...
...
```

EXAMPLE MESSAGE

Error: Line 40: The portBundle is not supported.

In the above example (line 40), the portBundle construct is used and triggers the error message. The example below shows the section of the EDIF file without the portBundle construct.

Without portBundle: ... 40 (port clk1) 41 (port clk2) ... 78 (net clock 80 (joined 81 (portRef clk1) ...

EDFN-102 (information) Line %d: Defining view '%s' of cell '%s' to be the bus ripper.

DESCRIPTION

The variables `edifin_lib_ripper_cell_name` and `edifin_lib_ripper_view_name` specify that the ripper cell attributes be included on that view of that cell.

WHAT NEXT

This is an informational message. No action is required on your part.

EDFN-103 (information) Line %d: Defining view '%s' of cell '%s' to be the bus ripper.

DESCRIPTION

The variable `edifin_lib_ripper_cell_name` indicates that the ripper cell attributes be included on the specified view of the specified cell.

WHAT NEXT

This is an informational message. Not action is required on your part.

EDFN-104 (warning) Line %d: No symbol created for cell '%s' because the view that has been defined to be the correct view of the bus ripper cell (by setting the variable `edifin_lib_ripper_view_name`) was not found.

DESCRIPTION

The 'RIPPER' cellType of that cell specifies that the ripper cell attributes be included on the view of that cell that has been defined by setting the variable edifin_lib_ripper_view_name to be the correct view of the bus ripper cell, but the specified view wasn't found.

WHAT NEXT

If that cell is the correct one to use as the bus ripper cell, then (1) determine which view of that cell is the correct one to use, (2) set the variable edifin_lib_ripper_view_name to define that view to be the correct one, and (3) execute the edif format read_lib command again.

If that cell isn't the correct one to use as the bus ripper cell, then (1) determine which cell is the correct one to use, (2) set the variable edifin_lib_ripper_cell_name to define that cell to be the correct one, and (3) execute the edif format read_lib command again.

EDFN-105 (error) Line %d: invalid identifier token.

DESCRIPTION

This error occurs when the EDIF reader parses the EDIF file and detects an improperly formed identifier (one containing a character that cannot be part of an identifier). An identifier is composed only of alphanumeric or underscore characters.

WHAT NEXT

To fix this problem, refer to the line number in the error message to locate the improperly-formed identifier and correct it.

EXAMPLES

```
1 (edif Synopsys.edif (edifVersion 2 0 0) (edifLevel 0)
2   (keywordMap (keywordLevel 0)) (status)
3   (external (rename ADDER_db "ADDER.db") (edifLevel 0)
4     (technology (numberDefinition))
5     (cell ADDER (cellType GENERIC)
```

EXAMPLE MESSAGE

Error: Line 1: invalid identifier token. (EDFN-105)

In the above example, the name of the EDIF-generated program, "Synopsys.edif", is an identifier and cannot contain a dot as part of its name. Below is the correct example.

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external (rename ADDER_db "ADDER.db") (edifLevel 0)
4 (technology (numberDefinition))
5 (cell ADDER (cellType GENERIC)
```

EDFN-106 (error) Line %d: invalid integer token.

DESCRIPTION

This error occurs when the EDIF reader parses the EDIF file and detects an improperly formed integerToken (one containing a character that cannot be part of an integerToken). An integerToken can only contain numeric characters, and + and - signs; for example 123, -123, or +123.

WHAT NEXT

To fix the problem, refer to the line number in the error message to locate the improperly formed integerToken and correct it.

EXAMPLES

```
1 (edif Synopsys_edif (edifVersion 2B 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external (rename ADDER_db "ADDER.db") (edifLevel 0)
4 (technology (numberDefinition))
5 (cell ADDER (cellType GENERIC)
```

EXAMPLE MESSAGE

Error: Line 1: invalid integer token. (EDFN-106)

In the above example, the edifVersion number (edifVersion 2B 0 0) is specified incorrectly. It should be specified as follows:

```
1 (edif Synopsys_edif (edifVersion 2 0 0) (edifLevel 0)
2 (keywordMap (keywordLevel 0)) (status)
3 (external (rename ADDER_db "ADDER.db") (edifLevel 0)
4 (technology (numberDefinition))
5 (cell ADDER (cellType GENERIC)
```

EDFN-107 (warning) Line %d: Expected an identifier.

DESCRIPTION

The EDIF reader detected a syntax error on the line number referenced in the error message.

WHAT NEXT

Fix the EDIF input file to contain the correct syntax.

EDFN-108 (warning) Line %d: Expected a nameDef.

DESCRIPTION

The EDIF reader detected a syntax error in the EDIF input file on the line number specified in the error message.

WHAT NEXT

Fix or regenerate the EDIF input file.

EDFN-109 (warning) Line %d: Expected a nameRef.

DESCRIPTION

The EDIF reader detected a syntax error on the line number in the error message.

WHAT NEXT

Fix or regenerate the EDIF input file.

EDFN-110 (warning) Line %d: No connect location recognized.

DESCRIPTION

The EDIF reader detected that there is no connect location for the port specified on or near the line number in the error message.

WHAT NEXT

Fix the EDIF input file.

EDFN-111 (warning) Line %d: Multiple connect location ignored.

DESCRIPTION

The EDIF reader detected multiple connection locations for the port on or near the specified line number in the error message.

WHAT NEXT

Fix the EDIF input file.

EDFN-112 (warning) Line %d: Ignoring explicit bus declaration because the variable 'bus_inference_style' is set; individual port members will be added instead. Port busses will be inferred after all design objects are read.

DESCRIPTION

The system is ignoring the explicit bus declaration because the variable **bus_inference_style** is set. If this variable is set, the system will treat port members as individuals and infer them at the end when all of the design objects are read.

WHAT NEXT

If this is not a desirable behavior, do not use this variable.

EDFN-113 (warning) Line %d: Duplicate base name '%s' for %s bus. Using '%s' for base name instead.

DESCRIPTION

You receive this message to warn you that the EDIF reader detected in your EDIF file multiple busses with the same base name (for example, AAA[0:7], &AAA[0:7], AAA{7:0}).

WHAT NEXT

For convenience, you can temporarily accept the name specified in this message. However, to avoid receiving this message each time your EDIF file is read, edit the EDIF file so that it contains a unique base name for the specified bus.

EDFN-114 (error) File %s,
Line %d and
File %s,
Line %d: %s '%s' and %s '%s' both are changed to '%s' in '%s'.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-115 (error) port '%s' and port '%s' both are changed to '%s' in cell '%s' according to your names file.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFN-116 (information) Line %d: On cell '%s', defining view '%s' to be the bus ripper.

DESCRIPTION

The 'RIPPER' cellType and the variable `edifin_lib_ripper_view_name` specify that the ripper cell attributes be included on the specified view of the specified cell.

WHAT NEXT

This is an informational message. No action is required on your part.

EDFN-117 (information) Line %d: On cell '%s', defining view '%s' to be the bus ripper.

DESCRIPTION

You receive this message to inform you that the ripper cell attributes are being included on the specified view of the specified cell.

WHAT NEXT

This is an informational message only. No action is required on your part.

EDFN-118 (warning) Line %d: Base name and range extraction are not supported for multidimensional %s array '%s'.

DESCRIPTION

The EDIF reader does not support multidimensional arrays.

WHAT NEXT

Fix the design so it does not use multidimensional arrays.

EDFN-119 (warning) Line %d: Ignoring the ripper cell attributes specified here for cell '%s'; the attributes have already been included on cell '%s'.

DESCRIPTION

You receive this message if your EDIF input file contains multiple definitions of ripper cell attributes for a specific cell. In this case, the first definition encountered is used, and all subsequent definitions are ignored. This message informs you that a subsequent definition is being ignored.

WHAT NEXT

Edit the EDIF input file and ensure that it contains only one definition of the ripper cell attribute for each cell.

EDFN-120 (warning) Line %d:

No symbol created for cell '%s'

because the view that has been defined to be the correct view of the bus ripper cell (by setting the variable edifin_lib_ripper_view_name) was not found.

DESCRIPTION

The variable edifin_lib_ripper_cell_name specifies that the ripper cell attributes be included on the view of that cell that has been defined by setting the variable edifin_lib_ripper_view_name to be the correct view of the bus ripper cell, but the specified view wasn't found.

WHAT NEXT

If that cell is the correct one to use as the bus ripper cell, then (1) determine which view of that cell is the correct one to use, (2) set the variable edifin_lib_ripper_view_name to define that view to be the correct one, and (3) execute the edif format read_lib command again.

If that cell isn't the correct one to use as the bus ripper cell, then (1) determine which cell is the correct one to use, (2) set the variable edifin_lib_ripper_cell_name to define that cell to be the correct one, and (3) execute the edif format read_lib command again.

EDFN-121 (warning) Line %d:

No symbol created for cell '%s'

because the view that has been defined to be the correct view of the bus ripper cell (by setting the variable edifin_lib_ripper_view_name) was not found.

DESCRIPTION

The 'RIPPER' cellType of that cell and the variable `edifin_lib_ripper_cell_name` specify that the ripper cell attributes be included on the view of that cell that has been defined by setting the variable `edifin_lib_ripper_view_name` to be the correct view of the bus ripper cell, but the specified view wasn't found.

WHAT NEXT

If that cell is the correct one to use as the bus ripper cell, then (1) determine which view of that cell is the correct one to use, (2) set the variable `edifin_lib_ripper_view_name` to define that view to be the correct one, and (3) execute the edif format read_lib command again.

If that cell isn't the correct one to use as the bus ripper cell, then (1) determine which cell is the correct one to use, (2) set the variable `edifin_lib_ripper_cell_name` to define that cell to be the correct one, and (3) execute the edif format read_lib command again.

EDFN-122 (information) Line %d: On cell '%s', defining view '%s' to be the bus ripper.

EDFN-125 (error) Line %d: A portRef member construct referencing a port that is not an array is not valid.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF file and encounters a reference to a member of a port array, but the port itself is not declared as an array.

WHAT NEXT

Regenerate the EDIF input file.

EXAMPLES

```
...
20  (cell (rename rip_1x1 "rip_1x1") (cellType RIPPER)
...
24  (interface (port (rename bundle "bundle"))
25    (port (rename wire "wire") )
26    (joined (portRef bundle) (portRef wire))
)
...
100 (net out0
101   (joined (portRef (member wire 0) (instanceRef Ripper_2)) (portRef out0))
```

...

EXAMPLE MESSAGE

Error: Line 326: A portRef member construct referencing a port that is not an array is not valid. (EDFN-125)

In the above example, port wire is defined as a single port (line 25), but it is being referenced through a member construct (line 101). Below is a correct example:

```
... 20 (cell (rename rip_1x1 "rip_1x1") (cellType RIPPER) ... 24 (interface (port (array (rename bundle "bundle") 2)) 25 (port (array (rename wire "wire") 2 )) 26 (joined (portRef bundle) (portRef wire)) ) ... 100 (net out0 101 (joined (portRef (member wire 0) (instanceRef Ripper_2)) (portRef out0)) ...
```

EDFN-126 (error) Line %d: The ripper cell instance is corrupt.

DESCRIPTION

The system is not able to build an object for the instance specified by the line number in the error message.

WHAT NEXT

Check your design to make sure that the syntax for the construct of the specified instance, or the constructs before the instance is correct.

EDFN-127 (warning) Line %d:

Connections to a ripper with more than two pins are not supported.

DESCRIPTION

To reduce the amount of memory the EDIF format **read** command takes, a new method of reading rippers is being used. In this method, connections to a ripper with more than two pins are not supported.

WHAT NEXT

If the EDIF file contains connections to a ripper with more than two pins, set the

variable `edifin_old_ripper_reading` to TRUE. Then execute again the EDIF format **read** command.

EDFN-128 (error) Line %d: A ripper with pins of different widths is not valid.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF file and encounters a ripper with pins of different widths. The Synopsys EDIF reader can only support a ripper with pins of the same size.

WHAT NEXT

You need to regenerate the EDIF file. You can either instruct the EDIF reader to not generate a ripper design, or you can change the size of the ripper pins so that they are the same.

EXAMPLES

```
...
62 (cell ripCell (cellType RIPPER)
63   (view ripView (viewType SCHEMATIC)
64     (interface
65       (port (array (rename BUNDLE "bundle") 512 ))
66       (port (array (rename WIRE "wire") 256))
67     (joined
68       (portRef BUNDLE)
69       (portRef WIRE)
...
...
```

EXAMPLE MESSAGE

Error: Line 66: A ripper with pins of different widths is not valid. (EDFN-128)

In the above example, the interface of design ripCell contains two port arrays, BUNDLE and WIRE, of two different sizes, 512 and 256. Below is an example of a design with same size ripper pins which would satisfy the Synopsys EDIF reader requirement:

```
...
62 (cell ripCell (cellType RIPPER)
63   (view ripView (viewType SCHEMATIC)
64     (interface
65       (port (array (rename BUNDLE "bundle") 512 ))
66       (port (array (rename WIRE "wire") 512))
67     (joined
...
...
```

```
68      (portRef BUNDLE)
69      (portRef WIRE)
...
...
```

EDFN-129 (error) Line %d: An array member index less than 0 is not valid.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a reference to an array member with a negative index. A reference call to a member of an array should have an index greater or equal to 0.

WHAT NEXT

Refer to the line number in the error message and locate the error. The recommended solution is to regenerate the EDIF file. However, if you know EDIF and the design well, you can go the error line and correct the problem by providing the correct member index.

EXAMPLES

```
...
50  (cell (rename rip_1x1 "rip_1x1") (cellType RIPPER)
51  (view (rename Schematic_representation "Schematic_representation")
52    (viewType SCHEMATIC)
53    (interface (port (array (rename bundle "bundle") 2))
54      (port (array (rename wire "wire") 2) )
55      (joined (portRef bundle) (portRef wire))
    )
  )
...
326  (joined (portRef (member wire -1) (instanceRef Ripper_2)) (portRef out0))
```

EXAMPLE MESSAGE

Error: Line 326: An array member index less than 0 is not valid. (EDFN-129)

In the above example, "wire" is an array of 2 (line 54), so the valid member indexes for "wire" are 0 and 1. Line 326 has reference to "wire" with the specified member index of -1. Below is a correct example:

```
... 50 (cell (rename rip_1x1 "rip_1x1") (cellType RIPPER) 51 (view (rename
Schematic_representation "Schematic_representation") 52 (viewType SCHEMATIC) 53
(interface (port (array (rename bundle "bundle") 2)) 54 (port (array (rename wire
"wire") 2) ) 55 (joined (portRef bundle) (portRef wire)) ) ) ... 326 (joined
(portRef (member wire 0) (instanceRef Ripper_2)) (portRef out0)
```

EDFN-130 (error) Line %d: The array member index is greater than the size of the referenced array.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters a reference to an array member with an index greater than the array size. You can reference a member of an array, but the index has to be between 0 and array size -1. For example, if the array size is 8, the index member should be from 0 to 7.

WHAT NEXT

Refer to the line number in the error message and locate the error. The recommended solution is to regenerate the EDIF file. However, if you know EDIF and the design well, you can go to the error line and correct the problem by providing the correct member index.

EXAMPLES

```
...
50 (cell (rename rip_1x1 "rip_1x1") (cellType RIPPER)
51 (view (rename Schematic_representation "Schematic_representation")
52 (viewType SCHEMATIC)
53 (interface (port (array (rename bundle "bundle") 2))
54 (port (array (rename wire "wire") 2) )
55 (joined (portRef bundle) (portRef wire))
)
)
...
326 (joined (portRef (member wire 2) (instanceRef Ripper_2)) (portRef out0))
```

EXAMPLE MESSAGE

Error: Line 326: The array member index is greater than the size of the referenced array. (EDFN-130)

In the above example, "wire" is an array of 2 (line 54), so the valid member indexes for "wire" are 0 and 1. Line 326 has reference to "wire" with the specified member index of 2. Below is a correct example:

```
... 50 (cell (rename rip_1x1 "rip_1x1") (cellType RIPPER) 51 (view (rename
Schematic_representation "Schematic_representation") 52 (viewType SCHEMATIC) 53
(interface (port (array (rename bundle "bundle") 2)) 54 (port (array (rename wire
"wire") 2) ) 55 (joined (portRef bundle) (portRef wire)) ) ) ... 326 (joined
(portRef (member wire 1) (instanceRef Ripper_2)) (portRef out0))
```

EDFN-131 (error) Line %d: A ripper with a multi-dimensional

port array is not supported.

DESCRIPTION

The EDIF reader issues this error when it encounters a ripper cell containing a multi-dimensional port array. The Synopsys EDIF reader only supports a ripper cell with two ports or two single-dimensional port arrays of the same width.

WHAT NEXT

Regenerate the EDIF file and specify to the EDIF writer not to write out a multi-dimensional port array for a ripper cell.

EXAMPLES

```
...
57  (cell ripCell (cellType RIPPER)
58    (view ripView (viewtype SCHEMATIC)
59      (interface
60        (port (array (rename BUNDLE "bundle") 2 4)
61          (port (array (rename WIRE "wire") 2 4)
...
...
```

EXAMPLE MESSAGE

Error: Line 60: A ripper with a multi-dimensional port array is not supported.
(EDFN-131)

In the above example, line 60 defines a two-dimensional array BUNDLE of size 2 by 4, and line 61 defines a two-dimensional array WIRE of size 2 by 4.

EDFN-132 (error) Line %d:

The dimension of the %sRef member construct does not match the dimension of the %s array being referenced.

DESCRIPTION

The EDIF reader issues this error message when it parses the EDIF input file and encounters a port member reference with the dimension which does not match the dimension of the referenced port array.

WHAT NEXT

Refer to the line number in the error message, and locate the problem. You can either regenerate the EDIF input file, or if you know EDIF and the design well, you can fix the dimension and re-import the EDIF input file.

EXAMPLES

```
...
90  (port (array (rename DIFF_6_0_ "DIFF[6:0]") 7) (direction OUTPUT))
...
188 (net n5
189  (joined (portRef (member DIFF_6_0_ 2 6)) (portRef P20 (instanceRef U3)))
...
...
```

EXAMPLE MESSAGE

Error: Line 189: The dimension of the portRef member construct does not match the dimension of the port array being referenced. (EDFN-132)

In the above example, port array DIFF[6:0] is a one dimensional array, but the port member reference a two dimensional array.

EDFN-133 (error) Line %d: The ripper cell is corrupt.

DESCRIPTION

The EDIF reader issues this error when it parses the EDIF input file and encounters an internal problem.

WHAT NEXT

To fix this problem, restart the command. If the problem persists, please contact the Synopsys help line.

EDFO

EDFO-1 (warning) Some designs have no schematic.

DESCRIPTION

The variable `edifout_netlist_only` is set to false, and you executed the edif format write command. But for some of the designs that you want to write, no schematics have been created.

WHAT NEXT

If you want to write the designs without including schematic descriptions, set the variable `edifout_netlist_only` to true. Then execute the edif format write command again.

If you want to write the designs including schematic descriptions, execute the `create_schematics` command. Then execute the edif format write command again. If you're going to execute the edif format write command with the `-hierarchy` option, then be sure to also execute the `create_schematics` command with the `-hierarchy` option.

EDFO-2 (error) The meter scales in libraries '%s' and '%s' aren't equal.

DESCRIPTION

The meter scale is an attribute of a symbol library. It's used to ensure that when each of the symbols in that library is used in schematics creation, the scale of that symbol is compatible with that of every other symbol used in schematics creation. The scales in all libraries used in schematics creation must therefore be equal.

WHAT NEXT

If you want to use symbols from both of those symbol libraries, change the meter scale setting in the source text file of one or both of those libraries so that the attributes in each of the libraries will be equal to each other. Then compile those libraries again with the `read_lib` command. Then execute the `create_schematics` command again. Then execute the edif format write command again.

If one of those symbol libraries is not one that you want to use symbols from, make sure that there's a symbol in the source text file for each of the cell components that's instantiated in the designs that you want to write. Then compile again with the `read_lib` command those libraries that you just added symbols to. Then execute

the `create_schematics` command again. Then execute the `edif` format write command again.

EDFO-3 (error) The meter scale in library '%s' and external scale in library '%s' aren't equal.

DESCRIPTION

The meter scale and external scale are attributes of a symbol library. They are exactly equivalent to and interchangeable with each other (if a library has both attributes, the external scale is ignored and the meter scale is used). They're used to ensure that when each of the symbols in that library is used in schematics creation, the scale of that symbol is compatible with that of every other symbol used in schematics creation. The scales in all libraries used in schematics creation must therefore be equal.

WHAT NEXT

If you want to use symbols from both of those symbol libraries, change the meter scale (or external scale) setting in the source text file of one or both of those libraries so that the attributes in each of the libraries will be equal to each other. Then compile those libraries again with the `read_lib` command. Then execute the `create_schematics` command again. Then execute the `edif` format write command again.

If one of those symbol libraries is not one that you want to use symbols from, make sure that there's a symbol in the source text file for each of the cell components that's instantiated in the designs that you want to write. Then compile again with the `read_lib` command those libraries that you just added symbols to. Then execute the `create_schematics` command again. Then execute the `edif` format write command again.

EDFO-4 (error) The external scales in libraries '%s' and '%s' aren't equal.

DESCRIPTION

The external scale is an attribute of a symbol library. It's used to ensure that when each of the symbols in that library is used in schematics creation, the scale of that symbol is compatible with that of every other symbol used in schematics creation. The scales in all libraries used in schematics creation must therefore be equal.

WHAT NEXT

If you want to use symbols from both of those symbol libraries, change the external scale setting in the source text file of one or both of those libraries so that the attributes in each of the libraries will be equal to each other. Then compile those libraries again with the `read_lib` command. Then execute the `create_schematics` command again. Then execute the `edif` format write command again.

If one of those symbol libraries is not one that you want to use symbols from, make sure that there's a symbol in the source text file for each of the cell components that's instantiated in the designs that you want to write. Then compile again with the `read_lib` command those libraries that you just added symbols to. Then execute the `create_schematics` command again. Then execute the `edif` format write command again.

EDFO-5 (error) The external scale in library '%s' and meter scale in library '%s' aren't equal.

DESCRIPTION

The external scale and meter scale are attributes of a symbol library. They are exactly equivalent to and interchangeable with each other (if a library has both attributes, the external scale is ignored and the meter scale is used). They're used to ensure that when each of the symbols in that library is used in schematics creation, the scale of that symbol is compatible with that of every other symbol used in schematics creation. The scales in all libraries used in schematics creation must therefore be equal.

WHAT NEXT

If you want to use symbols from both of those symbol libraries, change the external scale (or meter scale) setting in the source text file of one or both of those libraries so that the attributes in each of the libraries will be equal to each other. Then compile those libraries again with the `read_lib` command. Then execute the `create_schematics` command again. Then execute the `edif` format write command again.

If one of those symbol libraries is not one that you want to use symbols from, make sure that there's a symbol in the source text file for each of the cell components that's instantiated in the designs that you want to write. Then compile again with the `read_lib` command those libraries that you just added symbols to. Then execute the `create_schematics` command again. Then execute the `edif` format write command again.

EDFO-6 (warning) No meter scale found for symbol libraries--

using external scale.

DESCRIPTION

The meter scale and external scale are attributes of a symbol library. They are exactly equivalent to and interchangeable with each other. If a library has both attributes, the external scale is ignored and the meter scale is used.

WHAT NEXT

Specify a symbol library that contains a meter scale.

EDFO-7 (warning) No meter scale or external scale found for symbol libraries.

DESCRIPTION

The meter scale and external scale are attributes of a symbol library. They are equivalent to and interchangeable with each other. If a library has both attributes, the external scale is ignored and the meter scale is used. The scales are used to ensure that when each of the symbols in that library are used in a schematics creation, the scale of that symbol is compatible with that of every other symbol used in the schematics creation. The scales in all libraries used in a schematics creation must, therefore, be equal.

If no meter scale or external scale attribute is found for the symbol libraries, then an arbitrary scale of 1 is used in the schematics creation.

WHAT NEXT

Specify symbol libraries which contain scale information.

EDFO-8 (error) %s '%s' has no symbol.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can

provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the create_schematics command again. Then execute the edif format write command again.

EDFO-9 (error) A pin on cell '%s' has no port reference.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the create_schematics command again. Then execute the edif format write command again.

EDFO-10 (information) Net '%s' is renamed to '%s' in design '%s' because it's connected to the port by that name.

DESCRIPTION

The variable edifout_name_nets_same_as_ports is set to true, and you executed the edif format write command.

WHAT NEXT

If you don't want the name of each net that's connected to a port to be changed to the name of that port, set the variable edifout_name_nets_same_as_ports to false. Then execute the edif format write command again.

EDFO-11 (warning) Net '%s' is renamed to '%s' in design '%s'

because it's not connected to the port by that name.

DESCRIPTION

The variable `edifout_name_nets_same_as_ports` is set to true, and you executed the `edif` format `write` command. Because the name of each net that's connected to a port is changed to the name of that port, in order to avoid there being two different nets with the same name, the name of each net that's not connected to a port but that is the same as the name of that port must be changed.

WHAT NEXT

If you don't want the name of each net that's connected to a port to be changed to the name of that port, set the variable `edifout_name_nets_same_as_ports` to false. Then execute the `edif` format `write` command again.

EDFO-12 (error) There's %s in %s '%s' that has no name.

DESCRIPTION

This common error occurs when a pin in a cell instance has no name. It might happen when the original source of the design being written was in a format that can use order-based instantiation as well as name-based instantiation. Order-based instantiation occurs when pins are described by the *order* of the pins in a cell instance instead of by the *names* of the pins. The names of the pins therefore aren't known.

WHAT NEXT

Change the description of the design in the original source of that design. Make sure that you use only name-based instantiation in the original source. Then read again with the `read` command the original source of the design that you just changed. Then execute the `edif` format `write` command again.

Alternatively, resolve the reference for this cell reference. If the reference is resolved, the pin name, direction, and width will be known. The reference can be resolved by reading in the design for this reference. To avoid the memory usage of reading in the entire design, make a copy of the design that contains only the port interface descriptions. This "dummy" design can be read in place of the entire design.

EDFO-13 (error) The value of variable '%s' isn't valid.

DESCRIPTION

The edif file can't be written unless the value of this variable is valid.

WHAT NEXT

Set this variable to a valid value. Then execute the edif format write command again.

EDFO-14 (warning) The variable 'edifout_power_and_ground_representation' is not defined using 'cell'.

DESCRIPTION

If you do not indicate how to represent power and ground, power and ground are arbitrarily represented as cells.

WHAT NEXT

cell is the default option for **edifout_power_and_ground_representation** variable, but you can specify **port** or **net** to represent power and ground.

EDFO-15 (error) The symbols '%s' and '%s' are both used as %s symbols.

DESCRIPTION

These are attributes of a symbol library: logic_0_symbol, logic_1_symbol, in_port_symbol, out_port_symbol, inout_port_symbol, in_osc_symbol, out_osc_symbol, inout_osc_symbol. They specify for each of these special components which symbol to use in schematics creation. There must be only one such attribute for each one.

WHAT NEXT

For example, there might be two attributes for the power cell symbol in the source text file of one of the symbol libraries: logic_1_symbol : "PWR"; logic_1_symbol : "VDD"; Delete all but one of those power cell symbol attributes. Then compile that library again with the read_lib command. Then execute the create_schematics command

again. Then execute the edif format write command again.

EDFO-16 (error) The schematic '%s' was created %s the "-no_bus" option,
but the schematic '%s' was created %s the "-no_bus" option.

DESCRIPTION

When you execute the edif format write command with the -hierarchy option, all the schematics you want to write must have been created with or all must have been created without the "-no_bus" option.

WHAT NEXT

Either with or without the "-no_bus" option, execute the create_schematics command again with the -hierarchy option. Then execute the edif format write command again.

EDFO-17 (error) The width of bussed port '%s' in design '%s' can't be resolved.

DESCRIPTION

If the design being written was compiled with the current release of the Synopsys Design Compiler, then that design might be corrupt.

WHAT NEXT

If the design being written was compiled with the current release of the Synopsys Design Compiler, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the design being written wasn't compiled with the current release of the Synopsys Design Compiler, then execute the compile command again. Then execute the edif format write command again.

EDFO-18 (error) The library of cell '%s' is corrupted.

Not all view identifier properties of the cell are found.

DESCRIPTION

These attributes are the view identifier properties of the symbol for a cell: edif_cell_name, edif_view_name, and edif_name_property. If a symbol has any of these attributes, then it must have all three of them.

WHAT NEXT

Change the symbol definition for the cell in the source text file of the symbol library. Either delete the view identifier property attributes that are there, so that the symbol has none of those attributes, or add appropriate view identifier property attributes, so that the symbol has all three of those attributes. Then compile that symbol library again with the read_lib command. Then execute the create_schematics command again. Then execute the edif format write command again.

EDFO-19 (warning) The library of cell '%s' is corrupted. Not all view identifier properties of the cell are found.

DESCRIPTION

These attributes are the view identifier properties of the symbol for a cell: edif_cell_name, edif_view_name, and edif_name_property. If a symbol has any of these attributes, then it must have all three of them.

WHAT NEXT

Change the symbol definition for the cell in the source text file of the symbol library. Either delete the view identifier property attributes that are there, so that the symbol has none of those attributes, or add appropriate view identifier property attributes, so that the symbol has all three of those attributes. Then compile that symbol library again with the read_lib command. Then execute the create_schematics command again. Then execute the edif format write command again.

EDFO-20 (warning) Change '%s' of type %s to '%s' to match vhdl name.

DESCRIPTION

The variable edifout_match_vhdl_names is set to true, and you executed the edif format write command.

WHAT NEXT

If you don't want the names of objects changed to conform to VHDL naming rules, set the variable `edifout_match_vhdl_names` to false.

EDFO-21 (error) A bussed off-sheet connector of width %d and an off-sheet connector are both named '%s'.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the `create_schematics` command again. Then execute the `edif` format write command again.

EDFO-22 (error) Two bussed off-sheet connectors of width %d and of width %d are both named '%s'.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the `create_schematics` command again.

Then execute the edif format write command again.

EDFO-23 (error) One of the pins or ports in %s '%s' is corrupted.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the create_schematics command again. Then execute the edif format write command again.

EDFO-24 (error) Port reference '%s' on cell '%s' has no design reference.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the create_schematics command again. Then execute the edif format write command again.

EDFO-25 (error) There's no port for port reference '%s' on

design '%s'.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the `create_schematic` command again. Then execute the edif format `write` command again.

EDFO-26 (error) One of the nets in schematic '%s' is corrupted.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, the schematic may be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, notify your Synopsys applications engineer. To aid in fixing the problem, provide a test case if possible. Most useful are a test case that includes the original source and a log of the commands executed.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, execute the `create_schematics` command again. Then execute the edif format `write` command again.

EDFO-27 (error) The schematic '%s' is corrupted.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the `create_schematics` command again. Then execute the `edif` format `write` command again.

EDFO-28 (error) The schematic '%s' was created with the "-bit_mappers" option.

DESCRIPTION

When you execute the `edif` format `write` command, the schematics you want to write must not have been created with the `"-bit_mappers"` option.

WHAT NEXT

Without the `"-bit_mappers"` option, execute the `create_schematics` command again. Then execute the `edif` format `write` command again.

EDFO-29 (error) The schematic '%s' was created with the "-implicit" option.

DESCRIPTION

When you execute the `edif` format `write` command, the schematics you want to write must not have been created with the `"-implicit"` option.

WHAT NEXT

Without the `"-implicit"` option, execute the `create_schematics` command again. Then execute the `edif` format `write` command again.

EDFO-30 (error) The symbol for '%s' is corrupted.

DESCRIPTION

If the schematic being written was created with the current release of the Synopsys Schematics Generator, then that schematic might be corrupt.

WHAT NEXT

If the schematic being written was created with the current release of the Synopsys Schematics Generator, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the schematic being written wasn't created with the current release of the Synopsys Schematics Generator, then execute the `create_schematics` command again. Then execute the `edif` format `write` command again.

EDFO-31 (information) Schematic '%s' might have been modified due to netcon insertion.

DESCRIPTION

Obsolete

WHAT NEXT

Obsolete

EDFO-32 (error) The cell for '%s' is corrupted.

DESCRIPTION

If the design being written was created with the current release, then that design might be corrupt.

WHAT NEXT

If the design being written was created with the current release, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the design being written wasn't created with the current release, then create the design again. Then execute the edif format write command again.

EDFO-33 (error) The special symbols in the schematic '%s' are not the same as the special symbols in the schematic '%s'.

DESCRIPTION

When you execute the edif format **write** command with the *-hierarchy* option, all of the schematics you want to write must have been created with the same special symbols.

WHAT NEXT

Execute the **create_schematics** command again with the *-hierarchy* option. Then execute the edif format **write** command again.

EDFO-34 (error) Library '%s' has no symbols.

DESCRIPTION

A library created with the current release of the Synopsys Library Compiler has no symbols.

WHAT NEXT

Make sure the library source text file has symbol constructs in it, and execute the **read_lib** command again. Then execute the edif format **write_lib** command again.

EDFO-35 (error) The library '%s' is corrupted.

DESCRIPTION

If the library being written was created with the current release of the Synopsys Library Compiler, the library might be corrupt.

WHAT NEXT

If the library being written was created with the current release of the Synopsys

Library Compiler, notify your Synopsys applications engineer. It will help to correct the problem if you can provide a test case that includes the original source and a log of the commands executed.

If the library being written was not created with the current release of the Synopsys Library Compiler, execute the **read_lib** command again. Then execute the edif format **write** command or the edif format **write_lib** command again.

EDFO-36 (error) The schematic '%s' was created with the "-no_rip" option.

DESCRIPTION

When you execute the edif format **write** command, the schematics you want to write must not have been created with the **-no_rip** option.

WHAT NEXT

Without the **-no_rip** option, execute the **create_schematics** command again. Then execute the edif format **write** command again.

EDFO-37 (warning) The variable '%s' is obsolete.

DESCRIPTION

This variable no longer has any effect.

WHAT NEXT

Remove the setting of this variable from your script.

EDFO-38 (error) The values of variables '%s' and '%s' aren't compatible.

DESCRIPTION

The edif file can't be written unless the values of these variables are compatible.

WHAT NEXT

Set these variables to compatible values. Then execute the edif format **write** command again.

EDFO-39 (error) The values of variables '%s' and '%s' aren't compatible.

DESCRIPTION

The edif file can't be written unless the values of these variables are compatible.

WHAT NEXT

Set these variables to compatible values. Then execute the edif format **write** command again.

EDFO-40 (warning) Bussed port '%s' in design '%s' cannot be represented as a multidimension array.

DESCRIPTION

The structure of the bus is such that there can be no multidimension array interpretation.

WHAT NEXT

Do not to use multidimension buses in your design.

EDFO-41 (error) One of the bussed pins or ports in design '%s' can't be represented as a numerical array.

DESCRIPTION

The structure of the bus is one for which there can be no numerical array interpretation.

WHAT NEXT

`edifout_numerical_array_members` variable can only support buses which have indexes greater than 0, check your design to make sure all of the buses have indexes greater than 0.

EDFO-42 (error) The power or ground reference is corrupted.

DESCRIPTION

If the design being written was created with the current release of the Synopsys Design Compiler, the design might be corrupt.

WHAT NEXT

If the design being written was created with the current release of the Synopsys Design Compiler, notify your Synopsys applications engineer. It will help to correct the problem if you can provide a test case that includes the original source and a log of the commands executed.

If the design being written was not created with the current release of the Synopsys Design Compiler, execute the `read` command again. Then execute the edif format `write` command again.

EDFO-43 (error) Specified to write the power cell in the external library that actually contains the ground cell and to write the ground cell in the external library that actually contains the power cell. This is not supported.

DESCRIPTION

Writing both the power cell in the external library that actually contains the ground cell and the ground cell in the external library that actually contains the power cell is not supported.

WHAT NEXT

Set the variables `edifout_power_library_name` and `edifout_ground_library_name` correctly. Then execute the edif format `write` command again.

EDFO-44 (error) %s '%s' in %s '%s' is corrupted.

DESCRIPTION

If the design or schematic being written was created with the current release of the Synopsys Design Compiler or Schematics Generator respectively, then that design or schematic might be corrupt.

WHAT NEXT

If the design or schematic being written was created with the current release of the Synopsys Design Compiler or Schematics Generator respectively, please notify your Synopsys applications engineer. If you can provide a test case, that will aid in fixing the problem. A test case that includes the original source and a log of the commands executed is the most useful.

If the design or schematic being written wasn't created with the current release of the Synopsys Design Compiler or Schematics Generator respectively, then execute the **read** or **create_schematics** command respectively again. Then execute the edif format **write** command again.

EDFO-45 (information) The design '%s' uses the logic %s reference '%s' in the library '%s'.

DESCRIPTION

WHAT NEXT

EDFO-46 (warning) The design '%s' uses the built-in Synopsys logic %s reference.

DESCRIPTION

The system does not find user's specified power and ground reference, so it is using the Synopsys built in logic references.

WHAT NEXT

Specify the source for power and ground, or let the system use the Synopsys built in power and ground source.

EDFO-47 (warning) File %s, line %d: '%s' '%s' cannot change to existing '%s' '%s'.

DESCRIPTION

The system is detecting that there are two different objects with the same name.

WHAT NEXT

Ensure that your design does not contain multiple objects with the same name.

ELAB

ELAB-3 (warning) %s Extraneous argument for system function/task %s ignored.

DESCRIPTION

If you provide more arguments than the compiler requires when you make a system function or task call, the compiler ignores the extraneous arguments.

WHAT NEXT

This is a warning message only and requires no action on your part.

SEE ALSO

elaborate (2).

ELAB-5 (warning) %s Encountered extra 'dc_script_begin' pragma.

DESCRIPTION

The **read** command or **elaborate** command issues this warning code when an extra 'dc_script_begin' is encountered in the vhdl design.

For e.g. -- pragma dc_script_begin -- set_dont_touch find (net, N1) false -- pragma dc_script_end -- pragma dc_script_begin <<--- extra 'dc_script_begin' pragma.

WHAT NEXT

Locate the extra 'dc_script_begin' in the vhdl design at the specified line number. Then either provide corresponding 'dc_script_end' pragma or remove it, as intended.

SEE ALSO

elaborate (2), **read** (2).

ELAB-6 (warning) %s Encountered extra 'dc_script_end'

pragma.

DESCRIPTION

The **read** command or **elaborate** command issues this warning code when an extra 'dc_script_end' is encountered in the vhdl design.

For e.g. -- pragma dc_script_begin -- set_dont_touch find (net, N1) false -- pragma dc_script_end -- pragma dc_script_end <---- extra 'dc_script_end' pragma.

WHAT NEXT

Locate the extra 'dc_script_end' in the vhdl design at the specified line number. Then either provide corresponding 'dc_script_begin' pragma or remove it, as intended.

SEE ALSO

elaborate (2), **read** (2).

ELAB-7 (error) %s Disable Presto features in Verification Friendly DC Mode

DESCRIPTION

If you use multiple dimension array in Verication Friendly DC Mode, this error message will happen.

WHAT NEXT

Rewrite RTL source codes or remove special Presto directives.

SEE ALSO

elaborate (2), **read** (2).

ELAB-8 (warning) %s Disable Presto features in verification

friendly mode

DESCRIPTION

If you use enum directive and label directive in Verification Friendly DC Mode, this warning message will happen.

WHAT NEXT

Rewrite RTL source codes or remove special Presto directives.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-9 (warning) %s Manual resource sharing pragmas will be ignored.

DESCRIPTION

This warning message occurs when the `hdlin_disable_manual_resource_sharing` variable is set to true. All of the manual resource sharing pragmas are ignored. The default value of the variable is false.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, you can use manual resource sharing by setting the `hdlin_disable_manual_resource_sharing` variable to false.

SEE ALSO

`hdlin_disable_manual_resource_sharing`(3)

ELAB-28 (warning) %s SCALARED keywords are ignored.

DESCRIPTION

You receive this warning to let you know that for synthesis purposes, the compiler ignores the scalared keyword.

WHAT NEXT

This is a warning only and requires no action on your part.

SEE ALSO

`elaborate` (2).

ELAB-33 (warning) %s SV Assertions are ignored for synthesis since %s is not set to true.

DESCRIPTION

This warning message issues once for each module elaboration where the Presto HDL Compiler encounters a labelled assertion or assertion severity system task call that must be ignored due to the tcl environment variable setting cited in the message. Because SystemVerilog Assertions (SVA) allow synthesis' optimizers to recognize more "don't care" conditions than otherwise specified by the RTL, they are not applied by default but must be enabled - both as a product feature and also by certifying that individual assertions have proven to be unreachable prior to synthesizing this RTL.

WHAT NEXT

This is only a warning message. No action is required.

However, if you want the construct to be either exploited or ignored with no warnings, you must set `hdlin_enable_assertions` to true and also establish its assertion label (with lexical scope) as an element of the `confirmed_SVA()` environment array giving this a true or false value.

SEE ALSO

`analyze`(2)
`elaborate`(2)
`hdlin_enable_assertions`(3)

ELAB-65 (warning) %s Always block that has both a timing control statement as well as embedded event (@) expression is not supported by synthesis.

DESCRIPTION

You receive this warning when an always block has both a timing control statement

and an embedded event (@) expression, a situation that Synthesis does not support.

WHAT NEXT

Change the always block description by removing either the timing control statement or the embedded event (@) expression. Then invoke the compiler again.

SEE ALSO

elaborate (2).

ELAB-66 (warning) %s The event depends on both edge and nonedge expressions, which synthesis does not support.

DESCRIPTION

You receive this warning message because you have assigned to an event both edge and nonedge expressions, which Synthesis does not support.

WHAT NEXT

Modify your description so that the event depends on either an edge expression or a nonedge expression, but not both.

SEE ALSO

elaborate (2).

ELAB-67 (warning) %s Only simple variables are allowed in the sensitivity list for synthesis.

DESCRIPTION

You receive this warning because you have not included simple variables in the sensitivity list. Synthesis supports only simple variables in the sensitivity list.

WHAT NEXT

Use simple variables in the sensitivity list. Then invoke the compiler again.

SEE ALSO

`elaborate` (2) .

ELAB-68 (warning) %s The event depends on two edges of the same variable, which synthesis does not support.

DESCRIPTION

You receive this warning because you have assigned to an event two edges of the same variable, which synthesis does not support.

WHAT NEXT

Modify your description so that the event depends on only one edge of the variable. Then invoke the compiler again.

SEE ALSO

`elaborate` (2) .

ELAB-69 (warning) %s In the event expression with 'posedge' or 'negedge' qualifier, synthesis allows only simple variables.

DESCRIPTION

You receive this warning to let you know that synthesis allows only simple variables in an event expression with a 'posedge' or 'negedge' qualifier. If the event expression in your description contains no simple variables, you receive this warning.

WHAT NEXT

Modify your description to include only simple variables in the event expression.

SEE ALSO

`elaborate` (2) .

ELAB-90 (error) %s Always block that has both a timing control

statement as well as embedded event (@) expression is not supported by synthesis.

DESCRIPTION

You receive this error message when an always block has both a timing control statement and embedded event (@) expression, which synthesis does not support.

WHAT NEXT

Change the always block description by removing either the timing control statement or the embedded event (@) expression. Then invoke the compiler again.

SEE ALSO

elaborate (2).

ELAB-91 (error) %s The event depends on both edge and nonedge expressions, which synthesis does not support.

DESCRIPTION

You receive this error message because you have assigned to an event both edge and nonedge expressions, which Synthesis does not support.

WHAT NEXT

Modify your description so that the event depends on either an edge expression or a nonedge expression, but not both.

SEE ALSO

elaborate (2).

ELAB-92 (warning) %s Only simple variables are allowed in the sensitivity list for synthesis.

DESCRIPTION

You receive this warning message because you have not included simple variables in

the sensitivity list. Synthesis supports only simple variables in the sensitivity list.

WHAT NEXT

Use simple variables in the sensitivity list. Then invoke the compiler again.

SEE ALSO

elaborate (2).

ELAB-93 (error) %s Events that depend on two edges of the same variable are not supported by synthesis.

DESCRIPTION

You receive this error message because you have put in the event expression both 'posedge' and 'negedge' of the same variable. Synthesis supports only one edge of a variable in the event expression.

WHAT NEXT

Review your design description and decide which edge you want to use. Then invoke the **elaborate** command again.

SEE ALSO

elaborate (2).

ELAB-94 (error) %s In the event expression with 'posedge' or 'negedge' qualifier, synthesis allows only simple variables.

DESCRIPTION

You receive this error message because you did not specify simple variables only under a 'posedge' or 'negedge' qualifier in the event expression. Synthesis supports only simple variables under those qualifiers.

WHAT NEXT

Review your design description and make the appropriate changes, using only simple variables under 'posedge' or 'negedge'. Then invoke the compiler again.

SEE ALSO

`elaborate (2) .`

ELAB-95 (error) %s Unsupported expressions appear in the sensitivity list.

DESCRIPTION

You receive this error message because unsupported expressions appear in the sensitivity list with posedge or negedge. Only simple variables, or variables indexed by a constant or a constant expression as offset, are allowed in the sensitivity list with posedge or negedge, by synthesis policy. For example:

```
parameter p=5;
  always @(posedge a[p+2])
```

WHAT NEXT

Change the expression following posedge or negedge so it conforms to the above synthesis policy.

SEE ALSO

`elaborate (2) .`

ELAB-100 (warning) %s Variable '%s' is a legacy of HDL Compiler. For Presto HDL compiler, please use '%s' instead.

DESCRIPTION

This is an old HDLC variable.

WHAT NEXT

ELAB-101 (error) %s %s in constant function is illegal.

DESCRIPTION

Illegal action inside constant function.

WHAT NEXT

ELAB-102 (warning) %s %s in constant function will be ignored.

DESCRIPTION

The action inside constant function will be ignored.

WHAT NEXT

ELAB-103 (error) %s Try to get value of parameter before the declaration of the parameter.

DESCRIPTION

Try to get value of parameter before the declaration of the parameter!.

WHAT NEXT

ELAB-104 (warning) %s Symbol '%s' is not included in modport.

DESCRIPTION

This symbol is not included in modport.

WHAT NEXT

ELAB-105 (error) %s The name '%s' is not a modport of the interface instance actually provided on port '%s'.

DESCRIPTION

This issues during the elaboration of an module or interface one of whose formal ports requires a modport with the specified name to be supplied as the actual port of the instantiation. The actual interface provided on the indicated port did not satisfy that expectation. Either an interface instance was provided with no such modport defined, or a modport of a different name was passed by mistake.

WHAT NEXT

Check the spelling of the modport name vs the modports declared by the interface type of the instance being provided on this port.

ELAB-106 (warning) %s A symbol named '%s' is already defined differently in the receiving scope.

DESCRIPTION

This warning message issues in SystemVerilog contexts when a problem arises merging two copies of a well-known scope. It indicates that two or more reuses of a common definition are not actually in perfect agreement about its authorship or meaning.

SystemVerilog modules and interfaces share access to global "compilation unit" scopes such as \$unit (formerly known as \$root) and to SV package scopes. When they are separately analyzed, each module's or interface's .pvl file, and each package's .pvk file holds a replica of selected entities within these scopes. Package imports, interface instantiations, and type parameterizations expect to share these common definitions. So as the separate parts are recombined, the SystemVerilog compiler applies a "trust-but-verify" protocol before accepting the equivalence of a foreign definition to its local homograph. If the declaration, scope, and provenance (i.e., source code location) of the two symbols match up perfectly, they can become identified with each other. When this protocol fails, compilation proceeds by accepting both homographs.

The message is only a warning, because both definitions survive after the merger and continue to support all their existing referents. References to the foreign definition that arrive alongside it continue to refer to the foreign definition. References to the name in the receiving scope are bound to its lexically local definition. But future mergers of the receiving scope with any others can cause multiple repeats of the warning. Also, the existence of two meanings for one name may make some compiler output ambiguous. The presence of type homographs can result in strict datatype mismatches and unexpected results from type comparison operations.

WHAT NEXT

Locate the relevant declaration(s) of this name. If the name is not one you declared (e.g. it looks like it might be a compiler temporary), it usually belongs to a struct or enum type declaration which you might know by one or more typedef'ed names. The internal name for a struct or enum type becomes visible in instantiation reports when the type is passed as a type parameter; experiments using that feature can help to locate these.

The location info in this report may point either to the semantic action which merges scopes, or to one of the homograph declarations. Merge actions can occur deeply nested in the actual receiving scope, so be sure to consider the name's definition in all parent scopes of the reported line number, too. If the declaration sites are not all within the source file currently being analyzed or read, consider

how they come to be included in this compilation. There must be just one lexical occurrence of the declaration of any strong data type. Function, task and named block declarations must be reproduced verbatim, and ideally should be acquired by file inclusion or package reference.

The problem may be related to 'include' file revisions, to 'include'ing one file into several scopes, or to an attempt to pass a type parameter or refer to a package between incompatible compilations of the same application. Occasionally this warning also arises due to imperfections in DC SystemVerilog's ability to match up copies of enum types, or certain types of generated names. If you suspect this to be the case, contact Synopsys support.

Check that files 'included' by both compilation units are the same version of the same file, and that they use the same basename for the file, even if the directory paths differ. Some matching criteria are sensitive to line location and token sequencing. Note that macro expansion outcomes can differ due to the 'define' namespace of separate analyze commands, or the prevailing 'defines' at different points of inclusion. One file, analyzed with different releases of the dc_shell tool, may be incompatible with itself; although analyses done on distinct hosts or even operating systems with the same release level of dc_shell should be interchangeable. ELAB-106 is extra sensitive to many subtle kinds of miscoordination between separately compiled components. If you are integrating subprojects for their first time, you will need to establish uniform ways of preparing any infrastructure they share.

ELAB-107 (error) %s Wrong slice size .

DESCRIPTION

Wrong slice size.

WHAT NEXT

ELAB-108 (error) %s Attempt to operate %s on null string.

DESCRIPTION

Attempt to operate on null string.

WHAT NEXT

ELAB-109 (error) %s Type query specifies nonexistent dimension.

DESCRIPTION

Type query specifies nonexistent dimension.

WHAT NEXT

ELAB-110 (error) %s Invalid hierarchical modport port.

DESCRIPTION

Invalid hierarchical modport port.

WHAT NEXT

ELAB-111 (error) %s Unsupported operation on double: %s.

DESCRIPTION

Unsupported operation on double.

WHAT NEXT

ELAB-112 (error) %s Multiple sequential assignment.

DESCRIPTION

Multiple sequential assignment.

WHAT NEXT

ELAB-113 (error) %s Non-standard synchronous coding style not supported.

DESCRIPTION

Non-standard synchronous coding style not supported.

WHAT NEXT

ELAB-114 (warning) %s Variable %s has an invalid value: %s.

DESCRIPTION

WHAT NEXT

ELAB-115 (error) %s RTL Netlist found.

DESCRIPTION

RTL Netlist found.

WHAT NEXT

ELAB-116 (warning) %s Variable %s is not supported in Incremental Mode.

DESCRIPTION

WHAT NEXT

ELAB-117 (error) %s Array of GTECH_* instances is not

supported yet.

DESCRIPTION

Array of GTECH_* instances is not supported yet.

WHAT NEXT

ELAB-118 (error) %s Unsupported resource : %s .

DESCRIPTION

WHAT NEXT

ELAB-119 (error) %s Array length should be positive integer.

DESCRIPTION

This message issues because you have provided a zero or negative value when specifying an array length.

EXAMPLE

When you try to convert an integer to an array type in VHDL, you might write

```
...
CONV_UNSIGNED(A, 0)
...
```

which requests an empty vector of bits - the zero here is not correct. Or in SystemVerilog you might use a C-style declaration to declare

```
byte lcd_text[N];
...
```

which can provoke this error if N = -42.

WHAT NEXT

Correct the values of the array length in your design.

ELAB-120 (warning) %s %s does not exist, resource declaration will be ignored.

DESCRIPTION

This warning message will happen when the operator does not have the operator label in resource declaration, or the operator is optimized away. Then the resource declaration will be ignored.

WHAT NEXT

If the user wants to use resource declaration, please add the operator label for the operator.

ELAB-130 (warning) %s The initial value for signal '%s' is not supported for synthesis. Presto ignores it.

DESCRIPTION

You receive this warning message if the signal is assigned an initial value when it is declared. Presto VHDL ignores initial values for signals. If the only assignment to a signal is from the initial value declaration, the signal will be treated as an undriven net for synthesis.

WHAT NEXT

You may ignore this warning, if the declaration initialization is not the only assignment to this signal. However, if the declaration initialization is the only assignment to this signal, then either a second assignment to the signal should be added, or a constant should be used instead.

ELAB-160 (error) %s Redeclaration of port '%s' is not allowed.

DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected that the same port is declared twice inside the same function, task, or module. Following is an example that illustrates this type of error:

```
function f;
  input a;
  input a;      // redeclaration of already declared port
```

```
...
endfunction;
```

WHAT NEXT

Remove or rename as appropriate one of these ports.

SEE ALSO

`analyze` (2), `read` (2).

ELAB-182 (error) %s Task call %s should not have parentheses unless it has a parameter.

DESCRIPTION

You receive this error message because the task declaration you wrote has an empty parameter list.

The following example shows a task declaration that would generate this error:

```
task foo();
...
endtask
```

The correct task declaration is

```
task foo;
...
endtask
```

WHAT NEXT

Rewrite the task declaration as shown in the example, removing the parentheses.

SEE ALSO

`analyze` (2), `read` (2).

ELAB-190 (warning) %s Constructs from STD.TEXTIO are not

supported for synthesis, they will be ignored. %s

DESCRIPTION

You receive this warning from the **read** command or the **elaborate** command, either of which issues this message when constructs from STD.TEXTIO package are in use. The details of the error appear in the message.

WHAT NEXT

To avoid receiving this warning message in the future, remove the constructs from STD.TEXTIO package. This warning message can be safely ignored.

SEE ALSO

elaborate (2), **read** (2). **hdlin_ignore_textio_constructs** (3).

ELAB-191 (error) %s Constructs from STD.TEXTIO package are not supported. %s

DESCRIPTION

You receive this error from the **read** command or the **elaborate** command, either of which issues this message when constructs from STD.TEXTIO package are in use. The details of the error appear in the message.

WHAT NEXT

To avoid receiving this error message in the future, remove the constructs from STD.TEXTIO package.

SEE ALSO

elaborate (2), **read** (2). **hdlin_ignore_textio_constructs** (3).

ELAB-192 (warning) %s There are nonblocking assignments inside TASK which set out/inout port '%s', this may introduce

simulation mismatch.

DESCRIPTION

You receive this warning when TASK has nonblocking assignments which set the out/inout ports, this may introduce simulation mismatch. For example:

```
module ShiftR (Out, In);
output Out;
input In;
reg Out;
always@(In)
    tShift(Out, In );
task tShift(output Q, input D);
    Q <= D ;
endtask
endmodule
```

WHAT NEXT

To avoid receiving this warning message in the future, do not set output/inout port of TASK using nonblocking assignment, you may change the out/inout port as global variable, the above example can be rewrite as:

```
module ShiftR (Out, In);
output Out;
input In;
reg Out;
always@(In)
    tShift(In);
task tShift(input D);
    Q <= D ;
endtask
endmodule
```

SEE ALSO

elaborate (2), **read** (2).

ELAB-201 (warning) %s Unconnected output '%s' in function

call tied to ground.

DESCRIPTION

Presto has found that the named output is not driven by any logic for this instance of function call. Sometimes this represents an issue in your design and sometimes it doesn't. You should review your source code to ensure that this will not translate into incorrect outputs.

Presto has grounded the logic that may depend on these function outputs.

An example of this situation happens in the following code:

```
procedure elab_201_example(in1: in std_logic;
                           out1: out std_logic;
                           undriven_out : out std_logic_vector)
begin
    out1 := '0';
end procedure elab_201_example;
```

WHAT NEXT

ELAB-207 (error) %s Malformed specify block in Verilog source code.

DESCRIPTION

You receive this error message because your Verilog source code contains an invalid use of a specify block.

The following example, containing two specify blocks in the same module (an invalid instance), illustrates this type of error.

```
module m;
  ...
  specify
  ...
  endspecify
  ...
  specify
  ...
  endspecify
  ...
endmodule;
```

WHAT NEXT

Modify your Verilog source code to remove the invalid usage.

SEE ALSO

`analyze` (2), `read` (2).

ELAB-210 (Error) %s integer overflow occurs.

DESCRIPTION

You receive this error message because there is an integer overflow in an arithmetic operation.

For example, the following code causes the error message because the operation 2^{**32} overflows in the range of integers.

```
module M (a,d);
  input [31:0] a;
  output [31:0] d;
  reg [31:0] d;

  always begin
    d = 2**32 - a;
    $display ("%d = %d
", d);
  end

endmodule
```

Another possible integer overflow case is introduced by verilog shifter. By verilog language standard, the right operand of a shifter is always treated as an unsigned number. The constant '-1' ($32'b11111111111111111111111111111111$) in the following example is interpreted as unsigned number, which causes the integer overflow.

```
module m (input [1:0] in1, output [1:0] out1);
  assign out1 = (in1 << -1);
endmodule
```

WHAT NEXT

Check the operand of the operator, on the line indicated by the error message, to ensure that the result is within integer range, or use a Verilog number vector to represent a large value.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-229 (error) %s 0-repeat concat not supported in generate expressions.

DESCRIPTION

This error message occurs because an expression in generate block contains a 0-repeat concat operation that Presto HDL Compiler does not support.

WHAT NEXT

Rewrite your source code to remove the occurrence of 0-repeat concats and try again.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-230 (error) %s Multiple blocks have been named '%s' in a scope.

DESCRIPTION

You get this error when two (or more) blocks with the same name are declared in the same local scope.

WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

ELAB-231 (error) %s %s declaration redeclares symbol '%s'.

DESCRIPTION

You see this message because you have assigned a function or task declaration to a symbol that has already been defined.

In the following example, which demonstrates such a situation, the symbol *f* is

declared twice: first as a register and then as a function:

```
reg f;           // initial declaration of 'f'  
function f;     // illegal redeclaration of 'f'  
...  
endfunction
```

The example elicits the VER-106 message.

WHAT NEXT

Rename either the function declaration or the other declaration and all corresponding uses of the symbol.

SEE ALSO

analyze (2), **read** (2).

ELAB-255 (error) %s Internal error in %s at line %d.

DESCRIPTION

You receive this error message because an internal compiler error has occurred, related to the indicated position in the source code.

The nature of this error prevents availability of more specific information about it.

WHAT NEXT

Please file a star against Presto with your testcase if it's possible.

SEE ALSO

elaborate (2), **read** (2).

ELAB-256 (error) %s %s call violation: %s.

DESCRIPTION

You receive this error because the RTL power constructs were used incorrectly. The RTL power constructs include power, isolate and retain calls. The reason can be incorrect number of parameters, unsupported parameter types, width mismatch or the wrong place to call the functions.

WHAT NEXT

For details on how to use RTL power constructs, please refer to the Power Compiler User Guide, chapter "Implementing Multivoltage Designs Using RTL Isolation and Power Constructs", and section "Multivoltage Elements: \$isolate and \$power".

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-275 (error) %s You must specify a named block with `infer_mux` when used outside a case statement.

DESCRIPTION

You receive this error message because you have used the Synopsys `infer_mux` pragma outside of a `case` statement without specifying the label of a named block on which MUX inference is to be applied.

WHAT NEXT

Using `infer_mux`, specify the label of the named block on which you want to apply MUX inference. Then invoke the compiler again.

SEE ALSO

`elaborate` (2).

ELAB-276 (warning) %s All symbols and listed symbols are designated as %s set/reset in block '%s'; using the all designation.

DESCRIPTION

You receive this warning because you have designated incompatible conditions, which the compiler has to resolve:

- You have explicitly marked a symbol as a set/reset signal in a list of symbols annotated with the Synopsys set/reset pragma.
- You have implicitly marked the symbol as a set/reset signal using the Synopsys

pragma that applies set/reset inferencing to all symbols.

Under these circumstances, the compiler uses set/reset inferencing on all symbols (not just the listed symbols), and this warning informs you of that fact.

WHAT NEXT

This warning is for your information and requires no action on your part.

elaborate (2).

ELAB-277 (warning) %s More than one multibit pragma specified for symbol '%s'; using '%s'.

DESCRIPTION

You receive this warning message from the **elaborate** or **read** command if there are two multibit pragmas on one variable. The message informs you about which pragma is being used.

WHAT NEXT

Remove the pragma you do not want to use, and reexecute the command.

SEE ALSO

elaborate (2), **read** (2).

ELAB-278 (warning) %s The pragma '%s' for object '%s' will be ignored because the object could not be found.

DESCRIPTION

You receive this warning because you tried to place a pragma on an object that does not exist.

WHAT NEXT

Inspect your design and make sure it is correct and that there are no errors in the spelling of objects and other components.

ELAB-280 (warning) %s Signal on port %d renamed from '%s' to '%s' in '%s'.

DESCRIPTION

You receive this warning when the name of a signal on a port, such as on the second port in the following example,

```
module test(x, \x[0] );
    input [0:0] x;
    output \x[0];
    assign \x[0] = x[0];
endmodule
```

is different in the output netlist than it would usually be, because of a name conflict, such as a conflict with the name of a component of a bus.

In this example, the output signal on the second port will be renamed from "x[0]" to "x[0]1".

ELAB-281 (error) %s Default branch isn't the last branch in the case statement.

DESCRIPTION

You receive this error message because you have specified a default branch that is not the last branch in the *case* statement, which is must be.

WHAT NEXT

Review your design and make sure the default branch you specify is the last branch in the *case* statement.

ELAB-282 (warning) %s Parameter range specification is only meaningful to synthesis, not simulation, which might result in

different behavior.

DESCRIPTION

Providing a range (size) for a parameter is only used during synthesis. You might see different behavior between synthesis and simulation if you have explicitly sized parameters.

WHAT NEXT

Review your design description and make appropriate changes.

SEE ALSO

`elaborate` (2).

ELAB-283 (warning) %s Function '%s' is mapped to module '%s' but body is not empty and will be ignored.

DESCRIPTION

You receive this warning because you specified a function whose body contains code. When you use the `map_to_module` pragma, because calls to that function are mapped to the specified module, the body of the function is not used. This warning lets you know that your design has such a function and its body contains code and will be ignored.

WHAT NEXT

This warning is informational only and requires no action on your part.

SEE ALSO

`elaborate` (2).

ELAB-284 (error) %s Return port name '%s' conflicts with names of function input parameters.

DESCRIPTION

You receive this error message because a function description in your design

contains an output port that has the same name as one of the input ports, an invalid condition. This occurred in connection with your use of the *map_to_module* or *map_to_operator* pragmas. Following is an example of a description that would elicit this error message. The **return_port_name** is specified as **o** and so is one of the input ports.

```
function f;
    // synopsys map_to_module ADDER
    // synopsys return_port_name "o"
input o;
input p;
endfunction
```

WHAT NEXT

Change the name of the port whose name duplicates the name of another port. Then invoke the command again.

ELAB-285 (error) %s Conversion function on formal port is not supported.

DESCRIPTION

You receive this error message because conversion function is called with formal port as argument while port mapping, which is not supported.

```
begin
    U1 : TEST_E
    port map ( Cone(A) => Ctwo(TA), Z => TZ );
```

WHAT NEXT

Remove the conversion functions on port formals and try again

ELAB-286 (error) %s Type conversion on formal port is not supported.

DESCRIPTION

You receive this error message because port formals have Type conversion on them, while port mapping which is not supported by Presto.

WHAT NEXT

Remove the type conversion on formal port and try again.

ELAB-287 (error) %s Incorrect specification of port formals.

DESCRIPTION

You receive this error message because a syntax error is detected on port formals during port mapping.

WHAT NEXT

Please check the correct syntax of specifying port formals during port mapping and try again.

ELAB-288 (error) %s synthesis_on and synthesis_off directives are not used in pair within current design unit.

DESCRIPTION

You receive this error message because either synthesis_on or synthesis_off is missed within current design unit.

WHAT NEXT

Please follow the error message to complete the synthesis_off/on pair and try again.

ELAB-289 (error) %s A synthesis_off or translate_off object has been used in an expression.

DESCRIPTION

You receive this error message because a synthesis_off or translate_off object has been used in an expression.

WHAT NEXT

Please follow the error message to check if the synthesis_off/on translate_on/off pragma has been put at a wrong place.

ELAB-290 (error) %s The synthesis_on/synthesis_off or translate_on/translate_off attribute is inconsistent on arg #%d.

DESCRIPTION

You receive this warning message because the synthesis_on/synthesis_off or translate_on/translate_off is inconsistent between the formal and actual argument.

WHAT NEXT

Please follow the warning message to check if the synthesis_off/on translate_on/off pragma is put at a wrong place or is missing.

ELAB-292 (warning) %s '%s' is being read, but does not appear in the sensitivity list of the block.

DESCRIPTION

You receive this warning message if not all the signals that are read appear in the sensitivity list of the block. This may result in simulation-synthesis mismatches.

Consider the following example:

For Verilog:

```
always @(in1)
    myout = in1 | in2 ;
```

For VHDL:

```
entity e is
    port(in1, in2: in bit; myout: out bit);
end;

architecture a of e is
begin
    process(in1) begin
        myout <= in1 or in2;
    end process;
end;
```

This example will result in an OR gate whose inputs are *in1* and *in2*, and whose output is *myout*. The output of the OR gate will potentially change whenever *in1* or *in2* changes. However, in simulations of the original description, *myout* will change only when *in1* changes, because *in1* is the only signal to appear in the sensitivity list of the block.

WHAT NEXT

Add the signal specified in the warning to the sensitivity list of the block.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-293 (warning) %s Variable %s is read before being assigned; the synthesized result may not match simulations.

DESCRIPTION

You receive this warning message because a variable that is local to a function or task was read before being assigned. When the `hdlin_infer_function_local_latches` variable is set to `false`, the Presto HDL Compiler does not preserve variable values across separate calls to a task or function, unlike a simulator. Any bits of the variable that are not assigned before being used are given the value 0. No latches are inferred for variables local to a subprogram.

When the `hdlin_infer_function_local_latches` variable is set to `true`, the compiler matches the simulator's behavior. This may result in additional latches in your design.

WHAT NEXT

If you intended to use a value set during a previous call, set `hdlin_infer_function_local_latches` to `true` in order to preserve the value across calls.

If you did not intend to use a value across calls, check your design to verify that you assigned all local variables before using them.

SEE ALSO

`elaborate`(2)
`read`(2)

ELAB-294 (warning) %s Floating pin '%s' connected to ground.

DESCRIPTION

You receive this warning message when a previously unconnected pin has been connected to ground. This message reminds you to check whether the behavior resulting from connecting the pin to ground conforms to your expectations.

WHAT NEXT

Verify that connecting the specified pin to ground results in the desired behavior.

SEE ALSO

elaborate (2), **read** (2).

ELAB-295 (error) %s Number of actual arguments in task or function call does not match the number of formals.

DESCRIPTION

You receive this error message because the number of actual arguments in a function or task call does not match the number of formal arguments expected by the corresponding function or task.

WHAT NEXT

Identify the offending parameters and add or remove them accordingly. See the function or task definition to determine which parameters are required.

SEE ALSO

elaborate (2), **read** (2).

ELAB-296 (error) %s Index bounds '%s' for vector '%s' are wrong.

DESCRIPTION

You receive this error message because the bounds of a vector declaration are not an integer type or sized parameter value is overflow. The following example shows the compiler attempting to use a real number as a vector bound.

```
...
reg [3.0:0] x;           // error: "3.0" is not a valid array bound
...
```

The following example shows the compiler attempting to override sized parameter, the new value is overflow for the given size.

```
module test (a, b, c);
parameter WIDTH = 8;
```

```

input [WIDTH-1:0] a, b;
output [WIDTH-1:0] c;
bottom #(W(WIDTH)) U1 (a, b, c); // W has 3 bits, but 8 need 4 bits.
endmodule

module bottom (a, b, c);
parameter [2:0] W = 4;
input [W-1:0] a, b;
output [W-1:0] c;
assign c = a + b;
endmodule

```

WHAT NEXT

Modify each part select so that it uses only integer bounds. In the example, you would replace "3.0" with "3". Modify sized parameter definition or new parameter value.

SEE ALSO

elaborate (2), **read** (2).

ELAB-297 (error) %s '%s' is a task and not a function.

DESCRIPTION

You receive this error message because a function call is attempting to enable a task. A function call can only enable functions. The symbol a function call refers to must be defined by a function declaration.

A function returns a value; thus, a function call must be used as an expression.

WHAT NEXT

Check that you did not attempt to enable a task. If you did not, either change the function call to a task, or rewrite the task to a function.

SEE ALSO

elaborate (2), **read**(2).

ELAB-298 (error) %s Array index out of bounds %s.

DESCRIPTION

You receive this error message because the index used to access the array is not within the range of valid indices defined by the array declaration.

In the following example, the valid array indices must be in the range 0:1 because of the way the array is declared. Attempting to access location 2 outside the valid range, as in the following example, results in this error.

```
reg [1:0] a;  
...  
a[2] = 1'b1;           // error: index out of bounds
```

WHAT NEXT

Modify the array index so that it is within the valid index range given by the array declaration.

SEE ALSO

elaborate (2), **read** (2).

ELAB-299 (error) %s Array index out of bounds %s.

DESCRIPTION

You receive this error message because the index used to access the array is not within the range of valid indices defined by the array declaration. In the following example, the array index must be within the range 0:1 because of the way the array is declared. Attempting to access location 2, which is outside the valid range, results in this error message.

```
reg [1:0] a;  
...  
x = a[2];           // error: index out of bounds
```

WHAT NEXT

Modify the array index so that it is within the valid index range given by the array declaration.

SEE ALSO

elaborate (2), **read** (2).

ELAB-300 (error) %s Cannot test variable '%s' because it was not in the event expression or with wrong polarity.

DESCRIPTION

You receive this error message when the outermost if statement in the always block tests some other variable that does not appear in a *posedge* or *negedge* expression or with wrong polarity. When an always block's sensitivity list contains more than one *posedge* or *negedge* expression, the Presto HDL Compiler assumes that one expression represents the clock, and any remaining expressions represent asynchronous sets or resets. For each set or reset condition, the always block should contain an if statement that tests it.

WHAT NEXT

Modify your rtl to meet the above requirements. See the *HDL Compiler for Verilog Reference Manual* or the *VHDL Compiler Reference Manual* for information on how the compiler infers flip-flops.

SEE ALSO

elaborate (2), **read** (2).

ELAB-301 (warning) %s Only constant-valued subscripts are checked in the sensitivity list; other subscripted expressions are ignored.

DESCRIPTION

You receive this warning message because Presto HDL Compiler does not perform sensitivity list checking on variable subscripts.

Sensitivity list checking verifies that all signals read by a combinational always block are in its sensitivity list.

WHAT NEXT

Remove the variable subscript from the sensitivity list.

SEE ALSO

elaborate (2), **read** (2).

ELAB-302 (error) %s The statements in this 'always' block are outside the scope of the synthesis policy. Only an 'if' statement is allowed at the top level in this always block.

DESCRIPTION

You receive this error message when the statement at the top level of the always block is not an if statement.

WHAT NEXT

See the *HDL Compiler for Verilog Reference Manual* and the *VHDL Compiler Reference Manual* for ways to infer flip-flops and latches from always blocks with an if statement.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-303 (error) %s The expression in the reset condition of the 'if' statement in this 'always' block can only be a simple identifier or its negation.

DESCRIPTION

You receive this error message when the reset condition of the *if* statement is not a simple identifier or a negation of the simple identifier. Presto HDL Compiler only supports an identifier or its negation as the reset condition.

WHAT NEXT

Modify the reset condition so that it is either a simple identifier or a negation of the simple identifier. The following example shows how to modify the RTL code.

Original RTL code:

```
if (~reset || jt_cbits[6]) ec_mode <= 1'b0;  
else ec_mode <= 1'b1;
```

Modified RTL code:

```
if (~reset) ec_mode <= 1'b0;  
else if (jt_cbits[6]) ec_mode <= 1'b0;  
else ec_mode <= 1'b1;
```

SEE ALSO

elaborate (2), **read** (2).

ELAB-304 (warning) %s Case- or If-statement or ?: operator has an infer_mux attribute and a default branch or incomplete mapping. This can cause nonoptimal logic if a mux is inferred. %s.

DESCRIPTION

This warning message may be displayed when mux inference has been requested for a case statement, if statement or ?: operator.

You receive this warning when a case statement does not have all the values of the case variable explicitly enumerated. Instead, a default branch is used (explicitly or implicitly) to represent a lot of them together as in the following example.

```
case(c) // synopsys infer_mux
  2'b00: out = in1 ;
  2'b01: out = in2;
  default: out = in2;
endcase
```

A MUX_OP is not the optimal hardware for this representation. You will not receive this warning if you delete the default branch and explicitly add labels for 2'b10 and 2'b11.

You also receive this warning when an if statement has a final else branch or the control variable is not compared against all possible values, as in the following example:

```
if (sel == 2'b00) // synopsys infer_mux
  dout <= a;
else if (sel == 2'b01)
  dout <= b;
else
  dout <= in2;
```

You will not receive this warning if you change this code by:

```
if (sel == 2'b00) // synopsys infer_mux
  dout <= a;
else if (sel == 2'b01)
  dout <= b;
else if (sel == 2'b10)
  dout <= in2;
else if (sel == 2'b11)
  dout <= in2;
```

For the ?: operator, in the current version you will always receive this warning. Change this operator by a case statement to avoid the warning message.

Finally, you may receive many ELAB-304 warning messages when you set the variable hdlin_infer_mux to all because this is equivalent to use the infer_mux pragma or attribute in any case, if or ?:.

WHAT NEXT

To avoid this warning message, remove the infer_mux pragma or recode by a case or if statement where all possible values are enumerated.

SEE ALSO

elaborate (2), **read** (2). **hdlin_infer_mux** (3).

ELAB-305 (error) %s Clock %s used as data.

DESCRIPTION

You receive this error message because Presto HDL Compiler does not allow clock signals to be used for purposes other than clocking.

WHAT NEXT

Remove the unsupported code from your design.

SEE ALSO

elaborate (2), **read** (2).

ELAB-306 (error) %s Illegal use of tristate value.

DESCRIPTION

You receive this error message when a tristate value is used in an expression in a way that Presto does not support, as in the following example.

```
out = in & 1'bz
```

This error is also issued when a variable assigned to a tristate value is used in an expression, as in the following example.

```
if(c) tmp = 1'bz;  
else tmp = in1 ;
```

```
out = tmp & in2
```

WHAT NEXT

Remove the unsupported portion of code.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-307 (error) %s Case labels are not parallel in %s at line %d. A MUX_OP cannot be inferred.

DESCRIPTION

You receive this error message because Presto HDL Compiler does not infer a MUX_OP for the case statements that are not parallel. A case is parallel when all its branches are mutually exclusive.

WHAT NEXT

Remove the "infer_mux" pragma from this case statement, or if the branches really will be mutually exclusive, prepend a "unique" qualifier to the case statement in SystemVerilog or add a "parallel_case" pragma in traditional Verilog.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-308 (warning) %s Mismatch between simulation and synthesis may occur due to three-state value.

DESCRIPTION

You receive this warning message when the design contains a variable that is conditionally assigned to a three-state value, and the variable is read in the same always block in which it is conditionally assigned. Reading such a variable in the HDL source code generates logic that uses the output of a three-state buffer, which may cause a mismatch between simulations and synthesis.

In the following example, `tmp` is assigned to a three-state value and assigned to `out` when both `c` and `in1` are false.

```
if(c)
    tmp = 1'bz ;
else if (in1)
    tmp = in2 ;
out = tmp ;
```

WHAT NEXT

Modify the code so that the design does not read a variable that is not conditionally assigned to `z`.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-309 (warning) %s Cannot infer a MUX_OP in %s at line %d.

DESCRIPTION

You receive this warning message if a `MUX_OP` cannot be inferred for an `if` or `case` statement because one or more of the following requirements were not met:

- Because variable `hdlin_infer_mux` was set to "none" .
- For the `case` statement, all case labels must be constants.
- For the `if` statement, all control expressions must be simple comparisons that are constants compared with a common variable.
- The number of case labels must be greater than or equal to the value of the `hdlin_mux_size_min` variable.
- The number of case labels must be less than or equal to the value of the `hdlin_mux_size_limit` variable.
- The ratio of case label number to branch number must be less than or equal to the value of the `hdlin_mux_oversize_ratio` variable.

WHAT NEXT

Modify the if or case statement so that it meets the above requirements.

```
elaborate (2), read (2); hdlin_mux_oversize_ratio (3), hdlin_mux_size_limit (3),  
hdlin_mux_size_min (3).
```

ELAB-310 (warning) %s Comparison against '?', 'x', or 'z' values is always false. It may cause simulation/synthesis mismatch.

DESCRIPTION

You receive this warning when any operand in a comparison expression has *xfp* or *z* values. The result of such expressions are always determined to be false, and the corresponding branch is never executed.

In the following example, 'then-branch' of the if-conditional is never executed.

```
if(2'b0x) begin  
    out = in1;      /* Will never fire */  
end  
else begin  
    out = in2;      /* Will always fire */  
end
```

In the following example, the case branch condition that contains *x* or *z* values are never reached.

```
case(c)  
  1'bx : out = in1 ; /* Will never fire */  
  1'b0 : out = in2 ;  
endcase
```

WHAT NEXT

Rewrite the design to eliminate the occurrence of *x* or *z* from conditional expressions, or convert the case into a casex or casez statement.

SEE ALSO

```
elaborate (2), read (2).
```

ELAB-311 (warning) %s DEFAULT branch of CASE statement

cannot be reached.

DESCRIPTION

You receive this warning message when you execute the **read** or **elaborate** command and your design contains a case statement in which the default branch can never be executed. This warning is issued when the compiler detects that at least one of the other branches will always be executed.

```
case(c)
  1'b1 : out = in1 ;
  1'b0 : out = in2 ;
  default: out = in2 ;
endcase
```

WHAT NEXT

Verify that your case statement is written as you intended. If so, delete the default branch.

SEE ALSO

elaborate (2), **read** (2).

ELAB-312 (warning) %s Out of bounds bit select replaced with X.

DESCRIPTION

You receive this warning message when you apply a subscript to a bit vector, and the bit vector attempts to access a bit that is out of range of the vector.

WHAT NEXT

Modify the subscript so that it attempts to access a bit that is within range of the vector.

SEE ALSO

elaborate (2), **read** (2).

ELAB-313 (error) %s Repetition multiplier in a concatenation is not constant expression.

DESCRIPTION

You receive this error message because you have specified a repetition multiplier in a concatenation that is not a constant expression, which is not allowed. The repetition multiplier in a concatenation must be a constant. For example, `{i{x}}` is not allowed if `i` is a varying expression.

WHAT NEXT

Review your design and make appropriate corrections.

SEE ALSO

`elaborate` (2).

ELAB-314 (warning) %s Case branch%s unreachable.

DESCRIPTION

You receive this warning message because one or more branches in a case statement are unreachable due to stronger branch conditions in earlier branches.

For example, in the following Verilog code, the first branch of the case statement is always taken. As a result, all subsequent case branches are unreachable.

```
module m (a, b, y);
  input a, b;
  output reg y;

  reg t0, t1;

  always begin
    case (1'b1)
      1'b1: y = a;
      b: y = ~a;
      default: y = b;
    endcase
  end

endmodule // m
```

WHAT NEXT

Dead case branches can be an indication of a design error. Examine the case statement and verify that the unreachable branches are intentional.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-315 (error) %s A statement in your design description tried to read a three-state value.

DESCRIPTION

You receive this error message because a statement in your source code tried unsuccessfully to read a `z` value. Synthesis does not support `z` values.

WHAT NEXT

Rewrite your description to change or eliminate the value or values in question.

ELAB-316 (error) %s A statement in your design description tried to read an 'x', '?', or three-state value.

DESCRIPTION

You receive this error message because a statement in your source code tried unsuccessfully to read an `x`, `?`, or `z` value. Synthesis does not support these values.

WHAT NEXT

Rewrite your description to change or eliminate the value or values in question.

ELAB-317 (error) %s A statement in your design description tried to read an 'x', '?', or three-state value in a case expression.

DESCRIPTION

You receive this error message because a statement in your source code tried

unsuccessfully to read an **x**, **?**, or **z** value in a case expression. Synthesis does not support these values in a case expression.

WHAT NEXT

Rewrite your description to change or eliminate the value or values in question.

ELAB-318 (error) %s Unable to read from modfile %s: %s

DESCRIPTION

You receive this error message because your intermediate file could not be read, a situation that might be caused by restricted directory permission or by disk corruption.

WHAT NEXT

Change the directory permission to allow access. Then invoke the **analyze** command again to analyze the corrupted module file and attain a modfile that is not corrupted.

SEE ALSO

analyze (2), **elaborate** (2).

ELAB-319 (information) %s Reading module %s from file %s.

DESCRIPTION

Reading module from the corresponding .pvl file.

WHAT NEXT

No action is necessary.

SEE ALSO

elaborate (2), **read** (2).

ELAB-320 (warning) %s File %s for module %s cannot be

found.

DESCRIPTION

You receive this warning message because the corresponding intermediate files, such as .pvl, .syn, and etc for the module could not be found.

WHAT NEXT

Reanalyze the module.

ELAB-321 (error) %s Number of ports on reference design '%s' is inconsistent with specified instance '%s'.

DESCRIPTION

You receive this error message because the number of ports on reference design is inconsistent with specified instance.

WHAT NEXT

Rewrite your description to make the number of ports on reference design is consistent with specified instance.

ELAB-322 (error) %s Width of port '%s' on reference design '%s' is inconsistent with specified instance '%s'.

DESCRIPTION

You receive this error message because the width of port on reference design is inconsistent with specified instance.

WHAT NEXT

Rewrite your description to make the width of port on reference design is consistent with specified instance.

ELAB-323 (error) %s Too many ports found on gate

instantiation

DESCRIPTION

Too many ports found on gate instantiation

WHAT NEXT

Check that the correct number of ports has been specified on the gate instantiation.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-324 (error) %s Too many ports passed to instance %s

DESCRIPTION

Too many ports passed to instance

WHAT NEXT

Check that the correct number of ports has been passed to the instance listed above.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-325 (error) %s Unknown port %s in instance %s in module %s

DESCRIPTION

Unknown port in instance in module

WHAT NEXT

Check that the offending port listed above has been specified correctly.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-326 (error) %s module data file %s revision mismatch: Expected %d, got %d

DESCRIPTION

module data file revision mismatch.

WHAT NEXT

analyze the rtl file again using new version.

ELAB-327 (error) %s Cannot resolve pin %s on cell %s:%s.

DESCRIPTION

Cannot resolve pin on cell.

WHAT NEXT

modify rtl source to make sure the module instantiation agree with submodule declaration.

ELAB-328 (error) %s Replication constant contains 'x' or 'z'.

DESCRIPTION

The repeat count of this replication operator is a constant expression that contains 'x' or 'z'. It is unusable for elaborate-time replication of the data or assignment pattern. The following example will trigger this error:

```
x = { 3'bx11 { y } };
```

WHAT NEXT

Replace the replication constant by a constant expression resolvable to 0s and 1s. Or, if this constant was meant to produce 'x' or 'z' data values in the result, insert a comma after the constant so that it parses as a list element and not as a

replication operator.

SEE ALSO

elaborate (2), **read** (2).

ELAB-329 (warning) %s A 'disable' statement for block '%s' appears outside the block and is being ignored.

DESCRIPTION

You receive this warning message because a disable statement appears outside of the block it attempts to disable, as in the following example:

```
always begin
    begin : block_a
y = 1'b1;
    end
    disable block_a;
end
```

A disable statement must appear with the block to be disabled; otherwise, the disable statement has no effect and is ignored.

WHAT NEXT

Examine your code to verify the block you want to disable, and revise the code so that the disable statement appears inside the block to be disabled.

SEE ALSO

elaborate (2), **read** (2).

ELAB-330 (error) %s Attempt to disable block '%s' out of function scope is not supported.

DESCRIPTION

You receive this error message when a disable statement inside a function refers to a block that is either outside the function or that does not contain the disable statement. The Presto HDL Compiler for Verilog supports only disable statements that refer to a block inside the current function.

WHAT NEXT

Change the design so that all disable statements are within the block they disable, and that all disable statements refer to blocks within the same function or task.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-331 (error) %s Attempt to disable block '%s' out of task scope is not supported.

DESCRIPTION

You receive this error message when a disable statement inside a task refers to a block that is either outside the task or that does not contain the disable statement. The Presto HDL Compiler of Verilog supports only disable statements that refer to a block inside the current task.

WHAT NEXT

Change the design so that all disable statements are within the block they disable, and that all disable statements refer to blocks within the same function or task.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-332 (warning) %s Concatenations cannot have unsized numbers; assuming 32 bits.

DESCRIPTION

You receive this warning message when a concatenation contains an unsized constant. The compiler cannot calculate the correct size of the concatenation. The size is assumed to be 32 bits.

This construction is disallowed by the IEEE Verilog standard, but is permitted by the compiler for backward compatibility.

The following two concatenations will trigger this warning:

```
x = { 0, a };  
z = { b, 'hf, c };
```

WHAT NEXT

Avoid this style. Use an explicit size on all constants within concatenations.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-333 (warning) %s This SV Assertion is ignored for synthesis since %s is not set to true.

DESCRIPTION

This warning message issues when the Presto HDL Compiler finds a labelled assertion or assertion severity system task call whose usage is not confirmed by the tcl environment variable setting cited in the message. Because SystemVerilog Assertions (SVA) can lead synthesis to using a larger set of "don't care" conditions during optimization, you must separately certify that these assertions have proven to be unreachable prior to synthesizing this RTL.

WHAT NEXT

This is only a warning message. No action is required.

However, if you do not want the construct to be ignored, you must set `hdlin_enable_assertions` to true and also set an element of the `confirmed_SVA` environment array to true whose element name identifies the label and lexical scope of the applicable assertion. The most specific form of its element name is used in the warning message when `hdlin_enable_assertions` is already true.

The recommended way to confirm assertions is to assemble a separate tcl file to source into your `dc_shell` before elaborating the design elements which use SVA. This same file should then be sourced into `fm_shell` when formally verifying the results of this elaboration.

SEE ALSO

`analyze`(2)
`elaborate`(2)
`confirmed_SVA`(3)
`hdlin_enable_assertions`(3)

ELAB-334 (error) %s Part-select direction does not match declared direction of symbol '%s' (declared [%d:%d], part-select

is [%d:%d]).

DESCRIPTION

You receive this error message when a part-select statement on a variable conflicts with the variable's declaration. If the variable is declared with the left bound greater than the right bound, then the part-select must also use a left bound greater than a right bound, and vice versa.

For example, the following code will trigger this error because the part-select 'x[1:2]' does not match the declared direction of 'x'.

```
module test(x, y);
input [2:0] x;
output [1:0] y;

assign y = x[1:2];

endmodule
```

WHAT NEXT

Correct the part-select statement so that the bounds are compatible with the variable's declaration.

SEE ALSO

elaborate (2), **read** (2).

ELAB-335 (warning) %s 'Case' statement is full and has only one nontrivial branch; it will be inlined.

DESCRIPTION

You receive this warning message because a case statement in the design either is marked as a full case by the user, or is proved to be a full case by the compiler, and has only one useful branch. Because in a the full case, at least one branch must execute, the single branch of the case statement will always be executed. The compiler has detected this situation and will skip generating logic to test the case condition, executing the code in the body as if it were not surrounded by the case statement.

Most commonly, this message arises when case statements have one normal branch, and a default branch that only assigns variables to 'bx'. For example:

```

module test(a,y);

    input  a;
    output y;
    reg   y;

    always
    case (a)
        1'b1: y = 1'b1;
        default: y = 1'bx;
    endcase
endmodule

```

In this case, the presence of the default branch means that the case statement is full (that is, one branch will always be taken.) Then, Because the default branch only assigns variables to 1'bx, it can be optimized away, and the resulting single-branch case can be simplified to unconditionally assign y = 1'b1.

In the next example, the // synopsys full_case directive tells the compiler that all possible values of x are handled in the case statement. However, there is only one branch. The compiler concludes that a must always be 1. Thus, the branch will always be executed.

```

module test(a,y);

    input  a;
    output y;
    reg   y;

    always
    case (a) // synopsys full_case
        1'b1: y = 1'b1;
    endcase
endmodule

```

This second example is an uncommon coding style. The compiler issues this warning to remind you to verify that the case statement is as you intended it.

WHAT NEXT

Verify that the case statement implements the behavior you intended.

SEE ALSO

elaborate (2), **read** (2).

ELAB-336 (error) %s Presto does not support processes with

multiple event statements.

DESCRIPTION

You receive this error message because Presto Compiler does not support multiple event statements in the same process.

WHAT NEXT

Change the source code to remove the use of multiple event in the same process.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-337 (warning) %s Assignment to supply0/1 variable '%s' is ignored.

DESCRIPTION

You receive this warning message if you attempt to make an assignment to a variable declared as 'supply0' or 'supply1'. These variables always have values of 0 and 1, respectively; any assignments you attempt are ignored.

WHAT NEXT

Remove the specified assignment, then reexecute the command.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-338 (warning) %s Module '%s' contains a supply%d variable '%s'. Replacing with wire driven by a continuous assignment to %d.

DESCRIPTION

You receive this warning message when a supply0 or supply1 variable appears in your design.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

elaborate (2), **read** (2).

ELAB-339 (warning) %s Symbol '%s', declared as an enum, may be assigned non-enum values.

DESCRIPTION

A variable declared using the 'synopsys enum' pragma may be assigned to a value that is not a member of the enum. An enumerated type declaration represents an assertion by the user that a variable can only be assigned a certain set of values; if the design assigns a value that is not part of the user-declared enum, results may be unpredictable.

The compiler is not always able to determine conclusively when an expression will evaluate to a value listed in the enum. For example, the compiler cannot determine the possible values of input ports. Another case occurs when a symbol declared as an enum is assigned the result of an arithmetic or logical expression that cannot be evaluated to a constant at compile time.

In the following example, the expression 'current_state + 2'b01' will trigger this error. By examining the code, you can determine that the expression evaluates to a value that is contained in the enumerated type, except when 'current_state' is equal to 'last_state'. Since it is only executed when 'current_state' is not 'last_state', it would be safe to leave this code as is.

```
module test (clock);  
  
    input clock;  
  
    parameter [1:0] /* synopsys enum states */ first_state = 2'b00,  
    second_state = 2'b01, last_state = 2'b10;  
  
    reg [1:0] /* synopsys enum states */ current_state, next_state;  
  
    always @(posedge clock) begin  
        if (current_state == last_state)  
            next_state = first_state;  
        else  
            next_state = current_state + 2'b01;  
        end  
    endmodule
```

However, if the 'always' block were replaced with:

```
assign next_state = current_state + 2'b01; // result is 2'b11 when
                                         // current_state == last_state

then 'next_state' could be assigned 2'b11. This contradicts the user-declared enum,
and could have unpredictable results and cause simulation/synthesis mismatches.
```

WHAT NEXT

If you receive this warning, make certain that the symbol is ONLY assigned a values that are listed in the enumerated type declaration.

If the variable is assigned to the value of an input port, make sure that the port will only be assigned to values within the enum. If that is the case, declare the port as a member of the same enumerated type using the 'synopsys enum' pragma.

If the variable is assigned to an expression result, make sure that expression can never evaluate to a non-enum value.

If you cannot determine that the value assigned will be a member of the declared enumerated type, you must remove the enum declaration from the variable.

ELAB-340 (warning) %s Enumerated type '%s' is not compatible with type of symbol '%s'.

DESCRIPTION

You receive this error message because the specified enumerated type is not compatible with the specified symbol type. This error occurs at elaboration when parameters in the size specifications are resolved.

In the following example, the variable **current_state** has bounds of [0:SIZE], which resolves to [0:3], but the enumerated type states has bounds of [0:SIZE2], which resolves to [0:2].

```
parameter SIZE = 3;
parameter SIZE2 = 2;

parameter [0:SIZE] /* synopsys enum states */ state1 = 4'd0, state2 = 4'd1;
reg [0:SIZE2] /* synopsys enum states */ current_state;
```

WHAT NEXT

If it is a typo, modify the design so that the symbol and the enumerated type share the same type.

If user intends to let the symbol and the enumerated type have different type, the user have to make sure that the synthesis behavior is what the user wants.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-341 (error) %s The number of enum encodings given does not match the number of literals.

DESCRIPTION

You receive this error message when, in an enumerated type declaration, there is a different number of literals and encodings.

WHAT NEXT

Fix the design so that the number of encodings and literals is the same.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-342 (error) %s Expression involving %s operator cannot have a real operand.

DESCRIPTION

You receive this error message because the specified operator does not support real operands. Real operands are not supported for synthesis.

WHAT NEXT

If your design is intended for synthesis only, remove real operands from the design.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-343 (error) %s Source file for '%s' was not analyzed by

this release of the compiler; re-analyze it.

DESCRIPTION

Your **read**, **analyze**, or **elaborate** command requires data about the specified entity, module, or package that was stored by a previous **analyze** command. A file of such data was found, but it had been produced by an incompatible version of the Presto HDL compiler. The file cannot be read in its current version.

WHAT NEXT

Reanalyze all design source files needed for this compilation using **this release** of Design Compiler - on any platform. Or adjust your working directory settings to use the environment that contains the properly analyzed sources.

When the analyzed data files are in synch with the compiler release you are using, reexecute the failed command.

SEE ALSO

analyze (2), **elaborate** (2), **read** (2).

ELAB-344 (error) %s File '%s' does not contain an analyzed design.

DESCRIPTION

You receive this error message when you execute the **read** or **elaborate** command and specify a file that does not contain an analyzed design. The compiler was expecting a file that is an analyzed design. The Presto HDL Compiler stores pre-analyzed designs in disk files.

WHAT NEXT

Re-analyze the module or entity you are elaborating or reading and specify a file that contains an analyzed design.

SEE ALSO

elaborate (2), **read** (2).

ELAB-345 (error) %s Symbol '%s' is a function that is being

called as a task.

DESCRIPTION

You receive this error message when a function in your design is being called as a task. A task call is a stand-alone statement, whereas a function call generates a value.

WHAT NEXT

Modify the design so that the function is called only in places where an expression is expected.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-346 (error) %s Variable '%s' must be non-negative.

DESCRIPTION

You receive this error message when a variable that controls the Presto HDL Compiler has a negative value. Only non-negative values are supported.

WHAT NEXT

Identify the variable that has a negative value and change it to a non-negative value. See the manual page of the variable for valid values.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-347 (warning) %s Division by 0 evaluates to 'x'.

DESCRIPTION

You receive this warning message because an expression contains a division by 0, which evaluates to 'x' in Verilog.

WHAT NEXT

Verify that you intended to write an expression with 0 as the divisor.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-348 (error) %s Incorrect datatype for variable '%s'.

DESCRIPTION

You receive this error message when a variable that controls the behavior of the Presto HDL Compiler has a value that is the wrong datatype. This occurs when a non-numeric value is assigned to a variable that should contain a string, or when a variable that should be `true` or `false` has a numeric value, or contains another string.

WHAT NEXT

Use the correct datatype in interactive use, and correct any scripts that set the variable. To determine what type of value the variable should have, see the manual page of the appropriate variable.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-349 (warning) %s Potential simulation-synthesis mismatch if index exceeds size of array '%s'.

DESCRIPTION

You receive this warning message if the bit-width of the index expression is larger than the bit-width of the array bounds, or if an array has bounds that cannot be expressed as `[0 : 2^n-1]` or vice versa.

An array in the program is indexed by an expression that can evaluate to an out-of-bounds index, and the compiler cannot determine if the index will evaluate to a legal subscript.

If the index does evaluate to an out-of-bounds value, the synthesized result may not match Verilog simulations. Assigning to, or reading from, an out-of-bounds location may have unpredictable results.

For example, in the following Verilog module, a register is indexed by the input port 'addr'. If 'addr' ever has the value 3'd7, then the register will be accessed out-of-bounds, but the correct logic can be generated.

```
module test(addr, data, write);
    input [2:0] addr;
    input data, write;
    reg [6:0] mem;

    always @(addr or data or write)
        if (write)
            mem[addr] = data;

endmodule
```

For example, in the following Verilog module, a register is indexed by the input port 'addr'. If 'addr' ever is more than the value 4'd6, then the register will be accessed out-of-bounds, and the bad logic will be generated. When 'addr' ever has the value 4'd8, it will access mem[0], not mem[8].

```
module test(addr, data, write);
    input [3:0] addr;
    input data, write;
    reg [6:0] mem;

    always @(addr or data or write)
        if (write)
            mem[addr] = data;

endmodule
```

WHAT NEXT

Verify that the index expression cannot evaluate to an out-of-bounds value.

SEE ALSO

elaborate (2), **read** (2).

ELAB-350 (error) %s Can't resolve constant expression for symbol '%s'.

DESCRIPTION

In certain circumstances, the Presto HDL compiler may not evaluate constant expressions with operands larger than 32 bits. To work around this problem, pre-compute such expressions in your design, or use HDL Compiler to elaborate that design. This problem will be fixed in an upcoming release.

WHAT NEXT

Either pre-compute the value, or use HDL Compiler on this design.

ELAB-351 (warning) %s Comparison against 'unknown' value is always false; may cause simulation/synthesis mismatch.

DESCRIPTION

You receive this message because the result of a comparison, by definition, can produce only one result. In the following example, the body of the first IF statement always executes, and the body of the second IF statement never executes. All comparisons against the uninitialized value *U* fail because the result of an equality comparison against *U* is always false, and the result of a disequality comparison against *U* is always true.

```
IF(A2 /= "U") THEN
    ONE_2 <= '1';           -- SHOULD ALWAYS FIRE
END IF;

IF(A2 = "U") THEN
    ZERO_2 <= '1';         -- SHOULD NEVER FIRE
END IF;
```

WHAT NEXT

Ensure that you intended to compare against *U*; and, if not, correct the comparison.

ELAB-352 (error) %s Operator '%s' not found in synthetic library.

DESCRIPTION

You receive this message because the operator defined by a *map_to_operator* attribute is not described in any of the synthetic libraries in the **synthetic_library** variable (and is not found in **standard.sldb**).

WHAT NEXT

To use the synthetic library operator, ensure that it can be found in the files defined by the **synthetic_library** variable.

SEE ALSO

`synthetic_library` (3).

ELAB-353 (error) %s Width of the actual at the port '%s' does not match. %s

DESCRIPTION

You receive this message because a temporary signal/variable does not have a proper bit width.

The following example shows that a `temp_out` signal connected to a `Y` port is too wide or too narrow when represented in hardware.

```
architecture A of E is
component C1
    port (A : integer range 0 to 15;
          Y : integer range 0 to 15);
end component;
signal temp_in : integer range 0 to 15;
signal temp_out : integer range 0 to 31;
begin
U1: C1 port map (A => temp_in, Y => temp_out);
end A;
```

WHAT NEXT

Define a temporary signal/variable with the proper bit width. The following example is a modification of the one above to provide a proper bit width for the `temp_out` signal.

```
architecture A of E is
component C1
    port (A : integer range 0 to 15;
          Y : integer range 0 to 15);
end component;
signal temp_in : integer range 0 to 15;
signal temp_out : integer range 0 to 31;
signal temp : integer range 0 to 15;
begin
temp_out <= temp;
U1: C1 port map (A => temp_in, Y => temp);
end A;
```

ELAB-354 (error) %s Cannot read architecture file %s: %s.

DESCRIPTION

You receive this message because during a read or elaborate command, the Presto HDL compiler cannot open or read a file describing the source language (and, for VHDL, the architecture) of the module or entity being elaborated.

You also receive this message if the module or entity has not yet been analyzed or if the module or entity name is misspelled.

WHAT NEXT

Ensure that the module or entity being elaborated has already been analyzed, and that the entity or module name is correctly specified.

SEE ALSO

elaborate (2), **read** (2).

ELAB-355 (information) %s Elaborating module '%s'.

DESCRIPTION

You automatically receive this message for each module elaborated during a read or elaborate command.

WHAT NEXT

No action is necessary.

SEE ALSO

elaborate (2), **read** (2).

ELAB-356 (error) %s No modules exist in the analyzed file.

DESCRIPTION

You receive this message because the Presto HDL compiler finds no modules or entities in the file being read from the **read** command using a **verilog** or **vhd1** format. The error is reported by the **read** command.

WHAT NEXT

Ensure that the file being read contains at least one module or entity.

SEE ALSO

`read (2)`.

ELAB-357 (error) %s Module '%s' cannot be found for elaboration.

DESCRIPTION

You receive this message because the Presto HDL compiler cannot find the module to be elaborated. The error is reported by the `elaborate` command.

WHAT NEXT

Ensure that the module to be elaborated has been analyzed.

SEE ALSO

`elaborate (2)`, `analyze (2)`.

ELAB-358 (error) %s Mismatching number of connections in module/component instantiation.

DESCRIPTION

The number of port connections of the module/component instantiation does not match the number of ports in the module/component declaration. Either you specified too many or not enough connections to the module/component.

WHAT NEXT

Check against the module/component declarations to find out which ports are unconnected or whether you specified too many connections.

SEE ALSO

ELAB-359 (error) %s The procedure/task %s cannot be mapped to %s because it has an inout port (%s).

DESCRIPTION

HDL Compiler issues this error when, during the activity of the **read** command or **elaborate** command, the compiler encounters a procedure or task that has a map-to-entity or map-to-operator or map_to_module directive and also has an inout port or signal port. HDL Compiler does not support inout or signal ports on mapped procedures.

WHAT NEXT

Remove the inout port from the mapped function or procedure, and issue the command again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-360 (error) %s The REAL data type is not supported for synthesis.

DESCRIPTION

HDL Compiler does not support the use of the REAL data type when synthesizing VHDL.

WHAT NEXT

Rewrite your design so that it does not use the REAL data type.

SEE ALSO

elaborate (2), **read** (2).

ELAB-361 (error) %s Unable to open standard synthetic

libraries; check for correct installation.

DESCRIPTION

The Presto HDL Compiler could not open the standard synthetic library file, standard.sldb, or the standard GTECH library, gtech.db. This probably indicates that Design Compiler is not installed correctly.

WHAT NEXT

Verify the successful completion of the the installation of Design Compiler.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-362 (error) %s Cannot find port '%s' on synthetic operator '%S'.

DESCRIPTION

The Presto HDL Compiler cannot find a port it expected to find on a synthetic operator. This usually indicates that a function that uses the map-to-operator pragma has incorrect parameter names for the synthetic operator that it is mapped to.

WHAT NEXT

Verify that any functions mapped to synthetic operators use the correct port (parameter) names.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-363 (error) %s Incorrect value for `hdlin_infer_mux`: '%s'; possible values are 'all', 'default', or 'none'.

DESCRIPTION

Allowed values for the `hdlin_infer_mux` variable are `all`, `none`, and `default`. When `all`

is the value, HDL Compiler attempts to infer a MUX_OP for a signal or variable assigned in a case statement. When *none* is the value, HDL Compiler does not attempt to infer any MUX_OPs for a Verilog or VHDL design.

When *default* (the default value) is the value, HDL Compiler attempts to infer a MUX_OP for a signal or variable assigned in a case statement or if statement, if the statement is either marked with the **infer_mux** directive, or is in a process associated with the **infer_mux** attribute or directive. A MUX_OP cannot be inferred if it violates the **hdlin_mux_size_limit** variable.

For details, see the *HDL Compiler for Verilog Reference Manual* or the *VHDL Compiler Reference Manual*.

To determine the current value of this variable, type **list hdlin_infer_mux**. For a list of hdl variables and their current values, type **list -variables hdl**.

WHAT NEXT

Set **hdlin_infer_mux** to one of the values *all*, *default*, or *none*.

SEE ALSO

elaborate (2), **read** (2); **hdlin_infer_mux** (3).

ELAB-364 (warning) %S Replication constant {%-d{...}} is non-standard.

DESCRIPTION

The replication factor applied to a Verilog concatenation or a System Verilog assignment pattern must be either positive (Verilog-2001 and earlier) or non-negative (Verilog-2005 and later).

The setting of **hdlin_vrlg_std** at the time the (System)Verilog source is analyzed determines which definition of the replication operator is provided when elaborating zero replications. When supported as an extension, negative replication constants are also issued this warning; then they are handled using the prevailing definition of zero replication.

Non-standard replications analyzed when **hdlin_vrlg_std <= 2001** return 1'b0. This is compatible with an extension made by Synopsys Verilog products of that era. Replications analyzed when **hdlin_vrlg_std >= 2005** whose elaboration-time constant is zero or (with this warning) negative cause the repeated expressions to elaborate once (for their side-effects), but not to contribute result values to a surrounding concatenation or assignment pattern. Verilog 2005 permits such empty replication results only within an otherwise non-empty concatenation.

WHAT NEXT

Make sure you intend to use a negative number (or zero) as the repeat count in your concatenation. Check the setting of `hdlin_vrlg_std` used when the elaborated module was analyzed and align this with your choice for whether `1'b0` or an empty result is intended. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

SEE ALSO

`analyze` (2), `elaborate` (2), `read` (2).

ELAB-365 (warning) %s Net '%s' or a directly connected net is driven by more than one process or block.

DESCRIPTION

You receive this warning when a 'reg' variable is driven by more than one always block or a 'wire' variable is driven by more than one continuous assignment and you have also set the variable `hdlin_prohibit_nontri_multiple_drivers` to *false*.

Note: This warning is issued because an invalid design could result.

In simulation, if a 'reg' variable is driven by more than one always block, the definition, in effect, depends on which block executed most recently. In synthesis, since all blocks are concurrently executing at all times, this is not the case, and invalid designs can result if the drivers are simply shorted together. However, when the `hdlin_prohibit_nontri_multiple_drivers` variable is set to *false*, multiple drivers of 'reg' variables are permitted.

A multiple-driven 'wire' variable is prohibited by the Verilog standard. Although some simulators permit this behavior, HDL Compiler issues the ELAB-366 error if it occurs. However, when `hdlin_prohibit_nontri_multiple_drivers` is set to *false*, multiple drivers are permitted. **Note** that this variable setting might cause the generation of invalid designs.

The compiler permits multiple drivers on nets declared as 'tri', although it issues a warning if all the drivers are not three-state devices.

WHAT NEXT

An invalid design might result when this warning is issued. Multiple driver nets are only generated because the `hdlin_prohibit_nontri_multiple_drivers` variable is set to *false*.

Consider modifying your design, to avoid driving a variable from more than one always block or continuous assignment.

SEE ALSO

elaborate (2), **read** (2).

ELAB-366 (error) %s Net '%s' or a directly connected net is driven by more than one source, and not all drivers are three-state.

DESCRIPTION

You receive this error message when a 'reg' variable is driven by more than one always block or a 'wire' variable is driven by more than one continuous assignment or input port and not all of the drivers are three-state.

In simulation, if a 'reg' variable is driven by more than one always block, the definition, in effect, depends on which block executed most recently. In synthesis, since all blocks are concurrently executing at all times, this behavior is not possible, and invalid designs can result if the drivers are simply shorted together. Therefore, HDL Compiler issues an error if any bits of any variable are driven by more than one process.

A multiply-driven net declared as 'wire' is not supported in synthesis and Presto HDL Compiler issues the ELAB-366 error if it occurs. If you want the compiler to permit such behavior, set the **hdlin_prohibit_nontri_multiple_drivers** variable to **false**. **Note** that this variable setting might cause the generation of invalid designs.

The compiler permits multiple drivers on nets declared as 'tri', although it issues a warning if all the drivers are not three-state devices.

COMMON ISSUES

Sharing the same loop index variable between processes is a common source of this error. At the end of each process or always block, the loop index variable is driven by the last value it had during the loop.

```
integer i;
always begin
  if (c)
    for (i = 0; i < N; i = i + 1)
      x[i] = ~x[i];
end
always begin
  if (c)
    for (i = 0; i < N; i = i + 1)
      y[i] = ~y[i];
```

```
end
```

To avoid this situation, use different variables in the different always blocks or declare the loop index variables locally, as in the following example.

```
always begin: x_block
    integer i;
    if (c)
        for (i = 0; i < N; i = i + 1)
            x[i] = ~x[i];
    end
always begin: y_block
    integer i;
    if (c)
        for (i = 0; i < N; i = i + 1)
            y[i] = ~y[i];
    end
```

In some cases the compiler can determine that the variable **i** is never read before being assigned in the block, and in those cases the error is not issued.

Previous versions of HDL Compiler treated loop variables as a special case and did not allow them to be read after the loop. However, the Presto HDL Compiler treats loop variables as full-fledged program variables, which can lead to this situation.

WHAT NEXT

Modify your design to avoid driving a variable from more than one always block or continuous assignment. Or if all drivers of the variable are three-state devices, change the declaration of the variable to 'tri', which permits multiple drivers.

Another alternative is to set **hdlin_prohibit_nontri_multiple_drivers** to *false*. **Note** that this setting might allow the generation of invalid designs to be generated. For that reason, it is not recommended.

SEE ALSO

elaborate (2), **read** (2); **hdlin_prohibit_nontri_multiple_drivers** (3).

ELAB-367 (error) %s Clock expression must be one bit wide.

DESCRIPTION

An expression you use as a clock signal must be one bit wide. If you use an expression that is wider than one bit, you receive this error message. In Verilog,

you specify the clock using an event statement, such as "@(posedge clock)". In VHDL, you specify a clock event using "if (clock'event and clock = '1')".

WHAT NEXT

Modify your design so that all clock expressions are one bit wide.

SEE ALSO

elaborate (2), **read** (2); **hdlin_infer_mux** (3).

ELAB-368 (error) %s Net '%s', or a directly connected net, is driven by more than one source, and at least one source is a constant net.

DESCRIPTION

You receive this error when a 'reg' variable is driven by more than one always block, or a 'wire' variable is driven by more than one continuous assignment or input port, and at least one of the drivers is a constant. This is an error because an invalid design results when the output of a gate is connected directly to the Logic0 or Logic1 nets.

In simulation, if a 'reg' variable is driven by more than one always block, the definition, in effect, depends on which of the blocks executed most recently. In synthesis, since all blocks are concurrently executing at all times, this behavior is not possible, and invalid designs can result if the drivers are simply shorted together. Therefore, HDL Compiler issues an error if any bits of any variable are driven by more than one process.

A multiply-driven 'wire' variable is prohibited by the Verilog standard. Although some simulators permit this behavior, HDL Compiler issues the ELAB-366 or ELAB-368 error in this situation. If you wish to permit this behavior, you may set **hdlin_prohibit_nontri_multiple_drivers** to *false*. **Note** that this variable setting may cause the generation of invalid designs.

Ordinarily, multiple drivers are permitted on nets declared as 'tri'; however, constant nets are an exception to this rule because the implementation would result in an invalid design.

COMMON ISSUES

A common source of this error message is sharing the same loop index variable between processes. At the end of each process or always block, the loop index variable is driven by the last value it had during the loop.

```

integer i;
always begin
  if (c)
    for (i = 0; i < N; i = i + 1)
      x[i] = ~x[i];
end
always begin
  if (c)
    for (i = 0; i < N; i = i + 1)
      y[i] = ~y[i];
end

```

To avoid this situation, either use different variables in the different always blocks, or declare the loop index variables locally, as in the following example.

```

always begin
  integer i;
  if (c)
    for (i = 0; i < N; i = i + 1)
      x[i] = ~x[i];
end
always begin
  integer i;
  if (c)
    for (i = 0; i < N; i = i + 1)
      y[i] = ~y[i];
end

```

In some cases the compiler can determine that the variable **i** is never read before being assigned in the block, and in those cases the error is not issued.

Previous versions of HDL Compiler treated loop variables as a special case, and did not allow them to be read after the loop; however, the Presto HDL Compiler treats loop variables as full-fledged program variables, which can lead to this situation.

WHAT NEXT

Modify your design to avoid driving a variable from more than one always block or continuous assignment.

When none of the drivers is a constant net, another alternative is to set **hdlin_prohibit_nontri_multiple_drivers** to *false*. However, when one of the drivers is a constant net, an error is always generated, because the result would be an invalid design.

SEE ALSO

`elaborate` (2), `read` (2), `hdlin_prohibit_nontri_multiple_drivers` (3).

ELAB-369 (error) %s The width of port %s on instance %s of design %s is inconsistent with other instantiations of the same design.

DESCRIPTION

You receive this error message when a module is instantiated in your design more than once, but the width of the ports is inconsistent among all of the instances.

In the following example, the module named *foo* is instantiated twice, but the ports named *a* and *b* have different widths, causing the error message.

```
module E (a, b, out1, out2);
  input [2:0] a;
  input [3:0] b;
  output [3:0] out1, out2;

  foo U1 (a, out1);
  foo U2 (b, out2);
endmodule
```

The instance for which this error is reported may not be the actual instance that uses the wrong width. Since the design is not yet linked, the compiler cannot check which of the instances is correct and can only report the inconsistency.

In the example above, the error is reported for instance U2, because instance U1 has already been seen and uses a different width. As the first in the list, the module named *foo* might require a 3-bit port, a 4-bit port, or another size. Errors that affect all instances equally are checked during linking instead of during elaboration.

WHAT NEXT

Correct the width of the ports so that they are consistent, and then invoke the compiler again.

SEE ALSO

`elaborate`(2)

ELAB-370 (warning) %s No MUX_OP inferred for the case because it might lose the benefit of resource sharing.

DESCRIPTION

You receive this warning message because the compiler did not infer the MUX_OP you specified for the case statement, because the case statement would lose the benefit of resource sharing.

WHAT NEXT

This is a only a warning and requires no action on your part.

ELAB-371 (warning) %s Pragmas has been removed in compiling.

DESCRIPTION

The tool issues this warning when pragmas are removed in the specified location during compilation, usually in rewriting intermediate language code.

For example, when inferring carryin for the following statement, one of the two adders will be removed, along with the label pragma associated with that adder.

```
a = a1 + //synopsys label adder1  
      a2 + //synopsys label adder2  
      cin;
```

WHAT NEXT

No action is required on your part. However, if you want to avoid the removal of pragmas, change your Verilog code.

SEE ALSO

elaborate (2), **read** (2).

ELAB-372 (warning) %s Unsupported use of user-encoded

enumeration type as array index.

DESCRIPTION

You receive this error message because synthesis does not support user-encoded enumeration types used as an array index. A user-encoded enumeration type is one that has an associated `ENUM_ENCODING` attribute.

During synthesis, enumeration values are implemented by choosing a binary encoding. VHDL requires that the meaning of an enumeration value used as an index is the position of the enumeration value in the enumeration type definition. Since the encoded value and the position are usually different values, correct synthesis would require the insertion of inefficient decoding logic.

EXAMPLE

The following declaration of `A1` is not supported because the index type `ENUM1` is an user-encoded enumerated type.

```
...
attribute ENUM_ENCODING : string;
attribute ENUM_ENCODING : string;
type ENUM1 is (M1, M2, M3, M4);
attribute ENUM_ENCODING of
  ENUM1 : type is "0010 1000 1001 1111";

type A1 is array (ENUM1 range <>) of BOOLEAN;
...
```

WHAT NEXT

Rewrite the source code so that it does not use arrays with user-encoded enumeration types as an index. The tool allows the use of the enumeration type with default encoding as an array index type.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-373 (warning) %s Potential overflow which may cause synthesis and simulation mismatch in operator '%s'.

DESCRIPTION

This warning message occurs when the tool detects a potential overflow in an operator (such as exponent or abs) of the expression.

For example, in the following expression if *tmp* is less than zero, there will be an integer overflow.

```
2 ** (31 - tmp)
```

In the following expression, if *tmp* is the minimum integer, there will be an integer overflow.

```
abs(tmp)
```

WHAT NEXT

This is a warning message only. No action is required on your part. However, it is good practice to remove the overflow exponent or abs from the expression.

SEE ALSO

elaborate (2), **read** (2).

ELAB-374 (information) %s Inferred unloaded sequential element for %s.

DESCRIPTION

You receive this message when the Presto HDL Compiler infers a sequential element that is not required for proper functioning of the design being elaborated, but whose inference was requested by the user.

An RTL-level design description in Verilog or VHDL may contain variables that ordinarily would create a sequential cell (either because they are assigned under a clock edge, or because they are conditionally assigned) but whose values are never read, or whose values are not used in computing any output of the design. Because their values are not used (that is, they have no loads, or no path to the outputs), by default HDL Compiler (Presto) will not create sequential cells for these variables.

In some circumstances designers wish to retain these sequential cells. Unloaded sequential cells can be inferred by two methods. First, if `hdlin_preserve_sequential` is TRUE, then a sequential cell will be inferred for any variable that is conditionally assigned or assigned under a clock, regardless of whether its value is used or not. Second, if `hdlin_preserve_sequential` is not set, but some variables are marked with the "preserve_sequential" pragma, only those variables will receive sequential cells even if they have no loads.

WHAT NEXT

Examine the set of variables for which unloaded sequential cells are inferred.

If you do not want any unloaded sequential cells, make sure that `hdlin_preserve_sequential` is FALSE and no pragmas appear in your HDL source files.

If you do intend to infer some unloaded sequential cells, but some unwanted cells also appear, and the variable `hdlin_preserve_sequential` is TRUE, consider using the pragma method for finer control over the inference.

Otherwise, no action is required on your part.

SEE ALSO

`hdlin_preserve_sequential` (3), `elaborate` (2), `analyze` (2), `read` (2), `read_file` (2), `hdlin_preserve_sequential` (3).

ELAB-375 (error) %s Could not resolve hierarchical reference '%S'.

DESCRIPTION

You receive this message when the object referred to by a hierarchical identifier could not be found.

WHAT NEXT

Find the object that the hierarchical identifier was meant to refer to and fix the hierarchical name to correctly refer to this object.

SEE ALSO

`elaborate` (2), `analyze` (2), `read` (2), `read_file` (2),

ELAB-376 (Error) %s elaborating interface '%s'.

DESCRIPTION

This error message occurs if you attempt to elaborate a SystemVerilog interface, because that is not supported in synthesis.

WHAT NEXT

Refer to the SystemVerilog User Guide for recommended use models.

SEE ALSO

elaborate (2).

ELAB-377 (warning) %s The resolution function '%s' is not marked with a resolution method directive. It is being ignored.

DESCRIPTION

The tool issues this warning message if any function that is used as a resolution function is not marked with one of the following resolution method directives:

```
-- synopsys resolution_method wired_and  
-- synopsys resolution_method wired_or  
-- synopsys resolution_method wired_three_state
```

The tool does not support arbitrary resolution functions. Only *wired_and*, *wired_or*, and *three_state* functions are allowed. The tool requires that all resolution functions are marked with one of the resolution method directives indicating the kind of resolution being performed.

This resolution function will be ignored.

WHAT NEXT

This is a warning message only. No action is required on your part. However, if you do not want the resolution function to be ignored, add one of the following resolution method directives to the resolution function:

```
-- synopsys resolution_method wired_and  
-- synopsys resolution_method wired_or  
-- synopsys resolution_method wired_three_state
```

SEE ALSO

elaborate (2), **read** (2).

ELAB-378 (Error) %s the content %s is not defined in interface instance %s.

DESCRIPTION

You receive this error message when you are accessing the content of the interface through an instance, but the content is not defined in the interface. The following example results in the error message.

```
interface simple_bus;
  logic a;
endinterface;

module top(i, o);
  input i;
  output o;

  simple_bus sb();

  assign o = i & o.b; //b is not defined in the interface
endmodule
```

WHAT NEXT

Correct the interface content access or add the content definition in the corresponding interface and run the command again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-379 (Error) %s value of double type is not supported in synthesis.

DESCRIPTION

You receive this error message because you are attempting to synthesize a real, float, or double data type, which synthesis does not support.

WHAT NEXT

Do not use real, float, or double data types for synthesis. Correct the data type and run the command again.

SEE ALSO

elaborate (2).

ELAB-380 (Error) %s name of port %s is inconsistent with

module definition or other instances.

DESCRIPTION

You receive this error message because the specified port name is inconsistent with module definition or other module instances having the named port connection. One of the ports is an interface or modport instance in the module instantiation.

In the following example, the *foo* module is instantiated with a named port connection. It uses the named ports *a*, *o* and *ifc*, and *ifc* is an interface instance. However, *a* is not in the port list of the *foo* module, so the error message occurs.

```
interface ifc;
  logic x,y;
endinterface

module E (a, out1);
  input [2:0] a;
  output [3:0] out1;
  iface ifc();
  foo U1 (.a(a), .o(out1), .ifc(ifc));
endmodule

module foo(input [2:0] i, output [3:0] o, iface ifc);
endmodule
```

WHAT NEXT

Correct the names of the ports so that they are consistent, and then invoke the compiler again.

SEE ALSO

elaborate (2).

ELAB-381 (error) %s interface/modport port %s in an instantiation is incompatible with corresponding module definition or interface definition.

DESCRIPTION

This error message occurs when the specified port name in an instantiation is incompatible with the corresponding module definition or interface definition in one of the following cases:

- Connecting an interface/modport instance to a non interface/modport port
- Connecting a non interface/modport instance to an interface/modport port
- Connecting an interface instance to a different interface port
- Connecting a modport instance to a different modport
- Connecting a modport instance to a different interface port
- Connecting an interface instance to a modport port
- Connecting a modport instance to a different modport port.

In the following example, the module named *foo* is instantiated with the ports named *a*, *out1*, and *ifc*. The *ifc* port is an interface instance that is connected to the output port named *o2*. However, the *o2* port is not a compatible interface port. This causes the error message.

```

interface iface;
  logic x,y;
  modport MP(input x, output y);
endinterface

module E (a, out1);
  input [2:0] a;
  output [3:0] out1;
  iface ifc();
  foo U1 (ifc.MP);
endmodule

module foo(output o2);
endmodule

```

Another example that results in the error message is when you attempt to connect a modport of an interface instance to a different modport port.

```

interface iface;
  wire x,y;
  modport MP1(input x, output y);
  modport MP2(input x, output y);
endinterface

module E (a, out1);
  input [2:0] a;
  output [3:0] out1;
  iface ifc();
  foo U1 (ifc.MP1);
endmodule

module foo(iface.MP2 ifc);
endmodule

```

Attempting to connect an interface instance to a modport port is not allowed in synthesis due to the separate compilation constraint. The following example results in the error message.

```
interface iface;
  wire x,y;
  modport MP(input x, output y);
endinterface

module E (a, out1);
  input [2:0] a;
  output [3:0] out1;
  iface ifc();
  foo U1 (ifc);
endmodule

module foo(iface.MP ifc);
endmodule
```

WHAT NEXT

Correct the ports in the module instantiation and the module definition so that they are consistent and then invoke the compiler again.

SEE ALSO

`elaborate(2)`

ELAB-382 (error) %s Module %s was not elaborated because it contains the generic interface as port.

DESCRIPTION

You receive this error message because you are elaborating a module with generic interface as port.

WHAT NEXT

Specify the interface in elaboration or elaborate the upper designs containing instantiations of this module.

SEE ALSO

`elaborate (2).`

ELAB-383 (error) %s Too many elements in assignment pattern expression list

DESCRIPTION

The elements listed in an aggregate expression must be in one-to-one correspondence with the members of the structure type or the elements of the array type into which the aggregate expression is being assigned, aggregated, or cast.

EXAMPLE

In the following example, structures of type *shoe* have just two members. Since *shoe* is not declared to be a *packed* structure, lists enclosed within curly braces that are assigned to *shoes* are interpreted according to the rules for aggregate expressions. Thus, lists longer than two elements are rejected, even if they would be valid as (packed array) concatenations.

```
typedef struct {
    logic [3:0]heel;
    logic [3:0]toe;
} shoe;

shoe left, right;
shortint tongue;

left = { right.toe, 4'b1111, tongue };      // Shoe is too small
right= { 1'b1, left.heel[2:0], left.toe }; // Not a Verilog concat
```

WHAT NEXT

Check for a mismatch between the structure declaration and its uses, due to incompatible versions of two source files.

If concatenation was intended where an unpacked aggregate expression is now parsed, consider changing the structure declaration to *packed*, or regrouping the elements to correspond to the structure members as declared.

ELAB-384 (error) %s Too few elements in assignment pattern expression list

DESCRIPTION

The elements listed in an aggregate expression must be in one-to-one correspondence with the members of the structure type or the elements of the array type into which the aggregate expression is being assigned, aggregated, or cast.

EXAMPLE

In the following example, structures of type *shoe* have just two members. Since *shoe* is not declared to be a *packed* structure, lists enclosed within curly braces that are assigned to *shoes* are interpreted according to the rules for aggregate expressions. Thus, lists with less than two elements are rejected, even if they would be valid as (packed array) concatenations.

```
typedef struct {
    bit [3:0] sole;
    bit [3:0] tongue;
} shoe;

shoe left, right;
byte heel;

left = { right.sole }; // Shoe is too big
right= { heel };      // Not a Verilog concat
```

WHAT NEXT

Check for a mismatch between the structure declaration and its uses, due to incompatible versions of two source files.

If concatenation was intended where an aggregate expression is now parsed, check that the structure declaration is *packed*, or try decomposing and regrouping the listed elements to correspond to the structure members as declared.

ELAB-385 (Error) %s interface '%s' cannot be found.

DESCRIPTION

This error message occurs because the Presto HDL compiler cannot find the intermediate files of the interface.

WHAT NEXT

Ensure that the interface has been analyzed and the intermediate files are in the working directory, and then run the compiler again.

SEE ALSO

analyze (2), **elaborate** (2), **read** (2).

ELAB-386 (error) %s Name clash on net '%s'.

DESCRIPTION

You receive this error message because your two names in your design cause a name clash in the netlist. The name clash can be between two same named objects or two similar named objects in conjunction with a naming style.

Eg. when choosing net naming style "%n_%d" the following declarations can create a name clash:

```
// net naming style set to "%s_%d"  
  
// nameclash regarding r_0:  
reg r_0;  
reg [0:3] r; // will result in r_0, r_1, r_2 and r_3
```

WHAT NEXT

Ensure that all object names in your design are unambiguous, considering the naming style you are using.

SEE ALSO

elaborate (2), **read** (2), **analyze** (2).

ELAB-387 (error) %s The '%s' attribute is supported only if that attribute is used in conformance with the style described in the Synopsys manual for the VHDL Compiler.

DESCRIPTION

You receive this error message when an attribute usage is not in conformance with the style described in the Synopsys manual for the VHDL Compiler.

You might have used the attribute as the RHS expression of blocking assignment, non-blocking assignment, or, in the return expression of function, etc.

WHAT NEXT

See the *HDL Compiler for VHDL Reference Manual* for ways to use the attributes.

SEE ALSO

elaborate (2), **read** (2).

ELAB-388 (warning) %s X and/or Z bits occur in an actual parameter to the '%s' design template.

DESCRIPTION

This warning message occurs when you create an instance of a parameterized subdesign using a constant value that contains X or Z bits.

In classical synthesis, these bits are zeroed to form ordinary integer or string constants. However, in the current operating mode, the full four-state parameter value is used as written when the subdesign is elaborated. If the subdesign uses it as a casex or casez statement label, there may be a mismatch between synthesis and simulation results.

Synthesis results will also differ from HDL Compiler, from versions of Presto HDL up to and including 2004.06, and from Presto synthesis results obtained with the **hdlin_allow_4state_parameters** variable set to false.

Don't care bits in parameters do not indicate wildcard matching within the design libraries.

WHAT NEXT

Convert the casex item into a literal or convert the casex statement into a case statement.

For more information, see the **-parameters** option on the **elaborate** command man page.

SEE ALSO

elaborate(2)
hdlin_allow_4state_parameters(3)

ELAB-389 (warning) %s X and Z bits in parameters of subdesign '%s' are set to zero.

DESCRIPTION

You are creating an instance of a parameterized subdesign using a constant value which contains x or z bits. In classical synthesis coding styles, parameters are integer or string constants. In the current operating mode, 4-state parameter values are being cast to 2-state values (by setting x and z bits to zero) before the subdesign is elaborated. If the subdesign uses this parameter as a casex or casez statement label, there may be a mismatch between synthesis and simulation results.

Don't-care bits in parameters do not indicate wildcard matching within the design libraries.

WHAT NEXT

Try to convert the casex item into a literal or convert the casex statement into a case statement.

SEE ALSO

`elaborate -parameter (2), hdlin_allow_4state_parameters.`

ELAB-390 (warning) %s Variable or function call in casex item is a potential simulation/synthesis mismatch.

DESCRIPTION

You receive this warning message when a variable or function call is used in a casex item. Even if an x bit is assigned to a variable or returned by a function call, the value of the case item will not match both 0 and 1, as it would for an x bit in a literal in a casex item. For example:

```
b = 2'b1x ;
casex (a)
  b : ... // in this case, 2'b1x only matches 2'b10
endcase
```

A full example:

```
module m( o1 , o2 );
output o1, o2 ;
reg o1, o2 ;

function f ;
  input [1:0] R ;
  casex (2'b11)
    R : f = 1'b0 ;
    default : f = 1'b1 ;
  endcase
endfunction

always begin
  o1 = f(2'b1x) ;
end

reg [1:0] R;
always begin
  R = 2'b1x;
  casex (2'b11)
    R : o2 = 1'b0 ;
    default: o2 = 1'b1 ;
```

```
    endcase
end

endmodule
```

WHAT NEXT

Convert the casex item into a literal or convert the casex statement into a case statement.

SEE ALSO

ELAB-391 (warning) %s Variable %s may be read before being assigned; the synthesized result may not match simulations.

DESCRIPTION

You receive this warning message because a variable that is local to a function or task may be read before being assigned. When the `hdlin_infer_function_local_latches` variable is set to `false`, the Presto HDL Compiler does not preserve variable values across separate calls to a task or function, unlike a simulator. Any bits of the variable that are not assigned before being used are given the value 0. No latches are inferred for variables local to a subprogram.

When the `hdlin_infer_function_local_latches` variable is set to `true`, the compiler matches the simulator's behavior. This may result in additional latches in your design.

WHAT NEXT

If you intended to use a value set during a previous call, set `hdlin_infer_function_local_latches` to `true` in order to preserve the value across calls.

If you did not intend to use a value across calls, check your design to verify that you assigned all local variables before using them.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-392 (warning) %s Value of function %s may be used before being assigned; the synthesized result may not match simulations.

DESCRIPTION

A Verilog function definition implicitly declares a variable, internal to the function, with the same name as the function. You receive this warning message when the function may return without the variable having been assigned or when the variable may be read by the function body before the variable is assigned.

When the `hdlin_infer_function_local_latches` variable is set to *false*, the Presto HDL Compiler does not preserve variable values across separate calls to a task or function, unlike a simulator. Any bits of the variable that are not assigned before being used are given the value 0. No latches are inferred for variables local to a subprogram.

When the variable `hdlin_infer_function_local_latches` is set to *true*, the compiler matches the simulator's behavior. This may result in additional latches in your design.

WHAT NEXT

If you intended to use a return value set during a previous call, set `hdlin_infer_function_local_latches` to *true* in order to preserve the value across calls.

If you did not intend to use a return value across calls, check your design to verify that a meaningful value is returned by the function.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-393 (warning) %s Value of function '%s' is used before being assigned; the synthesized result may not match

simulations.

DESCRIPTION

A Verilog function definition implicitly declares a variable, internal to the function, with the same name as the function. You receive this warning message when the function returns without the variable having been assigned or when the variable is read by the function body before the variable is assigned.

When the variable **hdlin_infer_function_local_latches** is set to *false*, the Presto HDL Compiler does not preserve variable values across separate calls to a task or function, unlike a simulator. Any bits of the variable that are not assigned before being used will be given the value 0. No latches will be inferred for variables local to a subprogram.

When the variable **hdlin_infer_function_local_latches** is set to *true*, the compiler will match the simulator's behavior. This might result in additional latches in your design.

WHAT NEXT

If you intended to use a return value set during a previous call, set **hdlin_infer_function_local_latches** to *true* in order to preserve the value across calls.

If you did not intend to use a return value across calls, check your design to verify that a meaningful value is returned by the function.

SEE ALSO

elaborate (2), **read** (2).

ELAB-394 (error) %s Specified resource sharing (label %s) is not realizable. There is conflict among the operations.

DESCRIPTION

You receive this error message when the specified resource sharing is not realizable. For example:

```
module ppf (cond, cond2, a,b, c, d, z, y); input cond, cond2; input [3:0] a, b, c, d; output [3:0] z, y; reg [3:0] z, y;

always @(a or b or c or d) begin : b1 /* synopsys resource r0 : ops = "a0 a1", map_to_module = "DW01_add", implementation = "rpl", add_ops="false"; */

if (cond) begin z = a + /* synopsys label a0 */ b; y = c + /* synopsys label a1 */
```

```
d; end else z = a + c; end  
endmodule  
  
Resoure r0 can not be shared by a0 and a1.
```

WHAT NEXT

Modify resource sharing pragma, make sure the specified resources can be shared.

SEE ALSO

elaborate (2), **read** (2).

ELAB-395 (warning) %s Latch inferred in design %s read with 'hdlin_check_no_latch'

DESCRIPTION

The variable `hdlin_check_no_latch` directs the `read` command to ensure no latch is inferred in the HDL file.

WHAT NEXT

Check whether the value of `hdlin_check_no_latch` is correct or HDL file contains error hence latches are inferred unexpectedly.

SEE ALSO

elaborate (2), **read** (2).

ELAB-396 (warning) %s Floating net '%s' connected to ground.

DESCRIPTION

You receive this warning message when a previously unconnected net has been connected to ground. This message reminds you to check whether the behavior resulting from connecting the net to ground conforms to your expectations.

WHAT NEXT

Verify that connecting the specified net to ground results in the desired behavior.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-397 (error) %s The module or interface '%s' needs to be analyzed.

DESCRIPTION

This error message occurs when the Presto HDL Compiler fails to read the intermediate file after analyzing.

WHAT NEXT

Ensure that the module or interface is analyzed before running the command.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-398 (error) %s Synthesis does not support implicit ref port '%s'.

DESCRIPTION

You receive this error message when you pass an **interface instance** to a **module instantiation** and the interface declares a variable. According to section 19.2.2 of the System Verilog LRM, such variables pass to the module as implicit ports whose direction is **ref**. However, ref ports are not supported in synthesis.

The port name cited in the message is constructed from the interface's port or instance name, followed by an underscore and the variable name.

In the following example, *s* is a logic variable in the *I* interface that becomes a ref port for module test, and causes the error message.

```
interface I();
    logic s;
endinterface

module test(I i);
endmodule
```

```
module top();
I i;
test t (i); // Error: ... implicit ref port 'i_s' (ELAB-398)
endmodule
```

WHAT NEXT

Change the variable to *net*, or refer to a *modport* of the interface which imposes a synthesizable port direction for this variable.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-399 (error) %s Type query %s on undefined expression or type.

DESCRIPTION

You receive this error message because the tool detected an error when querying on an undefined expression or type.

In the example below, the argument of \$bits is undefined, which causes the error message to be issued.

```
module top(i, o);
input [$bits(t)-1:0] i;
output [$bits(t)-1:0] o;
endmodule
```

WHAT NEXT

Correct the query argument and run the command again.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-400 (error) %s Type query %s requires an array

reference as the first argument.

DESCRIPTION

This error message occurs when you attempt an array query on a non-array type.

In the following example, the \$left argument does not have an array type, so the error message is issued.

```
typedef logic t;

module top(i, o);
    input [$left(t)-1:0] i;
    output [$left(t)-1:0] o;
endmodule
```

WHAT NEXT

Correct the query argument and run the command again.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-401 (warning) %s Comparisons to don't-care or to unknown literals are always treated as being false. This may cause simulation to disagree with synthesis.

DESCRIPTION

This warning message occurs because comparisons in hardware are inherently different than in the simulator. Digital hardware comparators can only distinguish between ones and zeros. As a result, it does not make sense to synthesize comparisons to three-state, don't-care, or unknown literals. Since signals are assumed to carry a value of one or zero, equality tests to non-one or zero values always return false in synthesis.

WHAT NEXT

This is only a warning message. No action is required.

If the comparison was used only for simulation purposes you do not need to modify your HDL. For example, if you want to print a message when an input port is in the high-impedance state, it is acceptable to compare its value to z.

If you are using the comparison to affect the state of your circuit, you should consider recoding your HDL. For example, if you need a four-state state machine, do not declare a single-bit variable and use 0, 1, x, and z as your states. In hardware, each bit only holds two useful states: 1 and 0.

SEE ALSO

`elaborate(2)`

ELAB-403 (warning) %s Presto uses shift to implement signed division.

DESCRIPTION

You receive this warning message when Presto HDL Compiler uses shift to implement signed division. The result does not match the simulation result, but it is the same behavior as the HDL Compiler and Formality.

If you want to match simulation behavior, set the `hdlin_signed_division_use_shift` variable to `false`, which is the default value.

WHAT NEXT

This is only a warning message. No action is required.

However, you can perform the verification and change the value of the `hdlin_signed_division_use_shift` variable to `false` to match the simulation result.

SEE ALSO

`analyze(2)`
`elaborate(2)`
`read(2)`
`read_file(2)`
`hdlin_signed_division_use_shift(3)`

ELAB-404 (error) %s Unpacked type used as index.

DESCRIPTION

You receive this error message when an unpacked type is used as an index for a subscription or a vector part-select.

WHAT NEXT

Change the type of index expression or cast it to packed types and run the command again.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-405 (warning) %s Net %s or a directly connected net may be driven by more than one process or block.

DESCRIPTION

You receive this warning message when a `reg` variable is driven by more than one always block, or a `wire` variable could be driven by more than one continuous assignment, and you have also set the `hdlin_prohibit_nontri_multiple_drivers` variable to `false`.

This warning message is issued because an invalid design could result.

In the following example, the assignment in the module could cause multidriven issues for wire t.

```
module M(input i, output o);
  wire t = i;
  assign t = o;
endmodule
```

The compiler permits multiple drivers on nets declared as `tri`, but it issues a warning if one of the drivers is not a three-state device.

WHAT NEXT

This is only a warning message.

An invalid design may result when this warning is issued. Multiple driver nets are only generated because the `hdlin_prohibit_nontri_multiple_drivers` variable is set to `false`.

Consider modifying the design to avoid driving a variable from more than one always block or continuous assignment.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-406 (warning) %s The binding of %s is ignored.

DESCRIPTION

You receive this message from the **elaborate** or **read** command when the compiler eliminates binding of the specified signal. The bindings are usually made by assignments. The reason for the elimination is that there is no reference to the specified signal before the next binding.

For example:

```
always @* begin
    t = 1;
    t = 2;
end
```

The binding of the first assignment to *t* is overwritten by the second assignment. The message warns you that the first assignment is eliminated.

The following is another example:

```
module M (input i, output o);
reg t;
always @* begin
    t = 1;
end
endmodule
```

The binding of *t* is not used anywhere else, so you are warned when it is eliminated.

WHAT NEXT

This is only a warning message.

However, if the elimination is unexpected, modify the code and run the tool again.

SEE ALSO

```
analyze(2)
read(2)
```

ELAB-407 (error) %s All edge events in a single process must

depend on the same signal.

DESCRIPTION

This error message occurs when a process contains more than one event wait (in VHDL), or when an always block contains more than one edge expression (in Verilog or SystemVerilog). All of the waits must be for an edge on the same signal.

WHAT NEXT

Recode the design so that all event waits depend on the same variable.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-408 (error) %s Only some paths through the process contain event waits; waits must occur on all or no paths through a process.

DESCRIPTION

This error message occurs when a process contains any event wait (in VHDL), or when an always block contains any edge expression (in Verilog or SystemVerilog). All paths through that block must reach at least one event wait. It must be impossible to execute the process or block without triggering a wait.

WHAT NEXT

Recode the design so that all paths reach an event wait.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-409 (error) %s Edge expression being tested is not a

simple edge.

DESCRIPTION

This error message occurs when a process contains any event wait (in VHDL), or when an always block contains any edge expression (in Verilog or SystemVerilog). The event the system is waiting for must be a simple edge expression.

WHAT NEXT

Recode the design so that all event waits are for simple edge expressions.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-410 (error) %s Processes with both 'wait' statements and 'if' statements that test events are not currently supported.

DESCRIPTION

This error message occurs when a process contains an event wait, and an if statement in the same process contains an event as part of the condition. This process type is not supported by Presto.

WHAT NEXT

Recode the design so that it contains only event waits or an if statement that tests an event condition.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-411 (error) %s Processes or always blocks with multiple events are disallowed when `hdlin_allow_multiple_waits` is false.

DESCRIPTION

This error message occurs when the Presto HDL Compiler encounters a process

containing more than one event wait when reading or elaborating a Verilog or VHDL design.

Presto supports the read and elaborate processes, except when the **hdlin_allow_multiple_waits** variable is set to false. The default value is true.

The most common reason for setting **hdlin_allow_multiple_waits** to false is as part of a range of settings that ensure that designs can be elaborated by the Formality RTL readers.

WHAT NEXT

Either set **hdlin_allow_multiple_waits** to true, or recode the design so that it contains only a single event wait or an if statement that tests an event condition.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-412 (error) %s Wait or event statements that do not depend on edge events are not supported.

DESCRIPTION

This error message occurs when the design being read or elaborated contains a process with a wait statement that does not depend on an edge event, or an always block that does not depend on a posedge or negedge expression.

This error also occurs when SystemVerilog designs contain special-form always blocks, such as `always_comb` or `always_ff`, and also contain a sensitivity list. Designs containing any of these statements are not supported.

WHAT NEXT

Recode the design so that it contains only event waits.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-413 (error) %s Processes containing more than one 'if'

statement that tests an event expression are not supported.

DESCRIPTION

This error message occurs because a process that contains more than one if statement that tests an event expression is not supported.

WHAT NEXT

Recode the design so that each process contains no more than one if statement that tests an event expression in each process.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-414 (warning) %s Ignoring %s - too complex for synthesis to utilize.

DESCRIPTION

This warning message issues when the Presto HDL Compiler finds a labelled assertion or assertion severity system task call whose logical structure lies outside the current synthesis subset.

- Generally, the asserted expression should compare only one variable or signal to a compile-time constant, or else
 - It should make a \$onehot or \$onehot0 claim about a collection of signal wires.
 - It must not have any statements in its action_block.
 - It should use bitwise NOT (~) of the complete argument, rather than reduction NOT (!) of each bit when forming a \$onehot() argument to assert a one-cold relationship.

Consult the SystemVerilog User Guide for the exact definition of the subset currently supported by this release.

WHAT NEXT

This is only a warning message. No action is required.

However, if you do not want the construct to be ignored, you must simplify it, perhaps into several separate relations.

SEE ALSO

elaborate(2)
confirmed_SVA(3)
hdlin_enable_assertions(3)

ELAB-420 (warning) %s Invalid symbol '%s' or expression in a signal name list of a pragma or assertion. It is being ignored.

DESCRIPTION

This warning message occurs when the Presto HDL Compiler finds an invalid symbol or expression in the list of signal names submitted to a Verilog or VHDL compiler pragma or in a SystemVerilog assertion. This can be caused by one of the following:

- The type of the signal or expression is invalid for the pragma or asserted condition.
- If the signal or its expression is an array, its index or bounds should be a constant expression. No function call is allowed, including a constant function call.
- The type of the signal or the expression accessing it cannot involve a union type.
- For one_hot and one_cold pragmas or \$onehot and \$onehot0 system functions, the signal name list can only contain signals that are ports.

WHAT NEXT

This is only a warning message. No action is required.

However, if you do not want the symbol and/or its expression to be ignored in this context, correct the symbol name and/or its expression and analyze the RTL again.

SEE ALSO

analyze(2)
elaborate(2)
read(2)

ELAB-425 (error) %s Found expression without known width in

context that requires one

DESCRIPTION

You receive this error when you use an expression that cannot have a width or whose width cannot be determined in a context that requires an expression with a well-defined width.

An example from SystemVerilog:

```
interface IFC;
    logic a, b;
    assign b = a;
    modport mp(output a, input b);
endinterface

module test(output out, input in);
    IFC ifc();
    bot bot(ifc.mp, out, in);
endmodule

module bot (IFC.mp ifc, output out, input in);
    assign out = ifc; // Error -- intended ifc.b, not just ifc
    assign ifc.a = in;
endmodule
```

WHAT NEXT

Make sure that you have not written an expression without a well-defined width.

SEE ALSO

elaborate (2), **read** (2).

ELAB-490 (error) %s Variable or function call in casex item is a potential simulation/synthesis mismatch.

DESCRIPTION

You receive this error message in verification friendly mode when a variable or function call is used in a casex item. Even if an x bit is assigned to a variable or returned by a function call, the value of the case item will not match both 0 and 1, as it would for an x bit in a literal in a casex item. For example:

```
b = 2'b1x ;
```

```
casex (a)
  b : ... // in this case, 2'b1x only matches 2'b10
endcase
```

A full example:

```
module m( o1 , o2 );
output o1, o2 ;
reg o1, o2 ;

function f ;
  input [1:0] R ;
  casex (2'b11)
    R : f = 1'b0 ;
    default : f = 1'b1 ;
  endcase
endfunction

always begin
  o1 = f(2'b1x) ;
end

reg [1:0] R;
always begin
  R = 2'b1x;
  casex (2'b11)
    R : o2 = 1'b0 ;
    default: o2 = 1'b1 ;
  endcase
end

endmodule
```

WHAT NEXT

Convert the casex item into a literal or convert the casex statement into a case statement.

SEE ALSO

elaborate(2)
read(2)

ELAB-491 (warning) %s Embedded configuration statements

are not supported for synthesis. They are ignored.

DESCRIPTION

This warning is issued when the design on which the **elaborate** or **read** command is invoked includes embedded configuration statement. Embedded configuration statements are not supported, and is ignored.

WHAT NEXT

Rewrite the design using configuration blocks and try again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-495 (error) %s Variable or function call in case-inside item is a potential simulation/synthesis mismatch.

DESCRIPTION

You receive this error message in when a variable or function call is used in a case-inside item. Even if an x bit is assigned to a variable or returned by a function call, the value of the case-inside item will not match both 0 and 1, as it would for an x bit in a literal in a case-inside item. For example:

```
b = 2'b1x ;
case (a) inside
    b : ... // in this case, 2'b1x only matches 2'b10
endcase
```

A full example:

```
module m( o1 , o2 );
output o1, o2 ;
reg o1, o2 ;

function f ;
input [1:0] R ;
case (2'b11) inside
    R : f = 1'b0 ;
    default : f = 1'b1 ;
endcase
endfunction
```

```
always begin
    o1 = f(2'b1x) ;
end

reg [1:0] R;
always begin
    R = 2'b1x;
    case (2'b11) inside
        R : o2 = 1'b0 ;
        default: o2 = 1'b1 ;
    endcase
end

endmodule
```

WHAT NEXT

Convert the case-inside item into a literal or convert the case-inside statement into a case statement.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-500 (warning) %s No Design Compiler license, Presto optimization: %s can not be enabled.

DESCRIPTION

Presto advanced optimizations need check Design Compiler (DC) license. If no DC license, the optimizations will not be enabled and this warning message will be generated.

WHAT NEXT

Get DC license.

ELAB-501 (error) %s defparam assignment for %s was ignored.

DESCRIPTION

Defparam assignment to task, function or block parameters are ignored for synthesis.

WHAT NEXT

Recode the design using named parameter assignments and try again.

ELAB-510 (information) %s Presto preserved an unloaded net '%s'.

DESCRIPTION

You receive this information message when Presto HDL Compiler preserves a net that may not be driving any loads.

WHAT NEXT

Check your design for possible misconfiguration of port directions or port connections and try again. You may ignore this information if the connections are part of the required design specifications.

ELAB-600 (error) %s Pre-analyzed files for module '%s' not found.

DESCRIPTION

You receive this message because the Presto HDL compiler cannot find the pre-analyzed files for the given module during elaboration.

WHAT NEXT

Ensure that the module to be elaborated has been analyzed with the variable `hdlin_sv_ieee_assignment_patterns` set to a value of 2 or higher.

SEE ALSO

`elaborate` (2), `analyze` (2).

ELAB-601 (error) %s %s is not supported for %s.

DESCRIPTION

The combination of array of instances and assignment patterns on ports on a module

instantiation is not supported for synthesis.

WHAT NEXT

Please recode to remove either the array of instances, or the assignment pattern on the ports construct and try again.

SEE ALSO

elaborate (2), **analyze** (2).

ELAB-800 (error) %s The loop variable is not initialized to a constant.

DESCRIPTION

You receive this error message when your loop variable is not initialized to a constant, as required by Presto synthesis. The following example results in the error message.

```
for(i = non_constant ; i < 64 ; i = i+1)
begin
    loop_body
end
```

WHAT NEXT

Rewrite the loop so that the loop variable is initialized to a constant. The previous example can be rewritten as follows if non_constant is positive:

```
for (j = 0; j < 64; j = j+1)
begin
    i = j + non_constant;
    if ( i < 64 )
        loop_body
end
```

SEE ALSO

elaborate (2), **read** (2);

ELAB-801 (warning) %s BDD result may not be complete.

DESCRIPTION

You receive this error message because the BDD memory limit has been reached. The BDD result may not be complete, so the QOR (Quality of Results) may be worse than expected. The default BDD memory limit is 6M.

WHAT NEXT

Use the hidden variable **hdlin_bdd_memory_limit** to increase the memory limit.

SEE ALSO

elaborate (2), **read** (2);

ELAB-802 (warning) %s The port default value in entity declaration for port '%s' is not supported. Presto ignores it.

DESCRIPTION

You receive this warning message because port default values in entity declaration are ignored by Presto VHDL.

In the following example, the port default values '1' and 'Z' for the ports A and Z will be ignored:

```
entity test is
  port (A: in std_logic := '1';
        EN: in std_logic;
        Z: out std_logic := 'Z'
      );
end;
```

WHAT NEXT

Verify if it implements the behavior you intended after ignoring the port default values, and modify your code if needed.

SEE ALSO

elaborate (2), **read** (2).

ELAB-803 (warning) %s There is a name conflict between the instance '%s' and an existing cell. The name of the instance is being renamed to '%s'.

DESCRIPTION

This warning message occurs when you specify an instance name of a module instantiation that has already been used by another existing cell. The message may be caused by the following circumstances:

- There is a name conflict between your instance name and another instance name generated in FOR-GENERATE statement. In this case, if the original instance name in the FOR-GENERATE statement is *mod_name*, the tool may generate a series of instance names based on it in the form: *mod_name*, *mod_name_1*, *mod_name_2*, etc.
- There is a name conflict between your instance name and another instance name in your code.

WHAT NEXT

If you want the instance name to be renamed to the new name indicated in the warning message, no action is required on your part. However, if you want to keep the instance name unchanged, you can resolve the conflict by modifying the name of the conflicting instance name in your code, and then run the tool again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-804 (error) %s error found for parameters value near token '%s'.

DESCRIPTION

You received this error message because there is an error in parameter value list given by module/component instantiation or by elaborate command.

Presto VHDL adds support for the following types: integer, bit, bit_vector, std_ulogic, std_ulogic_vector, std_logic, std_logic_vector, signed, and unsigned.

Presto Verilog adds support for parameters with verilog numbers and strings.

Presto SVerilog adds support for parameters wth verilog numbres, strings and type parameters.

The parameter specification is a list of values separated by commas, based on parameter order (for example, "3,4,5") or parameter names (for example, "N=>8, M=>16").

WHAT NEXT

Correct the error in the parameter value list and then run the command again. Refer to the man page for the **elaborate** command for information on the accepted parameter list syntax.

SEE ALSO

elaborate (2).

ELAB-820 (error) %s This use of clock'event specification not supported

DESCRIPTION

This error occurs if you use more than one **if clock'event** expression in a process or if you embed the **clock'event** expression inside a subprogram or loop.

The following example shows a positive- and negative-edge trigger in the same process.

```
entity test is
  port(clock, a: in bit; z1, z2: out bit);
end;

architecture a of test is
begin
  process (clock)
  begin
    if(clock'event and clock = '1') then
      z1 <= a;
    end if;

    if(clock'event and clock = '0') then -- ERROR
      z2 <= a;
    end if;
  end process;
end;
```

WHAT NEXT

Restructure your code to have a single "if clock'event" construct at the start of the process.

The previous example can be fixed by splitting the process into two processes.

```
entity test is
  port(clock, a: in bit; z1, z2: out bit);
end;

architecture a of test is
begin
  process (clock)
  begin
    if(clock'event and clock = '1') then
      z1 <= a;
    end if;
  end process;

  process (clock)
  begin
    if(clock'event and clock = '0') then
      z2 <= a;
    end if;
  end process;
end;
```

ELAB-832 (warning) %s Undriven register '%s' is connected to primary output '%s'.

DESCRIPTION

This warning message occurs when Presto determines that the listed register is not driven in the source code. The cause might be an issue in your design. Review your source code to ensure that this will not translate to incorrect outputs.

Normally, Presto grounds undriven registers, but the listed register will not be grounded because it is connected to a primary output.

An example of this situation happens in the following code:

```
module example(input [1:0] x, input y, output reg [1:0] z);
  always @* begin
    z[2*x]= y;
  end
endmodule
```

For $z[1]$, Presto normally creates the register $z_reg[1]$, but it can never be assigned because $2*x$ will never be 1. Therefore, $z_reg[1]$ is an undriven register

and it is not created. The output z[1] is also undriven.

WHAT NEXT

Modify your code to drive the listed register properly.

SEE ALSO

ELAB-833n

ELAB-833 (warning) %s Register '%s' is undriven.

DESCRIPTION

This warning message occurs when Presto determines that the listed register is not driven in the source code. The cause might be an issue in your design. Review your source code to ensure that this will not translate to incorrect outputs.

An example of this situation happens in the following code:

```
module example(input [1:0] x, input y, output reg z);
    reg [1:0] t;
    always @* begin
        t[2*x]= y;
        z= &t;
    end
endmodule
```

For t[1], Presto normally creates the register t_reg[1], but it can never be assigned because 2*x will never be 1. Therefore, t_reg[1] is an undriven register and it is not created.

Note that Presto grounds automatically undriven registers that are not connected to primary outputs. In the example Presto handles t[1] as constant 0 because it is not directly connected to output z. The output z is 0.

For undriven registers connected to primary outputs, Presto issues a warning with the ELAB-832 message.

WHAT NEXT

Modify your code to drive the listed register properly.

SEE ALSO

ELAB-832(n)

ELAB-900 (error) %s Loop exceeded maximum iteration limit.

DESCRIPTION

You receive this error message when your loop runs on forever, or is designed to run some number of times greater than the iteration limit. When the compiler processes loops, the loop condition must fail at some point.

WHAT NEXT

Set the `hdlin_while_loop_iterations` variable to a higher number.

SEE ALSO

`elaborate` (2), `read` (2); `hdlin_while_loop_iterations` (3).

ELAB-901 (error) %s Function call stack exceeded maximum depth.

DESCRIPTION

You receive this error message when the depth of the function call stack exceeds the maximum depth currently supported by Presto to prevent runaway function call chains.

The most probable reason of this error is because your design has an infinite recursion.

Note that this message may be shown for recursive functions that finish in simulation, but are infinite in synthesis. One example of infinite recursion, and thus unsupported, is this design:

```
module fact (input [3:0] n, output [40:0] z);

    function [40:0] f;
        input [3:0] k;
        begin
            if (k==0)
                f = 1;
            else
                f = k * f(k-1);
        end
    endfunction

    assign z = f(n);
endmodule
```

This example will not finish in synthesis because the terminating condition depends

on a port and therefore is never a proper constant.

WHAT NEXT

Check your design for an infinite recursion.

SEE ALSO

elaborate (2), **read** (2).

ELAB-902 (warning) %s In the call to '\$display', the '%%%c' format specifier is not supported.

DESCRIPTION

You receive this warning message when you execute the **elaborate** or the **read** command with a format specifier that is not supported. The following specifiers are supported, and the rest are ignored:

WHAT NEXT

Reexecute the **elaborate** or **read** command with a format specifier that is supported.

SEE ALSO

elaborate (2), **read** (2).

ELAB-903 (warning) %s Insufficient pins supplied to array of modules for instance '%s' of design '%s'.

DESCRIPTION

You receive this warning message when the wires you specify for a given port do not meet the following requirements:

- 1) Wires must match the width of the port on the module.
- 2) The wires must be an integer multiple of the width of the port.

WHAT NEXT

Respecify the wires so that they meet the above requirements.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-904 (error) %s When instantiating '%s' array of modules, the implementation design '%s' must be available.

DESCRIPTION

You receive this error message when you execute the `elaborate` or `read` command and specify an array of modules that contain a black box.

Because of the strict nature of the port connections for instantiating an array of modules, the design to be instantiated cannot be a black box; you must provide the complete design.

WHAT NEXT

Verify that the implementation design is available. Also check to see that there is not a typo in the name of the module to be instantiated.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-906 (error) %s Too many parameters passed to module instance %s.

DESCRIPTION

You receive this message because the list of parameter override values exceeds the number of parameters declared in the module. This is a list of parameter override values that can be supplied when instantiating a module.

WHAT NEXT

Ensure that the number of parameters passed to a module instance matches the number of parameters declared in the module.

ELAB-908 (error) %s Exponentiation is only supported if the

base is a power of 2 or the exponent is 2.

DESCRIPTION

You receive this error message because one of these situations exist. Either

1. The base of an exponentiation expression is variable and the exponent is not 2.
or
2. The exponent is not 2.

WHAT NEXT

Correct the expression so that its base is constant or its exponent is not 2.

SEE ALSO

elaborate (2) ~

ELAB-909 (warning) %s Case statement is not a full case.

DESCRIPTION

You receive this warning message because you used the " // synopsys full_case" directive for this case statement and you set the **hdlin_check_user_full_case** variable to **true**. However, the case statement is not a full case statement.

WHAT NEXT

No action is necessary on your part. However, you can verify that the case statement implements the behavior you intended, try to make the case statement full, or set the **hdlin_check_user_full_case** variable to **false**.

SEE ALSO

elaborate (2), **read** (2).

ELAB-910 (warning) %s Case statement is not a parallel case.

DESCRIPTION

You receive this warning message because you used the " // synopsys parallel_case"

directive for this case statement and you set the `hdlin_check_user_parallel_case` variable to `true`. However, this case statement is not parallel. A case is parallel when all of its branches are mutually exclusive.

WHAT NEXT

Try to make the case statement parallel, or set the `hdlin_check_user_parallel_case` variable to `false`.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-911 (error) %s Can not find return port name of type function '%s'.

DESCRIPTION

You receive this error message because this type function does not have the required return port name.

WHAT NEXT

Define a return port name for the type function by using -- pragma `return_port_name`.

SEE ALSO

`elaborate` (2).

ELAB-912 (error) %s Negative exponent.

DESCRIPTION

You receive this error message when the tool detects a negative exponent.

The exponent might be entered directly or might be the result of an expression. For example, the expression `(2**(M-N))` has a negative exponent when both M and N are constant, and N is larger than M.

WHAT NEXT

Remove the negative exponent from the expression.

SEE ALSO

`elaborate` (2).

ELAB-913 (error) %s Divide by zero.

DESCRIPTION

You receive this error message when the tool detects division by a constant value, which is zero in a VHDL file.

The zero might be entered directly or it might be the result of an expression. For example, the expression (WIDTH/ (M-N)) divides by zero if both M and N are equal constants.

WHAT NEXT

Remove the division by zero from the expression.

SEE ALSO

`elaborate` (2).

ELAB-914 (error) %s Direction ('to' or 'downto') does not agree with 'first' and 'last' values in range.

DESCRIPTION

You receive this error message because you specified a direction that conflicts with the position in the range.

- Use the keyword `downto` when the first value in the range is greater than the last value.
- Use the keyword `to` when the first value in the range is less than the last value.

WHAT NEXT

Rewrite your descriptions using `downto` and `to` as described above. In the following example, the direction is `downto`, because 15 is greater than 0.

VHDL:

```
signal my_bus : bit_vector ( 15 to 0 );
```

SEE ALSO

elaborate (2).

ELAB-915 (error) %s Expected value but was supplied unknown

DESCRIPTION

You receive this error message because a case statement contains "unknown" instead of a value.

For example, the tool issues the message if an enumeration literal with a U encoding is supplied to a case statement.

WHAT NEXT

Change the case choice to avoid an unknown value.

SEE ALSO

elaborate (2).

ELAB-916 (error) %s Can not find definition for %s .

DESCRIPTION

You receive this error message if the declared function, operator, or procedure cannot be found in the VHDL libraries or packages.

WHAT NEXT

Include the correct library or package.

SEE ALSO

elaborate (2), **read** (2).

ELAB-917 (error) %s Type of port '%s' is unconstrained.

DESCRIPTION

You receive this error message if the port type is unconstrained.

WHAT NEXT

Do not use unconstrained for the port type.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-918 (warning) %s Physical types are not supported. Presto ignores it.

DESCRIPTION

You receive this warning message because physical types are not supported by Presto VHDL. Presto ignores physical types.

WHAT NEXT

No action is required on your part. Use caution when physical types are used.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-919 (error) %s Unsupported range type used in array declaration.

DESCRIPTION

You receive this error message because the range type you specified in the array declaration is not supported. For example, std_logic is not supported as the range of an array.

WHAT NEXT

Rewrite the array declaration using a supported range type.

SEE ALSO

elaborate (2), **read** (2).

ELAB-920 (warning) %s OPS entry '%s' is already included in another resource. Entry ignored.

DESCRIPTION

You receive this warning message because during **elaborate** or **read** command activity, the compiler detected a label that appears in the ops list of more than one resource, which is invalid.

The following example shows the invalid entry:

```
synopsys resource r0 : ops = "op1 op2";      //op2 appears twice
synopsys resource r1 : ops = "op2 op3";
```

WHAT NEXT

Correct your code so that each label appears in the ops list of only one resource.

SEE ALSO

elaborate (2), **read** (2).

ELAB-921 (error) %s Built-in %s currently is not supported yet.

DESCRIPTION

The built-in used is not supported yet. Changes to VHDL sources may be needed.

WHAT NEXT

Change your VHDL source file to avoid using the built-in.

SEE ALSO

elaborate (2), **read** (2).

ELAB-922 (error) %s Constant value required.

DESCRIPTION

This error message occurs because an expression in the indicated line of your RTL description does not evaluate to a constant value, as required by the language.

In the example below, the expression in the generate case statement is required to evaluate to a constant value at elaboration time. The use of an input port in that expression violates this requirement.

```
module m (a);
    input a;

    generate
        case (a)          // error: not constant
            ...
    endgenerate
endmodule
```

WHAT NEXT

Change your source file to use a constant value and run the command again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-923 (error) %s Potential glitch on net '%s': A signal/variable can't be synchronously and asynchronously assigned within the same process.

DESCRIPTION

This error is issued when the design on which the **elaborate** or **read** command is invoked is not supported for synthesis because there is a potential glitch on a net. This is caused by the order in which multiple sequential statements that assign to the same net are executed.

In the following example, the if statements are executed sequentially.

```
architecture RTL of E is
begin
    process (CLK, RST)
    begin
        if (CLK'event and CLK ='1') then
```

```

        Q <= D;
    end if;
    if (RST = '1') then
        Q <= '0';
    end if;
end process;
end RTL;

```

In the event that the conditions on both if statements evaluate to TRUE, Q will momentarily be assigned the value of D before being assigned '0', resulting in a possible glitch.

To avoid this situation, if a D flip-flop with an asynchronous reset is desired, the rtl can be rewritten as shown.

```

architecture RTL of E is
begin
process (CLK, RST)
begin
    if (RESET = '1') then
        Q <= '0';
    elsif (CLK'event and CLK ='1') then
        Q <= D;
    end if;
end process;
end RTL;

```

WHAT NEXT

Modify the design to avoid a potential glitch on a net and ensure that the design accurately specifies the desired functionality. Invoke the compiler again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-924 (warning) %s Signal assignment delays are not supported for synthesis. They are ignored.

DESCRIPTION

This warning is issued when a signal assignment statement in the design on which the **elaborate** or **read** command is invoked includes delay information. The delay is not supported and is ignored.

WHAT NEXT

No modification is required. Ensure the delay that is ignored is not integral to the

functionality of the design.

SEE ALSO

elaborate (2), **read** (2).

ELAB-925 (error) %s Attribute %s is not supported for synthesis.

DESCRIPTION

This error is issued when the compiler encounters an attribute that is not supported for synthesis in the design on which the **elaborate** or **read** command is invoked.

WHAT NEXT

Remove the attribute that is causing the error and rerun the compiler.

SEE ALSO

elaborate (2), **read** (2).

ELAB-926 (error) %s %s types are not supported for synthesis.

DESCRIPTION

This error is issued when the compiler encounters a physical, access, or file type in the design on which the **elaborate** or **read** command is invoked. These types are not supported for synthesis.

WHAT NEXT

Avoid using unsupported types in the design.

SEE ALSO

elaborate (2), **read** (2).

ELAB-927 (error) %s cannot find architecture %s of entity %s in

library %s.

DESCRIPTION

This error message occurs when the compiler is unable to find a specific entity or architecture pair in a library.

WHAT NEXT

Ensure that all entity and architecture names are specified correctly. Remove any special characters that may be problematic.

SEE ALSO

elaborate (2), **read** (2).

ELAB-928 (error) %s An if statement containing a clock event has an illegal else branch and is not supported for synthesis.

DESCRIPTION

This error occurs when a value is assigned on the "else" part of an "if clock'event".

An example of RTL that is not synthesizable because an assignment does not depend on a clock edge is shown:

```
entity test is
  port(clock, a, b: in bit; z: out bit);
end;

architecture a of test is
begin
  process (clock, a, b)
  begin
    if(clock'event and clock = '1') then
      z <= a;
    else
      z <= b; -- ERROR
    end if;
  end process;
end;
```

The following example shows RTL that is not synthesizable because assignments occur on multiple clock edges:

```
entity test is
```

```

port(clock, a, b: in bit; z: out bit);
end;

architecture a of test is
begin
  process (clock, a, b)
  begin
    if(clock'event and clock = '1') then
      z <= a;
    elsif(clock'event and clock = '0') then
      z <= b; -- ERROR
    end if;
  end process;
end;

```

A variable can receive both asynchronous and synchronous assignments, but the asynchronous assignment must take precedence. That is, there must be a Boolean condition that enables the asynchronous part and disables the synchronous part.

WHAT NEXT

Use an "if" statement to ensure that either that the asynchronous or synchronous assignments fire in any execution of the process. Make sure that the condition controlling this "if" (the asynchronous reset condition) is level sensitive, not edge sensitive.

SEE ALSO

elaborate (2), **read** (2).

ELAB-929 (error) %s Illegal use of unpacked type %s.

DESCRIPTION

This error message occurs because the RTL code uses an unpacked type in a location where unpacked types are illegal, as shown in the following example.

```

struct {int i;} ctrl; // unpacked structure
...
y = ctrl ? a:b; //
error: control expression not allowed to be of unpacked type

```

WHAT NEXT

Change the unpacked type to a packed type and run the command again.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-930 (error) %s Incompatible types %s.

DESCRIPTION

This error message occurs because the language standard requires the equivalence of two types in the indicated context, but the actual provided types are not equivalent, as shown in the example below.

```
// two non equivalent structures
struct {int i;} a;
struct {char c;} b;
...
y = c ? a : b; // error: types of both conditional branches must be equivalent
```

The precise rules for type compatibility are given in section 5.8 of the *SystemVerilog LRM*. Incompatibility can arise due to differences in vector widths, packed versus unpacked dimensions, unpacked structures that come from different declaration sites, or other inconsistencies between two data types where they are required to correspond.

WHAT NEXT

The end of the error message indicates the kind of construction that requires the type equivalence, which is usually an assignment, an aggregate construction, or a relational operator.

Identify the part of the cited line that corresponds to the indicated language feature. Determine the source of the two types that are involved. Correct the data accesses or their type declarations so that equivalent types are used and run the command again.

SEE ALSO

`elaborate`(2)
`read`(2)

ELAB-931 (warning) %s implicit truncation caused by range

overflow.

DESCRIPTION

This warning message occurs when a value is truncated by the CONV_SIGNED or CONV_UNSIGNED function, because the value overflows the range specified by SIZE.

WHAT NEXT

This is a warning message only. No action is required on your part. However, be aware that some information may be lost because of the truncation.

SEE ALSO

elaborate (2), **read** (2).

ELAB-932 (Error) %s %s type as range type is not supported.

DESCRIPTION

You receive this error message because the range type you specified in the array declaration or loop parameter is not supported. For example, std_logic/bit/boolean is not supported as the range of an array. or std_logic/bit/boolean is not supported as the discrete range in the loop parameter.

WHAT NEXT

Rewrite the array declaration or loop parameter range using a supported range type.

SEE ALSO

elaborate (2), **read** (2).

ELAB-933 (warning) %s REM operator is synthesized differently in this version of HDL Compiler.

DESCRIPTION

This warning message occurs when a REM operator with a potentially negative first operand is encountered.

Previous versions of HDL Compiler synthesized the REM operation as a MOD operation,

resulting in a potential synthesis and simulation mismatch.

The Presto engine within HDL Compiler handles a REM operation with a negative first operand correctly and does not translate it as a MOD operation. Therefore, Presto HDL Compiler does not produce the same result as previous versions of HDL Compiler.

WHAT NEXT

This is a warning message only. No action is required on your part.

If a REM operation is intended, be aware that the synthesis results may differ from that of older versions of HDL Compiler. However, if a MOD operation is intended, modify the source code to use a MOD operator.

To suppress further instances of this warning, add ELAB-933 to the list of error codes specified by the suppress_errors variable.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-934 (error) %s Architecture '%s' of design '%s' cannot be found.

DESCRIPTION

This error occurs when the specified architecture for a design cannot be found.

WHAT NEXT

Ensure the desired architecture exists and has been specified correctly.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-935 (warning) %s the direction (to or downto) does not agree with the values first and last in the range.

DESCRIPTION

This warning message occurs when you specify a direction that conflicts with the position in the range.

- Use the keyword **downto** when the first value in the range is greater than the last value.
- Use the keyword **to** when the first value in the range is less than the last value.

WHAT NEXT

This is a warning message only. No action is required.

Ignore the warning message if the code is unreachable. However, if the code does not reflect the design you intended, make the necessary corrections and rerun the command.

SEE ALSO

`elaborate(2)`

ELAB-936 (warning) %s Attribute %s is not supported for synthesis and will be ignored.

DESCRIPTION

This warning is issued when the compiler encounters an attribute that is not supported in the design on which the **elaborate** or **read** command is invoked.

WHAT NEXT

No user action is required. However, be aware that the attribute will be ignored.

SEE ALSO

`elaborate (2)`, `read (2)`.

ELAB-937 (error) %s Constant expression too complex.

DESCRIPTION

You are receiving this error message because in a context requiring a constant expression you are using an expression that is not constant or too complex to be handled by the compiler. This can be a restriction of the language or the compiler.

Example:

```
module (in);
  input [0:3] in;
  parameter p = 2;

  generate
    if (in[p])      // error: in[p] is not a constant expression
    ...
  end generate
```

WHAT NEXT

Simplify the constant expression so the compiler can determine the value at compile time.

SEE ALSO

elaborate (2), **read** (2).

ELAB-938 (error) %s An order based parameter was specified after a name based parameter for the module instance %s.

DESCRIPTION

This error happens when the argument to the elaborate command includes a combination of order-based and name-based parameter values, and all the order-based parameters are not specified before name-based parameters.

WHAT NEXT

Modify the arguments to the elaborate command so that all order-based parameters occur before name-based parameters.

SEE ALSO

elaborate (2).

ELAB-939 (error) %s The system function '%s' is not supported for synthesis.

DESCRIPTION

This error message occurs when a system function called in the design is not

implemented for synthesis.

WHAT NEXT

Remove the specified system function call in your design and reread or reanalyze it.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-940 (warning) %s real types are ignored.

DESCRIPTION

This warning message occurs when a real type is encountered in the design. Real types are not supported by the compiler and are ignored.

WHAT NEXT

This is a warning message only. No action is required.

However, be aware the portion of the design that involves real types will not be implemented.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-941 (error) %s attribute %s of prefix %s cannot be found.

DESCRIPTION

This error message occurs when the attribute specification of the named attribute in the attribute reference is nonexistent or is defined in an invalid scope.

WHAT NEXT

Ensure that the attribute specification of the desired attribute is defined in the current scope and then rerun the command.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-942 (Error) %s %s of physical types are not supported in synthesis.

DESCRIPTION

You receive this error message because physical types are not supported by Presto VHDL as procedure or function parameters, entity or block ports types, etc.

WHAT NEXT

Remove the procedure or function parameters, or the entity or block ports that are assuming physical types and rerun the command.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-943 (warning) %s Generic %s does not have a default value.

DESCRIPTION

You receive this warning message because the generic default value is not specified.

WHAT NEXT

Set the default value for the given generic and run the command again.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-944 (warning) %s Non-standard coding style used to

implement a sequential element.

DESCRIPTION

You receive this warning message when the design contains a non-standard coding style to describe a sequential element. Non-standard coding styles can lead to problems during simulation and may not be supported by other tools.

The following example contains a non-standard coding style to infer a sequential element with asynchronous reset. Two separate if statements are used to describe the synchronous part and the asynchronous reset. This can cause a problem during simulation.

```
entity e is
  port (d: in bit;
        q: out bit;
        clk: in bit;
        r: in bit
      );
end;

architecture a of e is
  signal t: bit;
begin

  p: process (clk) is
  begin
    if (clk'event and clk = '1') then
      t <= d;
    end if;
    if (r = '1') then
      t <= '0';
    end if;
  end process;

  q <= t;

end;
```

The next example shows a standard way to describe the sequential element:

```
entity e is
  port (d: in bit;
        q: out bit;
        clk: in bit;
        r: in bit
      );
end;

architecture a of e is
  signal t: bit;
```

```
begin

p: process (clk) is
begin
  if (r = '1') then
    t <= '0';
  else if (clk'event and clk = '1') then
    t <= d;
  end if;
end process;

q <= t;

end;
```

WHAT NEXT

This is only a warning message. No action is required.

If you are willing to accept potential simulation problems, you can leave the code unchanged.

If you want to avoid possible simulation problems, refer to the *HDL Compiler (Presto Verilog) Reference Manual* or *HDL Compiler (Presto VHDL) Reference Manual* for the recommended coding style.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-945 (error) %s Attribute not supported with index value different from '1'.

DESCRIPTION

You receive this error because the VHDL attribute is used with an index value different from '1'. The attribute is only supported for index value '1'.

WHAT NEXT

Rewrite your VHDL code so it doesn't use the attribute with an index value different from '1'.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-946 (error) %s Assignment to %s overflows declared bounds.

DESCRIPTION

This error message occurs when a variable is assigned a value whose size is larger than the declared bounds of the variable.

WHAT NEXT

Fix the offending assignment and try again.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-950 (error) %s out of bounds index [%d] into scope array '%S'.

DESCRIPTION

WHAT NEXT

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-951 (error) %s Indexed access to %s not allowed.

DESCRIPTION

This error message occurs when an indexed access is made into a scope that does not support indexed operation.

WHAT NEXT

Rewrite your design to change or eliminate the illegal access and try again.

SEE ALSO

elaborate(2)
read(2)

ELAB-952 (error) %s The genvar '%s' has been assigned the value '%s' repeatedly.

DESCRIPTION

This error message occurs when the same **genvar** variable is assigned more than one time. According to the Verilog LRM this is illegal. Only one assignment to each **genvar** variable is allowed.

WHAT NEXT

Rewrite the Verilog RTL code so that there is only one assignment to each **genvar** variable.

SEE ALSO

elaborate(2)
read(2)

ELAB-953 (error) %s Array of scopes '%s' cannot be referenced without an index.

DESCRIPTION

This error message occurs when your Verilog RTL code contains a hierarchical reference to an object inside a generate loop scope. The hierarchical reference must specify which iteration of the for loop it refers to. This is accomplished by subscripting the for loop scope name with the value of the **genvar** variable specific to this loop iteration, as shown in the following example:

```
module m (y);
    output [0:3] y;
    genvar i;

    generate
        for (i=0; i<4; i=i+1) begin : blk
            wire t;
        end
    endgenerate
```

```
assign y = blk[1].t;      // subscript 'blk' with genvar value '1'  
endmodule
```

WHAT NEXT

Rewrite your Verilog RTL code so that the hierarchical name uses subscripts to access specific generate loop iterations.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-954 (warning) %s Nonstandard generate block outside of generate conditional or generate loop.

DESCRIPTION

This warning message occurs because the Verilog standard no longer permits generate blocks that do not belong to the branches of a generate conditional or a generate loop.

Presto Verilog still handles singleton generate blocks for backward compatibility, but other tools may not.

The following example shows a singleton generate block that causes this warning message:

```
module m ();  
  
begin : blk      // deprecated singleton generate block  
end  
  
end
```

WHAT NEXT

This is only a warning message.

You can eliminate this warning message by using a generate block that is associated with a generate conditional or a generate loop.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-955 (warning) %s State register '%s': changing state encoding from gray to binary.

DESCRIPTION

This warning message indicates that the requested FSM encoding style "gray" cannot be implemented because the number of states is not a power of 2. In this case the encoding is changed to binary.

WHAT NEXT

This is only a warning message. The state machine will still be implemented, but with binary encoding.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-956 (Warning) %s Unknown FSM encoding '%s' requested.

DESCRIPTION

You are receiving this warning message because you set the Presto option "hdlin_force_fsm_encoding" to an unknown value. The permitted values are: one_hot, binary, gray, none.

In case of an unknown value, the value 'none' is assumed.

WHAT NEXT

Change the value of the option "hdlin_force_fsm_encoding" to one of the permitted values.

SEE ALSO

`elaborate (2)`, `read (2)`.

ELAB-957 (Error) %s Generate construct not inside generate

region.

DESCRIPTION

You are receiving this error message because the Verilog standard requires that generate constructs must occur inside a generate region (generate regions are indicated by the keywords 'generate...endgenerate'). The generate construct at the indicated source location is not inside a generate region.

WHAT NEXT

Add a generate region, by surrounding generate constructs with the keywords 'generate...endgenerate'.

SEE ALSO

elaborate (2), **read** (2).

ELAB-958 (Error) %s Generate loop requires named begin block.

DESCRIPTION

You are receiving this error message because the Verilog 2001 standard requires that loop generate constructs contain a named begin block. Your RTL either does not contain a begin block or the begin block is not named. Please note that the 2005 update of the Verilog standard all

WHAT NEXT

Add a named block to the loop generate construct.

SEE ALSO

elaborate (2), **read** (2).

ELAB-959 (error) %s Illegal value assigned to a genvar variable.

DESCRIPTION

This error message occurs when any bit of of a genvar variable is set to an X or Z. Genvar values with X or Z are not supported in Synthesis.

WHAT NEXT

Rewrite the Verilog RTL code such that genvar variables are assigned legal values and try again.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-960 (error) %s Constant value not supported in given context.

DESCRIPTION

This error message occurs when any bit of a constant value is an X or Z, and the context in which it is used does not allow for such values in the constant.

WHAT NEXT

Rewrite the Verilog RTL code such that the constant value does not evaluate to bits with X or Z, and try again.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-961 (error) %s Constant expression (%s) not supported in given context.

DESCRIPTION

This error message occurs the reported operation is not supported in evaluation context.

WHAT NEXT

Rewrite the Verilog RTL code such that the reported operation does not happen in the given context, and try again.

SEE ALSO

`elaborate(2)`

ELAB-974 (warning) %s Netlist for always_comb block contains a latch%s.

DESCRIPTION

This warning message occurs during **read** or **elaborate** command activity to advise you that a latch is inferred for an always_comb block.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

If combinational logic is intended, you can rewrite the always_comb block.

If combinational logic is not intended, you can remove the always_comb keyword.

SEE ALSO

elaborate(2)
read(2)

ELAB-975 (warning) %s Netlist for always_latch block does not contain a latch.

DESCRIPTION

This warning message occurs during **read** or **elaborate** command activity to advise you that the netlist for an always_latch block does not contain a latch. This may be because the always_latch block represents combinational logic or because all latches could be optimized away.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

If latched logic is intended, determine whether the body of the `always_latch` block represents latched logic. If it does not, then a design problem in the `always_latch` block has been detected. However, if the `always_latch` block does represent latched logic, then a coding simplification opportunity may have been detected.

If latched logic is not intended, you can replace the `always_latch` keyword.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-976 (warning) %s Netlist for always_ff block does not contain a flip-flop.

DESCRIPTION

This warning message occurs during `read` or `elaborate` command activity to advise you that the netlist for an `always_ff` block does not contain a flip-flop. This may be because the `always_ff` block does not actually represent sequential logic or because all of the flip-flops could be optimized away.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

If sequential logic is intended, determine whether the body of the `always_ff` block represents sequential logic. If not, then a design problem in the `always_ff` block has been detected. However, if the `always_ff` block does represent sequential logic, then a coding simplification opportunity may have been detected.

If sequential logic is not intended, you can replace the `always_latch` keyword.

ELAB-982 (warning) %s Netlist for always_comb block is empty.

DESCRIPTION

This warning message occurs during `read` or `elaborate` command activity to advise you that no logic is inferred for an `always_comb` block, because none of the signals driven from that block are needed to compute the outputs of the module. For example:

```
module test(input  logic in,
             output logic out);
  logic tmp;
  assign out = in ;
  always_comb begin
    tmp = in;
  end
endmodule
```

WHAT NEXT

If combinational logic is intended, determine whether the body of the `always_comb` block represents combinational logic. If not, then a design problem in the `always_comb` block has been detected.

However, if the `always_comb` block does represent combinational logic, then either the signals driven by this block are not connected as intended or a coding simplification opportunity has been detected and the `always_comb` block can be removed.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-983 (warning) %s Netlist for always_latch block is empty.

DESCRIPTION

This warning message occurs during `read` or `elaborate` command activity to advise you that no logic is inferred for an `always_latch` block, because none of the signals driven from that block are needed to compute the outputs of the module. For example:

```
module test(input  logic clk,
             input  logic in,
             output logic out);
    logic tmp;
    always_latch begin
        if(clk)
            tmp <= in;
    end
endmodule
```

WHAT NEXT

If latched logic is intended, determine whether the body of the `always_latch` block represents latched logic. If not, then a design problem in the `always_latch` block has been detected.

However, if the `always_latch` block does represent latched logic, then either the signals driven by this block are not connected as intended or a coding simplification opportunity has been detected and the `always_latch` block can be removed.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-984 (warning) %s Netlist for always_ff block is empty.

DESCRIPTION

This warning message occurs during `read` or `elaborate` command activity to advise you that no logic is inferred for an `always_ff` block, because none of the signals driven from that block are needed to compute the outputs of the module. For example:

```

module test(input logic clk,
            input logic in,
            output logic out);
    logic tmp;
    always_ff @(posedge clk) begin
        tmp <= in;
    end
endmodule

```

WHAT NEXT

If sequential logic is intended, determine whether the body of the `always_ff` block represents sequential logic. If not, then a design problem in the `always_ff` block has been detected.

However, if the `always_ff` block does represent sequential logic, then either the signals driven by this block are not connected as intended or a coding simplification opportunity has been detected and the `always_ff` block can be removed.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-985 (warning) %S Netlist for always block is empty.

DESCRIPTION

This warning message occurs during `read` or `elaborate` command activity to advise you that no logic is inferred for a SystemVerilog always block with an implicit or explicit sensitivity list, because none of the signals driven from that block are needed to compute the outputs of the module. For example:

```

module test(input logic in,
            output logic out);
    logic tmp;
    assign out = in ;
    always @* begin
        tmp = in;
    end
endmodule

```

WHAT NEXT

Either the signals driven by this block are not connected as intended or a coding simplification opportunity has been detected and the always block can be removed.

SEE ALSO

elaborate(2)
read(2)

ELAB-989 (error) %s Packed union members must be of the same size.

DESCRIPTION

You receive this error message because a packed union has been declared with members of different sizes. The *Language Reference Manual* (LRM) specifies that "A packed union shall contain members that must be packed structures, or packed arrays or integer data types all of the same size".

For example:

```
module test #(parameter OFFSET_BITSIZE = 16,
              parameter PAGE_BITSIZE = 16);
    union packed {
        int numeric;
        struct packed {
            bit [OFFSET_BITSIZE-1:0] offset;
            bit [PAGE_BITSIZE-1:0] page;
        } vaddress;
    } one_union;
endmodule
```

If the module test is going to be instantiated with parameter values other than the defaults, they must add 32, in order for the bit width of the packed structure vaddress to be of the same size than the integer numeric (32).

WHAT NEXT

Modify your source file so that all union members have the same bit width.

ELAB-990 (error) %s Width of distributed port expression does not equal width of declared type of structure of instances.

DESCRIPTION

You receive this message because a distributed port expression, such as .p(<expr>), in a structure of instances does not have the same number of bits as the type declared for the structure of instances.

WHAT NEXT

Modify code so that the distributed port expression has the same number of bits as the declared type of the structure of instances.

ELAB-991 (warning) %s The type of a <distributed port expression> is not equivalent to the structured <type> of these instances.

DESCRIPTION

You receive this message because a distributed port expression, such as .p(<expr>) in a structure of instances, does not have the declared type for the structure of instances. For example, the type declared for the structure of instances might be a packed structure, while the type of the distributed port expression might be a simple bit-vector type of the same length.

WHAT NEXT

If the expression bit width of each distributed port matches the number of instances, they will be distributed anyway. However, as a precaution, you should examine the RTL code to make sure that the distributed port expression's type is actually intended to align with the instance structure in a bit-streamed order. If so, consider using an explicit cast of the port expression to clarify that this is what you intend.

ELAB-992 (error) %s The lhs width=%s does not match the rhs width=%s of the assignment statement.

DESCRIPTION

You receive this message because the assignment statement has a width mismatch problem.

WHAT NEXT

Modify code to resolve this issue.

ELAB-993 (warning) %s Synthesis/simulation mismatch for

multiplier.

DESCRIPTION

You receive this error message because the multiplier is optimized assuming no result truncation. Verilog/VHDL semantics require result truncation to be taken into account. In most cases assuming no result truncation results in the intended behaviour and better QOR. If the design relies on multiplier truncation, this message indicates bad logic. When you see this message, there may be a synthesis/simulation mismatch.

Strict Verilog/VHDL semantics can be forced by setting the following option:

```
set hdlin_idxopt_optimize_mul false
```

This will resolve the synthesis/simulation mismatch, but can result in QOR degradation.

WHAT NEXT

Modify code to resolve this issue.

ELAB-994 (warning) %s Found an unknown pragma '%s'; it will be ignored.

DESCRIPTION

You receive this warning message from the **elaborate** or **read** command, if there is an unknown pragma. The unknown pragma will be ignored.

WHAT NEXT

Check the spelling of the unknown pragma and correct it if necessary; otherwise consider to remove the unknown pragma.

SEE ALSO

elaborate (2), **read** (2).

ELAB-995 (error) %s Real to integer conversion is not

supported.

DESCRIPTION

This error message occurs because the Presto HDL Compiler does not support the real to integer conversion currently.

WHAT NEXT

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-996 (error) %s WAIT statement inside FOR loop is not supported.

DESCRIPTION

This error message occurs because the Presto HDL Compiler does not support WAIT statements inside FOR loops.

WHAT NEXT

Modify the code to remove the error source.

SEE ALSO

[elaborate\(2\)](#)
[read\(2\)](#)

ELAB-997 (error) %s Multidimensional part-select is not supported.

DESCRIPTION

This error message occurs because the Presto HDL Compiler does not support part-select operators (+: and -:) with multidimensional arrays.

WHAT NEXT

Modify the code to remove the error source.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-998 (error) %s The rhs width does not match the lhs width of the logical operator statement.

DESCRIPTION

You receive this message because the logical operator statement has a width mismatch problem.

WHAT NEXT

Modify code to resolve this issue.

ELAB-999 (error) %s Width of actual parameter does not match the formal parameter '%s'.

DESCRIPTION

You received this error message because width of the actual parameter does not match the mismatch the actual parameter, given by module/component instantiation or by elaborate command.

WHAT NEXT

Modify formal or actual parameter type to match the width.

ELAB-1000 (error) %s Overflow in a conversion of a real type number: %s.

DESCRIPTION

You receive this message because there is an overflow in a conversion of a real type

number.

WHAT NEXT

Modify code to resolve this issue.

ELAB-1001 (error) %s Overflow in a real type number or calculation.

DESCRIPTION

You receive this message because there is an overflow in a real type number or calculation. The number/result is greater than REAL'HIGH = 1.0e+38 or smaller than REAL'LOW = -1.0e+38.

WHAT NEXT

Modify code to resolve this issue.

ELAB-1002 (warning) %s Real types with ranges are not supported and will be ignored.

DESCRIPTION

You receive this message because there is a real type with a range defined. This is not supported. A real type without ranges will be used.

WHAT NEXT

This is a warning message only. No action is required.

However, be aware the portion of the design that involves real types with ranges could behave differently.

ELAB-1010 (error) %s Complex usage of multiple events

statements is not supported.

DESCRIPTION

This error message occurs because the Presto HDL Compiler does not support complex multiple events in an verilog always block or a VHDL process.

WHAT NEXT

Modify the code to have only one event per always or process.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-1011 (warning) %s Comparison operator always returns '%s' when comparing values with different widths.

DESCRIPTION

This warning message occurs when the tool detects that there is a comparison with values of different width which evaluates always as unequal.

This can result in never reached statements within a comparison branch.

WHAT NEXT

Resolve the potential problem.

SEE ALSO

`elaborate (2)`, `read (2)`.

ELAB-1012 (error) %s The width is too big.

DESCRIPTION

This error message is issued when the tool detects that there is a width which exceeds the supported range.

WHAT NEXT

Resolve the potential problem by decreasing the used width.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-1013 (error) %s PORT/GENERIC declaration in BLOCK header is not supported.

DESCRIPTION

Declaration and use of generics and ports in a block header is not supported.

WHAT NEXT

Remove port and generic declarations from the block header and adapt the block statements if necessary.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-1014 (warning) %s The lhs width=%s does not match the rhs width=%s of the comparison.

DESCRIPTION

This warning message occurs when the tool detects that there is a comparison with values of different widths.

WHAT NEXT

Correct the widths so that they are the same and run the command again.

SEE ALSO

`elaborate`(2)
`read`(2)

ELAB-1015 (warning) %s Ignoring SystemVerilog checker '%s' instantiation: '%s'

DESCRIPTION

This warning message occurs because the SystemVerilog *checker* construct and its instantiations are ignored.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`elaborate(2)`
`read(2)`

ELAB-1016 (Error) %s Port %s is not declared by this module or interface

DESCRIPTION

You receive this error message when a port name used in a module or interface instantiation or in an **elaborate -parameter** argument is not declared as a port by that module or interface.

In the following example, the *foo* module is instantiated with a named port connection. It uses the named ports *a*, *o* and *state*. However, *state* is not in the port list definition of the *foo* module, so the error message occurs.

```
module E (a, out1, state);
  input [2:0] a;
  output [3:0] out1;
  output state;
  foo U1 (.a(a), .o(out1), .state(state));
endmodule

module foo(input [2:0] i, output [3:0] o, output status);
endmodule
```

WHAT NEXT

Correct the names of the ports so that they are consistent with the module

definition, and then invoke the compiler again.

SEE ALSO

elaborate (2) **link** (2)

ELAB-1060 (error) %s Symbol '%s' results in multiple objects.

DESCRIPTION

The named symbol results in creation of objects that conflicts with each other. The most likely cause of this error is importing of symbols from interfaces or classes into a module. During the import phase, homographs are created that in most cases can be automatically resolved, however in some cases such as this, automatic resolution is not possible.

WHAT NEXT

Look for ELAB-106 warnings for the symbol in question, and rename or resolve the homographs.

SEE ALSO

ELAB-106 (n),

ELAB-2000 (error) %s Incorrect value for hdlin_infer_ram: '%s'; possible values are 'all', 'default', or 'none'.

DESCRIPTION

Allowed values for the **hdlin_infer_ram** variable are *all*, *none*, and *default*. When *all* is the value, HDL Compiler attempts to infer a RAM_OP for a 2-dimensional register. When *none* (the default value) is the value, HDL Compiler does not attempt to infer any RAM_OPs for a Verilog or VHDL design.

When *default* is the value, HDL Compiler attempts to infer a RAM_OP for a 2-dimensional register, only if the register is marked with the **infer_ram** directive,

For details, see the *HDL Compiler for Verilog Reference Manual* or the *VHDL Compiler Reference Manual*.

To determine the current value of this variable, type **list hdlin_infer_ram**. For a list of hdl variables and their current values, type **list -variables hdl**.

WHAT NEXT

Set `hdlin_infer_ram` to one of the values `all`, `default`, or `none`.

SEE ALSO

`elaborate` (2), `read` (2), `hdlin_infer_ram` (3).

ELAB-2001 (warning) %s Ignored infer_ram pragma value '%s' on register '%s'.

DESCRIPTION

You receive this message because, during `elaborate` or `read` command activity, the compiler has detected invalid synopsys `infer_ram` pragma value on the memory element.

Currently supported values are `none`, `auto`, `distrubuted` and `no_rw_check`. These values specify the implementation of memory.

For details, see the *HDL Compiler for Verilog Reference Manual* or the *VHDL Compiler Reference Manual*.

SEE ALSO

`elaborate` (2), `read` (2), `hdlin_infer_ram` (3).

ELAB-2002 (warning) %s The design '%s' has no parameters. The parameters '%s' has been ignored.

DESCRIPTION

You receive this message because, during `elaborate` or `read` command activity, the compiler has detected that cell has be instantiated with the parameter. But the down design to which this cell is linked does not take any parameters.

SEE ALSO

`elaborate` (2), `read` (2).

ELAB-2004 (warning) %s Signal %s has %s attribute, but is %s.

A possible mismatch of attribute and behavior.

DESCRIPTION

You receive this warning message because one_hot signal is used in an active low situation while one_hot attribute indicates the signal should be active high, or a one_cold signal is used in an active high situation while one_cold attribute indicates the signal should be active low.

This warning reminds the designer to keep the attribute of the signal consistent with the behavior of the signal.

WHAT NEXT

This is a only a warning and requires no action on your part.

ELAB-2008 (information) %s Complex logic will not be considered for set/reset inference.

DESCRIPTION

You receive this information when, during **elaborate** or **read** command activity, some possible set/reset logics have been excluded from consideration for set/reset inference, because they were estimated to be too complex, for example, because they were driven by another instance.

If the `hdlin_infer_complex_set_reset` is set to TRUE, if the control logic is complex and that drives the data pin of register to zero, the control logic gets moved to the reset line; and any control logic that drives the data pin to one, gets moved to the set line. And if `hdlin_infer_complex_set_reset` is set to FALSE (default), no complex control logic gets moved to the set/reset lines and it will stay on the data line.

Usually excluding these complex possibilities leads both to better quality of result and to better runtime. Hence this message is not a warning, but only informational. Occasionally, however, the designer knows reasons why it would be good for the compiler to consider additional, more complex, possibilities. When this is so, it can be communicated to the compiler by overriding to true the default value of the `hdlin_infer_complex_set_reset` variable.

SEE ALSO

elaborate (2), **read** (2), **hdlin_infer_complex_set_reset** (3).

ELAB-2010 (error) %s Size mismatch in the assignment.

DESCRIPTION

This error message occurs when right hand side of the assignment is not the same as left hand size.

WHAT NEXT

Fix the offending assignment and try again.

SEE ALSO

elaborate (2), **read** (2).

ELAB-2015 (warning) %s illegal tristate driver '%s' on the wired types. may cause simulation/synthesis mismatch.

DESCRIPTION

You receive this message because Output of the tristate is used to drive more than one wired net. These nets may be driven directly by the tristate, or might be driven indirectly through another wired net.

WHAT NEXT

Check the assignments on wired type, to fix the error

ELAB-2016 (error) %s Found illegal tristate driver/drivers on the wired types.

DESCRIPTION

You receive this message because Output of the tristate is used to drive more than one wired net. These nets may be driven directly by the tristate, or might be driven indirectly through another wired net. To override this error message set `hdlin_error_illegal_driver_on_wired_type` to FALSE. Overriding this error might cause

WHAT NEXT

To override this error message set `hdlin_error_illegal_driver_on_wired_type` to FALSE.

Overriding this error might cause simulation/synthesis mismatch.

ELAB-2017 (warning) %s Ignoring 'infer_onehot_mux' pragma because case not marked %s.

DESCRIPTION

You receive this message because the case statement marked as "infer_onehot_mux" is not marked as "full_case" or "parallel_case". Both pragmas "full_case" and "parallel_case" are required for the "infer_onehot_mux" pragma to be honored by the compiler.

WHAT NEXT

Make sure the case statement is really "full" and "parallel", then add the "full_case" and "parallel_case" pragmas to the "infer_onehot_mux" pragma.

ELAB-2018 (error) %s Conflicting pragmas '%s' and '%s' cannot be applied simultaneously.

DESCRIPTION

You receive this message because you applied two conflicting pragmas simultaneously. The pragmas are either conflicting or the tool does not support the application of both pragmas.

WHAT NEXT

Keep the pragma that was intended to be used and remove the conflicting other pragma.

ELAB-2020 (error) %s %s.

DESCRIPTION

Presto VHDL front-end has detected the following semantic error during **analyze** command. Please fix this error and re-analyze this file.

```

ELAB-2024 (warning) %s Clock %s used as data.

DESCRIPTION

You receive this warning message because Presto HDL Compiler detected clock signals used for purposes other than clocking.

WHAT NEXT

Modify the design to avoid using clock for purposes other than clocking.

SEE ALSO

`elaborate (2), read (2).`

ELAB-2025 (error) %s Call to impure function '%s' is not supported.

DESCRIPTION

You receive this error message because Presto VHDL does not support calls to Impure functions.

SEE ALSO

`elaborate (2), read (2).`

ELAB-2028 (error) %s Default value of the sized parameter '%s' has been overridden with an expression whose self-determined type is not as wide as the parameter.

DESCRIPTION

You receive this warning message when the default value of a sized parameter '%s' has been overridden with an expression whose self-determined type is not as wide as the parameter.

In synthesis the expression used in a parameter override is evaluated in a self-determined context, so in the following example, parameter P in the instantiation "bot1" is overridden with an expression that is evaluated with 1-bit width precision.

But in simulation, because the width of the sized parameter P in the module BOT is 2, the expression would be evaluated with 2-bit width precision. As in this example, the difference in precision can lead to different results between simulation and synthesis.

```
'define E 1'b1 + 1'b1
module TOP (output test_bit);
    wire [1:0] w1, w2;
    assign test_bit = (w1 == w2);
    BOT#(.P('E)) bot1(w1);
    BOT bot2(w2);
endmodule

module BOT #(parameter [1:0] P = 'E) (output [1:0] o);
    assign o = P;
endmodule
```

WHAT NEXT

Either reduce the size of the parameter or override the parameter with an expression whose self-determined type is as least as wide as the parameter.

ELAB-2029 (warning) %s Default value of the sized parameter '%s' has been overridden with an expression whose self-determined type is not as wide as the parameter.

DESCRIPTION

You receive this warning message when the default value of a sized parameter '%s' has been overridden with an expression whose self-determined type is not as wide as the parameter.

In synthesis the expression used in a parameter override is evaluated in a self-determined context, so in the following example, parameter P in the instantiation "bot1" is overridden with an expression that is evaluated with 1-bit width precision.

But in simulation, because the width of the sized parameter P in the module BOT is 2, the expression would be evaluated with 2-bit width precision. As in this example, the difference in precision can lead to different results between simulation and synthesis.

```
'define E 1'b1 + 1'b1
module TOP (output test_bit);
    wire [1:0] w1, w2;
    assign test_bit = (w1 == w2);
    BOT#.P('E) bot1(w1);
    BOT bot2(w2);
endmodule

module BOT #(parameter [1:0] P = 'E) (output [1:0] o);
    assign o = P;
endmodule
```

WHAT NEXT

Either reduce the size of the parameter or override the parameter with an expression whose self-determined type is at least as wide as the parameter.

ENV

ENV-001 (error) Value for %s cannot be larger than the %s value.

DESCRIPTION

Some commands work in pairs, specifying a max and min value. The min value must be less than the max value. For example, never specify a **min_capacitance** which is larger than the **max_capacitance** for the same design or port.

WHAT NEXT

Remove the old value or use a different value.

ENV-1 (error) Variable '%s' is not defined.

DESCRIPTION

WHAT NEXT

ENV-002 (warning) Invalid value '%s' for variable '%s'.

%s

DESCRIPTION

You received this message because you specified an invalid value for the specified variable. The message should provide valid values for the variable.

WHAT NEXT

If the message did not provide valid values for the variable, refer to the manual page for the variable. Reset the variable with a valid value, then reexecute the command.

ENV-003 (Information) Using automatic %s wire load selection

group '%S' %S.

DESCRIPTION

Automatic wire load selection by area is being performed on the design or on a hierarchical cell. The specified selection group is used to determine which wire load model to apply to hierarchical cells at and below this cell or design, based on their cell area. There might be a different selection group for max and min conditions.

WHAT NEXT

To see which wire load models are set, you can use the **report_wire_load** command.

EQN

EQN-1 (error) Undefined variable on or near line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-2 (error) Undefined operator on or near line %d at or near '%s'.

DESCRIPTION

This error is generated when an undefined operator or command has been specified.

WHAT NEXT

Check for a spelling error in the command name and reinvoke the command. Type "list -commands" to see a list of the available commands.

EQN-3 (error) Incorrect number of operands on or near line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-4 (error) Operator can not process operand of this type on or near line %d at or near '%s'.

DESCRIPTION

This error is generated when the operand for the given operator can not accept the given operand.

WHAT NEXT

Check and correct operands, then reissue the current command.

Comparison Operators: ==, !=, <, <=, >, >= takes two operands from float, integer, string, and list. Arithmetic Operators: *, / takes two operands from float and integer. Special arithmetic Operator plus: + takes two operands from float, integer, string, and lists. Arithmetic operator minus: - takes two operands from float, integer, and list. Assignment Operator: '=' operator in a = b, a and b must be the same operand type and can be float, integer, string, and list. Redirect operators: > and >>. For example a > b where operand a is a string expression and b is a file name.

EQN-5 (error) Evaluation error on or near line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-6 (error) Internal error.

DESCRIPTION

WHAT NEXT

EQN-7 (error) Evaluation error on or near line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-8 (error) Error on or near line %d at or near '%s'

DESCRIPTION

WHAT NEXT

EQN-9 (error) Operator used in bad context on or near line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-10 (warning) Defining new variable '%s'.

DESCRIPTION

WHAT NEXT

EQN-11 (error) Could not write file '%s'.

DESCRIPTION

WHAT NEXT

EQN-12 (error) Break statement not enclosed in loop on or near

line %d.

DESCRIPTION

WHAT NEXT

EQN-13 (error) Continue statement not enclosed in loop on or near line %d.

DESCRIPTION

WHAT NEXT

EQN-14 (error) Can't execute command '%s' in this context on or near line %d.

DESCRIPTION

WHAT NEXT

EQN-15 (error) Can't divide by zero on or near line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-16 (error) Operand must be positive on or near line %d at

or near '%s'.

DESCRIPTION

WHAT NEXT

EQN-17 (error) The abbreviated option '%s' matches more than 1 argument for this command.

DESCRIPTION

This error message is generated when there is more than one options whose abbreviation is the same.

WHAT NEXT

Type command -help and look for the availability option of the command. Then reinvoke the command.

EQN-18 (error) Unexpected argument '%s'.

DESCRIPTION

WHAT NEXT

EQN-19 (error) %s required for the '%s' argument.

DESCRIPTION

WHAT NEXT

EQN-20 (error) Arithmetic overflow or exception encountered.

DESCRIPTION

WHAT NEXT

EQN-21 (warning) Function '%s' leaked %d allocations for %d bytes.

DESCRIPTION

WHAT NEXT

EQN-22 (information) Additional information in file '%s'.

DESCRIPTION

WHAT NEXT

EQN-23 (error) That is an invalid name for a user defined

function.

DESCRIPTION

User-function names must be simple strings or identifiers.

WHAT NEXT

Choose a different name for this user function.

EQN-24 (error) define_function cannot be used to redefine the builtin '%s' command.

DESCRIPTION

The define_function command can only be used to define new user functions. It cannot be used to change the definition of a builtin command.

WHAT NEXT

Choose a name for this user function that does not conflict with the name of a builtin command.

EQN-25 (error) The %s command cannot be used outside of a user defined function.

DESCRIPTION

The **get_parameter** command retrieves values from the invocation line of the currently executing user-defined function. It can only be used when defining a user function.

The **return** command returns values from a currently executing user-defined function. It can only be used when defining a function.

WHAT NEXT

Use this command only from within a user-defined function.

EQN-26 (error) Cannot use both -remainder and -option for the

`get_parameter` command on line %d.

DESCRIPTION

The "-option" option to the `get_parameter` command fetches a single option for the argument list. The "-remainder" option fetches the entire remaining list of parameters to this user function. These options cannot be used together.

WHAT NEXT

Decide which use is more appropriate, or use the `get_parameter` command twice, once with -option, once with -remainder.

EQN-27 (error) Type '%s' is not a valid variable type for %s call on line %d.

DESCRIPTION

The variable types that are acceptable for the `get_parameter` command and the `create_variable` command are *integer*, *float*, *string*, *list*, and *object*.

The `get_parameter` command also accepts the type *flag* for dash options that do not have a following value.

WHAT NEXT

Use one of the predefined variable types.

EQN-28 (error) Variable '%s' cannot be redefined by %s on line %d.

DESCRIPTION

The `get_parameter` command returns the user function parameter value in a newly created local variable. The `get_parameter` command cannot be used to change an existing local variable.

The `create_variable` command creates a new variable either globally or locally to a user function. `create_variable` cannot be used to overwrite an existing variable.

WHAT NEXT

Choose a different name for the variable that returns the parameter value, or remove the variable from the local scope by using the `remove_variable` command before calling `get_parameter`.

Call `remove_variable` to remove the previous definition of the variable before creating a new one with `create_variable`.

EQN-29 (error) A value is required for the '%s' option of user function '%s' on line %d. get_parameter call on line %d fails.

DESCRIPTION

Most parameters to user functions are of the form `-option value`. It is an error to specify the option `-option` without following it with the option value `value`.

WHAT NEXT

Call the user function with the value following the option.

EQN-30 (error) Argument %s is required for calls to user function '%s' on line %d. get_parameter call on line %d fails.

DESCRIPTION

Required parameters to a user function are defined using `get_parameter` without the `-default` option. If the defined parameter is not present when calling the user-defined function, this error occurs.

WHAT NEXT

Call the user function with the required parameter. Or redefine the user function making this parameter's options by using the `-default` option to `get_parameter`.

EQN-31 (error) Cannot convert value %s to type %s, %s call on

line %d.

DESCRIPTION

The value given to the user function call cannot be converted to the type specified in the **get_parameter** or **create_variable** command.

WHAT NEXT

When calling the user function, use the correct type for that option. When creating variables, try not to use type conversion for the variable's initial value.

EQN-32 (error) User function "%s

DESCRIPTION

The user function identified is not currently defined.

WHAT NEXT

Either the function has not yet been defined, the given function name was typed incorrectly, or the function is a built-in command.

EQN-33 (error) Specify only one of -local and -global.

DESCRIPTION

A variable can only be removed from one scope at a time. The **remove_variable** command can accept an argument of *-local* to remove a variable local to the current executing function or *-global* to remove a variable from the global variable list. By default, the command first checks the local variable list, then checks the global variable list.

The **variable_exists** command normally checks the local scope first (if currently in a user-defined function), then the global scope. Defining both *-local* and *-global* is redundant.

WHAT NEXT

Try the command without using either the *-local* or *-global* options, or just use one option.

EQN-34 (error) Variable %s not defined in %s scope.

DESCRIPTION

The defined variable was not found in the named scope (local or global). Either the **remove_variable** command was invoked with the incorrect scope flag (-local or -global) or the variable does not exist in the scope.

WHAT NEXT

Try removing the variable from the other scope. Perhaps the variable was never created, or it had already been removed.

EQN-35 (error) Variable %s not defined.

DESCRIPTION

The named variable is not defined.

WHAT NEXT

Perhaps the variable was never created, or perhaps it had already been removed.

EQN-36 (error) Variable '%s' is protected.

DESCRIPTION

This variable was defined in the system **synopsys_dc.setup** file. These system variables are protected and cannot be removed.

WHAT NEXT

Use another variable.

EQN-37 (error) Specify either a default value, or a variable type.

DESCRIPTION

The **create_variable** command determines what type of variable to create by using the given type, or by using the same type as the initial value for the variable. One of

these two options must be defined.

WHAT NEXT

Use the `-type` option to **create_variable**, or define an initial value.

EQN-38 (error) Cannot list builtin command '%s'.

DESCRIPTION

The **list_function** command cannot list built-in commands.

WHAT NEXT

Use the **list_function** command only on user-defined functions.

EQN-39 (error) Cannot remove builtin command '%s'.

DESCRIPTION

The **remove_function** command cannot remove built-in commands.

WHAT NEXT

Use the **remove_function** command only on user-defined functions.

EQN-40 (warning) Undefined command name '%s' encountered.

DESCRIPTION

WHAT NEXT

EQN-41 (warning) Syntax or context checking is not supported

for '%s'.

DESCRIPTION

This message indicates that the syntax or context checking is not supported for this user-defined function created by the define_funtion command.

WHAT NEXT

EQN-42 (error) Argument '%s' has been specified more than once.

DESCRIPTION

You have specified an argument multiple times, when only one is allowed.

WHAT NEXT

Remove the redundant argument.

Sometimes this error can occur as a result of command aliasing. If you can only see one specification of the argument, try using the alias command to see whether your command has an alias which includes the extra argument. If so, you can use the unalias command to remove the alias.

EQNI

EQNI-1 (error) Illegal left hand side at line %d.

DESCRIPTION

WHAT NEXT

EQNI-2 (error) Illegal function at line %d.

DESCRIPTION

WHAT NEXT

EQNI-3 (error) Invalid use of '?' in token '%s' at line %d.

DESCRIPTION

WHAT NEXT

EQNI-4 (error) Design name must be specified at line %d.

DESCRIPTION

WHAT NEXT

EQNI-5 (error) Signal ?%s set a second time at line %d.

DESCRIPTION

WHAT NEXT

EQNI-6 (error) Signal %s set a second time at line %d.

DESCRIPTION

WHAT NEXT

EQNI-7 (error) Invalid use of '?' in input '%s'.

DESCRIPTION

WHAT NEXT

EQNI-8 (error) Port %s declared twice at line %d.

DESCRIPTION

WHAT NEXT

EQNI-9 (error) Invalid use of '?' in output '%s'.

DESCRIPTION

WHAT NEXT

EQNI-10 (warning) Unknown command "%s

DESCRIPTION

WHAT NEXT

EQNI-11 (error) Can't read file "%s

DESCRIPTION

WHAT NEXT

EQNO

EQNO-0 (error) Invalid design to write out as equations.

DESCRIPTION

WHAT NEXT

EQNO-1 (error) Cannot write out design with non-combinational cell(s).

DESCRIPTION

WHAT NEXT

EQNO-2 (error) Cannot write out design with INOUT ports.

DESCRIPTION

WHAT NEXT

EQNO-3 (error) Cannot write out design with ports with unknown direction.

DESCRIPTION

WHAT NEXT

EQNO-4 (warning) The value of variable 'equationout_%s' isn't

valid--using '%s'.

DESCRIPTION

WHAT NEXT

EST

EST-1 (warning) The '%s' command is not supported by Estimator. The command is skipped.

DESCRIPTION

The command listed in this error message is not supported by Estimator. Estimator prints this warning message and skips the command. The command does not affect the execution of Estimation.

WHAT NEXT

No action by user is required.

EST-2 (Error) Estimator cannot proceed without an Estimation license.

DESCRIPTION

An Estimation license ought to have been checked out before reaching this point in the execution. But a license check determined that the Estimation license was not checked out.

WHAT NEXT

Check your license server. Report problem to Synopsys Hotline / Support Center.

EST-3 (Error) Invalid value '%s' for the 'estimate_resource_preference' variable.

DESCRIPTION

Valid values for the 'estimate_resource_preference' variable are "fast" and "small". The default is "fast".

WHAT NEXT

Please set the 'estimate_resource_preference' variable to a valid value and

continue.

EST-4 (Error) Invalid value '%s' for the 'estimate - resource_preference' option.

DESCRIPTION

Valid values for the '-resource_preference' option to the 'estimate' command are "fast" and "small". The default is "fast".

WHAT NEXT

Please use a valid value for the '-resource_preference' option and continue.

EST-5 (Error) The design '%s' has not been read in.

DESCRIPTION

Please read in the design before running the estimate command.

WHAT NEXT

EST-6 (Error) The current design is not defined.

DESCRIPTION

This error is generated when the current design is not defined when running the estimate command.

WHAT NEXT

Use **list_designs** commands to see whether there is any design in memory or use **read** command to read a design in. Then invoke the **current_design** command to set the desired current design.

EST-7 (error) Estimation terminated with errors.

DESCRIPTION

This message indicates that estimation was terminated and did not write the intermediate design back to the database. Because the design was not written back to the database, the **current_design** is unchanged. The explanation for abnormal termination should have appeared in an error message previous to this one.

WHAT NEXT

Resolve errors and rerun estimation.

EST-8 (error) Estimation of synthetic parts failed.

DESCRIPTION

This message indicates that the estimation of synthetic parts failed. A more detailed explanation for the failure should have appeared in an error message previous to this one.

WHAT NEXT

Resolve errors and rerun estimation.

EST-9 (error) Cannot run the '%s' command on the design '%s' because it is an estimated design.

DESCRIPTION

The current design (or one of its sub-designs) is an estimated design - i.e. it was generated by the 'estimate' command, or it was generated by using (V)HDL Compiler functionality with only an Estimator license. Certain operations are not permitted on estimated designs. The current command is one of those unpermitted operations.

WHAT NEXT

EST-10 (Error) Estimator does not support FPGA libraries.

DESCRIPTION

Estimator does not support FPGA libraries.

WHAT NEXT

EST-11 (warning) Estimator does not support FPGA-specific Library Component optimization. FPGA-specific optimization disabled.

DESCRIPTION

This warning message occurs when your library contains components whose use requires FPGA-specific optimization. Estimation will proceed with the FPGA-specific optimization disabled.

WHAT NEXT

EST-12 (warning) The effort level for 'flattening' was automatically reduced from 'high' to 'medium'.

DESCRIPTION

Estimator does not allow a high effort setting for flattening. The effort level is automatically reduced to medium.

WHAT NEXT

EST-13 (warning) The design '%s' will be marked as an estimated design after ungrouping because one or more of its

sub-designs are estimated.

DESCRIPTION

One or more of the subdesigns of the specified design are estimated. The system needs to keep track of which designs are estimated because certain actions are allowed or disallowed on estimated designs.

When cells in a design are ungrouped, the design is marked as estimated if any of its subdesigns are estimated.

WHAT NEXT

EST-14 (error) Cannot write out an estimated design in non-db format.

DESCRIPTION

The current design (or one of its subdesigns) is an estimated design. For example, it was generated by the 'estimate' command, or it was generated by using (V)HDL Compiler functionality with only an Estimator license. Writing out of netlists is not permitted on estimated designs.

WHAT NEXT

EST-15 (warning) The gtech design generated from this HDL compilation can be used for Estimation only.

DESCRIPTION

This design was analyzed/elaborated using only an Estimator license. Since a (V)HDL Compiler License was not used, the resulting gtech design from high-level compile will be allowed as input to Estimation only. This design cannot be used as input to the compile command (Design Compiler).

WHAT NEXT

EST-16 (warning) The current design is an estimated design :

The ATPG vectors will not be saved.

DESCRIPTION

The current design is an estimated design. You may run ATPG (i.e. the `create_test_patterns` command) in order to estimate the fault coverage that can be obtained. However, the vectors generated by the ATPG run will not be saved.

WHAT NEXT

EST-17 (error) Illegal operation if an Estimator key is not checked out.

DESCRIPTION

The software attempted an operation which is legal only if an Estimator key is already checked out. If an Estimator key was not checked out, the software exits.

WHAT NEXT

Contact the Synopsys support line.

EST-18 (warning) Power constraints will be ignored during Estimation.

DESCRIPTION

The design has power constraints. These will not be taken into consideration during Estimation. You can analyze power (with the `report_power` command) on the estimated design after Estimation has completed.

Power analysis on estimated designs is supported. However, power optimization during estimation is not supported.

WHAT NEXT

No action is required. You may analyze power (with the `report_power` command) after Estimation has completed.

EST-19 (error) The security handshake for Estimator failed.

DESCRIPTION

This is an internal error. The security handshake between HDL Advisor and Estimator failed.

WHAT NEXT

Contact the Synopsys support line.

EST-20 (error) Cannot run Estimator stand-alone. It must be run through Chip Architect.

DESCRIPTION

Estimator can only be run after a security handshake with Chip Architect. Estimator must be run through Chip Architect. It cannot be run stand-alone.

WHAT NEXT

EXPT

EXPT_7 (error) '%s' '%s' in design '%s' has no symbol library.

DESCRIPTION

WHAT NEXT

EXPT-1 (error) The variable '%s' isn't defined.

DESCRIPTION

WHAT NEXT

EXPT-2 (error) The variable '%s' is of an unsupported external export option type.

DESCRIPTION

WHAT NEXT

EXPT-3 (error) Unknown export format '%s'.

DESCRIPTION

This error is generated when the **write** command encounters an invalid write (export) format.

WHAT NEXT

Invoke the **write -help** command for valid write (export) formats. Identify and correct format, then reinvoke the **write** command.

EXPT-4 (error) Can't open export file '%s'.

DESCRIPTION

WHAT NEXT

EXPT-5 (error) Cannot execute '%s'.

DESCRIPTION

WHAT NEXT

EXPT-6 (warning) Library '%s' used which wasn't created by %s interface.

DESCRIPTION

WHAT NEXT

EXPT-8 (error) Unable to find an external scale attribute for schematic '%s'.

DESCRIPTION

WHAT NEXT

EXPT-9 (error) The external scales in libraries '%s' and '%s'

aren't equal.

DESCRIPTION

WHAT NEXT

EXPT-10 (error) The route grids in libraries '%s' and '%s' aren't equal.

DESCRIPTION

WHAT NEXT

EXPT-11 (information) %s name '%s' changed to '%s'.

DESCRIPTION

This message is for information only and indicates that an object in the design database has had its name changed. The name change could have happened automatically (for example, if the name was not compliant with the target syntax) or manually (for example, if a user executed the **change_names** command).

WHAT NEXT

Because this is a message for information only, no further action is indicated.

EXPT-12 (information) Design '%s' had %d name changes.

DESCRIPTION

WHAT NEXT

EXPT-13 (error) Schematic '%s' was created with an invalid

setting for the variable '%s'.

DESCRIPTION

WHAT NEXT

EXPT-14 (warning) The %s name '%s' is corrupted.

DESCRIPTION

WHAT NEXT

EXPT-15 (warning) The name of net '%s' in design '%s' can't be changed to the name of both ports '%s' and '%s' to which it's connected.

DESCRIPTION

WHAT NEXT

Because multiple ports are connected to the same net, to avoid this problem, the design must be modified with the **compile** command to insert enough extra logic.

Set *compile_fix_multiple_port_nets* to *true*, execute the **compile** command, and execute the **create_schematic** command again. Then execute the edif format **write** command again. If you are going to execute the edif format **write** command with the *-hierarchy* option, be sure to execute the **create_schematic** command with the *-hierarchy* option.

For future use, set *compile_fix_multiple_port_nets* to *true* in your initialization.

EXPT-16 (error) One of the %s has no name.

DESCRIPTION

WHAT NEXT

EXPT-17 (error) The schematic is corrupted or is an old version.

DESCRIPTION

WHAT NEXT

EXPT-18 (error) %s '%s' is corrupted.

DESCRIPTION

WHAT NEXT

EXPT-19 (error) Schematic '%s' was created with incompatible values for the variables '%s' and '%s'.

DESCRIPTION

WHAT NEXT

EXPT-20 (error) Ripper symbol '%s' in library '%s' is corrupted; it does not have the attribute 'ripped_pin'.

DESCRIPTION

WHAT NEXT

FEAS

FEAS-001 (error) You do not have the necessary license key.

DESCRIPTION

The user does not have the necessary license key to run the given feature.

WHAT NEXT

Check the location of the keyfile, either the default location or at \$SYNOPSYS_KEY_FILE. Check the key file to see if the feature exists. If the user does not have the feature in the key file, then the user cannot run this feature. It could also be that all the licenses are in use.

FEAS-002 (warning) High Fanout Synthesis has not been performed

DESCRIPTION

High Fanout Synthesis has not been performed on this design.

WHAT NEXT

User should run high fanout synthesis before running this command. Otherwise, the result may not be accurate.

FEAS-003 (warning) Zero Path Margin is given but adjustments for Zero Path violating endpoints not enabled. Margin not enabled if adjustments not enabled

DESCRIPTION

The design has been given a Zero Path margin value, but margin adjustments for Zero Path violating endpoints have not been enabled. Thus, the margin adjustments will not be performed.

WHAT NEXT

User should turn on Zero Path adjustments if this is intended, or remove the Zero Path margins.

FEAS-004 (warning) Zero Wire Load Margin is given but adjustments for Zero Wire Load violating endpoints not enabled. Margin not enabled if adjustments not enabled

DESCRIPTION

The design has been given a Zero Wire Load margin value, but margin adjustments for Zero Wire Load violating endpoints have not been enabled. Thus, the margin adjustments will not be performed.

WHAT NEXT

User should turn on Zero Wire Load adjustments if this is intended, or remove the Zero Wire Load margins.

FEAS-005 (warning) compare mode is set to 1. It overwrites all other margin value settings

DESCRIPTION

Compare mode is turned on and overwrites all given margin values.

report_adjusted_endpoints(2)
```

FEAS-100 (warning) Found zero path (ZP), startpoint %s (arrival time %.2f), endpoint %s (required time %.2f, delta setup %.2f), with slack %.2f.

DESCRIPTION

This is a Zero Path, meaning that the required time at endpoint is less than the arrival time at the start time, so there is not enough time for the signal to propagate to the endpoint. Zero Path violations are independent of the physical layout of the circuit. In other words, it is impossible for the design to meet timing on this path.

WHAT NEXT

Check the constraints and clocks on this path and make corresponding changes to relax timing window.

FEAS-101 (warning) Found zero wireload path (ZWL), startpoint %s (arrival time %.2f), endpoint %s (required time %.2f, delta setup %.2f), with slack %.2f.

DESCRIPTION

A Zero Wire Load Path has been found. The zero wire load delay of this path is the delay through the path assuming zero wire load at every output pin of cells in this path. In other words, this is the best case timing possible for this path. A Zero Wire Load path (or a Zero Wire Load violating path) is one where the arrival time at the startpoint plus to zero wire load delay of this path is more than the required time of the endpoint. This means that there is not enough time for the signal to propagate through this path and meet timing.

WHAT NEXT

Check the design constraints and logic structure for this path. Fix constraints if there is error. Consider changing logics or use multicycle path if timing is

impossible to meet.

FEAS-102 (information) Zero endpoint %s: start arrival = %f, required time = %f, library setup adjustment = %f, margin = %f.

DESCRIPTION

This information shows the margin adjustment applied to a zero path endpoint. A Zero Path is a timing path where the required time at endpoint is less than the arrival time at the start point, so there is not enough time for the signal to propagate to the endpoint, even when the interconnect delay on the path is ignored. Zero Path violations are independent of the physical layout of the circuit. In other words, it is impossible for the design to meet timing on this path.

The different items printed are:

start arrival. This is the arrival time at the start point of the path.

required time. This is the required time at the end point of the path.

library setup **adjustment**. This is an adjustment the tool adds to the calculation in order to take into consideration that the transition time to the end point will be different from the current transition, thereby resulting in a different delay.

The required time for an endpoint depends on the setup time of the endpoint flip-flop, and this setup time depends on its input transition. Before any optimization, the input transition is very likely to be very bad and unrealistic compared to the input transition for a properly optimized design. This results in a very unrealistic setup time for the endpoint flip-flop in the early stage of the design where feasibility flow is being used. However, it is expected that optimization will fix the input transition and setup time. Hence, the library setup adjustment represents the expected change in the setup time after the transition time is fixed. This adjustment is a characteristic of the cell and the library and the tool calculates this adjustment automatically when considering the margin values to adjust.

margin. This is the margin that the tool applies to the end point for this path. The margin is calculated as follows:

```
ZP violation = (required time + library setup adjusment) - start arrival  
margin applied = (1 + ZP_MARGIN/100) * ZP violation  
where ZP_MARGIN is the zero path margin (in percentage) the user has set using  
the set_feasibility_options command.
```

EXAMPLE

Suppose the user has set the ZP_MARGIN to 25% and the tool gave the following message:

Information: Zero endpoint DSP/top0/x_top/reg/r_reg_10_/D: start arrival = 4.50000, required time = 4.390979, library setup adjustment = 0.002595, margin = -0.13303250.

(FEAS-102)

This means that the endpoint DSP/top0/x_top/reg/r_reg_10_/D has a zero path violation. The zero path violation is (required time + library setup adjustment) - (start arrival) = (4.390979 + 0.002595) - 4.50000 = -0.106426

Therefore, the margin will be (1 + 25/100) * ZP violation = 1.25 * (-0.106426) = -0.13303250

WHAT NEXT

see set_feasibility_options

FEAS-103 (information) Zero wireload endpoint %s: start arrival = %f, required time = %f, zero wireload delay = %f, library setup adjustment = %f, margin = %f.

DESCRIPTION

This information shows the margin adjustment applied to an endpath with zero wireload violation. A Zero Wireload Path (or Zero Wireload violating path) is a timing path where the required time at endpoint is less than the arrival time at the start point plus the delay through the path assuming zero wireload at each cell, so there is not enough time for the signal to propagate to the endpoint, even when the interconnect delay on the path is ignored. Zero Wireload violations are independent of the physical layout (i.e. placement) of the circuit, and depends only on the cell characteristics and constraints on the path. In other words, it is highly impossible for the design to meet timing on this path.

The different items printed in this message are:

start arrival. This is the arrival time at the start point of the path.

required time. This is the required time at the end point of the path.

zero wireload delay. This is the total delay through the path, assuming zero wireload at each output pin of cells. In other words, this is a best-case timing through the path.

library setup **adjustment.** This is an adjustment the tool adds to the calculation in order to take into consideration that the transition time to the end point will be different from the current transition, thereby resulting in a different delay.

The required time for an endpoint depends on the setup time of the endpoint flip-flop, and this setup time depends on its input transition. Before any optimization, the input transition is very likely to be very bad and unrealistic compared to the input transition for a properly optimized design. This results in a very unrealistic setup time for the endpoint flip-flop in the early stage of the design where feasibility flow is being used. However, it is expected that optimization will fix

the input transition and setup time. Hence, the library setup adjustment represents the expected change in the setup time after the transition time is fixed. This adjustment is a characteristic of the cell and the library and the tool calculates this adjustment automatically when considering the margin values to adjust.

margin. This is the margin that the tool applies to the endpoint for this path. The margin is calculated as follows:

```
ZWL violation = (required time + library setup adjusment) - (start arrival +  
zero wireload delay)  
margin applied = (1 + ZWL_MARGIN/100) * ZWL violation  
where ZWL_MARGIN is the zero wireload margin (in percentage) the user has set  
using the set_feasibility_options command.
```

EXAMPLE

Suppose the user has set the ZWL_MARGIN to be 0% and the tool gave the following message:

```
Information: Zero wireload endpoint DSP/top0/x_top/r_reg_10_/D: start arrival =  
0.000000, required time = 4.389008, zero wireload delay = 4.458447, library setup  
adjustment = 0.004813, margin = -0.064625 (FEAS-103)
```

This means that the endpoint DSP/top0/x_top/reg/r_reg_10_/D has a zero path violation. The zero path violation is $(\text{required time} + \text{library setup adjustment}) - (\text{start arrival} + \text{zero wireload delay}) = (4.389008 + 0.004813) - (0.000000 + 4.458447) = -0.064626$

Therefore, the margin will be $(1 + 0/100) * \text{ZWL violation} = -0.064626$

If the ZWL_MARGIN was set to 25%, then the margin will be $(1 + 25/100) * \text{ZWL violation} = -0.0807825$

WHAT NEXT

see set_feasibility_options

FEAS-110 (information) Summary: %s

DESCRIPTION

Gives a summary of the number of timing vioations, zero paths, and/or zero wire load paths of a path group.

WHAT NEXT

None.

FILE

FILE-1 (error) Can't open file '%s'.

DESCRIPTION

WHAT NEXT

FILE-2 (error) Can't create file '%s'.

DESCRIPTION

WHAT NEXT

FILE-3 (error) Can't close file '%s'.

DESCRIPTION

WHAT NEXT

FILE-4 (error) Can't close file stream for '%s'.

DESCRIPTION

WHAT NEXT

FILE-5 (error) Invalid data format encountered.

DESCRIPTION

WHAT NEXT

FILE-6 (error) Alias '%s' depends on itself.

DESCRIPTION

WHAT NEXT

FILE-7 (error) Invalid history syntax.

DESCRIPTION

WHAT NEXT

FILE-8 (error) There is no previous command.

DESCRIPTION

WHAT NEXT

FILE-9 (error) Command '%d' not found; out of range.

DESCRIPTION

WHAT NEXT

FILE-10 (error) '%s' not found in history.

DESCRIPTION

WHAT NEXT

FILE-11 (error) Can't find file '%s'.

DESCRIPTION

WHAT NEXT

FLIPCHIP

FLIPCHIP-001 (Error) The input file is not of AIF type, but %s.

DESCRIPTION

You get this message because the input file is not AIF file.

WHAT NEXT

Please check the input file and make sure the line of file type is TYPE=AIF.

FLIPCHIP-002 (Error) The input file does not specify distance in the unit of um, but %s.

DESCRIPTION

You get this message because the units in the given file is not um.

WHAT NEXT

Please check the given file and make sure the line setted units is UNITS=um or UNITS=UM.

FLIPCHIP-003 (Error) The width of die(%f) is not legal.

DESCRIPTION

You get this message because the width of die in the input file is not legal.

WHAT NEXT

Please check the input file and make sure the width of die is positive.

FLIPCHIP-004 (Error) The hight of die(%f) is not legal.

DESCRIPTION

You get this message because the hight of die in the input file is not legal.

WHAT NEXT

Please check the input file and make sure the hight of die is positive.

FLIPCHIP-005 (Error) The type of input file is unspecified.

DESCRIPTION

You get this message because the type of input file is unspecified.

WHAT NEXT

Please specify the type of the file as TYPE=AIF.

FLIPCHIP-006 (Error) The unit of input file is unspecified.

DESCRIPTION

You get this message because the unit of input file is unspecified.

WHAT NEXT

Please specify the unit of the file as UNITS=um.

FLIPCHIP-007 (Error) Failed to open file %s.

DESCRIPTION

You get this message because the input file can't open.

WHAT NEXT

Please make sure the input file is existent.

FLIPCHIP-008 (Error) Must specify exactly one physical lib cell.

DESCRIPTION

You get this message because specify more than one physical lib cell.

WHAT NEXT

Please make sure only one physical li cell is specified.

FLIPCHIP-009 (Error) Can not find physical lib cell.

DESCRIPTION

You get this message because can't find phsical lib cell.

WHAT NEXT

Please make sure the physical lib cell specified is right.

FLIPCHIP-010 (Error) Bump cell %s does not exist, can't create without -physical_lib_cel specified.

DESCRIPTION

You get this message because can't create bumps without physical lib cell.

WHAT NEXT

Please use the option -physical_lib_cel to specify bump's physical lib cell.

FLIPCHIP-011 (Error) String %s is not a net Name.

DESCRIPTION

You get this message because one net name is not correct.

WHAT NEXT

Please check the net name and make sure it is a net name.

FLIPCHIP-012 (Error) String %s is not a bump cell inst name but other cell inst name.

DESCRIPTION

You get this message because one name in the input file isn't a bump cell name but other cell name.

WHAT NEXT

Please check the string and make sure it is a bump cell inst name.

FLIPCHIP-013 (Error) No verion type in aif or version isn't 2.0.

DESCRIPTION

You get this message because there's no verion type in aif or version type isn't 2.0.

WHAT NEXT

Please check the input file and make sure the version type is VERSION=2.0.

FLIPCHIP-020 (Error) No net to merge.

DESCRIPTION

You get this message because there's no flat net in the from net list.

WHAT NEXT

Please make sure there's at least one flat net in the from list.

FLIPCHIP-021 (Error) The net %s is not the same type as the

first net.

DESCRIPTION

You get this message because all the net type is not the same.

WHAT NEXT

Please make sure all the from net type is the same.

FLIPCHIP-022 (Error) Net %s has been already existent.

DESCRIPTION

You get this message because the to net is existent.

WHAT NEXT

Please reassign the to net which is not existent or add the net to the from net list.

FLIPCHIP-023 (Error) Not enough bumps for this personality type, skipping...

DESCRIPTION

You get this error because there are not enough bump cell to complete the net assignment of a certain personality type. The tool will skip net assignment for this personality type.

WHAT NEXT

Check the log to see which personality type it is processing while this error message is issued. To resolve this issue, you can 1) Instantiate more bump cells of this personality type 2) Adjust the number of driver or bump cells of this personality type 3) Specify a different -uniquify option(default is 1), the larger the -uniquify option, the less bumps cell will be needed.

FLIPCHIP-024 (Error) Bump %s port inst %s is power or ground, but the driver %s port inst %s isn't match the bump's port inst

type.

DESCRIPTION

You get the message because PG bump can't be assigned to driver which is not the same type. Power bump should be connected to power driver and ground bump should be connected to ground driver. Signal bump can be connected all type of drivers.

WHAT NEXT

You can use the command set_flip_chip_type to regroup drivers and bumps. Make sure that PG bumps are in the group of PG drivers. If the driver has all types of flip chip port inst, it must be in the group of signal bumps.

FLT

FLT-002 (information) Errors preprocessing compiled filter.

DESCRIPTION

This is a summary message generated after a filter expression has successfully parsed, but unsuccessfully processed because of an unknown identifier, type mismatch in a relation, or invalid operator in a relation.

WHAT NEXT

Look at previous error messages to determine the problem with the filter expression. Correct the problems, and retry the operation.

FLT-003 (error) while parsing filter expression: %s at '%s'

DESCRIPTION

A filter expression could not be successfully parsed, typically because of a syntax error. The point in the expression that caused the failure is shown along with the remainder of the expression.

WHAT NEXT

Look at the man pages for filter expression syntax, and verify that your expression conforms to the syntax. Ensure that supported relation and logical operators are in use, that the expression is constructed of a series of relations separated by logical operations, etc.

FLT-005 (error) Unknown attribute '%s'.

DESCRIPTION

Filters are evaluated within a context. Given the current context, an attribute which you entered is unknown.

A relation in a filter expression is very simple. For example, "area <= 2.4". In this case, the attribute is "area". If you were applying the filter to a pin collection, since "area" is not a valid pin attribute, this error would occur.

WHAT NEXT

Look at the man pages for the given command, and ascertain the valid values for attributes.

FLT-006 (error) Type mismatch between '%s' and '%s'.

DESCRIPTION

A relation in your filter expression has an identifier and value with inconsistent types. The following simple rules apply:

Identifier	Type mismatch generates:when value is: -----
	----- string/a - never an error numeric literalstring, true, false
boolean	numeric literal, string

Note some important distinctions: the boolean words TRUE and FALSE are interpreted as strings in a string relation, or as boolean in a boolean relation. Similarly, the numeric literal 2.4E-9 is interpreted as a string in a string relation, or as a number in a numeric relation.

WHAT NEXT

Re-enter the filter with valid identifier/value relations.

FLT-007 (error) Invalid operator '%s' for '%s' and '%s'.

DESCRIPTION

A relation in your filter expression has an identifier and value with consistent types but an invalid operator. The following simple rules apply:

Type:	Invalid operators: -----
----- string	None. All operators ok. numeric literal=~, !~ boolean=~, !~, <, >, >=, <=

WHAT NEXT

Re-enter the filter with a valid operator for the failed relation.

FMLINK

FMLINK-1 (warning) Error code %d encountered while writing SVF file:

%S

Operation aborted.

DESCRIPTION

dc_shell encountered an internal error while writing out the Formality verification setup (SVF) file. This may cause the SVF file to be incomplete.

WHAT NEXT

Please contact the Synopsys Support Center for assistance.

SEE ALSO

`set_svf(2)`

FOPT

FOPT-001 (error) Please specify only one focal area.

DESCRIPTION

You receive this error message because you have specified more than one focal metric for focal opt. The tool is expecting exactly one focal metric specified in one iteration of focal opt. continue to optimize.

WHAT NEXT

Specify only one of the following option with focal_opt: -hold_endpoints - setup_endpoint -drc_nets

SEE ALSO

focal_opt (2),

FOPT-002 (error) Can't find file %s.

DESCRIPTION

You receive this error message because you have specified a file that does not exist.

WHAT NEXT

Please verify the file location.

SEE ALSO

focal_opt (2),

FOPT-003 (error) Invalid specification for %s switch.

DESCRIPTION

The current specification for that switch is not valid one.

WHAT NEXT

Please use one of valid specification for the switch. To find out the valid specifications, please refer man page of focal_opt.

SEE ALSO

focal_opt (2)

FOPT-004 (Information) Using user defined cost priority %S, -priority switch is ignored in focal_opt.

DESCRIPTION

This message informs you that -prioritize switch in focal_opt is ignored because user has pre-defined cost priority settings. The user defined cost priority is coming from set_cost_priority command.

WHAT NEXT

No action is needed if user need to tool to respect user-defined cost priority settings. If this is not inteneded, then user need to remove the cost priority settings and run focal_opt with -prioritize option.

SEE ALSO

focal_opt (2), **set_cost_priority** (2)

FP

FP-1 (error) Unsupported combination of options specified.

DESCRIPTION

You received this error message because you specified an invalid option combination.

```
[-control_type aspect_ratio] cannot be combined with one or more of "-core_width", "-core_height", "-keep_io_place", "-core_aspect_ratio".  
[-control_type width_and_height] cannot be combined with one or more of "-core_aspect_ratio", "-core_utilization", "-keep_io_place", "-num_rows".  
[-control_type boundary] cannot be combined with one or more of "-core_aspect_ratio", "-core_utilization", "-core_width", "-core_height", "-num_rows", "pad_lim".
```

WHAT NEXT

Re-run the command with legal combination of options.

FP-2 (error) Invalid value specified for the option

DESCRIPTION

You received this error message because you specified an invalid value for the option.

WHAT NEXT

Refer to man page for acceptable values and re-run the command with correct option values.

FPCCI

FPCCI-001 (Warning) Command '%s' is obsolete. Please use '%S' instead.

DESCRIPTION

This warning message occurs when you use a certain command which is obsolete and will be removed in later release.

WHAT NEXT

Please use the new command proposed in the warning message.

FPCCI-002 (Warning) Design constraints have been removed. You need to re-apply design constraints on current design.

DESCRIPTION

This warning message occurs because merge_fp_hierarchy deletes all design constraints from the cell.

WHAT NEXT

Please re-apply design constraints using read_sdc command.

FPCCI-003 (Warning) fp_set_pin_constraints is called without any option.

DESCRIPTION

This warning message occurs because fp_set_pin_constraints is called without any option.

WHAT NEXT

Please use fp_remove_pin_constraints to apply default values for pin constraints.

FPCCI-004 (Warning) Original sdc file is not provided. Couldn't update sdc file. This may cause constraints mismatch with new logical hierarchy.

DESCRIPTION

This warning message occurs because sdc file is not providing while using command merge_fp_hierarchy.

WHAT NEXT

Please provide an sdc file or manually check/modify sdc for the new logical hierarchy.

FPCCI-005 (Error) Please specify correct UPF supply net for option -net_name.

DESCRIPTION

This error message occurs because command connect_virtual_pg_net fail to get flat net name from UPF supply net object.

WHAT NEXT

Please provide correct UPF supply net object.

FPCCI-006 (Error) Fail to find lib cell name from power switch %S .

DESCRIPTION

This error message occurs because command fail to get lib cell name from specified power switch.

WHAT NEXT

Please use map_power_switch to provide correct lib cell list.

FPCCI-007 (Error) Cannot find voltage area %s.

DESCRIPTION

This error message occurs because fail to get voltage area object with specified name.

WHAT NEXT

Please use report_voltage_area to check the voltage area.

FPCCI-008 (Error) Cannot find %s in design hierarchy.

DESCRIPTION

This error message occurs because fail to get specified hierarchy module in voltage area.

WHAT NEXT

Please use report_voltage_area to check hierarchy modules in the voltage area.

FPCCI-009 (Error) Cannot find hierarchy modules in voltage area %S.

DESCRIPTION

This error message occurs because fail to get hierarchy modules list in specified voltage area.

WHAT NEXT

Please use report_voltage_area to check hierarchy modules in the voltage area.

FPCCI-010 (Error) Specified hierarchy module %s inconsistent

with voltage area %s.

DESCRIPTION

This error message occurs because specified hierarchy module is not under specified voltage area.

WHAT NEXT

Please use report_voltage_area to check hierarchy modules in the voltage area.

FPCCI-011 (Error) The specified shielding width is less than or equal to the minimum DB unit!

DESCRIPTION

This is a user error caused by specifying a shielding width that is significantly smaller than any legal width.

WHAT NEXT

Examine your specification of shielding width and make sure that it is at least as large as any layer's minimum width.

FPCCI-012 (Error) The specified shielding width (%.3f) is less than the minimum width for %s (%.3f)!

DESCRIPTION

This is a user error caused by specifying a shielding width that is smaller than one or more of the specified metal layers' minimum width.

WHAT NEXT

Examine your specification of shielding width and make sure that it is at least as large as any specified layer's minimum width.

FPCCI-013 (Error) Failed to get base unit!

DESCRIPTION

This is an internal error.

WHAT NEXT

Contact your Synopsys representative.

FPCCI-014 (Warning) Object %s is not a logical cell instance

DESCRIPTION

`remove_mim_property` only accepts logical cell instances as input

WHAT NEXT

see `remove_mim_property` man page

FPCCI-015 (Error) Unable to remove MIM property successfully from %s

DESCRIPTION

This is an internal error.

WHAT NEXT

Contact your Synopsys representative.

FPCCI-016 (Error) %s failed in %s

DESCRIPTION

This is an internal error.

WHAT NEXT

Contact your Synopsys representative.

FPCCI-017 (Warning) %s does not belong to any MIM group

DESCRIPTION

The logical cell instance above does not share the same reference (master) cell with any other logical cell instance in the design. In addition, no MIM property has been attached by the user to designate it as belonging to an MIM group. See man page for uniquify_fp_mw_cel option -store_mim_property for more information regarding MIM property.

FPCCI-018 (Warning) The scan chains in the design will be deleted, please input your scandef file for scan design.

DESCRIPTION

This is a warning message that existing scan chains will be deleted prior to proceeding.

FPCCI-019 (Error) Object %d is not a softMacro

DESCRIPTION

This is a User error.

WHAT NEXT

Make sure that objects specified for uncommit are soft macro objects.

FPCCI-020 (Warning) Multiply instantiated soft macros detected.

uncommit_fp_soft_macros does not support multiply instantiated macros

The results of this command may be invalid

DESCRIPTION

User has specified a soft macro which belongs to a MIM group of soft macros. uncommit_fp_soft_macros currently does not support unommitting MIM group soft macros.

WHAT NEXT

Run uncommit_fp_soft_macros with this soft macro removed from the list to be uncommitted.

FPCCI-021 (Warning) Hier. cell instance %s does not have MIM property

DESCRIPTION

This hier. cell instance has not been assigned MIM property, or the MIM property may have been previously removed.

WHAT NEXT

see remove_mim_property man page Also see man page for uniquify_fp_mw_cel - store_mim_property

FPCCI-022 (Warning) MIM property for %s has been removed

DESCRIPTION

The MIM property for this instance has been removed because this is the lone instance which has the MIM property. By definition this instance is no longer an MIM and so the MIM property was removed. This condition arises probably because the MIM property of all other instances that were previously assigned as an MIM group together (with uniquify_fp_mw_cel -store_mim_property) had been earlier removed.

WHAT NEXT

see remove_mim_property man page Also see man page for uniquify_fp_mw_cel - store_mim_property

FPCCI-023 (Error) No plan groups selected!

DESCRIPTION

No plan groups were selected in either create_fp_plan_group_padding or remove_fp_plan_group_padding

WHAT NEXT

see create_fp_plan_group_padding man page or remove_fp_plan_group_padding man page.

FPCCI-024 (Warning) fp_create_plan_group_padding is deprecated, please use create_fp_plan_group_padding

DESCRIPTION

fp_create_plan_group_padding is an antiquated command name. Please begin to use create_fp_plan_group_padding.

WHAT NEXT

see create_fp_plan_group_padding man page

FPCCI-025 (Warning) fp_remove_plan_group_padding is deprecated, please use remove_fp_plan_group_padding

DESCRIPTION

fp_remove_plan_group_padding is an antiquated command name. Please begin to use remove_fp_plan_group_padding.

WHAT NEXT

see remove_fp_plan_group_padding man page

FPCCI-026 (Info) create_fp_block_shielding is running in -block_level mode. The options -inside_boundary, -outside_boundary, and any object collection will be ignored in

this command session

DESCRIPTION

This is an information message. When in block_level mode, this command can only be used to create block shielding around the cell boundary. All other options are still functional.

WHAT NEXT

See the man page for `create_fp_block_shielding`.

FPCCI-027 (Warning) `create_fp_block_shielding` option - `tie_to_net` takes a collection of 1 net. More than one net was found in the collection. The command will use only the 1st net in the collection for tieing to the created shielding.

DESCRIPTION

This is an warning message about improper arguments to the option "tie_to_net". This option takes only 1 net object in the collection. The command encountered more than one net specified in the collection. The command will interepret the first net in the collection as the net to use.

WHAT NEXT

See the man page for `create_fp_block_shielding`.

FPL

FPL-001 (error) Internal error, %s:%d

DESCRIPTION

The application encountered an internal error at the specified file and line.

WHAT NEXT

Report the problem.

FPL-002 (error) Iterating %s failed

DESCRIPTION

Iterating objects of specified type failed.

WHAT NEXT

This usually indicates database corruption. Check the database.

FPL-003 (error) Cells are not placed. Run create_fp_placement first!

DESCRIPTION

The shape_fp_blocks command requires cells to be placed before it can run.

WHAT NEXT

Place the cells using create_fp_placement command before running this command.

FPL-004 (error) No cell open!

DESCRIPTION

No Milkyway cell is open. The command is supposed to operate on the currently opened cell.

WHAT NEXT

Open the cell you want the command to act on.

FPL-005 (error) -adjust_channels option is incompatible with every other option except for -constraint_file.

DESCRIPTION

When running the shape_fp_blocks command, the -adjust_channels option can not be invoked together with any other option except for the -constraint_file option.

WHAT NEXT

Remove other options.

FPL-006 (error) Global route/Placement congestion map doesn't exist. Please generate one before running this command.

DESCRIPTION

When running the shape_fp_blocks with the -incremental congestion_driven option, the command relies on congestion map to determine the appropriate channel widths. Without the congestion map, the command can not run.

WHAT NEXT

Generate congestion map (for example, run global route) before running this command.

FPL-007 (error) No object available for shaping!

DESCRIPTION

The command shapes non-fixed plan groups and/or soft macros. There were none in the currently opened design.

WHAT NEXT

If there are plan groups/soft macros that you want to shape, unfix them. If there are none, do not run this command.

FPL-008 (error) Cannot find %s in the file used for the incremental run

DESCRIPTION

This error occurs because the object mentioned does not exist in the file.

The `-incremental` option of the **shape_fp_blocks** command is designed to repeat the last floorplan (that is, to keep the same relative locations of plan groups and soft macros), while making appropriate adjustments for some changes that might have occurred. This could include changes such as increasing or decreasing target utilization of plan groups and soft macros, changing core size and shape, or adding blockages. However, changing which objects are to be shaped makes it impossible to create the same relative locations, so it is not allowed. The first time the command is run, it stores the floorplan decisions in a file. When the command is run using the `-incremental` option, it reads this file and attempts to follow the same decisions. This error indicates that the object mentioned does not exist in the file, which means that it did not exist when the command was previously run.

WHAT NEXT

Run the command without specifying the `-incremental` option.

FPL-099 (error) %s

DESCRIPTION

See error message.

WHAT NEXT

See error message.

FPL-101 (warning) No macros to pack

DESCRIPTION

The command is supposed to pack macros; there were none provided.

WHAT NEXT

Choose some macros to pack. Note that the command will not pack fixed macros, so if the macros you want packed are fixed, unfix them first.

FPL-102 (warning) %s is not a macro cell, skipping it

DESCRIPTION

The macro packing command is given a standard cell to pack; those will be skipped.

WHAT NEXT

Make sure that the objects provided to the command are macro cells.

FPL-103 (warning) Macros will not be packed for group %s, since it is not inside the core

DESCRIPTION

The mentioned plan group provided to the command was outside core. The macro packing works only inside core area.

WHAT NEXT

Make sure that the plan groups provided to the command are inside core.

FPL-104 (warning) Preplaced macro %s is in MIM plan group,

marking it not preplaced

DESCRIPTION

The command does not support preplaced macros inside multiply instantiated plan groups (MIMs); in order for the command to proceed, the preplaced macro is marked not preplaced.

WHAT NEXT

This usually happens when the placement command is initially run in the flat mode (this causes large macros to be preplaced) and later a hierarchy is chosen where large macros become part of MIMs. It may be better to specify the hierarchy in the initial placement.

FPL-105 (warning) Fixed macro inside MIM plan group %s, will be ignored

DESCRIPTION

The command does not support fixed macros inside multiply instantiated plan groups (MIMs); in order for the command to proceed, the fixed macro's connection to the plan group will be ignored.

WHAT NEXT

Unfix macros belonging to MIMs.

FPL-106 (warning) Global route congestion map doesn't exist. Will use placement congestion map instead.

DESCRIPTION

When running the shape_fp_blocks with the -incremental congestion_driven option, the command relies on congestion map to determine the appropriate channel widths. It attempts to find the global route congestion map; this warning indicates that it could not find it, and that it will use (generally less accurate) placement congestion map instead.

WHAT NEXT

If more accurate results are needed, run global route before running this command.

FPL-107 (warning) not enough space for channels in %s

DESCRIPTION

The shaping command produced channels that are narrower than the initial estimated requirement. This is typically due to perceived lack of space, as the command tries to make sure that the blocks stay within their target utilization.

WHAT NEXT

At this stage, the channel size have to be roughly estimated by the command. Channels can be more accurately set by using "shape_fp_blocks -incremental congestion_driven" command after a congestion map has been generated.

FPL-108 (warning) Channels in %s may be smaller than initial estimated requirement

DESCRIPTION

The shaping command produced channels that are narrower than the initial estimated requirement. This is typically due to perceived lack of space, as the command tries to make sure that the blocks stay within their target utilization.

WHAT NEXT

At this stage, the channel size have to be roughly estimated by the command. Channels can be more accurately set by using "shape_fp_blocks -incremental congestion_driven" command after a congestion map has been generated.

FPL-109 (warning) Large number of fixed standard cells detected, may be unable to avoid overlapping them with macros.

DESCRIPTION

When too many standard cells are fixed, it may be difficult or impossible to place macros without overlapping those fixed cells. Placement can place macros while ignoring overlaps with fixed standard cells. This behavior is controlled by the overlap_ignore_fixed_stdcells_count parameter. If a design has more then this number of fixed standard cells, then macro to standard cell overlaps will be allowed. If a design has less than this number of fixed standard cells, then macro to standard cells overlaps will be avoided. Note that even if macro to standard cells overlaps are avoided, there still may be some overlaps if the placement problem is difficult.

WHAT NEXT

Determine which standard cells really need to be fixed and unfixed the remaining. To have macro placement avoid the remaining fixed standard cells, set overlap_ignore_fixed_stdcells_count parameter to a value larger than the number of fixed standard cells (note that this may produce macros overlapping each other). The syntax for this is:

```
set_fp_placement_strategy -name overlap_ignore_fixed_stdcells_count -value number
```

FPL-110 (warning) Soft macro %s does not have its own congestion map, will use global congestion map instead.

DESCRIPTION

When running shape_fp_blocks -incremental congestion_driven, the command tries to use congestion map inside soft macros to help estimate their size. This warning means that it failed to find a congestion map inside a soft macro and will use the top level congestion map instead.

WHAT NEXT

If there is a possibility that the size of the soft macro needs to increase to avoid internal congestion, generate congestion map inside the soft macro before running this command.

FPL-199 (warning) %s

DESCRIPTION

See warning message.

WHAT NEXT

See warning message.

FPOPT

FPOPT-002 (error) one or more macros are not fixed,
optimize_fp_timing cannot continue.

DESCRIPTION

Command optimize_fp_timing requires all macros have fixed location.

WHAT NEXT

mark all macros as fixed location.

FSM

FSM_IN-0 (error) Compiler cannot read the file %s.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot open the file %s.

WHAT NEXT

Ensure that the file name is correct.

SEE ALSO

`read` (2).

FSM_IN-1 (warning) Compiler found illegal command %s (line: %d).

DESCRIPTION

You receive this message because once the finite-state machine (FSM) compiler starts reading rows, the `.encoding` and `.field` commands are the only ones allowed.

FSM_IN-2 (error) Input port %s is declared twice (line: %d).

DESCRIPTION

You receive this message because the input port is declared multiple times.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-3 (error) Output port %s is declared twice (line: %d).

DESCRIPTION

You receive this message because the output port specified in the message is declared multiple times.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-4 (warning) Only one %s command is allowed (line: %d).

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler has already read a clock signal.

WHAT NEXT

The FSM compiler ignores the clock signal read on the line specified in the message.

FSM_IN-5 (error) Name %s is missing (line: %d).

DESCRIPTION

You receive this message because the line specified in the message is missing a clock signal name.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-6 (error) %s signal %s is not an input port (line: %d).

DESCRIPTION

You receive this message because the signal connect to the clock pin is not an input

signal.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-7 (error) Invalid %s sense %s exists (line: %d).

DESCRIPTION

You receive this message because the clock sense or reset sense specified in the message is invalid. The clock sense is "rising_edge" rather than "falling_edge," or the reset sense is "rising" rather than "falling."

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-8 (error) The compiler cannot write the file named %s.

DESCRIPTION

You receive this error message because the finite state machine (FSM) compiler cannot open the named file and write out the state encoding information for Formality.

WHAT NEXT

Ensure that the disk is not full and that you have write permission for the file and its directory. After making the necessary changes, run the command again.

SEE ALSO

`fsm_export_formality_state_info(3)`

FSM_IN-10 (error) The state %s is not a state in the state table (line: %d).

DESCRIPTION

You receive this message because, during reading of the .st file, a state was

read that is not in the state table. You must ensure that the reset state is a valid state.

WHAT NEXT

Abandon .st file read.

SEE ALSO

`read (2)`.

FSM_IN-11 (error) State %s is used multiple times in .encoding (line: %d).

DESCRIPTION

You receive this message because the specified state has already been used in the .encoding section.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-13 (error) Binary encoding %s is used multiple times (%s at line %d and %s at line %d).

DESCRIPTION

You receive this message because the same encoding is used multiple times. For example, this could occur when encoding '001' is used to represent both state 'S0' and state 'S2.'

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-15 (error) A clock must be specified for the state table.

DESCRIPTION

You receive this message because a clock must be specified for each state table.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-16 (error) The state table must have at least one %s.

DESCRIPTION

You receive this message because a state table must have at least one output.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-17 (error) A mismatched number of %s exists.

DESCRIPTION

You receive this message because the number of inputs in .inputnames is not equal to the number of declared inputs.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-19 (error) The clock and reset cannot be on the same input port.

DESCRIPTION

You receive this message because the clock and reset are connected to the same input port.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-21 (error) Too few binary inputs exist (line: %d).

DESCRIPTION

You receive this message because the number of binary input variables is less than the number of input columns in the state table.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-22 (error) Too many binary inputs exist (line: %d).

DESCRIPTION

You receive this message because the number of binary input variables is larger than the number of input columns in the state table.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-23 (error) Binary input has the invalid character %c (line: %d).

DESCRIPTION

You receive this message because the binary input is the specified invalid character. The only valid values are **0**, **1** and **-**.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-24 (error) The compiler cannot read the present state

(line: %d).

DESCRIPTION

You receive this message because the compiler cannot read the present state from the state table file.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-25 (error) Illegal present state %s exists (line: %d).

DESCRIPTION

You receive this message because an illegal present state representation exists. In other words, the specified invalid state representation is -, &, or ~.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-26 (error) Compiler cannot read the next state (line: %d).

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot read the next state from the state table file.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-27 (warning) The next state, %s, is illegal (line: %d).

DESCRIPTION

You receive this message because the next state representation is an illegal

representation. The state specified in the message is + or *.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-28 (error) Compiler cannot read binary outputs (line: %d).

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot read the binary outputs from the state table file.

WHAT NEXT

Abandon the FSM load.

FSM_IN-29 (error) Too few binary outputs exist (line: %d).

DESCRIPTION

You receive this message because the number of binary output variables is less than the number of the output columns in the state table.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-30 (error) Too many binary outputs exist (line: %d).

DESCRIPTION

You receive this message because the number of binary output variables is larger than the number of output columns in the state table.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_IN-31 (error) Binary output has an invalid character %c (line: %d).

DESCRIPTION

You receive this message because the binary output specified in the message is an illegal representation. It is a character other than - or ~.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_UI-32 (error) Design %s is not a state table.

DESCRIPTION

You receive this message because there is no state table in the design specified in the message.

WHAT NEXT

The finite-state machine (FSM) logic optimization, state minimization, or redundant state removal cannot be completed.

FSM_OUT-32 (error) Design %s is not a state table.

DESCRIPTION

You receive this message because there is no state table in the design specified in the message.

WHAT NEXT

Abandon dumping the finite-state machine (FSM).

FSM_EX-34 (error) The design must have only input and output

ports.

DESCRIPTION

You receive this message because the port type of the design must be input or output and cannot be inout and three-state.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract` (2).

FSM_OUT-34 (error) The design can have only input and output ports.

DESCRIPTION

You receive this message because the finite-state machine (FSM) can have only input and output ports. It cannot have any inout or three-state ports.

WHAT NEXT

Abandon dumping the FSM.

FSM_COMP-36 (warning) All existing encodings are ignored for the %s encoding style.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler is using the state encoding style set up by the `set_fsm_encoding_style` command.

SEE ALSO

`set_fsm_encoding_style` (2).

FSM_COMP-37 (warning) Number of state bits is reset to %d to encode %d states for the %s encoding style.

DESCRIPTION

You receive this message because the size of the state vector does not match the number of state bits.

WHAT NEXT

The finite-state machine (FSM) compiler automatically makes up a new state vector.

FSM_COMP-38 (warning) Length of specified encodings is extended to match number of state bits.

DESCRIPTION

You receive this message because the number of bits of the state vector is larger than the number of bits of the existing encodings.

WHAT NEXT

Pad the encodings with zeros.

FSM_COMP-39 (warning) The number of state bits is reset to the length of the specified encodings.

DESCRIPTION

You receive this message because the number of bits of the state vector is too small.

WHAT NEXT

Make a new state vector with the same number of bits as the existing encodings.

FSM_COMP-40 (error) Cannot perform the %s encoding on

more than 30 bits.

DESCRIPTION

You receive this message because the number of bits of the encoding is larger than 30, and the encoding style is not **one_hot**.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

extract (2).

FSM_EX-47 (error) Cannot extract the design when the state vector is partially reset.

DESCRIPTION

You receive this message because some of the sequential elements have reset and some of them have not. In a finite-state machine (FSM), every sequential element should reset, or no sequential elements can enter the rest phase.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

extract (2).

FSM_EX-48 (error) Invalid reset for the state vector %s.

DESCRIPTION

You receive this message because, for the finite-state machine (FSM), each sequential element can have only one of the asynchronous controls. A generic sequential element has the following four asynchronous controls:

SEQ_F00, **SEQ_F01**, **SEQ_F10**, and **SEQ_F11**.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract (2)`.

FSM_EX-49 (error) The multiple clock signals %s and %s are not allowed.

DESCRIPTION

You receive this message because multiple clock signals are not allowed for a finite-state machine (FSM).

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2)`.

FSM_EX-50 (error) Multiple clock phases are not allowed.

DESCRIPTION

You receive this message because, in a finite-state machine (FSM), all sequential elements should have the same clock phase, whether rising or falling.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2)`.

FSM_EX-51 (error) The multiple reset signals %s and %s are

not allowed.

DESCRIPTION

You receive this message because, in a finite-state machine (FSM), all sequential elements should connect the same reset signal.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_EX-52 (error) Multiple reset phases are not allowed.

DESCRIPTION

You receive this message because, in a finite-state machine (FSM), all sequential elements should have the same rest phase, whether rising or falling.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_EX-53 (error) The multiple drivers on the %s network are not allowed.

DESCRIPTION

You receive this message because no driver of the multiple driver net is allowed for a finite-state machine (FSM).

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2).`

FSM_EX-54 (error) The state vector element %s has illegal %s logic.

DESCRIPTION

You receive this message because a reset or a clock has illegal combinational logic.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract (2).`

FSM_EX-55 (error) Net %s on the %s network has no drivers.

DESCRIPTION

This message is not used.

FSM_EX-56 (warning) The state vector for the state table extraction is not specified.

DESCRIPTION

You receive this message because the state vector is not specified.

WHAT NEXT

The state vector is generated directly from the network by searching for all sequential elements in the network, and it uses sequential element names as the elements of the state vector.

FSM_EX-57 (warning) Assuming that all noncombinational cells are the state vector.

DESCRIPTION

You receive this message because all noncombinational cells in the network are the state vector cells.

FSM_EX-58 (error) The design has no flip-flop instances.

DESCRIPTION

You receive this message because the network has no flip-flop.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract` (2).

FSM_EX-59 (error) The state vector cell %s is not in the design.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot find the state vector cell in the network.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_GRP-59 (warning) The state vector cell %s is not in the

design.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot find the state vector cell in the design.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_EX-60 (warning) The design has an invalid noncombinational cell %s.

DESCRIPTION

You receive this message because the design (from which the state table is to be extracted) has a noncombinational cell that is neither a latch nor a flip-flop.

WHAT NEXT

If the design was created using the `group` command with the `-fsm` option, use the `ungroup` command to ungroup the design. Next, mark all cells on which this error message was issued with the `dont_touch` attribute. Finally, use `group -fsm` to create a design from which the state table can be successfully extracted.

SEE ALSO

`extract` (2), `group` (2), `ungroup` (2).

FSM_EX-61 (error) The state vector cell %s is not clocked.

DESCRIPTION

You receive this message because the state vector cell specified in the message is not clocked. There is no cell driver in the clock pin of the sequential element.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract (2)`.

FSM_EX-62 (error) No state encodings are provided for the design,
so the state vector cannot be longer than 8.

DESCRIPTION

You receive this message because state encodings are not provided. When this occurs, the finite-state machine (FSM) compiler generates all possible state encodings and the state vector becomes too large. When the state vector bit size is larger than 8, you should abandon the FSM extraction because 2^8 is too large.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2)`.

FSM_EX-63 (warning) No state names are provided for design.
They are automatically generated.

DESCRIPTION

You receive this message because no state encoding is provided, so no state names are provided.

WHAT NEXT

The finite-state machine (FSM) compiler automatically generates all state names (for example, S0, S1, S2, ...).

FSM_EX-64 (warning) No state encodings are provided for the design.

All possible state codes are used.

DESCRIPTION

You receive this message because all possible state codes are used.

FSM_EX-65 (error) For extraction, state codes must be specified with the state names.

DESCRIPTION

You receive this message because a state name does not have a state code. Every state must have a specified state code, otherwise the finite-state machine (FSM) cannot be correctly extracted .

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_EX-66 (error) The reset state code %s is not for a valid state.

DESCRIPTION

You receive this message because the reset state code does not represent the code of a valid state.

WHAT NEXT

Abandon the The finite-state machine (FSM) extraction.

SEE ALSO

`extract (2).`

FSM_VER-68 (error) The two state machines you specified do not have the same number of ports.

DESCRIPTION

You receive this error message because the two finite state machines (FSMs) you specified do not have the same number of ports. The tool requires that each FSM have the identical number of ports.

WHAT NEXT

Abandon this FSM verification.

SEE ALSO

`extract (2), read (2).`

FSM_VER-69 (error) The two state machines specified do not have identical ports.

DESCRIPTION

You receive this error message because the port descriptions of the two finite state machines (FSMs) you specified have to be identical, but they are not. The items in the port descriptions that must be identical are

- The number of the ports on each state machine
- The bus widths
- The port names

WHAT NEXT

Abandon this FSM verification.

SEE ALSO

`extract (2), read (2).`

FSM_VER-70 (error) The two state machines you specified do not have the same number of states.

DESCRIPTION

You receive this error message because you specified two state machines that do not have the same number of states or the states named do not have the same names in each finite state machine (FSM). The FSM verification package supports verification only on state machines that have the identical number of states and identical state names.

WHAT NEXT

Abandon this FSM verification.

SEE ALSO

`extract (2), read (2).`

FSM_VER-71 (error) The two state machines you specified do not have identical states.

DESCRIPTION

You receive this error message because the state names of the two finite state machines (FSMs) you specified are not identical. The tool requires that the state names be identical.

WHAT NEXT

Abandon this FSM verification.

SEE ALSO

`extract (2), read (2).`

FSM_VER-72 (error) The two state machines you specified are not equivalent.

DESCRIPTION

You receive this error message because the two state machines you specified are not equivalent. This does not necessarily mean that the simulation will fail. This might be because the FSM verification package provided with Design Compiler does not support such FSM verification, for example, two FSMs having a different number of states.

WHAT NEXT

Use Formality to verify the designs. Or reimplement the design with option `hdlin_infer_fsm=false`.

SEE ALSO

`extract` (2), `read` (2).

FSM_VER-73 (information) The two state machines you specified are equivalent.

DESCRIPTION

You receive this message to let you know that the two finite state machines (FSMs) you specified are equivalent and the verification is successful.

WHAT NEXT

This message is for your information only and does not require any further action on your part.

FSM_EX-74 (error) Compiler cannot convert flip-flops to generic FFGEN.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot convert flip-flops into generic FFGEN. For the FSM extraction, all flip-flops must be converted to generic FFGEN, which means that all synchronous controls are

converted into combinational logic.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2)`.

FSM_EX-75 (error) The specified state encodings are inconsistent with the length of state vector.

DESCRIPTION

You receive this message because the length of all encodings must be consistent with the length of the state vector.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract (2)`.

FSM_COMP-76 (error) Encoding length of %d bits is too few to encode %d states.

DESCRIPTION

You receive this message because the (`number_of_encoding_bit`)² is less than `number_of_states`. For example, if a finite-state machine (FSM) has nine states, but the encoding is only 3-bit, the 3-bit encoding cannot represent nine states.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2).`

FSM_COMP-77 (warning) State assignment used %d bits and is truncating the state vector.

DESCRIPTION

You receive this message because the length of the resultant encoding is less than the maximum number of the state vector bits.

WHAT NEXT

Truncate the state vector.

FSM_IN-78 (error) Unknown port %s in .field statement (line: %d).

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot find the port name specified in the message in the 'input_set' and 'input_set' generated from 'stdb_get_input_port_order' and 'stdb_get_input_port_order'.

WHAT NEXT

Abandon the FSM load.

FSM_IN-79 (error) Invalid order of the input and output ports at %s (line: %d).

DESCRIPTION

You receive this message because the order of the input and output ports is not correct. In other words, the input and output are mixed. For example, this occurs in the following designation: `in0 in1 out0 in2 ...`

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_VER-80 (error) Finite state machine %s preprocess failed and may cause verification failure.

DESCRIPTION

The dont cares are failed to be annotated.

WHAT NEXT

Set fsm_auto_inferring to false, or use Formality to verify.

FSM_ENC-81 (error) Encoding %s has an invalid base specification %s.

DESCRIPTION

You receive this message because the encoding base is invalid. It can be only **binary**, **octagon**, **decimal**, or **hexagon**.

WHAT NEXT

Quit dc_shell.

FSM_ENC-82 (error) Encoding %s has an invalid base specification (line: %d).

DESCRIPTION

You receive this message because the encoding base is invalid. It can be only **binary**, **octagon**, **decimal**, or **hexagon**.

WHAT NEXT

Quit dc_shell.

FSM_ENC-83 (error) Encoding %s has an invalid number specification %s with base %s.

DESCRIPTION

You receive this message because the encoding specified in the message has an invalid bit number according to the encoding base. For example, this error occurs if the base is binary and one of the encoding bits is larger than **1**, like **10012**.

WHAT NEXT

Quit dc_shell.

FSM_ENC-84 (error) Encoding %s has an invalid number specification %s with base %s (line: %d).

DESCRIPTION

You receive this message because the encoding specified in the message has an invalid bit number according to the encoding base. For example, this error occurs if the base is binary and one of the encoding bits is larger than **1**, like **10012**. The only difference between this message and **FSM_ENC-84** is that this message indicates the line number.

WHAT NEXT

Quit dc_shell.

FSM_ENC-85 (error) Encoding %s overflow.

DESCRIPTION

You receive this message because an encoding bit is less than 0.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

extract (2).

FSM_IN-86 (error) Cannot transition to the next state, which is invalid (line: %d).

DESCRIPTION

You receive this message because the next state representation contains one of the invalid characters '+' or '&'.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_GRP-87 (error) No state vector is specified for FSM grouping.

DESCRIPTION

You receive this message because no state vector is specified for finite-state machine (FSM) grouping.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_EX-88 (error) Cannot extract the design with combinational feedback loops.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot extract a design with combinational feedback loops.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract (2).`

FSM_IN-89 (warning) The state table has zero states.

DESCRIPTION

You receive this message because the state table has zero states.

FSM_VER-90 (error) Finite state machine %s postprocess failed and may cause verification failure.

DESCRIPTION

Can not recover the original state encoding.

WHAT NEXT

Set `fsm_auto_inferring` to `false`, or use Formality to verify.

FSM_COMP-92 (warning) The design has zero states, so it is entirely combinational.

DESCRIPTION

You receive this message because there is no sequential element in the design.

WHAT NEXT

The design acts as a combinational design.

FSM_COMP-93 (warning) The design has one state that is

removed, and the design becomes entirely combinational.

DESCRIPTION

You receive this message because there is only one state in the design. The design must have at least two states to be a sequential design and must have zero states to be a combinational design. Since it has one state, that state can be removed so the design can become combinational.

WHAT NEXT

The finite-state machine (FSM) compiler automatically removes the state, so the design becomes combinational.

FSM_UI-94 (warning) State minimization found all states equivalent, so the design is entirely combinational.

DESCRIPTION

You receive this message because all states are equivalent, so the finite-state machine (FSM) is only one state. In other words, it is a combinational design.

FSM_VER-96 (error) Design '%s' requires a single reset state for verification.

DESCRIPTION

You receive this message because you did not specify a single reset state, which is necessary for the finite state machine (FSM) verification.

WHAT NEXT

Abandon this FSM verification.

FSM_VER-97 (error) Design '%s' requires a state vector for

verification.

DESCRIPTION

You receive this error message because you did not provide the state vector for the finite state machine (FSM) verification.

WHAT NEXT

Use the `dc_shell` command `set_fsm_state_vector` to specify the state vector. Or abandon this FSM verification.

FSM_EX-98 (error) One or more starting states are required for extraction using reachability.

DESCRIPTION

You receive this message because the reachable option is set in the finite-state machine (FSM) extraction, so at least one starting state is required.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_IN-103 (error) Ambiguous output values are specified at lines %d and %d.

DESCRIPTION

You receive this message because ambiguous output values occur at the two lines specified in this error message. For example, this could happen with the following two rows from a state table: 10 S0 S1 00 and 10 S0 S0 00.

WHAT NEXT

Abandon the finite-state machine (FSM) load.

FSM_LINT-104 (warning) The next state in design %s is unspecified for some transitions.

DESCRIPTION

You receive this message because the next state is not specified in the state transitions.

FSM_LINT-105 (warning) The next state in design %s is unspecified for some transitions from state %s.

DESCRIPTION

You receive this message because the next state is not specified in the state transitions. The message is same as that in FSM_LINT-104 except that it also indicates the current state name.

FSM_LINT-106 (warning) Some output values are unspecified in design %s.

DESCRIPTION

You receive this message because at least one of the output cubes is not fully specified.

FSM_LINT-107 (warning) The value of output %s in design %s is unspecified for some transitions from state %s.

DESCRIPTION

You receive this message because at least one of the output cubes is not fully specified. The message is same as that in FSM_LINT-106, except that it also indicates the unspecified output name and the current state name.

FSM_LINT-108 (warning) No transitions from some states are

specified in design %s.

DESCRIPTION

You receive this message because at least one dead state exists in the design specified in the message.

FSM_LINT-109 (warning) No transitions from state %s are specified in design %s.

DESCRIPTION

This warning message occurs when the state specified in the message is a dead state in the design specified in the message. This message is similar to **FSM_LINT-108**, except that this warning also indicates the name of the dead state.

WHAT NEXT

This is a warning message only. No action is required on your part. The finite state machine (FSM) optimization automatically removes the dead state.

SEE ALSO

FSM_LINT-108 (n).

FSM_LINT-110 (warning) No transitions are specified to some states in design %s.

DESCRIPTION

You receive this message because at least one dead state exists in the design specified in the message.

FSM_LINT-111 (warning) No transitions are specified to state %s in design %s.

DESCRIPTION

This warning message occurs when the state specified in the message is one of the

dead states in the design. This message is similar **FSM_LINT-110**, except that this message also indicates the name of the dead state.

WHAT NEXT

This is a warning message only. No action is required on your part.

SEE ALSO

FSM_LINT-110 (n).

FSM_LINT-112 (warning) The state graph is disconnected in design %s.

DESCRIPTION

You receive this message because the number of processed states is not equal to the number of states in the finite-state machine (FSM), so at least one state is disconnected in the state graph.

FSM_EX-113 (error) The design is already a state table (STDB).

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot extract a design that is already an STDB.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

extract (2).

FSM_EX-114 (warning) Extraction resulted in a state table with

no rows.

DESCRIPTION

You receive this message because the extracted finite-state machine (FSM) compiler resulted in a state table with no rows.

FSM_IN-115 (warning) The state table contains no rows.

DESCRIPTION

You receive this message because no rows exist in the state table.

FSM_COMP-115 (warning) State table contains no rows.

DESCRIPTION

You receive this message because the state table is empty or the design does not have the st format.

WHAT NEXT

Keep the design unchanged.

FSM_OUT-115 (warning) State table contains no rows.

DESCRIPTION

You receive this message because there are no rows in the state table.

FSM_EX-116 (error) The asynchronous reset signal %s cannot drive the combinational logic of the state machine.

DESCRIPTION

You receive this message because the signal '%s' is an asynchronous signal that is used to reset the state machine to a certain start state, and this signal must fanout only to the state vector elements in the design (from which the state table

is to be extracted).

WHAT NEXT

If the design was created by using the **group** command with the **-fsm** option, use the **ungroup** command to ungroup the design. Next, examine the fanout of the reset signal specified in the message. All combinational gates (in the fanout of this reset signal) that do not transitively fanout to the asynchronous pins of the state vector flops must be marked with the **dont_touch** attribute. Finally, execute **group -fsm** to create a design from which the state table can be successfully extracted.

SEE ALSO

group (2), **ungroup** (2).

FSM_EX-117 (error) The clock signal %s cannot drive the state machine's combinational logic.

DESCRIPTION

You receive this message because the signal specified in the message must fanout only to the state vector elements in the design.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

extract (2).

FSM_EX-126 (error) Cannot extract the multiple clocks feeding the state vector element %s.

DESCRIPTION

You receive this message because the "clocked_on_also" must be driven by the same pin as "clocked_on" and must be in inverted phase.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract (2)`.

FSM_EX-127 (warning) The extraction is too expensive.

DESCRIPTION

You receive this message because the finite-state machine (FSM) compiler cannot build the BDD because the network is too large.

WHAT NEXT

Discard the BDD formulas for the network, and abandon the FSM extraction. See the subsequent `FSM_EX-144` message for the name of the finite state machine.

FSM_IN-129 (error) The use of the percent operator has resulted in an ambiguous specification.

DESCRIPTION

You receive this message because the `on_set` and `off_set` covers overlap, so the use of the percent operator results in an ambiguous specification.

WHAT NEXT

Abandon the finite-state machine (FSM) PLA build.

FSM_VER-130 (error) The length of the encoding of the initial state of design '%s' is inconsistent with the length of the state vector.

DESCRIPTION

You receive this error message because the number of elements of the state vector you specified is not equal to the number of bits of the initial state encoding. The tool requires that these two numbers be the same.

WHAT NEXT

Abandon this FSM verification.

FSM_IN-131 (warning) Compiler ignores the row at line %d, since previous row(s) containing the percent operator cover all input conditions implied by this row.

DESCRIPTION

You receive this message because the previous row(s) already containing the percent operator (%) provide for all input conditions implied by this row.

FSM_VER-132 (error) The two designs you specified must be netlists for verification.

DESCRIPTION

You receive this error message because you did not specify two designs that are both mapped netlists, which the tool requires for verification. The designs cannot be generic GTECH netlists or statetable.

WHAT NEXT

Abandon this FSM Verification.

FSM_EX-133 (warning) Ignoring missing state vector cell %s.

DESCRIPTION

Cannot find a state vector cell in the network.

WHAT NEXT

Ignore the missing state vector cell.

FSM_EX-134 (error) You must specify the state vector for the

state table extraction.

DESCRIPTION

You receive this message because the state vector must be specified in the extracting design.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

`extract` (2).

FSM_VER-135 (error) Design '%s' must have only input and output ports.

DESCRIPTION

You receive this error message because your design contains inout ports or tristate ports, which the tool does not allow. A finite state machine (FSM) can have only input ports and output ports.

WHAT NEXT

Abandon this FSM verification.

FSM_VER-136 (error) Design '%s' contains invalid non-combinational cell '%s'.

DESCRIPTION

You receive this error message because your design contains an invalid noncombinational cell, which the tool does not support. Every sequential element in the network is part of the state vector. An error occurs if any noncombinational cell cannot belong to the state vector set.

WHAT NEXT

Abandon this FSM verification.

FSM_VER-137 (error) Design '%s' contains combinational feedback loops.

DESCRIPTION

You receive this error message because the named design contains combinational feedback loops. The compiler does not allow finite state machines (FSMs) to contain combinational feedback loops.

WHAT NEXT

Abandon this FSM verification.

FSM_VER-138 (warning) Ignoring missing state vector cell '%s' in design '%s'.

DESCRIPTION

You receive this warning because the tool cannot find the named state vector cell in the network. The compiler ignores this cell.

WHAT NEXT

This is a warning only. No further action is required on your part.

FSM_EX-140 (error) State encoding %s is invalid for the state %s.

DESCRIPTION

You receive this message because the state encoding specified in the message must be composed of **0** or **1**.

WHAT NEXT

Abandon the finite-state machine (FSM) extraction.

SEE ALSO

extract (2).

FSM_VER-140 (warning) Optimized netlist with non unique state encoding. State name: '%s'.

DESCRIPTION

You receive this warning because the tool optimized one or more state registers away during the FSM optimization. There is no way to verify such netlist for Formilty.

WHAT NEXT

This is a warning only. If you try to verify the netlist with Formilty, turn off the FSM optimization with `fsm_auto_inferring=false`

FSM_LINT-141 (warning) The FSM for design %s is large. Consider partitioning the design for better results.

DESCRIPTION

You receive this message because the finite-state machine (FSM) is too large to be extracted.

WHAT NEXT

Abandon the FSM extraction.

SEE ALSO

`extract` (2).

FSM_EX-141 (warning) The output function for the state %s is too large to be represented.

DESCRIPTION

You receive this message because the output function for the state specified in the message has too many terms in its sum-of-products representation. For example, a parity function obtained by performing the XOR operation on 32 bits of a 32-bit data-bus would have too many terms.

WHAT NEXT

Try to remove the logic corresponding to the complex function from the netlist used for state machine extraction. In other words, make the state machine simpler.

FSM_EX-142 (warning) The transition function for the state %s is too large to be represented.

DESCRIPTION

You receive this message because the transition function for the state specified in the message has too many terms in its sum-of-products representation. The transition function represents the set of all possible input sequences under which the state machine goes from the state specified in the message to any other state. For example, a parity function obtained by performing the XOR operation on 32 bits of a 32-bit data-bus would have too many terms.

WHAT NEXT

Try to remove the logic corresponding to the complex function from the netlist used for state machine extraction. In other words, make the state machine simpler.

FSM_LINT-142 (warning) The FSM size is large. Consider partitioning your original design.

DESCRIPTION

You receive this message because the finite-state machine (FSM) size is very large. The offset cannot be generated for two-level logic optimization, but the FSM is still extracted.

WHAT NEXT

Consider partitioning your original design.

SEE ALSO

`extract (2).`

FSM_RED-143 (information) The FSM has %d cubes which

exceeds the limit of %d so the `reduce_fsm` command is too expensive and is unable to complete execution.

DESCRIPTION

This information message occurs when the combinational logic of the finite state machine (FSM) contains a number of cubes that is too large.

The `reduce_fsm` command cannot complete execution.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`reduce_fsm` (2).

FSM_LINT-143 (error) The number of outputs in the state table is %d but the number of outputs in the design is %d.

DESCRIPTION

You receive this message because the state table for the *current design* has a different number of outputs than the design. This inconsistent state might have been caused by unconnected output ports in the design.

WHAT NEXT

Examine all previous finite-state machine (FSM) and `FSM_LINT` warnings and make necessary changes to the design or script to eliminate them. Abandon the finite-state machine (FSM) extraction.

FSM_EX-144 (information) The finite state machine %s has been extracted.

DESCRIPTION

You receive this message because a finite-state machine (FSM) has been successfully extracted.

FSM_EX-145 (information) The finite state machine %s cannot be extracted.

DESCRIPTION

You receive this message because a finite-state machine (FSM) has not been successfully extracted.

FSM_EX-146 (information) The finite state machine %s has been extracted with the same encoding style.

DESCRIPTION

You receive this message because a finite-state machine (FSM) has been extracted with the same encoding style and is going to be extracted twice.

FSM_EX-147 (warning) FSM auto-optimization skipped.

DESCRIPTION

You see this warning about your design because of one of the following reasons:

- o The tool can not find the named state register in the current design.
- o All state registers are directly driven by other registers, which only drive state registers. In that case, inferring FSM cannot simplify any next-state function.
- o Any state register is a scan register.

WHAT NEXT

If you really need to infer the FSM, use the old FSM extraction flow.

SEE ALSO

[**fsm_auto_inferring** \(3\)](#).

FSM_LINT-151 (warning) The output port %s has no drivers.

DESCRIPTION

You receive this message because the output port specified in the message is ignored for all finite-state machine (FSM) operations.

FSM_LINT-152 (warning) Please use new developed FSM optimization features, and see the 'man fsm_auto_inferring' command man page for further details.

DESCRIPTION

This message indicates that the command is obsolete. The new developed FSM package covers this feature.

WHAT NEXT

See the man page, using 'man fsm_auto_inferring'.

SEE ALSO

`man fsm_auto_inferring`

FV

FV-1 (error) The design to align '%s' is not in the original hierarchy.

DESCRIPTION

The subdesign with the given pathname does not exist in the original design hierarchy.

WHAT NEXT

Refer to the Design Compiler Manual for the correct syntax of all set_compare_design_script options.

FV-2 (warning) These endpoints are driven by combinational feedback loops.

They will be set to logic zero during verification.

DESCRIPTION

Verification will fail on an endpoint pair (e1, e2) if a feedback loop drives e1 but not e2 (or vice versa) unless e2 happens to be logic zero. Therefore, the software sets to logic zero any endpoint that is found to be driven by a combinational feedback loop.

WHAT NEXT

Other endpoints in the subdesign will be verified as usual. You should inspect any failures occurring on other endpoints.

FV-3 (info) Setting input port '%s' to logic %s in design %s. The 'test_hold' attribute has value %d.

DESCRIPTION

The **test_hold** attribute is on the input port mentioned. In order to verify the designs in "mission" mode as opposed to test mode, the input port is assigned a constant logic value opposite to the value of the **test_hold** attribute.

WHAT NEXT

If the **test_hold** attribute is present on the original and the optimized designs, then the user can optionally remove the attributes before verification. Thus mission mode and test mode will both be checked for functional equivalence.

FV-4 (error) This message is not currently used.

DESCRIPTION

WHAT NEXT

FV-5 (error) Cannot find cell in original design with name '%s'.

DESCRIPTION

WHAT NEXT

FV-6 (info) Setting JTAG Instruction Register outputs to logic one in design '%s'.

DESCRIPTION

This assignment is done for verification purposes only. It has the effect of logically eliminating the Boundary Scan Registers from the design. The original design is not modified.

WHAT NEXT

Verification distinguishing vectors should not mention BSR source or end points.

FV-7 (info) Ignoring JTAG Test Data Out port in design '%s'.

DESCRIPTION

The test data out port does not appear in the original design.

WHAT NEXT

Verification distinguishing vectors should not mention the Test Data Out end point.

FV-8 (warning) No JTAG Test Data Out port was found.

DESCRIPTION

There is usually exactly one JTAG Test Data Out port. It is allowed for the user to remove it manually.

WHAT NEXT

FV-12 (info) Setting scan input port '%s' to logic %s in design %S.

DESCRIPTION

compare_design is intended to compare an original design (with no test attributes) against a scanned design with test attributes (the result of **insert_test**).

In this recommended methodology, verification puts the scanned design into "mission" mode, as opposed to test mode, by assigning logical constants to certain input ports. Logic zero is assigned to input ports with the attributes: **test_scan_enable**, **test_scan_clock**, **control_point_enable**. Logic one is assigned to input ports with the attributes: **test_scan_enable_inverted**, **control_point_enable_inverted**. Thus, some test logic is disabled during verification and will not be functionally verified.

Current Limitations: Verification does not verify the clocking logic of LSST scan registers.

WHAT NEXT

If the user wants to violate the recommended methodology and verify one scanned design against another scanned design, then the test attributes must be removed from both designs. The output ports must be in one-to-one name correspondence, or the **set_compare_design_script -ignore** command must be used to ignore endpoints unique to each design. Verification now compares the two designs for equivalence, including both mission mode and test mode.

Moreover, the user always has the option to apply **set_logic_zero** or **set_logic_one** (before **compare_design**) to selected input ports in order to limit the scope of verification.

FV-13 (warning) Verification failures may be caused by the level_sensitive or clocked_on_also attribute on port '%s'.

DESCRIPTION

Some verification failures occur because input clock ports have have the **level_sensitive** attribute or the **clocked_on_also** attribute.

For example, if MCK is a clock port (the master clock) then the command **set_signal_type "clocked_on_also" MCK -level_sensitive** sets MCK port attributes. These tell **compile** that the design has MS (Master/Slave) latches. **Compile** transforms all flip-flops into MS latches. Because the **level_sensitive** attribute is set, MCK is their master clock. Inferred clocks are slave clocks.

Associated verification failures involve endpoints that are MS latch "clocked_on" pins or inputs to hierarchical cells leading to "clocked_on" pins.

Compile infers MS latches with inferred clocks connected to "clocked_on" pins and signals identified by **set_signal_type** commands connected to "clocked_on_also" pins. Failures occur because translation switches these connections when **level_sensitive** attributes are set.

The failures should be ignored because they are side-effects of the way **compile** supports MS latches.

WHAT NEXT

Examine the clock logic with the **Design Analyzer** manually. Signals with set **level_sensitive** attributes should be connected to MS latch "clocked_on" pins.

FV-14 (error) The following involve unconnected endpoints:

DESCRIPTION

In the messages that follow this one, the first endpoint is from the original design and the second is from the optimized design. This error message informs the user that an unconnected endpoint is being compared to a connected endpoint. This causes a verification failure. A connected endpoint is categorized by its net connection. The categories are: connected to ground, connected to power, and connected to non-constant net.

WHAT NEXT

Examine the design for unconnected primary outputs and for unconnected inputs to sequential cells.

FV-15 (error) Could not align these output ports in %s design '%S':

DESCRIPTION

Alignment has failed during **compare_design** to align all output ports of the two designs. This may happen for two reasons.

- 1) The two designs cannot not be aligned; perhaps one has more output ports than the other. Verification cannot succeed under these conditions.
- 2) An inout port is being interpreted differently in the two designs being compared. Verification needs to interpret each inout port as either a sourcepoint or an endpoint. It does this by examining the net connected to the inout port.

If some other driver pin is connected to the net, then the port is interpreted as an endpoint.

If the net has no clear driver pin and more than one inout port connection, then the port with least alphabetical name is interpreted as the sourcepoint, and the others are interpreted as endpoints.

If the inout port is the only possible driver pin, then the inout port is interpreted as a sourcepoint.

WHAT NEXT

Check to see if the inout ports are used differently in the two designs. If so, then verification cannot be completed.

If verification is giving an improper interpretation to the inout ports, the user may consider copying the designs and giving explicit port directions to the ports on the copies. The the copies should be verified. Currently, there is no option to allow the user to indicate the interpretation of an inout port.

FV-16 (info) No logical constant assignments were made to JTAG

pins in design '%s'.

DESCRIPTION

WHAT NEXT

FV-17 (error) Could not align subdesign '%s'.

DESCRIPTION

Automatic alignment could not align the subdesign mentioned. During **compare_design -hier** the instance pathnames in the two hierarchies being compared must be the same.

If this message is issued during an ECO Compiler command, then this subdesign should be aligned explicitly with a subdesign in the other design hierarchy.

The **set_eco_align** command applied to a pair of output ports on the two subdesigns will accomplish alignment of the subdesigns.

WHAT NEXT

If **compare_design -hier** cannot work because instance pathnames in the two design hierarchies are not the same, then non-hierarchical verification may be attempted, using simply **compare_design**.

FV-18 (Warning) Accepting design '%s' because its DB reference design, '%s', is the same in both hierarchies.

DESCRIPTION

The two design hierarchies share some subdesigns. The user may do this intentionally in order to reduce the time for verification.

Most likely, the user did not intend for the hierarchies to share subdesigns. In this case, the script should be modified so that **uniquify -force** is used after reading the first design and before reading the second design.

For instance, if a hierarchical design is saved before and after **compile**, and later read into **dc_shell**, then the hierarchies will share subdesigns after linking, which is not the user's intention. The **uniquify -force** command is needed to separate the hierarchies during linking and subsequent verification.

Beware that this warning will not be issued during non-hierarchical verification. If the hierarchies share subdesigns, then verification may be linking both designs to subdesigns from just one of the hierarchies. Again, **uniquify -force** is a sure solution to avoid this problem.

WHAT NEXT

FV-19 (error) First design '%s' has %0d subdesigns, but second design '%s' has %0d subdesigns.

DESCRIPTION

The subdesigns of the two designs mentioned cannot be aligned, because there are a different numbers of subdesigns. The user may need to use the **ungroup** command to partially flatten one or both of the design hierarchies.

WHAT NEXT

compare_design and **eco_align_design** require that the two design hierarchies be identical from the top-level down to accepted designs.

The accepted designs must have the same source and end points, after **set_compare_design_script -ignore** or **set_compare_design_script -only** has been applied. The designs beneath the accepted designs are automatically accepted and not verified.

FV-20 (error) Could not open file: '%s'.

DESCRIPTION

A command tried to open a file for writing, but failed.

WHAT NEXT

Make sure that you have write permission in this directory. If the file already exists in the directory, make sure that you have write permission for that file.

If the permissions are OK, try NOT using the '~' (tilde) character. Some file manipulation functions do not accept path names that start with the tilde character. Try using absolute paths or relative paths instead.

FV-21 (error) This message is not currently used.

DESCRIPTION

WHAT NEXT

FV-22 (warning) Cell '%s' is an empty subdesign in design '%s'. The inputs of the cell will be ignored, not treated as verification endpoints.

DESCRIPTION

If a cell in a design instantiates an empty subdesign (no cells and no nets) then verification will treat the subdesign as a black-box, whose outputs are considered sourcepoints for downstream endpoints.

The input pins are ignored, not treated as endpoints, because the subdesign is empty and functional differences at the input pins could not affect real design endpoints.

It is likely that verification errors will occur and that the subdesign output pins will be mentioned in the report. The most likely explanation is that only one of the design arguments to **compare_design** contains the empty subdesign. The output pins are effectively undriven nets in one of the designs.

WHAT NEXT

Make sure that you really want to have an empty subdesign present.

If so, restrict yourself to comparing two designs whose empty subdesigns are in one-to-one name correspondence, so that the sourcepoints are alignable during verification.

FV-23 (info) This message is not currently used.

DESCRIPTION

WHAT NEXT

FV-24 (warning) The two designs have the same DB reference.

DESCRIPTION

WHAT NEXT

FV-25 (info) Interpreting '%s' in %s design as %s.

DESCRIPTION

The interpretation during verification of the mentioned source or endpoint is determined by its net connection. The interpretation may be unexpected by the user because of the declared direction of the point.

For example, if a net is connected to an output port, to input pins of combinational cells, and has no other driver, then verification interprets the output port as a verification sourcepoint because it is used as the driver of combinational logic. This situation may or may not be erroneous in the user's opinion.

This message may also be issued in cases where the driver of the net is ambiguous. A pass-thru net is an example of this.

WHAT NEXT

The user should examine the designs being compared and make sure that the input and output ports are used as intended.

FV-26 (error) Scan style '%s' not supported in compare_design or compile."

DESCRIPTION

The specified scan style attribute on the mentioned design is not supported.

Currently, verification supports the `clocked_scan` and the `multiplexed_flip_flop` styles.

WHAT NEXT

FV-27 (info) Using non-hierarchical verification because of boundary optimization.

DESCRIPTION

If the `boundary_optimization` attribute is present on any hierarchical block in the design, then `compare_design` flattens both design hierarchies just prior to verification; that is, after applying the `set_compare_design_script` commands. In the event that the script commands cannot be applied, because the design hierarchies are not identical, then the user must apply `ungroup -all` to both designs and re-write the script to apply to the flattened designs.

WHAT NEXT

If the user knows that boundary optimization was only applied to certain designs, then it may be possible to `ungroup` those affected designs; the user can then remove the `boundary_optimization` attribute from all of the hierarchical blocks in the design, in order to allow hierarchical verification to proceed.

FV-28 (error) Original and optimized designs have different scan styles: '%S' '%S'.

DESCRIPTION

The two designs must either have the same scan style, as determined by `set_test_methodology`, or one design must have no scan style.

WHAT NEXT

FV-29 (info) Using non-hierarchical verification because of scan

insertion.

DESCRIPTION

Scan insertion changes the hierarchical boundaries of subdesigns.

WHAT NEXT

FV-30 (error) This message is not currently used.

DESCRIPTION

WHAT NEXT

FV-31 (error) Cannot find the clock pin on the sequential cell '%S'.

DESCRIPTION

WHAT NEXT

Make sure that every sequential cell in the library has a clock pin designated.

FV-32 (warning) Discarding Dont-Care information on DB subdesign '%s'.

DESCRIPTION

This warning is usually issued when the design arguments to **compare_design** are in the wrong order.

Dont-Care information is sometimes automatically annotated on a DB design by the **read** command. This information is later used during **compile** and verification. **Compare_design** utilizes the Dont-Care information annotated on the first design, called the original design. **Compare_design** discards any Dont-Care information annotated on the second design, called the optimized design.

Compare_design is intended to compare an original design, before **compile**, against an optimized design, the result of **compile**. If the optimized design is a result of

compile, it will have no Dont-Care information on it.

The user is permitted to compare two designs with Dont-Care information, for instance two unoptimized designs, but the Dont-care information on the second design will be discarded. In this case, **compare_design** is effectively checking whether the second design (without its Dont-Cares) is a valid implementation of the first design (considering its Dont-Cares).

WHAT NEXT

Check the order of the arguments to **compare_design**. Switch them if necessary and re-execute.

FV-33 (error) Could not open fv_report file.

DESCRIPTION

WHAT NEXT

FV-34 (error) This message is not currently used.

DESCRIPTION

WHAT NEXT

FV-38 (error) Cannot find port or combinational cell '%s' in design '%s'.

DESCRIPTION

The port does not exist in the specified subdesign.

WHAT NEXT

Check that the pathname of the design is correct in the **set_compare_design_script** command.

FV-39 (error) Null token in pathname '%s'.

DESCRIPTION

A pathname may not contain consecutive slash characters.

WHAT NEXT

Examine the `set_compare_design_script` history for improper pathnames, or the sequential cell instance names (if using `insert_clock_tree`). See the *Design Compiler Family Reference Manual*.

FV-40 (error) Cannot find cell '%s' in design '%s'.

DESCRIPTION

The cell does not exist in the specified design.

WHAT NEXT

Examine the `set_compare_design_script` history for improper pathnames. See the *Design Compiler Family Reference Manual* on pathname specifications for `set_compare_design_script`.

FV-41 (error) Cannot find pin '%s' on hierarchical cell '%s' in design '%s'.

DESCRIPTION

The pin on the hierarchical cell does not exist within the specified design.

WHAT NEXT

Examine the `set_compare_design_script` history for improper pathnames. See the *Design Compiler Family Reference Manual* on pathname specifications for `set_compare_design_script`.

FV-42 (error) The name '%s' is a pathname, not a port,

sequential cell, or cell/pin name.

DESCRIPTION

The name of a verification point must be a port name, sequential cell name, or a hierarchical cell name followed by a slash and a pin name.

WHAT NEXT

See the *Design Compiler Family Reference Manual* on command syntax for **set_compare_design_script**.

FV-43 (error) There are no exact name matches in subdesign '%S' for:

DESCRIPTION

The **-accept** option of **set_compare_design_script** asserts that there is a one-to-one name correspondence between input and output ports of two subdesigns. The **-ignore** and **-only** options may be used earlier in order to eliminate some output ports from consideration.

WHAT NEXT

FV-45 (error) Expecting an instance pathname of subdesign, or '%S';
not '%S'.

DESCRIPTION

The first two names in this **set_compare_design_script** entry must be instance pathnames of subdesigns or the placeholder "null". In the **-only** and **-ignore** options, only one of the pathnames may be null. The placeholder is used to indicate that the option should not be applied to one of the designs being compared.

For the **-accept** option, "null" is not allowed as an instance pathname; the top-level designs may have different names; and, the instance pathnames below the top-level designs must be the same.

WHAT NEXT

If the **-accept** option is failing, make sure that the instance pathnames mentioned in the option exist in both designs.

FV-46 (error) Cannot find design hierarchy '%s'.

DESCRIPTION

The design hierarchy in the following **set_compare_design_script** entry is not a current argument to **compare_design**.

WHAT NEXT

See the *Design Compiler Family Reference Manual* for pathname specifications for **set_compare_design_script**.

FV-47 (error) Cannot find instance '%s' within design '%s'.

DESCRIPTION

The instance does not exist within the specified design.

WHAT NEXT

See the *Design Compiler Family Reference Manual* for pathname specifications for **set_compare_design_script**.

FV-48 (error) List of points to align does not have even number of names.

DESCRIPTION

After the first two pathnames in an **-align** option, the point names should be in pairs. The first point will be aligned with the second point in each pair.

WHAT NEXT

FV-49 (warning) Subdesign '%s' being accepted more than

once.

DESCRIPTION

The **set_compare_design_script history contains a redundant -accept** option for the specified design. This may be caused by a subdesign being accepted that is a descendant of another already accepted design. There is no run time or memory penalty associated with this warning.

WHAT NEXT

Review the script to make sure that all the subdesign comparisons desired will be performed.

FV-50 (error) The list of designs to accept does not have even number of names.

DESCRIPTION

The design pathnames in the **-accept** and **-compare** options should be in pairs. For each pair, the input and output ports of the first (original) design are aligned with the input and output ports of the second (optimized) design.

WHAT NEXT

FV-51 (error) These points appear more than once in following -invert_phase option for design '%s':

DESCRIPTION

A point may not have its phase inverted more than once by the commands in the **compare_design** script. The repetition exists within a single **invert_phase** option list.

WHAT NEXT

FV-52 (error) These points appear more than once in -

invert_phase lists for design '%s':

DESCRIPTION

A point may not have its phase inverted more than once by the commands in the **compare_design** script. The repetition involves more than one **invert_phase** option list.

WHAT NEXT

FV-53 (error) Cannot combine an **-only** script entry with other **-only** entries or with an **-ignore** entry.

DESCRIPTION

The **compare_design** script may not contain more than one **-only** option for a given subdesign. If the **compare_design** script contains an **-only** option for a given subdesign, then it may not contain any **-ignore** options for the same subdesign. The **compare_design** script may contain more than one **-ignore** option for a given subdesign, though one is sufficient and easier to manage.

WHAT NEXT

Edit your **compare_design** script so that it does not combine an **-only** entry with another **-only** entry or with an **-ignore** entry. Then re-execute.

FV-56 (error) No pathname specified in the following script entry:

DESCRIPTION

The first two names in the displayed **set_compare_design_script** entry must be pathnames of subdesigns or the placeholder "null". In the **-only**, **-ignore**, options, at most, one of the pathnames may be null.

WHAT NEXT

Edit your **set_compare_design_script** entry so that the pathname is appropriately specified; then re-execute.

FV-57 (error) Two pathnames specified in %s script entry: '%s'

'%S'.

DESCRIPTION

The first two names in the following `set_compare_design_scriptP` entry must be **pathnames of subdesigns or the placeholder "null". In the invert_phase, -source_phase_assign, and -end_phase_assign options, one of the pathnames must be null.**

WHAT NEXT

FV-58 (error) Cannot process script entry:

DESCRIPTION

Read the preceding error messages for an explanation of this error.

WHAT NEXT

FV-59 (info) Not assigning input scan port '%s' in second design, because port is connected in first design.

DESCRIPTION

`compare_design` assigns a logical constant to a connected input scan port (in the second design) only if the port is absent or unconnected in the first design.

WHAT NEXT

FV-60 (error) Attempted to invert phase of sequential cell with non-complementary outputs: '%s'.

DESCRIPTION

The Q and QN outputs of the specified sequential cell are not complementary. Possible reasons for this are: 1) The library specifies that the outputs are not complementary; 2) The functions driving the force_00 and force_11 inputs of the degenerated sequential cell are not logical zero. For purposes of verification, every sequential cell is degenerated into a primitive sequential cell. The outputs

(sourcepoints) of the primitive are Q and QN. The inputs (endpoints) of the primitive are next_state, force_00, force_01, force_10, force_11, clocked_on, and clocked_on_also (for Master-slave cells only). The functions driving the force endpoints characterize the asynchronous properties of the primitive sequential cell. The library may also contain an attribute asserting that the outputs Q and QN are complementary. The force_01 function represents the conditions under which the Q pin can be driven to zero and the QN driven to 1 simultaneously. The other force inputs have a similar interpretation. When the attribute is not present, verification tries to determine that Q and QN are effectively complementary by establishing that both force_00 and force_11 are logically zero. The exact degeneration process depends on the library characterization of the sequential cell and is not described here.

WHAT NEXT

FV-61 (error) The point to phase invert is not a port or sequential cell: '%s'.

DESCRIPTION

The only verification points that can be phase inverted are primary or hierarchical boundary ports and sequential cells.

WHAT NEXT

If you want to invert all the outputs of a hierarchical subdesign, you must list the outputs individually.

FV-62 (error) Cannot find sequential cell or port '%s' in design '%s'.

DESCRIPTION

The sequential cell does not exist in the specified design.

WHAT NEXT

See the *Design Compiler Family Reference Manual* on pathname specifications for **set_compare_design_script**.

FV-63 (warning) Some black-box cells exist during verification

DESCRIPTION

Black-box cells may arise during verification for several reasons.

Verification can succeed in the presence of black-boxes, as long as the black-boxes appear in both designs being compared, with the same instance names and pin names.

When verification failures occur the user should consider the following possible explanations:

- 1) The library does not contain a functional model for the cell. Some libraries contain cells that are intended to be treated as black-boxes during **compile**. The user should be aware of such cells in the link_library.
- 2) The user has intentionally instantiated a black-box in a design.
- 3) The functional model has been lost or is not accessible by verification, perhaps due to previous linking problems. The user should look for unresolved reference warnings during **link**.
- 4) An internal **dc_shell** error has occurred. There is a functional model in the library for the cell but it is not accessible during verification. Such an error should be reported to Synopsys.
- 5) The black-box is an instantiation of a Xilinx XBLOX macro cell. The functionality of these cells is unknown during verification. Resource Sharing may occur on the operators implemented by these XBNOX cells. When this happens verification will fail because there are different numbers so black-boxes in the original and optimized designs. A possible work-around is for the user to create gate-level models for the instances and re-link the designs.

WHAT NEXT

FV-64 (warning) An inout port has different interpretations in verification:

DESCRIPTION

The port is being interpreted differently in the two designs being compared. This discrepancy may cause verification failures or endpoint alignment problems.

Verification needs to interpret each inout port as either a sourcepoint or an endpoint. It does this by examining the net connected to the inout port.

If some other driver pin is connected to the net, then the port is interpreted as an endpoint.

If the net has no clear driver pin and more than one inout port connection, then the port with least alphabetical name is interpreted as the sourcepoint, and the others are interpreted as endpoints.

If the inout port is the only possible driver pin, then the inout port is interpreted as a sourcepoint.

WHAT NEXT

Check to see if the inout ports are used differently in the two designs. If so, then verification cannot be completed.

If verification is giving an improper interpretation to the inout ports, the user may consider copying the designs and giving explicit port directions to the ports on the copies. The the copies should be verified. Currently, there is no option to allow the user to indicate the interpretation of an inout port.

FV-65 (warning) Ignoring %s option for points in original design '%S':

DESCRIPTION

This option can apply only to points in the optimized design.

WHAT NEXT

If you are comparing a design against a copy of itself (each in its own sub-directory), it should be possible just to exchange the first and second names in this option and exchange the design pathname arguments to **compare_design**.

FV-66 (info) In verifying the %s design, these are treated as %s:

DESCRIPTION

Verification needs to interpret each port, sub-design pin, and register pin as either a sourcepoint or an endpoint. Furthermore, verification needs to determine a single driver for each net in the design, in order to perform combinational logic verification. Usually pin or port directions declared in the design are sufficient to determine source and endpoints, but in some cases (such as multiple driver nets and nets connected to inout pins) verification needs to choose a driver (sourcepoint) and make the other connections endpoints. This message informs the user of verification's choices.

WHAT NEXT

FV-69 (error) This message is not currently used.

DESCRIPTION

WHAT NEXT

FV-70 (error) The endpoint to ignore, '%s', is not an output port, a register, or a hierarchical cell of design '%s'.

DESCRIPTION

If the endpoint is a register or hierarchical cell, then all the input pins on the cell are ignored during verification. If the endpoint is a specific input pin on a register or hierarchical cell, then only that pin is ignored.

WHAT NEXT

Check that the instance pathname for the option exists in the design and that the cell and pins names exist in the mentioned design. Then re-execute.

FV-72 (error) The point to check for redundancy, '%s', in design '%s' is not a source point.

DESCRIPTION

The `-redundancy_check` option can be applied only to source points.

WHAT NEXT

See the *Design Compiler Family Reference Manual* on the `-redundancy_check` option.

FV-73 (error) The original design, '%s', was found to have these

scan ports, illegal in verification:

DESCRIPTION

compare_design uses the **test_scan_out** and **test_scan_out_inverted** attributes to determine the dedicated scan ports in the optimized design. The original design must not contain scan ports. **compare_design** is not intended to compare two designs that have both been modified for testability.

WHAT NEXT

Revise your methodology so that you compare the original designs with each other, and compare each original with each test modified version. Ensure that your original designs do not contain scan ports.

FV-74 (error) Failure in applying set_compare_design_script.

DESCRIPTION

This error will occur when verification is not done hierarchically, but there is a pathname to a subdesign in a **set_compare_design_script** command.

Otherwise, read the preceding error messages for an explanation.

WHAT NEXT

If pertinent, use the **compare_design -hier** or the **compile -verify_hier** option so that the pathnames in the script are present during verification.

FV-75 (warning) The following points in design '%s' were aligned more than once:

DESCRIPTION

The user is allowed to align a verification point more than once, but it is not recommended. The last alignment in the script is used during verification.

WHAT NEXT

FV-76 (warning) The following points were aligned more than

once to points in design '%s':

DESCRIPTION

The user is allowed to align a verification point more than once, but it is not recommended. The last alignment in the script is used during verification.

WHAT NEXT

FV-77 (warning) Realigning point '%s' in design '%s' and unaligning point '%s' in design '%s'.

DESCRIPTION

This message is issued during various ECO Compiler commands. The first point, being realigned, has been aligned previously to another point. The second point, being unaligned, was previously aligned to the first point.

WHAT NEXT

Check the `set_eco_align` command history to make sure that no point is aligned more than once.

FV-78 (error) Cannot align these two points: '%s/%s' and '%s/%s'."

DESCRIPTION

This message is issued during various ECO Compiler commands. Design objects can be aligned only if they are of the same type. The allowed types are (subdesign) port, sequential cell, and pin (on hierarchical cell).

Note: combinational cells cannot be aligned. In order to specify the reuse of a combinational cell, see the ECO Advanced Directive command `set_eco_reuse`.

WHAT NEXT

FV-80 (error) Attempted to align design '%s' with both design

'%s' and design '%s'."

DESCRIPTION

A design can only be aligned with one other design.

WHAT NEXT

If this message is issued during **compare_design**, then check the **set_compare_design_script** command history to make sure that no design is aligned more than once, via the **-accept** option.

If this message is issued during an ECO command such as **eco_align_design**, then check the **set_eco_align** command history for the current ECO design pair to make sure that no design is aligned more than once.

When two designs or points are aligned, all the designs along the paths from these two designs to their respective top-level designs are automatically aligned.

FV-81 (error) Cannot '%s' designs '%s' and '%s', at different depths in hierarchies.

DESCRIPTION

In order to **-align**, **-accept**, or **-compare** two designs, they must be at the same depth in their respective design hierarchies.

WHAT NEXT

It may be necessary to **ungroup** some designs above the two mentioned designs in order to make the two design hierarchies have identical tree structures. **compare_design** requires that the two design hierarchies be identical from the top-level down to accepted designs. The accepted designs must have the same source and end points, after **-ignore** options have been applied. The designs beneath the accepted designs are automatically accepted and not verified.

FV-83 (error) In %s design %s, cell '%s' is an empty subdesign.
In %s design %s, you must ungroup unaligned cell '%s'.

DESCRIPTION

Verification currently treats subdesigns without any cells or nets as empty and ungroups them internally. Such empty designs can result from **compile** if all internal

logic is optimized away.

WHAT NEXT

Unfortunately, you must perform a parallel ungrouping when comparing the pre-compile and post-compile versions. Rerun **compare_design**.

FV-84 (information) In %s design %s there is %s unique to

DESCRIPTION

The purpose of this message is to help you diagnose the cause of a verification miscompare between endpoints.

Following this message is a list of verification sourcepoints that are unique to its fanin. Unique means that there is no path from the sourcepoints to the endpoint in the other design during verification.

The roles of sourcepoint and endpoint can be swapped, indicating that a sourcepoint has unique fanout.

WHAT NEXT

GDM

GDM-001 (Error) Could not get %s record with id %d in Milkyway.

DESCRIPTION

You receive this error message because an error occurred while accessing the Milkyway database for the object of the error type.

WHAT NEXT

Please verify if any of the previous commands have modified Milkyway. Write out a fresh Milkyway database and re-read the design. If the message disappears, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-002 (Warning) Failed to iterate over %s objects in Milkyway.

DESCRIPTION

You receive this error message because an error occurred while accessing the Milkyway database for the object of the error type.

WHAT NEXT

Please verify if objects of the error type are present in Milkyway. Write out a fresh Milkyway database and re-read the design. If the message disappears, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-003 (Error) Could not get MW id from DC object (%s)%s.

DESCRIPTION

You receive this error message because an error occurred while accessing the Milkyway database object corresponding to timing model object of the above type.

WHAT NEXT

Please verify if object of the type is present in Milkyway. Write out a fresh

milkyway database and re-read the design. if the message disappear, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-004 (Warning) Milkyway object (%s)%s with id '%d' not present in DC.

DESCRIPTION

You receive this error message because an error occurred while accessing the timing model database for the object of the above type.

WHAT NEXT

Please verify if objects of the error type are present Milkyway. write out a fresh milkyway database and re-read the design. if the message disappear, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-005 (Error) Name of DC object (%s)%s and Milkyway object (%s)%s is not matching.

DESCRIPTION

You receive this error message because an error occurred while comparing the attributes of Milkyway objects and timing model datastructures.

WHAT NEXT

Please verify if objects of the error type are present Milkyway. write out a fresh milkyway database and re-read the design. if the message disappear, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-006 (Error) Could not find Milkyway object (%s) by name '%s'.

DESCRIPTION

You receive this error message because an error occurred while accessing the Milkyway database for the object of the above type with specified name '.

WHAT NEXT

please verify if objects of the error type are present Milkyway. write out a fresh milkyway database and re-read the design. if the message disappear, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-007 (Error) Multiple MW ids of type (%s) have same name '%S'.

DESCRIPTION

You recieve this error message because an error occured while accessing the Milkyway database for the object of the above type.

WHAT NEXT

please verify if objects of the error type are present Milkyway. write out a fresh milkyway database and re-read the design. if the message disappear, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDM-008 (Error) Milkyway object type is not (%s) for DC object (%S)%s.

DESCRIPTION

You recieve this error message because an error occured while comparing Milkyway object and corresponding Timing model datastructures.

WHAT NEXT

please verify if objects of the error type are present Milkyway. write out a fresh milkyway database and re-read the design. if the message disappear, check for the previous commands. Contact ICC Infrastructure Team for more help.

GDSO

GDSO-1 (error) There is no corresponding GDSII ID for layer '%s' in library.

This design cannot be written out.

DESCRIPTION

You receive this error message because there is missing GDSII-related information in the physical library. Therefore, the **write_gds** command cannot write out the routed design in GDSII format.

WHAT NEXT

Add GDSII-related information to the physical library (plib) file, and rerun the **read_lib** command to generate a pdb file.

EXAMPLE MESSAGE

```
Error: There is no corresponding GDSII id for layer 'MET1" in library.  
This design cannot be written out. (GDSO-1)
```

SEE ALSO

write_gds (2).

GDSO-2 (error) There is no geometry information in via '%s'.

DESCRIPTION

You receive this warning message because you executed the **write_gds** command and specified a via that is not properly linked to the library. Therefore, the via instance is not written out.

WHAT NEXT

Verify that the via exists in the physical library. Then, reexecute the command.

EXAMPLE MESSAGE

```
Error: There is no geometry information in via '%s'. (GDSO-2)
```

SEE ALSO

`write_gds` (2).

GDSO-3 (warning) Cannot find the cell reference in library.
Instance '%s' is not written out.

DESCRIPTION

You receive this warning message because you executed the `write_gds` command and specified a design that is not properly linked to the library. Therefore, the instance is not written out.

WHAT NEXT

Verify that the library cell exists in the logic library and physical library. Then, reexecute the command.

EXAMPLE MESSAGE

Error: Cannot find reference '%s' in library. Instance '%s' is not written out. (GDSO-3)

SEE ALSO

`write_gds` (2).

GDSO-4 (warning) Undefined wire rule %s encountered in db.
Wire segment ignored.

DESCRIPTION

You receive this warning message because the specified wire rule is not found in the library. Therefore, the `write_gds` command cannot write out the wire segment.

WHAT NEXT

Verify that the wire rule is not defined in the library. Define the wire rule, and reexecute the `write_gds` command.

EXAMPLE MESSAGE

warning: Undefined wire rule %s encountered in db. Wire segment ignored.

SEE ALSO

`write_gds` (2).

GDSO-5 (error) The file '%s' cannot be written out due to errors.

DESCRIPTION

You receive this error message because you have executed the `write_gds` command and specified a file that contains errors and, therefore, cannot be written out.

WHAT NEXT

Fix the specified errors, then reexecute the `write_gds` command and specify the file to be written out.

SEE ALSO

`write_gds` (2).

GDSO-6 (warning) There is no '%s' on instance '%s' of reference '%s'.

DESCRIPTION

You receive this warning message because you executed the `write_gds` command and specified an instance that does not have location (is not placed) or orientation. Therefore, the instance is not written out into a GDSII file.

WHAT NEXT

Check the design and verify that the instances are properly placed.

SEE ALSO

`write_gds` (2).

GDSO-7 (error) The design does not contain physical

information. Abort.

DESCRIPTION

You receive this error message because you executed the `write_gds` command and specified a design that is not a physical design db because it does not contain physical information.

WHAT NEXT

Check the design and verify that it contains post-route data.

SEE ALSO

`write_gds` (2).

GDSO-8 (warning) Truncate %s '%s' to %d characters.

DESCRIPTION

You received this warning message because you executed the `write_gds` command and specified a string that exceeds the GDSII string length limit.

WHAT NEXT

Reexecute the `write_gds` command and specify a string that does not exceed the GDSII string length limit.

SEE ALSO

`write_gds` (2).

GDSO-9 (error) There is no corresponding layer '%s' in library. This design cannot be written out.

DESCRIPTION

This error message indicates that there are missing layer specifications in the physical library. Therefore, the `write_gds` command cannot write out routed designs in GDSII format.

WHAT NEXT

Make sure the physical library matches the design.

EXAMPLE MESSAGE

Error: There is no corresponding layer 'MET1" in library.
This design cannot be written out. (GDSO-9)

SEE ALSO

write_gds (2).

GEN

GEN-1 (error) Cell '%s' instance '%s' pin '%s' has same Y coordinate as cell '%s' instance '%s' pin '%s'.

DESCRIPTION

Two pins of the same cell, or different cells in the same column, are found to overlap. This was probably caused by a problem in either the symbol library being used or in schematic generation. Check the identified pins in your symbol library source to see if they are pins of the same cell and if the same Y coordinate has been defined for them. If so, correct the Y coordinates, recompile the symbol library, and rerun the test. If this is not the case, report this as a bug in schematic generation.

WHAT NEXT

GEN-2 (error) Pin '%s' on Cell '%s' does not lie on a grid.

DESCRIPTION

WHAT NEXT

GEN-3 (warning) Creating a symbol for cell '%s' of type '%s'.

DESCRIPTION

This warning is issued when the `gen_show_created_symbols` dc_shell variable is set to "true" and `create_schematic` can not locate the symbol template for a cell in the database or in any of the symbol libraries. In such a case, `create_schematic` automatically generates a rectangular symbol template to use in the schematic. In general, this is done by putting all the input pins on the left side of the symbol and all other pins on the right side. The size of the generated symbol can be controlled by setting the `gen_max_ports_on_symbol_side` variable to an appropriate value.

WHAT NEXT

If this warning is issued for primitive gates, that may indicate that the `symbol_library` or `search_path` variables have not been set properly. This can be resolved by (1) finding the symbol library (a file with a .sdb suffix) to be used

and appending it to the `symbol_library` variable, and (2) appending its directory path to the `search_path` variable.

Libraries usually don't have symbol templates for hierarchical cells, so this warning should be ignored for such cells.

GEN-4 (error) Could not find pin: '%s', in cell: '%s' in schematic library '%s'.

DESCRIPTION

WHAT NEXT

GEN-5 (error) Symbol library doesn't have off-sheet connectors.

DESCRIPTION

WHAT NEXT

GEN-6 (warning) Symbol exceeds sheet size.

DESCRIPTION

This warning is issued when one of the symbol templates `create_schematic` creates exceeds the size of the sheet being used. This may be caused by either the sheet being too small or there being too many pins on the symbol.

This message is only issued for symbols that have so many pins that `create_schematic` creates a smaller square symbol with all the pins equally distributed along the four sides, and even then this symbol exceeds the sheet size.

WHAT NEXT

If this is of concern, use a larger sheet size. Since `create_schematic` will automatically create the smallest symbol possible for the given number of ports when this message is issued, the only way to make the symbol fit the sheet is to use a larger sheet.

GEN-7 (warning) Maximum ports on symbol side limit of '%d'

exceeded.

DESCRIPTION

WHAT NEXT

GEN-8 (warning) Can't rename off-sheet connector of net '%s' to the name of its port '%s' because net '%s' already exists.

DESCRIPTION

WHAT NEXT

GEN-10 (warning) Couldn't find all the port symbols in the generic symbol library.

DESCRIPTION

WHAT NEXT

GEN-11 (error) Couldn't find pin name '%s' in ripper symbol '%S'.

DESCRIPTION

WHAT NEXT

GEN-12 (error) Couldn't find a ripper symbol for creating a

bussed schematic.

DESCRIPTION

WHAT NEXT

GEN-13 (error) Annotator '%s' has an invalid format specification '%s'.

DESCRIPTION

WHAT NEXT

GEN-14 (error) An unnamed annotator has an invalid format specification '%s'.

DESCRIPTION

WHAT NEXT

GEN-15 (error) Annotator '%s' has more than %d '%%s' specifications in the format string.

DESCRIPTION

WHAT NEXT

GEN-16 (error) An unnamed annotator has more than %d '%%s'

specifications in the format string.

DESCRIPTION

WHAT NEXT

GEN-17 (error) Annotator '%s' has an invalid expression '%s'.

DESCRIPTION

WHAT NEXT

GEN-18 (error) An unnamed annotator has an invalid expression '%s'.

DESCRIPTION

WHAT NEXT

GEN-19 (warning) The symbol for cell '%s' has a pin off the route grid.

You may be mixing symbol libraries with different route grids.

DESCRIPTION

This warning is issued when one of the schematic symbols is found to have a pin that is located outside the route grid being used by *create_schematic*, i.e., the pin is somewhere in the middle of the square region defined by the four points around it that represent the intersection of vertical and horizontal grids instead of being on one of the edges or corners. This indicates that the schematic may contain symbols from more than one symbol library and that these libraries specify different route grids. In such a case, *create_schematic* picks up the route grid specified in the first symbol library it runs into, and uses that route grid in the schematic. Any symbols coming from libraries whose route grids do not match the one being used by *create_schematic* are not guaranteed to have their pins aligned with the route grid.

WHAT NEXT

If this is a problem in transferring the schematic to some external environment, try using symbol libraries with the same route grid. If this is not possible, try modifying the route grids in your symbol libraries to match each other. This is done by editing the .slib file and changing the argument to the `set_route_grid()` specification and then recompiling that library with the `read_lib` command.

GEN-20 (error) One of the pins or port busses is corrupted.

DESCRIPTION

This error is issued when one of the design ports or pins is found to have a corrupt bus structure. This can happen sometimes because of inconsistent bus creation by different tools in the design. In such a case, the port or pin that is found to have a corrupt bus structure will be drawn unbussed in the schematic, i.e. its bus will be ignored by `create_schematic`.

WHAT NEXT

If there are no other problems with the tool run, this message should be ignored as `create_schematic` automatically ignores the bus objects responsible for corruption.

GEN-21 (error) Cell %s's pin %s is on wrong side.

DESCRIPTION

WHAT NEXT

GEN-22 (error) Net %s connects pins of different widths.

DESCRIPTION

WHAT NEXT

GEN-23 (warning) The netlist contains bus-to-bus connections. Any nets involved in inter-bus connections will be

displayed as disconnected in the no-ripper schematic.

DESCRIPTION

WHAT NEXT

GEN-24 (error) Could not find the type mapper symbol in the generic symbol library. The generic symbol library is probably old - Please use a new library and recreate the schematic.

DESCRIPTION

GEN-25 (warning) All cells are power/ground or have no connection.

DESCRIPTION

Cells in the current design are all power cells or all ground cells. Or the cells have no pins.

WHAT NEXT

GEN-26 (error) member '%d not found in bus '%s' . Only following members present : '%s'. The design is corrupted.

DESCRIPTION

WHAT NEXT

GEN-27 (warning) Creating a very large schematic. It is approximately %d wide and %d tall.

Must skip the 'improve' algorithm due to insufficient memory.

DESCRIPTION

You receive this warning when you are trying to create a schematic for a very large design, but there is not sufficient memory available to perform the "improve" algorithm.

WHAT NEXT

You have available three courses of action:

- You can let the schematic creation continue, with the possibility that it will succeed, if there is enough memory.
- You can monitor the performance, using a UNIX utility such as **top**, to see if you are close to running out of address space.
- You can send an interrupt to the application, which terminates the schematic creation at the next check point in the algorithm.

Because large schematics are difficult to work with graphically, consider whether you really want your schematic to be so large. If you have flattened your design, going back to an unflattened design might be more workable and require less address space.

If it is imperative that you produce the schematic, rerun your application using the 64-bit version (if it is available to you), which has a memory address space limit exceeding 4 gigabytes. The process should eventually succeed, providing you have enough swap space on your machine.

SEE ALSO

`create_schematic` (2).

GEN-28 (warning) Creating a schematic with an extreme number of sheets.

The schematic being created has %d sheets.

Aborting attempt to create schematic.

DESCRIPTION

You receive this warning because you are trying to create a schematic that has too

many sheets, making it impractical to use. The process is terminated.

WHAT NEXT

You can avoid the issue by choosing a larger sheet size, which will result in fewer sheets: -size A is the smallest sheet size, -size B is larger, and so on, up to -size infinite, which is always just one sheet. For more information about sheet sizes, see the man page for the **create_schematic** command.

SEE ALSO

create_schematic (2).

GLO

GLO-1 (error) Program Failure

DESCRIPTION

This message indicates that the program produced an internal error that was not caught by other error handling mechanisms. There is no single reason for the failure. It could be the result of a bad installation of your software; more likely it is due to the tool trying to deal with unexpected data within your design DB.

WHAT NEXT

Make sure that the executable and the root installation are from consistent versions and that your software installation succeeded without error. If this is not the source of the failure, please report your problem to Synopsys

GR

GR-1 (warning) Route %% changed to %3.1f for %s route layers.

DESCRIPTION

You receive this message because the routing percentage data specified was not valid, so it has been changed as described in the message. The route percentage values should sum to 100.0 for each group of routing layers with a common route direction.

WHAT NEXT

Change the route percentage data to a valid value in either the technology library or the PDEF file.

GR-2 (warning) Location-based optimizations disabled because Steiner routing cannot be invoked with too few back-annotations on the design.

DESCRIPTION

You receive this message because technology data, such as the R and C coefficients, cannot be derived. This occurs because there is not enough capacitance, delay, and location back-annotation on the design. Steiner routing cannot function without this data. The result is that location-based optimization (LBO) is not activated. Instead, the wire load model (WLM) is used to determine capacitance and delay of new nets.

WHAT NEXT

For Steiner routing to work, all nets in the design must have capacitance and delay values; and locations must be annotated on all cells.

SEE ALSO

`read_pdef (2), read_sdf (2), reoptimize_design (2), set_cell_location (2), set_load (2).`

GR-3 (warning) Location-based optimizations disabled.

DESCRIPTION

You receive this message because location-based optimization is not activated: it has been disabled. The PDEF file read for the current design contains locations for leaf cells. This typically enables location-based optimization (buffer insertion and removal) to occur. In this case, however, location-based optimization has been explicitly disabled by setting one of the following variables to *false*:

- `compile_ok_to_buffer_during_inplace_opt`,
- `lbo_buffer_insertion_enabled`,
- `lbo_buffer_removal_enabled`.

WHAT NEXT

To enable location based optimization, ensure that the variables listed above are set to *true* in the setup file.

SEE ALSO

`compile_ok_to_buffer_during_inplace_opt` (3), `lbo_buffer_insertion_enabled` (3),
`lbo_buffer_removal_enabled` (3).

GR-4 (info) %s - horizontal: %.2g vertical: %.2g

DESCRIPTION

You receive this message to inform you that capacitance or resistance values are used for the horizontal and vertical routing layers. See the **GR-7** man page for additional information on the unit used for these values.

WHAT NEXT

This is an informational message only. No action is required on your part.

GR-5 (information) Using user-specified R and C coefficients.

DESCRIPTION

You receive this message to inform you that the capacitance and resistance values used for horizontal and vertical routing layers have been specified via user environment variables instead of having been calculated.

WHAT NEXT

This is an informational message only. No action is required on your part.

**GR-6 (information) Using edge_capacity_x: %g,
edge_capacity_y: %g, gcell_size: %d.**

DESCRIPTION

You receive this message to inform you of the specified parameters. See the **run_router** man page for a definition of these parameters.

WHAT NEXT

This is an informational message only. No action is required on your part.

**GR-7 (info) The distance unit in Capacitance and Resistance is
%s micron.**

DESCRIPTION

You receive this message because it provides information on the type of units in use. The unit used for capacitance is library capacitance units per micron. The unit used for resistance is library resistance units per micron.

WHAT NEXT

No action is necessary. The result is informative.

GR-8 (information) Using derived R and C coefficients.

DESCRIPTION

You receive this message to inform you that the capacitance and resistance values used for the horizontal and vertical routing layers are derived from the physical library.

WHAT NEXT

This is an informational message only. No action is required on your part.

GR-9 (info) %s is scaled by %5.2f

DESCRIPTION

You receive this message because it provides information on the type of scaling in use. It indicates the scaling factor for maximum or minimum values of capacitance or resistance coefficients.

WHAT NEXT

No action is necessary. The result is informative.

GR-10 (information) Library Derived %s : %.2g

DESCRIPTION

You receive this message to inform you of the library derived value for the vertical or horizontal capacitance or resistance coefficient.

WHAT NEXT

This is an informational message only. No action is required on your part.

GR-11 (information) User-specified %s : %.2g

DESCRIPTION

You receive this message to inform you of the user-specified value for the minimum or maximum, vertical or horizontal, capacitance or resistance coefficient.

WHAT NEXT

This is an informational message only. No action is required on your part.

GR-12 (information) %s used : %.2g

DESCRIPTION

You receive this message to inform you of the value for the minimum or maximum, vertical or horizontal, capacitance or resistance coefficient used for delay

estimation. Delay estimation is used in placement and routing estimation.

WHAT NEXT

This is an informational message only. No action is required on your part.

GR-13 (information) Using region-based R and C coefficients.

DESCRIPTION

You receive this message to inform you that the value is derived from the region for vertical and horizontal, capacitance and resistance coefficients used for delay calculation during placement and routing estimation. A region roughly corresponds to the net bounding box.

WHAT NEXT

This is an informational message only. No action is required on your part.

GR-14 (warning) Inconsistent between library RC data and extraction parameters

DESCRIPTION

You receive this message because there might be an inconsistency between your library RC data and extraction parameters. If you specify optional extraction parameters, the program can derive the RC data from them based on some normal condition assumptions. If this RC data is substantially different from your library RC data, you receive this warning message.

WHAT NEXT

Use the **report_lib** command with the **-physical** option to determine that your physical library numbers are correct. Ensure that you do not model the polysilicon layer as a routable layer. Note that the program uses only normal condition assumptions to derive RC data from the extraction parameters. Therefore, if you know that your numbers are correct, you can ignore this warning message.

SEE ALSO

report_lib (2). **set_delay_estimation_options** (2).

GR-15 (information) The RC model used is : %s

DESCRIPTION

This informational message describes which RC model the tool will use to compute the unit RC.

Valid RC models are as follows (given from the highest priority to the lowest priority):

- user - user-specified RC parameters
- library extractor based - based on extraction parameters
- 2.5D - based on 2.5D parameters and user-specified routing wire model
- library 2.5D - based on 2.5D parameters
- library 1D - based on 1D parameters

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

`set_delay_estimation_options(2)`
`PSYN-140(n)`
`PSYN-143(n)`

GR-16 (information) The routing wire model used is : %s

DESCRIPTION

This informational message describes which routing wire model the tool uses to compute the unit RC.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

`set_routing_wire_model(2)`
`GR-15(n)`

GR-21 (warning) Layer '%s' is not in the ignored layer list.

DESCRIPTION

You get this warning because the layer that you want to remove does not exist in the ignored layer list.

WHAT NEXT

Check ignored layer list using command "report_ignored_layers" to get the ignored layer list and only apply those layers in this command.

GR-22 (warning) Layer '%s' is set multiple times.

DESCRIPTION

You get this warning because when you run "set_ignored_layers" command, you use one layer name multiple times.

WHAT NEXT

GR-23 (error) Can't find layer '%s' in physical library.

DESCRIPTION

You get this error because you are trying to use a layer that does not exist in physical library.

WHAT NEXT

Run set_ignored_layers to use the existing routing layers from the physical library.

GR-24 (error) Can't use non-routing layer '%s'.

DESCRIPTION

You get this error because you are trying to use a non-routing layer in ignored layer list.

WHAT NEXT

Run `set_ignored_layers` to use the existing routing layers from the physical library.

GR-25 (error) Can't ignore all horizontal routing layers in RC computation.

DESCRIPTION

You get this error because you are trying to ignore all horizontal routing layers in ignored layer list.

WHAT NEXT

Run `set_ignored_layers`, but leave at least one horizontal routing layer. To check all horizontal routing layers from a physical library, run `report_lib` command.

GR-26 (error) Can't ignore all vertical routing layers in RC computation.

DESCRIPTION

You get this error because you are trying to ignore all vertical routing layers in ignored layer list.

WHAT NEXT

Run `set_ignored_layers`, but leave at least one vertical routing layer. To check all vertical routing layers from a physical library, run `report_lib` command.

GR-27 (warning) Routing wire model has higher priority than ignored layers.

DESCRIPTION

You get this warning because you are using user specified routing wire model for RC computation while you are specifying ignored layers. Although you can specify ignored layers, we will not consider ignored layers during RC computation when user-specified routing wire model is used for the design.

WHAT NEXT

GR-28 (error) Can't find layer '%s' in physical library.

DESCRIPTION

You get this error because you are trying to use a layer that does not exist in physical library.

WHAT NEXT

Run `set_layer_preferred_direction` on existing routing layers from the physical library.

GR-29 (error) Can't use non-metal layer '%s'.

DESCRIPTION

You get this error because you are trying to set direction on a non-metal layer in layer list.

WHAT NEXT

Run `set_layer_preferred_direction` on existing routable metal layers from the physical library.

GR-30 (error) Can't set all routing layers as horizontal.

DESCRIPTION

You get this error because you are trying to set horizontal direction for all routing layers

WHAT NEXT

Run `set_layer_preferred_direction`, but leave at least one horizontal routing layer. To check all routing layers direction from a physical library, run `report_layer_preferred_direction` command.

GR-31 (error) Can't set all routing layers as vertical.

DESCRIPTION

You get this error because you are trying to set vertical direction for all routing layers.

WHAT NEXT

Run `set_layer_preferred_direction`, but leave at least one vertical routing layer. To check all routing layers direction from a physical library, run `report_layer_preferred_direction` command.

GUI

```
### GUI-001.n ###
```

GUI-001 (Error) %s: %s '%s' not found.

DESCRIPTION

The specified object does not exist.

```
### GUI-002.n ###
```

GUI-002 (Error) %s: %s name is empty.

DESCRIPTION

The name for the relevant object type [toolbar|menu|window type|hotkey,...] is empty.

```
### GUI-003.n ###
```

GUI-003 (Error) %s: valid %s name cannot consist only of ampersands.

DESCRIPTION

Valid name for specified object type cannot consist only of ampersands. The object type can be a menu, toolbar, window type, hotkey, etc.

```
### GUI-004.n ###
```

GUI-004 (Error) %s: trailing '-' not allowed in menu name '%s'.

DESCRIPTION

Trailing '-' not allow in specified menu name.

```
### GUI-005.n ###
```

GUI-005 (Warning) %s: hotkey '%s' is reserved. Please use another hotkey.

DESCRIPTION

Specified hotkey is reserved by application. Please use another hotkey.

```
### GUI-006.n ###
```

GUI-006 (Warning) %s: hotkey '%s' is not supported.

DESCRIPTION

Specified hotkey is not supported. Please check spelling or use another hotkey. Shift modifier only work with letter or function hotkey. Thus, "Ctrl+Shift+4" is not supported.

```
### GUI-007.n ###
```

GUI-007 (Error) %s: hotkey '%s' is invalid. Please check spelling.

DESCRIPTION

Specified hotkey is invalid. Please check spelling.

```
### GUI-008.n ###
```

GUI-008 (Warning) %s: menu item '%s' already exist for %s '%s'.

DESCRIPTION

Specified menu item already exist for specified window type.

```
### GUI-009.n ###
```

GUI-009 (Warning) %s: hotkey '%s' will not be set for menu '%s'.

Hotkey had been used.

DESCRIPTION

Specified hotkey will not be set for specified menu. It had been used by another menu item or tcl command.

```
### GUI-010.n ###
```

GUI-010 (Error) %s: anchor offset must be nonzero.

DESCRIPTION

Anchor offset value for specified command must be either a positive or negative integer.

```
### GUI-012.n ###
```

GUI-012 (Warning) %s: Specified dock side '%s' is invalid. Top docking side will be used.

DESCRIPTION

Specified dock side is invalid. Valid values include left|top|right|bottom.

```
### GUI-014.n ###
```

GUI-014 (Error) %s: menu item '%s' not found for window type '%s'.

DESCRIPTION

Specified menu item not found for specified window type or default window type if not specified.

```
### GUI-015.n ###
```

GUI-015 (Warning) %s: hotkey '%s' is already set for tcl

command '%s'.

DESCRIPTION

Specified hotkey is already set for an existing tcl command.

```
### GUI-016.n ###
```

GUI-016 (Warning) %s: hotkey not set, hotkey '%s' is already set for menu item '%s'.

DESCRIPTION

Specified hotkey has already been used by a menu item. Use -replace option to force hotkey to be set.

```
### GUI-017.n ###
```

GUI-017 (Warning) %s: hotkey '%s' is reserved by system function '%s'.

DESCRIPTION

Specified hotkey has already been used by an internal system function.

GUI-018 (Error) None of the supported browsers %s are in the path

DESCRIPTION

This error message occurs when the application can not find a browser from the list of supported browsers in your environment.

WHAT NEXT

Please correct the PATH to get one of the supported browsers. Please contact your system administrator to get the location of the browsers.

SEE ALSO

`gui_online_browser(3)`

GUI-019 (Error) The default browser %s of your choice is not supported

DESCRIPTION

The current browser assigned to the variable `gui_online_browser` is not supported by your online help system.

WHAT NEXT

Please assign a browser from the the following list %s to the variable `gui_online_browser` and try to bring up the helpsystem.

SEE ALSO

`gui_online_browser(3)`

GUI-020 (Info) No %s installation specified with variable %s

DESCRIPTION

The application extension to ICC specified depends on the variable to point to the installation of that tool. The environment variable specified was not set so this extension to ICC will not be loaded.

WHAT NEXT

If you would like to load the ICC extension for that tool, then please setup the variable to point to the appropriate tool installation before running the ICC GUI.

SEE ALSO

GUI-021 (Warning) Extension %s not loaded because extension loading is disabled

DESCRIPTION

The loading of application extensions has been disabled. Therefore the specified extension will not be loaded.

WHAT NEXT

Re-enable extension loading if you want to have extensions loaded.

SEE ALSO

GUI-022 (Error) %s installation directory specified in variable %s is not a directory.

Extension can not be loaded from %s

DESCRIPTION

The installation directory for the extension was not a directory, so the extension could not be loaded.

WHAT NEXT

Correct the setting of the variable to specify the path to the installation of the tool and re-start the ICC GUI to get the extension loaded.

SEE ALSO

GUI-023 (Warning) The %s installation specified does not contain an ICC extension setup file %s

DESCRIPTION

The installation directory for the extension did not contain the expected ICC extension, so the extension could not be loaded.

WHAT NEXT

Correct the setting of the variable to specify the path to the installation of the tool and re-run ICC to get the extension loaded. If this version of the application does not support the ICC extension you may need to update to a newer version of this application.

SEE ALSO

GUI-024 (Info) Loaded %s extension from %s

DESCRIPTION

This message indicates that the ICC extension for the specified application was automatically loaded. The loading of the extension is controlled by the specification of the application installation for this application via a variable.

WHAT NEXT

There are no additional steps required to use this extension.

SEE ALSO

GUI-025 (Error) Error sourcing %s extension setup file %s

%s

error_info is:

%s

DESCRIPTION

There was an error detected when loading the ICC extension for the specified application. Please contact the support staff for the application to get assistance in correcting the problem.

WHAT NEXT

Please ensure that the application installation specified is correct. If there is an error in the extension then please contact the support staff for that application to get a fix for their ICC extension.

DESCRIPTION

axOpenCell failed.

WHAT NEXT

HDF-106 (Error) Place Pads failed

DESCRIPTION

Place Pads failed

WHAT NEXT

HDL

HDL-1 (error) Can't open Synopsys primitive package '%s'

DESCRIPTION

The compiler for your Verilog HDL or VHDL description could not find the file *verilog.prims* or *vhdl.prims*. This happens when Synopsys software is incorrectly installed on your machine.

WHAT NEXT

Reinstall the Synopsys software.

HDL-2 (error) Corrupt Synopsys primitive package

DESCRIPTION

The compiler for your VHDL or Verilog HDL description could not read in the primitive package *vhdl.prims* or *verilog.prims*. This occurs when the primitive package is from a previous version of the Synopsys software release.

WHAT NEXT

Reinstall the current version of Synopsys software.

HDL-3 (error) Can't find primitive "%s"

DESCRIPTION

This message indicates that an HDL Compiler primitive is missing from the installation of the Synopsys software. It can occur when trying to mix system files from different releases.

WHAT NEXT

Reinstall the Synopsys software.

HDL-4 (error) Condition of 'if' statement must be a single bit %s

DESCRIPTION

This error occurs when the condition tested in an 'if' statement does not evaluate to a Boolean (single bit).

WHAT NEXT

Rewrite your description so that the condition tested in the 'if' statement is a Boolean (single bit).

EXAMPLE

VHDL:

```
process
    variable condition_expr: bit_vector (0 to 3);
begin
    condition_expr := in_value;
    if (condition_expr) then
        -- use of condition_expr is incorrect
        out_value := in_value and previous_value;
    end if;
```

HDL-5 (error) Loop increment is zero %s

DESCRIPTION

An increment of zero prevents a *for* or *while* statement from ever making progress. An infinite loop is not synthesizable.

WHAT NEXT

Rewrite your description so that the loop statement has a non-zero increment.

HDL-6 (warning) Loop body will iterate zero times %s

DESCRIPTION

This warning occurs when the upper bound and lower bound specified for iteration are the same. This specification will cause the loop to iterate zero times.

WHAT NEXT

This is only a warning. Rewrite your description if you intended a non-zero number of iteration for the loop.

HDL-7 (warning) Loop will iterate over 1,000 times. (This will take awhile.) %s

DESCRIPTION

This warning message occurs when the number of iterations specified in a loop statement is greater than 1,000. A large number of iterations can cause slow run times.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, if you did not intend to specify such a large number of iterations for the loop, modify your description and then run the command again.

HDL-8 (error) Illegal exit to block %s

DESCRIPTION

This error can occur when a VHDL "exit" or Verilog "disable" refers to something other than an enclosing loop.

WHAT NEXT

Modify your HDL Source to "exit" or "disable" an enclosing loop.

HDL-9 (error) Illegal exit to block %s %s

DESCRIPTION

This error can occur when a VHDL "exit" or Verilog "disable" refers to something other than an enclosing loop.

WHAT NEXT

Modify your HDL Source to "exit" or "disable" an enclosing loop.

HDL-10 (error) Connection to port%s may not be a string %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-11 (error) Connection to port%s must be a variable %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-12 (error) Used constant%s which has not been given a value %s

DESCRIPTION

This error occurs when a declared constant or generic parameter is used before the value has been assigned. Remember that generic parameters can be used in the design name.

WHAT NEXT

Assign a value to the constant where it is declared.

HDL-14 (error) Tried to assign a value to a literal %s

DESCRIPTION

This error can occur when you try to assign a value to a literal. Literals include: numbers such as 567, vectors such as "1101", or enumeration literals as STATE_7. Assignments can be made with assignment statements or output parameters of subroutines.

WHAT NEXT

If the literal is an subroutine actual parameter, change the mode to "out". If the literal lies on the left-hand side of an assignment, move it to the right.

HDL-15 (error) Literal may contain only '0', '1', 'Z', 'D', or 'U' %s

DESCRIPTION

0, 1, Z, D, or U are the only values recognized by this compiler. This error occurs when you specify some other value, such as 'X' (see the example below).

WHAT NEXT

Rewrite your description to use one of the recognized values.

EXAMPLES

VHDL:

```
attribute ENUM_ENCODING: string;  
  
type color is (red, green, blue);  
            attribute ENUM_ENCODING of color: type is  
"00, 01, 1x";  
  
- the specification of X as an encoding in the literal will cause this error.
```

HDL-16 (error) Type of '%s' is unconstrained %s

DESCRIPTION

This error occurs when reading an unconstrained variable, port, or signal. For synthesis, all values must have a fixed bit width. The error occurs, for example, when you declare an entity port to have the type: *BIT_VECTOR*.

The error can also occur if a function with a **built_in** pragma is invoked before the function body is analyzed. In such a case, the workaround is to define the function and its body before the function is invoked.

WHAT NEXT

Use an array-bound constraint when you declare the object. In the above example, you can change the entity port type to *BIT_VECTOR(1 to N)*, where *N* is a constant, literal, or generic value.

EXAMPLES

```
entity foo is
end foo;

architecture bar of foo is
    function func_with_builtin (i, size: integer)      return bit_vector;
    constant x:bit_vector(31 downto 0) := func_with_builtin(3, 32);

    function func_with_builtin      (i, size: integer)  return bit_vector is
        -- pragma built_in SYN_INTEGER_TO_SIGNED
    begin
        ..
        ..
    end;

    --
    -- workaround will be to move the constant declaration after the
    -- function body
    --

begin
end;
```

HDL-17 (error) Untyped variable%s used %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-18 (error) Tried to read from a block with no direction %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-19 (error) Tried to write to a block with no direction %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-20 (error) Block expects value, but none was supplied %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-21 (error) Block returns value, but was assigned one %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-22 (error) Can't resolve goto to label '%s' %s

DESCRIPTION

This error occurs when you use a VHDL "next" or "exit" statement, or a Verilog "disable" statement and the identifier you uses does not refer to an enclosing loop name.

WHAT NEXT

Change the identifier in your statement to refer to an enclosing loop name.

HDL-23 (error) Array index out of bounds %s.

DESCRIPTION

This error occurs when any array element is indexed outside the bounds of the specified array.

WHAT NEXT

Modify your description so that access occurs within the specified bounds of the array.

EXAMPLES

Verilog:

```
reg [0:7] bus;  
single_bit = bus[8];
```

VHDL:

```
variable bus_array: bit_vector(0 to 7);  
single_bit := bus_array(8);
```

HDL-25 (error) Range is unconstrained %s

DESCRIPTION

This error occurs when you use an unconstrained range. The bounds of a range must be fixed before it may be used to specify an array range or declare a new object.

WHAT NEXT

Change your description so that a bound will be placed on the range before it is used.

HDL-26 (error) Found a negative value where a unsigned value was expected %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-27 (error) Constant value required %s

DESCRIPTION

This error occurs when the HDL Compiler requires a constant value, but can not calculate it. For example, the actual parameters in a VHDL generic map or Verilog parameter binding must be constant. This error occurs if you supply a VHDL signal, or Verilog wire value instead.

WHAT NEXT

Change the value to one that can be computed at compile-time. Computable values include: constants, literals, generics, parameters, and expressions that depend only

on these.

HDL-28 (error) Operand is not a value %s

DESCRIPTION

This error occurs where the HDL Compiler expects a value but finds something else (such as a type). Legal values include: constants, variables, signals, regs, wires, strings, and literals.

WHAT NEXT

Change the operand to a value.

HDL-29 (error) Operand is not a type %s

DESCRIPTION

This error occurs where the HDL Compiler expects a type but finds something else (such as a variable).

WHAT NEXT

Change the operand to a type.

HDL-30 (error) Operand is not a string %s

DESCRIPTION

This error occurs where the HDL Compiler expects a string but finds something else (such as a variable).

WHAT NEXT

Change the operand to a string.

HDL-31 (error) Too few input operands on dnode %s

DESCRIPTION

This error occurs when a subroutine is supplied less input arguments than it expects.

WHAT NEXT

Compare the subroutine declaration with the call identified in the error message. Change the arguments in the call to match the definition.

HDL-32 (error) Too many input operands on dnode %s

DESCRIPTION

This error occurs when a subroutine is supplied more input arguments than it expects.

WHAT NEXT

Compare the subroutine declaration with the call identified in the error message. Change the arguments in the call to match the definition.

HDL-33 (error) Too few output operands on dnode %s

DESCRIPTION

This error occurs when a subroutine call supplies less output arguments than are defined.

WHAT NEXT

Compare the subroutine declaration with the call identified in the error message. Change the arguments in the call to match the definition.

HDL-34 (error) Too many output operands on dnode %s

DESCRIPTION

This error occurs when a subroutine call supplies more output arguments than are defined.

WHAT NEXT

Compare the subroutine declaration with the call identified in the error message. Change the arguments in the call to match the definition.

HDL-36 (error) Source type of assignment is unconstrained %s

DESCRIPTION

This error occurs when you try to assign an unconstrained value to something. All arrays must be constrained before you use them.

WHAT NEXT

Place a constraint on the value.

HDL-37 (error) Tried to assign a value to an invalid symbol %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-38 (error) Type mismatch %s.

DESCRIPTION

This message indicates that the target of an assignment is not compatible with the assigned value. In VHDL, you may assign only between closely related types of equal size.

WHAT NEXT

Check the sizes of the source and target of the assignment. If they differ, then make them the same. If they already are the same size, then use a type conversion to change the source type into the target type.

HDL-39 (error) Tried to assign a type to an invalid symbol %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-40 (error) Target %s is incompatible with assigned value %s

DESCRIPTION

This error occurs when the target of an assignment is not compatible with the assigned value. In VHDL, you may assign only between closely related types of equal size.

WHAT NEXT

Check the sizes of the source and target of the assignment. If they differ, then make them the same. If they already are the same size, then use a type conversion to convert the source into the type of the target.

HDL-41 (error) Expected %s but was supplied %s %s

DESCRIPTION

This error occurs when it finds an unexpected argument to a subroutine. For example, if enumeration literal with a "U" encoding is supplied to a boolean function, HDL Compiler will report that a "value" was expected, but an "unknown" was supplied instead.

WHAT NEXT

Check the argument identified in the message, and change it to one of the expected types.

HDL-42 (error) Port%\$ has no type %\$

DESCRIPTION

This error occurs if you omit the type specification on a port declaration.

WHAT NEXT

Specify the type of the port.

HDL-43 (error) Tried to take a slice out of a non-array %\$

DESCRIPTION

This error occurs when you attempt to take a slice out of a non-array.

WHAT NEXT

Modify your description to convert the variable in question into an array.

EXAMPLES

Verilog:

```
wire foo, bar;  
  
assign foo[1:3] = bar;  
/* foo is not an array. This will cause the error to occur */
```

HDL-44 (error) Arguments to '%s' are not the same size %s

DESCRIPTION

HDL Compiler reports this error when it detects a difference in the bit-width of the arguments to a boolean operator.

WHAT NEXT

Make the arguments the same width.

HDL-47 (error) Divide by zero %s

DESCRIPTION

This error occurs where HDL Compiler detects division by a constant value: zero. The zero may be entered directly, or, more commonly, it is the result of an expression. For example, the expression: $(\text{WIDTH}/(\text{M}-\text{N}))$ will divide by zero if both M and N are equal constants.

WHAT NEXT

Remove the divide by zero from the expression.

HDL-48 (error) Negative exponent %s

DESCRIPTION

This error occurs where HDL Compiler detects a negative exponent. The exponent may be entered directly, or, more commonly, it is the result of an expression. For example, the expression: $(2^{**(\text{M}-\text{N})})$ will have a negative exponent when both M and N are constant, and N is a larger than M.

WHAT NEXT

Remove the negative exponent from the expression.

HDL-49 (error) Can't determine the value of the locally static

expression %s

DESCRIPTION

You receive this error message because the HDL Compiler cannot determine the value of the locally static expression. The use of complicated types of static expressions might cause this error message.

WHAT NEXT

Simplify the locally static expression.

SEE ALSO

`analyze` (2).

HDL-50 (error) Can't get member of array %s

DESCRIPTION

This error occurs when you use an object as though it were an array, when it was not declared that way.

WHAT NEXT

Either declare the object as an array, or don't use it like an array.

HDL-51 (error) Indexing into a non-array variable is not supported %s.

DESCRIPTION

This error occurs when you index a non-array variable.

WHAT NEXT

Modify your description to remove the attempt to index into the non-array variable.

EXAMPLES

Verilog:

```
reg foo, bar;  
  
bar = foo[0];  
/* Indexing into variable 'foo' is an error */
```

HDL-52 (error) AGG major type must be an array %s

DESCRIPTION

This error occurs when an aggregate is used as a non-array. For example, HDL Compiler will error if you qualify an aggregate with an integer type.

WHAT NEXT

Change the use of the aggregate to be consistent with its array type.

HDL-53 (error) Tried to take a member from a non-array %s

DESCRIPTION

This error occurs when you use an array index construct on an object that was not declared as an array. For example, if X is declared as an INTEGER, the expression (X(1)) will get this error.

This error occurs in Verilog when an object is declared as an enumerated type with the /* synopsys enum */ directive, and is then accessed with a bit select.

WHAT NEXT

Either change the object type to an array, or don't perform an array index directly on it. One way to avoid array indexing is to assign the value to a temporary array and index the temporary.

HDL-54 (error) Subtype in aggregate was not a submember or

subrange %s

DESCRIPTION

Currently, only integer values and integer ranges are supported with named associations in aggregates. This error occurs when something else is used.

WHAT NEXT

Change the aggregate to include only integer values and/or integer ranges.

HDL-55 (error) Source and target of slice assignment are not the same size %s

DESCRIPTION

This error occurs when a slice of an array is assigned an expression that has a different bit-width. Usually this is the result of a problem in expression the calculates the slice range. In the following example, the target is one bit larger than the source:

```
Z(A'width downto 0) <= A;
```

The following shows one way to fix the problem:

```
Z(A'width - 1 downto 0) <= A;
```

WHAT NEXT

Modify either the source or target to make the widths equal.

HDL-56 (error) Not enough args to 'lagg' %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-57 (error) Argument to '%s' is not an array or range %s

DESCRIPTION

This error occurs when an operation that is supported only on arrays and ranges is used on something else. For example, the 'first attribute is supported only on array and ranges. The expression: (STATE'first) would get this error if STATE were declared as an enumerated type. The 'first attribute is not supported for synthesis on enumerated types yet, even though this is legal VHDL.

WHAT NEXT

Change the object declaration to an array or range (integer) type. In the above example, STATE could be changed to an INTEGER subtype.

HDL-58 (error) Argument to '%s' is unconstrained %s

DESCRIPTION

This error occurs when you use an unconstrained range. The bounds of a range must be fixed before it may be used to specify an array range or declare a new object.

WHAT NEXT

Change your description so that a bound will be placed on the range before it is used.

HDL-60 (error) Casted from an unconstrained type %s

DESCRIPTION

This error occurs when you use an unconstrained range. The bounds of a range must be fixed before it may be used to specify an array range or declare a new object.

WHAT NEXT

Change your description so that a bound will be placed on the range before it is used.

HDL-61 (error) Direction ('to' or 'downto') does not agree with

'first'
and **'last'** values in range %s

DESCRIPTION

Use the keyword *downto* when the first value in the range is greater than the last value. Use the keyword *to* when the first value in the range is less than the last value. This error occurs these conditions are not met.

WHAT NEXT

Rewrite your descriptions so the above conditions are met.

EXAMPLES

VHDL:

```
signal my_bus : bit_vector ( 15 to 0 );  
-- downto should be used here because 15 is greater than 0
```

HDL-62 (error) 'binned_range' requires at least one operand %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-63 (error) Last name has no encoding %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-64 (error) %s was assigned values of different sizes %s

DESCRIPTION

This error occurs when an unconstrained value is assigned different sized values on separate branches of an "if" or "case".

WHAT NEXT

Change the assignments so they agree on the bit-width assigned to the unconstrained value.

HDL-65 (error) %s %s

DESCRIPTION

This error prefix is used by the primitive routines that implement the builtin VHDL and Verilog functions.

WHAT NEXT

Find the part of your code that is identified by the message, and change it according to the message.

HDL-66 (error) Was expecting a positive number, got %d instead %s

DESCRIPTION

This error occurs when a function that determines if its input is a positive power of 2 is supplied a number less than or equal to zero.

WHAT NEXT

Modify your description so that the input to this function is a positive number.

HDL-67 (error) Duplicate name in enum definition: '%s' %s

DESCRIPTION

This error occurs when identifiers or character literals listed by an enumeration type definition are not distinct.

WHAT NEXT

Modify your HDL description so that each identifier or character literal is used only once in each enumeration type definition.

HDL-68 (error) Encoding '%s' for '%s' is not valid.

DESCRIPTION

You can specify encoding for enumerated data types using the *enum_encoding* attribute. The encoding must be valid in terms of the values that the attribute specifies for the enumeration. The *enum_encoding* attribute must also be valid in terms of the length of the encoding. This error occurs if either of these conditions is not met.

WHAT NEXT

Modify the encoding specified for the enumeration to meet the above conditions.

EXAMPLES

VHDL:

```
attribute enum_encoding: string; type color is (red, green); attribute enum_encoding
of color: type is 00 1;
-- the encoding string for red is two bits long; it should be one -- bit long.
```

HDL-69 (error) Can't find a design or function '%s' to overload %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-70 (error) Can't find lvalue version of design '%s' %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-71 (error) Constant value %d overflowed '%s' %s

DESCRIPTION

This error occurs when the value assigned to a target is smaller than the lower bound or bigger than the upper bound of the range defined for the target.

WHAT NEXT

Modify your HDL description to make the allowable range larger.

HDL-72 (error) Slice width '%d' is not positive %s

DESCRIPTION

This error occurs when the width specified for a slice operation on an array is less than zero.

WHAT NEXT

Rewrite your HDL description so that the width specification is positive.

HDL-73 (error) Can't overload design '%s' uniquely %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-74 (error) At least one argument required for '%s' %s

DESCRIPTION

This error occurs when no arguments are specified for operators such as "and", "or", "xor" or "max".

WHAT NEXT

Modify your HDL description to provide at least one argument to the operator.

HDL-76 (error) 'others', vhdl range choices, and multiple choices in left-hand-side aggregates must be connected to OPEN%s

DESCRIPTION

This error occurs when an attempt is made to use the 'others' construct is used as part of an association list on the left hand side of an assignment.

WHAT NEXT

Modify your HDL description to remove this use of 'others'

HDL-77 (error) Tried to change the type of %s %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-78 (error) Tried to assign an unconstrained type to variable %s %s

DESCRIPTION

This error occurs if a variable is declared to be of a type that is unconstrained (such as BIT_VECTOR). The VHDL compiler for synthesis requires that all the type of a variable be constrained.

WHAT NEXT

Modify your HDL description to specify a constraint for the type of the variable.

HDL-79 (error) Illegal open connection to builtin function %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-80 (error) Variable %s has an uninitialized type %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-81 (error) Can't find a design '%s' that has correct

parameter profile (Could be a type mismatch)%s

DESCRIPTION

If the design reported is called 'indexed-name', an array index in the reported line is non-integer. Enumerated types are not supported. Synopsys supports indices of any type of integer.

```
entity e is
end;
architecture a of e is
TYPE mytype      IS      (first, second );
TYPE my_type_array IS      array (first to second) of integer range 0 to 7;
SIGNAL this_index :      mytype;
SIGNAL this_array :      my_type_array;
SIGNAL other_array :      my_type_array;

begin
other_array(first) <= this_array(this_index);    -- this is line 11
end;
```

WHAT NEXT

If the line reported in the error message contains an array whose index is not type integer, modify your VHDL so that the type is integer.

If your VHDL does not have an array indexed by a non-integer type, contact your Synopsys support representative.

SAMPLE MESSAGE

```
Error: Can't find a design 'indexed-name' that has correct parameter profile
(Could be a type mismatch)
in call to 'indexed-name'
called from e line 11 in file 'e.vhd' (HDL-81)
```

HDL-82 (error) Unknown HDL format '%s'

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-83 (error) Can't open %s primitive package '%s'

DESCRIPTION

This error occurs if the file "vhdl.prims" (for VHDL descriptions) or "verilog.prims" (for Verilog descriptions) cannot be found. This could be because of an error in installing Synopsys software on your machine.

WHAT NEXT

Check to make sure that the software has been correctly and completely installed.

HDL-84 (error) Was expecting a non-negative number, got %d instead %s

DESCRIPTION

This error occurs when a function that computes the logarithm of a number is supplied a negative number as its argument.

WHAT NEXT

Provide a positive number as an argument for this function.

HDL-85 (error) Subprogram body or architecture for '%s' was not defined %s.

DESCRIPTION

This error occurs when a function is specified without specifying the function's subprogram. This error also occurs when you elaborate a design for which no architecture has been specified.

WHAT NEXT

Provide the appropriate architecture or function body.

HDL-86 (error) Subprogram '%s' was used but has no body defined %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-87 (error) Value cannot be interpreted as a boolean %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-90 (error) Slice direction does not match array direction %s

DESCRIPTION

This error occurs if the direction ('to' or 'downto') specified for a slice operation on an array does not agree with the direction specified in the definition of the array.

WHAT NEXT

Modify the HDL description to correct the direction of the slice.

HDL-91 (warning) Can't find '%s' referred to by the '%s' attribute %s

DESCRIPTION

This error occurs when the object for which an attribute is specified cannot be

found. For example, if the arrival_time attribute for a port is specified and if the port does not exist in the design, then this error would occur.

WHAT NEXT

Check your HDL description to see if you have misspelt the name of the object or specified an attribute for a non-existent object.

HDL-92 (warning) Ignored illegal EQUAL or OPPOSITE attribute %s

DESCRIPTION

This error occurs if an incorrect number of values are specified for the EQUAL or OPPOSITE attributes.

WHAT NEXT

Modify your HDL description to provide exactly two values to these attributes.

HDL-93 (warning) %s %s

DESCRIPTION

This warning prefix is used by the primitive routines that implement the builtin VHDL and Verilog functions.

An example of when this message is issued is if the VHDL compares bit arrays of different widths. VHDL comparisons between bit arrays of different widths generate logic for dictionary order (VHDL LRM 7-4) rather than arithmetic ordering. For instance, "10" is considered greater than "011". Most significant bits are compared first, with missing least significant bits treated as null values (which are less than all other bit values). See "Relational Operators" in the VHDL Compiler Reference manual for more detail and examples.

WHAT NEXT

Find the part of your code that is identified by the message, and change it according to the message.

For comparisons between VHDL bit arrays of different widths, check that lexicographic ordering ('dictionary order') is appropriate. If not, one operand should be altered to match the width of the other operand.

EXAMPLE

Example problem for VHDL comparisons between bit arrays of different widths:

```
signal sigvec : std_logic_vector(2 downto 0);  
...  
if (sigvec > "00") then  
-- even when sigvec is "000", it is greater than "00".  
-- this branch will always be taken.  
end if;
```

HDL-94 (error) Aggregate contains too many elements %s.

DESCRIPTION

This error occurs when the number of elements specified for an aggregate is greater than the implicit size of the aggregate.

WHAT NEXT

Modify your description to provide the appropriate number of elements.

EXAMPLES

VHDL:

```
signal my_bus: bit_vector ( 0 to 3);  
  
my_bus <= (0, 1, 1, 0, 1);  
  
-- this is an error because five elements are specified. The aggregate's size is  
four [0,3]; so four elements should have been specified.
```

HDL-95 (error) Aggregate contains too few elements %s.

DESCRIPTION

This error occurs when the number of elements specified for an aggregate are less than the implicit size of the aggregate.

WHAT NEXT

Modify your description to provide the appropriate number of elements.

EXAMPLES

VHDL:

```
signal my_bus: bit_vector ( 0 to 3);

my_bus <= ('0', '1', '1'); -- this is an error because only three elements are
                           specified. The aggregate's size is 4 [0,3] so four elements should be specified.
```

HDL-96 (error) Infinite recursion detected %s

DESCRIPTION

A function that calls itself is recursive. Recursive functions call themselves directly, or call others functions that eventually call back. Recursive functions usually check a condition that terminates the recursion. The number of nested calls made before termination is called the depth of the recursion.

The HDL compiler allows recursive functions only if the depth of the recursion can be determined at read time. This error is invoked whenever HDL compiler can not determine the depth of a recursive call.

WHAT NEXT

Modify the recursive function to make the recursive call only under a condition that will eventually prove false after a few nested calls. For example, you can add a parameter to the function that is decremented for each nested call. If you return immediately from the function when the parameter reaches zero, HDL compiler will allow the recursion.

EXAMPLES

```
-- VHDL
entity e is
port(a: in bit; z: out bit);
end;
architecture a of e is
function f(a: in bit) return bit is
begin
return(f(a));    -- Infinite recursive call
end;

begin
      z <= f(a);
end;
```

```

/* Verilog */
module e(a,z);
input a;
output z;
function f;
input a;
f = f(a);      /* Infinite recursive call */
endfunction

assign z = f(a);
endmodule

```

EXAMPLE MESSAGE

```

Error: Infinite recursion detected
      in routine f line 6 in file 't.v'
called from f line 7 in file 't.v'
called from f line 7 in file 't.v'
called from f line 7 in file 't.v'
...

```

HDL-97 (error) Can't determine type of operand %s

DESCRIPTION

This error occurs if the type of an operand cannot be determined.

WHAT NEXT

Modify your HDL description to qualify the operand with its type.

HDL-98 (error) Non-static loop or event waits in only some branches detected %s

DESCRIPTION

This error occurs in one of two cases: (1) It is an RTL description and a process, loop, or branch within a loop was not broken with event waits and (2) It is a behavioral description and elaborated without -s option.

EXAMPLE

The following example is an RTL description that triggers the HDL-98 error message. In the example, the *while* loop is broken with an *event wait*. However, the process

must also be broken with an *event wait*. If `enable = '0'`, the description doesn't have an *event wait* because there isn't one for the process.

VHDL

```
library IEEE;
use IEEE.std_logic_1164.all;

entity HDL_98 is
    port( a      : in std_logic_vector(7 downto 0);
          clk     : in std_logic;
          enable  : in std_logic;
          b      : out std_logic_vector(7 downto 0)
        );
end HDL_98;

architecture RTL of HDL_98 is
begin
    process begin
        while (enable = '1') loop
            wait until clk'event and clk ='1';
            b <= a;
        end loop;
    end process;
end RTL;
```

Verilog

```
module HDL_98 (a, clk , b , enable);
input [7:0] a;
input clk, enable;
output [7:0] b;
reg [7:0] b;

always
    while (enable)
        begin
            @ (posedge clk);
            b <= a;
        end
endmodule
```

WHAT NEXT

If it is an RTL description modify your description to include an *event wait* in each branch and loop in your description. If it is a behavioral description use command `elaborate -s`.

In the following example, the above description is modified to include an *event wait* for the process.

VHDL

```
library IEEE;
use IEEE.std_logic_1164.all;
```

```

entity correct is
  port( a      : in std_logic_vector(7 downto 0);
        clk     : in std_logic;
        enable : in std_logic;
        b      : out std_logic_vector(7 downto 0)
      );
end correct;

architecture RTL of correct is
begin
  process begin
    while (enable = '1') loop
      wait until clk'event and clk ='1';
      b <= a;
    end loop;
    wait until clk'event and clk = '1'; -- this wait is added
  end process;
end RTL;

```

Verilog

```

module correct (a, clk , b , enable);
input [7:0] a;
input clk, enable;
output [7:0] b;
reg [7:0] b;

  always begin
    @ (posedge clk)
    while (enable)
      begin
        @ (posedge clk);
        b <= a;
      end
    end
  endmodule

```

EXAMPLE MESSAGE

Error: Non-static loop or event waits in only some branches detected
 in routine HDL_98 line 7 in file 'HDL_98.v' (HDL-98)

HDL-99 (error) Tried to use the value of an instance which does not return a value %s

DESCRIPTION

This error occurs when a construct that does not return a value is used in an expression. An example of such a construct is the 'task' construct in Verilog and the 'procedure' construct in VHDL.

WHAT NEXT

Modify your HDL description to correct the error.

HDL-100 (error) Aggregate type is an unconstrained array %s

DESCRIPTION

This error occurs if the type of an aggregate is an unconstrained type such as bit_vector.

WHAT NEXT

Modify your HDL description so that the type of the aggregate is a constrained type.

HDL-101 (error) Argument must be a constrained array %s

DESCRIPTION

This error occurs if you attempt to do a slice or index operation on an unconstrained array (such as bit_vector).

WHAT NEXT

Modify your HDL description to make the array constrained.

HDL-103 (warning) Function may be completed without returning a value %s

DESCRIPTION

This warning occurs if (in VHDL) the return statement for a function does not return a value or (in Verilog) a function does not return a value by assigning a value to a variable that has the same name as the function.

WHAT NEXT

Modify your HDL description to ensure that the function returns a value. If you do not need to return a value, use a procedure (in VHDL) or a task (in Verilog).

HDL-104 (error) Can't get width of port %s %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-105 (error) HDL translation aborted.

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-106 (error) Bits of range driven differently %s

DESCRIPTION

This error occurs when values are assigned to some but not all bits of a variable whose type is a range. This usually happens when the variable is converted into an array and some bits of the array are assigned values. If this array is now converted back into a range and used, this error will occur.

WHAT NEXT

Modify your HDL description so that either all or none of the bits are driven.

HDL-107 (error) Tried to use a synchronized value %s

DESCRIPTION

This error occurs when you assign a value to a variable inside an "if(clock'event)" block, and then attempt to read it after the "end if" statement. In the following example, **temp** is improperly read:

```

entity test is
  port(clock: in bit; toggle: out bit);
end;

architecture a of test is
begin
  process (clock, toggle)
    variable temp: bit;
  begin
    if(clock'event and clock = '1') then
      temp := not temp;
    end if;

    toggle <= temp; -- ERROR
  end process;
end;

```

WHAT NEXT

Move the statement that reads the value into the "if" block, or change the variable into a signal and read the signal outside the process.

The following example shows how to move read of **temp** outside the process of the previous example:

```

entity test is
  port(clock: in bit; toggle: out bit);
end;

architecture a of test is
  signal temp: bit;
begin
  process (clock, toggle)
  begin
    if(clock'event and clock = '1') then
      temp <= not temp;
    end if;
  end process;

  toggle <= temp; -- OK
end;

```

EXAMPLE MESSAGE

Error: Tried to use a synchronized value in routine test line 14 in file 't.v' (HDL-107)

HDL-108 (error) Tried to use a conditionally driven value% s %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-109 (error) This use of clock edge specification not supported %s

DESCRIPTION

This error occurs if you use more than one "if clock'event" expression in a process or if you embed the 'event expression inside a subprogram or loop.

The following example shows a positive- and negative-edge trigger in the same process.

```
entity test is
  port(clock, a: in bit; z1, z2: out bit);
end;

architecture a of test is
begin
  process (clock)
  begin
    if(clock'event and clock = '1') then
      z1 <= a;
    end if;

    if(clock'event and clock = '0') then -- ERROR
      z2 <= a;
    end if;
  end process;
end;
```

WHAT NEXT

Restructure your code to have a single "if clock'event" construct at the start of the process.

The previous example can be fixed by splitting the process into two processes.

```
entity test is
```

```

port(clock, a: in bit; z1, z2: out bit);
end;

architecture a of test is
begin
process (clock)
begin
    if(clock'event and clock = '1') then
        z1 <= a;
    end if;
end process;

process (clock)
begin
    if(clock'event and clock = '0') then
        z2 <= a;
    end if;
end process;
end;

```

EXAMPLE MESSAGE

Error: This use of clock edge specification not supported in routine test line 13 in file 't.v' (HDL-109)

HDL-110 (error) Illegal assignment to '%s'. It depends on a non-edge %s

DESCRIPTION

This error occurs when a value is assigned in the FALSE branch of an "if clock'event". This error can happen if a value is assigned on the "else" part of the "if clock'event", or if a value is assigned before the "if clock'event" and in the TRUE branch.

The first example below shows an illegal assignment in the FALSE branch:

```

entity test is
    port(clock, a, b: in bit; z: out bit);
end;

architecture a of test is
begin
process (clock, a, b)
begin
    if(clock'event and clock = '1') then
        z <= a;
    else
        z <= b; -- ERROR
    end if;

```

```
    end process;
end;
```

The second example behaves like the previous one because the assignment from "b" takes effect only when there is no event on the clock.

```
entity test is
  port(clock, a, b: in bit; z: out bit);
end;

architecture a of test is
begin
  process (clock, a, b)
  begin
    z <= b; -- ERROR

    if(clock'event and clock = '1') then
      z <= a;
    end if;
  end process;
end;
```

The behavior of these examples cannot be synthesized by the HDL Compiler. Notice that "z" behaves like a D flip-flop just after each clock event, but whenever a positive or negative transition is on either "a" or "b", the value is asynchronously reset to "b".

A variable can receive both asynchronous and synchronous assignments, but the asynchronous assignments must take precedence. That is, there must be a Boolean condition that enables the asynchronous part and disables the synchronous part.

The following example is still illegal since the asynchronous enable condition (reset) does not override the synchronous assignments:

```
entity test is
  port(clock, a, b, reset: in bit; z: out bit);
end;

architecture a of test is
begin
  process (clock, a, b, reset)
  begin
    if(reset = '1') then
      z <= b; -- ERROR, Since the if clock'event is not disabled by reset
    end if;

    if(clock'event and clock = '1') then
      z <= a;
    end if;
  end process;
end;
```

WHAT NEXT

Use an "if" statement to insure that either that the asynchronous or synchronous assignments fire in any execution of the process. Make sure that the condition controlling this "if" (the asynchronous reset condition) is *level sensitive*, not *edge sensitive*. The following examples show how to fix the previous code:

```
entity test is
  port(clock, a, b, reset: in bit; z: out bit);
end;

architecture a of test is
begin
  process (clock, a, b, reset)
  begin
    if(reset = '1') then
      z <= b; -- OK, since the if clock'event won't fire if we get here
    elsif(clock'event and clock = '1') then
      z <= a;
    end if;
  end process;
end;
```

EXAMPLE MESSAGE

Error: Illegal assignment to 'z'. It depends on a non-edge in routine test line 12
in file 't.v' (HDL-110)

HDL-111 (error) Illegally declared clock edge specification %s.

DESCRIPTION

This error occurs when you use the 'event construct in VHDL, or the positive-edge construct in Verilog, on a value that is not a single-bit simple signal or variable.

WHAT NEXT

Change your code to refer to a single-bit clock signal.

HDL-112 (error) Range (integer) types are illegal on inout (out) signal parameters to procedures %s.

DESCRIPTION

This error occurs when the inout (out) signal parameters of a procedure are of range

(integer) type, which the VHDL Compiler does not support for synthesis.

WHAT NEXT

Convert range type to a bit-vector type. For example, modify "bad.vhdl" to "good.vhdl".

```
-- "bad.vhdl"
package tp is

    subtype i4 is integer range 0 to 3;
    procedure p (signal x: in integer; signal y: inout integer);

end tp;

package body tp is

    procedure p (signal x: in integer; signal y: inout integer) is
    begin
        y <= x + y;
    end;

end tp;

use work.tp.all;

entity bad is
    port (a: in i4;
          b: inout i4;
          clk: in BIT;
          z: out i4);
end bad;

architecture a of bad is
    signal ax, bx : i4;
begin
    process (a, b)
    begin
        if (clk'event and clk = '1') then
            ax <= a;
            bx <= b;
            p(ax, bx);
            z <= bx;
        end if;
    end process;
end a;
```

```

-- "good.vhdl"
library IEEE;
use IEEE.STD_LOGIC_1164.all;
use IEEE.STD_LOGIC_SIGNED.all;
use IEEE.STD_LOGIC_ARITH.all;

package tp is

    subtype i4 is integer range 0 to 3;
    procedure p (signal x:in integer;
                 signal y:inout STD_LOGIC_VECTOR(0 to 1));

end tp;

package body tp is

    procedure p (signal x:in integer;
                 signal y:inout STD_LOGIC_VECTOR(0 to 1))
    is
    begin
        y <= CONV_STD_LOGIC_VECTOR(x + CONV_INTEGER(y), 2);
    end;

end tp;

library IEEE;
use IEEE.STD_LOGIC_1164.all;
use IEEE.STD_LOGIC_SIGNED.all;
use IEEE.STD_LOGIC_ARITH.all;
use work.tp.all;

entity good is
    port (a: in i4;
          b: inout i4;
          clk: in BIT;
          z: out i4);
end good;

architecture a of good is
    signal ax : i4;
    signal bx : STD_LOGIC_VECTOR(0 to 1);
begin
begin
    process (clk, a, b)
    begin
        if (clk'event and clk = '1') then
            ax <= a;
            bx <= CONV_STD_LOGIC_VECTOR(b, 2);
            p(ax, bx);
            z <= CONV_INTEGER(bx);
        end if;
    end process;
end a;

```

HDL-113 (error) Width of port %s is inconsistent with other instances %s

DESCRIPTION

This error occurs if the width of a port is different for different instances of a subdesign (component) in the same parent design.

WHAT NEXT

Modify your HDL description so that the width of the port is consistent across various instances of the instantiated design.

HDL-114 (error) Number of ports of instance is inconsistent with other instances %s

DESCRIPTION

This error occurs when the same subdesign (component) is instantiated with differing number of ports in the same parent design.

WHAT NEXT

Modify your HDL description so that the number of ports is the same for all instances of the instantiated design.

HDL-115 (error) Illegal mixing of named and unnamed port association %s

DESCRIPTION

This error occurs if, in instantiating a subdesign (component), named and positional styles of port association are mixed.

WHAT NEXT

Use either named style or positional style of specifying port association.

HDL-116 (error) Parameter%s must be associated with a

constant %s

DESCRIPTION

This error occurs if a parameter (generic) is specified but no value is assigned to it.

WHAT NEXT

Specify a value for the parameter (generic).

HDL-117 (error) Register inference not supported if "hdlin_infer_reg_and_latch" is false %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-118 (error) Single bit value expected %s

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-123 (error) Can't determine type of aggregate or concat %s

DESCRIPTION

This error occurs when the type of an aggregate or concatenation cannot be determined.

WHAT NEXT

Modify your HDL description to qualify the operation with a type.

HDL-124 (error) Elements of aggregate or string literal are out of bounds, overlap, or do not cover all cases %s

DESCRIPTION

This error occurs when the values specified for an aggregate do not cover all the possible elements or if more than one value is specified for the same element or if the values specified are for elements that are not part of this aggregate.

WHAT NEXT

Modify your HDL description to ensure that there is one to one correspondence between elements of the aggregate and the values specified for it.

HDL-127 (error) Argument to concat has incorrect size %s

DESCRIPTION

The arguments to a VHDL concatenation must either 1) be the same type (two BITS, or two BIT_VECTORS), or 2) one must be an array and the other must be a member of that array (one BIT_VECTOR and one BIT). This error indicates that the arguments to the VHDL concatenation operator are invalid (an array of BITS concatenated with an array of INTEGERS).

WHAT NEXT

Make the concatenation arguments compatible.

HDL-130 (error) Could not find synthetic_library '%s'

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-131 (error) synthetic_library '%s' is not a valid library

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-135 (warning) In resource '%s' %s OPS entry '%s' is already included in resource '%s' %s. Entry ignored.

DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the compiler has detected a label that appears in the ops list of more than one resource, which is invalid. Following is an example that illustrates this invalid situation:

```
synopsys resource r0 : ops = "op1 op2";      //op2 appears twice
synopsys resource r1 : ops = "op2 op3";
```

WHAT NEXT

Correct your code so that no label appears in the ops list of more than one resource. For more information about the ops directive, see Chapter 7 of the *HDL Compiler for Verilog Reference Manual*.

SEE ALSO

analyze (2), **read** (2).

HDL-139 (error) %s '%s' could not be found in the search path %s.

DESCRIPTION

This error occurs when the HDL Compiler can't find a file in the search path. The search path lists directories where HDL Compiler should look for source files.

WHAT NEXT

First, check the spelling of the file name. If it is correct, fix your search path to include the directory that holds the file.

HDL-140 (error) Tried to read a %s value%s %s

DESCRIPTION

This error occurs when reading a "threestated" or "don't cared" value. For example:

```
if(ENABLE) then  
    X := A;  
else  
    X := 'Z'; -- Threestate assignment  
end if;  
  
Y := W and X; -- Error: reading a threestated value.
```

WHAT NEXT

Generally, you should read these values in a separate process or always block. If you must read them in the same process or always block, read the value before any don't care or threestate assignments.

HDL-141 (warning) '%s' does not indicate a unique instance or resource in resource '%s' %s

DESCRIPTION

WHAT NEXT

HDL-142 (warning) Instance or resource '%s' not found in

resource '%s' %s

DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the compiler has detected a label in the ops list of a resource that is not defined in the code. Following is an example that illustrates this invalid condition:

```
always @(a or b or c or s) begin : block
  /* synopsys resource r1 : ops = "op1 op4";
   */
  casex (s)
    2'b00: x = a + b;      //synopsys label op1
    2'b01: y = a + c;      //synopsys label op2
    2'b1x: z = b + c;      //synopsys label op3
                           //op 4 is not defined
  endcase
```

WHAT NEXT

Be sure to define all labels used in this way.

SEE ALSO

analyze (2), **read** (2).

HDL-143 (warning) Subroutine label '%s' is not unique in scope.
Label ignored. %s */

DESCRIPTION

WHAT NEXT

HDL-144 (warning) No appropriate operation, procedure or function to which label '%s' can be bound

DESCRIPTION

You receive this message because, during **analyze** or **read** activity, the compiler has detected a label that does not follow an entity that can be labeled. Label pragmas must appear after the entity they label. Following is an example that illustrates

this situation:

```
always @(a or b or c or s) begin : block
/* synopsys resource r1 : ops = "op1 op2";
 */
//synopsys label op4      //
op4 does not follow an entity that can be labeled
casex (s)
 2'b00: x = a + b;      //  synopsys label op1
 2'b01: y = a + c;      //  synopsys label op2
 2'b1x: z = b + c;      //  synopsys label op3
endcase
end
```

WHAT NEXT

Correct your code so that op4 labels an entity, or remove op4. For more information about resource and label pragmas, see Chapter 7 of the *HDL Compiler for Verilog Reference Manual*.

SEE ALSO

analyze (2), **read** (2).

HDL-145 (error) Label '%s' used on more than one resource in same scope %s.

DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the compiler has detected a label that is applied to two operators, which is invalid. You can apply a label to only one operator. Following is an example that illustrates this invalid situation:

```
always @(a or b or c or s) begin : block
/* synopsys resource r0 : ops = "op1 op2";
 */
casex (s)
 2'b00: x = a + b;      //synopsys label op1
 2'b01: y = a + c;      //synopsys label op2
 2'b1x: z = b + c;      //synopsys label op2 appears twice, invalid
endcase
end
```

WHAT NEXT

analyze (2), **read** (2).

HDL-146 (error) Type function '%s' not found %s

DESCRIPTION

This error occurs when the *type function* identified with the **type_function** pragma cannot be found. Used in conjunction with the **map_to_operator** pragma, the **type_function** pragma defines the return type of the function in which the **type_function** pragma is used.

WHAT NEXT

Provide the function referred to in the **type_function** pragma.

NOTE

Use of *type_function* is discouraged. Use *output_port_type* instead.

HDL-147 (error) Ports of type function '%s' don't match %s

DESCRIPTION

This error occurs when the ports in the function identified by the **type_function** pragma do not match the ports in the function in which the *type_function* is embedded.

WHAT NEXT

Modify the type function so the ports match.

NOTE

Use of *type_function* is discouraged. Use *output_port_type* instead.

HDL-148 (error) Invalid constraint on an enumeration type %s

DESCRIPTION

This error occurs when the subrange of an enumerated type does not match the type declaration. This can occur if the range is out of order or the direction does not match.

WHAT NEXT

Change the subrange expression to match the enumeration declaration.

HDL-149 (error) Synthetic library has no one-bit multiplexor.

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-150 (error) Component implication (map_to_entity) subprogram port '%s' has an unconstrained type %s

DESCRIPTION

This error occurs when you use a subroutine with a map_to_entity attribute, and one of the subroutine's ports is unconstrained. All port types must be constrained before you can use map_to_entity.

WHAT NEXT

Add range constraints to the port type declarations.

HDL-151 (error) You are only allowed to use state vector '%s' in one process per design.

DESCRIPTION

This error indicates that the state_vector attribute was used more than once in an entity or module. Each entity or module is allowed a single state vector.

WHAT NEXT

If you need two state vectors (to implement communicating state machines, for

example) put each state machine in a separate entity or module. If you only need one state vector, then remove the extraneous state vector attribute.

HDL-152 (error) Expected an enumeration literal %s

DESCRIPTION

This error occurs when an enumeration literal is expected, but something else is supplied. For example, this can occur in an enumeration subrange where the bounds should be specified by enumeration literals, but are instead specified by integers.

WHAT NEXT

Use an enumeration literal where it is expected.

HDL-153 (warning) Share effort '%s' is not supported. Using 'low' share effort instead.

DESCRIPTION

The `hlo_share_effort` must be one of 'low', 'medium' or 'high'.

WHAT NEXT

The program will work with 'low' effort. If you want a different effort level, please correct the spelling in your `dc_shell` script.

HDL-154 (error) Inconsistent port declaration detected for port%s %s

DESCRIPTION

This error occurs when port names in subroutine calls do not match the names in the subroutine definition.

WHAT NEXT

Make sure the subroutine call and subroutine definition port names match.

HDL-155 (error)Index value '%d' is not within array bounds [%d,%d] %s

DESCRIPTION

This error occurs when the index value is not within the bounds specified for the array.

WHAT NEXT

Modify the description so that the index value lies within the array bounds.

EXAMPLES

Verilog:

```
reg [3:0] my_bus;  
wire foo;  
  
assign foo = my_bus[4];  
/* 4 is outside the array bounds [0,3] */
```

VHDL:

```
variable my_bus: bit_vector (0 to 3);  
signal foo: bit;  
  
foo <= my_bus(4);  
-- 4 is outside the array bounds [0,3]
```

HDL-156 (error) Index range [%d,%d] is not within array bounds [%d,%d] %s

DESCRIPTION

This error occurs when the index range is not within the bounds defined for the array.

WHAT NEXT

Modify the description so that the index range is within the bounds defined for the array.

EXAMPLES

Verilog:

```
reg [3:0] my_bus;  
wire [1:0] foo;  
  
assign foo = my_bus[4:3];  
/* 4 is outside the array bounds [0,3] */
```

VHDL:

```
variable my_bus: bit_vector (0 to 3);  
signal foo: bit_vector (0 to 1);  
  
foo <= my_bus(4 downto 3);  
-- 4 is outside the array bounds [0,3]
```

HDL-158 (warning) State vector '%s' was specified, but is not a valid state vector.

DESCRIPTION

The state vector directive identifies the variable that holds the state of a state machine. See or for more information on the state vector directive.

This error occurs when the variable identified in the directive either does not exist, or did not get a flip-flop to hold its value. For more information on how to get the HDL Compiler to build a flip-flop to hold the value of a variable, see or .

WHAT NEXT

Spell the variable in the state vector directive so it matches the variable declaration. Next, check the inferred devices report (see). If the state variable does not appear in the report, or if the memory device listed is not a flip-flop, modify your description to assign the variable on the edge of a clock.

EXAMPLES

```
-- VHDL  
entity e is  
port(clock, a: in bit; z: out bit);  
end;  
architecture a of e is  
signal state : bit;  
attribute state_vector : string;  
attribute state_vector of a:architecture is "state";
```

```

begin
process begin
-- This will fail because the wait is disabled
-- wait until clock'event and clock = '1';
state <= state xor a;
end process;
z <= state;
end;

/* Verilog */
module e(clock, a, z);
input clock, a;
output z;
reg state;
/* The variable name is misspelled */
/* synopsys state_vector statex */
always @(posedge clock) begin
state = state ^ a;
end
assign z = state;
endmodule

```

EXAMPLE MESSAGE

Warning: State vector 'statex' was specified, but is not a valid state vector. (HDL-158)

HDL-159 (error) Operator '%s' not found in synthetic library.

DESCRIPTION

The operator defined by a *map_to_operator* attribute was not described in any of the synthetic libraries in the *synthetic_library* variable (and was not found in **standard.sldb**).

WHAT NEXT

If you want to use the synthetic library operator, make sure it can be found in the files defined by *synthetic_library*.

HDL-160 (warning) No synthetic_library specified. Resource sharing is disabled.

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-162 (warning) may_merge_with and dont_merge_with conflict in resource '%s'
may_merge_with ignored %s

DESCRIPTION

This error occurs when you state that two resources may merge and also that they may not merge. For example, if you indicate that resource R0 may merge with R1, but that R1 may not merge with R0, you will get this error. For more information see the "User Directive Conflicts" section of the "Resource Sharing" chapters in either of the reference manuals for VHDL and Verilog compiler.

WHAT NEXT

Modify your directives so that the **may_merge_with** and **dont_merge_with** directives do not disagree.

HDL-163 (error) Resolution function '%s' must be labeled with a "resolution_method" pragma
. Resolution functon ignored %s.

DESCRIPTION

The VHDL Compiler does not support arbitrary resolution functions. It supports *wired_and*, *wired_or* and *three_state* as resolution methods. Any function that is used as a resolution function must include a *resolution_method* pragma that indicates which of the three supported resolution methods is to be used. This error occurs when the *resolution_method* pragma is missing.

WHAT NEXT

Add one of the following *resolution_method* pragma to the resolution function:
wired_and, *wired_or*, or *three_state*

HDL-164 (error) Resolution function '%s' is not legal for variable or type %s

Use "wired_and", "wired_or", or "three_state" %s.

DESCRIPTION

The VHDL Compiler does not support arbitrary resolution functions. It supports *wired_and*, *wired_or* and *three_state* as resolution methods. Any function that is used as a resolution function must include a *resolution_method* pragma that indicates which of the three supported resolution methods is to be used. This error occurs when the *resolution_method* pragma indicates a resolution method other than the three methods supported.

WHAT NEXT

Modify the *resolution_method* pragma for the resolution function to be one of the following: *wired_and*, *wired_or* or *three_state*.

HDL-165 (error) Cannot find resolution function '%s'. Resolution function ignored.

DESCRIPTION

The indicated function could not be found. This happens when the name of the function is spelled incorrectly.

WHAT NEXT

Check to make sure all resolution functions are provided and spelled correctly.

HDL-167 (error) %s contains the invalid string '%s'.

DESCRIPTION

This error occurs when an environment variable should have a string value, but instead the value has some other type.

WHAT NEXT

When you assign the value of the environment variable, you can use double quotes around the value you assign to insure it is a string.

HDL-169 (warning) The state-vector does not fan out. It's flip-flops are being deleted.

DESCRIPTION

HDL Compiler removes all logic which does not eventually fan out to output or inout ports. This warning occurs when the state vector flip flops are deleted due to a lack of fanouts. This does not necessarily indicate an error, but it probably means that the state machine is not hooked up properly.

WHAT NEXT

If you know that the state vector is unused, then you can safely ignore this warning. Otherwise, check the connections in your state machine to be sure the output ports, next-state logic and state vector communicate properly.

HDL-170 (warning) Comparisons to a '%s' are treated as always being false %s

This may cause simulation to disagree with synthesis.

DESCRIPTION

Comparisons in hardware are inherently different than in the simulator. Digital hardware comparators can only distinguish between ones and zeros. Thus, it makes no sense to synthesize comparisons to three-state, don't-care or unknown literals. Since signals are assumed to carry a value of one or zero, equality tests to non-one/zero values always return false in synthesis.

WHAT NEXT

There is probably no need to modify your HDL if the comparison was used for simulation purposes only. For example, if you want to print a message when an input port is in the high-impedance state, it is ok to compare its value to 'z'. If you are using the comparison to affect the state of your circuit, you should consider recoding your HDL. For example, if you need a four-state state-machine, don't declare a single-bit variable and use 0, 1, x, and z as your states. In hardware, each bit only holds two useful states: 1 and 0.

HDL-172 (error) Variable%s, which is assigned using RTL

assignment, cannot accept return values from a task call%.

DESCRIPTION

You receive this message during the issuance of a **read** command or an **elaborate** command, when a variable that is the target of an RTL assignment is passed to an output or inout argument of a task call.

HDL Compiler does not let you mix RTL (nonblocking) and procedural (blocking) assignments and pass them to a given variable in one process (see VE-57). HDL Compiler treats task arguments of type output or inout as procedural (blocking) assignments. Therefore, you cannot combine them with RTL (nonblocking) assignments to the same variable within a process.

In the following example, *y* is the target of an RTL assignment and is passed to the output argument of task *t*. This code causes HDL Compiler to issue HDL-172.

```
task t;
    input a;
    output z;

    z = ~a;
endtask

always @(posedge ck) begin
    if (reset)
        y <= 0;
    else
        t (x, y);
end
```

WHAT NEXT

Avoid this error by using procedure assignments for variables that must be passed to output or inout arguments of task calls. For example, the always block in the example above could be rewritten like this:

```
always @(posedge ck) begin
    if (reset)
        y = 0;
    else
        t (x, y);
end
```

SEE ALSO

elaborate (2), **read** (2); **VE-57** (n).

HDL-173 (warning) Add_ops attribute value "%s" is not valid for

resource '%s'.

Attribute value is assumed to be "false".

DESCRIPTION

The value shown is not valid. The value assigned for **add_ops** must be either "true" or "false".

WHAT NEXT

Assign either "true" or "false" for **add_ops**.

HDL-174 (error) Variable %s of type 'wire' cannot accept return values from a task call %s.

DESCRIPTION

This error occurs when a variable of type *wire* is passed to an output or inout argument of a task call.

WHAT NEXT

Modify your description so that the variable passed to the output or inout argument of the task is of type *reg*.

HDL-175 (error) Clock variable '%s' is being used as data %s.

DESCRIPTION

The synthesis policy does not support the use of a value as both clock and data in the same process.

WHAT NEXT

If you need to compute a value that is based on a clock signal (for example, to generate a gated clock), then you must perform the computation outside any process that is sensitive to the clock edge.

HDL-176 (warning) Variable '%s' is being read asynchronously

%S.

This may cause simulation-synthesis mismatches.

DESCRIPTION

This warning occurs in the asynchronous reset part of a process or always block. It occurs when a value not in the sensitivity list or block timing control is read.

This typically occurs when a non-constant value is assigned on the asynchronous reset.

In the following example `reset_data` is incorrectly read:

```
-- VHDL
entity e is
port(clock, a, reset_enable, reset_data: in bit; z: out bit);
end;
architecture a of e is
begin
process (clock, reset_enable) begin
if(reset_enable = '1') then
z <= reset_data -- WARNING
elsif(clock'event and clock = '1') then
z <= a;
end if;
end process;
end;

/* Verilog */
module e(clock, a, reset_enable, reset_data, z);
input clock, a, reset_enable, reset_data;
output z;
reg z;

always @ (posedge clock or posedge reset_enable) begin
if(reset_enable) z = reset_data; /* WARNING */
else z = a;
end
assign z = state;
endmodule
```

The problem with this description is that the simulation model does not react to changes in `reset_data` while `reset_enable` is held high.

WHAT NEXT

In VHDL the solution is to add `reset_data` to the process sensitivity list.

In Verilog, you can't add `reset_data` to the sensitivity list without breaking the model. Thus, In the above case Synopsys recommends that you verify that your model does not rely on the fact that during reset, the simulator holds `z` steady even though `reset_data` changes. The synthesized register will be transparent during

reset.

HDL-177 (warning) Local variable '%s' is being read before its value is assigned,

%s.

This may cause simulation not to match synthesis.

DESCRIPTION

HDL Compiler assumes that processes should run whenever doing so would change an output value. If a description is written so that the simulator might not execute a process even though doing so could change an output, HDL Compiler displays a warning. The incomplete sensitivity list warning (see **HDL-179**) tells when a signal is read but it is not on the sensitivity list. A simulation/synthesis mismatch can occur when the signal changes because the synthesized hardware reacts immediately, whereas the simulator waits for an event on the sensitivity list.

This warning is similar to **HDL-179**, but it happens with variables instead of signals. The difference is that you can't fix the problem by adding to the sensitivity list because variables are not allowed in the sensitivity list.

The following example shows how such a situation can cause a simulation/synthesis mismatch:

```
entity e is
port(a: in bit; z: out bit);
end;

architecture a of e is
begin
process(a)
variable temp: bit;

z <= temp; -- WARNING
temp := a;
end process;
end;
```

HDL Compiler builds a circuit with 'a' feeding directly to 'z'. The simulator, however, feeds the opposite value. Consider what happens when 'a' transitions from '0' to '1'. At the start of the process, 'temp' holds a '0', so 'z' is driven with '0'. At the end of the process, 'temp' is assigned '1', the new value of a. When 'a' transitions from '1' to '0', the process runs a second time, and the '1' in temp finally makes it to the output. Notice that 'z' lags one step behind 'a'. In this case it means that 'z' is really equal to 'not a'.

WHAT NEXT

You can fix this problem by making default assignments to all variables as the first step in a process. Or you can reorder the computations in the process to read variables only after they have been set.

The following example shows a fixed version of the previous example. Notice that the assignments are reordered.

```
entity e is
port(a: in bit; z: out bit);
end;

architecture a of e is
begin
process(a)
variable temp: bit;
begin
temp := a;
z <= temp; -- OK
end process;
end;
```

EXAMPLE MESSAGE

Warning: Local variable 'temp' is being read before its value is assigned, in routine e line 7 in file 't.v'. This may cause simulation not to match synthesis.
(HDL-177)

HDL-178 (warning) Only simple variables are checked in the sensitivity list. The variable in the sensitivity list on line %d is ignored.

DESCRIPTION

The list of variables to which a process (in VHDL) or an *always block* (in Verilog HDL) is sensitive must contain simple variable names. Lists that contain indexed variables or not-processed variables are ignored.

WHAT NEXT

If possible, rewrite the description so that the sensitivity list contains only simple names. As you rewrite the description, be careful not to introduce errors by making the process or block sensitive to more variables than necessary. The usual workaround is to assign to a temporary variable the required bit or slice of the variable, and to make the process or block sensitive to this temporary variable.

EXAMPLES

VHDL

```
process ( bus(1) ) begin
-- bus(1) is not a simple variable. The workaround follows:

temp := bus(1);
process ( temp ) begin
```

Verilog

```
always @ (bus[1]) begin
// bus[1] is not a simple variable. The workaround follows:

assign temp = bus[1];
always @ ( temp ) begin
```

HDL-179 (warning) Variable '%s' is being read %s, but is not in the process sensitivity list of the block which begins there.

DESCRIPTION

Since the hardware generated by the HDL compiler is sensitive to all inputs, you should normally include all read signals in a process's sensitivity list. This warning is displayed when you don't.

The following example shows why it is important to include all read signals in the sensitivity list:

```
entity e is
port(a, b: in bit; z: out bit);
end;

architecture a of e is
begin
process(a) begin
z <= a xor b;
end process;
end;
```

HDL Compiler builds a circuit with an 'xor' gate reading 'a' and 'b', and driving 'z'. Whenever either 'a' or 'b' changes, the hardware immediately computes a new value for 'z'.

The simulator, in contrast, executes the process only when 'a' changes, since 'b' was left out of the sensitivity list. Thus, while 'a' keeps a steady value, the simulator does not propagate changes in 'b' to the output. This can cause a simulation/synthesis mismatch.

WHAT NEXT

It is always safer to include values in the sensitivity list to ensure an accurate modeling of the hardware. If you want to leave values out (for simulation efficiency, for example), you should convince yourself that leaving them out does not change the results computed by the simulator, and then ignore this warning.

If you are not sure whether delaying the execution of a process will affect the results, it is safer to simply add the value to the list.

For example, the above description would be much safer if written:

```
entity e is
port(a, b: in bit; z: out bit);
end;

architecture a of e is
begin
process(a, b) begin
z <= a xor b;
end process;
end;
```

EXAMPLE MESSAGE

Warning: Variable 'b' is being read in routine e line 8 in file 'b.v', but is not in the process sensitivity list of the block which begins there. (HDL-179)

HDL-180 (warning) Variable '%s' is being read %s, but does not occur in the timing control of the block which begins there.

DESCRIPTION

A variable is missing from the timing control, also known as the sensitivity list. This warning indicates which variable is missing from the list.

Leaving a variable out of the sensitivity list can cause simulation to disagree with synthesis. Simulation only propagates changes for variables when they appear in the sensitivity list. Synthesized hardware will propagate changes even for variables missing from the sensitivity list.

The following example shows the importance of a complete sensitivity list:

```
module e(a, b, z);
input a, b;
output z;
reg z;
always @( a ) begin /* Incomplete sensitivity list */
```

```
z = a ^ b;
end
endmodule
```

HDL Compiler builds a circuit with an 'xor' gate reading 'a' and 'b', and driving 'z'. Whenever either 'a' or 'b' changes, the hardware immediately computes a new value for 'z'.

The simulator, in contrast, executes the always block only when 'a' changes, since 'b' was left out of the sensitivity list. Thus, while 'a' keeps a steady value, the simulator does not propagate changes in 'b' to the output. This situation can cause a simulation/synthesis mismatch.

WHAT NEXT

To ensure an accurate modeling of the hardware, it is always safer to include values in the sensitivity list. If you want to omit values (for simulation efficiency, for example), first verify that leaving them out won't change the results computed by the simulator then ignore this warning.

If you are not sure whether delaying the execution of a block will affect the results, it is safer simply to add the value to the list.

For example, the previous description would be much safer if written

```
module e(a, b, z);
input a, b;
output z;
reg z;
always @(* a or b) begin /* Much safer */
z = a ^ b;
end
endmodule
```

EXAMPLE MESSAGE

```
Warning: Variable 'b' is being read
          in routine e line 6 in file 'b.v',
          but does not occur in the timing control of the block which begins
          there.      (HDL-180)
```

HDL-183 (error) The multi-bit clock '%s' is not supported %s.

DESCRIPTION

This error occurs when the variable that serves as the clock for a description is greater than 1 bit in width. The clocking variable for a design is the one that is specified in VHDL statements such as: wait until clock'event and clock = '1' ; and in Verilog statements as: always @ (posedge clock)

WHAT NEXT

Rewrite your description to specify a 1-bit wide clock.

HDL-184 (error) Case statement was not fully specified. (There exists no TRUE branch)%s

DESCRIPTION

This error occurs if none of the case statement alternatives match the case expression in a case statement.

WHAT NEXT

Modify your HDL description so that at least one case statement alternative can match the case expression.

HDL-185 (error) Couldn't find the package '%s' in memory.

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-186 (error) An order based parameter was specified after a name based parameter for the template '%s' %s

DESCRIPTION

This error happens when the argument to the *elaborate* command includes a combination of order-based and name-based parameter values, and all the order-based parameters are not specified before name-based parameters.

WHAT NEXT

Modify the arguments to the *elaborate* command so that all order-based parameters occur before name-based parameters.

HDL-187 (error) Too many parameters were specified for the template '%s'.

DESCRIPTION

This error occurs when the argument to the *elaborate* command includes more parameter values than the number of generics (parameters) that exist in the design.

WHAT NEXT

Modify the arguments to the *elaborate* command to remove the extra parameters.

HDL-188 (error) The parameter '%s' does not exist on template '%S'.

DESCRIPTION

This error occurs when the argument to the *elaborate* command includes a parameter value for a generic (parameter) that does not exist in the design. This error can also occur when a parameterized design is instantiated in VHDL with a named parameter that does not exist in the instantiated entity.

WHAT NEXT

Remove the incorrect parameter from the arguments to the *elaborate* command.

HDL-189 (error) Couldn't find the template '%s' in memory.

DESCRIPTION

This is a non-fatal internal error.

WHAT NEXT

Contact your Synopsys support representative.

HDL-190 (error) The variable '%s' has an illegal format. Please check documentation.

DESCRIPTION

This error occurs when the format specified for naming the template of a design ("template_name_style") or for naming the architecture of a design (when writing out VHDL) has an invalid character.

WHAT NEXT

See the "Design Compiler Interface" chapter of the VHDL Compiler manual for the correct way to set this variable. Modify the appropriate variable to be of the specified format.

HDL-191 (error) The parameter '%s' is not a valid integer.

DESCRIPTION

This error occurs when the value specified for a generic (parameter in Verilog) is not an integer.

WHAT NEXT

Rerun the elaborate command with the correct value for the parameter.

HDL-192 (warning) '%s' is an invalid argument for variable '%s'.

DESCRIPTION

WHAT NEXT

HDL-193 (information) Building the design '%s'%s.

DESCRIPTION

This information message is issued when a new design is being built as a result of the **read** or **elaborate** command.

WHAT NEXT

HDL-194 (error) Could not find the template %s

DESCRIPTION

This error occurs when the template specified to the `elaborate` or similar commands does not exist or was not found because of incorrect library specification (in VHDL).

WHAT NEXT

Check to see if the name of the template has been correctly spelled. If using VHDL, check to make sure that the libraries have been correctly specified.

HDL-195 (error) Couldn't find the symbol '%s'.

This is probably because the %s '%s' is not the same %s that the %s '%s' was analyzed with.

DESCRIPTION

This error can happen if a design unit is analyzed with a package, and then is elaborated with another package. Normally, this will be flagged as an error. However, if both versions of the package were analyzed before the entity was, the timestamp checking will think that this is okay, but if the packages are significantly different, problems may occur.

WHAT NEXT

Re-analyze all of the source code from scratch.

HDL-196 (error) User specified sharing information caused combinational loops in design '%s'.

DESCRIPTION

This error happens if combinational loops are created through user specified sharing

information. The following example shows how such a loop could be created.

```
// synopsys resource r1 : ops = "a0 b1";
// synopsys resource r2 : ops = "a1 b0";

if (s) begin
    tmp = a + b; // synopsys label a0;
    z = tmp + c; // synopsys label a1;
end
else begin
    tmp = d + e; // synopsys label b0;
    z = tmp + f; // synopsys label b1;
end
```

WHAT NEXT

Check the pragmas in your HDL file and remove the sharing that causes the combinational loop.

HDL-200 (error)'default' clause must be the last clause in a case statement.

DESCRIPTION

In a Verilog HDL case statement, the *default* clause must be the last clause. This error occurs if this condition is not met.

WHAT NEXT

Rewrite your description so that the *default* clause occurs last in the case statement.

HDL-201 (error) Character '%c' is not allowed in the variable '%S'.

DESCRIPTION

This error occurs when the format specified for separators in the name of a template ("template_seperator_style") contain illegal characters. This error may also occur if the format for naming an architecture (when writing out VHDL) contains illegal characters.

WHAT NEXT

See the "Design Compiler Interface" chapter of the VHDL Compiler manual for the correct way to set this variable. Modify the format so that it contains only legal characters.

HDL-202 (information) Saving the %s '%s'.

DESCRIPTION

This information message is issued when a design (module, entity, or architecture) or a package is being saved to the disk.

WHAT NEXT

HDL-203 (information) Overwriting the %s '%s'.

DESCRIPTION

This information message is issued when the new design or package that is being processed overwrites an existing design or package of the same name.

WHAT NEXT

HDL-204 (error) Too many generics were specified% s

DESCRIPTION

This error occurs when more generics are specified as arguments to the "elaborate" command than are specified in the description of the design being elaborated.

WHAT NEXT

Check the design description to find the correct number of generics and rerun the "elaborate" command with the correct number of generics.

HDL-205 (error) The value specified for generic '%s' is out of

range% s

DESCRIPTION

This error occurs when the value specified for a generic is bigger than the maximum or smaller than the minimum allowable value for the generic.

WHAT NEXT

Check the description of the design being elaborated to find the allowable value of the generic and rerun the "elaborate" command with the correct value for the generic.

HDL-206 (error) Cannot determine type of the aggregate %s (This error can occur if an aggregate and a generic appear in the same component instantiation.)

DESCRIPTION

This error occurs if a generic map is used and if a port is indexed (or sliced) on the left hand side of a port map clause of a component instantiation statement.

WHAT NEXT

Modify the HDL description to (a) replace the generic with a constant or (b) not slice or index the port on the left hand side of the port map statement.

HDL-207 (error) %s contains the invalid list '%s'.

DESCRIPTION

This error occurs when the dc_shell variable "vhdlout_conversion_functions" is set to an incorrect value.

WHAT NEXT

See the "Design Compiler Interface" chapter of the VHDL Compiler manual for the correct way to set this variable.

HDL-208 (warning) hdlin_source_to_gates_mode set to invalid

value "%s", "off" will be used instead.

DESCRIPTION

This warning occurs when the dc_shell variable "hdlin_source_to_gates_mode" is not set to a valid value.

WHAT NEXT

Set the variable to a correct value.

HDL-209 (warning) The VHDL design '%s' contains generics but was treated

as a "design." To save as a "template", which can be instantiated

with different parameters, use the "analyze" command. This is recommended

since this does not require changing HDL code or setting any variables.

Alternately reread file(s) with "%s = "TRUE\"", or insert the synthetic comment "template" in the HDL source.

DESCRIPTION

This warning occurs if a design is read in using the "read" command. Use the "analyze" command if you want to elaborate this design with different values for the generics.

WHAT NEXT

HDL-210 (error) Can't find port '%s' on synthetic operator '%s'

DESCRIPTION

You receive this message because, during processing of a function that has a

map_to_operator pragma, the compiler has not found a match between the names of formal parameters and the names of input ports of the synthetic operator.

WHAT NEXT

Correct the code so that these two entities contain the same names. For more information about the **map_to_operator** pragma, see Chapter 4 of the *DesignWare Developer Guide*.

SEE ALSO

analyze (2), **read** (2); **compile** (2).

HDL-211 (warning) Configurations are ignored during %s.

The %s/%s commands must be used
to build a configuration.

DESCRIPTION

VHDL source files that contain configurations must be read in using the **analyze** command. If they are read in using the **read** command, the configuration statements are ignored.

WHAT NEXT

If the configuration statements should not be ignored, read in the VHDL source file using the **analyze -f vhdl** command. You can then build the design by using the **elaborate** command.

HDL-213 (error) The library '%s' is mapped to the directory '%s' which is not writable. The VHDL analyzer can not be invoked.

DESCRIPTION

All library names have a mapping to a UNIX directory in dc_shell. These mappings are done either in your '.synopsys_vss.setup' file or by the dc_shell command 'define_design_lib'.

The 'read -f vhdl' command writes intermediate files to the library WORK. The corresponding UNIX directory was not writable, or did not exist at the time the read command was invoked.

WHAT NEXT

Change the mapping for library WORK either in your .synopsys_vss.setup file or by using the define_design_lib command. Also make sure the corresponding UNIX directory exists and has the necessary permissions.

The .synopsys_vss.setup file is read only once, at program start up. Hence, if you change the mapping here you must re-start dc_shell or design_analyzer for the change to take effect.

Note that there is a search path involved for the .synopsys_vss.setup file. If there is one in the directory where the dc_shell is started it will be used. Else if there is one in your home directory it will be used. Else the one in <synopsys_root>/admin/setup/ will be used. If only some setup information was found in a file outside <synopsys_root>/admin/setup/.synopsys_vss.setup, the next one is read to get the missing information.

HDL-220 (warning) Variable '%s' is driven in more than one process or block

in file %s

This may cause mismatch between simulation and synthesis.

DESCRIPTION

In simulation, the **always** block last fired up drives the variable (the drivers are multiplexed). In synthesis, the drivers are shorted together. This situation is especially serious if the values driven by two **always** blocks are different constants, since this will short power to ground.

The HDL Compiler does not keep track of individual bits in a bus when issuing this warning. If bits of a bus are driven from different **always** blocks, and each bit is driven from one block only, this warning is still issued even though simulation and synthesis match.

WHAT NEXT

If individual bits of a bus are driven from a single block, you can ignore this warning. Otherwise, move the drivers of the variable into the same **always** block or use a three-state bus. If the problem came from the reuse of a loop variable, declare separate loop variables for each block.

FIRST EXAMPLE

In the following example, the simulator will assign 'C' from either 'A' or 'B', depending on which changed most recently. HDL Compiler simply shorts 'A' and 'B' to 'C'.

```

module VERILOG_EXAMPLE ( A, B, C );
input A, B;
output C;
reg C;
    always @( A ) begin
        C = A ;
    end
    always @( B ) begin
C = B;
    end
endmodule

```

EXAMPLE MESSAGE

Warning: Variable 'C' is driven in more than one process or block
in file /home/mine/design/dir/x220.ver
This may cause mismatch between simulation and synthesis. (HDL-220)

SECOND EXAMPLE

In the following example, 'i' is used as a loop index in two **always** blocks. The result is that 'i' is driven in both processes by different constants. Both power and ground are shorted onto 'i'. This is a serious problem that should be fixed by declaring separate loop variables for each block.

```

module VERILOG_EXAMPLE ( A, B, C );
input [3:0] A, B;
output [3:0] C;
reg [3:0] C;
integer i;

    always @( A ) begin
        for (i=0; i<=1; i=i+1) C[i] = A[i];
    end
    always @( B ) begin
        for (i=2; i<=3; i=i+1) C[i] = B[i];
    end
endmodule

```

EXAMPLE MESSAGE

Warning: Variable 'i' is driven in more than one process or block
in file t.v
This may cause mismatch between simulation and synthesis. (HDL-220)
Warning: Variable 'C' is driven in more than one process or block
in file t.v
This may cause mismatch between simulation and synthesis. (HDL-220)

The first warning in this example is serious because the first block drives a '1' onto 'i', and the second block drives a '3'. The second warning is not serious because different bits of 'C' are driven from each block.

HDL-222 (error) Process %s has both a sensitivity list as well as embedded wait statements.

DESCRIPTION

The use of wait statement in a function or process is mutually exclusive with the use of a sensitivity list.

WHAT NEXT

Remove the sensitivity list or re-write the offending code to not make use of the wait statement.

EXAMPLE

```
entity MULTWAIT_VHDL is
    port( I1, I2: in BIT ;
          CLOCK : in BIT ;
          Out_Port : out BIT );
end MULTWAIT_VHDL;

architecture test_behavior of MULTWAIT_VHDL is
begin
    process ( clock ) begin
        wait until clock'event and clock = '1' ;
        Out_Port <= I1 ;
        wait until clock'event and clock = '1' ;
        Out_Port <= I2 ;
    end process;
end test_behavior;
```

EXAMPLE MESSAGE

```
wait until clock'event and clock = '1' ;
^
**Error: vhdlan,1044 /home/mine/design/dir/x222.vhd(10):
Wait statement must not appear in a function or a process which has a
sensitivity list.
wait until clock'event and clock = '1' ;
^
**Error: vhdlan,1044 /home/mine/design/dir/x222.vhd(12):
Wait statement must not appear in a function or a process which has a
sensitivity list.
```

HDL-223 (error) Always block %s has both a timing control

statement as well as embedded event ('@') expressions.

DESCRIPTION

You receive this message to inform you that the always block in your design cannot contain, as it does, both a timing control statement and embedded event ('@') expressions because the code as written does not accommodate this construction. The example shown illustrates a similar instance:

```
module multwait_V( I1, I2, CLOCK, Out_Port);
input CLOCK;
input I1, I2;
output Out_Port;
reg Out_Port ;

always @(`posedge CLOCK)
begin : process_blk
  `posedge CLOCK
  Out_Port = I1;
  `posedge CLOCK
  Out_Port = I2;
end
endmodule
```

The following example shows the error message that the compiler would issue in response to the above code:

```
Error: Always block
      in routine multwait_V line 7 in file '/home/mine/design/dir/x223.ver'
      has both a timing control statement as well embedded
      event ('@') expressions. (HDL-223)
```

WHAT NEXT

Remove the timing control statement or rewrite the code so that it does not make use of embedded event expressions.

SEE ALSO

analyze (2), **read** (2).

HDL-224 (error) Wait statements in process %s use different clocks or clock edges.

DESCRIPTION

All wait statements in same process must be triggered by same clock edge.

WHAT NEXT

Modify the offending process' wait statements to be triggered by same clock edge.

EXAMPLES

In this example one wait statement is triggered by a rising clock edge while the other is triggered by the falling clock edge.

```
entity MULTWAIT_VHDL is
    port( I1, I2: in BIT ;
          CLOCK : in BIT ;
          Out_Port : out BIT );
end MULTWAIT_VHDL;

architecture test_behavior of MULTWAIT_VHDL is
begin
    process begin
        wait until clock'event and clock = '1' ;
        Out_Port <= I1 ;
        wait until clock'event and clock = '0' ;
        Out_Port <= I2 ;
    end process;
end test_behavior;
```

EXAMPLE MESSAGE

```
Error: Wait statements in process
      in routine MULTWAIT_VHDL line 0 in file '/home/mine/design/dir/x224.vhd'
      use different clocks or clock edges. (HDL-224)
```

HDL-225 (error) Event ('@') expressions in always block %s use different clocks or clock edges.

DESCRIPTION

You receive this message to inform you that the always block in your design cannot contain event expressions ('@') that use different clocks or clock edges.

The example shown illustrates a similar instance, one in which the event expressions are triggered by positive and negative clock edges, respectively.

```
module multwait_V( I1, I2, CLOCK, Out_Port);
input CLOCK;
input I1, I2;
output Out_Port;
reg Out_Port ;

always
```

```
begin : process_blk
  @(posedge CLOCK)
  Out_Port = I1;
  @(negedge CLOCK)
  Out_Port = I2;
end
endmodule
```

The following example shows the error message that the compiler would issue in response to the above code:

```
Error: Event ('@') expressions in always block
      in routine multwait_V line 7 in file '/home/mine/design/dir/x225.ver'
      use different clocks or clock edges. (HDL-225)
```

WHAT NEXT

Modify the offending always block's event ('@') expressions so that they are triggered by same clock edge.

SEE ALSO

analyze (2), **read** (2).

HDL-226 (error) Process %s contains unsupported wait statements.

DESCRIPTION

WHAT NEXT

HDL-227 (error) Always block %s contains unsupported event ('@') expressions.

DESCRIPTION

Event expressions are not supported in subprograms or **for** loops.

WHAT NEXT

Modify subprograms not to contain event expressions or "inline" them. Change **for** loops into **forever** loops.

EXAMPLES

Example of unsupported **for** loop:

```
module V1(a, b, clock, d);
input [0:3] a, b ;
input clock ;
output [0:3] d;
reg d;

integer i;
always begin
  for (i = 32'd0; /* for-loop enclosing event expression, not supported */
        i < 32'd4;
        i = i + 32'd1)
  begin
    @ (posedge clock)
    d[i] = a[i] & b[i];
  end
end
```

Above example rewritten into supported format:

```
module V2(a, b, clock, d);
input [0:3] a, b ;
input clock ;
output [0:3] d;
reg d;

integer i;
always begin
  i = 32'd0; /* init of loop-invariable */
  forever
  begin : infinite_label
    i = i + 32'd1; /* increment loop-invariable */
    @ (posedge clock)
    d[i] = a[i] & b[i];
    if( i > 32'd4) disable infinite_label; /* loop exit */
  end
end
```

EXAMPLE MESSAGE

```
Error: Always block
      in routine V1 line 9 in file '/home/my/design/x227.ver'
      contains unsupported event ('@') expressions. (HDL-227)
```

HDL-230 (error) '%s' is used as a name for an internal package.
Please use

a different name for your package.

DESCRIPTION

You have defined a package name that conflicts with a built-in package. The built-in packages are "vhdl," "verilog," and VHDL's predefined "standard."

WHAT NEXT

Because these packages are built in, they are always present. Hence, the VHDL library clause is of no help here.

You must modify the name of the conflicting package.

EXAMPLES

```
-- VHDL
package standard is
end;
```

EXAMPLE MESSAGE

Error: "standard" is used as a name for an internal package. Please use a different name for your package. (HDL-230)

HDL-231 (warning) The enum encoding '%s' is not a valid state machine encoding.

The state name for the state '%s' will not be saved.

DESCRIPTION

The Synopsys state machine compiler only accepts 0 or 1 encodings for its states. For example, a don't care state is not passed to the state machine compiler during the subsequent extract information. The logic for the state is still treated correctly but the encoding for the state will not be shown by the *report_fsm* command.

For a don't care state, it is possible that every time the state is referenced, it will receive a different encoding.

WHAT NEXT

Be aware that state machine encodings other than 0 or 1 will not be saved.

HDL-232 (error) The encoding '%s' for state '%s' is invalid.

DESCRIPTION

Valid states that can be passed to the Synopsys state machine compiler are vectors of 0's and 1's. don't care states are parsed and ignored, but no other states are valid.

WHAT NEXT

Change the encoding for the state to a valid encoding.

HDL-233 (warning) The encoding '%s' for state '%s' is a duplicate of state '%s'. This state name will not be saved.

DESCRIPTION

There were two states in your design with identical encodings. The second state name will not be saved.

WHAT NEXT

To avoid this warning, replace all references to the duplicate state name with the original state name and remove the definition for the duplicate state.

HDL-234 (warning) Design '%s' has multiple architectures defined.

The first architecture defined ("%s") will be used to build the design.

DESCRIPTION

VHDL allows you to define multiple architectures for one entity. When using the **read** command, however, only one design is built per entity. As a result, only the first architecture encountered is used.

WHAT NEXT

You can use the **analyze** or **elaborate** commands to build architectures other than the

first one defined in your design.

EXAMPLES

```
ENTITY A_VHDL IS
END ;

ARCHITECTURE DOIT OF A_VHDL IS
BEGIN
END ;

ARCHITECTURE DOIT AGAIN OF A_VHDL IS
BEGIN
END ;
```

EXAMPLE MESSAGE

Warning: Design 'A_VHDL' has multiple architectures defined.
The first architecture defined ('DOIT') will be
used to build the design. (HDL-234)

HDL-235 (error) Could not read 'gtech.db' in the libraries/syn directory.

DESCRIPTION

This error message indicates that your installation of the Synopsys tools has been corrupted. You need to reread "libraries/syn/gtech.db" from your Synopsys release tape.

WHAT NEXT

HDL-236 (warning) Non-constant case-item used in casex or casez.

HDL Compiler assumes the expression is never 'x' or 'z' %s

DESCRIPTION

This warning is not serious unless the expression used in the case-item may take the value 'x' or 'z'. HDL Compiler builds the logic of a casex or casez assuming the case-item expression will yield ones and zeros. Under simulation, when some bits of the expression are 'x' or 'z', they are ignored. This can generate a simulation/synthesis mismatch in the following example:

```

module e(a, z);
input a;
output z;
reg z;
wire ctl;
assign ctl = a ? 1'b0 : 1'bx;

always @(ctl) begin
casex(1'b1)
ctl: z = 1'b1;
default: z = 1'b0;
endcase
end
endmodule

```

Under simulation, when 'a' is false, 'ctl' is assigned 'x', and the first branch of the casex always fires making 'z' one.

Under synthesis, the 1'bx is treated as a dont-care, and ?: operation optimizes away leaving 'ctl' always equal to zero ('b' is left unconnected). Since 'ctl' never matches the case expression, the second branch always fires, making 'z' zero.

WHAT NEXT

If you know that the expression in the case-item is never 'x' or 'z', then you may ignore this warning.

You can eliminate the warning by omitting expressions from the case-items of casex and casez statements. If you need an expression as a case-item, use a regular case statement.

EXAMPLE MESSAGE

The code fragment above receives the following message:

Warning: Non-constant case-item used in casex or casez. HDL Compiler assumes the expression is never 'x' or 'z' in routine e line 10 in file 'b.v' (HDL-236)

HDL-240 (error) Pragma map_to_entity is not supported for procedures with INOUT ports.

Port '%s' is defined as an INOUT port '%s'.

DESCRIPTION

Pragma **map_to_entity** is not supported for procedures with IN/OUT ports. When a port is used as input and output at the same clock cycle, a combinational loop results.

Usually, in a circuit with an IN/OUT port, a control (switch) logic determines the

port's direction in each clock cycle. The use of IN/OUT ports implies multiple-cycle behavior of a procedure, and Synopsys does not support procedures with multiple-cycle behavior.

WHAT NEXT

Change the IN/OUT port to one IN port and one OUT port.

HDL-241 (error) Unable to resolve GTECH reference.

DESCRIPTION

This error message is issued following a LINK error message.

WHAT NEXT

See the LINK error message.

HDL-250 (error) Can not synthesize logic for assignment of UNKNOWN to identifier %s %s.

DESCRIPTION

There is no hardware device to produce an UNKNOWN signal. The UNKNOWN value is for simulation purpose only.

WHAT NEXT

Use '-- pragma translate off' and '-- pragma translate on' to direct the VHDL Compiler to skip this assignment.

HDL-260 (warning) The parameter '%s' is not a valid integer. Treated as uninitialized when using the get_attribute command.

DESCRIPTION

All parameters must be integers for instantiation. This parameter is treated as uninitialized when using the get_attribute command.

WHAT NEXT

Change the parameter to an integer within 32 bits.

HDL-270 (error) An unsupported expression is assigned to constant '%s' %s.

DESCRIPTION

Synopsys does not synthesize logic for HDL description in a constant declaration. All constants must be computable during HDL compilation. Therefore, the computation in constant declarations is restricted to operations of *integer* type. Moreover, arithmetic operations on integer constants greater than 32 bits is not supported.

WHAT NEXT

Cast constants to *integer* type if you need to perform an arithmetic operation in constant declaration. Otherwise, move the computation outside of constant declaration. For example, you can change the constant to a variable and perform the arithmetic operations on the variable. Note that computations on variables always produce logic.

HDL-272 (warning) Selector for MUX is always logic one - %s

DESCRIPTION

When one selector of a MUX is always one, the selected input is always being transferred to the output. Hence this input could override all other inputs. Such a situation could occur in Verilog if a *casex* statement is used and one of the conditions is *x* in all the bits. This is useful as a default condition, but should not be used along with Synopsys parallel-case directive.

WHAT NEXT

Designers should check their HDL descriptions to confirm their intention to have one selector of a MUX always be logic one. If such is not the intention, the designer should modify the HDL description.

HDL-281 (warning) Signal %s has the asynchronous set/reset attribute attached but not used

for set/reset in design '%s'.

DESCRIPTION

Check the condition used in branch constructs (for example, "if then else" case). If a branch has an asynchronous set/reset assignment, each variable appearing in the branch's conditional expression must have the asynchronous set/reset attribute. In nested branch constructs, the condition for the `else` branch includes negation for the `if` branch.

WHAT NEXT

HDL-282 (warning) Signal %s

has the synchronous set/reset attribute attached but not used for set/reset in design '%s'.

DESCRIPTION

Check the condition used in branch constructs (for example, "if then else" case) inside a clocked process. If a branch has a synchronous set/reset assignment, each variable appearing in the branch's conditional expression must have the synchronous set/reset attribute. In nested branch constructs, the condition for the `else` branch includes negation for the `if` branch.

WHAT NEXT

HDL-283 (warning) Signal '%s' has the asynchronous set/reset attribute

attached in process %s but not used for set/reset in that process.

DESCRIPTION

Check the condition used in branch constructs (for example, "if then else" case) inside a process. If a branch has an asynchronous set/reset assignment, each variable appearing in the branch's conditional expression must have the asynchronous set/reset attribute. In nested branch constructs, the condition for the `else` branch includes negation for the `if` branch.

WHAT NEXT

HDL-284 (warning) Signal '%s' has the synchronous set/reset attribute attached in process %s but not used for set/reset in that process.

DESCRIPTION

Check the condition used in branch constructs (for example, "if then else" case) inside the process. If a branch has a synchronous set/reset assignment, each variable appearing in its conditional expression must have the synchronous set/reset attribute. In nested branch constructs, the condition for the *else* branch includes the negation of that for the *if* branch.

WHAT NEXT

HDL-285 (error) Cannot find matching slave process '%s' for master process %s.

DESCRIPTION

Both master and slave processes must have labels. A master process must be attributed with the label of the slave process. Similarly, a slave process must be attributed with the label of the master process.

WHAT NEXT

Check the labels of master and slave processes, and make sure they match.

HDL-287 (warning) State output of master latch '%s' does not connect directly to input of slave latch '%s'.

Fail to infer master-slave latch.

DESCRIPTION

A pair of latches defined as a master-slave latch cannot be paired because the data input of the slave latch does not connect directly to the output of the master latch.

WHAT NEXT

HDL-288 (warning) Master latch '%s' and slave latch '%s' have independent asynchronous-clear controls.

Fail to infer master-slave latch.

DESCRIPTION

A pair of latches defined as a master-slave latch cannot be paired because their asynchronous set/reset conditions are not the same.

WHAT NEXT

HDL-289 (warning) Master latch '%s' and slave latch '%s' have independent asynchronous-set controls.

Fail to infer master-slave latch.

DESCRIPTION

A pair of latches defined as a master-slave latch cannot be paired because their asynchronous set conditions are not the same.

WHAT NEXT

HDL-290 (warning) Master latch '%s' and slave latch '%s' have independent asynchronous-clear/set controls.

Fail to infer master-slave latch.

DESCRIPTION

A pair of latches defined as a master-slave latch cannot be paired because their asynchronous set/reset conditions are not the same.

WHAT NEXT

HDL-291 (warning) State output of master flip-flop '%s' does not connect directly to input of slave flip-flop '%s'.
Or the input of slave flip-flop is driven by multiple sources including the state output of master flip-flop.
Fail to infer master-slave flip-flop.

DESCRIPTION

WHAT NEXT

HDL-292 (warning) Master flip-flop '%s' and slave flip-flop '%s' have independent asynchronous-clear controls.
Fail to infer master-slave flip-flop.

DESCRIPTION

A pair of flip-flops defined as a master-slave flip-flop cannot be paired because their asynchronous reset conditions are not the same.

WHAT NEXT

HDL-293 (warning) Master flip-flop '%s' and slave flip-flop '%s' have independent asynchronous-set controls.

Fail to infer master-slave flip-flop.

DESCRIPTION

A pair of flip-flops defined as a master-slave flip-flop cannot be paired because their asynchronous set conditions are not the same.

WHAT NEXT

HDL-294 (warning) Master flip-flop '%s' and slave flip-flop '%s' have independent asynchronous-load controls.
Fail to infer master-slave flip-flop.

DESCRIPTION

A pair of flip-flops defined as a master-slave flip-flop cannot be paired because their asynchronous data load conditions are not the same.

WHAT NEXT

HDL-295 (warning) Master flip-flop '%s' and slave flip-flop '%s' have different asynchronous data.
Fail to infer master-slave flip-flop.

DESCRIPTION

A pair of flip-flops defined as a master-slave flip-flop cannot be paired because they are loaded with different asynchronous data.

WHAT NEXT

HDL-296 (warning) Master flip-flop '%s' and slave flip-flop '%s' have independent asynchronous-clear/set controls.

Fail to infer master-slave flip-flop.

DESCRIPTION

A pair of flip-flops defined as a master-slave flip-flop cannot be paired because their asynchronous set/reset conditions are not the same.

WHAT NEXT

HDL-297 (warning) Slave flip-flop '%s' has synchronous-clear control,
cannot be merged with master flip-flop '%s'.
Fail to infer master-slave flip-flop.

DESCRIPTION

The only synchronous data loaded on the slave flip-flop must be the state output of the master flip-flop.

WHAT NEXT

HDL-298 (warning) Slave flip-flop '%s' has synchronous-set control,
cannot be merged with master flip-flop '%s'.
Fail to infer master-slave flip-flop.

DESCRIPTION

The only synchronous data loaded on the slave flip-flop must be the state output of the master flip-flop.

WHAT NEXT

HDL-299 (warning) Slave flip-flop '%s' has synchronous-toggle control,

cannot be merged with master flip-flop '%s'.
Fail to infer master-slave flip-flop.

DESCRIPTION

The only synchronous data loaded on the slave flip-flop must be the state output of the master flip-flop.

WHAT NEXT

HDL-300 (warning) State output of master cell '%s' drives nets in addition to the input of slave cell '%s'.
Fail to infer master-slave latch/flip-flop.

DESCRIPTION

Cannot tap off the internal state of a master-slave latch/flip-flop.

WHAT NEXT

HDL-301 (warning) Master latch '%s' cannot be merged with slave flip-flop '%s'.
Fail to infer master-slave latch/flip-flop.

DESCRIPTION

The pair of latches defined as a master-slave latch is not really a master-slave latch.

WHAT NEXT

HDL-302 (warning) Master flip-flop '%s' cannot be merged with slave latch '%s'.

Fail to infer master-slave latch/flip-flop.

DESCRIPTION

The pair of flip-flops defined as a master-slave flip-flop is not really a master-slave flip-flop.

WHAT NEXT

HDL-303 (warning) Master cell '%s' cannot find its matching slave cell.

Fail to infer master-slave latch/flip-flop.

DESCRIPTION

A latch (flop-flop) inferred in a master process does not directly drive any latch (flop-flop) in the matching slave process to form a master-slave latch (flip_flop).

WHAT NEXT

HDL-304 (warning) Slave cell '%s' cannot find its matching master cell.

Fail to infer master-slave latch/flip-flop.

DESCRIPTION

A latch (flop-flop) inferred in a slave process is not directly driven by any latch (flop-flop) in the matching master process to form a master-slave latch (flip-flop).

WHAT NEXT

HDL-305 (error) '%s' is not a port or variable/signal, cannot be used

for asynchronous set/reset control in process %s.

DESCRIPTION

The attributed asynchronous set/reset can be attached only to a port or a variable/signal.

WHAT NEXT

HDL-306 (error) '%s' is not a port or variable/signal, cannot be used
for synchronous set/reset control in process %s.

DESCRIPTION

The attributed synchronous set/reset can be attached only to a port or a variable/signal.

WHAT NEXT

HDL-307 (warning) Latch inferred in design '%s' read with
'hdlin_check_no_latch'.

DESCRIPTION

The variable *hdlin_check_no_latch* directs the **read** command to ensure no latch is inferred in the HDL file.

WHAT NEXT

HDL-308 (warning) One_hot/one_cold pragma containing '%s' and '%s'
is used to optimize set/reset condition for cell '%s'.
Make sure there is an assertion for this one_hot/one_cold

pragma.

DESCRIPTION

See VE-109 or VHDL-2252.

WHAT NEXT

HDL-309 (warning) Object '%s' appears in two one_hot directives.

The directive containing this object is ignored.

DESCRIPTION

You receive this message because, during **elaborate** or **read** command activity, the compiler has detected the same signal in the signal name list of two **one-hot** directives, which is invalid. A signal can appear only in the signal name list of one **one-hot** or one **one-cold** directive. Following is an example that illustrates this situation:

```
synopsys one_hot "s1, r1"      //signals s1 and s2 appear twice
synopsys one_hot "s2, r2"
synopsys one_hot "s1, s2"
```

WHAT NEXT

Correct the code so that no signal appears more than once in the signal name list of **one_hot** directives.

elaborate (2), **read** (2).

HDL-310 (warning) Object '%s' appears in two one_cold directives.

The directive containing this object is ignored.

DESCRIPTION

You receive this message because, during **elaborate** or **read** command activity, the compiler has detected the same signal in the signal name list of two **one-cold** directives, which is invalid. A signal can appear only in the signal name list of one **one-hot** or one **one-cold** directive. Following is an example that illustrates this

situation:

```
synopsys one_cold "s1, r1"      //signals s1 and s2 appear twice
synopsys one_cold "s2, r2"
synopsys one_cold "s1, s2"
```

WHAT NEXT

Correct the code so that no signal appears more than once in the signal name lists of **one_cold** directives.

elaborate (2), **read** (2).

HDL-311 (warning) Object '%s' appears in a **one_hot** directive and a **one_cold** directive.

The directive containing this object is ignored.

DESCRIPTION

You receive this message because, during **elaborate** or **read** command activity, the compiler has detected the same signal in the signal name list of a **one_hot** directive and a **one_cold** directive, which is invalid. A signal can appear only in the signal name list of one **one_hot** or one **one_cold** directive. Following is an example that illustrates this invalid situation:

```
synopsys one_hot "s1, r1"      //signals s1 and r1 appear twice
synopsys one_cold "s2, r2"
synopsys one_cold "s1, r1"
```

WHAT NEXT

When your code contains **one_hot** and **one_cold** directives, be sure that no signal appears more than once in the signal name list of both directives.

SEE ALSO

elaborate (2), **read** (2).

HDL-312 (warning) The design being compiled contains %d operations.

Because of the large search space, resource sharing may take a long time to complete. You might consider turning

resource sharing and resource implementation to area only.

DESCRIPTION

Because of the nature of the resource sharing problem, the search space grows quickly as the number of operations increase. When running in timing driven resource sharing mode, this results in a large number of calls to the timing verifier. As a result, this can cause very long run times.

WHAT NEXT

If you turn resource allocation and resource implementation to area only, the performance should increase significantly. This can be done either with the `hlo_resource_allocation` and `hlo_resource_implementation` variables, or it can be done with the `set_resource_allocation` and `set_resource_implementation` commands on a design by design basis (maybe included in an embedded script for the designs that you wish to run in area based mode).

HDL-320 (warning) Mismatch between simulation and synthesis may occur because of three-state value %s used %s.

DESCRIPTION

An HDL description similar to the following example may cause a mismatch between RTL simulation and a gate-level simulation of the netlist resulting from synthesis. Discrepancy for the value of 'W' may occur if in simulation cycle $t-1$ 'c1' is Logic1, and in simulation cycle t both 'c1' and 'c2' are Logic0.

```
if (c1)
    Q = high-impedance;
else if (c2)
    Q = d;
W = Q;
```

The HDL description in the next example may cause a mismatch between RTL simulation and gate-level simulation of the netlist resulting from synthesis. Discrepancy for the value of 'W' may occur if in simulation cycle $t-1$ both 'c1' and 'c3' are Logic1, and in simulation cycle t both 'c1' and 'c3' are Logic0.

```
if (c1)
    Q = high-impedance;
```

```

else if (c2)
    Q = d1;
else
    Q = d2;

if (c3)
    X = Q;

W = X;

```

WHAT NEXT

Separate the statement into two processes. One process assigns the three-state value and the other process reads the three-state value.

```

process 1

begin
    if (c1)
        Q = high-impedance;
    else if (c2)
        Q = d;
end

```

```
process 2
```

```

begin
    W = Q;
end

```

**HDL-321 (error) Assignment to loop index '%s' is beyond synthesis policy
%s.**

DESCRIPTION

An HDL description similar to the following example is beyond synthesis policy.

```

for (i = 0; i<loop_max; i = i + 1)
begin

```

```
...
    i = loop_max; // exit the loop
...
end
```

WHAT NEXT

Use "disable" statement to exit a loop.

```
begin : my_loop
  for (i = 0; i<loop_max; i = i + 1)
    begin
      ...
      disable my_loop; // exit the loop
      ...
    end
  end
```

HDL-322 (error) Bad bus_naming_style variable '%s' used.

DESCRIPTION

The bus_naming_style variable has been incorrectly defined. It should be of the type "%s_%d".

WHAT NEXT

Define the variable to be something like "%s_%d", or dont define it all and the default will be used.

HDL-325 (error) Constant propagation on constant larger than 32 bits is not supported %s.

DESCRIPTION

Synopsys does not support constant propagation on a constant larger than 32 bits. This error occurs when a constant needs to be expanded to a value greater than 32 bits.

In the following example, constant 'h100 needs to be expanded to 64 bits

```
wire [63:0] sum;  
assign sum = 127 + 'h100;
```

WHAT NEXT

Use a temporary variable within 32 bits range, such as in the following example:

```
wire [31:0] temp;  
wire [63:0] sum;  
  
assign temp = 127 + 'h100;  
assign sum = temp;
```

HDL-326 (error) Enumeration type defined in a generate statement is not supported %s.

DESCRIPTION

Synopsys does not support enumeration type definition in a VHDL generate statement.

In the following example, the type definition of *STATE_TYPE* is not supported.

```
architecture a of e is  
begin  
    G: for copy in 0 to 1 generate  
        P : process  
            type STATE_TYPE is (S1, S2);  
            variable state : STATE_TYPE;  
        begin  
            if (c = '1') then  
                state := S1;  
            else  
                state := S2;  
            end if;  
        end process P;  
    end generate G;  
end a;
```

WHAT NEXT

Move the type definition from the generate statement to the architecture declaration

region, as in the following example:

```
architecture a of e is
type STATE_TYPE is (S1, S2); -- new location
begin
  G: for copy in 0 to 1 generate
    P : process
      variable state : STATE_TYPE;
    begin
      if (c = '1') then
        state := S1;
      else
        state := S2;
      end if;
    end process P;
  end generate G;
end a;
```

HDL-327 (error) Connection to instance port %s is too wide %s.

DESCRIPTION

In the following example, the signal *temp_out* connected to the port *Y* is too wide when represented in hardware.

```
architecture A of E is
component C1
  port (A : integer range 0 to 15;
        Y : integer range 0 to 15);
end component;
signal temp_in : integer range 0 to 15;
signal temp_out : integer range 0 to 31;
begin
U1: C1 port map (A => temp_in, Y => temp_out);
end A;
```

WHAT NEXT

Define a temporary signal/variable with the proper bit width.

```
architecture A of E is
component C1
  port (A : integer range 0 to 15;
        Y : integer range 0 to 15);
end component;
signal temp_in : integer range 0 to 15;
signal temp_out : integer range 0 to 31;
```

```

signal temp : integer range 0 to 15;
begin
temp_out <= temp;
U1: C1 port map (A => temp_in, Y => temp);
end A;

```

HDL-328 (error) Connection to instance port %s is too narrow %s.

DESCRIPTION

In the following example, the signal *temp_out* connected to the port *Y* is too narrow when represented in hardware.

```

architecture A of E is
component C1
    port (A : integer range 0 to 15;
          Y : integer range 0 to 31);
end component;
signal temp_in : integer range 0 to 15;
signal temp_out : integer range 0 to 15;
begin
U1: C1 port map (A => temp_in, Y => temp_out);
end A;

```

WHAT NEXT

Define a temporary signal/variable with the proper bit width.

```

architecture A of E is
component C1
    port (A : integer range 0 to 15;
          Y : integer range 0 to 31);
end component;
signal temp_in : integer range 0 to 15;
signal temp_out : integer range 0 to 15;
signal temp : integer range 0 to 31;
begin
temp_out <= temp;
U1: C1 port map (A => temp_in, Y => temp);
end A;

```

HDL-330 (error) Port name '%s' mismatches names of synthetic operator %s.

DESCRIPTION

The formal parameter names of the subprogram do not match those of the synthetic operator defined by the **map_to_operator** pragma.

WHAT NEXT

When using **map_to_operator**, make sure the formal parameter names of the subprogram matches those of the synthetic operator defined by the **map_to_operator** pragma. The match is also case-sensitive.

To check the port names of a synthetic operator, use the **report_synlib** command.

For example:

```
dc_shell> read standard.sldb
dc_shell> report_synlib standard.sldb
```

```
*****
Report : library
Library: standard.sldb
Version: v3.1a
Date   : Wed Jun 29 06:50:37 2001
*****
```

```
Library Type      : Synthetic
Tool Created     : v3.1a
Date Created     : Dec. 16, 1776
Library Version  : 3.1
```

Operators:

Operator	Ports	Dir
<hr/>		
ADD_TC_CI_OP	A	in
	B	in
	CI	in
	Z	out
ADD_TC_OP	A	in
	B	in
	Z	out
. . .		

HDL-350 (error) %s

in parsing parameter value: %s for parameter '%s'

DESCRIPTION

The parameter value is not acceptable in this particular context. The usual cause is a syntax error, value of incorrect type, or value out of bounds.

You may also find that the value being parsed is either shorter or longer than you expect. Perhaps the value reported above was intended to represent two values. In this case, make sure that you separate your parameter values by commas, and make sure that your parentheses and quotes match.

WHAT NEXT

Check the expected parameter type and syntax carefully.

HDL-351 (error) Specified value: %s for parameter '%s' has improperly sized array elements

DESCRIPTION

A value was specified for an unconstrained array, but the value is not legal because the number of bits is not a multiple of the array element size.

WHAT NEXT

You must specify a number of bits that is a multiple of the array element size.

HDL-352 (error) Specified value: %s for parameter '%s' is not the correct size

DESCRIPTION

The value specified is not legal because it is too large or too small for the parameter's type.

WHAT NEXT

You must specify a number of bits that exactly fits the type.

HDL-353 (error) Can't find type information for type '%s'.

DESCRIPTION

This message indicates that the type is not in VHDL standard package.

WHAT NEXT

You can change the types of the generic parameters to use types in the VHDL standard package.

HDL-354 (error) Can't find directory '%s'.

DESCRIPTION

The directory cannot be accessed. It either does not exist or is protected.

WHAT NEXT

Check the value of the dc_shell variable that sets the path to the directory.

HDL-360 (warning) The variable hdlin_files is not supported for releases later than v3.3b.

DESCRIPTION

This warning occurs when the hdlin_files variable is used. This variable is supported for v3.3a and v3.3b but not for subsequent releases. Please refer to the WHAT NEXT section below for the solution.

WHAT NEXT

The variable **hdlin_files** specifies a list of file pathnames to be used by the **read -format vhdl** or **read -format verilog** commands. The files specified in **hdlin_files** are read before files specified in the **read command**. This variable is normally used to list VHDL source files that contain packages used by the **current_design**.

Instead of using **hdlin_files**, use the **analyze** command to analyze any packages currently specified in **hdlin_files**. The **analyze** command is a better solution for the following reasons:

1. You can analyze packages to different design libraries via the **-w** option of **analyze**.

2. When **analyze** is used, packages are not analyzed multiple times, thereby saving time. Any VHDL packages listed in **hdlin_files** are input each time a design is read that uses the package.

HDL-361 (warning) The variable `hdlin_source_to_gates_mode` is obsolete with v3.3a.

DESCRIPTION

This warning occurs when the `hdlin_source_to_gates_mode` variable is used. This variable is obsolete with v3.3a.

WHAT NEXT

Remove this variable from your script to disable this warning message.

HDL-362 (error) Can't find design for cell '%s' on line %d in '%s'.

DESCRIPTION

The design symbol corresponding to the cell's reference can not be found in the symbol table. This may happen if you are using pragmas or synopsys directives, ie. `translate_on/off` or `synthesis_on/off`.

WHAT NEXT

Check the pragmas or synopsys directives for typos.

HDL-370 (warning) You are using the `full_case` directive with a case statement in which not all cases are covered.

DESCRIPTION

HDL Compiler assumes that all the conditions which are not covered cannot occur in practice. This means that these conditions are treated as don't cares, which may result in mismatches between synthesis and simulation. Following is an example that will result in this mismatch:

```
module test (a, b, c, d);  
input a, c, d;
```

```

output    b;
reg      b;

always @( a or d or c)
begin
  case (a)
    1'b0: b = d;
  endcase
  case (a) // synopsys full_case
    1'b1: b = c;
  endcase
end

endmodule

```

The second case statement is indicated as a full case, but the case when $a = 1'b0$ is not covered. This means that this condition can never occur, so HDL Compiler treats it as a don't care condition. As a result, the first case statement becomes redundant and is optimized out.

The compiler assumes that all the conditions which are not covered cannot occur in practice. This means that these conditions are treated as don't cares which may affect the logic generated by other statements.

WHAT NEXT

Specify all the possible branches in the case statement, if you want to avoid a simulation mismatch.

HDL-371 (warning) You are using the parallel_case directive with a case statement in which some case-items may overlap.

DESCRIPTION

There is more than one case-item that evaluates to true in the case statement with the **parallel_case** directive. This may lead to logic which is not the same as the simulated description. The use of the parallel_case directive under these circumstances is discouraged. Following is an example of this:

```

module test (c[1:0],y);
input [1:0] c;
output y;
reg y;

always@(c)
begin
  case {c[1:0]} //synopsys parallel_case
    2'b1x: y = 0;
    2'bx1: y = 1;
  endcase
end

```

```
end  
endmodule
```

For this case statement, if $c = 2'b11$, $y = 0$ in simulation, but in synthesis both case-items are executed, so $y = 1$. For the condition $c = 2'b11$, HDL Compiler assumes the output is a don't care.

WHAT NEXT

Rewrite the conditions of this case statement in such a way that the different branches do not overlap any more, or don't use the **parallel_case** directive.

HDL-380 (warning) No MUX_OP inferred for the case %s because it might lose the benefit of resource sharing.

DESCRIPTION

The variable **hdlin_dont_infer_mux_for_resource_sharing** is set to true causing this MUX_OP not to be inferred. This MUX_OP is connected to two or more synthetic operators, which can not be shared by a MUX_OP. (They might be sharable otherwise.)

WHAT NEXT

Set **hdlin_dont_infer_mux_for_resource_sharing** to false, or re-write the case statement as to not share synthetic operators.

HDL-381 (warning) A MUX_OP has been inferred for the case %s which may possibly lose the benefit of resource sharing.

DESCRIPTION

The variable **hdlin_dont_infer_mux_for_resource_sharing** is set to false and a MUX_OP was inferred for a case statement that has two or more synthetic operators.

WHAT NEXT

Set **hdlin_dont_infer_mux_for_resource_sharing** to true, or don't infer a MUX_OP for this case statement.

HDL-382 (warning) A MUX_OP has been inferred for the case

%s which has either a default clause or an incomplete mapping.

DESCRIPTION

A MUX_OP has been inferred for a case statement that has an incomplete specification. Because MUX_OP's are hierarchical (the logic is in a separate level of hierarchy), this may result in a nonoptimal design.

The following five "case" statement coding styles result in this message:

1. Default branch A default branch refers to an "others" statement in a VHDL "case" statement or a "default" statement in a Verilog "case" statement. When a default branch covers more than one possible value, the inputs to the inferred MUX_OP are duplicated for the branches that are not covered in the "case" statement. The logic could be more optimal if a MUX_OP was not inferred. Following are examples of "case" statements that contain default branches covering more than one possible value:

Verilog

```
case (SEL)
  2'b00: DOUT = DIN[0];
  2'b01: DOUT = DIN[1];
  default: DOUT = DIN[2]; // covers 2'b10 and 2'b11 branches
endcase
```

VHDL

```
case SEL is
  when "00" => DOUT <= DIN(0);
  when "01" => DOUT <= DIN(1);
  when others => DOUT <= DIN(2); -- covers "10" and "11" branches
end case;
```

2. Missing case branches Missing branches in a "case" statement in Verilog (all "case" statements need to be completely specified in VHDL) result in duplicate inputs to the inferred MUX_OP since all branches of the "case" statement are enumerated. If a MUX_OP is not inferred, the logic can be optimized. This is also true if the "case" statement uses the Synopsys "full_case" directive. Following is an example:

Verilog

```
case (SEL)                                case (SEL) //synopsys full_case
  2'b00: DOUT <= DIN[0];  2'b00: DOUT <= DIN[0];
  2'b01: DOUT <= DIN[1];  OR  2'b01: DOUT <= DIN[1];
  2'b10: DOUT <= DIN[2];  2'b10: DOUT <= DIN[2];
endcase                                     endcase
```

3. Missing assignments Similar to missing "case" branches, missing assignments in a "case" statement branch result in duplicate inputs to the inferred MUX_OP. If a MUX_OP is not inferred, the logic can be optimized. Following are examples of "case" statements with missing assignments that result in the HDL-382 message. These

examples infer two MUX_OPs, one for the output DOUT and one for DOUT2. Notice, an assignment to DOUT is missing in one of the branches, which results in the HDL-382 message.

Verilog

```
-----
case (SEL)
 2'b00: begin
    DOUT = DIN[0];
    DOUT2 = DIN[0];
  end
 2'b01: begin
    DOUT = DIN[1];
    DOUT2 = DIN[1];
  end
 2'b10: DOUT2 = DIN[2]; // Missing assignment to DOUT
 2'b11: begin
    DOUT = DIN[0];
    DOUT2 = DIN[0];
  end
endcase
```

VHDL

```
-----
case SEL is
  when "00" => DOUT <= DIN(0);
                 DOUT2 <= DIN(0);
  when "01" => DOUT <= DIN(1);
                 DOUT2 <= DIN(1);
  when "10" => DOUT2 <= DIN(2); -- Missing assignment to DOUT
  when "11" => DOUT <= DIN(0);
                 DOUT2 <= DIN(0)
  when others => DOUT <= DIN(2);
                 DOUT2 <= DIN(2);
end case;
```

4. Use of "dont_cares" The use of "dont_cares" ("x") in a "case" statement branch results in duplicate inputs to the inferred MUX_OP. If a MUX_OP is not inferred, the logic can be optimized. Following are examples of "case" statements that result in this message:

Verilog

```
-----
case (SEL)          case (SEL)
 2'b00: DOUT = DIN[0]; 2'b00: DOUT = DIN[0];
 2'b0x: DOUT = DIN[1];   OR 2'b01: DOUT = DIN[1];
 2'b10: DOUT = DIN[2]; 2'b10: DOUT = 1'bx;
 2'b11: DOUT = DIN[0]; 2'b11: DOUT = DIN[0];
endcase           endcase
```

VHDL

```
-----
case SEL is
  when "00" => DOUT <= DIN(0);
```

```

when "0X" => DOUT <= DIN(1);
when "10" => DOUT <= DIN(2);
when "1X" => DOUT <= DIN(0);
when others => DOUT <= DIN(2);
end case;

```

5. Nested conditionals Nested conditionals refer to "if" statements inside "case" statements and "case" statements inside "case" statements ("case" statements inside "if" statements are not supported for MUX_OP inference). The inner "if" or "case" condition becomes one of the select lines to the MUX_OP, so data inputs to the MUX_OP are duplicated to size the MUX_OP according to the number of select lines. The logic could be more optimal if MUX_OPs were not inferred for nested conditionals. Following are examples of "if" statements nested in "case" statements:

Verilog

```

-----
case (SEL)
  2'b00: DOUT <= DIN[0];
  2'b01:
if (DIN[0])
  DOUT <= DIN[1];
else
  DOUT <= DIN[0];
  2'b10: DOUT <= DIN[2];
  2'b11: DOUT <= DIN[0];
endcase

```

VHDL

```

-----
case SEL is
  when "00" => DOUT <= DIN(0);
  when "01" =>
if (DIN(0) = '1') then
  DOUT <= DIN(1);
else
  DOUT <= DIN(0);
end if;
  when "10" => DOUT <= DIN(2);
  when "11" => DOUT <= DIN(0);
  when others => DOUT <= DIN(2);
end case;

```

WHAT NEXT

Don't infer a MUX_OP for this "case" statement.

HDL-383 (warning) A MUX_OP was not inferred for the case %s because its branching factor of %d is greater than

hdlin_mux_size_limit.

DESCRIPTION

A attempt to infer a MUX_OP from a case statement with a branching factor larger than **hdlin_mux_size_limit** was attempted. This is usually the result of nested if or case statements with disjoint supports. It is best to not infer a MUX_OP in these situations, for then the optimizer will be able to effectivly optimize the assignments.

WHAT NEXT

Increase **hdlin_mux_size_limit**, rewrite the case statement to avoid the large branching factor, or do not infer a MUX_OP.

HDL-384 (warning) A MUX_OP for the case %s was not inferred because the variable hdlin_infer_mux was set to "none."

DESCRIPTION

A **hdlin_infer_mux** setting of "none" will override a local **infer_mux** attribute.

WHAT NEXT

Set **hdlin_infer_mux** to "all" or "default."

HDL-385 (warning) A MUX_OP for the case %s was inferred because the variable hdlin_infer_mux was set to "all."

DESCRIPTION

A **hdlin_infer_mux** setting of "al" will infer a MUX_OP for every possible case statement.

WHAT NEXT

Set **hdlin_infer_mux** to "none" or "default" and use the **infer_mux** directive when necessary.

HDL-386 (error) Number of enumeration encoding values does

not match the number of enumeration values.

DESCRIPTION

The number of enumeration encoding values defined via the ENUM_ENCODING attribute must match the number of enumeration values for the type.

WHAT NEXT

Modify the number of enumeration or enumeration attribute values.

HDL-387 (error) Can't redefine reference named '%s' %s

DESCRIPTION

Certain invalid arguments (like a wire or function name) to pragma **map_to_module** can trigger this error message. The **map_to_module** pragma requires a module or component name as its argument. The following VHDL code demonstrates the problem:

```
function FUNC; //synopsys map_to_module FUNC //synopsys return_port_name DBUS input  
DBUS;  
  
FUNC = DBUS; endfunction
```

WHAT NEXT

Supply a module name or component name to the appropriate **map_to_module** pragma.

HDL-388 (error) Can't find declarative scope for component '%s'

DESCRIPTION

It can happen if the use clause for the package in which the component is declared is surrounded by a synthesis off/on pair

WHAT NEXT

Either remove the synthesis off/on pair enclosing the use clause or do not instantiate the component

HDL-389 (warning) The following design name is very long:

'%S'

DESCRIPTION

This message is issued when a design name exceeds 64 characters. Long design names may be a problem for external downstream tools.

If the design contains parameters (generics), the design name is generated automatically based on the following variable settings:

- template_naming_style
- template_parameter_style
- template_separator_style

WHAT NEXT

If the design name was generated automatically, modify one or more of the variables listed above to reduce its length.

HDL-390 (warning) Statement not accelerated: Line %d, %s

DESCRIPTION

This statement contains HDL constructs that are outside of the "turbo" subset. The statement cannot be accelerated and may result in excessive run time to elaborate the containing module.

WHAT NEXT

Refer to the "turbo" subset document to determine what prevents the statement from being accelerated. Modify the HDL code to adhere to the "turbo" subset.

HDL-391 (error) Naming clash with %s

DESCRIPTION

This error occurs when a net has the same name as an other object in your design (net, instance, etc).

WHAT NEXT

Generally, the culprit is in the bus_naming_style. Choosing a poor bus_naming_style can cause this error: bus_naming_style=%s%d is problematic. Try the default bus_naming_style=%s_%d instead.

HDL-392 (error) Combinational loop found on a sequential element pin (net; %s).

DESCRIPTION

This error occurs when a net coming from (or getting to) a sequential element contains a loop.

WHAT NEXT

Typically, this error signals that some simulation statements remain in the HDL code. For example:

```
CLK <= not CLK after 10 ns; process(CLK) begin if CLK'event and CLK='1' then B <= A;  
end if; end process;
```

will create a loop on the CLK net. The simulation-only statements should be isolated with synthesis_on and off directives, like in:

```
-- synopsys synthesis_off CLK <= not CLK after 10 ns; -- synopsys synthesis_on
```

HDL-393 (warning) A MUX_OP was not inferred for the case %s because the ratio of MUX_OP data inputs to unique data inputs is %d, which exceeds the hdlin_mux_oversize_ratio.

DESCRIPTION

A MUX_OP was not inferred for a case statement that had too few unique assignments, as this may have negatively affected elaboration time and quality of results. This

situation arises when many assignments of a case statement are missing or identical. Discrete logic may be more desirable than a MUX_OP.

For a more detailed description of incompletely specified case statements, see HDL-382.

WHAT NEXT

Don't infer a MUX_OP for this "case" statement.

**HDL-394 (warning) Unconditional concurrent assignment to tristate value %s,
may not result in hardware.**

DESCRIPTION

The following example shows an unconditional concurrent assignment to tristate value in Verilog.

```
module e(m);
output m;
assign m = 1'bz;
endmodule
```

The following example shows an unconditional concurrent assignment to tristate value in VHDL.

```
library IEEE;
use IEEE.std_logic_1164.all;

entity E is
    port(m : out std_logic);
end E;

architecture A of E is
begin
    m <= 'Z' ;
end A;
```

Since the output port 'm' is always driven to tristate value, HDL Compiler will leave the port unconnected.

EXAMPLE MESSAGE

Warning: Unconditional concurrent assignment to tristate
in routine e line 6 in file 'b.v',
may not result in hardware. (HDL-394)

HDL-395 (warning) The statement %s, is never reached.

DESCRIPTION

HDL Compiler will automatically eliminate unreachable statements.

The following example shows an unreachable statement in Verilog. The statement: 'out1=in2' is never reached. This is because the first condition '(c1 | c2)' will always be true when the condition '(c1 & c2)' is true. Conversely, if '(c1 | c2)' is false, '(c1 & c2)' has to be false.

```
module foo(in1, in2, in3, c1, c2, out1);
input in1, in2, in3, c1, c2;
output out1;
reg out1;

always @(in1 or in2 or in3 or c1 or c2)
begin
if (c1 | c2)
out1=in1;
else if (c1 & c2)
out1=in2;
else
out1=in3;
end
endmodule
```

The following example shows an unreachable statement in VHDL. The statement: 'out1 <= in2' is never reached. This is because the first condition '(c1 or c2)' will always be true when the condition '(c1 and c2)' is true. Conversely, if '(c1 or c2)' is false, '(c1 and c2)' has to be false.

```
entity foo is
    port( in1, in2, in3 : in bit ;
          c1, c2      : in boolean ;
          out1       : out bit );
end foo;

architecture bar of foo is
begin
    process ( in1, in2, in3, c1, c2 )
    begin
        if (c1 or c2) then
            out1 <= in1;
        else
            if (c1 and c2) then
                out1 <= in2;
            else
                out1 <= in3;
            end if;
        end if;
    end process;
```

```
end bar;
```

EXAMPLE MESSAGE

Warning: The statement in routine e line 6 in file 'b.v',
is never reached. (HDL-395)

HDL-396 (warning) The flip-flop/latch %s, has asynchronous feedback.

this feedback will not be removed.

DESCRIPTION

HDL Compiler does not remove the feedbacks for latches or the asynchronous feedbacks for latches.

The following examples illustrate the cases mentioned above. The first has latch whose output is being fed back in its input

```
module foo(in1,c1, c2, out1);
input in1,c1, c2;
output out1;
reg out1;

always @(in1 or c1 or c2)
begin
if (c1)
out1=in1;
else if (c2)
out1=out1; // This statement results in a feedback in the latch
end
endmodule
```

The second example shows a flip-flop which has an asynchronous feedback

```
module foo(in1,c1, clk, out1);
input in1,c1, clk;
output out1;
reg out1;

always @(posedge clk or posedge reset)
begin
if (reset)
out1=out1 // This statement results in a feedback in the latch;
else
out1=in1;
end
endmodule
```

HDL-397 (warning) A feedback loop found at buffer or inverter '%s'

DESCRIPTION

This error is issued when some buffers or inverters form a combinational feedback loop in boundary logic. For example, the following Verilog description is invalid because the CLK input of the flip-flop has a feedback loop.

```
CLK = ~CLK;
always@(posedge CLK)
begin
    Q = D;
end
```

WHAT NEXT

Check the HDL description and remove the combinational feedback loop.

HDL-398 (error) Loop index %s is not initialized %s

DESCRIPTION

A loop index is used under one set of conditions, but remains uninitialized when used under another set of conditions. This can happen when moving code from a for loop in one "if" branch into the "else" branch.

Once a variable is used as a loop iterator, it is handled as a "loop index" for the rest of its scope.

WHAT NEXT

The most likely cause is code moved outside a for loop. In this situation, the for loop probably needs to be duplicated in both places to properly initialize the loop index.

HDL-399 (warning) NUMERIC_STD.STD_MATCH: L'LENGTH /= R'LENGTH, returning FALSE "%s"

DESCRIPTION

This message indicates that parameters to STD_MATCH have different lengths. Result will be FALSE.

WHAT NEXT

HDL-400 (warning) Clock signal is not in the sensitivity list. "%s

DESCRIPTION

This message indicates that clock signal is not in the sensitivity list which could cause a simulation and synthesis mismatch.

WHAT NEXT

HDL-401 (warning) The mode selected for resource implementation

is use_fastest. The mode selected for resource allocation is either none or area_only. If timing constraints are not met, the fastest possible implementation will initially be selected for each resource. If you know that timing will be met with the smallest

implementations it might save CPU time to set resource implementation to area_only.

DESCRIPTION

The current settings for resource allocation is not constraint-driven, while the resource implementation is set to use_fastest. If timing constraints are not met during the high level optimization phase, the selection of the largest implementation may cost additional CPU time.

WHAT NEXT

If you do not want the fastest implementation to be selected set resource implementation to area_only.

HDL-402 (error) No implementation is available for module %s.

DESCRIPTION

Each synthetic library module (e.g. DW01_add) needs at least one implementation (e.g. rpl) to be usable for synthesis. In this particular case no implementation is available for one module. Possible reasons for this are: dont_use statements have forbidden the use of all implementations that are in the synthetic library or the synthetic library itself is incomplete.

WHAT NEXT

Check dont_use statements in your dc_shell scripts or look at your synthetic library source code, if you are using your own synthetic library.

HDL-403 (error) You cannot use a "for" loop iterator that is more than 32 bits wide.

DESCRIPTION

You receive this message if the **read** or elaborate command detects a "for" loop iterator more than 32 bits wide; these are not currently supported.

WHAT NEXT

Redefine the "for" loop iterator to have a width of 32 bits or fewer, and re-execute the command.

SEE ALSO

elaborate (2), **read** (2).

HDL-404 (error) You cannot use a duplicate count of 0.

DESCRIPTION

You receive this message if the **read** or **elaborate** command detects a duplicate count of 0 (for example, {0{a}}). Duplicate counts of 0 are not supported.

WHAT NEXT

Remove the duplicate operator that has the 0 duplicate count, and re-execute the

command.

SEE ALSO

elaborate (2), **read** (2).

HDL-405 (warning) Local variable %s define %s is being read before it is fully assigned

DESCRIPTION

You receive this message if the **read** or **elaborate** command detects that a local variable may be read before it is assigned. The variable might be local to a sequential block or to a subroutine. An initial value of 0 is assigned to all the uninitialized local variables.

WHAT NEXT

Initialize the local variable.

SEE ALSO

elaborate (2), **read** (2).

HDL-406 (error) Potential overflow which may cause synthesis and simulation mismatch %s

DESCRIPTION

You receive this error message because the HDL Compiler detects a potential overflow in the exponent operator of the expression.

For example, an integer overflow occurs if temp is 0 in the expression $2^{** (31 - \text{tmp})}$.

WHAT NEXT

Remove the overflow exponent from the expression.

SEE ALSO

elaborate (2).

HDL-407 (warning) Potential overflow which may cause synthesis and simulation mismatch %s

DESCRIPTION

You receive this warning message because the HDL Compiler detects a potential overflow in the exponent operator of the expression.

For example, an integer overflow occurs if tmp is 0 in the expression `2 ** (31 - tmp)`.

WHAT NEXT

No action is required on your part. However, you can remove the overflow exponent from the expression.

SEE ALSO

`elaborate (2)`.

HDL-410 (warning) The design being compiled contains %d operations. Because of the large search space, resource sharing

may take a long time to complete. You might consider turning resource allocation to area only.

DESCRIPTION

Because of the nature of the resource sharing problem, the search space grows quickly as the number of operations increases. When running in timing driven resource allocation mode, this results in a large number of calls to the timing verifier. As a result, this can cause very long run times.

WHAT NEXT

If you turn resource allocation to area only, the performance should increase significantly. This can be done either with the `hlo_resource_allocation` variable, or it can be done with the `set_resource_allocation` command on a design by design basis (maybe included in an embedded script for the designs that you wish to run in area based mode).

HDL-411 (warning) The design being compiled contains %d operations. Because of the large search space, resource implementation may take a long time to complete. You might consider turning resource implementation to area only.

DESCRIPTION

Because of the nature of the resource implementation problem, the search space grows quickly as the number of operations increases. When running in timing driven resource implementation mode, this results in a large number of calls to the timing verifier. As a result, this can cause very long run times.

WHAT NEXT

If you turn resource implementation to area only, the performance should increase significantly. This can be done either with the `hlo_resource_implementation` variable, or it can be done with the `set_resource_implementation` command on a design by design basis (maybe included in an embedded script for the designs that you wish to run in area based mode).

HDL-412 (error) HDL Compiler does not support local register declarations.

DESCRIPTION

You receive this error message because the HDL Compiler does not support register declarations within sequential blocks.

The Presto HDL Compiler handles register declarations within sequential blocks.

Set `hdlin_enable_presto` to `true` to use the Presto HDL Compiler.

WHAT NEXT

Either use the Presto HDL Compiler, or recode your design to use module-scope registers instead of locally declared registers.

SEE ALSO

`hdlin_enable_presto(3)`.

HDL-413 (information) HDL directives for resource sharing/implementation are ignored.

DESCRIPTION

The support to do resource sharing/implementation as per manual HDL directives is discontinued since the tool can make better choice with the knowledge of design context.

`map_to_module`, `implementation` and `resource sharing` directives specified using OPS attribute will be ignored.

Implementation specified for synthetic operators using `set_implementation` **is also ignored**.

WHAT NEXT

Contact your Synopsys support representative.

HDLA

HDLA-1 (error) Design '%s' does not contain HDL analysis information.

DESCRIPTION

Either of the following cases may apply :

- Your top Verilog HDL or VHDL design was not input using `dc_shell` with `hdlin_enable_analysis_info` or `bc_enable_analysis_info` set to true.
- The `read` or `analyze` command encountered an error in your Verilog HDL or VHDL source file. HDL analysis information is not generated for subsequent designs.
- The program may have found the design in another design file that doesn't contain HDL analysis information.
Check your `search_path` variable to ensure that the design loaded by the program is the one you expected.

WHAT NEXT

Fix your syntax errors and use `dc_shell` to `read/analyze` your HDL source files and regenerate the GTECH design.

HDLA-2 (error) Errors detected while linking '%s' to '%s'.

DESCRIPTION

The GTECH library, 'gtech.db', is not in the given search path.

WHAT NEXT

Ensure that the GTECH library, 'gtech.db', can be found in the search path.

HDLA-3 (warning) Errors detected while linking '%s' to '%s'.

DESCRIPTION

The program is unable to find a design in the given technology-mapped design file(s) or technology library that correspond to instantiations of that design in higher levels of the design hierarchy.

Information about the design or its instantiations in the technology-mapped design is unavailable.

WHAT NEXT

Ensure that the mapped design files or technology library specified are the same ones generated or used in linking the design. These files are specified using the project variables **gtech_db_files**, **mapped_db_files**, and **link_library**. The directories for these files are specified in the **search_path** variable.

To ensure that you have correctly linked the design, load the design into **dc_shell**, and execute the **link** command from the top level of the design.

HDLA-4 (warning) Port '%s' of GTECH design '%s' is not found in the mapped design.

DESCRIPTION

This message was generated because a port in the GTECH design does not have an equivalent in the mapped design.

This can happen if any of the following is true:

1. The GTECH and mapped design files contain different designs.
2. The bus naming style used in generating the GTECH design file differs from that used in generating the technology-mapped design file.
3. A **group** or **ungroup** command was performed on the designs in one design file and not the other.
4. A **change_names** command was executed on the designs in one design file and not the other.

WHAT NEXT

In general, ensure that any commands that can change the names or the hierarchical

structure of the design are performed on both design files in the same relative order.

For the previous situations in particular, try the following:

1. Check the design files to ensure that they describe the same designs.
2. Define the **bus_naming_style** variable to be similar to "%s_%d" or allow the default to be used. In either case, ensure that the same variable is used to generate both design files.
3. Perform the **group** or **ungroup** command on both design files in the same relative order.
4. Perform the **change_names** command on both design files in the same relative order.

HDLA-5 (error) Design '%s' is multiply defined.

DESCRIPTION

The design exists in more than one design file.

WHAT NEXT

Check the design files to ensure that a design only occurs once.

HDLA-6 (error) Can't find instance '%s' in design '%s'.

DESCRIPTION

An instance in the GTECH design could not be found in the technology mapped design.

WHAT NEXT

Use *dc_shell* to *read/analyze* the HDL source files and *compile* the top level design to generate a new technology mapped design.

HDLA-7 (error) Design '%s' contains repeated instances.

Please use the uniquify or set_dont_touch commands on them.

DESCRIPTION

This message indicates that repeated instances exist in your design. Your design must not contain repeated instances that are indistinguishable from each other.

When a design is used (instantiated) more than once in a design, you must use the **dc_shell** commands **uniquify** or **set_dont_touch** on the instances.

WHAT NEXT

Use one of the three following strategies to address this issue:

- 1) Load your design into *dc_shell*, link it, and issue the **uniquify** command on the top-level design.
- 2) Use the **set_dont_touch** command on all repeated instances (places where the same design is instantiated more than once).
- 3) Modify your design so that it contains no repeated instances.

For more information, refer to the **uniquify**, and **set_dont_touch** manual pages.

HDLA-8 (error) Can't find design '%s'.

DESCRIPTION

The design cannot be found in the GTECH design file(s).

WHAT NEXT

Ensure that design exists in the HDL source and that it is spelled correctly in the project file as the value of the **top_design_name** variable.

HDLA-9 (warning) The GTECH design %s does not have HDL analysis information.

DESCRIPTION

This message indicates that the **elaborate** command was used on .syn files that were created by **analyze** in either **dc_shell** or **design_analyzer** with either **hdlin_enable_analysis_info** or **bc_enable_analysis_info** set to false. To view **analyze** in either **dc_shell** or **design_analyzer**, but not in **ha_shell**. In HDL Advisor, to view

links between the GTECH design files and HDL source design files, the design must be both analyzed and elaborated in with these variables set to true.

WHAT NEXT

Set **hdlin_enable_analysis_info** or **bc_enable_analysis_info** to true and input the design using the **analyze** and **elaborate** or **read** commands.

If this message was issued from within *ra_shell*, it is due to either of the following:

- The design was previously analyzed outside *ra_shell*,
eg. by *dc_shell* without the variables set.

Analyze the HDL source file that contains the design
using *ra_shell*.

- A list of files was issued to *ra_shell*'s **analyze**
command and one or more of the files analyzed before
the file containing the design had an error.

```
for example, analyze -f vhdl { file1.vhdl file2.vhdl file3.vhdl }
```

If *file1.vhdl* has an analyze error, the designs in
file1.vhdl and the following files will not have
links between the GTECH design and the
HDL source files.

Ensure that all HDL source files analyze without errors.

- The design is a Verilog module, specified in a
Verilog HDL file that is included by another Verilog HDL file.
Items specified inside a Verilog HDL 'include' file
cannot be traced. This is a current limitation of HDL analysis
tools.

Do not reference a Verilog module using 'include'.
Instead, include it in an analyzed file using the
verilog_file_list variable or the **analyze** and
elaborate command in *ra_shell*.

HDLA-10 (warning) Design '%s' does not contain HDL analysis

information.

DESCRIPTION

This design does not contain HDL analysis information, and may be one of these:

- a DesignWare part;
- a mapped design,
- a design that was not **read/analyzed** using **ra_shell** or **dc_shell**;
- a design that was **read** or **analyzed** after an error was encountered in your Verilog HDL or VHDL source file.
(HDL analysis information is not generated for subsequent designs).
- a design that resides in another design file that doesn't contain HDL analysis information. Check your **search_path** variable to ensure that the design loaded by the HDL analysis tool is the one you expected.

WHAT NEXT

If the design is not a DesignWare part, use **ra_shell** or **dc_shell** to reanalyze your design; or check the project file and ensure that the GTECH design files are in the indicated directories.

HDLA-11 (error) Variable '%s' is not set.

DESCRIPTION

The variable specified in the error message has not been set in the project file (by default **.synopsys_analyzer.setup**.)

WHAT NEXT

If you are using the default project file (**.synopsys_analyzer.setup**), edit the project file so that the above variable is set.

If you are creating your own project file, set the variable in your project file and

specify the filename when invoking the tool using the **-f** command line option.

HDLA-12 (warning) Variable '%s' is not set.

DESCRIPTION

The variable specified in the error message has not been set in the project file (by default **.synopsys_analyzer.setup**.)

This variable is not required to bring up RTL Analyzer, but does affect the design files loaded.

WHAT NEXT

If you are using the default project file (**.synopsys_analyzer.setup**), edit the project file so that the above variable is set.

If you are creating your own project file, set the variable in your project file and specify the filename when invoking the tool using the **-f** command line option.

HDLA-13 (error) Can't find '%s' in path '%s'.

DESCRIPTION

The file cannot be found in the given path.

WHAT NEXT

Check that the file is correctly set and spelled in the project file and that the **search_path** variable is correctly set to find that file.

HDLA-14 (error) MainWin environment is not set up.

DESCRIPTION

MainWin files, which control the display of the windows, have not been set up or an incorrect version of MainWin has been set up.

WHAT NEXT

Check with your Synopsys administrator.

HDLA-15 (error) Undefined Synopsys root directory.

DESCRIPTION

The Synopsys root directory is undefined.

WHAT NEXT

Check with your Synopsys administrator.

HDLA-16 (error) '%s' is not a directory.

DESCRIPTION

You have specified an invalid directory; or, the directory or one or more of its parents are read or search protected.

WHAT NEXT

Check your project file to ensure that variables specifying directories are correctly set.

Change your permissions to enable reading and searching of the appropriate directory and all of its parents. For example,

```
chmod a+rx <dir_name>
```

HDLA-17 (error) Can't read '%s'.

DESCRIPTION

The file cannot be found, or is read protected.

WHAT NEXT

Check your project file to ensure that the file and path are correctly set, and that variables specifying directories are correctly set.

Change your permissions to enable reading of the appropriate file. For example,

```
chmod a+r <dir_name>
```

HDLA-18 (warning) Register or instantiated cell '%s' is missing in the mapped design %s.

DESCRIPTION

There are two possible reasons for the generation of this warning message.

- There might be a naming style mismatch between the GTECH and mapped domains;
- The mapped design might have been generated in **dc_shell** (for example, by executing **change_names**, **group**, or **ungroup**) without the corresponding GTECH design having been generated in **ra_shell**; or vice versa.

WHAT NEXT

Check your **ra_shell** and **dc_shell** scripts and edit them as necessary to correct one or both of the above errors, and try again.

HDLA-19 (warning) Pin '%s' does not exist on the instantiated mapped design %s.

DESCRIPTION

For a user-instantiated design, all pins are expected to exist on the mapped design. This message could be generated if there is a name mismatch between the ports of the user-instantiated design in the GTECH and the ports of the mapped design files.

There are two possible reasons for a name mismatch.

- There might be a naming style mismatch between the GTECH and mapped domains;
- The mapped design might have been generated in dc_shell (for example, by executing **change_names**, **group**, or **ungroup**) without the corresponding GTECH design having been generated in **ra_shell**; or in ha_shell, or vice versa.

WHAT NEXT

Check your **ra_shell** and **dc_shell** scripts and edit them as necessary Check your ha_shell and dc_shell scripts and edit them as necessary to correct one or both of the previous errors and try again.

HDLA-20 (warning) Pin '%s' does not exist on the instantiated library cell %s.

DESCRIPTION

The pin does not exist on a user instantiated library cell. This message could be generated if there is a name mismatch between the pins of the library cells in the GTECH and the mapped design files.

There are two possible reasons for a name mismatch.

- There might be a naming style mismatch between the GTECH and mapped domains;
- The mapped design might have been generated in **dc_shell** (for example, by executing **change_names**, **group**, or **ungroup**) without the corresponding GTECH design having been generated in **ra_shell**; or vice versa.

WHAT NEXT

Check your **ra_shell** and **dc_shell** scripts and edit them as necessary to correct one or both of the above errors, and try again.

HDLA-21 (error) Design '%s' appears multiple times in a hierarchy or in more than one hierarchy.

DESCRIPTION

The same file was used when linking the GTECH and mapped designs.

WHAT NEXT

Use the original design file for linking GTECH and make a copy of the file for linking mapped designs. See also HDLA-7.

HDLA-22 (warning) Instantiated design '%s' of cell '%s' is

empty.

DESCRIPTION

This warning is generated when the design does not contain any nets, either because the design is empty, or because it is an instantiated library design.

WHAT NEXT

Check the value of the **search_path** variable and the setting of other RTL Analyzer variables to ensure that the correct design has been linked.

HDLA-23 (warning) %s is out of date with respect to %s.

DESCRIPTION

This message indicates that the dependencies between the two specified files are incorrect, probably because the files were not generated by the same **ra_shell** or **dc_shell** session.

WHAT NEXT

Regenerate both files using the same **ra_shell** or **dc_shell** session.

HDLA-24 (warning) Logic Inspector : %s

DESCRIPTION

A message that is specific to the Logic Inspector.

WHAT NEXT

HDLA-25 (information) Sorry: no link to help for that item.

DESCRIPTION

You invoked F1 help for an item, such as a menu item or toolbar button, but there is no link to help for that item.

WHAT NEXT

Try to find help for the item some other way. For example, if the item is a toolbar button or menu item, choose Menus and Toolbar Buttons from the window's help menu and look for the item.

HDLA-26 (information) The selected object can not be linked to the design. Try selecting an output port or assignment statement.

DESCRIPTION

This message is generated when New Logic is executed in the Logic Inspector window but RTL Analyzer unable to find an object in the GTECH design that corresponds to the currently selected object. This situation usually occurs when the selected object is a construct in the HDL source.

WHAT NEXT

Select a related port or assignment statement in the HDL source and re-execute the New Logic command.

HDLA-27 (information) The selected object is not driven by boolean logic. This may be because Logic Inspector does not search through hierarchy boundaries, registers or designWare parts. Try selecting an output port or assignment statement.

DESCRIPTION

Issued when New Logic is executed in the Logic Inspector window but the object in the GTECH design that corresponds to the currently selected object is not driven by boolean logic.

WHAT NEXT

Try selecting a related construct in the HDL source and run the New Logic command again. If the offending construct is a pin of a module/entity instance statement, use HDL Browser's Push In operation to go to the definition of the module or entity-architecture, select the corresponding port construct, and run the New Logic command again. You may have to push in multiple levels of hierarchy to get to a port that is driven by logic.

HDLA-28 (information) Unable to link back to the selected object. Try a lower reduction effort.

DESCRIPTION

Issued by the Logic Inspector when a reduction of the boolean logic leaves it in a state that cannot be displayed.

WHAT NEXT

This usually only happens at the High setting of Reduction Effort. Switch to a lower setting.

HDLA-29 (information) No Design Data

DESCRIPTION

This message is generated when there is no design data. The most common reasons for missing design data are these:

- You requested that the program display data from the mapped design, but only the GTECH design is loaded;
- You requested that the program display power data, but the design does not contain power data.

WHAT NEXT

If the problem is that no mapped design is loaded, do the following:

If you invoked this program from Design Compiler or Design Analyzer, ensure that the current design in that program is mapped, then re-invoke this program.

Otherwise, use Load Mapped Design in the File menu of HDL Browser to load the mapped design.

If the problem is that the design does not contain power data, do the following:

If you invoked this program from Design Compiler or Design Analyzer, use the report_power or report_rtl_power commands to ensure that the current design in that program contains power data, then re-invoke this program.

Otherwise, update your design to include power data, then use Load GTECH Design or Load Mapped Design in the File menu of HDL Browser to load the appropriate design.

HDLA-30 (error) Please enter a value to search for.

DESCRIPTION

Issued by HDL Browser's Find Text dialog when you push the Find Forward, Find Backward, or Find All button but haven't specified a string in the Find What field.

WHAT NEXT

Type a string into the field or click the button to the right of the field and pick a previously found string from the drop down list.

HDLA-31 (information) The string '%s' was not found.

DESCRIPTION

Issued after a Find Text operation in HDL Browser when the specified string was not found in the file being displayed.

WHAT NEXT

Try the search again after changing the string or disabling the Match Case check box.

HDLA-32 (error) The GTECH design doesn't cover all of the constructs in source, .bi, and .id files. Displayed results are probably wrong.

DESCRIPTION

This message is generated by HDL Browser when the data in the GTECH design does not account for all of the constructs in an HDL source file that was just loaded.

WHAT NEXT

Check that the HDL source file and the corresponding **.bi** and **.id** files have not been changed since the file(s) that contain the GTECH design were generated. If

necessary, regenerate the GTECH design files. Contact Synopsys if the problem persists after recreating the GTECH design files.

HDLA-33 (error) Source file out of sync with GTECH design!

%S

probably was changed since the GTECH design was generated.

DESCRIPTION

This message indicates that HDL Browser attempted to load an HDL source file or the corresponding **.bi** or **.id** file, but found that the file's checksum does not match the value stored in the GTECH design. This situation probably occurred because the HDL source file was changed after the GTECH design was generated.

WHAT NEXT

You can continue to use this program, but HDL Browser cannot show this HDL source file. To be able to view this HDL source file, you must re-analyze and re-elaborate the GTECH design and then reload it into this program. If you invoked this program from Design Compiler or Design Analyzer, re-invoke this program after re-analyzing and re-elaborating the GTECH design. Otherwise, re-analyze and re-elaborate the GTECH design using the Build GTECH window or **ra_shell**, then use Load GTECH Design from the File menu of HDL Browser to reload the design.

HDLA-34 (error) Couldn't read HDL source file:

%S

DESCRIPTION

This message indicates that HDL Browser was unable to find or read the requested HDL source file.

WHAT NEXT

Ensure that the file exists in one of the directories specified by the **search_path** variable and that the file is readable.

HDLA-35 (error) Couldn't read .bi file:

%S

DESCRIPTION

This message indicates that HDL Browser was unable to find or read the specified **.bi** file. (There is a **.bi** file that corresponds to each HDL source file.)

WHAT NEXT

Ensure that the file exists in one of the directories specified by the **search_path** variable and that the file is readable.

HDLA-36 (error) The data in **.bi** file:
is not consistent with the text in HDL source file:
The HDL source file may have been changed since the **.bi** file
was created.

DESCRIPTION

This message indicates that the data in the specified HDL source file is inconsistent with the data in the corresponding **.bi** file.

WHAT NEXT

Determine whether the HDL design file has been changed since the **.bi** file was created, and re-create the **.bi** and GTECH design files if necessary. If the problem persists, contact Synopsys.

HDLA-37 (information) Stopped search after finding %d occurrence(s) of '%s'. Search again from a different starting location to find any additional occurrences.

DESCRIPTION

This message indicates that HDL Browser has stopped searching because it has reached the limit of number of occurrences that can be found in one operation. Limiting the number of occurrences per operation (currently 1000) allows a Find All operation to take place in a reasonable length of time.

WHAT NEXT

To find more occurrences, position the last found occurrence at the top of the window and then repeat the Find All operation.

HDLA-38 (information) Found %d occurrence(s) of '%s'.

DESCRIPTION

This message indicates the number of occurrences found by HDL Browser during a Find All operation.

WHAT NEXT

Click OK to dismiss the dialog, then scroll or use Find Next and Find Previous to view all the found occurrences.

HDLA-39 (information) Unable to find a path to or through the selected point.

DESCRIPTION

This message indicates that a Worst GTECH or Worst Mapped command was issued but Path Browser was unable to find a path to or through the currently selected object.

WHAT NEXT

Select a different object and re-issue the command.

HDLA-40 (error) The selected object is not a design, cell, pin or port.

DESCRIPTION

This message indicates that you issued a command to display a new path or object, but the currently selected object is not a design, cell, pin, or port.

WHAT NEXT

Select an object that is a design, cell, pin, or port, and re-execute the command.

If you selected a construct in HDL Browser, use the flying box and Hot Cursor window to find a related construct that functions adequately.

HDLA-41 (error) No Path Displayed.

DESCRIPTION

This message indicates that you have issued the Worst Current Start/End Points GTECH command when Path Browser is not displaying a path. This command displays the worst GTECH path that has the same start and end points as the currently displayed path; therefore, you must display a path before issuing this command.

WHAT NEXT

Use an appropriate Path Browser command to display a path, and reissue the Worst Current Start/End Points command.

HDLA-42 (error) Unable to map the start and end points of the current path to equivalent objects in the GTECH design.

DESCRIPTION

This message indicates that you have issued the Worst Current Start/End Points GTECH command, but Path Browser is unable to find objects in the GTECH design that correspond to the start and end points of the currently displayed path. This situation can arise if the currently displayed path was traced interactively in the mapped design, so that the start or end point is a gate for which there is no exact equivalent in the GTECH design.

WHAT NEXT

Ensure that the start and end points of the current path are registers, ports of the overall design, or ports of hierarchy blocks that exist in both the GTECH and mapped versions of the design. Then reissue the Worst Current Start/End Points command.

HDLA-43 (information) db file not loaded.

DESCRIPTION

This message indicates that you directed the tool to display data from the mapped design, but only the GTECH design, and not the mapped design, is loaded.

WHAT NEXT

If you invoked RTL Analyzer from dc_shell (via the rtl_analyzer command), make sure that when you invoked RTL Analyzer, the current design was a mapped design (i.e. compiled).

If you executed RTL Analyzer directly, choose Edit Project Settings and specify the mapped design. Save the project then choose Load Mapped Design.

HDLA-44 (error) Not available in this mode.

DESCRIPTION

This message, issued by Profiler, indicates that you attempted to enable Follow Selected while Profiler was in Timing mode. Follow Selected is not supported in Timing mode.

WHAT NEXT

To see the worst path through or to an object, select the object in any window and then choose View->Show Selected (or push the Find Selected toolbar button) in Profiler.

HDLA-45 (error) Project variable %s not set.

DESCRIPTION

This message indicates that the project variable is not set that specifies the directory or directories containing the on-line help topic files. This variable is normally set in the system-level **.synopsys_analyzer.setup** file and is not changed by users.

WHAT NEXT

Ask your system administrator to check the tool installation. If the installation is correct, contact Synopsys.

HDLA-46 (error) Help error: %s

DESCRIPTION

This message indicates that a help topic is missing, unreadable, or contains an error. For example, the topic specified for a jump point could not be found.

Examples:

```
Help error: bad query command  
Help error: Couldn't load file: <filename>  
Help error: Couldn't find marker: <markername>
```

WHAT NEXT

Have your system administrator check the tool installation. Contact Synopsys if the installation is correct.

HDLA-47 (error) Could not open help context map file.

DESCRIPTION

This message indicates that the tool was unable to read the file that specifies the help topic to be displayed for each menu item and toolbar button using F1 help.

WHAT NEXT

Have your system administrator determine whether the file **cetxtmap.qdh** exists in the on-line help directory and is readable.

HDLA-48 (information) Mapped domain of design '%s' is not loaded.

DESCRIPTION

This message indicates that the mapped domain of the design was not loaded.

WHAT NEXT

If you invoked RTL Analyzer from dc_shell (via the rtl_analyzer command), make sure that when you invoked RTL Analyzer, the current design was a mapped design (i.e. compiled).

If you executed RTL Analyzer directly, choose Edit Project Settings and specify the mapped design. Save the project then choose Load Mapped Design.

HDLA-49 (warning) '%s' is not a directory.

DESCRIPTION

You have specified an invalid directory; or, the directory or one or more of its parents are read or search protected.

WHAT NEXT

Check your (**search_path** variable or a project file that you may have created) to ensure that variables specifying directories are correctly set.

Change your permissions to enable reading and searching of the appropriate directory and all of its parents. For example,

```
chmod a+rx <dir_name>
```

HDLA-50 (warning) Command line option '%s' is not unique. Possible completions are { %s }.

DESCRIPTION

A prefix of a command line option was used. However, two or more valid command line options share the same prefix.

WHAT NEXT

Use a larger substring of the appropriate command line option to insure that its prefix is unique.

HDLA-51 (warning) The '%s' command is not supported in ra_shell.

DESCRIPTION

This message indicates that the command you issued, while valid in **dc_shell**, is not supported in **ra_shell**, the RTL Analyzer shell user interface. For example, **compile** is supported only in **dc_shell**, and is ignored in **ra_shell**. The command is ignored.

WHAT NEXT

If you need to use the command, issue it from within **dc_shell** and not **ra_shell**.

HDLA-52 (information) Couldn't find a path to or through the selected point.

DESCRIPTION

Issued by Profiler when a New Path command failed to find any path to or through the currently selected object.

WHAT NEXT

Select a different object and try the command again.

HDLA-53 (error) %s is not the name of a valid host.

DESCRIPTION

The given hostname is not the name of a valid host. This could be due to a typo in your project file.

WHAT NEXT

Edit the project file and ensure that the variable is set to a valid hostname.

HDLA-54 (error) Project variable '%s' is not one of the following valid values : %s.

DESCRIPTION

The value of the variable is not valid. This could be due to a typo in the project file.

WHAT NEXT

Edit the project file and ensure that the variable is set to one of the valid values.

HDLA-55 (error) Could not invoke %s on %s.

DESCRIPTION

The given program could not be invoked on the given host. This may be due to an incorrect hostname, incorrect executable name, or problems with the network.

WHAT NEXT

Ensure that the host exists, the host is alive, via the UNIX 'ping' command, and the executable exists for the architecture of the given host .

HDLA-56 (warning) Could not find or execute %s.

DESCRIPTION

The given program could not be found or is not executable.

WHAT NEXT

HDLA-57 (error) Load Design failed. See error messages.

DESCRIPTION

The Load Design operation failed.

WHAT NEXT

Check the error messages to find out why the load failed. Some common problems are: incorrect values specified in the Load Design dialog, missing files, and files unreadable due to permissions.

HDLA-58 (error) Estimator terminated due to a fatal error.

DESCRIPTION

The Estimator process terminated due to a fatal error.

WHAT NEXT

Report this to Synopsys.

HDLA-59 (error) Estimator terminated due to an error. No Estimator results are available.

DESCRIPTION

The Estimator process terminated due to an error.

WHAT NEXT

Check the messages in the Estimator window to find out why the Estimator run failed to produce an estimated design.

HDLA-60 (information) Reload not needed.

DESCRIPTION

The latest versions of the designs that you requested to be loaded (GTECH, Mapped, or both) are already loaded.

WHAT NEXT

HDLA-61 (error) Unable to load the Estimated design.

DESCRIPTION

One or more errors occurred while attempting to load the estimated design.

WHAT NEXT

Check error messages to see what failed. If you are able to correct the problem, you can use the Load Design dialog to attempt to load the estimated design.

HDLA-62 (information) Estimator not enabled.

To enable, ensure that an Estimator license is available and reinvoke RTL Analyzer with the -estimate command line option or with project variable enable_estimation set to TRUE.

DESCRIPTION

You tried to display the Estimator window, but the Estimator is not enabled for this RTL Analyzer run.

WHAT NEXT

To enable the Estimator, ensure that an Estimator license is available and reinvoke RTL Analyzer with the -estimate command line option or with project variable enable_estimation set to TRUE.

HDLA-63 (error) Could not change working directory to

DESCRIPTION

You tried to change the current working directory to the specified directory, but the program was unable to do so.

WHAT NEXT

Check that the specified path is valid and that all permissions are correct.

HDLA-64 (warning) %s is not a valid command line option.

DESCRIPTION

The given option is invalid.

WHAT NEXT

Check the User's Guide or invoke -help command line option to see a list of valid command line options.

HDLA-65 (warning) Design %s is empty. It will be treated as an

unresolved reference during link.

DESCRIPTION

The program unifies a design after loading it in. If any design in the hierarchy is empty, then this design is not unified, leading to multiple instantiation of this design. To get around this problem the program treats empty designs as black boxes, which are unresolved references during link.

WHAT NEXT

The user should confirm that the design being warned about is really intended to be empty. If so, then there is no problem and the later LINK-5 warning about any unresolved references to this design can also be ignored.

HDLA-66 (warning) %s was removed in version %s.

DESCRIPTION

The given variable or command was removed in the aforementioned version.

WHAT NEXT

Check the Reference Manual for alternate commands.

HDLA-67 (warning) %s will be removed in version %s.

DESCRIPTION

The given variable or command will be removed in the aforementioned version.

WHAT NEXT

Check the Reference Manual for alternate commands.

HDLA-68 (warning) %s was made obsolete in version %s.

Please use %s.

DESCRIPTION

The given variable or command was removed in the aforementioned version. Please use the given alternate variable or command.

WHAT NEXT

Check the Reference Manual for alternate commands.

HDLA-69 (warning) %s will be obsolete in version %s. Please use %s.

DESCRIPTION

The given variable or command will be removed in the aforementioned version. Please use the given alternate variable or command.

WHAT NEXT

Check the Reference Manual for alternate commands.

HDLA-70 (error) Build GTECH terminated due to a fatal error.

DESCRIPTION

The Build GTECH process terminated due to a fatal error.

WHAT NEXT

Report this to Synopsys.

HDLA-71 (error) Build GTECH terminated due to an error. No Build GTECH results are available.

DESCRIPTION

The Build GTECH process terminated due to an error.

WHAT NEXT

Check the messages in the Build GTECH window to find out why the Build GTECH run failed to produce a gtech design.

HDLA-72 (error) Unable to load the built GTECH design.

DESCRIPTION

One or more errors occurred while attempting to load the GTECH design.

WHAT NEXT

Check error messages to see what failed. If you are able to correct the problem, you can use the Load Design dialog to attempt to load the built gtech design.

HDLA-73 (warning) Directory '%s' is not writable.

DESCRIPTION

You do not have write permission to the given directory.

WHAT NEXT

Use the UNIX 'chmod' command to add write permission or specify a different directory.

HDLA-74 (error) The current path is not in the mapped design.

DESCRIPTION

This message indicates that you issued the Worst Current Start/End Points GTECH command when the Path Browser is not displaying a path in the mapped design. This command is used to display the worst path in the GTECH design that corresponds to a path in the mapped design. Therefore, Path Browser must be displaying a path in the mapped design when this command is executed.

WHAT NEXT

Use an appropriate Path Browser command to display a path in the mapped, then reissue the Worst Current Start/End Points GTECH command.

HDLA-75 (error) Unable to correlate the path in the mapped design to a corresponding path in the GTECH design.

DESCRIPTION

This message occurs when you issue the Worst Current Start/End Points GTECH command, but Path Brower is unable to correlate the currently displayed path in the mapped design to a corresponding path in the GTECH design. This situation can arise if the currently displayed path was traced interactively in the mapped design, so that the start or end point is a gate for which there is no exact equivalent in the GTECH design.

WHAT NEXT

Ensure that the start and end points of the current path are registers, ports of the overall design, or ports of hierarchy blocks that exist in both the GTECH and mapped versions of the design. Then reissue the Worst Current Start/End Points command.

HDLA-76 (warning) %s is not a valid RTL Analyzer or BCView variable.

DESCRIPTION

A variable was set in an RTL Analyzer or BCView project file which is not a valid variable name for the tool.

WHAT NEXT

Check the spelling of the variable.

HDLA-77 (warning) %s are incompatable variables. Choosing '%S'.

DESCRIPTION

A set of incompatable RTL Analyzer or BCView variables have been set. The tool has chosen a compatable subset of them.

WHAT NEXT

Delete one or more of the variables to make a compatable set of RTL Analyzer or

BCView variables.

HDLA-78 (error) Design '%s' contains multiple instances. Please use the 'set_dont_touch' or 'uniquify' dc_shell commands to resolve this problem.

DESCRIPTION

The given design contains multiple instances of a subdesign. To resolve this problem, either uniquify the design, which will make each instance a separate subdesign; or use the 'set_dont_touch' command to put a synopsys dont_touch attribute on the appropriate subdesign(s).

WHAT NEXT

To dont_touch the design, place the appropriate 'set_dont_touch' command(s) in a dc_shell-compatable script file and specify the name of this file as the value of the 'constraints_include_file' RTL Analyzer variable and restart Build Gtech, or if you invoked RTL Analyzer from dc_shell, include the 'set_dont_touch' command in dc_shell and re-run the 'rtl_analyzer' dc_shell command.

To uniquify the design, place the 'uniquify' command in a dc_shell-compatable script file and specify the name of this file as the value of the 'constraints_include_file' RTL Analyzer variable and restart Build Gtech, or if you invoked RTL Analyzer from dc_shell, include the 'uniquify' command in dc_shell and re-run the dc_shell 'rtl_analyzer' command.

HDLA-79 (warning) No combinational loop found in circuit.

DESCRIPTION

This message is issued when you select "Combinational Loop" on the Data menu in the Path Browser and there are no combinational loops in the circuit.

WHAT NEXT

Nothing. This is good news!

HDLA-80 (warning) Combinational loop found in circuit. Use "Data->Combinational Loop" in Path Browser to display the

loop.

DESCRIPTION

You have combinational loops in your gtech circuit.

WHAT NEXT

Go to the Path Browser. Select "Combinational Loop" under the Data menu. The GTECH path comprising the loop will be shown in the path browser. Select elements in the path and look in HDL Browser to identify constructs in your RTL code that causes the path.

HDLA-81 (warning) Could not change directory to '%s'

DESCRIPTION

The program could not change directory to the specified directory. This directory might not exist.

WHAT NEXT

Ensure that the directory exists.

HDLA-82 (warning) The command '%s" has been unaliased.

DESCRIPTION

The name of an user specified alias clashed with a shell command. The alias was automatically unaliased.

WHAT NEXT

Remove this alias from the .synopsys_dc.setup file and any of the script files or use another name for the alias.

HDLA-83 (error) Files '%s' and '%s' have the same basename.

DESCRIPTION

Having 2 HDL files with the same basename confuses this tool because it only uses the basename to identify an HDL file to allow moving files between directories.

WHAT NEXT

Ensure that no 2 HDL files in the project file have the same basename. On UNIX you can do this without renaming files by using links.

HDLA-84 (warning) Rebuild design '%s' to obtain enhanced HDL tracing information. This design was built by Synopsys release '%s'.

DESCRIPTION

In the v1997.08 release, the following tracing capabilities have been added:

- Tracing of elements inside VHDL Entity/Architecture pairs that reside in different files.
- Tracing elements inside subprogram calls (such as VHDL functions and procedures or Verilog functions and Tasks).
- Tracing iteration-specific elements within the scope of finite loops (such as VHDL and Verilog for loops).
- Tracing elements inside a VHDL package or VHDL package_body.
- Improvements in tracing elements inside conditional statements (such as VHDL condition signal assignments, VHDL if statements, VHDL case statements, Verilog if statements, Verilog case statements and Verilog ?: constructs).

This message was generated because the design does not contain enhanced tracing information. This design was built using a previous release of RTL Analyzer. This might be due to one of the following reasons.

- the design was not generated by the current Synopsys release of

RTL Analyzer or **ra_shell**,

- the hdl source files were analyzed by a previous Synopsys release of **ra_shell**,
- when elaborating an hierarchical design containing an instance of design 'foo', the file 'foo.ra' was loaded instead of regenerating design 'foo'. The design file, 'foo.ra', was not generated by the current Synopsys release.

WHAT NEXT

Use the Current Synopsys release of **Build GTECH** window in RTL Analyzer or **ra_shell** to regenerate your design. If you are running RTL Analyzer from within **dc_shell**, then be sure to set the variable `hdlin_enable_analysis_info = true` in **dc_shell** before reading in your design.

SEE ALSO

`hdlin_enable_analysis_info(3)`

HDLA-85 (error) Dependency loop involving files '%s' and '%s' and the definition of '%s' detected.

DESCRIPTION

There are files in the list specified in the variables '`vhdl_file_list`' or '`verilog_file_list`', which use definitions from each other. This creates a dependency loop.

WHAT NEXT

Check your source files and eliminate the dependency loop.

HDLA-86 (error) Parsing of '%s' failed with the following message: '%s'.

DESCRIPTION

There is a syntax error in the reported file.

WHAT NEXT

If the parser reports a macro usage without prior definition, the problem can be fixed by defining a macro in each file where it is used. This creates some warning messages during analyze, but these can be ignored. RTL Analyzer build can currently not handle macros used in a file and defined in another file.

HDLA-87 (error) Dependency loop involving the design '%s' detected.

DESCRIPTION

The mentioned module instantiates other modules, which in turn instantiate again this module. Thus, a loop is created, which does not allow to process the design.

WHAT NEXT

Check your source files and eliminate the dependency loop.

HDLA-88 (warning) The design files define two differnt modules ('%s' and '%s') with the same name but only different spelling.

DESCRIPTION

If the design consists of Verilog and VHDL files, this can lead to problems, since the decision of which module to use for an instantiation might depend on the order of analysis.

WHAT NEXT

Check your source files and give the modules a unique name.

HDLA-89 (warning) Calculation of HDL tracing information has been disabled.

DESCRIPTION

Due to errors in the HDL source files, further calculation of HDL tracing information has been disabled. The resulting designs will not have the necessary information to allow other Synopsys Analysis tools to trace elements of those

designs to the HDL source. This will affect you if :

- You are analyzing multiple HDL files. Designs in the files analyzed after this message appears will not contain HDL information.
- You have multiple designs in one file. Designs that are analyzed after this message appears will not contain HDL information.

WHAT NEXT

Fix your syntax errors and use `dc_shell` to *read/analyze* your HDL source files and regenerate the GTECH design. Ensure that you have set `hdlin_enable_analysis_info=true` for RTL designs or `bc_enable_analysis_info=true` for behavioral designs.

SEE ALSO

`hdlin_enable_analysis_info(3)` `bc_enable_analysis_info(3)`

HDLA-90 (warning) The design %s does not have tracing information linking it to its HDL source. It might have not been processed with `bc_enable_analysis_info` set to true.

DESCRIPTION

This message indicates that

- 1) the `elaborate` command was used on .syn files that were created by the `analyze` command without the variable `bc_enable_analysis_info` set to `true`,
or
- 2) the `bc_check_design/schedule` command was used on .db files that were created by the `elaborate` command without the variable `bc_enable_analysis_info` set to `true`.

In Synopsys HDL analysis tools, in order to view links between designs and their HDL source files, the designs must be processed with the variable `bc_enable_analysis_info` set to `true`.

WHAT NEXT

From within dc_shell set the variable **bc_enable_analysis_info** to **true** while processing designs to be analyzed in Synopsys HDL analysis tools.

SEE ALSO

bc_enable_analysis_info(3).

HDLA-91 (information) You invoked this tool from Design Compiler or Design Analyzer. Please re-analyze and re-elaborate your design there and then reload it using the items in the File menu of HDL Browser.

DESCRIPTION

This tool was invoked through a command in Design Compiler or Design Analyzer. The Build GTECH window invokes ra_shell which will result in a Synopsys db file that is protected. This file cannot be read into Design Compiler or Design Analyzer. Hence, we have disabled the Build GTECH Design from HDL Source window.

WHAT NEXT

Re-analyze and re-elaborate your design in Design Compiler or Design Analyzer and use the Load items in the File menu of the HDL Browser to reload your design.

HDLA-92 (information) bc_view launched successfully with process-id %s. Please refer to the log
in the xterm window titled 'bc_view' for further details.

DESCRIPTION

WHAT NEXT

SEE ALSO

bc_view(2)

HDLA-93 (information) Reload done successfully in the existing bc_view with process-id %s.

Please refer to the log in the xterm window titled 'bc_view' for further details.

DESCRIPTION

WHAT NEXT

SEE ALSO

`bc_view(2)`

HDLA-94 (warning) The design '%s' is not in a stage that `bc_view` can analyze.

DESCRIPTION

This warning tells you that the design in question cannot be analyzed with the `bc_view` command because the `dc_shell` variable `bc_enable_analysis_info` was not set as `true` when you ran `analyze` or `elaborate` on the design. Thus, there is no tracing information in the design and it cannot be analyzed with `bc_view`.

WHAT NEXT

Set `bc_enable_analysis_info` as `true` and again perform `analyze`, `elaborate -s`, and `schedule` or `bc_check_design`, depending on the stage the design was in when you tried to run `bc_view`.

SEE ALSO

`bc_view (2)`, `schedule (2)`, `bc_check_design (2)`; `analyze (3)`, `elaborate (3)`.

HDLA-95 (error) No license to analyze SystemC designs can be obtained.

DESCRIPTION

You receive this message because the `bc_view` command was unable to obtain an SC-Schedule license at the current time. You must have a valid SC-Schedule license to analyze SystemC designs with the `bc_view` command.

WHAT NEXT

Wait until an SC-Schedule feature becomes available and attempt to load your design again.

SEE ALSO

`bc_view` (2).

HDLA-96 (error) No license to analyze HDL designs can be obtained.

DESCRIPTION

You receive this message because the `bc_view` command was unable to obtain a BC-Schedule license at the current time. You must have a valid BC-Schedule license to analyze HDL designs with the `bc_view` command.

WHAT NEXT

Wait until a BC-Schedule feature becomes available and attempt to load your design again.

SEE ALSO

`bc_view` (2).

HDLA-97 (fatal) Your license file does not contain any of the features needed to run this application.

DESCRIPTION

You receive this message because your license file does not contain the features required to run BCView. The required features depend on the language of your design source code. For VHDL or Verilog, you must have the BC-Schedule feature. For SystemC, you must have the SC-Schedule feature.

WHAT NEXT

Upgrade your licenses, and try running BCView again.

HDLA-100 (error) The command `bc_view` is no longer supported.

Please use the `report_schedule` command instead.

DESCRIPTION

The `report_schedule` command should be used to analyze the results after scheduling, instead of `bc_view` which is no longer supported.

WHAT NEXT

Do a man `report_schedule` to see the analysis capabilites of the command.

SEE ALSO

HDLOUT

HDLOUT-1 (warning) Expect to see the member name but found %s.

DESCRIPTION

When hdlout_internal_busses is set to TRUE, it will parse the bus member names to form a range of a bus. This process only happen after doing compile while all the data are bit-blasted.

This warning tells that the name might contain range or some form that causes parsing failure.

WHAT NEXT

HFS

HFS-059 (Error) HFS failed for driver %s

DESCRIPTION

The 'create_buffer_tree' command was not able to produce a valid buffer tree for one of the subtrees of the specified driver. This usually happens when some sink pins are so isolated that no clustering can be made without violating the design rules even using low fanouts, or there is no enough space to place a buffer.

WHAT NEXT

Try to use a different buffer with higher drive strength ("set_cbt_options --references").

HFS-064 (Warning) HFS could not detect any bufferable fanout driven by pin %s.

DESCRIPTION

The reported pin does not have any fanout in the current netlist.

WHAT NEXT

HFS-122 (Warning) Pin %s/%s is inside a hierarchical cell %s marked dont_touch.

DESCRIPTION

You receive this message because a high fanout tree in your design traces to the reported pin, which is found within a subdesign protected by the `dont_touch` attribute. High Fanout Synthesis ignores this sub-tree, because a `dont_touch` subdesign cannot be modified.

WHAT NEXT

Remove the `dont_touch` attribute from the subdesign represented by the specified hierarchical cell as follows.

1. Execute the **report_cell** command for the hierarchical cell specified by this message. This provides you with the name of the corresponding subdesign.
2. Use the **current_design** command to set this subdesign to be the *current_design*.
3. Remove the **dont_touch** attribute from the *current_design*.
4. Set the *current_design* back to the one you work on.
5. Uniquify the design.

SEE ALSO

current_design (2), **report_cell** (2).

HFS-196 (Error) Insufficient free sites to place buffer.

DESCRIPTION

No empty space (site not covered by a placement blockage, a block or a fixed cell) was found for buffer inserted during HFS, so synthesis of the high fanout net was not completed for this reason.

WHAT NEXT

Please check placement obstructions and placement regions.

HFS-701 (Information) Buffering net %s.

DESCRIPTION

WHAT NEXT

HFS-702 (Warning) Skipping net %s marked dont_touch.

DESCRIPTION

WHAT NEXT

HFS-703 (Information) Skipping net %s - inside SLM.

DESCRIPTION

WHAT NEXT

HFS-710 (Error) The design's max_fanout value is not valid (%2.0f). Ignoring it.

DESCRIPTION

WHAT NEXT

HFS-720 (Information) Buffer tree break point: %s '%s' %s

DESCRIPTION

There are several reasons that a buffer tree will be broken into a set of trees during the high-fanout synthesis in `create_buffer_tree` and `place_opt`. Here are the reasons and suggestions for removing the break points:

The buffer/inverter cell has the `dont_touch` attribute.

The buffer/inverter cell has the **size_only** attribute.

The hierarchical pin has a clock attribute.

The hierarchical pin has a timing constraint attribute.

The hierarchical pin is on a Voltage Area interface.

The hierarchical pin is on an ILM interface.

The pin or its net is in a **dont_touch** module.

The hierarchical pin drives a dont_touch net.

The hierarchical pin is **dont_touch** on both nets.

The pin is on a hier cell list of -preserve_boundary.

The hierarchical pin is entering the top and variable
compile_no_new_cells_at_top_level = true.

The hierarchical pin is exiting on the top and variable
compile_no_new_cells_at_top_level = true.

WHAT NEXT

If the **dont_touch**, **size_only**, clock attributes or timing constraint are not needed, then remove them and re-run.

The Voltage Area and ILM break points cannot be removed.

HFS-721 (Information) Connection class conflict: keep buffer tree with driver '%s' (%s) and load pin '%s' (%s)

DESCRIPTION

This message indicates that Automatic High-Fanout Synthesis (AHFS) during **place_opt** or **create_buffer_tree** is keeping the buffer tree driven by the named pin because the buffer tree has a load pin with a conflicting connection class.

WHAT NEXT

HFS-722 (Warning) %s %s

DESCRIPTION

This message indicates that a driver pin or net is being skipped in **remove_buffer_tree** for one of these reasons:

"Skipping net that does not have exactly one driver: " Multi-driver nets do not have their buffer trees removed.

"Skipping net that has no driver: " The net has no driver.

"Skipping driver with no net connection: " The driving pin in the object_list does not have any net attached.

"Skipping driver whose net does not have exactly one driver: " Multi-driver nets do not have their buffer trees removed.

"Skipping pin that is not a driver: " The pin in the object_list is not an output or inout pin.

WHAT NEXT

HFS-800 (Information) Total number of removal drivers is %d.

DESCRIPTION

This message indicates that Automatic High-Fanout Synthesis (AHFS) during **place_opt** or **create_buffer_tree** is removing the specified number of old buffer trees.

WHAT NEXT

HFS-801 (Information) Total number of insertion drivers is %d.

DESCRIPTION

This message indicates that Automatic High-Fanout Synthesis (AHFS) during **place_opt** or **create_buffer_tree** is inserting the specified number of new buffer trees.

WHAT NEXT

HFS-802 (Information) Automatic high-fanout synthesis deletes %d cells.

DESCRIPTION

This message indicates that Automatic High-Fanout Synthesis (AHFS) during `place_opt` or `create_buffer_tree` has deleted the specified number of buffer or inverter cell instances.

WHAT NEXT

HFS-803 (Error) Setting option %s is not allowed for the current value of option -optimize_buffer_trees.

DESCRIPTION

The current value of option `-optimize_buffer_trees` determines which other options are relevant and which are not allowed to be set.

When `-optimize_buffer_trees` is TRUE, these options are not allowed: `-hf_threshold` `-mf_threshold` `-remove_effort`

When `-optimize_buffer_trees` is FALSE, these options are not allowed: `-skip_for_hfs`

WHAT NEXT

First set the value of `-optimize_buffer_trees` and then set the other allowed options.

It is not recommended to switch the value of `-optimize_buffer_trees` in a single script. If the user does switch the value of `-optimize_buffer_trees` in a single script, then the non-relevant options values will be ignored during AHFS.

HFS-804 (Warning) Ignoring buffer or inverter in `-skip_for_hfs` list '%s' (%s)

",

DESCRIPTION

The `-skip_for_hfs` option does not allow buffers or inverters (without `dont_touch` and `size_only`) to be listed.

Buffers and inverters (without `dont_touch` and `size_only`) may be driven (indirectly) from other drivers.

If that happens then the entire buffer tree is going to be re-built and the skip has no effect. That is why CCC disallows "skip" on regular buffers.

When using `-skip_for_hfs`, the user should think of skipping entire trees, not parts of trees.

WHAT NEXT

HFS-805 (Error) There are no driver pins or ports in the -from <object_set>.

DESCRIPTION

The `-from` option on `remove_buffer_tree` is expecting a set of ports, pins, or nets with at least one driver pin or input port.

Note that power and ground nets are not supported unless this option has been already set: `set_ahfs_options -constant_nets true`.

Nets with multiple drivers are not allowed.

Look for HFS-722 warnings in the log.

WHAT NEXT

Make sure that the collection passed to the `-from` option contains a driver pin or port, or that the nets have driver pins.

HFS-808 (Warning) Connection class conflicts exist in the buffer tree driven by '%s'

",

DESCRIPTION

Some pins in the buffer tree are connected with connection class conflicts. Pins should not be connected to each other if they do not share any classes in common. The "universal" class can be connected to any other pin.

You can use **set_ahfs_options -default_reference <buffer_type_list>** to limit the buffer (or inverter) types used during **create_buffer_tree**.

If you want to avoid connection class conflicts, you may need to remove the buffer tree and rebuild it using buffers whose pin classes are compatible with the driver and loads of the high-fanout net.

WHAT NEXT

Make sure that the connection_class attributes on the lib_pin objects are correct. Use **report_constraints -connection_class -all_violators** for details of all nets with connection class violations.

Use **report_buffer_tree -break_points -from <driver_pin>** to see details of the connection class conflicts.

HLS

HLS-1 (error) The invocation '%s' of function '%s' constrains the function input '%s' to be smaller than its default. This is not currently supported when elaborating for scheduling.

DESCRIPTION

If the actual constraints passed in is smaller then default then this error occurs.
For example : function [7:0] A; input [7:0] IN; ... endfunction function [20:0] B ;
reg [5:0] TEMP; ... A(TEMP); <---- error here ... endfunction

WHAT NEXT

Changed the constraints to be the same as the default.

HLS-2 (error) The task '%s' on line %d contains an inout parameter. This is not currently supported when the task is being preserved using the preserve_function pseudo-comment.

DESCRIPTION

Tasks with inout parameters cannot be preserved using the preserve_function compiler directive.

WHAT NEXT

Either do not preserve the task, by removing the preserve_function compiler directive, or rewrite the task to not use inout parameters.

HLS-3 (error) The call to preserved procedure '%s' on line %d, contains a complicated expression specified

for parameter '%s'.

DESCRIPTION

The call to a procedure contains a complicated expression
(this includes sliced busses).

This is not currently supported when the procedure
is being preserved using the preserve_function pragma
and when the parameter is an out or inout parameter.

WHAT NEXT

Either do not preserve the procedure, by removing its
preserve_function pragma, or do not use complex expressions
as parameters, when calling it.

HLS-4 (error) Could not link call to function '%s' at line %d.

DESCRIPTION

Could not find a design to implement the called function. This can happen for a number of reasons. For example, the types of the parameters in the call to the function do not match the types of the parameters in the function declaration. Or, for example, the function name may be misspelled.

WHAT NEXT

Verify that the function is being called with the correct parameter types.

HLS-5 (error) No suitable process for HLS

DESCRIPTION

The current design has no process that can be processed by HLS

WHAT NEXT

Set the current design or add a process that is suitable for HLS

HLS-6 (error) '%s' is not a valid %s. Valid options are %S

DESCRIPTION

The flag you used is not among the acceptable options.

WHAT NEXT

Choose one of the valid options.

HLS-7 (error) Negative HLS timing constraint

DESCRIPTION

The specified delay parameter on the set_cycle family of commands is negative. This is an invalid input.

WHAT NEXT

Specify a positive value for the delay.

HLS-8 (error) Unrecognized HLS datapath topology identifier

DESCRIPTION

The topology identifier you have used is not in the currently supported set.

WHAT NEXT

The topology tags we support are documented in the HLS manual. You may have to quote the tag you use, if it contains special (nonalphanumeric) characters.

HLS-9 (error) No schedule data available

DESCRIPTION

For some reason there is no scheduling information available in the current design.

WHAT NEXT

The current design has no scheduling data present. This will usually happen because the design has not been scheduled, or scheduling failed for some reason.

HLS-10 (error) No scheduled process

DESCRIPTION

There is no scheduled process in the current design.

WHAT NEXT

The current design has no scheduled process. This situation happens because the design contains no suitable process, the process has not been scheduled, or scheduling failed for some reason.

HLS-11 (error) Timing constraint across hierarchy

DESCRIPTION

The timing constraint refers to two or more objects that are at different levels of hierarchy, or that have different ancestries.

WHAT NEXT

You cannot constrain the objects directly. Instead, you can constrain the outermost object to the boundary of the hierarchical element that contains the innermost object; then constrain the innermost with regard to the boundary. Note that as the number of hierarchical levels crossed by the desired constraint increases, the number of these new constraints also increases.

HLS-12 (error) Timing constraint across loop(s)

DESCRIPTION

The timing constraint refers to two or more objects that are on different sides of a loop.

WHAT NEXT

You cannot constrain the objects directly. Instead, you can constrain the first with

regard to the beginning of the loop, and the second with regard to the end of the loop; and then constrain the loop. Note, however, that a constraint from beginning to end of a loop governs the number of cycles in one pass of the loop. Think about the number of passes that may be made and what that implies for your overall constraint.

HLS-13 (Warning) The loop at line %d in file '%s' is not needed, so it was deleted.

DESCRIPTION

Because none of the signals driven in the loop fanned out to the outputs, the loop was unnecessary and was removed.

WHAT NEXT

Check the loop for errors. If there are no errors, the loop is not needed and can be removed.

HLS-14 (error) non-block common schedule

DESCRIPTION

The objects designated are not the proper type to share a schedule.

WHAT NEXT

Only function and procedure calls can have their schedules shared. In the worst case, you can rewrite your input HDL so that otherwise identical functions have different names.

HLS-15 (error) Chained unrelated ops

DESCRIPTION

The objects designated are not in the same execution sequence.

WHAT NEXT

You cannot chain two operations that are in different branches of a conditional. Check the operation names that you are using. In particular, pay close attention to

the hierarchical decomposition of your design (loops, for example, are separate levels of hierarchy) and its effect on naming.

HLS-16 (error) inconsistent clock net ID

DESCRIPTION

The object designated as the clock net in the *clock* declaration does not match the clock net you used in the HDL.

WHAT NEXT

Create the proper net as the clock. Check for the name being a bit different due to hierarchical naming effects. Use **find net** to see what the names really are.

HLS-17 (error) No clock exists

DESCRIPTION

The HLS process could not find the clock signal.

WHAT NEXT

Use **create_clock** to create a known clock signal. The clock signal should agree with the clock you used in *wait* statements in the HDL text (if you used *wait* statements).

HLS-18 (warning) no reset net

DESCRIPTION

There is no designated reset net.

WHAT NEXT

There is no reset net for this design. This condition means that the design may power on in some unknown state, and never be properly initialized.

HLS-19 (error) non-unique path between locked operations

DESCRIPTION

The objects designated as being locked together do not have a unique timing relationship to one another.

WHAT NEXT

This situation occurs when there is a conditional branch in the execution path from one operation to the next. You cannot lock the objects, but you can constrain them. Use **set_max_cycles** and **set_min_cycles** to define an acceptable envelope. If you need a rigid timing relationship, you must rewrite the HDL to eliminate the conditional or move it away from the locked operations.

HLS-20 (error) Indeterminate path length

DESCRIPTION

The objects designated do not have a statistically determined time interval between them, so the constraint is not enforceable.

WHAT NEXT

Break down the constraint so that the part of the path that isn't determinate (for example, a loop) has a separate constraint that tells how many cycles the loop can take for one iteration. The constraint can then be enforced.

HLS-21 (error) Lock across lexical scopes

DESCRIPTION

The objects designated are at different levels of the design hierarchy, or they are in different subtrees.

WHAT NEXT

You cannot lock these with respect to one another. You can, however, lock them with respect to the boundaries of the hierarchical subtrees they are contained within and then lock the subtrees with respect to one another.

HLS-22 (error) Lock with nonunique path source

DESCRIPTION

The set of objects designated does not contain a single state common ancestor.

WHAT NEXT

For a lock to be meaningful there must be a single state in which the lock begins. Your lock specification contains two or more operations that are on separate execution paths. But each of these operations "begins" the lock. Ask yourself what you want this constraint to enforce. If you really want both operations, replace the constraint with a set of independent constraints, each having only one beginning.

HLS-23 (error) Overconstrained timing.

DESCRIPTION

The system of timing constraints you have given has no solution.

WHAT NEXT

Analysis of your constraints indicates an internal inconsistency. You have asked that no more than four cycles take place between two operations, but these two operations are also constrained elsewhere to be no less than five cycles apart. Somewhere there is a constraint that you must relax.

HLS-24 (error) The named reset net does not exist

DESCRIPTION

The net you have designated as the reset net does not exist, or it is invisible in the current context.

WHAT NEXT

If you are not at the top of the design hierarchy, the net is probably not visible. Otherwise, the net you have named does not exist. Perhaps the name of the net inside the compiler is not the same as the name you gave it. To see what nets are visible, use **find net**.

HLS-25 (error) Could not find an architecture for entity '%s'.

DESCRIPTION

When elaborating a design for scheduling, you must designate an architecture.

WHAT NEXT

If you designated an architecture, and there are errors, correct the errors. If you did not designate an architecture, do so now.

HLS-26 (error) You specified variable '%s' as being mapped to a memory but the variable was never used.

DESCRIPTION

A resource was declared that mapped the defined variable to a memory to be scheduled by behavioral synthesis. But the variable was never used.

WHAT NEXT

Either remove the variable from the resource, or make sure that the variable is used.

HLS-27 (error) The signal or port '%s' was mapped to a memory. Only variables can be mapped to a memory.

DESCRIPTION

Behavioral synthesis requires that only variables be mapped to memories.

WHAT NEXT

Change the declaration of the signal to a variable.

HLS-28 (warning) The variable '%s' was specified multiple times

on the resource '%s'.

DESCRIPTION

In the variable declaration for the designated resource, the named variable was declared more than once.

WHAT NEXT

Declare the variable once only.

HLS-29 (error) The variable '%s' was mapped to a memory, but its type is not an array type.

DESCRIPTION

Variables mapped to memories must be arrays.

WHAT NEXT

Declare the variable as an array.

HLS-30 (error) Binding %s of operator %s for processor %s (instance %s) not found

DESCRIPTION

When instantiating an operation instance, a binding cannot be found for the operator type on the designated processor.

WHAT NEXT

Make sure that the appropriate synthetic library .sldb is specified, and that the processor named actually exists in the .sldb libraries in memory.

HLS-31 (error) Illegal use of variable '%s' in function '%s'./n

Memory slices are not supported.

DESCRIPTION

Your behavioral description has an array that's mapped to a memory or register file. Your array access does not use the full data word length, rather, it uses just a bit slice. We only support memory array access not slices.

WHAT NEXT

Assign the full data word length to a temporary variable and then read the bit slice

HLS-32 (error) Illegal use of variable '%s' in design '%s'. Memory assignments without indexing are not supported.

DESCRIPTION

Currently we only support memory members accessing not slices or the whole array.

WHAT NEXT

Use the loop to do this type of assignments.

HLS-33 (error) Unanalyzable, unsatisfiable timing constraints.

DESCRIPTION

Detected an unsatisfiable timing constraint (as specified by set_cycles, set_min_cycles or set_max_cycles). Unfortunately, this error is unanticipated and Behavioral Compiler does not generate information to allow you to analyze the error using BCView.

WHAT NEXT

Unsatisfiable timing constraints usually result from maximum timing constraints being too tight with respect to minimum timing constraints. Maximum timing constraints are created by set_max_cycles and set_cycles commands, and minimum timing constraints are created by data flow dependencies, set_min_cycles, and set_cycles commands.

If you are unable to proceed based on the information provided by Behavioral Compiler and this manual page, please contact Synopsys support. We apologize for the inconvenience.

HLS-34 (Information) The output of preserved function %s at line %d has type[%d:0].

DESCRIPTION

You receive this message to inform you that the output type of the specified preserved function has been assigned as specified.

Currently, in Behavioral Compiler, the output type of a preserved function in a Verilog design is determined by each consumer, even if the output type has been specified otherwise. In the following example, the output type of the preserved function foo will be [6:0] even though the function foo is specified to be [9:0], because the consumer x has the type [6:0].

```
module test(....)

reg [6:0] x;
reg [9:0] data1;
reg [9:0] data2;
reg [5:0] data3;

function [9:0] foo;
input [9:0] a;
input [9:0] b;
//synopsys preserve_function
begin
    foo = a + b
end

endfunction

always begin: reset_loop
    ....
    x = foo(data1, data2) + data3;
```

WHAT NEXT

If you can accept the type of the specified preserved function as described in the message, no action is required on your part. However, if you want to ensure a certain output type, create a temporary variable that contains the intended preserved function output type. Then, the entire output will propagate correctly.

For example, the following code creates a temporary variable foo_var with value [9:0], and assigns foo() to foo_var. Thus, the output of the preserved function has type [9:0].

```
module test(....)

reg [6:0] x;
reg [9:0] data1;
```

```

reg [9:0] data2;
reg [5:0] data3;
reg [9:0] foo_var;

function [9:0] foo;
input [9:0] a;
input [9:0] b;
//synopsys preserve_function
begin
    foo = a + b
end

endfunction

always begin: reset_loop
    ...
    foo_var = foo(data1, data2);
    x = foo_var + data3;

```

HLS-35 (Warning) Unrolling the loop results in a large number of operations,
this may increase search space and slow down run time%**s**

DESCRIPTION

BC unrolled the for loops by default and sometimes unrolling for loops causes slow down the tool since it will have large number of operations. To speed up the tool, for loops can be kept unroll using dont_unroll attributes.

WHAT NEXT

Please use dont_unroll attribute to keep the loop in rolled.

HLS-36 (Error) The %s argument is obsolete. Please use the write_rtl command instead.

DESCRIPTION

You receive this error message because the **-rtl_script** argument to the **write** command is obsolete. Equivalent functionality is available through the **write_rtl** command.

The **-rules_name** option is no longer necessary.

WHAT NEXT

Use the `write_rtl` command to generate a synthesizable RTL model.

SEE ALSO

`write_rtl` (2).

HLS-37 (error) No time to evaluate condition

DESCRIPTION

A conditional branch is trying to create two initial states in the state graph. This conditional cannot be evaluated in time to create the proper conditional transitions. This situation probably occurred because you began a loop inside a conditional in the first state of a process.

WHAT NEXT

Insert a `wait` to give the machine time to evaluate the condition before it tries to enter the loop. Or move the condition inside the loop.

HLS-38 (error) chained loop begins (fixed i/o timing)

DESCRIPTION

Two loop beginnings occur in the same state, which is illegal in fixed I/O timing mode.

WHAT NEXT

To allow time to evaluate the `exit` condition of the outer loop, separate the loop `begins` by one or more `wait` statements.

HLS-39 (information) All wait statements are followed by an exit. A global synchronous reset with %s polarity has been inferred

for %s.

DESCRIPTION

When all `wait` statements are followed by an `exit` from the main loop, the exits are treated as a global synchronous reset. This treatment allows a more efficient implementation for the exit logic.

WHAT NEXT

This is an information message. No further action is required.

HLS-40 (information) All clock transitions are followed by a disable statement.

A global synchronous reset with %s polarity has been inferred for %s.

DESCRIPTION

When all clock transitions are followed by an exit from the main loop, the exits are treated as a global synchronous reset. This allows a more efficient implementation for the exit logic.

WHAT NEXT

This is an information message. No further action is required.

HLS-41 (error) Port '%s' was assigned to using a non-RTL assignment at line %d. Use the RTL assignment operator '<=' for assignments to ports.

DESCRIPTION

Behavioral synthesis requires that the transitions of all ports be synchronized to clock boundaries. As a result, the RTL assignment operator must be used to assign to ports.

WHAT NEXT

Change the "==" assignment operator to a "<=" every time the port is written to.

HLS-42 (error) The exit statement on line %d in file %s is illegal.

Only global reset exits are allowed to cross loop boundaries.

DESCRIPTION

Currently, the only exits that are allowed to cross loop boundaries are global resets.

WHAT NEXT

Change the invalid statement.

HLS-43 (error) A write operation at the end of '%s' (%s) conflicts with the I/O at the beginning of the loop (%s).

When running in super state mode, please insert a wait statement after the last write in the loop.

DESCRIPTION

When running behavioral synthesis in "super-state" mode, the scheduler is required to make sure that writes in the super-state happen at the end of the super-state, and reads of I/O happen before the writes (and after the writes of the previous super-state). This helps to match simulation behavior.

However, consider the following pseudo-code fragment:

```
while ( <cond> )
    out <= ...
    <<< clock boundary >>>
    out <= ...
end
```

When the loop executes for the second time, the write to port "out" at the end of the loop will conflict with the write to port "out" at the beginning of the loop. In the simulation of the behavioral code, the out at the end of the loop will be overwritten by the out at the beginning of the loop. However, because the scheduler will need to insert more states between the beginning and end of the loop, the behavior of the RTL machine generated would be different. The write to port "out" at the end of the loop would then be visible to the outside world for a few cycles.

To avoid this simulation/synthesis mis-match, it is required that there is a clock boundary between writes at the end of the loop and I/O at the beginning.

WHAT NEXT

Insert a clock boundary (wait in VHDL or always @ in verilog) at the end of the loop (after the last write in the loop).

HLS-44 (error) The write operation '%s' conflicts with I/O at the beginning of '%s' (%s).

When running in super state mode, please make sure that the I/O is broken by a clock boundary (e.g. just before the loop).

DESCRIPTION

When running behavioral synthesis in "super-state" mode, the scheduler is required to make sure that writes in the super-state happen at the end of the super-state, and reads of I/O happen before the writes (and after the writes of the previous super-state). This helps to match simulation behavior.

However, consider the following pseudo-code fragment:

```
out <= ...
while ( <cond> )
    out <= ...
```

When simulating the behavioral code, the write to port "out" before the loop will be over-written by the write to port "out" after the loop. When the design is scheduled, however, cycles will be inserted at the beginning of the loop which will cause the first write to port "out" to be visible for a few cycles. This would cause a simulation mis-match.

WHAT NEXT

Insert a clock boundary (wait in VHDL or always @ in verilog) just before the loop.

HLS-45 (error) The write operation '%s' before the loop
'%s' conflicts with I/O that occurs
after the loop (%s).

DESCRIPTION

When running behavioral synthesis in "super-state" mode, the scheduler is required to make sure that writes in the super-state happen at the end of the super-state, and reads of I/O happen before the writes (and after the writes of the previous super-state). This helps to match simulation behavior.

However, consider the following pseudo-code fragment:

```
out <= ...
while ( <cond> )
    ...
end
out <= ...
```

When the behavioral code is simulated, when "cond" is FALSE, the write to port "out" after the loop will over-write the write before the loop. However, the scheduler will have to insert cycles to see whether or not the loop needs to be evaluated. As a result, the write to port "out" before the loop will become visible to the outside world for a cycle or two.

To prevent this simulation/synthesis mis-match, a clock boundary needs to be inserted to make sure that the two writes to port "out" will not happen in the same cycle in the behavioral code.

WHAT NEXT

Insert a clock boundary (wait in VHDL or always @ in verilog) either just before the loop, or just after the loop.

HLS-46 (error) Write operations occur inside '%s'
just before an exit (%s)
that conflict with I/O that happens after

the loop (%s).

DESCRIPTION

When running behavioral synthesis in "super-state" mode, the scheduler is required to make sure that writes in the super-state happen at the end of the super-state, and reads of I/O happen before the writes (and after the writes of the previous super-state). This helps to match simulation behavior.

However, consider the following pseudo-code fragment:

```
while ( <cond> )
    ...
    if ( <cond2> )
        out <= ...
        exit;
    end if
    ...
end
out <= ...
```

When simulating the behavioral code, the write to port "out" just before the exit will over-write the write to port "out" after the loop. However, if the scheduler were to insert cycles between the two writes to port "out", the simulation behavior would be different.

WHAT NEXT

The easiest thing to do is to insert a clock boundary (wait in VHDL or always @ in verilog) after the end of the loop.

The other option would be to insert a clock boundary before every exit from the loop.

HLS-47 (error) The design contains parallel paths where one path is broken by clock boundaries, and another path is not. This is not allowed in super-state mode. The paths start from the if/case statement on line %s in file %s.

A wait statement is located on line %d in file %s.

DESCRIPTION

Consider the following code fragment:

```
if ( <cond> )
    <<< clock boundary >>>
end
```

The conditional clock boundary causes problems because the scheduler is not able to divide the circuit up into "super-states". The I/O that happens before the "if" statement may or may not occur in the same cycle as the I/O that happens after the "if" statement.

WHAT NEXT

Either remove the clock boundaries (wait in VHDL or always @ in verilog) along the parallel paths that contain them, or else insert clock boundaries in the paths where they are missing.

HLS-48 (error) Missing clocks in design.

DESCRIPTION

A clock, and a clock period, must be defined for each behavioral process before a design is scheduled. This is necessary in order to determine if an operation can fit into one cycle, or multiple cycles, or if multiple operations can fit into a single cycle.

WHAT NEXT

Make certain every signal which "clocks" a behavioral process (by virtue of being used in the wait statements of the process) has been used in a create_clock command after the design has been elaborated. The create_clock command specifies the signal that is the clock and the clock period.

HLS-49 (error) No license for behavioral synthesis.

DESCRIPTION

Could not find a license for behavioral synthesis.

WHAT NEXT

Make certain that you have a license and that the license is properly installed before next trying to use the behavioral synthesis product.

HLS-50 (Warning) Reset declarations of user and HDL clash: non-equivalent simulation may result.

DESCRIPTION

The user has declared a reset net, and there is (apparently) a reset net implicit in the HDL text: the user's reset net will be used.

WHAT NEXT

The reset net declared by the Design Compiler command will override any automatic inference of reset net and reset sense (true high or low) that can be derived from the HDL description. However, this may cause a clash between the behaviors of the synthesized design and the original HDL, particularly in the case where a true-low or negated signal is used. In any case, the user encountering this warning should make up his or her mind as to which reset methodology is to be used: and then either (1) declare an implicit reset net and delete all references to it from the architecture of the HDL, or else (2) make sure that there is a conditional main-loop exit after each and every wait of the HDL, and delete all references to the reset net from the Design Compiler session and/or script. It is mixing these two strategies that causes the warning to be issued.

HLS-51 (error) Unsatisfiable Timing Constraints

DESCRIPTION

Detected an unsatisfiable timing constraint (as specified by `set_cycles`, `set_min_cycles` or `set_max_cycles`).

WHAT NEXT

Unsatisfiable timing constraints usually result from maximum timing constraints being too tight with respect to minimum timing constraints. Maximum timing constraints are created by `set_max_cycles` and `set_cycles` commands, and minimum timing constraints are created by data flow dependencies, `set_min_cycles`, and `set_cycles` commands.

HLS-52 (error) Fixed IO schedule is unsatisfiable

DESCRIPTION

Two or more fixed operations in the HDL source have too much summed path delay between them to be scheduled in fixed i/o mode. Move the operations, add waits, or relax the clock.

WHAT NEXT

In fixed IO mode, the wait statements in HDL source code specify partial schedules for input/output operations and loop begins and ends. If the critical path between two fixed events is longer than the distance between them, then a satisfactory schedule cannot be constructed. You can either insert wait statements, or relax your clock period, to increase the amount of time available to perform the operations you have specified.

HLS-53 (error) Error in building synthetic operators.

DESCRIPTION

An error occurred in building the operators in this design. Since the operator timings are needed for behavioral synthesis, this results in an abort of the scheduling of the design.

WHAT NEXT

Check your synthetic library variables and licenses.

HLS-54 (error) Clock sense is incompatible with HDL text.

DESCRIPTION

Somewhere in the HDL text you have said that the active clock edge is either rising or falling. Then you issued a command to set the active clock edge. But the command did not agree with the text.

WHAT NEXT

Get your story straight and try again. You don't have to specify the edge in both the HDL and in Design Compiler; try just doing it in one place or the other. But if you must do both, at least get it consistent.

HLS-55 (error) At line %d, a clock event is being checked using an 'if' statement. Checking for clock edges using if statements is not supported when elaborating for scheduling. Please use wait statements instead.

DESCRIPTION

When elaborating a design for scheduling, users are not allowed to check for clock edges using if statements. For example, the following is not supported:

```
process ( clk ) begin
    if ( clk'event and clk = '1' ) then
    .
    .
    .
    end if;
end process;
```

Instead, you should use something like the following:

```
process begin
    wait until clk'event and clk = '1';
    .
    .
    .
end process;
```

WHAT NEXT

Change the "if (clk'event)" to a "wait until clk'event".

HLS-56 (error) The always block at line %d checks a clock edge in its timing control. When elaborating a design for scheduling, you are not allowed to check clock edges in the timing control of always blocks. Instead, clock edges should be checked for in

the body of the block.

DESCRIPTION

When elaborating for scheduling, you are only allowed to check for clock edges inside the body of the block. For example, the following form is illegal:

```
always @ ( posedge clk ) begin
.
.
.
end
```

Instead, please use the following format:

```
always begin
  @ ( posedge clk )
.
.
.
end
```

WHAT NEXT

Modify the verilog source to test the clock edge inside the body instead of inside the block's timing control.

HLS-57 (error) When elaborating for scheduling, instantiated components are not supported. An instantiated component was found on line %d in file '%s'

DESCRIPTION

Instantiated components are not allowed inside designs that are being elaborated for scheduling.

WHAT NEXT

Either remove the instantiated component, or move the component to a higher level design (i.e. the design that instantiates the behavioral design).

HLS-58 (error) When elaborating a design for scheduling, there only one block is allowed. The design '%s' contains blocks at lines %d and %d.

DESCRIPTION

Designs that are elaborated for scheduling are only allowed to have one block (i.e. one process in VHDL and one always block in verilog).

WHAT NEXT

Either split the blocks into multiple designs, or merge the blocks together.

HLS-59 (error) The block at line %d has multiple clocks (%s and %s).

Multiple clocks are not supported when elaborating for scheduling.

DESCRIPTION

A block that is elaborated for scheduling can only be triggered by a single clock.

WHAT NEXT

Remove one of the clocks from the block.

HLS-60 (error) When elaborating for scheduling, clocks must be single-bit ports. At line %d, variable %s

is used as a clock.

DESCRIPTION

Clocks when elaborating for scheduling must be single bit ports.

WHAT NEXT

Remove the illegal clock statement, and replace it with a clock that is triggered by a port.

HLS-61 (error) When elaborating for scheduling, clocks must be single-bit ports. The multi-bit port '%s' was used in design '%s'.

DESCRIPTION

It is illegal to use a multi-bit port as a clock when elaborating for scheduling.

WHAT NEXT

Use a single-bit port as the clock.

HLS-62 (error) The wait statement at line %d is not supported when elaborating for scheduling.

DESCRIPTION

WHAT NEXT

HLS-63 (error) The port '%s' at line %d in design '%s' is an inout port.

Inout ports are not supported when elaborating for scheduling.

DESCRIPTION

Inout ports are not currently supported by scheduling.

WHAT NEXT

In verilog, change the port from an inout to either an input or an output port. For VHDL, change the port to either buffer, in, or out.

HLS-64 (error) The edge specification used on line %d is not supported
when elaborating for scheduling.

DESCRIPTION

When elaborating for scheduling, only positive or negative edges are supported.

WHAT NEXT

Change the edge specification.

HLS-65 (error) The variables that are mapped onto memory '%s' contain indices that overlap. Currently, variable indices are not allowed to overlap.

DESCRIPTION

When multiple variables are mapped onto the same memory, the indices of the variables must be non-overlapping. In future releases, we may support re-mapping of array indices, but currently the indices specified by the user are the ones that are used.

WHAT NEXT

Change the array indices so that they are non-overlapping.

HLS-66 (error) Indexes into array types must be done using an integer index. The access to variable '%s' (resource '%s') at line %d is not an integer.

DESCRIPTION

Accesses to arrays must be done using integer types.

WHAT NEXT

Change the index into the array to be an integer type.

HLS-67 (error) Specified clock period is insufficient.

Available clock period(%f) = specified clock period(%f) - margin(%f).

DESCRIPTION

The clock period specified is insufficient. Behavioral Compiler must reserve a part of the clock period to account for FSM delay, FF setup and register clock-to-Q delay. This reserved part is called the margin. The available clock period is the specified clock period minus the margin. Datapath operations are scheduled in the available clock period.

This error message is generated if the margin exceeds the specified clock period, leaving no available clock period in which operations can be scheduled.

WHAT NEXT

Please make sure the clock period specified (using the `create_clock` command) is a positive value and is larger than the margin that Behavioral Compiler reserves. The margin can be viewed and adjusted using the `bc_margin` command.

HLS-68 (error) Scheduled designs must have exactly one clock signal.

`%d` were found.

DESCRIPTION

A process to be scheduled is allowed to have exactly one clock signal. Any other number is wrong and will cause scheduling to exit.

WHAT NEXT

Either declare a clock using `create_clock`, or don't declare so many clocks. Be careful, if you have used explicit references to a clock in wait statements, that the clock you declare is the same as the clock in all of your wait statements.

HLS-69 (error) Failed to Find a Legal Schedule

DESCRIPTION

Scheduling has failed to find a legal schedule. An illegal schedule is one in which operations bound to the same architectural resource (e.g., read/write operations on the same RAM) are scheduled into overlapping csteps, or operations are scheduled into skipped csteps (e.g., csteps between an exit and loop-end). This usually happens due to low scheduling effort, or due to tight timing constraints.

WHAT NEXT

First, make sure that the number of cycles specified allows sequential scheduling of operations bound to the same resource. Second, use timing constraints to guide scheduling (e.g., use "set_cycles" to sequence operations bound to the same resource). Third, try a higher scheduling effort level and/or a higher number of cycles.

HLS-70 (error) The process at line %d is inside of a generate statement.

This is not allowed when elaborating for scheduling.

DESCRIPTION

Processes are not allowed inside of generate statements.

WHAT NEXT

Remove the generate statement.

HLS-71 (error) The design has already been scheduled.

DESCRIPTION

You have passed a design to scheduling that has already been scheduled. Essential data has been stripped off the design.

WHAT NEXT

You should re-elaborate the design.

HLS-72 (error) The design has no schedule report information.

DESCRIPTION

You have asked for a report on the scheduling of a design that does not have any scheduling report data attached to it.

WHAT NEXT

Most likely you have asked for a scheduling report after changing the current design or after loading a .db file that was not created by scheduling. That is, the file and/or design is simply not annotated with the scheduling information. You should check the file and how it was generated. If necessary, re-run scheduling to generate a new db file.

HLS-73 (error) Failed to allocate hardware for '%s'.

DESCRIPTION

You receive this message because Behavioral Compiler is unable to allocate hardware for the design. The most likely cause of this failure is that incompatible operations have been constrained to the same processor. Synthesis libraries do not have any one component that can execute all of these operations.

An example of a pair of incompatible operations is an addition and a memory read operation. A memory usually cannot perform an addition and so the two operations cannot be executed on the same processor.

WHAT NEXT

Review your synthesis script for commands that constrain operations and variables to the same hardware resource. Examples of such commands are **set_common_resource** and **set_exclusive_use**.

Review the output of these commands in your synthesis log to verify any incompatible operations that are being constrained and remove those constraints.

Use the **bc_set_implementation** command with the **-list_valid** option to list hardware that can implement the operations you attempted to constrain.

SEE ALSO

bc_set_implementation (2), **set_common_resource** (2), **set_exclusive_use** (2).

HLS-74 (Error) Unable to schedule loop '%s'.

DESCRIPTION

You receive this error message because the **schedule** command is unable to schedule the specified loop. The loop violates a scheduling restraint.

For further information about interpreting the report, refer to the one of the following user and modeling guides:

- *Behavioral Compiler VHDL User and Modeling Guide*
- *Behavioral Compiler Verilog User and Modeling Guide*
- *SystemC Compiler User and Modeling Guide*

WHAT NEXT

Resolve the scheduling constraint violation by modifying your behavioral source code or synthesis script so that the number of required clock cycles is less than or equal to the number of available clock cycles.

Study the contributing constraints or relationships listed in the constraint violation table. Your modifications to the behavioral source code and synthesis script will need to reconcile these constraints.

The constraints and relationships are described below. They are listed alphabetically based on the name of the constraint or relationship as it appears in the constraint violation table.

assigned clock cycle The **schedule** command has scheduled the two operations to occur the specified number of clock cycles apart.

Use the **set_cycles**, **set_min_cycles**, and **set_max_cycles** commands to control how these operations are scheduled relative to one another.

conflicting array accesses The two operations might access the same array location, causing the array accesses conflict. In order to prevent the conflict, the accesses must not occur in the same clock cycle.

For more information about conflicting array accesses, refer to the man pages for the **bc_report_memories** command if your array is mapped to a memory, or the man pages for the **bc_report_arrays** command if your array is mapped to a register file.

control dependency Operations inside an *if* or *case* conditional branch must be executed after the conditional branch is evaluated and before the conditional branch ends.

data dependency A data dependency exists between two operations if the output of one operation is the input of a second operation.

inferred clock cycle (cycle fixed mode) In cycle-fixed I/O scheduling mode, the **schedule** command counts the number of clock statements between I/O-related operations in your behavioral source code, and executes the operations in exact clock cycles.

The types of I/O-related operations are

- Reads and writes of I/O ports
- Reads and writes of signals
- Loop boundaries (`begin`, `end`, `continue`, `exit`).

inferred constraint The **schedule** command has inferred a dependency to prevent the operations from being scheduled in inappropriate clock cycles.

Modify other constraints and relationships to accommodate the inferred constraint.

inner pipelined loop latency This constraint reflects the latency you specified for a pipelined loop.

loop latency This constraint is the number of clock cycles needed to execute one iteration of the loop.

Modify the loop latency using the **set_cycles**, **set_min_cycles**, or **set_max_cycles** command to constrain the beginning and end of the loop.

loop pipelining exit requirement Exits from a pipelined loop must occur within the initiation interval to ensure their occurrence before the next iteration of the loop starts.

loop pipelining flush requirement After exiting a pipelined loop, the FSM controller waits for all remaining iterations of the pipeline to finish. The number of clock cycles for completion depends upon the latency and the initiation interval.

loop pipelining latency This constraint reflects the latency you specified for a pipelined loop.

loop precedence Operations inside a loop must execute after the loop begins and before it ends.

multicycled combinational delay The operation has a combinational delay that exceeds the available clock period. The available clock period is specified with the **create_clock** command minus the clock cycle margin.

pipelined loop carried dependency Loop carried dependencies are data dependencies that span successive iterations of a loop. The producer of the data is in one iteration and the consumer is in another.

The pipelined loop carried dependency ensures that the producer is executed at a clock cycle equal to or earlier than the clock cycle of the consumer.

precedence This constraint indicates a precedence between the two operations that requires the first operation to occur earlier or at the same clock cycle as the

second operation.

registered control You have a conditional expression whose value must be computed at least one clock cycle before operations within the conditional branches can be executed.

This occurs under one of the following conditions:

- You have used the **register_control -outputs** command to specify that the generated FSM controller for your design must have registered outputs.
- The operation in a conditional branch is a multicycled operation. The condition must be held in a register for the duration of the operation.
- The operation in a conditional branch is mapped to a synthetic operator whose inputs are required to be held stable over a clock cycle. Properties of operator inputs are specified in the synthetic library containing the operator.

registered input The inputs of the second operation must be computed one clock cycle earlier.

This occurs under one of the following conditions:

- You have used the **register_control -inputs** command to specify that the generated FSM controller for your design must have its inputs registered.
- The second operation is a multicycled operation. The inputs to the operation must be held stable for the duration of the operation.
- The operation is mapped to a synthetic operator whose specification in the synthetic library requires it to have stable inputs.

required clock cycle The **schedule** command has inferred a dependency to prevent the operations from being scheduled in inappropriate clock cycles.

Modify other constraints and relationships to accommodate these requirements.

resource capacity dependency One or more of the operations are mapped to synthetic operators bound to synthetic components with resource capacity limits. In order to satisfy the resource capacity limits, the two operations must be executed in different clock cycles.

An example is an array that is mapped to a single-port memory. All array accesses are mapped to memory access operators and these are implemented on memory ports. Since the memory has only one port, no two array accesses can be executed in the same clock cycle.

The constraint or relationship string contains information regarding the component instance name and the specific resource provided by that component that is limited.

sequential operation state transition An operation is mapped to a synthetic operator (for example, `mult_2_stage_UNS_OP`) implemented on a sequential component (for example, `DW02_mult_2_stage`). This constraint indicates that the two stages of the sequential component must be executed in separate clock cycles.

superstate i/o ordering This constraint reflects the relationships between read and write to I/O ports or signals in superstate-fixed I/O scheduling mode.

- All read and write operations in one superstate occur at least one clock cycle before those in the next superstate.

- All write operations belonging to the same superstate execute in the clock cycle corresponding to the trailing superstate boundary (clock statement).
- All read operations belonging to the same superstate execute at least one clock cycle after the leading superstate boundary (clock statement) and at or before the trailing superstate boundary (clock statement).

superstate ordering Consecutive clock statements (superstates) in your code are executed at least one clock cycle apart.

unchainable The first operation produces data that is used by the second operation. The two operations cannot be executed in the same clock cycle because the cumulative delay through the synthetic components that implement them exceeds the available clock period. The available clock period is specified with the **create_clock** command minus the clock cycle margin.

unchainable across loop iterations The second operation produces data that is used by the first operation in the next iteration of the loop. The two operations cannot be executed in the same clock cycle because the cumulative delay through the synthetic components that implement them exceeds the available clock period. The available clock period is specified with the **create_clock** command minus the clock cycle margin.

unchainable(memory read) The operations feeding data to or getting data from the memory read operation cannot be executed in the same clock cycle as the memory read. This requirement is defined by the synthetic library description of the memory implementing the memory read.

unchainable(memory write) The operations feeding data to the memory write operation cannot be executed in the same clock cycle as the memory write. This requirement is by the synthetic library description of the memory implementing the memory write.

user 'chain_operations' This reflects a constraint set with the **chain_operations** command.

user 'dont_chain_operations' This reflects a constraint set with the **dont_chain_operations** command.

user 'set_cycles' This reflects a constraint set with the **set_cycles** command.

user 'set_max_cycles' This reflects a constraint set with the **set_max_cycles** command.

user 'set_min_cycles' This reflects a constraint set with the **set_min_cycles** command.

user 'set_common_resource' This reflects a constraint set with the **set_common_resource** command. In order to satisfy the resource capacity limit specified, the two operations must be scheduled in different clock cycles.

SEE ALSO

schedule (2).

HLS-75 (Error) Unable to schedule loop '%s'.

DESCRIPTION

You receive this message because the **schedule** command has encountered a scheduling constraint violation and is unable to complete scheduling the loop.

Scheduling constraints are caused by behavioral code constructs and synthesis commands. The HLS-74 man page lists the various scheduling constraints.

The report that immediately precedes this error message contains details about the violation.

WHAT NEXT

In most cases, this error is caused by operations or code constructs that are forced to execute in the same clock cycle.

Use scheduling constraint commands such as **set_cycles**, **set_min_cycles**, and **set_max_cycles**, to force the operations or code constructs to be executed in different clock cycles.

For further information about resolving scheduling constraint violations, see the HLS-74 man page.

SEE ALSO

HLS-74 (n).

HLS-78 (error) The requested FSM table file cannot be opened.

DESCRIPTION

You have asked for a file that contains data on the FSM state table and output pin assignments. The file name you have given cannot be opened.

WHAT NEXT

Check write permissions on the directory in question. Check for the existence of a file of the same name with no write permission. Check disk quotas and availability.

HLS-79 (error) Internal error: no next state.

DESCRIPTION

Something has gone seriously wrong inside the scheduler's control unit generator. It has created a state that has no next state under any circumstances.

WHAT NEXT

File a bug report. Try rewriting your HDL with different loop exits, continues, and nesting structures.

HLS-80 (error) Cannot open schedule report file

DESCRIPTION

I cannot open the desired file for some reason.

WHAT NEXT

Try another file name, another disk, another directory, or making some space on your current disk. Check protection on the current directory.

HLS-81 (error) Current design is not for HLS

DESCRIPTION

The current design is not set up properly for HLS.

WHAT NEXT

The current design may not be the top level design, it may not have been elaborated using the proper scheduling flag, or it may simply be inappropriate as a scheduling target.

HLS-82 (error) The reg '%s' is driven in block '%s' and in block '%s'. Currently, when elaborating for

scheduling, a reg may only be driven in a single block.

DESCRIPTION

There are two always blocks that both drive the same reg. This is currently not supported when elaborating for scheduling.

WHAT NEXT

Re-write the source code so that the reg is only driven in a single block.

HLS-83 (error) The signal '%s' is driven in process '%s' and in process '%s'. Currently, when elaborating for scheduling, a signal may only be driven in a single process.

DESCRIPTION

There are two processes that both drive the same signal. This is currently not supported when elaborating for scheduling.

WHAT NEXT

Re-write the source code so that the signal is only driven in a single process.

HLS-84 (warning) No area information for operation %s.

DESCRIPTION

No area estimate is available for the operation. This can adversely impact overall quality of results.

WHAT NEXT

Area estimates are derived from cached model entries that are generated before scheduling.

Specify a cache read directory that has entries for the operations that are contained in the behavioral description, or specify a (writeable) cache write directory and .

HLS-85 (warning) Unknown annotation style.

DESCRIPTION

Known styles are "pre" and "post".

WHAT NEXT

This is not normally set by the user. "Pre" means that there will be a register between the control unit outputs and the datapath control inputs. "Post" means this will not be present. In some cases it may be necessary to override the user's choice to assure functional correctness. The default is "post".

HLS-86 (error) Operator name '%s' not found in Synthetic Libraries

DESCRIPTION

The specified operator name is not defined in any of the current synthetic libraries.

WHAT NEXT

Add the appropriate synthetic library to the list, synthetic_library.

HLS-87 (error) No schedulable process

DESCRIPTION

There is no process of that name that can be scheduled.

WHAT NEXT

The process(es) you have named (or the default processes if you did not name any) is not schedulable. Hence the command you have issued is not appropriate. If you are not sure what the proper process is, try 'find'. If you didn't use the -s flag in elaborate, you must elaborate with the -s flag.

HLS-88 (error) Bad edge constraint

DESCRIPTION

You cannot constrain a loop without using either the from_begin, from_end, to_begin, or to_end flags.

WHAT NEXT

Review the design and reissue the constraint using a flag that means what you want. The default for ordinary operations is to constrain with respect to the beginning; but no such default exists with loop or other structured operations.

HLS-89 (error) Bad hierarchy

DESCRIPTION

The constraint algorithm has encountered an unexpected situation in the hierarchy of your design.

WHAT NEXT

It appears that the object you wish to constrain is not contained within (i.e. it is not a cell of) any other object. As such, it is impossible to constrain it. If you wish to constrain the outermost loop of a process, which contains all of the behavior of the process, you should constrain the process itself.

HLS-90 (error) No load enable register in the standard synthetic library.

DESCRIPTION

There is no load enable register in the standard synthetic library. This register is necessary to calculate the area costs of registers for behavioral synthesis.

WHAT NEXT

Since this register description should be in the standard synthetic library, this error is most likely due to an improper installation of the Synopsys tools. Please contact your system administrator.

HLS-91 (warning) Inconsistent pipelined loop (simulation may not match)

DESCRIPTION

A pipelined loop has been given one number of cycles by implicit scheduling using fixed i/o timing mode, and another number of cycles by a user command that establishes loop pipelining initiation interval and latency. The result is that you should not expect simulation of the scheduled and unscheduled designs to match.

WHAT NEXT

If this really matters to you, you should probably rewrite your HDL so that the fixed i/o mode interpretation will match the loop pipeline parameters you have given. You could also use superstate-fixed mode.

HLS-92 (error) No reset signal polarity

DESCRIPTION

There is a reset signal but whether it is true high or true low has not been specified.

WHAT NEXT

Use the `set_implicit_reset_signal` command to state the proper polarity.

HLS-93 (error) No ending endpoint for timing constraint

DESCRIPTION

You must use a "to", "to_begin", or "to_end", or you must state a valid cell at which the constraint can end.

WHAT NEXT

Use the `find cell` command to find an appropriate cell to begin the constraint; then use the appropriate flag to state which timing edge of the cell you want to specify. If the cell is a single-cycle operation, it doesn't matter which you use.

HLS-94 (error) No beginning endpoint for timing constraint

DESCRIPTION

You must use a "from", "from_begin", or "from_end", or you must state a valid cell from which the constraint can begin.

WHAT NEXT

Use the find cell command to find an appropriate cell to begin the constraint; then use the appropriate flag to state which timing edge of the cell you want to specify. If the cell is a single-cycle operation, it doesn't matter which you use.

HLS-95 (error) Multiple conflicting constraint endpoints

DESCRIPTION

The constraint has multiple from or to endpoints that are in conflict with one another.

WHAT NEXT

Use multiple constraint commands to accomplish this kind of goal. You aren't allowed to use more than one of each kind of endpoint specifier (from or to) in one constraint command.

HLS-96 (error) No target library

DESCRIPTION

I am unable to find a target library.

WHAT NEXT

The DC variable "target_library" should be set to the name of the desired technology library.

HLS-97 (warning) The delay specified on the write to signal '%s' on line %d is %d which is not an exact multiple of the cycle time %d.

%d cycles will be used for the delay.

DESCRIPTION

When using the after statement with the Behavioral Compiler, the delay specified must be an exact multiple of the clock period.

WHAT NEXT

Modify the delay in the hdl source to be an exact multiple of the clock period.

HLS-98 (error) The delay on the write to signal '%s' at line %d causes the assignment to be pushed outside of the enclosing loop. In order for synthesis to match simulation, this requires loop pipelining. However, the enclosing loop contains exits, and loop pipelining is not currently allowed in loops with exits.

DESCRIPTION

When a signal is delayed such that its assignment occurs outside of the enclosing loop, the loop must be pipelined in order to match simulation. However, in the current release, loop pipelining is only allowed inside of loops with no exit statements.

WHAT NEXT

If you do not want pipelining, either decrease the delay on the signal or add more waits inside of the loop. If you do want pipelining, you will have to remove the exits in the loop (note that while loops have an implicit exit).

HLS-99 (error) The delay on the write to signal '%s' at line %d causes the assignment to be pushed outside of the enclosing block. In order for synthesis to match simulation, this requires loop pipelining. However, the enclosing block

is not a loop so no loop pipelining can occur.

DESCRIPTION

If a delayed write causes the assignment to be pushed outside of a preserved function call, it is an error as there is no way to match simulation.

WHAT NEXT

Either add more wait statements to the function, or decrease the delay on the assignment.

HLS-100 (information) The delay on the write to signal '%s' at line %d causes the assignment to be pushed outside of the enclosing block. In order for synthesis to match simulation, this requires loop pipelining. The loop will be pipelined with an initiation interval of %d and a latency of %d.

DESCRIPTION

When a signal is delayed such that its assignment occurs outside of the enclosing loop, the loop must be pipelined in order to match simulation. The loop will be automatically pipelined in order to match simulation.

WHAT NEXT

HLS-101 (warning) The %s is delayed by %d cycles. However, delayed assignments are only supported for fixed-I/O mode. The delay will be ignored.

DESCRIPTION

Delayed assignments are supported only during fixed I/O scheduling.

WHAT NEXT

If the hdl code depends on the delay, either use fixed I/O scheduling, or rewrite the hdl so that it no longer depends on the delayed assignment.

HLS-102 (error) Object to be extruded is not a cell

DESCRIPTION

You cannot extrude any object except a cell.

WHAT NEXT

Check that the arguments you are passing to the `extrude` command are in fact cells.

Be careful that the design owning the cells you are extruding is not used in another design or that it has already got dummy pins with the correct names. Otherwise a link error will occur.

HLS-103 (error) Must have a Design Compiler Expert license to compile a design for behavioral synthesis.

DESCRIPTION

Behavioral Compiler requires a Design Compiler Expert license to time the design (before scheduling), as well as when mapping a design that has been scheduled to gates.

WHAT NEXT

HLS-104 (information) Set loop '%s' to have initiation interval of %d cycles and latency of %d cycles.

DESCRIPTION

Executing the command "pipeline_loop"

WHAT NEXT

HLS-105 (error) Loop '%s' cannot be set to latency of %d cycles because its member node %s is fixed at %d cycles after the loop begins.

DESCRIPTION

WHAT NEXT

HLS-106 (error) Loop '%s' cannot be loop-pipelined because it contains exits

DESCRIPTION

WHAT NEXT

HLS-107 (error) Loop '%s' cannot be set to initiation interval of %d cycles and latency of %d cycles because %d is not an even multiple of %d

DESCRIPTION

WHAT NEXT

HLS-108 (error) Loop '%s' cannot be loop pipelined because it

contains nested loop '%s'

DESCRIPTION

WHAT NEXT

HLS-109 (warning) Delayed assignments require the transport keyword in order for synthesis to match simulation.
The transport keyword is missing on line %d in file %s.

DESCRIPTION

Delayed assignments are supported when elaborating for behavioral synthesis, but the delay is synthesized as a "transport delay" instead of the default "intertial delay". The syntax of the transport delay is:

```
out <= transport f(in) after 100 ns;
```

WHAT NEXT

Add the transport keyword to the delayed assignment.

HLS-110 (warning) The loop '%s' was specified multiple times as dont_unroll.

DESCRIPTION

This warning message occurs when multiple resources are declared that specify the named loop as being *dont_unroll*.

For example:

```
/* synopsys resource R1 : dont_unroll = "L1 L1"; */
```

WHAT NEXT

Remove the named loop.

HLS-111 (warning) A `dont_unroll` attribute was specified for a loop named '`%s`', but the loop could not be found.

DESCRIPTION

This warning message indicates that the user attempted to set a `dont_unroll` attribute on a loop that doesn't exist.

WHAT NEXT

Do one of the following: correct the `dont_unroll` attribute to point to an existing loop; create the specified loop; or remove the `dont_unroll` attribute.

HLS-112 (error) A reset has already been inferred from the HDL by elaborate

DESCRIPTION

The stated reset signal conflicts with one already inferred from the HDL text.

WHAT NEXT

Check the name of the reset signal in the HDL text. The name may be different for different processes, so you must identify which process you mean. If you insist on the reset signal you gave in the command, you may have to change the name in the HDL text.

HLS-113 (error) Reset signal polarity clash

DESCRIPTION

The reset signal polarity clashes with that given in the HDL description.

WHAT NEXT

It may be necessary to correct this condition on a process-by-process basis. Check the HDL text as well; something may be happening that you did not intend to cause.

HLS-114 (error) Inconsistent reset signal polarity

DESCRIPTION

The reset cannot be both true high and true low.

WHAT NEXT

Use either high or low for this flag, but not both.

HLS-115 (error) Either true or false

DESCRIPTION

The reset signal must be declared "asynchronous" or "not asynchronous."

WHAT NEXT

The default is synchronous (false). If you want to set or reset this flag, you must use the flag value (asynchronous is TRUE or FALSE).

HLS-116 (error) Invalid i/o mode flag

DESCRIPTION

The valid options are *cycle_fixed*, *superstate_fixed*.

WHAT NEXT

The reference manual describes what each option means.

HLS-117 (Information) Design has already been timed.

DESCRIPTION

Because the design has already been timed for Behavioral Compiler, it will not be timed again unless the **bc_time_design -force** command is used.

WHAT NEXT

The **bc_time_design -force** command should be used if the technology or synthetic libraries have changed since the design was last timed.

HLS-118 (warning) The for loop on line %d uses the iterator '%s' that is larger than necessary to cover the range of the loop. '%s' is defined on line %d with a bit-width of %d. The range of the loop is %d to %d which only requires the iterator to have a bit-width of %d. This will create inefficient logic if the for loop is not unrolled when elaborating for Behavioral Compiler.

DESCRIPTION

Consider the following example:

```
integer i;  
.  
.  
.  
for ( i = 0 ; i < 10 ; i = i + 1 ) begin : for1  
.  
.  
.  
end
```

Note that "i" is declared to be an integer, which is defined as a 32-bit value. Because the for loop is not unrolled, it builds an adder and a comparator inside the loop to increment the iterator and to check the bounds of the iteration. With a 32-bit iterator, the incrementor and the comparator are built larger than necessary. In the above example, if the "integer i" was replaced with "reg [3:0] i", only a 4-bit adder and incrementor would be built.

Note that if the for loop is unrolled (always in regular elaboration, and the default in elaboration for Behavioral Compiler), this problem does not exist. When unrolling the loop, the iterator is treated as a series of constants, and the size of the iterator is irrelevant.

WHAT NEXT

To reduce the size of the arithmetic operators used inside the *for* loop, the size of the iterator can be reduced to the designated value.

Be aware, though, that if the iterator is used in other sections of the code, these other sections may be relying on the larger size of the variable. In such a case, you may want to declare a dedicated variable that will be used only in the *for* loop.

HLS-119 (warning) The iterator '%s' is used in the for loops on lines %s that are not being unrolled.

The bit-widths required by the loops (%s) are different, and it might be more efficient to declare separate iteration variables for each for loop.

DESCRIPTION

Consider the following example:

```
reg [9:0] i;  
. . .  
for ( i = 0 ; i < 10 ; i = i + 1 ) begin : for1  
. . .  
end  
. . .  
for ( i = 0 ; i < 1023 ; i = i + 1 ) begin : for2  
. . .  
end
```

The first *for* loop requires only a 4-bit iterator, and the second *for* loop requires a 10-bit iterator. Because the same iterator is used for both loops, however, 10-bit arithmetic operations are built in the first loop.

Note that this is relevant only when elaborating for Behavioral Compiler and when the *for* loops are not unrolled.

WHAT NEXT

Defining a separate iterator for each loop allows the first loop to use 4-bit

arithmetic units. This may create more efficient logic (however, if the registers and arithmetic units are shared between the two loops, it might not really matter).

HLS-120 (error) The for loop on line %d uses the iterator '%s', which is too small to cover the range of the loop.
'%s' is defined on line %d with a bit width of %d.
The range of the loop is %d to %d, which requires the iterator to have a bit width of at least %d.

DESCRIPTION

Consider the following example:

```
reg [1:0] i;  
. . .  
for ( i = 0 ; i < 10 ; i = i + 1 ) begin : for1  
. . .  
end
```

Note that *i* is declared to be only 2 bits wide, but *i* must be able to store integers as high as 10. The iterator variable *i* must be declared to have at least 4 bits so that it can store all of the possible values of the *for* loop.

A special case is the condition where the range of the *for* loop exactly covers the range of the iterator. Consider the following example:

```
reg [3:0] i;  
. . .  
for ( i = 0 ; i <= 15 ; i = i + 1 ) begin : for1  
. . .  
end
```

At first glance, it appears that the variable *i* has been declared wide enough to cover the range of the *for* loop. A *reg* that is declared [3:0] can represent numbers in the range of 0 to 15.

However, a closer look at the example reveals that the above *for* loop will never terminate. The loop will terminate only when the value of *i* is greater than 15. Because the *reg* *i* can represent values in the range of only 0 to 15, *i* will never be greater than 15, and the loop will not terminate.

WHAT NEXT

Declare the bit width of the iterator variable to be large enough to store a value of at least 1 + the loop range.

HLS-121 (error) Could not write data file

DESCRIPTION

The data file that is normally passed from the shell to the scheduling process could not be written.

WHAT NEXT

Check the write permissions and the hierarchical structure of the design. You may have loaded a bad design.

HLS-122 (warning) License cannot be recovered

DESCRIPTION

The behavioral license you checked out manually has been lost.

WHAT NEXT

If you need it, you must check it out again manually.

HLS-123 (error) The memory '%s' is being passed in as an argument to routine '%s' at line %d. This is not allowed when elaborating for scheduling.

DESCRIPTION

Users are not allowed to pass whole memories as arguments to functions or procedures.

However, users can access the variable directly inside of the function or procedure. This means that the function must be declared in the scope of the variable that represents the memory. In VHDL, this means declaring the function inside the

declarative region of the process (the same place where variables are defined). In Verilog, this simply means defining the variable and the subprogram at the same level.

WHAT NEXT

Either rewrite the code to access the memory directly (moving the definition of the function to the scope of the variable if necessary) or restructure the code so that the memories are not accessed inside of subprograms.

HLS-124 (warning) The operator '%s' and the module '%s' are connected by more than one sequential binding, one of which is the binding '%s'.

DESCRIPTION

Behavioral Compiler uses the first sequential binding it encounters for a given combination of operator and module. All other bindings are ignored.

WHAT NEXT

Prune the sequential bindings down to a single binding for each operator/module pair, so that you know which binding is being used.

HLS-125 (warning) The check_bindings command cannot verify the sequential binding '%s' of module '%s'

DESCRIPTION

The **check_bindings** command is restricted to combinational bindings. The aforementioned sequential binding will be skipped.

WHAT NEXT

Sequential bindings must be checked manually.

HLS-126 (Warning) Cannot merge output registers of multi-

cycle operations.

DESCRIPTION

Multicycle operations are resource-shared, but their outputs fan out to more than one register. This condition may lead to long compile times because of the high numbers of multicycle timing constraints required.

WHAT NEXT

HLS-127 (Warning) Edge %s may be driven by operations of different cycle delays

DESCRIPTION

An edge may be driven by several operations because of conditional assignments. If these operations have different cycle delays, different multicycle timing paths may be created from one register to another. This situation adversely affects the quality of results for logic synthesis.

WHAT NEXT

HLS-128 (Warning) Loop %s has no exit Operations and/or transfers following it are dead code and will be pruned.

DESCRIPTION

In the design, there is a loop that has "no exit." And there is code after the loop. This dead code cannot be executed, and it will be pruned from the design.

WHAT NEXT

Check the source HDL: the named loop has "no exit" but still has code after it.

HLS-129 (Warning) Post-scheduling uniquify failed

DESCRIPTION

Automatic uniquification after scheduling failed. The design must be uniquified manually before `compile`.

WHAT NEXT

HLS-130 (error) The process%*s* at line %d does not contain any wait statements. Behavioral Compiler requires that each process being elaborated for scheduling have at least one wait statement. This is necessary to determine the clock and clock edge to use for the process.

DESCRIPTION

Behavioral Compiler requires that every process being run through behavioral synthesis have at least one wait statement.

WHAT NEXT

Add a wait statement to the process.

HLS-131 (error) The always block%*s* at line %d does not contain any posedge or negedge statements. Behavioral Compiler requires that each always block being elaborated for scheduling have at least one edge statement. This is necessary to determine

the clock and clock edge to use for the block.

DESCRIPTION

Behavioral Compiler requires that every **always** block being run through behavioral synthesis have at least one *posedge* or *negedge* statement.

WHAT NEXT

Add a *posedge* or *negedge* statement to the process.

HLS-132 (error) The process%*s* at line %d contains waits that check

both positive edges and negative edges of clocks. The wait at line %d checks the positive edge of the clock, and the wait at line %d checks the negative edge. Checking both edges is not supported.

DESCRIPTION

A process is allowed to check only one edge of the clock.

WHAT NEXT

Change all of the "waits" to check either the positive or negative edge of the clock.

HLS-133 (error) The always block%*s* at line %d contains both *posedge* and *negedge* declarations. There is a *posedge* declaration at line %d and a *negedge* declaration at line %d. It is illegal to check both edges of a clock within a single

always block.

DESCRIPTION

An **always** block is allowed to check one edge of the clock.

WHAT NEXT

Change all of the edge declarations to be either all *posedge* or all *negedge*.

HLS-134 (error) Design has not been timed for Behavioral Compiler

DESCRIPTION

The design has not been timed for Behavioral Compiler. Delay estimates, chaining delay estimates, and area costs are not available.

WHAT NEXT

Make certain that the design was elaborated with the *-schedule* switch and then perform the command **bc_time_design**.

HLS-135 (Error) Clock period is too small for operation '%s' which requires a minimum clock period of '%f'.

DESCRIPTION

The clock period is too small for the internal delay of a sequential operation.

WHAT NEXT

HLS-136 (information) The clock transitions being checked at lines

%d and %d are different. No synchronous reset will be inferred

for the %s at line %d.

DESCRIPTION

Behavioral Compiler infers a synchronous reset only if all clock transitions in a process are identical.

WHAT NEXT

If a synchronous reset is desired, check the clock transitions to ensure they are compatible.

HLS-137 (information) The clock transition at line %d is not followed by an if statement. No synchronous reset will be inferred for the %s at line %d.

DESCRIPTION

To infer a synchronous reset, every single clock transition must be followed by a condition that checks the reset condition and exits the block if the condition is true. The clock transition mentioned in the message is not followed by a condition.

WHAT NEXT

If an inferred synchronous reset is desired, add a check for the reset condition after the specified clock transition.

HLS-138 (information) The clock transition at line %d is followed by an if statement, but the contents of the if block is not a single exit statement. In order to infer a synchronous reset, the if block can only contain a single statement that exits from the block. No synchronous reset will be inferred for the %s at line %d.

DESCRIPTION

The contents of an *if* statement that is an inferred synchronous reset can only be a

single statement that terminates the entire **process** or **always** block (exit statement in VHDL and disable statement in Verilog).

WHAT NEXT

Check the *if* statement that follows the defined clock transition. If a synchronous reset is desired, make sure that the content of the *if* statement is simply an exit from the entire block.

HLS-139 (information) The clock transition at line %d is followed by
an if statement with a single exit statement, but the exit statement
does not reset the entire block (process in VHDL, always block in
verilog). No synchronous reset will be inferred for the %s at line %d.

DESCRIPTION

The contents of an *if* statement that is an inferred synchronous reset can only be a statement that terminates the entire **process** block or **always** block (exit statement in VHDL and disable statement in Verilog).

WHAT NEXT

Check the *if* statement that follows the defined clock transition. If a synchronous reset is desired, make sure that the content of the *if* statement is simply an exit from the entire block.

HLS-140 (information) The clock transitions at lines %d and %d are
both followed by a conditional that exits the main block.
However,
the conditions for the two exits are different. No synchronous reset

will be inferred for the %s at line %d.

DESCRIPTION

For a synchronous reset to be inferred, all of the conditions on the conditional **exits** that follow clock transitions must be identical.

WHAT NEXT

If a synchronous reset is desired, check the conditions following the two mentioned **wait** statements. The conditions need to be identical.

HLS-141 (error) The `chain_operations` and `dont_chain_operations` commands require two or more operations as arguments.

DESCRIPTION

Chaining is the process of scheduling multiple operations in the same cycle. Therefore, more than one operation must be defined.

WHAT NEXT

Define two or more operations for this command.

HLS-142 (information) The clock transition at line %d is followed by an `if` statement, but the `if` statement has multiple branches. In order to infer a synchronous reset, the `if` statement can only contain a single branch with a statement that exits from the block. No synchronous reset will be inferred for the %s at line %d.

DESCRIPTION

The contents of an `if` statement that is an inferred synchronous reset can be only a single branch with a statement that terminates the entire **process** block and **always** block (`exit` statement in VHDL and `disable` statement in Verilog).

WHAT NEXT

If a synchronous reset is desired, make sure that the *if* clause that follows the clock transition has only a single branch.

HLS-143 (error) The variable '%s' was attributed as being a %s in resource %s on line %d. However, the variable is not defined in the process at line %d. If it is not a shared memory the variable should be defined, and if it is a shared memory it should set "bc_allow_shared_memories = true".

DESCRIPTION

The variables that are defined in a memory (or registerfile) specification must be defined in the same process as the resource that specified the memory (or registerfile). The only exception is a memory shared by processes, in which "bc_allow_shared_memories" should be set "true".

WHAT NEXT

Check that the resource was defined properly or "bc_allow_shared_memories" was set to "true". If it was, make sure that the corresponding variable is defined in the process or "bc_allow_shared_memories" is set to "true".

HLS-144 (error) The variable '%s' was attributed as being a %s in resource %s on line %d. However, the variable is not defined in the scope of the always block at line %d.

DESCRIPTION

The variables that are specified in a memory (or registerfile) specification must be defined in the same always block as the resource that specified the memory (or registerfile). Memories are not allowed to span across multiple always blocks, so the variable definition must be given inside the scope of the always block.

WHAT NEXT

Check that the resource was defined properly. If it was, make sure that the corresponding variable is defined inside of the always block.

HLS-145 (error) Multiple operations have been defined as an endpoint for a timing offset

DESCRIPTION

Only one operation can be identified as an endpoint of the timing offset.

WHAT NEXT

Do not specify more than one operation as an endpoint for a timing offset.

HLS-146 (error) The for loop at line %d contains the loop at line %d and the for loop is being unrolled. For loops are not allowed to contain other loops if they are being unrolled.

DESCRIPTION

A *for* loop that is being unrolled is not allowed to contain other loops (with the exception of other *for* loops that are being unrolled).

WHAT NEXT

Either remove the loop from inside the *for* loop or mark the *for* loop as being "dont_unroll"ed (done with the *dont_unroll* attribute in VHDL and with the *dont_unroll* field of a resource in Verilog).

HLS-147 (error) The command '%s' is only valid on designs that have been elaborated for scheduling, but have not been scheduled yet.

The design '%s' is not valid.

DESCRIPTION

This command operates only on designs that have been elaborated for scheduling.

WHAT NEXT

Make sure the design being passed in to this command has been elaborated for scheduling.

HLS-148 (error) The command '%s' is not valid on designs that have

been elaborated for scheduling and have not been scheduled yet.

The design '%s' is not valid.

DESCRIPTION

This command does not work on designs that have not been scheduled yet.

WHAT NEXT

Schedule the design before trying to use this command.

HLS-149 (Error) Found scheduling template containing resource contention.

DESCRIPTION

WHAT NEXT

HLS-150 (error) Loop '%s' cannot be loop-pipelined because

the branches of the conditional at line %s are unbalanced.

DESCRIPTION

WHAT NEXT

HLS-151 (error) You cannot chain fewer than two operations

DESCRIPTION

You must give two or more operations as arguments to the `chain` command.

WHAT NEXT

HLS-152 (information) Scheduling '%s' ...

DESCRIPTION

WHAT NEXT

HLS-153 (information) Allocating hardware for '%s' ...

DESCRIPTION

WHAT NEXT

HLS-154 (error) Variable '%s' is not initialized for operation '%s'

DESCRIPTION

The variable specified in the error message is used by the operation before it has been written to or initialized.

WHAT NEXT

Ensure that your behavioral description initializes or writes to the variable before it is used by an operation.

HLS-155 (warning) Variable '%s' is read before being written or initialized. This will cause a simulation-synthesis mismatch.

DESCRIPTION

In your behavioral description a variable is read before being initialized or written to. This will cause unpredictable synthesis results.

The behavior of the synthesized design will not match that of your behavioral description.

If you do not initialize a variable, its initial value will be unknown and a simulation-synthesis mismatch may occur for the first iterations of your design until the variable is written for the first time.

If you rely on the variable value to be preserved after a design reset you will experience a simulation-synthesis mismatch. To avoid this situation the variable has to be written before being read in the same run of the design the read operation happens.

An instance where you can safely ignore this warning message is when you use a rolled loop to initialize your variable - insufficient loop index information may cause false warnings.

WHAT NEXT

Initialize or write to the variable before reading its value. Do not assume the current value of a variable will be preserved upon a design reset.

HLS-156 (Information) Operation '%s' is activated by gate '%s'

DESCRIPTION

WHAT NEXT

HLS-157 (warning) Ignoring multi-cycle delay for operation '%s'

DESCRIPTION

When bc_enable_multi_cycle is set to false (The default value is true.), BC is forced to make operations single cycle, even if their propagation delays are greater than the clock period. If BC is forced to treat it as a single cycle operation, the user may have problems meeting timing during compile. Normally, the clock cycle time should be greater than or equal to the sum of operation execution time and the margin (sum of clock_to_Q delay and setup time) to execute the operation in one cycle. If you don't like to have multicycle operations, try to constrain the synthetic library to force bc_time_design to select a faster component. In addition, use bc_time_design -fastest to use the fastest available implementation for each synthetic operation.

WHAT NEXT

Please set bc_enable_multi_cycle to true if you want to let BC infer multicycle synthetic operations from the propagation delays and clock cycle periods. To change the margin amount, please use bc_margin command.

HLS-158 (warning) Logic group '%s' has propagation delay of '%f',

which is longer than the clock period of '%f'

DESCRIPTION

This warns if logic delay is longer than the real clock period. The real clock period is defined as: the original period - the margin. The margin is the sum of the clk_to_Q delay and setup time. You may change the margin by using bc_margin command.

WHAT NEXT

When bc_enable_multi_cycle is set to true, BC will infer multicycle operations when the propagation delay is greater than the real period. To force bc_time_design to use the fastest available implementation available in the library, please use

```
"bc_time_design -fastest".
```

HLS-159 (Error) Failed to schedule pipelined loop '%s' under initiation interval of %d and loop delay of %d

DESCRIPTION

WHAT NEXT

HLS-160 (Error) Detected Inconsistent Sequential Bindings. In module '%s', for operator '%s', Binding '%s' has %d states, but binding '%s' has %d states

DESCRIPTION

When there are more than one sequential binding for the same operator and same module, all sequential bindings must have the same number of states, and use the same resources in each corresponding state.

WHAT NEXT

HLS-161 (Error) Detected Inconsistent Sequential Bindings. In module '%s', for operator '%s', State '%d' of binding '%s' uses %d resources, but state '%d' of binding '%s' uses %d resources

DESCRIPTION

When there is more than one sequential binding for the same operator and same module, all sequential bindings must have the same number of states and use the same resources in each corresponding state.

WHAT NEXT

HLS-162 (Error) Detected Inconsistent Sequential Bindings.

In module '%s', for operator '%s',
State '%d' of binding '%s' uses resource '%s',
but state '%d' of binding '%s' does not use that resource

DESCRIPTION

When there is more than one sequential binding for the same operator and same module, all of the sequential bindings must have the same number of states and use the same resources in each corresponding state.

WHAT NEXT

HLS-163 (Error) Inconsistent FSM registration flags.

DESCRIPTION

The flag `-none` is incompatible with the flags `-inputs` and `-outputs`.

WHAT NEXT

HLS-164 (Warning) one of the allowed flags must be used.

DESCRIPTION

The flags `-inputs`, `-outputs`, or `-none` must be used.

WHAT NEXT

HLS-165 (error) The %s '%s' is accessed globally in
subprogram '%s'
at line %d in file %s.
This is not supported when elaborating for scheduling.

DESCRIPTION

When elaborating for scheduling, an error occurs when a VHDL signal or Verilog

register is accessed globally inside a function or procedure (that is, it is accessed inside the function but is not one of the parameters of the function).

Note that VHDL variables and Verilog reg variables declared inside the scope of the **always** block are legal.

WHAT NEXT

Either remove the access to the signal or reg or pass the signal or reg in as a parameter to the function or procedure.

HLS-166 (warning) The subprogram '%s' contains a %s statement at line %d in file %s.
No synchronous reset will be inferred.

DESCRIPTION

If a clock transition is checked within a subprogram, there is no way to reset the design when the reset signal is set. Thus, if a clock transition is checked inside of a subprogram, no synchronous reset will be inferred.

WHAT NEXT

Either remove the clock transition from inside of the subprogram or remove all checks for the reset signal; and then use the **set_behavioral_reset** command to define the reset signal.

HLS-167 (error) The subprogram '%s' at line %d in file '%s' contains loops. This is not supported when elaborating for scheduling.

DESCRIPTION

The only loop allowed inside a subprogram is an unrolled *for* loop. All other loops are illegal when elaborating for scheduling.

WHAT NEXT

Rewrite your source HDL code so that the subprogram does not contain any illegal loops.

HLS-168 (error) Cannot find legal binding for %s of operator type %s

DESCRIPTION

Allocation failed because the operation cited does not have a legal binding in the synthetic library. Check unconnected inputs and outputs of the operation, which may make certain synthetic bindings illegal for the operation.

WHAT NEXT

HLS-169 (error) It is illegal to use a 'wire' variable inside of an always block. The wire variable '%s' is used as an iterator in a for loop at line %d in file %s.

DESCRIPTION

In Verilog, it is illegal to use a *wire* inside of an **always** block.

WHAT NEXT

Change the *wire* declaration to a *reg* declaration.

HLS-170 (Error) %s constraint involving '%s' and '%s' is illegal because it crosses levels in the design hierarchy.

DESCRIPTION

With respect to cells, a timing constraint must be placed in the same level of design hierarchy.

WHAT NEXT

HLS-171 (Error) Failed to schedule loop named '%s'

DESCRIPTION

Behavioral Compiler has failed to schedule the named loop because of timing constraint violations. This aborts the scheduling of the rest of the design.

WHAT NEXT

Relax timing constraints for the named loop. Note that implicit timing constraints are created for signal/port reads and writes in super-state io mode.

HLS-172 (error) You cannot specify common resource for fewer than two operations

DESCRIPTION

You must give two or more operations as arguments to the **set_common_resource** command.

WHAT NEXT

Please reissue the **set_common_resource** command using two or more operations as arguments.

HLS-173 (error) You must specify a unique process

DESCRIPTION

The command requires an explicitly named process if more than one schedulable process is present in your design.

WHAT NEXT

Reissue the last command using the **-process** *process* option and argument.

HLS-174 (Warning) Conditional action on reset transition.

DESCRIPTION

There is a conditional action before the first wait of the design. This results in a conditional being executed when the reset pulse forces the design to transition the beginning of the process. However, there is no way to assure that the conditions upon which the conditional depends are valid at the time of the reset; this may result in simulation failures.

WHAT NEXT

Move the conditional(s) to after the first wait of the process.

HLS-175 (Warning) Read operation %s for signal %s is redundant because the value is not used.

DESCRIPTION

A read operation on a signal or port is identified as redundant because the read value is never used. This situation can arise when the operations that make use of the read values can never be exercised.

WHAT NEXT

If the read operation is really unnecessary in the design, then delete it; otherwise modify the design so that the read values are used.

HLS-176 (Error) Write operation %s for signal %s is redundant because it is in dead code or the value has not been initialized.

DESCRIPTION

A write operation on a signal or port has been identified as redundant because the written value has not been assigned. This situation can arise because the write operation is in a block of code that is never executed, because of uninitialized variables, or because operations that assign the values are never exercised.

WHAT NEXT

Check the design for the offending write operation, and either delete this write operation, or ensure that values are assigned.

HLS-177 (Warning) Operation %s outputs are not used.

DESCRIPTION

Combinational data path operation outputs are never used. This can happen when certain operations are never exercised, then values consumed by these operations will never get used. Array write operation is an exception.

WHAT NEXT

Check operations that use values produced by the named operation, and make sure that these operations can be exercised.

HLS-178 (Error) Cannot schedule operations %s and %s on a common resource.

DESCRIPTION

The two named operations have inconsistent internal resources and therefore cannot be scheduled on a common resource. This situation arises when `set_common_resource` is used to group combinational operations with sequential operations, or to group sequential operations that cannot be implemented on the same modules.

WHAT NEXT

Change the `set_common_resource` commands so that sequential operations are grouped only with sequential operations on the same module types.

HLS-179 (error) The always block at line %d contains references to the variable '%s'. This variable is defined as a Behavioral Compiler memory in the always block at line %d. See Behavioral Compiler User Guide to find out how to share

memories between blocks.

DESCRIPTION

Behavioral Compiler supports memories that are shared by different blocks. It is accomplished by setting "bc_allow_shared_memories = true" and specifying the list of address port names to be used in each block by "address_port_name". See Behavioral Compiler User Guide for details.

WHAT NEXT

Modify the design so that the memory is only accessed inside of a single design or use the rule for shared memory feature.

HLS-180 (error) The for loop on line %d uses the iterator '%s'
On line %d, the iterator '%s' is redefined.
This is currently not supported when elaborating
for scheduling.

DESCRIPTION

Consider the following example:

```
for i in a'range loop
    ...
        for i in b'range loop
    ...
        end loop;
    ...
end loop;
```

If the outer for loop is not unrolled, and the inner for loop uses an iterator with the same name, this will generate an error.

WHAT NEXT

Rename the iterator on one of the two for loops.

HLS-181 (error) Cannot pipeline loop '%s' with initiation interval

%d. A path has a timing path whose length is too long.

DESCRIPTION

This error indicates that Behavioral Compiler is unable to pipeline a loop with the initiation interval specified because a loop-carry dependency (LCD) conflicts with a path within the loop.

We explain this situation in detail with an example below.

In the loop below, assume that the addition operations are multi-cycled operations that require 1 clock cycle to complete and that the operations do not chain.

```
loop_begin
    a := v2 + in_j;    -- add_1
    b := a + in_m;    -- add_2
    v2 := v1;          -- carry forward past output of add_2
    v1 := b;          -- carry forward current output of add_2
loop_end
```

Furthermore, assume that you have set a "set_min_cycles 3" constraint from add_1 to add_2.

If:

x = clock cycle at which add_1 is scheduled and
y = clock cycle at which add_2 is scheduled,
then,
y - x >= min_delay, or
y >= min_delay + x --- (Equation 1)

Now consider loop pipelining. If the loop is pipelined with initiation interval of 1 clock cycle, successive iterations are launched every clock cycle and overlap as shown in the figure below:

iteration 1	iteration 2	iteration 3
-----	-----	-----
add_1	add_1	add_1
.	.	.
add_2	add_2	add_2
.	.	.

A loop-carry dependency (LCD) occurs when data generated by an operation in a loop iteration is used by an operation in one of the succeeding loop iterations.

In our example, this occurs since the add_2 operation in iteration 1 produces data that is carried forward two iterations using the variables v1 and v2 and is eventually used by the add_1 operation in iteration 3.

Clearly, add_2 of iteration 1 must complete prior to the clock cycle in which add_1 of iteration 3 is executed for the data dependency to be met. This is an LCD constraint.

If:

```
delay(add_2) = execution time for add_2
#iter        = number of iterations between
                producer add_2 (iteration 1) and
                consumer add_1 (iteration 3)
ii           = initiation interval in clock cycles,
```

then, the LCD constraint specifies:

```
(completion cycle of producer) <= (start cycle of consumer)
```

which can be expressed as:

```
y + delay(add_2) <= (#iter * ii) + x
y                 <= (#iter * ii) + x - delay(add_2) --- (Equation 2)
```

Combining Equation 1 and Equation 2, we get:

```
(min_delay + x) <= y <= (#iter * ii) + x - delay(add_2)
```

For this to be consistent, we need:

```
min_delay + x <= (#iter * ii) - delay(add_2) + x
min_delay      <= (#iter * ii) - delay(add_2)           --- (Equation 3)
```

In our example,

```
#iter        = 2
ii          = 1
delay(add_2) = 1

(#iter * ii) - delay(add_2) = 1
min_delay                  = 3
```

This does not satisfy Equation 3. Behavioral Compiler complains of an LCD violation and generates a report which elaborates on the path, operations, and delays that are causing the error.

WHAT NEXT

From Equation 3 above, the LCD can be met if:

```
min_delay <= (#iter * ii) - delay(add_2)
```

Recommended fix:

- Increase ii, the initiation interval to 2.

Other possible fixes are:

- (i) Use a different component for add_2, if delay(add_2) is large.
- (ii) Reduce the minimum delay between add_1 and add_2 from 3 to 1, by eliminating

unnecessary paths (dependencies) within an iteration on the loop.

HLS-182 (error) Loop '%s' cannot be loop-pipelined with initiation interval %d

because '%s' will occur after '%s' of the next iteration

There is a minimum timing constraint of %d cycles from %s to %s. Try changing initiation interval to %d.

DESCRIPTION

In loop pipelining, for each signal/port, Behavioral Compiler requires that read's in one iteration happen before writes in the next iteration, and that writes in one iteration happen 1 cycle before read and writes in the next iteration.

WHAT NEXT

Increase initiation interval.

HLS-183 (error) Loop '%s' cannot be loop-pipelined with initiation interval %d

because memory read/write on %s will be permuted. '%s' may occur at

the same time or after '%s' of the next iteration since there is a minimum timing constraint of %d cycles from %s to %s. Try changing initiation interval to %d.

DESCRIPTION

In loop pipelining, for each RAM, Behavioral Compiler requires that memory read and writes in one iteration happen 1 cycle before memory writes in the next iteration, and that memory writes in one iteration happen 1 cycle before memory reads in the next iteration.

WHAT NEXT

Increase initiation interval.

HLS-184 (error) Loop '%s' cannot be loop-pipelined with initiation interval %d

because operation '%s' has a delay of %d cycles.

Try changing initiation interval to %d.

DESCRIPTION

In loop pipelining, each operation is repeatedly executed at the rate of the initiation interval. For multi-cycle operations, Behavioral Compiler requires that its cycle delay be less than or equal to the initiation interval.

WHAT NEXT

Increase initiation interval.

HLS-185 (error) Loop '%s' cannot be loop-pipelined with initiation interval %d

because operation '%s' uses sequential binding '%s' where state %d and %d

both use internal resource '%s'.

Try increasing initiation interval.

DESCRIPTION

In loop pipelining, each operation is repeatedly executed at the rate of the initiation interval. For sequential operations that reserve internal resources in different states, Behavioral Compiler requires that the initiation interval not cause conflicts on the internal resources.

WHAT NEXT

Increase initiation interval.

HLS-186 (error) Cannot pipeline loop '%s' with initiation interval

%d. A path has a minimum length that is too long.

DESCRIPTION

This error indicates that Behavioral Compiler is unable to pipeline a loop with the initiation interval specified because a loop-carry dependency (LCD) conflicts with a path within the loop.

We explain this situation in detail with an example below.

Let us consider a loop with 4 add operations and let us assume each add operation needs its own clock cycles. The add operations in the loop below are executed in successive clock cycles.

```
loop_begin
    a := v2 + in_j;    -- add_1
    b := a + in_k;    -- add_2
    c := b + in_l;    -- add_3
    d := c + in_m;    -- add_4
    v2 := v1;          -- carry forward past output of add_4
    v1 := d;          -- carry forward current output of add_4
loop_end
```

As we can see, the path from add_1 to add_4, via add_2 and add_3, requires at least 3 cycles between add_1 and add_4.

If:

```
x = clock cycle at which add_1 is scheduled and
y = clock cycle at which add_4 is scheduled,
then,
y - x >= min_delay, or
y      >= min_delay + x           --- (Equation 1)
```

Now consider loop pipelining. If the loop is pipelined with initiation interval of 1 clock cycle, successive iterations are launched every clock cycle and overlap as shown in the figure below:

iteration 1	iteration 2	iteration 3
-----	-----	-----
add_1		
add_2	add_1	
add_3	add_2	add_1
add_4	add_3	add_2
	add_4	add_3
		add_4

A loop-carry dependency (LCD) occurs when data generated by an operation in a loop iteration is used by an operation in one of the succeeding loop iterations.

In our example, this occurs since the add_4 operation in iteration 1 produces data that is carried forward two iterations using the variables v1 and v2 and is eventually used by the add_1 operation in iteration 3.

Clearly, add_4 of iteration 1 must complete prior to the clock cycle in which add_1 of iteration 3 is executed for the data dependency to be met. This is an LCD constraint.

If:

```

delay(add_4) = execution time for add_4
#iter        = number of iterations between
                producer add_4 (iteration 1) and
                consumer add_1 (iteration 3)
ii           = initiation interval in clock cycles,

```

then, the LCD constraint specifies:

$$(\text{completion cycle of producer}) \leq (\text{start cycle of consumer})$$

which can be expressed as:

$$\begin{aligned} y + \text{delay}(add_4) &\leq (\#iter * ii) + x \\ y &\leq (\#iter * ii) + x - \text{delay}(add_4) \end{aligned} \quad \text{--- (Equation 2)}$$

Combining Equation 1 and Equation 2, we get:

$$(\text{min_delay} + x) \leq y \leq (\#iter * ii) + x - \text{delay}(add_4)$$

For this to be consistent, we need:

$$\begin{aligned} \text{min_delay} + x &\leq (\#iter * ii) - \text{delay}(add_4) + x \\ \text{min_delay} &\leq (\#iter * ii) - \text{delay}(add_4) \end{aligned} \quad \text{--- (Equation 3)}$$

In our example,

```

#iter        = 2
ii          = 1
delay(add_4) = 1

(\#iter * ii) - delay(add_4) = 1
min_delay                  = 3

```

This does not satisfy Equation 3. Behavioral Compiler complains of an LCD violation and generates a report which elaborates on the path, operations, and delays that are causing the error.

WHAT NEXT

From Equation 3 above, the LCD can be met if:

$$\text{min_delay} \leq (\#iter * ii) - \text{delay}(add_4)$$

Recommended fix:

- Increase ii, the initiation interval to 2.

Other possible fixes are:

- (i) Use a different component for add_4, if delay(add_4) is large.
- (ii) Reduce the minimum delay between add_1 and add_4 from 3 to 1, by eliminating unnecessary paths (dependencies) within an iteration on the loop.

HLS-187 (error) Cannot pipeline loop '%s' with initiation interval %d. A path with fixed nodes has a minimum length that is too long.

DESCRIPTION

This error indicates that Behavioral Compiler is unable to pipeline a loop with the initiation interval specified because a loop-carry dependency (LCD) conflicts with a path within the loop. The path in the loop passes through two nodes that are a fixed distance from one another. There need not be a data-dependency between these two nodes.

We explain this situation in detail with an example below.

Let us use the following loop and, to simplify the explanation, assume: (a) the I/O scheduling mode is cycle fixed, (b) each addition operation requires its own clock cycle, and (c) there is no chaining.

```
loop_begin
    a := v2 + j;          -- add_1
    out_a <= a;           -- io_write
    wait/@posedge          -- clock_edge
    b := in_b;            -- io_read
    d := b + k;           -- add_2
    v2 := v1;              -- carry forward past output of add_2
    v1 := d;               -- carry forward current output of add_2
loop_end
```

The operations add_1 to add_2 have no data-dependence. However io_write is data-dependent on add_1 and add_2 is data-dependent on io_read. The operations io_write and io_read are fixed 1 clock cycles apart by the semantics of cycle-fixed I/O scheduling mode.

There is a transitive, minimum-delay path from add_1 to add_2 through io_write and io_read of length 3.

If:

```
x = clock cycle at which add_1 is scheduled and
y = clock cycle at which add_2 is scheduled,
```

then,

$$y - x \geq \text{min_delay}, \text{ or} \\ y \geq \text{min_delay} + x \quad \text{--- (Equation 1)}$$

Now consider loop pipelining. If the loop is pipelined with initiation interval of 1 clock cycle, successive iterations are launched every clock cycle and overlap as

shown in the figure below:

iteration 1	iteration 2	iteration 3
add_1		
io_write	add_1	
io_read	io_write	add_1
add_2	io_read	io_write
	add_2	io_read
		add_2

A loop-carry dependency (LCD) occurs when data generated by an operation in a loop iteration is used by an operation in one of the succeeding loop iterations.

In our example, this occurs since the add_2 operation in iteration 1 produces data that is carried forward two iterations using the variables v1 and v2 and is eventually used by the add_1 operation in iteration 3.

Clearly, add_2 of iteration 1 must complete prior to the clock cycle in which add_1 of iteration 3 is executed for the data dependency to be met. This is an LCD constraint.

If:

```
delay(add_2) = execution time for add_2
#iter        = number of iterations between
                producer add_2 (iteration 1) and
                consumer add_1 (iteration 3)
ii           = initiation interval in clock cycles,
```

then, the LCD constraint specifies:

```
(completion cycle of producer) <= (start cycle of consumer)
```

which can be expressed as:

```
y + delay(add_2) <= (#iter * ii) + x
y                  <= (#iter * ii) + x - delay(add_2) --- (Equation 2)
```

Combining Equation 1 and Equation 2, we get:

```
(min_delay + x) <= y <= (#iter * ii) + x - delay(add_2)
```

For this to be consistent, we need:

```
min_delay + x <= (#iter * ii) - delay(add_2) + x
min_delay      <= (#iter * ii) - delay(add_2)       --- (Equation 3)
```

In our example,

```
#iter        = 2
ii          = 1
delay(add_2) = 1

(#iter * ii) - delay(add_2) = 1
```

```
min_delay = 3
```

This does not satisfy Equation 3. Behavioral Compiler complains of an LCD violation and generates a report which elaborates on the path, operations, and delays that are causing the error.

WHAT NEXT

From Equation 3 above, the LCD can be met if:

```
min_delay <= (#iter * ii) - delay(add_2)
```

Recommended fix:

- Increase ii, the initiation interval to 2.

Other possible fixes are:

- (i) Use a different component for add_2, if delay(add_2) is large.
- (ii) Reduce the minimum delay between add_1 and add_2 from 3 to 1, by eliminating unnecessary paths (dependencies) within an iteration on the loop.

HLS-188 (error) Unable to find scheduling data in FSM-style format.

DESCRIPTION

This message indicates that the **db** file you have loaded does not have the correct annotations for FSM-style reporting of schedule information, perhaps because an early software version was used. With versions earlier than v3.3b, **schedule** was not set up to annotate files for FSM-style reporting.

WHAT NEXT

To annotate the file with FSM information, re-execute **schedule** using v3.3b or a later version. However, even without the annotations, you can still use **report_schedule -variables** and **report_schedule -operations**.

HLS-189 (information) Register '%s' will be inferred as multibit module.

DESCRIPTION

During compile, the register will be inferred as multibit module.

WHAT NEXT

To turn off this property, set `bc_infer_multibit` to *false* or set `bc_minimum_multibit_componet_width` to a larger one.

HLS-190 (error) No multiplexors in the standard synthetic library.

DESCRIPTION

There is no multiplexor in the standard synthetic library. This is necessary to calculate the area costs for behavioral synthesis.

WHAT NEXT

Since this multiplexor description should be in the standard synthetic library, this error is most likely due to an improper installation of the Synopsys tools. Please contact your system administrator.

HLS-191 (information) Binding '%s' to '%s' for timing.

DESCRIPTION

WHAT NEXT

HLS-192 (information) Selected '%s' to implement '%s'.

DESCRIPTION

WHAT NEXT

HLS-193 (information) Using wordlevel timing to calculate

chaining of '%s'.

DESCRIPTION

WHAT NEXT

HLS-195 (error) Loop %s cannot be loop-pipelined with initiation interval %d because the memory operation '%s' must be no later than %d cycles after the operation '%s'. This implies a minimum delay of %d

cycles from %s to %s. However, this violates the timing constraint of

DESCRIPTION

WHAT NEXT

HLS-196 (error) Loop %s cannot be loop-pipelined with initiation interval %d because the memory operation '%s' must be no later than %d cycles after the operation '%s'.

This implies a minimum delay of %d cycles from %s to %s
However, this is unsatisfiable because %s

is fixed at cycle %d, and %s is fixed at cycle %d.

DESCRIPTION

WHAT NEXT

HLS-197 (error) Loop %s cannot be loop-pipelined with initiation interval %d

because the signal read/write operation '%s' must be no later than %d

cycles after '%s'. This implies a minimum delay of %d cycles from %s to %s. However, this violates the timing constraint of

DESCRIPTION

WHAT NEXT

HLS-198 (error) Loop %s cannot be loop-pipelined with initiation interval %d

because the signal read/write operation '%s' must be no later than %d cycles

after '%s'. This implies a minimum delay of %d cycles from %s to %s. However, this is unsatisfiable because %s

is fixed at cycle %d, and %s is fixed at cycle %d.

DESCRIPTION

WHAT NEXT

HLS-199 (error) Speculative execution must be either true or false

DESCRIPTION

The variable "enable_speculative_execution" must have the value "true" or "false" in order to be correctly interpreted.

WHAT NEXT

Set it to "true" or "false". The default setting is "true".

HLS-200 (error) State chaining must be either true or false

DESCRIPTION

The variable "enable_state_transition_chaining" must have the value "true" or "false" in order to be correctly interpreted.

WHAT NEXT

Set it to "true" or "false". The default setting is "true".

HLS-201 (error) BC FSM coding style is not in the valid set

DESCRIPTION

The valid options are "one_hot_coding", "two_hot_coding", "counter_based", and "use_fsm_compiler". The default is "two_hot_coding".

WHAT NEXT

Set the desired coding style. Notice that the option "use_fsm_compiler" results in a minimum-length state assignment; notice also that this is incompatible with state transition chaining.

HLS-202 (error) FSM compiler and state transition chaining are incompatible

DESCRIPTION

The use of FSM compiler to generate a state coding is not compatible with the use of state transition chaining.

WHAT NEXT

Either choose an alternative state coding or disable state transition chaining. Set the alternative coding using the variable "bc_fsm_coding_style"; disable state transition chaining using the variable "enable_state_transition_chaining".

HLS-203 (error) Unable to create attributes for BC

DESCRIPTION

This is an internal error. Attributes necessary for running Behavioral Compiler cannot successfully be created.

WHAT NEXT

Reanalyze and rellaborate the design. That should take care of it.

HLS-204 (error) No reference for memory cell

DESCRIPTION

The cell has no reference.

WHAT NEXT

Check your synthetic libraries and link the design.

HLS-205 (error) Cannot use the memory master as a cell

DESCRIPTION

The cell you have named is the memory master. It is needed for internal purposes but it is not subject to being constrained.

WHAT NEXT

Find the memory read operation or memory write operation you want using find -h cell.

HLS-206 (error) Not a memory cell

DESCRIPTION

The ignore_precedence commands only work on memory read and write operations.

WHAT NEXT

The ignore_precedence commands only work on memory read and write operations. Check the names of the operations and reissue the command, if you want to ignore the constraints of memory operations. If you want to eliminate constraints on other kinds of operations, you must change your source code to eliminate constraints of data and control precedence.

HLS-207 (error) Fixed schedule (%s at cstep %d) produces a state transition cycle at loop begin named %s

DESCRIPTION

A combinational cycle around the named loop begin is created by the fixed schedule

WHAT NEXT

HLS-208 (error) The named stall pin does not exist.

DESCRIPTION

The net you designated as the stall pin does not exist or it is invisible in the current context.

WHAT NEXT

If you are not at the top of the design hierarchy, the net is probably not visible. Otherwise, the net you have named does not exist. Perhaps the name of the net inside the compiler is not the same as the name you gave it. To see what nets are visible, use `find net`.

HLS-209 (Warning) There already exists a timing constraint between these two operations. The new timing constraint will be applied and replace the old one.

DESCRIPTION

There is already a timing constraint between the two operations you specified. The old constraint will be removed and the new one applied in its place.

WHAT NEXT

This is a warning. No further action is needed.

HLS-210 (information) To enable this feature, you may also use a Behavioral Compiler license (BC-VHDL, BC-HDL).

DESCRIPTION

The feature reported to be not available in the previous error message can also be enabled by using one of the Behavioral Compiler licenses: BC-VHDL or BC-HDL.

WHAT NEXT

If you want to use a Behavioral Compiler license to enable the feature, call **get_license** BC-HDL or **get_license** BC-VHDL.

HLS-211 (error) Inappropriate reporting data for condition reporting

DESCRIPTION

The DB file is either generated by an old version of scheduling or is not the result of scheduling.

WHAT NEXT

The conditional branch information may be retrievable if you set the dc-shell variable bc_fsm_coding_style to "use_fsm_compiler". To do this successfully you will also have to turn off state transition chaining by setting the variable enable_state_transition_chaining to "false".

HLS-212 (error) Compilation of user defined Design Ware parts failed.

DESCRIPTION

WHAT NEXT

HLS-213 (error) Unconditional loop exit at line %s is not allowed.

DESCRIPTION

All exit statements in a loop must have conditions under which they exit. Otherwise, it causes a problem when the exit and loop_continue are scheduled in the same control step for execution.

WHAT NEXT

If there is an exit statement in a loop, it occurs only when its exit condition is true; An unconditional exit is not allowed in the middle of loop.

HLS-214 (Information) Determine default margin.

DESCRIPTION

When bc_estimate_timing_effort is set to high, during bc_time_design the default margin will be determined if margin is not set yet. This default margin will be used during schedule.

WHAT NEXT

If user want to set the margin, user can call the command "bc_margin". If user does not want to set the margin at all, set bc_estimate_timing_effort medium/low/zero.

HLS-215 (information) Delete variable '%s' in process '%s'.

DESCRIPTION

The intermediate variable has been removed. To maintain the variable, use set_exclusive_use command.

WHAT NEXT

This is an information message only. You do not need to take any further action. To find out about how to maintain the variable, please see man page for the set_exclusive_use command.

HLS-216 (information) Set cycle margin to %.2f .

DESCRIPTION

Set cycle margin. The margin includes clk2q, setup delay for register, mux (4X1) delay which locates in front of register, fsm decoding delay as well as clock uncertainty if specified. The margin can be specified through command bc_margin or BC will determine the default margin during bc_time_design.

WHAT NEXT

User can specify the margin in various ways using different options. Please see the man page for bc_margin.

HLS-217 (error) Need a Behavioral Compiler license to enable

this feature.

DESCRIPTION

Could not find a license for csa transformation

WHAT NEXT

Make certain that you have a license and that the license is properly installed before trying to use the behavioral synthesis product again.

HLS-218 (error) All Behavioral Compiler licenses are already in use.

DESCRIPTION

The command attempted requires a Behavior Compiler license. All available licenses of this type at your site are currently in use.

WHAT NEXT

Wait until a license of this type at your site is freed.

HLS-219 (warning) The command '%s' will be obsoleted in the next release.

Please use the command '%s' instead.

DESCRIPTION

The command will be replaced by new command in the next release. In the next release, to get the same behavior, users should replace the command by the new one.

WHAT NEXT

Replace the old command by the new command.

HLS-220 (error) The command 'dont_chain_operations' has been obsoleted.

Please use the command 'set_min_cycles' instead.

DESCRIPTION

WHAT NEXT

HLS-221 (error) bc_allocation_effort must be one of 'default', 'zero', 'low', 'medium', 'high'.

DESCRIPTION

You set the variable **bc_allocation_effort** to an incorrect value. If you set **bc_allocation_effort** to default, allocation will be done using the same effort as defined in the **schedule** command.

WHAT NEXT

HLS-222 (error) bc_bit_level_muxing must be either 'true' or 'false'.

DESCRIPTION

WHAT NEXT

HLS-223 (error) clock signal '%s' drives multi-cycle operation '%S'.

DESCRIPTION

WHAT NEXT

HLS-224 (error) Error: connection '%s' on function '%s' is a signal. This is not currently supported when

elaborating for scheduling.

DESCRIPTION

Try to use variables instead of signals.

e.g. procedure A(... signal A : std_logic) <---- error

procedure A(... variable A : std_logic ...) <---- suggested

WHAT NEXT

HLS-225 (error) No address port of shared memory is specified in process '%s';

At least one port of the shared memory is specified.

DESCRIPTION

Address ports of shared memory is specified as Addr_port_i_name,

WHAT NEXT

Only the address ports specified are used in the process.

HLS-226 (error) Syntax error in address port specification '%s' of shared memory in process '%s'.

DESCRIPTION

Address ports of shared memory is specified as Addr_port_i_name,

WHAT NEXT

Only the address ports specified are used in the process.

HLS-227 (error) The specified address port '%s' of shared

memory '%s' in process '%s' is not found.

DESCRIPTION

See the .sl file of the shared memory to find all the address port names.

WHAT NEXT

HLS-228 (error) Unable to create attributes for BC

DESCRIPTION

This is an internal error. Attribute BSDB_BC_ALLOW_SHARED_MEMORY_ATTR necessary for running Behavioral Compiler cannot successfully be created.

WHAT NEXT

Reanalyze and reelaborate the design. That should take care of it.

HLS-229 (error) Loop '%s' cannot be pipelined with initiation interval of 1 because of the registered controller outputs.

DESCRIPTION

Behavioral Compiler can not pipeline a loop with initiation interval of 1 if the command 'register_control -outputs' has been called.

WHAT NEXT

Increase the initiation interval to 2 or remove the register_control -outputs command

HLS-230 (Error) Unrecoverd error has occured. This error might be cured via using a different type of fsm compiler. Try set

"bc_use_fsm_compiler = false" in dc_shell and rerun.

DESCRIPTION

This case is not supported in current fsm model. But the other fsm model supports this case.

WHAT NEXT

Set "bc_use_fsm_compiler = false" in dc_shell and run schedule again.

HLS-231 (error) The subprogram '%s' contains a %s statement which fails to preserve the function.

DESCRIPTION

One of the following constructs will fail to preserve function: 1. unrolled loops. 2. memory read operations. 3. memory write operations. 4. signal read operations. 5. signal write operations. 6. wait statements 7. preserved functions. Example to show all the illegal constructs within functions or procedures(tasks):

```
try1_loop:while(tmp < 10 )loop -- unrolled loop wait until clk'event and clk = '1' ;
-- wait statement mem(addr) := "00001111"; -- memory write and signal addr read. --
mem and addr are declared inside of process, -- but not inside of this function.
addr := func1(addr); -- illegal if func1 is another preserved function. end loop;
```

WHAT NEXT

Avoid using the illegal constructs mentioned above for the preserved function.

HLS-232 (information) Checking '%s' ...

DESCRIPTION

WHAT NEXT

HLS-233 (error) The design contains parallel paths where one path is broken by clock boundaries, and another path is not.

This is not allowed in cycle-fixed mode.
The paths start from the if/case statement on
line %s in file %s.
A wait statement is located on line %d in file %s.

DESCRIPTION

WHAT NEXT

Either remove the clock boundaries (wait in VHDL or always @ in verilog) along the parallel paths that contain them, or else insert clock boundaries in the paths where they are missing.

HLS-234 (warning) '%s' can not chain with '%s',
chain_operations will be ignored.

DESCRIPTION

You have attempted to use the chain_operations command on operations that cannot be chained together either because they are unrelated or chaining them in the same clock cycle will violate the clock period constraints. You can specify chaining only for operations in the same execution sequence that have data flow dependencies among them. If the operations are related, it may still not be possible to chain them into the same clock cycle as the total delay thorough them is greater than the specified clock period.

WHAT NEXT

If you want to specify constraints between unrelated operations use the set_min_cycles, set_max_cycles or the set_cycles commands instead. If the operations are related and you see this warning increase the clock period or use components with less delay(s) by using the bc_time_design -fastest command.

HLS-235 (error) The output of operation '%s', which has the attribute "carry_port_name", is connected to another operation. This violates the rule that all outputs of the operation must be

connected to an output port on the design.

DESCRIPTION

When we want to generate a csa tree without a final adder in "transform_csa", we need to set the attribute "carry_port_name" with the specified port name on the root (add/sub/mult) operation of original expression. It is assumed that before the transformation, the outputs of the root operation are connected to one port on the design, and the specified carry port is driven by logic zero.

An example of a legal expression looks like (in vhdl):

```
sum <= A + B + C * B; -- 'sum' and 'carry' are ports on the design  carry <=
"00000000";
```

An example of setting the attribute is:

```
set_attribute add_363 "carry_port_name" "carry" -type string
```

NOTE: This transformation assumes that the "sum/carry" ports on the design are only used by the parent design by adding them together. Any other use of these ports may result in incorrect logic.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-236 (error) The output of operation '%s', which has the attribute

"carry_port_name", has multiple fan-out. This violates the rule that

all outputs of the operation must be connected to the same port on the design.

DESCRIPTION

When we want to generate a csa tree without a final adder in "transform_csa", we need to set the attribute "carry_port_name" with the specified port name on the root (add/sub/mult) operation of original expression. It is assumed that before the transformation, the outputs of the root operation are connected to one port on the design, and the specified carry port is driven by logic zero.

An example of a legal expression looks like (in vhdl):

```
sum <= A + B + C * B; -- 'sum' and 'carry' are ports on the design carry <=
"00000000";
```

An example of setting the attribute is:

```
set_attribute add_363 "carry_port_name" "carry" -type string
```

NOTE: This transformation assumes that the "sum/carry" ports on the design are only used by the parent design by adding them together. Any other use of these ports may result in incorrect logic.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-237 (error) The operation '%s' has a "carry_port_name" attribute

referencing port '%s'. This port is not driven by logic zero which is required in order to use the "carry_port_name" attribute.

DESCRIPTION

When we want to generate a csa tree without a final adder in "transform_csa", we need to set the attribute "carry_port_name" with the specified port name on the root (add/sub/mult) operation of original expression. It is assumed that before the transformation, the outputs of the root operation are connected to one port on the design, and the specified carry port is driven by logic zero.

An example of a legal expression looks like (in vhdl):

```
sum <= A + B + C * B; -- 'sum' and 'carry' are ports on the design carry <=
"00000000";
```

An example of setting the attribute is:

```
set_attribute add_363 "carry_port_name" "carry" -type string
```

NOTE: This transformation assumes that the "sum/carry" ports on the design are only used by the parent design by adding them together. Any other use of these ports may result in incorrect logic.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-238 (error) Could not find operations CSA_UNS_OP and CSA_TC_OP.

This is probably because the synthetic library dw01.sldb is missing from the synthetic_library variable specification.

DESCRIPTION

The transform_csa command needs to be able to find the synthetic operations "CSA_UNS_OP" and "CSA_TC_OP" in the libraries specified by the synthetic_library variable.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-239 (error) Could not find operations MULT2_UNS_OP and MULT2_TC_OP.

This is probably because the synthetic library dw02.sldb is missing from the synthetic_library variable specification.

DESCRIPTION

The transform_csa command needs to be able to find the synthetic operations "MULT2_UNS_OP" and "MULT2_TC_OP" in the libraries specified by the synthetic_library variable.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-240 (error) Cell '%s' is part of multiple resource constraints.

DESCRIPTION

If you use the **set_common_resource** command, you have to make sure that you bind every cell to only one resource.

WHAT NEXT

Review the `set_common_resource` constraints that you have applied to the design and remove constraints that apply to more than one cells.

HLS-241 (error) Forcing the operations '%s' to share resources created a false combinational loop.

DESCRIPTION

If you use the **set_common_resource** command, you have to make sure that you do not force the creation of a false combinational loop. This can happen, e.g. if the operations of two different chains are forced to share resources. Consider the following example, where `i1` and `i2` are input ports, `o1` and `o2` are output ports:

```
wait until clk'event and clk = '1'; o1 <= (i1 + a) * b; wait until clk'event and clk = '1'; o2 <= c + (i2 * d); wait until clk'event and clk = '1';
```

If the multiplications are forced to be executed on resource `MULT` and the additions are forced to share the adder `ADD`, there is a path `ADD -> MULT -> ADD` with no register in between.

WHAT NEXT

HLS-242 (Error) Forcing the operations '%s' and '%s' to share resources would result in a false path that is longer than the cycle time.

DESCRIPTION

The application of `set_common_resource` can create a false path that is longer than the clock period. By default, BC will not create such a path.

WHAT NEXT

HLS-243 (warning) Forcing the operations '%s' and '%s' to share resources will result in a false path that is longer than the cycle time.

DESCRIPTION

WHAT NEXT

HLS-244 (error) The option 'force_sharing' can only be used in combination with 'max_count'.

DESCRIPTION

WHAT NEXT

HLS-245 (error) The 'allow_false_path' option can only be used in combination with the 'force_sharing' option.

DESCRIPTION

WHAT NEXT

HLS-246 (error) 'min_count' must be less or equal than

'max_count'.

DESCRIPTION

WHAT NEXT

HLS-247 (error) Can not apply set_common_resource to memory access '%s'.

DESCRIPTION

WHAT NEXT

HLS-248 (error) Variable power_gated_clock_logic has incorrect value.

DESCRIPTION

The variable power_gated_clock_logic may only have specific values (see manual/specification) which must fit to the argument of the set_clock_gate command.

WHAT NEXT

HLS-249 (error) Variable power_test_enable has incorrect value.

DESCRIPTION

The variable power_test_enable must be either 'true' or 'false'.

WHAT NEXT

Set the variable to have the correct value.

HLS-250 (error) Variable power_test_obs_logic has incorrect value.

DESCRIPTION

The variable power_test_obs_logic must be either 'true' or 'false'.

WHAT NEXT

Set the variable to have the correct value.

HLS-251 (error) Variable power_test_obs_logic_depth has incorrect value.

DESCRIPTION

The variable power_test_obs_logic_depth must have a value greater than 0.

WHAT NEXT

Set the variable to have the correct value.

HLS-252 (error) Variable power_reg_size_threshold has incorrect value.

DESCRIPTION

The variable power_reg_size_threshold must have a value greater than 0.

WHAT NEXT

Set the variable to have the correct value.

HLS-253 (error) Reg '%s' was assigned in a blocking assignment in other process but was read using the continue assignment at

line '%d'.

DESCRIPTION

Behavioral synthesis requires that the transitions of all ports be synchronized to clock boundaries. As a result, the RTL assignment operator must be used to assign to ports.

WHAT NEXT

Use reg declaration and non-blocking assignment.

HLS-254 (information) Operations '%s' and '%s' were not merged into CSA operations because of upper-bit truncation between them.

DESCRIPTION

When a addition/subtraction/multiplication tree is transformed into a CSA tree, the intermediate values of the original tree do not exist in the transformed tree. As a result, if there is a truncation being performed in the tree, the same truncation would not be able to be performed in the CSA tree. Since transform_csa will not alter the bit-accurate behavior of the design, the truncation blocks the transformation.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-255 (information) Operations '%s' and '%s' were not merged into CSA operations because of upper-bit or lower-bit truncation between them.

DESCRIPTION

When a addition/subtraction/multiplication tree is transformed into a CSA tree, the intermediate values of the original tree do not exist in the transformed tree. As a

result, if there is a truncation being performed in the tree, the same truncation would not be able to be performed in the CSA tree. Since transform_csa will not alter the bit-accurate behavior of the design, the truncation blocks the transformation.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-256 (information) Operation '%s' has multiple fan-out. It was duplicated creating upto %d extra operation(s) to allow the CSA transformation to be performed.%s

DESCRIPTION

The operation has multiple fan-out. In order to transform the operation with its successor(s) into CSA operations, the operation needs to be duplicated, which causes extra CSA operation(s). This may increase area, but should reduce the delay.

WHAT NEXT

If the transformed tree is not on the critical path, then it may be better not to duplicate the operation. This can be done either by not specifying the -duplicate switch, or by putting a "dont_duplicate_csa" attribute on the operations that should not be duplicated.

HLS-257 (information) Operation '%s' has multiple fan-out and was not duplicated. See the man page for transform_csa to find out how to duplicate the operation to reduce delay at the expense of extra area.%s

DESCRIPTION

The operation has multiple fan-out. In order to transform the operation with its

successor(s) into CSA operations, the operation needs to be duplicated, which causes extra CSA operation(s). This may increase area, but should reduce the delay.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-258 (error) Unable to create attributes for BC

DESCRIPTION

This is an internal error. Attribute BSDB_BC_CONSTRAIN_SIGNAL_MEMORY_ATTR necessary for running Behavioral Compiler cannot successfully be created.

WHAT NEXT

Report to BC R&D or CAE.

HLS-259 (warning) Command "transform_csa" cannot be applied to the scheduled design '%s'.

DESCRIPTION

The command can only be applicable to the design which has not been scheduled.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-260 (warning) The timing of design '%s' was invalidated by "transform_csa".

DESCRIPTION

The timing of design is invalidated by transform_csa if the design was timed and transform_csa transformed the design.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-261 (warning) Operation '%s' has both of the attributes "transform_csa" and "dont_transform_csa" with "true" values. The attribute "dont_transfrom_csa" is not honored.

DESCRIPTION

Because "transform_csa" and "dont_transform_csa" with "true" values are conflict, we choose "transform_csa" to be honored and ignore the other attribute.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-262 (warning) Operation '%s' has both of the attributes "duplicate_csa" and "dont_duplicate_csa" with "true" values. The attribute "dont_transfrom_csa" is not honored.

DESCRIPTION

Because "duplicate_csa" and "dont_duplicate_csa" with "true" values are conflict, we choose "duplicate_csa" to be honored and ignore the other attribute.

WHAT NEXT

Set only one of them to be "true".

HLS-263 (error) bc_schedule_branches_asap must be either

'true' or 'false'.

DESCRIPTION

WHAT NEXT

HLS-264 (error) %s must be either 'true' or 'false'.

DESCRIPTION

The environment variable mentioned above is a boolean variable. The only values accepted are either 'true' or 'false'.

WHAT NEXT

Rest the specified variable to have only boolean values.

HLS-265 (warning) There exist a path from '%s' to '%s' having no timing information.

DESCRIPTION

WHAT NEXT

HLS-266 (information) Memory instance '%s' was declared as a shared memory and
was used by processes %s.

DESCRIPTION

The memory instance can be accessed by one or more than one process. This message lists the processes that were detected as using this memory.

WHAT NEXT

This is an information message. No further action is needed.

HLS-267 (information) Memory instance '%s' was declared as a shared memory, but was used by one process '%s'.

DESCRIPTION

The shared memory can be accessed by one or more than one process. In your design, only one process accesses the memory.

WHAT NEXT

This is an information message. No further action is needed.

HLS-268 (warning) Ports of memory '%s' are not fully utilized. Mapping of bindings %s requires %d %s resources, but only %d resources are available.

DESCRIPTION

In order to maximally utilize the ports of memory, the resource counts, which is specified in .sl file, must be increased.

WHAT NEXT

Change the resource count of the resouce in .sl file to the required number.

HLS-269 (error) Detected an inconsisteny among %s bindings in memory module '%s':
For Bindings '%s' and '%s' are pipelined, but their initiation intervals are different.

DESCRIPTION

For a multi-port memory, the pattern of resource usage for each binding of same access type (read or write) must be uniform. Specifically, All bindings of same access type must be non-pipelined, or all of them can be pipelined, but must have same initiation intervals.

WHAT NEXT

Change the specification of resource use of the states of bindings in .sl file so that the patterns of resource use among the states be uniform.

HLS-270 (error) The node '%s' is part of conflicting timing constraints.

DESCRIPTION

WHAT NEXT

HLS-271 (error) Unable to create attributes for BC

DESCRIPTION

This is an internal error. Attribute BSDB_BC_DETECT_MEMORY_ACCESSES_ATTR necessary for running Behavioral Compiler cannot successfully be created. If "bc_detect_memory_accesses = true", the attribute must be created with true value and included in each (top) process design. Otherwise, the attribute is not created.

WHAT NEXT

Reanalyze and reelaborate the design. That should take care of it.

HLS-272 (warning) Detected an inconsistency of bindings in memory '%s'.

Binding '%s' is nonpipelined and binding '%s' is pipelined. Using this memory can cause a suboptimal schedule.

DESCRIPTION

The use of memory with both pipelined and nonpipelined binding for the same access type (such as read access or write access) is also allowed in Behavioral Compiler, but might not find an optimal schedule for the memory accesses.

WHAT NEXT

Adjust the resource names in the resource_use fields of the bindings in .sl file to make them nonpipelined or pipelined with same initiation intervals.

HLS-273 (error) Loop has exits but loop continue %s does not have any condition.

DESCRIPTION

The loop has both exits and loop continue but there is no distinguishable condition on these two operations. It means there is transition ambiguity between loop continue and loop exit.

WHAT NEXT

Look for source code and check that there is a condition for loop exit. If so, check that the condition is set the proper way.

HLS-274 (Error) The memory resource '%s' at line '%d' is not supported for multi-processes.

DESCRIPTION

There are some memory resources declared in the architecture level.

WHAT NEXT

Move those declarations into each process.

NAM

HLS-275 (error) Memory module '%s' cannot be found in the synthetic libraries.

DESCRIPTION

The memory module name specified in the design source file cannot be found in the available synthetic libraries.

WHAT NEXT

Change the module name into one in the current syntatic library set or add the synthetic library which defines the module to synthetic library set.

HLS-276 (error) Command "bc_report_memories" cannot be applied to design
'%s' which was not elaborated for behavioral synthesis.

DESCRIPTION

The **bc_report_memories** command processes only the designs elaborated for behavioral synthesis.

WHAT NEXT

Elaborate the design again with the -s option.

HLS-277 (error) Command "bc_report_memories" cannot be applied to the scheduled design '%s'.

DESCRIPTION

The command can only be applicable to the design which has not been scheduled.

WHAT NEXT

Apply the command before schedule, but after elaboration.

HLS-278 (error) Read memory access of '%s' in process '%s' cannot be performed because module '%s' does not have either a read only or read/write port.

DESCRIPTION

The memory module cannot be used for read access because there is no port for read.

WHAT NEXT

Change the memory module into one which can be read.

HLS-279 (error) Write memory access of '%s' in process '%s' cannot be performed because module '%s' does not have either a write only or read/write port.

DESCRIPTION

The memory module cannot be used for write access because there is no port for write.

WHAT NEXT

Change the memory module into one which can be written.

HLS-280 (warning) User Constraint was given to ignore memory precendences between '%s' and '%s' in process '%s', in which their accesses conflict.

DESCRIPTION

You put an ignore_memory_precendences constraint between two memory accesses which conflict. This can cause siumulation mismatch due to generation of incorrect logics.

WHAT NEXT

Do not use the constraint or check that the constraint does not produce incorrect logics.

HLS-281 (warning) User Constraint was given to ignore memory loop precendences between '%s' and '%s' in process '%s',

in which their accesses across iterations of loop conflict.

DESCRIPTION

You put an ignore_memory_loop_precedences constraint between two memory accesses, which conflict. This can cause simulation mismatch due to generation of incorrect logics.

WHAT NEXT

Do not use the constraint or check that the constraint do not produce incorrect logics.

HLS-282 (warning) The node '%s references design '%s' which does not drive output '%s'.

Please check the state binding in your .sl file.

DESCRIPTION

WHAT NEXT

HLS-283 (error) Because options -dont_split, -round_bits #, and -truncate_bits # conflict with each other, choose only one.

See the man page for transform_csa to find out how to control operation splitting.

DESCRIPTION

Operation splitting occurs when lower-bits of output of driving cell does not used in the loaded cell. There are three options for controlling operation splitting:

- dont_split means that transform_csa does not allow operation splitting.
- truncate_bits # means that transform_csa allow operation splitting up to # bits and used the last carry out bit.
- round_bits # means that transform_csa allow operation splitting up to # bits and used the last carry out and the most significant bit.

WHAT NEXT

The `transform_csa` command is obsolete. Please use `compile_ultra` or `set_ultra_optimization` instead.

HLS-284 (error) The variable `bc_allocation_effort` is no longer supported. Please use the option `-allocation_effort` for the `schedule` command.

DESCRIPTION

The shell variable `bc_allocation_effort` has been replaced by the `-allocation_effort` option of the `schedule` command and is no longer supported.

WHAT NEXT

To control the allocation effort of behavioral synthesis, please use the `-allocation_effort` option of the `schedule` command.

SEE ALSO

`schedule(2)`

HLS-285 (information) Operations '`%s`' and '`%s`' were not merged into CSA operations. See the man page for this command to find out how to use distributive rule to decrease delay at the expense of extra area.

DESCRIPTION

The corresponding expression in source file is `a * (b +)`. It can be changed into `a * b + a * ...` so that CSA transformation can be applied. This might increase area, but can reduce the delay. This might be beneficial if there is a constant term on the addition expression. But, it needs to examine operations which are connected to the addition to see that the operations together with the addition can merge into CSA operations.

WHAT NEXT

Change the expression of the form $a * (b + \dots)$ into $a * b + a * \dots$

HLS-286 (information) Operations '%s' and '%s' were not merged into CSA operations because '-dont_split' option was asserted. See the man page for transform_csa to find out how the operations can be merged by splitting operation.

DESCRIPTION

Operation splitting occurs when lower bits of output of the driving cell are not used in the loaded cell. There are three options for controlling operation splitting:

1. '-dont_split' means that transform_csa does not allow operation splitting.
2. '-truncate_bits #' means that transform_csa allows operation splitting up to # bits and uses the last carry out bit.
3. '-round_bits #' means that transform_csa allows operation splitting up to # bits and uses the last carry out and the most significant bit.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-287 (warning) Designware Foundation license is not available during transform_csa.

DESCRIPTION

The transform_csa command can be performed without Designware Foundation license, but can cause an error afterwards.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-288 (warning) Due to the transformation of operations with lower bit rounding, simulation mismatch can occur. See man pages to find out how simulation mismatch can be avoided on transform_csa.

DESCRIPTION

Simulation mismatch occurs when -round_bits n or -truncate_bits n is used. With -round_bits, simulation mismatch always occurs with -truncate_bits. It occurs when its value is small enough not to take into the result of operation of the least significat bits of inputs.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-289 (information) The direction of port '%s' will be input.

DESCRIPTION

WHAT NEXT

HLS-290 (warning) Could not find memory '%s' in synthetic libraries which is to be accessed by '%s' of instance '%s'.

DESCRIPTION

The memory used in design is not available in synthetic library. Note that memory name is case sensitive.

WHAT NEXT

Include the memory in synthetic library.

HLS-291 (information) cell '%s' will be chained if possible.

DESCRIPTION

A positive delay has been specified with `set_memory_output_delay` command. BC will try to chain the specified memory read operations with subsequent operations.

WHAT NEXT

No further action is required. This is simply an informational message to indicate that the `set_memory_output_delay` command was successfully applied.

HLS-292 (error) You cannot specify a zero delay with the set_memory_output_delay command.

DESCRIPTION

A zero delay has been specified with `set_memory_output_delay` command.

WHAT NEXT

The delay could be positive non zero number. To infer a register, specify a delay equal to the clock period.

HLS-293 (information) the design '%s' has been already timed. The timing table will be automatically update.

DESCRIPTION

This is an informational message. The current design has been already timed. The `set_memory_output_delay`(`set_memory_input_delay`) command will automatically update the current timing to take into account the delay specified with `set_memory_output_delay` or `set_memory_input_delay`.

WHAT NEXT

This is an information message. No further action is needed.

HLS-294 (error) Could not find memory name '%s' in synthetic library.

DESCRIPTION

The memory instance name specified in -name list does not exist in any of the synthetic libraries listed in the synthetic_library dc_shell variable.

WHAT NEXT

Make sure that the synthetic_library dc_shell variable includes a synthetic library that contains a memory where name matches the one specified. The command **bc_report_memories** can be used to get a list of memories available in the currently specified synthetic libraries or a list of memories used in the current design.

HLS-295 (error) Negative delays are not allowed with the set_memory_output_delay command.

DESCRIPTION

You have specified a negative delay with the **set_memory_output_delay** command. This is not allowed.

WHAT NEXT

Specify a delay greater than zero with the **set_memory_output_delay** command.

HLS-296 (error) STABLE = TRUE on a memory output port was detected this is inconsistent with positive internal delays

DESCRIPTION

This command is inconsistent when a STABLE attribute on the output port of the memory in the .sl file is TRUE and a positive internal delay is specified.

WHAT NEXT

Check your memory output STABLE attribute in the .sl file. or make sure that the internal delay is 0.

HLS-297 (warning) Due to the pipelining of loop '%s', the unbalanced branches of the conditional at line %s will get scheduled in the same number of control steps.

DESCRIPTION

Pipelining requires the loop body to be executed in the same number of control steps independently of the conditional branches being executed.

In your behavioral description, you have specified a conditional statement with different numbers of clock statements in the different branches. The loop that contains this conditional statement has been specified for pipelining.

In the synthesized design, in order to pipeline the loop, each of the branches will be executed in the same number of clock cycles.

WHAT NEXT

No further action is needed.

However, in simulation, the synthesized design may behave differently from your behavioral description due to the additional clock cycles inserted in some of the branches of the conditional statement.

If necessary, modify your behavioral description to have the same number of clock statements in all branches of the conditional statement.

HLS-298 (error) bc_force_balanced_branches has an illegal value.

Please use one of never, always, wait_based.

DESCRIPTION

WHAT NEXT

HLS-299 (information) Evaluation of an exit condition of loop
'%s' needs

%d extra clock cycles after the loop to preserve timing when exiting.

DESCRIPTION

When exiting loop, the evaluation of condition takes some amount of clock cycles. If state transition is not allowed, at least one clock cycle is needed after loop because the exit transition should be preserved across the loop. For cycle-fixed mode, the number of clock cycles is strictly required while for other modes, the clock cycles are added if not sufficient in source file by user. It could be an error if an i/o operation occurs during the period of clock cycles after loop because the exit is not completed at that period.

WHAT NEXT

For cycle-fixed mode, add more wait/@posedge after loop if not enough and for superstate-fixed, make sure that the extra clock cycles are used for exit transition.

HLS-300 (error) Current design is not defined.

DESCRIPTION

WHAT NEXT

HLS-301 (error) synthetic_library variable is not defined.

DESCRIPTION

"bc_report_memories" cannot work with undefined synthetic_library.

"set_memory_output_delay" cannot work with undefined synthetic_library.
"set_memory_input_delay" cannot work with undefined synthetic_library.

WHAT NEXT

Define synthetic_library variable before using the command.

HLS-302 (information) Only '-synthetic_libraries' or '-bindings' are applied because current design is not defined.

DESCRIPTION

"-synthetic_libraries" and/or "-bindings" work even though current design is not defined. But, for the other options to work design should be defined.

WHAT NEXT

HLS-303 (information) Multi-stage multiplication '%s' is not applicable to transformation.

DESCRIPTION

Because multi-stage multiplication is not combinational, transform_csa does not transform the operation. Note that after transform_csa to combinational multiplication, "optimize_registers" command to compiled gate-level design can help you generate a design of pipelined stage of the multiplication automatically. This mean that "transform_csa" and then "optimize_registers" flow can generate pipelined design automatically.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-304 (information) No addition/subtraction/multiplication

tree was found.

DESCRIPTION

The tree structure to be transformed is of the form in which if it is a single-node tree the node must be multiplication, and if is a multi-node tree non-leaf nodes must not be multiplication. In addition, note that addition/subtraction/multiplication to be transformed must be purely combinational.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-305 (erro) Because options '-balance_only' and '-chain_only' are conflict, choose only one of them. See the man page for transform_csa to find out the applications.

DESCRIPTION

-balance_only transforms an operation tree into a balanced addition tree. -chain_only transforms an operation tree into a chained addition tree. In BC-flow, -balance_only is intended for reducing timing while -chain_only is intended for reducing area.

WHAT NEXT

HLS-306 (warning) '-duplicate' option cannot be applied together with '%s' option. '-duplicate' was ignored.

DESCRIPTION

-balance_only transforms an operation tree into a balanced addition tree. -chain_only transforms an operation tree into a chained addition tree. In BC-flow, -balance_only is intended for reducing timing while -chain_only is intended for reducing area. Note that -duplicate is meaningful only for transform an operation tree into CSA operation (not additions).

WHAT NEXT

HLS-307 (error) '%s' is an invalid logic grouping size. Use one of 'zero', 'small', 'medium', and 'large'.

DESCRIPTION

WHAT NEXT

HLS-308 (warning) Negative value '%d' of option '%s' is not allowed.

The option was ignored.

DESCRIPTION

Values of -round_bits and -truncate_bits shound be zero or positive integers.

WHAT NEXT

Specify non-negative number.

HLS-309 (warning) Memory module '%s' uses binding '%s' which has no state information. This can cause a fatal error in schedule.

DESCRIPTION

Each binding defined in memory module should have non-empty state infarmation.

WHAT NEXT

Add state information inside of the binding.

HLS-310 (information) Operations '%s' extended input bit-width %s

to generate MULT2 operation without output extension. It increases area, but can reduce the delay.

DESCRIPTION

Currently, extending output of mult2 does not guarantee the correctness of simulation when the extended output is used as an input of csa tree. Therefore, we extended the input width of mult so that when decomposed into mult2 there is no need to extend its outputs.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-311 (warning) memory_address_port attributes were found in processes %s.

But, bc_allow_shared_memories is not set. The memory is assumed to be non-shared.

DESCRIPTION

Shared memory feature is effective only when bc_allow_shared_memories = "true". Otherwise, BC considers the memory as a non-shared memory. Use bc_report_memories command to find out the detail information of the memory used in scheduling.

WHAT NEXT

Set bc_allow_shared_memories to be true to apply the shared memory feature.

HLS-312 (error) Could not find operations MULTP_UNS_OP and MULTP_TC_OP.

This is probably because the synthetic library dw02.sldb is

missing from
the synthetic_library variable specification or the dw02.sldb
does not contain
the modules..

DESCRIPTION

The transform_csa command needs to be able to find the synthetic operations "MULT2_UNS_OP" and "MULT2_TC_OP" in the libraries specified by the synthetic_library variable.

WHAT NEXT

The transform_csa command is obsolete. Please use compile_ultra or set_ultra_optimization instead.

HLS-313 (error) Multiple %s bindings were defined in address port '%s' of memory '%s'.

DESCRIPTION

For each port of memory, only one read/write binding must be defined.

WHAT NEXT

Check the bindings of the memory.

HLS-314 (error) Reset signal came from synthetic operation or sequential operation.

DESCRIPTION

Reset signal must come from either combinational logic or port.

WHAT NEXT

Redefine reset signal.

HLS-315 (error) Number of cycles '%d' constrained to graph '%s'
by set_cycles command exceeds the minimum number of cycles %d required
for the graph.

DESCRIPTION

Note that the cycles specified by set_cycle command to the graph must be greater than or equal to the required minimum number of cycles.

WHAT NEXT

Reset the number of cycles.

HLS-316 (error) Because preserve function '%s' contains %s
the function cannot be treated as a designware. See the man
page to
find out the usage of preserve function attribute.

DESCRIPTION

A preserve function can be treated as a designware part if it does not contain -
loop construct - sequential operation - wait/posedge statement - memory access
operation, or - signal access operation

Use preserve "sequential" function attribute if the function want to be treated as a
schedulable component rather than a designware component.

WHAT NEXT

Remove the illegal statemet from the design description or use preserve sequential
function attribute.

HLS-317 (error) Negative delays are not allowed with the

`set_memory_input_delay` command.

DESCRIPTION

You have specified a negative delay with the `set_memory_input_delay` command. This is not allowed.

WHAT NEXT

Specify a delay greater than zero with the `set_memory_input_delay` command.

HLS-318 (error) You cannot specify a zero delay with the `set_memory_input_delay` command.

DESCRIPTION

A zero delay has been specified with `set_memory_input_delay` command.

WHAT NEXT

The delay should be positive non zero number.

HLS-319 (error) Cannot find variable '%s' in design '%s'.
`set_exclusive_use` will be ignored.

DESCRIPTION

The variable specified could not be found in the design.

WHAT NEXT

Check in your HDL, whether the variable really exists. If you tried applying this command on a db that has already been timed, you might want to try specifying this constraint right after elaboration.

HLS-320 (error) Precompiled design '%s' has not been created

in the Behavioral Compiler flow.

DESCRIPTION

To avoid inconsistencies, **bc_time_design** requires that precompiled parts that represent preserved functions have to be generated from within **bc_time_design**.

WHAT NEXT

Please call **bc_time_design** again using the **cache_user_dw** option.

HLS-321 (information) Writing preserved function '%s' to file '%s'
in library '%s' which is mapped to '%s'.

DESCRIPTION

The preserved function has been written into the design library as directed by the option **cache_user_dw** specified with **bc_time_design**.

WHAT NEXT

When you call **bc_time_design** again you can reuse the precompiled part by providing the name of the **design_library** for the **use_chached_user_dw** option of **bc_time_design**. However, please make sure that you only use this mechanism as long as the HDL code for all the preserved functions have not changed. Otherwise, you will observe simulation mismatches between the pre- and post scheduling versions of your design.

HLS-322 (warning) Reading precompiled version of preserved function '%s' from library '%s'.

DESCRIPTION

WHAT NEXT

HLS-323 (warning) Cannot find precompiled version of preserved function '%s'

in library '%s'. The preserved function will get compiled.

DESCRIPTION

bc_time_design was not able to find the precompiled function in the designated library. Therefore, **bc_time_design** has to compile the preserved function.

WHAT NEXT

HLS-324 (warning) test

DESCRIPTION

WHAT NEXT

HLS-325 (error) Behavioral Compiler does currently not support data

dependencies from the inside of a pipelined loop to the outside of that loop, unless the producer of the data is scheduled in the initiation interval.

DESCRIPTION

WHAT NEXT

HLS-326 (information) register '%s' has a reset value '%s'

DESCRIPTION

This is an information message to warn that a reset value has been assigned to this register. The set/reset pin of this register will be directly connected to the reset signal of the design.

WHAT NEXT

Since the reset/set pin of the considered register are directly connected to the reset signal of the design. You should expect a difference cycle behavior between signal A and B in the following example:

```
RstL: loop
  A <= "1011";
  B <= In1 + 4;
  wait until Clk'event and CLK ='1';
  exit reset_loop when reset = '1';

  MainL: loop
  ...
  end loop MainL;
end loop RstL;
```

A will get the value "1011" when the reset is sampled true. B will get the first value in the following rising edge.

HLS-327 (error) Negative external delays are not allowed with the
set_memory_output/input_delay command.

DESCRIPTION

You have specified a negative delay with the **-external** option of the **set_memory_input_delay** command or the **set_memory_output_delay** command. This is not allowed.

WHAT NEXT

Specify a delay greater than zero with the **-external** option.

HLS-328 (information) An old delay '%f' has been found on cell '%S'

DESCRIPTION

This is to inform you that cell '%s' had already an old delay value
Since no delay has been specified with set_memory_output/input_delay
command. The old delay is taken into account.

WHAT NEXT

To override the old delay specify a new one with the -delay option of `set_memory_output/input_delay`.

HLS-329 (information) An old external delay '%f' has been found on cell '%s'

DESCRIPTION

This is to inform you that cell '%s' had already an old external delay value. Since no external delay has been specified with `set_memory_output/input_delay` command. The old external delay is taken into account.

WHAT NEXT

To override the old delay specify a new one with the -external option of `set_memory_output/input_delay`.

HLS-330 (error) no memory found in synthetic libraries.

DESCRIPTION

No memory is declared in synthetic libraries

WHAT NEXT

check your synthetic libraries or your `synthetic_library` `dc_shell` variable if it includes the desired synthetic library.

HLS-331 (warning) no clock has been yet defined on the current design

DESCRIPTION

The delays specified with `set_memory_input_delay` and `set_memory_output_delay` must not exceed the effective clock period.

However, we cannot check this since the clock has not yet been created for your design.

WHAT NEXT

When you do create a clock, make sure that the delays specified with `set_memory_input_delay` and `set_memory_output_delay` do not exceed the effective clock period.

The effective clock period is the clock period you specify with the `create_clock` command minus the clock cycle margin computed by the `bc_margin` command or the `bc_time_design` command.

HLS-332 (error) The total delay '%f' exceeds the clock period '%f'

DESCRIPTION

The sum of the delays specified with `set_memory_input_delay` or `set_memory_output_delay` commands exceeds the clock period already specified.

WHAT NEXT

Check your delays and/or your clock period and make sure that the sum of the delays does not exceed the clock period.

HLS-333 (information) Please use "bc_clears_all_registers" rather than "reset_clears_all_bc_registers" next time.

DESCRIPTION

The official variable name is `bc_clears_all_registers` even though BC still supports `reset_clears_all_bc_registers` for a while.

WHAT NEXT

Replace `reset_clears_all_bc_registers` by `bc_clears_all_registers`.

HLS-334 (information) Nothing to report for given range in this

process.

DESCRIPTION

No operations or variables are scheduled in given range. During `report_schedule`, - start or -finish options are generated out of range.

WHAT NEXT

Do `report_schedule` to find out proper range.

HLS-335 (warning) The dont_unroll loop %s is missing.

DESCRIPTION

The dont_unroll attribute is specified but there's no loop has that name.

WHAT NEXT

Examine the source code to make sure the dont_unroll attribute is the correct name.

HLS-336 (warning) Direct reset is turned off because the command control_register -outputs is on.

DESCRIPTION

The direct reset (default mode) will keep reset signals from appearing in the datapath. However, the feature will not work if the command control_register -output and the reset signal will appear on datapath.

WHAT NEXT

use set_behavioral_reset -fsm to allow reset signal in the datapath.

HLS-337 (error) The command '%s' is only valid on designs that have been timed for scheduling, but have not been scheduled yet.

The design '%s' is not valid.

DESCRIPTION

This command operates only on designs that have been timed for scheduling.

WHAT NEXT

Make sure the design being passed in to this command has been timed for scheduling.

HLS-338 (error) The 'area' option for the schedule command has been renamed in 'extend_latency'.

DESCRIPTION

Due to the confusion the name of the 'area' option created, it has been renamed into 'extend_latency'.

WHAT NEXT

Call the **schedule** command using the 'extend_latency' option.

HLS-339 (information) the design '%s' has been already timed.

DESCRIPTION

This is an information message. The current design has been already timed.

WHAT NEXT

Rerun **bc_time_design** to update the timing table before scheduling.

HLS-340 (warning) Port '%s' drives node '%s'.

DESCRIPTION

When a port has been constrained using **bc_dont_register_input_port**, it is recommended that the port drives all consumers directly. Consider the example given

below where it is assumed that the port `data_in` has been marked as not requiring a register.

```
-- This is bad, a register might get allocated for tmp
tmp := data_in;
loop
    a := b + tmp;
    ...
end loop;

-- This is correct
loop
    a := b + data_in;
    ...
end loop;
```

WHAT NEXT

Check whether you can rewrite the HDL to avoid the unintentional allocation of registers.

HLS-341 (error) Design %s is already compiled for bc_time_design.

DESCRIPTION

This design has been already compiled for `bc_time_design`.

WHAT NEXT

To recompile the design, use the `-force` option.

HLS-342 (error) no cluster was found in %s

DESCRIPTION

No cluster was found in %s.

WHAT NEXT

Make sure that you already clustered random logic using the `bc_group_logics` or the `bc_time_design` commands.

HLS-343 (warning) %s attribute is set true on design %s

DESCRIPTION

This is a warning message. A %s attribute is set true on design %s. This design will not be compiled.

WHAT NEXT

Refer to the **bc_time_design** or the **bc_time_groups** man pages for more information.

HLS-344 (error) Design %s is not a cluster of random logic

DESCRIPTION

The **bc_time_groups** command is only applied on random logic groups that are clustered. This design is not a cluster of random logic.

WHAT NEXT

Make sure that all designs specified with **bc_time_groups** are clusters of random logic. For more informations on clustering random logic refer to **bc_time_design** and **bc_group_logics** commands.

HLS-345 (information) The delay on the write to signal '%s' at line %d

causes the assignment to be scheduled %d cycles after the beginning of the enclosing loop.

DESCRIPTION

The signal identified in the message has been specified as being delayed in the HDL. In order for synthesis to match simulation, Behavioral Compiler might have to pipeline the loop.

WHAT NEXT

This is an information message. No further action is necessary.

HLS-346 (warning) The design has a comparison operation on line %d that compares values of type std_logic_vector. This is ambiguous.

DESCRIPTION

BC is not able to map to any operator for this type of comparison operation. This is because the type of variables that are compared is not clearly defined for comparison. For example, BC will not figure out what kind of comparator should be used for std_logic_vector variables, because the values could be interpreted as signed or as unsigned. This might cause simulation mismatches!

If for example a and b are defined as std_logic_vector, then the following statement is ambiguous

```
if (a < b) then  
change it into e.g.  
if (signed(a) < signed(b)) then
```

WHAT NEXT

Check the hd1 code for the types of variables used in comparison operations. The type have to be clear such as signed or unsigned. ~

HLS-347 (warning) All dont_care nets will become logic zero nets.

DESCRIPTION

If a design has dont_care signals, BC will treat them as logic zero. For example, VHDL code

```
CS_Z <= '-' ;  
will be translated into  
CS_Z <= '0' ;
```

In other words, BC will generate the same design as the variable hdlin_make_dc_zero set to true.

WHAT NEXT

Providing a specific value for each signal is recommended. Rewrite your HDL code so

that it does not contain any dont care signals.

HLS-348 (error) The variable feeding input %s of operation %s is not initialized.

DESCRIPTION

Behavioral Compiler detected that an input variable to the operation described has never been initialized.

WHAT NEXT

Please make sure, that all variables in your HDL code are initialized appropriately.

HLS-349 (Error) Design %s contains a subdesign %s which does not drive a used output %s

DESCRIPTION

You can receive this message if you have a subdesign whose outputs are never used by designs higher in the hierarchy. Behavioral Compiler disconnects the cells driving these outputs. However, if designs higher in the hierarchy have operations to which these outputs are connected, Behavioral Compiler reports this error.

This can happen if there is unreachable code in the input behavioral description.

In the example below, the line "y := b + 16;" is never reached because main_loop is never exited. Behavioral Compiler will not drive the "b" output of subdesign "main_loop_design", but the output "b" is connected to an adder in subdesign "reset_loop_design", generating this error message.

```
reset_loop : loop
  x <= x_in
  wait until clk'event and clk='1' if reset='1' then exit reset_loop; end if;
  main_loop : loop
    a := 1 + x; b := a * 5;
    wait until clk'event and clk='1' if reset='1' then exit reset_loop; end if;
  end loop main_loop;
  y := b + 16; -- dead code
```

```
end loop reset_loop;
```

WHAT NEXT

Examine your design for code that uses the undriven output that was reported. Remove any unreachable code that uses the undriven output.

HLS-350 (warning) Operation '%s' has been turned into a multicycle operation.

DESCRIPTION

The margin time is set to take clock-to-Q delay and signal setup time into account. Even though the execution time of an operation is less than the clock period, if the sum of the margin and the execution time of an operation is bigger than the clock period, then the operation cannot be executed within a single cycle. Therefore, the operation is transformed into a multicycle operation. This warning message informs the user that this operation has been turned into a multicycle operation.

WHAT NEXT

- To disable multicycle operation, set `bc_enable_multi_cycle = false`
- To change the margin amount, use `bc_margin` command
- For a multicycle operation of '`n`' cycles, the available execution time is effectively: '`n`' * `clock_period - margin_amount`.

HLS-351 (information) Using precompiled version of preserved function '%s' from library '%s'.

DESCRIPTION

The subdesign for the preserved function identified in the message will be taken from the cached version in the specified library. This cached version replaces the subdesign previously linked to the main design.

WHAT NEXT

This is an information message. No further action is necessary.

HLS-352 (error) The variable %s is no longer supported.

Please use %s instead.

DESCRIPTION

The following variables are removed: - bc_connect_reset It is replaced by the default mode of the new reset implementation. To enforce the default setting, please use set_behavioral_reset without any argument. - bc_no_reset_on_datapath It used to be the same variable as "bc_connect_reset". So it's now replaced by "set_behavioral_reset". - bc_clears_all_registers It used to be used to clear all registers to zeros. Now you can you set_behavioral_reset with -all option to obtain the same behavior.

For the current release, it is an error because we want to make sure that users use the new command and variables. After that, when users may define these variable if they want to. Please modify your script to use the new command: set_behavioral_reset with new options.

WHAT NEXT

Also note that the following commands were also removed or modified:
set_behavioral_async_reset, set_behavioral_reset.

HLS-353 (error) There must be a main (infinite) loop inside the reset loop, if you are using the direct reset connection.

DESCRIPTION

You receive this message if you are using the direct reset connection and your design description has a reset loop that contains no main (infinite) loop. If you executed **set_behavioral_reset** without the **-fsm** option, by default you are using the direct reset connection.

Behavioral Compiler expects each process to be structured with the reset loop as the outermost loop, and the main loop as the next outermost loop. In this case, expected reset behavior might not be fully achieved.

Thus, Behavioral Compiler does not perform any strict checking for reset loop coding style when there is no nested infinite loop structure.

WHAT NEXT

Rewrite your code so that it has a nested loop structure with the reset loop as the outermost loop and the main (infinite) loop directly within the outermost loop, then re-execute. For an explanation of the recommended Behavioral Compiler coding style, see the manual page for the **set_behavioral_reset** command, or the *Behavioral Compiler User's Guide*.

SEE ALSO

set_behavioral_reset (2), *Behavioral Compiler User's Guide*.

HLS-354 (error) You cannot use a rolled loop before the first clock statement inside the reset loop block, if you are also using the direct reset connection. Add a clock statement before the rolled loop inside the reset loop block, or use **set_behavioral_reset -fsm**.

DESCRIPTION

You receive this message if you are using the direct reset connection and used a rolled loop before the first clock statement inside the reset loop block. If you executed **set_behavioral_reset** without the **-fsm** option, by default you are using the direct reset connection.

A construction where a conditional execution appears in the reset loop, especially before the first clock statement, makes the reset behavior unpredictable.

"for" loops are unrolled by default; no error message is issued if there is a "for" loop before the first clock statement. However, when you specify "dont_unroll" of a certain "for" loop, an error message is issued if a "for" loop with the "dont_unroll" attribute appears before the first clock statement, as in the following example:

```
--- code fragment
attribute dont_unroll of f1:label is TRUE;
begin
D <= "00001";
E <= "11111";

f1: for i in C'range loop
    C(i) <= A(i) and B(i);
    wait until clk'event and clk = '1';
end loop;

end process;
-- end of code fragment
```

WHAT NEXT

Insert a clock statement before the rolled loop, then re-execute. For an explanation of the recommended Behavioral Compiler coding style, see the manual page for the **set_behavioral_reset** command, or the *Behavioral Compiler User's Guide*.

Alternatively, you can use **set_behavioral_reset -fsm**; there are no coding style restrictions in this case. However, when the FSM reset is used, reset link checking is turned off and there might be a performance penalty.

SEE ALSO

set_behavioral_reset (2), *Behavioral Compiler User's Guide*.

HLS-355 (warning) No signal assignments appear before the first clock statement in the reset loop; therefore, the reset signal cannot be directly connected to any signals.

DESCRIPTION

You receive this message if you are using the direct reset connection and a clock statement appears in the reset loop before any signal operation. If you executed **set_behavioral_reset** without the **-fsm** option, by default you are using the direct reset connection.

The message warns you that currently no signals in your design can be connected to the reset signal. Signal registers are reset only if their signal assignments appear before the first clock statement in the reset loop. Otherwise, no signal registers can be directly connected to the reset signal.

In Behavioral Compiler, variable assignments are delayed until they are really necessary, which means that even though the HDL description shows some variable assignments, it is possible that Behavioral Compiler will not see any assignments before the first clock statement. Also, checking for reset loop coding style is carried out on the portion of the reset loop before the first clock statement. In this case, checking for reset loop coding style is effectively not carried out because there is no statement before the first clock statement.

WHAT NEXT

Remove the clock statement from the description; it does not perform any meaningful function. For an explanation of the recommended Behavioral Compiler coding style, see the manual page for the **set_behavioral_reset** command, or the *Behavioral Compiler User's Guide*.

Alternatively, you can use **set_behavioral_reset -fsm**; there are no coding style restrictions in this case. However, when the FSM reset is used, checking for reset loop coding style is turned off and there might be a performance penalty.

SEE ALSO

set_behavioral_reset (2), *Behavioral Compiler User's Guide*.

HLS-356 (error) You cannot use a reset loop that contains a conditional (if) statement before the first clock statement, if you are also using the direct reset connection. Add a clock statement before the conditional statement inside the reset loop block, or use `set_behavioral_reset -fsm`.

DESCRIPTION

You receive this error message if you are using the direct reset connection and your reset loop block contains a conditional (if) statement before the first clock statement. If you executed `set_behavioral_reset` without the `-fsm` option, by default you are using the direct reset connection.

In the direct reset connection, Behavioral Compiler directly connects the reset signal to the preset/clear pin of the register to be reset. If there is a conditional statement in the reset loop before the first clock, the assignment inside the conditional might not be reset in the first cycle. In addition, the reset value cannot be determined until run time.

Another structure that is not allowed is a rolled loop before the first clock statement in the reset loop; any rolled loop must have at least one clock statement.

WHAT NEXT

Insert a clock statement before the conditional statement, then re-execute. For an explanation of the recommended Behavioral Compiler coding style, see the manual page for the `set_behavioral_reset` command, or the *Behavioral Compiler User's Guide*.

Alternatively, you can use `set_behavioral_reset -fsm`; there are no coding style restrictions in this case. However, when the FSM reset is used, checking for reset loop coding style is turned off and there might be a performance penalty.

SEE ALSO

`set_behavioral_reset` (2), *Behavioral Compiler User's Guide*.

HLS-357 (information) The reset signal will be directly connected to the preset or clear pin of registers.

DESCRIPTION

This message informs you that the reset signal is being directly connected to the preset/clear pin of those registers that need to be reset. If you executed `set_behavioral_reset` without the `-fsm` option, by default you are using the direct

reset connection.

During **compile** (by Design Compiler), when the register is mapped to a filp-flop without a preset or clear pin, an equivalent implementation is realized with the reset signal hooked up to the D-pin of the mapped flip-flop. But as long as there is a reset pin in the mapped flip-flop, the reset signal is directly connected to it. The reset value for each register to be reset must be known, or an error message is generated.

Alternatively, you can let the FSM generate the reset signal as it generates other control signals, by executing **set_behavioral_reset -fsm**. In that case, the reset signal is fed into the FSM, and the reset signal is generated from the FSM. There are no coding style restrictions when the FSM reset is used; however, checking for reset loop coding style is turned off and there might be a performance penalty.

WHAT NEXT

If you intended for the reset signal to be directly connected to the preset or clear pin of registers, with no intervening logic, no action is required on your part. In this default direct reset connection mode, certain coding restrictions apply. For more information, see the manual page for the **set_behavioral_reset** command, or the *Behavioral Compiler User's Guide*.

Otherwise, use **set_behavioral_reset -fsm** as previously described.

SEE ALSO

set_behavioral_reset (2), *Behavioral Compiler User's Guide*.

HLS-358 (information) The reset signal will be generated from the FSM.

DESCRIPTION

This message informs you that the reset signal is being generated from the FSM, because you have executed **set_behavioral_reset -fsm**. The reset signal from the FSM can be regarded as a control signal normally generated from the FSM, and goes through glue logic in the datapath instead of being directly connected to preset/clear pin of registers. Since reset is a control signal, the main advantage of using this style of reset is that any general structures (for example, as conditionals and rolled loops) are allowed in the reset loop before the first clock statement. Also, when the FSM reset is used, checking for reset loop coding style is turned off. The main disadvantage is that it takes time to calculate the reset signal in the FSM, and there is additional delay when the reset functions as a select signal for some of MUXes to select the reset value over the normal data value.

Alternatively, you can let the reset signal be directly connected to the preset/clear pin of those registers that need to be reset, by executing **set_behavioral_reset** without the **-fsm** option.

WHAT NEXT

If you intended for the reset signal to be generated from the FSM, no action is required on your part. Otherwise, to enable the default direct reset connection re-execute **set_behavioral_reset** without the **-fsm** option.

SEE ALSO

set_behavioral_reset (2).

HLS-359 (information) The reset of the scheduled design has been set to %s.

DESCRIPTION

You receive this message to inform you that the reset of the scheduled design has been set to either synchronous or asynchronous, as specified in the message. The synchronous setting is the default; if you want the design's reset to be asynchronous, you must execute **set_behavioral_reset -async**.

WHAT NEXT

If the reset has been set to asynchronous and you want to keep this setting, no action is required on your part.

If the reset has been set to asynchronous and you want to change it to synchronous, execute **set_behavioral_reset** without the **-async** option.

If the reset has been set to synchronous and you want to change it to asynchronous, execute **set_behavioral_reset -async**.

If the reset has been set to synchronous and you want to keep this setting, then to avoid generating errors, follow these guidelines:

- Place an "if" statement after each clock statement.
- Ensure that the "if" block does not have an "else" path.
- Ensure that the "if" block does not have multiple exit paths.
- Ensure that the polarity and condition of the "if" block is the same for every occurrence.
- Ensure that in the "if" block, the exit block is outside the main loop, so that execution of the current] block is terminated when the branch is taken.
- Ensure that all reset jumps jump to the same exit block.

For example, if(reset = '1') then exit reset_loop; end if;
The destination block of the 'exit' should be the same.

SEE ALSO

set_behavioral_reset (2).

HLS-360 (warning) You have executed **set_behavioral_reset** without arguments; setting all reset options to their default values.

DESCRIPTION

This message informs you that you have executed **set_behavioral_reset** with no options, and therefore all default values will be used.

The default for the **-port** option is to use the reset port specified in the HDL code. If none is specified, an error message is generated.

Defaults for the other options are as follows:

```
-process (all)
-active (high)
-fsm (false)
-async (false)
-all (false)
```

NOTE: By using the default reset, you can get fast and simple implementation of reset, but there are restrictions in the coding style, which could generate warning or error messages for nonconformance. For information about the coding style restrictions, see the manual page for the **set_behavioral_reset** command or the *Behavioral Compiler User's Guide*.

Alternatively, to avoid coding restrictions, you can use **set_behavioral_reset -fsm**. However, when the FSM reset is used, checking for reset loop coding style is turned off and there might be a performance penalty.

WHAT NEXT

If the default values are acceptable to you, no action is required on your part. Otherwise, re-execute **set_behavioral_reset** with appropriate options.

SEE ALSO

set_behavioral_reset (2). *Behavioral Compiler User's Guide*.

HLS-361 (information) Checking for reset loop coding style will be performed on the reset loop.

DESCRIPTION

This message informs you that checking for reset loop coding style will be performed on the reset loop. Checking is performed if one of the following is true:

- You have executed the **set_behavioral_reset** command without the **-fsm** option; or
- You have executed the **schedule** command and it detects that checking for reset loop coding style has not been done (for example, if you have not executed **set_behavioral_reset**). In this case, **schedule** checks for reset loop coding style as one of the preliminary steps before the actual scheduling.

The default mode is a simple and intuitive way to implement the reset connections in the design. The following is a VHDL example of a desirable coding style for the default reset connection:

```
architecture behav of design_name is
begin
process
reset_loop: loop
signal or variable assignments;
clk statement
main_loop: loop

main functional description

end main_loop;
end reset_loop;
end process;
end behav;
```

The following is a similar Verilog example:

```
module
always begin: reset_loop
signal or variable assignments;
clk statement

forever begin: main_loop

main functional description

end // main_loop
end // reset_loop
end module
```

WHAT NEXT

If you want checking for reset loop coding style to be performed on the reset loop, no action is required on your part. Otherwise, to disable this checking, execute **set_behavioral_reset** with the **-fsm** option.

SEE ALSO

schedule (2), **set_behavioral_reset(2)**, *Behavioral Compiler User's Guide*.

HLS-362 (warning) Multiple rolled loops appear in the reset loop.

DESCRIPTION

You receive this message if you are using the direct reset connection and your design description has multiple rolled loops in the reset loop. If you executed **set_behavioral_reset** without the **-fsm** option, by default you are using the direct reset connection.

It is not recommended to have multiple loops in the reset loop. Sometimes the behavioral description inevitably has several rolled loops inside the reset loop. For example, if there is a big "for" loop to initialize a big array, it is preferable to keep it rolled. But in most other cases, it is preferable to have a single rolled loop (main loop) inside the reset loop.

WHAT NEXT

Rewrite your code so that it has a single rolled loop inside the reset loop, then re-execute. For an explanation of the recommended Behavioral Compiler coding style, see the manual page for the **set_behavioral_reset** command, or the *Behavioral Compiler User's Guide*.

Alternatively, you can use **set_behavioral_reset -fsm**; there are no coding style restrictions in this case. However, when the FSM reset is used, checking for reset loop coding style is turned off and there might be a performance penalty.

SEE ALSO

set_behavioral_reset (2), *Behavioral Compiler User's Guide*.

HLS-363 (error) The reset port was not specified either with set_behavioral_reset -port or in the HDL description. Cannot

define reset characteristic.

DESCRIPTION

You receive this message if you attempt to use a reset characteristic but Behavioral Compiler cannot find a specification of the reset port. If you do not define the reset port using **set_behavioral_reset -port**, the default is to use the reset port specified in the HDL code. If none is specified, this error message is generated.

WHAT NEXT

Specify the reset port, either by using **set_behavioral_reset -port**, or by adding the reset port specification to your HDL description.

SEE ALSO

set_behavioral_reset (2).

HLS-365 (warning) Multiple clock statements appear in the reset loop.

DESCRIPTION

You receive this warning message if you are using the default direct reset connection and have multiple clock statements in the reset loop. If you executed **set_behavioral_reset** without the **-fsm** option, by default you are using the direct reset connection.

Multiple clock statements in the reset loop are not recommended, because the reset actions either might not take place in the same clock cycle simultaneously, or might introduce additional delays in executing reset actions.

Also, with the direct reset connection, each rolled loop inside the reset loop should have at least one clock statement.

WHAT NEXT

If possible, rewrite your code so that only one clock statement appears in the reset loop. For an explanation of the recommended Behavioral Compiler coding style, see the manual page for the **set_behavioral_reset** command, or the *Behavioral Compiler User's Guide*.

If you must have multiple clock statements in the reset loop, you can use **set_behavioral_reset -fsm**; there are no coding style restrictions in this case. However, when the FSM reset is used, checking for reset loop coding style is turned off and there might be a performance penalty.

SEE ALSO

`set_behavioral_reset` (2), *Behavioral Compiler User's Guide*.

HLS-366 (error) Input port '%s' is updated inside function '%s'.

DESCRIPTION

You receive this message if the specified input port, which is an input to the specified function, is being modified within the function. You cannot modify a signal within a function if that signal is defined as an input to the function.

The following is an example of code that would generate this error message. The input port `coin_count` is modified in the "if" block of the function.

```
task coin_return_task;
// synopsys preserve_schedule_subprogram
    input [7:0] coin_count ;
    reg [7:0] coin_count_var ;

begin
if (coin_count > 7'b0) begin
    coin_count = coin_count - 4'b1010;
    .
    .
    .
```

WHAT NEXT

Define a local variable and use that local variable inside the function, as in the following example.

```
task coin_return_task;
// synopsys preserve_schedule_subprogram
    input [7:0] coin_count ;
    reg [7:0] coin_count_var ;

begin
    coin_count_var = coin_count;
if (coin_count_var > 7'b0) begin
    coin_count_var = coin_count_var - 4'b1010;
    .
    .
    .
```

HLS-367 (Warning) The reset of the scheduled design has been changed to %s, overriding the previously specified %s reset.

DESCRIPTION

You receive this message to inform you that the reset of the scheduled design has been changed from synchronous to asynchronous, or vice versa. Normally, this would happen as a result of your executing **set_behavioral_reset** with or without the **-async** option.

When a synchronous reset has been inferred from the code and then you execute **set_behavioral_reset -async**, you receive this message saying that the reset has been changed to asynchronous, overriding the previous synchronous setting.

When an asynchronous reset has been specified by executing **set_behavioral_reset -async** and then you execute **set_behavioral_reset** without the **-async** option, you receive this message saying that the reset has been changed to synchronous, overriding the previous asynchronous setting.

WHAT NEXT

If the specified change is what you intended, no action is required on your part. Otherwise, you can re-execute **set_behavioral_reset** with or without the **-async** option, to reverse the specification.

SEE ALSO

set_behavioral_reset (2).

HLS-368 (error) You cannot specify %s without also specifying %s.

DESCRIPTION

You receive this message if you execute **set_behavioral_reset** and use one, but not both, of the **-port** and **-active** options. These options must always be used together.

Of course, you can omit both options. In that case, the defaults are used.

WHAT NEXT

Re-execute **set_behavioral_reset** using either both the **-port** and **-active** options, or neither of those options.

SEE ALSO

set_behavioral_reset (2).

HLS-369 (error) This constraint is illegal because it crosses the subprogram hierarchy.

DESCRIPTION

You receive this message from **set_cycles**, **set_min_cycles**, or **set_max_cycles** if you attempt to place timing constraints on operations that are not in the same level of hierarchy and the same instance of the subprogram. You can place timing constraints only on operations that are in the same level of hierarchy and in the same instance of the subprogram.

WHAT NEXT

Review the design, and reissue the command using a set of constraints that apply to each subprogram instance.

HLS-370 (error) Failed to rebind multiple sequential bindings.

DESCRIPTION

You receive this message if the **schedule** command cannot find valid bindings for an operation that has multiple sequential binding choices; for example, multi-port memory.

WHAT NEXT

Contact Synopsys Technical Support.

HLS-371 (error) Superstate mode violation detected at loop-continue

of %s

DESCRIPTION

When running behavioral synthesis in "super-state" mode, the scheduler is required to make sure that writes in the super-state happen at the end of the super-state, and reads of I/O happen before the writes (and after the writes of the previous super-state). This helps to match simulation behavior.

However, consider the following pseudo-code fragment:

```
while ( <cond> )
    out <= ...
    <<< clock boundary >>>
    out <= ...
end
```

When the loop executes for the second time, the write to port "out" at the end of the loop will conflict with the write to port "out" at the beginning of the loop. In the simulation of the behavioral code, the out at the end of the loop will be overwritten by the out at the beginning of the loop. However, because the scheduler will need to insert more states between the beginning and end of the loop, the behavior of the RTL machine generated would be different. The write to port "out" at the end of the loop would then be visible to the outside world for a few cycles.

To avoid this simulation/synthesis mis-match, it is required that there is a clock boundary between writes at the end of the loop and I/O at the beginning.

WHAT NEXT

Insert a clock boundary (wait in VHDL or always @ in verilog) at the end of the loop (after the last write in the loop).

HLS-372 (error) Superstate mode violation detected at loop-entry of %s

DESCRIPTION

When running behavioral synthesis in "super-state" mode, the scheduler is required to make sure that writes in the super-state happen at the end of the super-state, and reads of I/O happen before the writes (and after the writes of the previous super-state). This helps to match simulation behavior.

However, consider the following pseudo-code fragment:

```
out <= ...  
while ( <cond> )  
    out <= ...
```

When simulating the behavioral code, the write to port "out" before the loop will be over-written by the write to port "out" after the loop. When the design is scheduled, however, cycles will be inserted at the beginning of the loop which will cause the first write to port "out" to be visible for a few cycles. This would cause a simulation mis-match.

WHAT NEXT

Insert a clock boundary (wait in VHDL or always @ in verilog) just before the loop.

HLS-373 (information) The reset signal will clear all registers.

DESCRIPTION

You receive this information because you have used the **-all** option with the **set_behavioral_reset** command prior to running **schedule** or **bc_check_design**.

When a reset is applied to the synthesized design, all of the registers in the design are cleared.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

set_behavioral_reset (2).

HLS-400 (error) Variable '%s' used in preserve_schedule_subprogram '%s' was not defined locally.

DESCRIPTION

All variables used in **preserve_schedule_subprogram** should be defined locally. But, signals can be used globally.

```
e.g. CASE1: reg [4:0] tmp; task A; input [4:0] p, q; output [4:0] x; //synopsys  
preserve_schedule_subprogram x = p + q + tmp ; <---- error: tmp has not passed in.
```

```
CASE2: task A; input [4:0] p, q, tmp; output [4:0] x; //synopsys  
preserve_schedule_subprogram x = p + q + tmp ; <---- ok
```

```
CASE3: input [4:0] a; task A; input [4:0] p, q; output [4:0] x; //synopsys  
preserve_schedule_subprogram x = p + q + a; <---- ok because 'a' is signal
```

```
CASE4: output [4:0] o; task A; input [4:0] p, q; //synopsys  
preserve_schedule_subprogram o <= p + q; <---- ok because 'o' is signal
```

WHAT NEXT

HLS-401 (error) can not create two preserve (sequential) function with same name '%s'

DESCRIPTION

When preserve (sequential) function is used, it is treated as a design. We can not have two different design with the same name.

WHAT NEXT

HLS-402 (error) illegal memory usage '%s' in the preserve schedule subprogram '%s'.

DESCRIPTION

When preserve schedule subprogram is shared(Only allowed in Verilog), the memory needs to be sharable. i.e. It needs to be declared as the same name and same memory type and same address port.

```
module test ( a, b, c, o1, o2, clk, reset );  
  
reg [4:0] mem[4:0],mem1[4:0];  
  
task t;  
  
input [4:0] a, b; //synopsys preserve_schedule_subprogram begin @(posedge clk);  
mem[0] = a + b; <---- illegal @(posedge clk); mem1[0] = a- b; <--- illegal @(posedge  
clk); end  
  
endtask
```

```

always begin : reset_loop

/* synopsys resource Shr_Mem: variables = "mem1", map_to_module = "DW03_ram1_s_d",
memory_address_ports = "addr"; */

@(posedge clk); if ( reset ) disable reset_loop;

t(a, b); o1 <= mem1[0];

end

always begin : reset_loop_2

/* synopsys resource Shr_Mem: variables = "mem", map_to_module = "DW03_ram1_s_d",
memory_address_ports = "addr"; */

@(posedge clk); if ( reset ) disable reset_loop_2;

t(a, b); o2 <= mem[0];

end

endmodule

```

WHAT NEXT

HLS-403 (information) Operations '%s' and '%s' were not merged

into CSA operations because of the mismatch of pins or nets connected
between them.

DESCRIPTION

When an addition/subtraction/multiplication tree is transformed into a CSA tree, the intermediate values of the original tree do not exist in the transformed tree. As a result, if there is an incomplete or non-regular connection between operations in the tree, the behavior of the connection would not be able to be performed in the CSA tree. Because **transform_csa** will not alter the bit-accurate behavior of the design, the irregular connection blocks the transformation.

transform_csa command is now obsolete.

WHAT NEXT

No thing needs to be done. **transform_csa** command is now obsolete.

HLS-404 (error) Ignoring execution precedence from '%s' to '%s'.

Removal of Read <-> Write precedences can lead to illegal allocation of memory bindings (ports). Consult your local Behavior Compiler expert for further information.

DESCRIPTION

When two memory operations, in which one is read access and the other is write, use a multi-port memory module with at least one read/write port cannot be performed simultaneously. Consequently, ignoring the memory precedence between them can cause a bad logic.

WHAT NEXT

Do not issue ignore memory precedence command between memory read and write operations.

HLS-405 (error) It is not recommended to uniquify Behavioral Compiler designs before scheduling. Of course, uniquify can be used for post-scheduled designs.

DESCRIPTION

The command uniquify changes the name of design which may cause problems during scheduling.

WHAT NEXT

Do not run the uniquify command before scheduling a Behavioral Compiler design.

HLS-406 (error) Not an array cell.

DESCRIPTION

The ignore_precedence commands only work on array read and write operations.

WHAT NEXT

Check the names of the operations and re-issue the command, if you want to ignore the constraints of array operations. If you want to eliminate constraints on other kinds of operations, you must change your source code to eliminate constraints of data and control precedence.

HLS-407 (error) No reference for array cell.

DESCRIPTION

The cell has no reference.

WHAT NEXT

Check your synthetic libraries and link the design.

HLS-408 (error) Cannot use the array master as a cell

DESCRIPTION

The cell you have named is the array master. It is needed for internal purposes but it is not subject to being constrained.

WHAT NEXT

Find the array read operation or array write operation you want using `find -h cell`.

HLS-409 (warning) '-use_bit_adder' option cannot be applied together with '%s' option. '-use_bit_adder' was ignored.

DESCRIPTION

The `-balance_only` option transforms an operation tree into a balanced addition tree. The `-chain_only` option transforms an operation tree into a chained addition tree. In BC-flow, `-balance_only` is intended for reducing timing while `-chain_only` is intended for reducing area. Note that `-use_bit_adder` is meaningful only for optimizing timing in bit level.

WHAT NEXT

Use only one of the options.

HLS-410 (warning) Preserved function '%s' has use_netlist pragma.

The netlist will be used rather than the cached version in library '%s'.

DESCRIPTION

There are multiple possible versions of the function design for **bc_time_design** to use. The use_netlist pragma in the HDL will be honored, rather than using the precompiled function in the designated library.

WHAT NEXT

HLS-411 (error) Variable '%s' is used in preserve_function '%s' but is not defined locally.

DESCRIPTION

All variables used in preserved functions should be defined locally.

WHAT NEXT

HLS-440 (warning) No AND or OR gate in the standard synthetic library.

DESCRIPTION

There is no AND or OR gate in the standard synthetic library. At least one of these gates is necessary to calculate the area costs of operand isolation banks for behavioral synthesis.

WHAT NEXT

Since AND/OR gate descriptions should be in the standard synthetic library, this

error is most likely due to an improper installation of the Synopsys tools. Please contact your system administrator.

HLS-483 (error) Loop '%s' cannot be loop pipelined with initiation interval %d because array read/write on %s will be permuted. '%s' can occur at the same time or after '%s' of the next iteration since there is a minimum timing constraint of %d cycles from %s to %s. Try changing initiation interval to %d.

DESCRIPTION

In loop pipelining, for each RAM, Behavioral Compiler requires that array read and writes in one iteration happen 1 cycle before array writes in the next iteration, and that array writes in one iteration happen 1 cycle before array reads in the next iteration.

WHAT NEXT

Increase initiation interval.

HLS-495 (error) Loop %s cannot be loop pipelined with initiation interval %d because the array operation '%s' must be no later than %d cycles after the operation '%s'. This implies a minimum delay of %d cycles from %s to %s. However, this violates the timing constraint of

%d cycles from %s to %s.

DESCRIPTION

WHAT NEXT

HLS-496 (error) Loop %s cannot be loop pipelined with initiation interval %d because the array operation '%s' must be no later than %d cycles after the operation '%s'.

This implies a minimum delay of %d cycles from %s to %s. However, this is unsatisfiable because %s is fixed at cycle %d, and %s is fixed at cycle %d.

DESCRIPTION

WHAT NEXT

HLS-497 (Error) %s constraint involving non-loop preserve_schedule_subprogram '%s' and a cell which is not in the subprogram is not supported.

DESCRIPTION

With respect to cells, a timing constraint must be placed in the same level of design hierarchy.

WHAT NEXT

HLS-498 (warning) Resource '%s' of memory '%s' specified in .sl file never be maximally utilized. At most %d of the resource can be

used
in parallel by the port bindings.

DESCRIPTION

In order to maximally utilize the resource, increase the number of ports.

WHAT NEXT

HLS-499 (error) All %s licenses are already in use.
The %s command needs such a license.

DESCRIPTION

The optimize_registers and pipeline_design commands require license of the type specified in the error message. All available licenses of this type at your site are currently in use.

WHAT NEXT

Wait until a license of this type at your site is freed.

HLS-500 (error) You need a license for %s
to enable the %s command.

DESCRIPTION

The optimize_registers and pipeline_design commands require a special license for which no key is available at your site.

WHAT NEXT

If you want to use these features purchase the above mentioned license from Synopsys.

HLS-501 (error) Clock was not defined in binding '%s' of

memory '%s'.

DESCRIPTION

For each binding of memory, a (single) clock must be defined.

WHAT NEXT

Check the binding of the memory module.

HLS-502 (error) Address port name was not defined in binding '%s' of memory '%s'.

DESCRIPTION

For each binding of memory, the address port name must be defined.

WHAT NEXT

Check the binding of the memory module.

HLS-503 (error) Multiple clocks were defined in binding '%s' of memory '%s'.

DESCRIPTION

For each binding of memory, one and only one clock must be defined.

WHAT NEXT

Check the binding of the memory module.

HLS-504 (error) Operation(s) specified in timing constraints command are signal probe(s).

DESCRIPTION

In `set_cycles`, `set_max_cycles`, or `set_min_cycles`, no schedulable from or to

operation was specified. The specified operation(s) is a signal probe.

WHAT NEXT

Check the operations (cells) used in the timing constraint commands. Check the output of the `find (cell ..)` command if it was used.

HLS-505 (warning) A timing constraint cannot be set on '%s', which is a signal probe.

DESCRIPTION

A timing constraint cannot be set from or to a signal probe when using `set_cycles`, `set_max_cycles`, or `set_min_cycles`. If a signal probe is specified, it is ignored.

WHAT NEXT

Check the operation(s) specified in the `set_cycles`, `set_max_cycles`, or `set_min_cycles` commands. Check the output of the `find (cell, ..)` command if it was used.

HLS-506 (warning) A timing constraint cannot be set on '%s', which is a signal probe.

DESCRIPTION

A signal probe is ignored from the list of specified operations that may or may not be chained using `chain_operations`, `dont_chain_operations`, or `bc_dont_chain`.

WHAT NEXT

Check the operation(s) specified in `chain_operations`, `dont_chain_operations`, and `bc_dont_chain`. Check the output of the `find (cell, ..)` command if it was used.

HLS-507 (error) All operations specified in chain/dont_chain

command are signal probes.

DESCRIPTION

In **chain_operations**, **dont_chain_operations**, or **bc_dont_chain**, no schedulable operations were specified. All specified operations are signal probes.

WHAT NEXT

Check the operations (cells) used in the **chain** and **dont_chain** commands. Check the output of 'find (cell ..)' command, if it were used.

HLS-508 (warning) A timing constraint cannot be set on '%s', which is a signal probe.

DESCRIPTION

A signal probe is ignored from the list of specified operations in **unschedule** and **preschedule** commands.

WHAT NEXT

Check the operation(s) specified in **unschedule** or **preschedule** commands. Check the output of the **find (cell, ..)** command if it was used.

HLS-509 (error) All operations specified in unschedule/preschedule command are signal probes.

DESCRIPTION

In **unschedule** or **preschedule**, no schedulable operations were specified. All specified operations are signal probes.

WHAT NEXT

Check the operations (cells) used in the **chain** and **dont_chain** commands. Check the output of the **find (cell ..)** command if it was used.

HLS-510 (error) Error in specifying port '%s' of the preserved

function at line '%d'. '%s'

DESCRIPTION

There was an error in specifying a port of a preserved function. Possible causes of the error include:

1. The port direction was not specified.
2. The port has multiple definitions.
3. The port is a return value, which cannot be used in preserve functions.

WHAT NEXT

Check the definition of the preserved function.

HLS-511 (error) You cannot specify both "preserved_functions" and "-exclude preserved_functions" at the same time.

DESCRIPTION

You receive this message if you have issued either **compile_preserved_functions** or **read_preserved_function_netlist** and have specified both *preserved_functions* and **-exclude preserved_functions**. These two options are mutually exclusive.

WHAT NEXT

Re-issue the command and specify only one of the above options.

SEE ALSO

compile_preserved_functions (2), **read_preserved_function_netlist** (2).

HLS-512 (error) Invalid argument %s specified for command option

-compile_effort.

DESCRIPTION

You receive this message if you execute **compile_preserved_functions** and specify an invalid argument for the **-compile_effort** option. Valid arguments are *low*, *1*, *medium*, *2*, *high*, and *3*.

WHAT NEXT

Re-issue `compile_preserved_functions` and use one of the valid arguments for the `-compile_effort` option.

SEE ALSO

`compile_preserved_functions` (2).

HLS-513 (error) You have specified two or more options that cannot be used together.

DESCRIPTION

You receive this message if you issue `compile_preserved_functions` with two or more options that cannot be used together; these options are as follows:

- `-compile_effort`
- `-include_script`
- `-no_compile`

WHAT NEXT

Re-issue `compile_preserved_functions` and specify only one of the above options.

SEE ALSO

`compile_preserved_functions` (2).

HLS-514 (warning) No preserved functions were found in '%s.'

DESCRIPTION

'`compile_preserved_functions`' or '`read_preserved_function_netlist`' command will by default process all preserved functions in the current design. However, no preserved functions were found.

WHAT NEXT

Check if '`preserve_function`' pragma is set on function(s) to be preserved. Also check if '`use_netlist`' pragma were set, and if there were errors while reading the external netlist.

HLS-515 (warning) The command ‘%s’ with the ‘-no_compile’ option has no effect without also specifying the ‘-write’ option.

DESCRIPTION

You receive this message if you issue **compile_preserved_function** with the **-no_compile** option, but not with the **-write** option. The **-no_compile** option is intended to be used if you want only to write elaborated or compiled db files of preserved function designs. You must use the **-no_compile** option if you invoke **compile_preserved_functions** after scheduling.

WHAT NEXT

If you want to write an elaborated or compiled db file of a preserved function design without actually compiling it, re-issue **compile_preserved_function** using both the **-no_compile** and **-write** options.

SEE ALSO

compile_preserved_function (2).

HLS-516 (warning) Skipping ‘%s’, because a mapped netlist for this preserved function was detected.

DESCRIPTION

You receive this message if you have issued **compile_preserved_functions** or **read_preserved_function_netlist** and have specified a preserved function whose design in memory is already a mapped netlist. These commands do not replace the existing design of a preserved function in memory if the design is a mapped netlist.

WHAT NEXT

If you receive this warning, do one of the following:

1. Remove the preserved function from the list of objects to be processed, if a list of objects is specified.
2. Specify the preserved function in the list of objects to be excluded.
3. Use the **-force_recompile** or **-force_reload** options to replace the design in the memory.

SEE ALSO

`compile_preserved_functions` (2), `read_preserved_function_netlist` (2).

HLS-517 (information) Calling '%s' on preserved function '%s'

DESCRIPTION

This message informs you that the `compile_preserved_functions` command is calling the script you specified with the `-include_script` option. Commands in the specified script will be executed on each of the preserved functions currently being processed by the command.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`compile_preserved_functions` (2).

HLS-518 (error) The filename option may not be applied to multiple preserved functions.

DESCRIPTION

Behavioral Compiler only supports one netlist per file. Therefore, it is not possible to apply the filename option to more than one preserved function at a time.

WHAT NEXT

If your design contains multiple preserved functions that you want to write out, you have to call `compile_preserved_functions` for each of those functions separately.

HLS-519 (information) Designs will be written to design library '%s.'

DESCRIPTION

This message informs you that the `compile_preserved_functions` command is writing the

design to the library you specified with the **-design_library** option, instead of to the default design library. The design can be read from the design library in using the **read_preserved_function_netlist** command.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

compile_preserved_functions (2), **read_preserved_function_netlist** (2).

HLS-520 (error) You cannot use the **-force_recompile** and **-no_compile** options together.

DESCRIPTION

You receive this message if you issue **compile_preserved_functions** with both the **-force_recompile** and **-no_compile** options. These options are mutually exclusive.

WHAT NEXT

Re-issue **compile_preserved_functions** and use only one of the two options.

SEE ALSO

compile_preserved_functions (2).

HLS-521 (error) You cannot use the '**-include_script**' option, because the preserved function '%s' contains an embedded script.

DESCRIPTION

You receive this message if you have issued **compile_preserved_functions** with the **-include_script** option, and the specified preserved function contains an embedded script. The constraints in the two scripts could potentially conflict with each other.

WHAT NEXT

Either remove the embedded script from the preserved function, or re-issue `compile_preserved_functions` without the `-include_script` option.

HLS-522 (warning) Existing design for preserved function

DESCRIPTION

You receive this warning message if your existing design is a mapped netlist and you issue `compile_preserved_functions` with the `-force_recompile` option, or `read_preserved_function_netlist` with the `-force_reload` option.

By default, if the existing design of a preserved function is a mapped netlist, that design is not overwritten. This message warns you that the existing design will be overwritten, because the `-force_recompile` or `-force_reload` option was used to override the default behavior.

WHAT NEXT

If you intended that the existing design for the specified preserved function be overwritten, no action is required on your part. Otherwise, to prevent this warning, do one of the following:

1. If the specified preserved function is on the list of objects to be processed, remove it.
2. Add the specified preserved function to the list of objects to be excluded.
3. Remove the `-force_recompile` or `-force_reload` option.

SEE ALSO

`compile_preserved_functions` (2), `read_preserved_function_netlist` (2).

HLS-523 (information) Compiling preserved function ‘%s’ with %s effort.

DESCRIPTION

This message informs you that the `compile_preserved_functions` command is using the level of compile effort you specified with the `-compile_effort` option. The default is *medium*.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`compile_preserved_functions` (2).

HLS-524 (error) You cannot use the `-netlist_file_name` and `-return_port` options if you specify more than one preserved function.

DESCRIPTION

You receive this message if you issue the `read_preserved_function_netlist` command with one or both of the options `-netlist_file_name` and `-return_port`, and more than one preserved function has been specified. You can use these options only for a single preserved function.

Multiple preserved functions would be specified if you did not use the `preserved_functions` option. By default, if you do not specify the `preserved_functions` list, netlists are read for all preserved functions in the current top-level design.

WHAT NEXT

To correct this error, do one of the following:

1. If you want to use the `-netlist_file_name` and/or the `-return_port` options, re-issue the `read_preserved_function` command using the `preserved_functions` option to specify a single preserved function.
2. If you want to use multiple preserved functions, re-issue the `read_preserved_function` command and do not use the `-netlist_file_name` and `-return_port` options. In that case, the following default values are used:

```
-netlist_file_name  preserved_function_name.db  
-return_port       preserved_function_name-return
```

SEE ALSO

`read_preserved_function_netlist` (2).

HLS-525 (error) The preserved function ‘%s’ has the same

name as a synthetic operator in the synthetic library.

DESCRIPTION

You receive this message if a preserved function has the same name as that of a synthetic operator in the synthetic library. The name of the preserved function must be unique and unused by any operators in your synthetic library.

WHAT NEXT

If you receive this message, do one or more of the following:

1. Change the name of the preserved function so that it does not conflict with names of operators in your synthetic library.
2. If you are using the `map_to_operator oper` pragma to use a DesignWare component, ensure that `oper` is not a preserved function.
3. Change the synthetic library. Using this solution, however, could cause some operators in the design not to be found, which could cause an error message to be generated.

HLS-526 (error) After scheduling, you cannot invoke ‘`compile_preserved_functions`’ without using the ‘`-no_compile`’ option.

DESCRIPTION

You receive this message if you schedule your design and then invoke the `compile_preserved_functions` command without the `-no_compile` option. After scheduling, you cannot recompile the preserved function, because the timing might change and invalidate the current schedule. Thus, after scheduling you can use `compile_preserved_functions` only to write the preserved function’s netlist to a db file. In that case, you must use both the `-no_compile` and `-write` options.

WHAT NEXT

If you receive this message, do one of the following:

1. If you want to write the preserved function’s netlist to a db file, re-issue `compile_preserved_functions` using both the `-no_compile` and `-write` options.
2. If you need to recompile the preserved function, restart with the

elaborated db.

HLS-527 (error) The ‘read_preserved_function_netlist’ command

cannot be invoked for preserved function ‘%s’ because the ‘use_netlist’ pragma was used in the latter.

DESCRIPTION

You receive this message if you attempt to read a netlist for a preserved function that has the **use_netlist** pragma. If you use the **use_netlist** pragma to read an external netlist for a preserved function, you cannot use the **read_preserved_function_netlist** command for that preserved function, because there could be a conflict between the two external netlists, and/or parameters (for example, **design_name** and **return_port**).

WHAT NEXT

Remove the **use_netlist** pragma from the preserved function and reanalyze and reelaborate the source file(s). Then reexecute **read_preserved_function_netlist**.

SEE ALSO

read_preserved_function_netlist (2).

HLS-528 (error) Preserved function ‘%s’ specified in the list of preserved functions to be processed or excluded, does not exist in the current top-level design ‘%s.’

DESCRIPTION

You receive this message if you issue the **compile_preserved_functions** or the **read_preserved_function_netlist** command, and one of the functions on the *preserved_functions* list cannot be found in the current top-level design. If you did not use the *preserved_functions* argument, by default the command attempts to process all preserved functions in the current top-level design.

This error could be caused by a misspelling or a typo, or by the presence of the **use_netlist** pragma on the preserved function, accompanied by an error reading the

netlist.

WHAT NEXT

If you receive this message, do one of the following:

1. Verify the correct spelling of the preserved function, and correct it if necessary.
2. Remove the specified preserved function from the list of preserved functions to be processed or excluded.
3. Remove the `use_netlist` pragma from the specified function.

SEE ALSO

`compile_preserved_functions` (2), `read_preserved_function_netlist` (2).

HLS-529 (error) Unable to read netlist file ‘%s’ in the default design library for preserved function ‘%s.’

DESCRIPTION

You receive this message if the `read_preserved_function_netlist` command cannot find the specified preserved function netlist in the default design library, or if the file is unreadable. This error could be caused by a misspelling or a typo, or by a read protection on the file.

WHAT NEXT

Verify that the specified netlist file exists in the directory to which the default design library is mapped, and is readable. Verify the correct spelling. Then reexecute `read_preserved_function_netlist`.

SEE ALSO

`read_preserved_function_netlist` (2).

HLS-530 (error) Unable to find design ‘%s’ in netlist file ‘%s’

in design_library '%s' for preserved function '%s.'

DESCRIPTION

You receive this message if a design with the same name as the specified preserved function cannot be found in the netlist file in the specified design library. This error could be caused by a misspelling or a typo.

WHAT NEXT

Ensure that the specified netlist file contains the name of a design that is exactly the same as the name of the specified preserved function. Then reexecute `read_preserved_function_netlist`.

SEE ALSO

`read_preserved_function_netlist` (2).

HLS-531 (error) Unable to read the file '%s' for preserved function '%s' using design_library '%s' which is mapped to '%s'.

DESCRIPTION

You receive this message if the `read_preserved_function_netlist` command cannot find the specified preserved function netlist in the specified design library, or if the file is unreadable. This error could be caused by a misspelling or a typo, or by a read protection on the file.

WHAT NEXT

Verify that the specified netlist file exists in the directory to which the specified design library is mapped, and is readable. Verify the correct spelling. Then reexecute `read_preserved_function_netlist`.

SEE ALSO

`read_preserved_function_netlist` (2).

HLS-532 (information) Using the design in netlist '%s'

in library ‘%s’ for preserved function ‘%s.’

DESCRIPTION

This message informs you that the **read_preserved_functions_netlist** command is reading the design in the netlist file *preserved_function_name.db*, located in the specified design library. The design is expected to be a non-hierarchical mapped netlist.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

read_preserved_function_netlist (2).

HLS-533 (error) Cannot link the external netlist ‘%s.’

DESCRIPTION

You receive this message if **read_preserved_function_netlist** cannot link an external netlist for a preserved function. One of several possible reasons for this error to occur is that the link and target libraries used in the external netlist are not found in the search path of the current top-level design.

WHAT NEXT

Inspect the link and target libraries used in the external netlist, and ensure that they exist in the search path of the current top-level design. Then reexecute **read_preserved_function_netlist**.

SEE ALSO

read_preserved_function_netlist (2).

HLS-534 (error) No %s library is set for the current top-level design ‘%s.’

DESCRIPTION

You receive this message if you execute **read_preserved_function_netlist** and the link

library or the target library is not set for the current top-level design. You set these using the **link_library** and **target_library** variables.

WHAT NEXT

Use the **link_library** or **target_library** variable to set the link or target library for the current top-level design.

SEE ALSO

`read_preserved_function_netlist` (2), `link_library` (3), `target_library` (3).

HLS-535 (warning) No link or target library is set for the netlist ‘%s.’

DESCRIPTION

You receive this message if you execute `read_preserved_function_netlist` and the link library or the target library is not set for the netlist. This might also imply that the external netlist is unmapped.

WHAT NEXT

Ensure that the external netlist is mapped to a link library or a target library. Use the **link_library** or **target_library** variable to set the link or target library for the netlist.

SEE ALSO

`read_preserved_function_netlist` (2), `link_library` (3), `target_library` (3).

HLS-536 (error) The library ‘%s’ used by the external netlist ‘%s’ is not used by the current top-level design ‘%s.’

DESCRIPTION

You receive this message from `read_preserved_function_netlist` if the external netlist uses a library not used by the top-level design. In this case, the final physical synthesis of the top-level design might be unsuccessful.

WHAT NEXT

Ensure that the external netlist is mapped only to libraries used by the top-level design. Alternatively, add the additional libraries used by the external netlist to the libraries used by the top-level design.

SEE ALSO

`read_preserved_function_netlist (2)`.

HLS-537 (error) The external netlist ‘%s’ is %s. It contains a %s ‘%S.’

DESCRIPTION

You receive this message from the `read_preserved_function_netlist` command if the external netlist you specified does not meet one or more of these requirements: The netlist must be nonhierarchical. Its target library must be included in the set of target libraries of the current top-level design. It cannot contain any generic logic components or synthetic operators.

WHAT NEXT

Be sure that the external netlist is correct according to the stated requirements. If the external netlist is not available, you can compile the preserved function using the `compile_preserved_functions` command.

SEE ALSO

`compile_preserved_functions (2)`, `read_preserved_function_netlist (2)`.

HLS-538 (information) Writing preserved function ‘%s’ to file ‘%S.’

DESCRIPTION

This message informs you that the `compile_preserved_functions` command is writing the design to a file `preserved_function_name.db` in the default design library, because you specified the `-write` option.

WHAT NEXT

This is an informational message only. No action is required on your part, unless

you want the file to be written to a library other than the default design library. In that case, reexecute **compile_preserved_functions -write** and also use the **--design_library** option.

SEE ALSO

compile_preserved_functions (2).

HLS-539 (information) Using the design in netlist ‘%s’ in the default design library for preserved function ‘%s.’

DESCRIPTION

This message informs you that the **read_preserved_functions_netlist** command is reading the design in the netlist file *preserved_function_name.db*, located in the default design library. The design is expected to be a non-hierarchical mapped netlist.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

read_preserved_function_netlist (2).

HLS-540 (warning) Cannot specify a return port for preserved function ‘%s’, because it has more than one output port. Ignoring the specified return port ‘%s’.

DESCRIPTION

You receive this warning message if you use the **-return_port** option of **read_preserved_function_netlist** to specify the return port, but the specified preserved function has more than one output port. In this case, Behavioral Compiler cannot identify the output port whose name is to be changed.

WHAT NEXT

Either re-issue **read_preserved_function_netlist** without the **-return_port** option, or modify the preserved function so that it has only one output port.

SEE ALSO

`read_preserved_function_netlist (2)`.

HLS-541 (information) Using port ‘%s’ from netlist ‘%s’ as return port for preserved function ‘%s.’

DESCRIPTION

This message is issued in ‘read_preserved_function_netlist’ command if the ‘-return_port’ option or ‘return_port_name’ pragma is not used to specify the return port for a preserved function, and the default output port of the function does not match with the output port of the netlist. In this case, the output port of the netlist is used.

WHAT NEXT

You may specify the output port in the netlist as the return port of the preserved function in ‘read_preserved_function_netlist’ command.

HLS-542 (error) Preserved function ‘%s’ could not be compiled using the script ‘%s.’

DESCRIPTION

This message is issued in ‘compile_preserved_functions’ command if the ‘-include_script’ option is used, and if the preserved function is not compiled. After executing commands in the specified script in order to compile the preserved function, a mapped netlist for the latter was not generated. A possible reason for this is an explicit ‘compile’ command was not given in the specified script.

WHAT NEXT

Please make sure that the user-specified script used to compile the preserved function contains a ‘compile’ command. The ‘compile’ command may be invoked in the default mode or with options.

HLS-543 (error) The ‘read_preserved_function_netlist’ command

cannot be invoked after scheduling.

DESCRIPTION

The ‘read_preserved_function_netlist’ command can be invoked after ‘elaborate -schedule’ or ‘bc_time_design,’ but not after scheduling is complete. Replacing the netlist of a preserved function may change its timing which could make the present schedule invalid.

WHAT NEXT

Please do not invoke ‘read_preserved_function_netlist’ after scheduling. If a new netlist for a preserved function must be used, re-start with the timed db of the top-level design, elaborated db, or ‘elaborate -schedule.’

HLS-544 (warning) The ‘use_netlist’ pragma is being phased out, and will not be supported after the v2000.05 release. Please use ‘read_preserved_function_netlist’ instead.

DESCRIPTION

You receive this message if you use the use_netlist pragma in a preserved function to read an external netlist for its design. This pragma is being phased out and will not be supported after the v2000.05 release; it has been replaced by the command **read_preserved_function_netlist**.

WHAT NEXT

To avoid this warning, remove the use_netlist and return_port_name pragmas from the preserved function. After executing **elaborate -schedule** on the top-level design, invoke **read_preserved_function_netlist**, specifying the netlist name and the return port name as command options.

SEE ALSO

elaborate (2), **read_preserved_function_netlist** (2).

HLS-545 (warning) The variable ‘%s’

is no longer supported.

DESCRIPTION

This message is issued when the variable that determines the map/compile effort of preserved functions is set. This variable is no longer supported, and its value will not affect the map effort of preserved functions. In order to compile preserved functions with the desired map effort, a new command 'compile_preserved_functions' can be used with the desired compile effort specified as a command option.

WHAT NEXT

To avoid this warning, please remove the above variable from the Synopsys DC setup file and your compilation scripts.

HLS-546 (error) The options '-cache_preserved_functions' and '-except' are no longer supported in 'bc_time_design.'

DESCRIPTION

This error is reported in 'bc_time_design' if any of the above two options to cache a preserved-function design are used. The feature to cache preserved-function designs during 'bc_time_design' is now obsolete. Please use the new command 'compile_preserved_functions' to compile and write a netlist for a preserved function, and 'read_preserved_function_netlist' to read a pre-compiled netlist.

WHAT NEXT

Please remove '-cache_preserved_functions' and/or '-except' from 'bc_time_design.'

HLS-547 (error) The options '-use_cached_preserved_functions' and '-recompile' are no longer supported in 'bc_time_design.'

DESCRIPTION

This error is reported in 'bc_time_design' if any of the above two options to read a cached preserved-function design are used. The feature to cache preserved-function designs during 'bc_time_design'

is now obsolete. Please use the new command
'compile_preserved_functions' to compile and write a netlist for a
preserved function, and 'read_preserved_function_netlist' to read a
pre-compiled netlist.

WHAT NEXT

Please remove '-use_cached_preserved_functions' and/or '-recompile'
from 'bc_time_design.'

HLS-548 (warning) The design has a comparison operation that compares values of type std_logic_vector. This is ambiguous. For more specific line information, please re-analyze with "bc_enable_analysis_info = true".

DESCRIPTION

BC is not able to map to any operator for this type of comparison operation. This is because the type of variables that are compared is not clearly defined for comparison. For example, BC will not figure out what kind of comparator should be used for std_logic_vector variables, because the values could be interpreted as signed or as unsigned. This might cause simulation mismatches!

If for example a and b are defined as std_logic_vector, then the following statement is ambiguous

```
if (a < b) then  
change it into e.g.  
if (signed(a) < signed(b)) then
```

WHAT NEXT

Check the hdl code for the types of variables used in comparison operations. The type have to be clear such as signed or unsigned. ~

HLS-549 (error) Failed to compile preserved functions.

DESCRIPTION

You receive this error message because the **compile_preserved_functions** command failed to complete.

WHAT NEXT

The output of the **compile_preserved_functions** command contains other warnings and errors that identify the problem. Refer to the man pages for those warnings and errors to solve the problem.

SEE ALSO

compile_preserved_functions (2) .

HLS-550 (error) Can't find %s port '%s' for design '%s'.

DESCRIPTION

Behavioral Compiler couldn't find a port with the given name in the design.

WHAT NEXT

Please specify a valid choice.

HLS-551 (error) Port '%s' of design '%s' has unsupported type inout.

DESCRIPTION

Behavioral Compiler does currently not support pipelined netlists with inout ports.

WHAT NEXT

Please modify the netlist such that it does not contain inout ports.

HLS-552 (error) Port '%s' of design '%s' has unknown type.

DESCRIPTION

Behavioral Compiler currently only supports pipelined netlists with input and output ports. Behavioral Compiler is not able to determine the type of the port that is mentioned in the error message.

WHAT NEXT

Please check the netlist and make sure that all port types are specified appropriately.

HLS-553 (error) You may not specify %s without specifying %s.

DESCRIPTION

Some options may only be used in combination with others.

WHAT NEXT

Please make sure that you only use valid combinations of command options.

HLS-554 (error) %s has to be %s.

DESCRIPTION

The value you specified for the option is illegal.

WHAT NEXT

Please specify a legal value.

HLS-555 (error) Inconsistent stage count for %s '%s'.

DESCRIPTION

Behavioral Compiler found an output port or a sequential element that can be reached from two different input ports through paths containing different numbers of sequential elements. Behavioral Compiler currently only supports those kinds of pipelined parts where the number of stages from every input to every output is the same.

WHAT NEXT

Please create a pipelined component that satisfies Behavioral Compiler's requirements.

HLS-556 (error) Found loop containing cell '%s'.

DESCRIPTION

Behavioral Compiler found a loop in the pipelined component. This is currently not supported.

WHAT NEXT

Please create a pipelined component that satisfies Behavioral Compiler's requirements.

HLS-557 (error) Inconsistent number of pipeline stages in netlist %S.

DESCRIPTION

Behavioral Compiler found two output ports, that can be reached from input ports using different numbers of sequential elements. THis is in conflict with Behavioral Compiler's requirements for pipelined components that all inputs have to be available at the same time and that all outputs have to be computet at the same time.

WHAT NEXT

Please create a pipelined component that satisfies Behavioral Compiler's requirements.

HLS-558 (error) Found control register '%s' in netlist '%s'.

DESCRIPTION

Behavioral Compiler found a sequential element, that is not part of the datapath. Behavioral Compiler only supports netlists without any internal control.

WHAT NEXT

Please create a pipelined component that satisfies Behavioral Compiler's requirements.

HLS-559 (error) The %s '%s' doesn't match name of the %S '%s' defined for netlist '%s'.

DESCRIPTION

Behavioral Compiler found conflicting specifications for the clock port of the pipelined netlist. This can happen if a port of the netlist (e.g. `clock1`) has been specified as being a clock port using the `create_clock` command, while the `clock_port_name` option specifies another port.

WHAT NEXT

Please make sure that you provide Behavioral Compiler with a consistent clock specification.

HLS-560 (error) Cannot find clock port %s for design %s.

DESCRIPTION

Behavioral Compiler did not find the clock port you specified.

WHAT NEXT

Please make sure that you provide Behavioral Compiler with a valid name for the clock port.

HLS-561 (error) Clock port %s for design %s is not an input port.

DESCRIPTION

The port you specified as being the clock port is not an input port.

WHAT NEXT

Please make sure that you provide Behavioral Compiler with a valid name for the clock port.

HLS-562 (error) Cannot find reset port %s for design %s.

DESCRIPTION

Behavioral Compiler did not find the reset port you specified.

WHAT NEXT

Please make sure that you provide Behavioral Compiler with a valid name for the reset port.

HLS-563 (error) Reset port %s for design %s is not an input port.

DESCRIPTION

The port you specified as being the reset port is not an input port.

WHAT NEXT

Please make sure that you provide Behavioral Compiler with a valid name for the reset port.

HLS-564 (error) You may specify only one of %s.

DESCRIPTION

You specified two incompatible options.

WHAT NEXT

Please make sure that you provide Behavioral Compiler with compatible options.

HLS-565 (warning) Assuming clock type is positive edge.

DESCRIPTION

Since the type of the clock has not been specified, Behavioral Compiler will assume that the sequential elements of your design are being triggered by the positive edge of the clock.

WHAT NEXT

Please make sure that the assumptions of Behavioral Compiler meet your requirements.

HLS-566 (error) The pipelining properties of netlist %s have already been determined. You may not specify any pipelining options.

DESCRIPTION

The netlist you are reading in for the preserved function has already been attributed with all the necessary pipelining properties. Behavioral Compiler is not able to handle - potentially conflicting - pipelining directives provided at the command line.

WHAT NEXT

Please call `read_preserved_function_netlist` again without any option regarding pipelining, ie. without `clock_port_name`, `clock_edge`, `sync_reset_name`, `async_reset_name` or `reset_polarity`.

HLS-567 (error) You specified pipelining options even though netlist

%s does not contain any sequential elements.

DESCRIPTION

The netlist read by Behavioral Compiler does not contain any sequential element. This conflicts with the pipelining options you specified, ie. at least one of `clock_port_name`, `clock_edge`, `sync_reset_name`, `async_reset_name` or `reset_polarity`,

WHAT NEXT

Please call `read_preserved_function_netlist` again without any pipelining related options.

HLS-568 (warning) Skipping netlist %s, it already contains

sequential elements.

DESCRIPTION

The netlist contains sequential elements. This is not allowed when pipelining Behavioral Compiler using the `compile_preserved_functions` command.

WHAT NEXT

Please read in the original, combinatorial netlist and apply `compile_preserved_functions` to it.

HLS-569 (warning) No clock period has been specified, pipelining %s for minimum clock period.

DESCRIPTION

You did not specify a clock period to be used for pipelining the preserved function. Behavioral Compiler also did not find a clock at either the top level design or at the preserved function. Therefore, the pipelined component will be built to achieve the minimum clock period.

WHAT NEXT

If you would like the preferred function to be pipelined for a particular clock period, please create a clock for the design or specify the `period` option for the `compile_preserved_functions` command.

HLS-570 (Information) Netlist %s is pipelined component with %d stages.

DESCRIPTION

Behavioral Compiler identified the netlist as being a pipelined component.

WHAT NEXT

No further action is required.

HLS-571 (Error) No clock port has been specified for sequential netlist %s.

DESCRIPTION

Behavioral Compiler determined that the netlist contains sequential elements. To be able to check the pipelining properties of the netlist you have to specify the clock port as well as the reset port if applicable.

WHAT NEXT

Please specify the clock port and reset port using the command options.

HLS-572 (warning) The reset synchronicity of sequential component %s is different from the one of the design.

DESCRIPTION

This message is issued when the sequential component from preserve function has a synchronous reset and BC design has an asynchronous reset or vice versa.

WHAT NEXT

Please check the reset synchronicity is defined correctly.

HLS-573 (warning) The reset polarity of sequential component %s is different from the one of the design.

DESCRIPTION

This message is issued when the sequential component from preserve function has an active high reset and BC design has an active low reset or vice versa.

WHAT NEXT

Please check the reset polarity of either sequential component or the design.

HLS-574 (warning) The clock polarity of sequential component

%s is different from the one of the design.

DESCRIPTION

This message is issued when the sequential component from preserve function has a rising edge clock and BC design has a falling edge clock or vice versa.

WHAT NEXT

Please check clock polarity of either sequential component or the design.

HLS-575 (error) When selecting any pipelining related option, you may specify neither 'include_script' nor 'no_compile'.

DESCRIPTION

The pipelining features of compile_preserved_functions require Behavioral Compiler to compile the netlist to be pipelined. Therefore, it is not possible to use pipelinineg related options together with the no_compile option. There are two ways to pipeline a netlist using compile_preserved_functions. You can either use a pipelining option or use an include script that calls the pipeline_design command. You may not combine those two approaches.

WHAT NEXT

Please call compile_preserved_functions with options that do not conflict with each other.

HLS-576 (error) The filename may not be hierarchical.

DESCRIPTION

When using the filename option of compile_preserved_functions or read_preserved_function_netlist, the name provided may not be hierarchical. Behavioral Compiler uses the design_library option to determine the directory of a file.

WHAT NEXT

Please call compile_preserved_functions or read_preserved_function_netlist again using a non-hierarchical filename.

HLS-577 (error) You may not specify an `input_delay` or `output_delay` when selecting the `include_script` option.

DESCRIPTION

When specifying an `include_script`, all constraints you want to apply to the preserved function have to be specified as part of the `include_script`.

WHAT NEXT

Please add the commands for applying input and output delay constraints to the `include_script`.

HLS-578 (error) No clock period defined for design %s.

DESCRIPTION

You receive this message because you invoked the `compile_preserved_functions` command without an `-include_script` argument. In this situation, Behavioral Compiler requires that you specify the clock period for the design.

WHAT NEXT

Use the `create_clock` command first before you invoke the `compile_preserved_functions` command.

SEE ALSO

`compile_preserved_functions` (2), `create_clock` (2), `compile` (2), `pipeline_design` (2), `create_port` (2).

HLS-579 (error) Cannot find the behavioral %s '%s' in the library '%s'.

DESCRIPTION

You receive this message because the behavioral design unit given is not in the library specified, and therefore could not be found for behavioral elaboration.

WHAT NEXT

You can use the **report_design_lib** command to determine the contents of a library.

If the design unit is not present, reanalyze the design unit by using the **analyze** command with the **-library** or **-work** option.

This problem also arises if you have set the dc_shell **hdlin_enable_presto** variable to *true* prior to running the **analyze** command on files containing behavioral design units. Set the dc_shell **hdlin_enable_presto** variable to *false* or use the **analyze** command with the **-schedule** option when analyzing files containing behavioral design units.

SEE ALSO

analyze (2), **report_design_lib** (2), ,B **hdlin_enable_presto** (3).

HLS-580 (error) Behavioral subprogram body or architecture for '%S' was not defined %S.

DESCRIPTION

You receive this message because, during elaboration for scheduling, a subprogram is called in the design, but the subprogram body is missing.

This error also occurs when you elaborate a design for which no architecture has been specified.

WHAT NEXT

Include the missing subprogram body or design architecture and re-analyze the design files.

This problem also arises if you have set the dc_shell **hdlin_enable_presto** variable to *true* prior to running the **analyze** command on files containing behavioral design units. Set the dc_shell **hdlin_enable_presto** variable to *false* or use the **analyze** command with the **-schedule** option when analyzing files containing behavioral design units.

SEE ALSO

`analyze` (2), `hdlin_enable_presto` (3).

HLS-581 (information) Possibly you did not analyze the missing %s with 'analyze -schedule'.

DESCRIPTION

You receive this message because the behavioral design unit given is not in the library specified; or it has not been analyzed with the option `-schedule` and, therefore, could not be found for behavioral analysis.

WHAT NEXT

You can use the `report_design_lib` command to determine the content of a library. If the design unit is not present, reanalyze the design unit by using the `analyze` command with the `-schedule` option and either the `-library` option or the `-work` option. Instead of using the `analyze` command described above, you can set the dc_shell `hdlin_enable_presto` variable to *false*.

SEE ALSO

`analyze` (2), `report_design_lib` (2), `hdlin_enable_presto` (3).

HLS-582 (error) Failed to compute timing margin.

DESCRIPTION

You receive this error message because the `bc_margin` command failed to compute the timing margin.

WHAT NEXT

The output of the `bc_margin` command contains other warnings and errors that identify the problem. Refer to the man pages for those warnings and errors to solve the problem.

SEE ALSO

`bc_margin` (2).

HLS-600 (error) Design '%s' is not a top-level behavioral design.

DESCRIPTION

The command you are trying to execute works only when your current design is a top-level behavioral module, elaborated with the **elaborate -s** command or the **compile_systemc** command.

Your current design is not a top-level behavioral module.

WHAT NEXT

From your behavioral source file, get the name of your behavioral module. Use the **current_design** command to set the current design to the name of that module.

Use the **list_designs** command to view a list of all designs contained in dc_shell.

SEE ALSO

current_design (2), **list_designs** (2).

HLS-601 (error) Design '%s' contains constructs not supported for FPGA synthesis.

DESCRIPTION

You tried to target your behavioral design for synthesis to an FPGA. However, your design contains constructs the tool does not support for synthesis to FPGA. These constructs include:

- Arrays mapped to register files
- Operations that are implemented in non-Synopsys synthetic libraries
- RTL processes

WHAT NEXT

Rewrite your behavioral description to remove these constructs.

Instead of mapping arrays to register files, map them to memories. Memories are more efficiently implemented on FPGAs.

In place of non-Synopsys components, use the components available to you in the Synopsys DesignWare libraries.

Move RTL processes outside your behavioral module. For example, implement an RTL module that contains your RTL processes and that also instantiates your behavioral module. This is equivalent to your original description.

SEE ALSO

`set_fpga` (2).

HLS-602 (error) Unable to link design '%s'.

DESCRIPTION

The command you tried to execute is unable to link your design, which indicates that the command was unable to find implementations for all the components and subdesigns your design uses.

WHAT NEXT

Be sure that implementations of all the components and subdesigns are present.

Use the `list_designs` command to view the designs currently in dc_shell, which will tell you if you inadvertently removed a subdesign.

Be sure that the value of the `link_library` variable and the `synthetic_library` variable contains all of the libraries that contain components your design uses.

SEE ALSO

`list` (2), `list_designs` (2), `list_libraries` (2); `link_library` (3), `synthetic_library` (3).

HLS-603 (information) Targeted design '%s' to FPGA target=''%s' device=''%s' speed=''%s'.

DESCRIPTION

You successfully targeted your design to the FPGA you specified. Your design is now configured for behavioral synthesis targeting this FPGA.

WHAT NEXT

This is an information message. You do not need to take any action.

SEE ALSO

`set_fpga` (2).

HLS-604 (error) Unable to find a valid version of FPGA Compiler II.

DESCRIPTION

You tried to target to an FPGA your behavioral design for synthesis. However, a valid version of FPGA Compiler II was not found on your operating system's search path, such as the PATH environment variable on UNIX systems.

WHAT NEXT

Behavioral synthesis targeting FPGAs requires version 3.6 or later of the Synopsys FPGA Compiler II. Please be sure that your search path includes the path to the `fc2_shell` executable contained in your FPGA Compiler II installation.

The version of FPGA Compiler II is important. Version 3.5 or earlier does not enable behavioral synthesis to FPGAs.

SEE ALSO

`set_fpga` (2).

HLS-605 (error) Incomplete specification. FPGA %s has not been specified.

DESCRIPTION

You used dc_shell variables to target your behavioral design for synthesis to FPGAs. But your specification is incomplete because you did not set one or more of three necessary variables.

WHAT NEXT

Make sure that you specify a legal FPGA specification with the following three dc_shell variables.

- `bc_fpga_target`
- `bc_fpga_device`
- `bc_fpga_speed`

SEE ALSO

`bc_fpga_device` (3), `bc_fpga_speed` (3), `bc_fpga_target` (3).

HLS-606 (error) Specified FPGA %s '%s' is not supported.

DESCRIPTION

You tried to target your behavioral design for synthesis to an FPGA. But the FPGA you specified is not supported.

WHAT NEXT

Behavioral synthesis targets only FPGAs that are supported by version 3.6 or later of the Synopsys FPGA Compiler II.

See the FPGA Compiler II documentation to be sure that your FPGA is supported.

SEE ALSO

`set_fpga` (2).

HLS-607 (error) Unable to launch FPGA Compiler II located at %s.

DESCRIPTION

Behavioral synthesis was unable to launch your installation of the Synopsys FPGA Compiler II.

WHAT NEXT

To target FPGAs, behavioral synthesis must be able to launch the `fc2_shell` executable in your FPGA Compiler II installation.

The most likely cause for this error is an incorrect operating system configuration or incorrect installation of FPGA Compiler II.

Verify that your operating system is compliant with the requirements in the manual *Installing and Licensing Synopsys Software*. Noncompliant operating system versions and patches can prevent the **fc2_shell** executable being launched.

Ensure that your FPGA Compiler II installation is set up correctly. The **fc2_shell** executable might be absent or might not launch if the setup is incorrect. See the FPGA Compiler II documentation for further information.

SEE ALSO

set_fpga (2).

HLS-608 (error) Unable to communicate with FPGA Compiler II launched from %s.

DESCRIPTION

Behavioral synthesis successfully launched FPGA Compiler II but is unable to communicate with it.

WHAT NEXT

To target FPGAs, behavioral synthesis must be able to launch and communicate with the **fc2_shell** executable in your FPGA Compiler II installation. This error indicates that communication was lost.

The most likely cause for this error is an incorrect operating system configuration or incorrect installation of FPGA Compiler II.

Verify that your operating system is compliant with the requirements in the manual *Installing and Licensing Synopsys Software*. Noncompliant operating system versions and patches can prevent the **fc2_shell** executable being launched.

Be sure that your FPGA Compiler II installation is set up correctly. The **fc2_shell** executable might be absent or might not launch if the set up is incorrect. See the FPGA Compiler II documentation for further information.

Another possible cause is a transient operating system or network anomaly. Test this possibility by rerunning your behavioral synthesis task.

SEE ALSO

set_fpga (2).

HLS-609 (error) Unable to create temporary workspace for FPGA synthesis %s.

DESCRIPTION

Behavioral synthesis is unable to create a temporary directory to house intermediate files during FPGA synthesis.

WHAT NEXT

Behavioral synthesis must be able to create a temporary workspace in which to place intermediate files during synthesis targeting FPGAs.

Be sure that the permissions settings in the directory in which you are running **dc_shell** let you create subdirectories and files.

SEE ALSO

set_fpga (2).

HLS-610 (error) The target technology for design '%s' cannot be changed. %s

DESCRIPTION

You tried, with the **set_fpga** command, to target a behavioral design for synthesis to an FPGA. Or you tried to remove such a specification with the **unset_fpga command**.

However, the state the design is in prevents the tool performing such a retargeting of technology. Some technology-specific tasks, for example timing or synthesis, have already been performed on the design.

WHAT NEXT

Remove the current behavioral design from **dc_shell** memory with the **remove_design** command.

Restart behavioral synthesis from the analysis and elaboration stage, or read in a .db file containing an elaborated design.

The design must not have been processed with any of the following commands:

- **schedule**

- `bc_time_design`
- `bc_margin`
- `compile_preserved_functions`

SEE ALSO

`read` (2), `remove_design` (2), `set_fpga` (2), `unset_fpga` (2), `write` (2).

HLS-611 (error) Unable to find an implementation for operator '%s' in a Synopsys DesignWare library. The operator is used by operations '%s' in design '%s'.

DESCRIPTION

You receive this error message because your design for behavioral synthesis targeting FPGAs contains operations that use components that Synopsys DesignWare does not own or support.

The only exceptions are memory read and write operators defined in a synthetic library that contains the implementation of memory wrappers used for memories inferred in your behavioral description, which Synopsys DesignWare does support.

WHAT NEXT

Remove from the `synthetic_library` variable synthetic libraries that Synopsys DesignWare does not support, noting the exceptions described in the previous paragraph. Replace the removed components with components found in the Synopsys DesignWare libraries.

SEE ALSO

`set_fpga` (2); `synthetic_library` (3).

HLS-612 (error) Design '%s' maps the array variables '%s' to register files, which are not supported for FPGA synthesis.

DESCRIPTION

You receive this error message because you have in your design arrays that have been

mapped to register files using the `map_to_registerfiles` compiler directive or the `dc_shell` variable `bc_use_registerfiles`. Register files are not supported in behavioral synthesis targeting FPGAs.

WHAT NEXT

Remove the mapping of arrays to register files.

Alternately, map array variables to memories instead, by using the `map_to_module` compiler directive.

For more information about mapping arrays to memories, see the *Behavioral Compiler User Guide* or the *SystemC Compiler User Guide*.

SEE ALSO

`set_fpga` (2).

HLS-613 (error) Design '%s' contains a non-behavioral process %S.

DESCRIPTION

Your behavioral module contains a register-transfer level (RTL) process. Behavioral modules with both behavioral and RTL processes are not supported for behavioral synthesis targeting FPGAs.

WHAT NEXT

Move your RTL processes out of your behavioral module. You can create an RTL module that contains your RTL processes and also instantiates your behavioral module. By connecting your RTL processes to your behavioral module you create a hierarchical description that is equivalent to your current description.

SEE ALSO

`set_fpga` (2).

HLS-614 (error) Unable to target design '%s' to specified FPGA.

DESCRIPTION

You receive this error message because you tried unsuccessfully to target to an FPGA your design for behavioral synthesis.

WHAT NEXT

This error message is always preceded by an error message detailing the specific reason your attempt was unsuccessful. Refer to the man page for that error message for more details.

SEE ALSO

`set_fpga` (2).

HLS-615 (error) An error occurred during processing of design %s, using the synthetic libraries specified by the user.

DESCRIPTION

You receive this error message because the compiler did not find the synthetic libraries you specified in your design. It looks for the standard set of Synopsys-specific synthetic libraries.

WHAT NEXT

Check to see if the the `dc_shell` variable `synthetic_library` lists all of the required synthetic libraries to support the operators in your design.

Preceding this error message, you might also see another error message that gives the specific reason for the failure. See the man page for that error message for more details.

SEE ALSO

`synthetic_library` (3).

HLS-616 (error) FPGA %s has not been specified, resulting in incomplete specification.

DESCRIPTION

You receive this error message because, in using the `set_fpga` command to target your behavioral design for synthesis to FPGAs, your specification is incomplete. One or more settings for the FPGA target, device, or speed is missing. These settings are options to the `set_fpga` command.

WHAT NEXT

Set the necessary options (-target, -device, and -speed) to the **set_fpga** command. Then run the command again.

SEE ALSO

set_fpga (2).

HLS-617 (error) Option '%s' is unsupported for behavioral synthesis to FPGA.

DESCRIPTION

You receive this error message because the command option you tried to execute has no effect on a design that has been configured for behavioral synthesis targeting an FPGA.

WHAT NEXT

Do not use the option when invoking the command on a design configured for behavioral synthesis to an FPGA.

SEE ALSO

set_fpga (2).

HLS-618 (error) File '%s' does not contain an implementation of preserved function '%s' that targets an FPGA.

DESCRIPTION

You receive this error message because you tried to use the **read_preserved_function_netlist** command to read in an implementation for a preserved function configured for behavioral synthesis targeting an FPGA.

However, the .db file you are reading from was not generated by running the **compile_preserved_function** command (with the **-write** option) on a design configured for behavioral synthesis targeting an FPGA. Therefore, the implementations the file contains are not valid for behavioral synthesis to an FPGA.

WHAT NEXT

- If you have a valid .db file, that is, one that was generated with **compile_preserved_function -write** on a design configured for behavioral synthesis to FPGA with the **set_fpga** command, specify that .db file as the file to read from.
- If you want to use the current .db file, do not configure the file for synthesis to FPGA. Use the **unset_fpga** command to remove your prior configuration.

SEE ALSO

compile_preserved_functions (2), **read_preserved_function_netlist** (2), **set_fpga** (2), **unset_fpga** (2).

HLS-619 (error) Preserved function '%s' and the corresponding design in file '%s' target different FPGAs.

DESCRIPTION

You receive this error message because you tried to read in an implementation for a preserved function using the **read_preserved_function_netlist** command. The preserved function is configured for behavioral synthesis targeting an FPGA.

The **read_preserved_function_netlist** command has found in the file you are reading from a design with the same name as the preserved function. However, this design is not mapped to the same FPGA as the design the preserved function is targeting.

WHAT NEXT

- If you have a .db file containing a design for the preserved function that targets the same FPGA, specify that file as the one to read from.
- Use the **set_fpga** command to retarget the preserved function to the FPGA that the design in the .db file targets.

SEE ALSO

read_preserved_function_netlist (2), **set_fpga** (2).

HLS-620 (error) The operation %s requires multiple clock cycles to execute. Multicycled operations are not supported in FPGA

synthesis.

DESCRIPTION

You receive this error message because the operation you specify takes multiple clock steps to execute, and FPGA synthesis does not support multicycled operations. An operation takes multiple clock steps if the delay its execution requires is larger than the clock period available.

Behavior synthesis reserves a part of the clock period, called the "margin," to provide for FSM delay, register setup, and clock-to-Q delay. The clock period available to execute the datapath operations is the specified clock period, minus the margin.

To avoid multicycled operations, the available clock period for the design must be larger than the delay of the slowest operation in the design, plus the margin.

Another way to avoid multicycled operations, instead of increasing the clock period, is to try to use faster components for synthesis, such as the **bc_time_design** command with the **-fastest** option, or by manually selecting faster components from the Synopsys DesignWare libraries.

WHAT NEXT

Here is a summary of ways to avoid multicycled operations:

- Increase the clock period, using the **create_clock** command.
- Reduce the margin, using the **bc_margin** command.
- Use **bc_time_design -fastest** to select the fastest components for synthesis.
- Use a pipelined component to implement the operation.
- Use the preserved function methodology to generate a faster component to implement the operation.

For more details, see the *Cocentric SystemC Compiler/Behavior Compiler User Guide*.

SEE ALSO

bc_margin (2), **bc_time_design** (2), **create_clock** (2), **compile_preserved_functions** (2).

HLS-621 (information) Removed FPGA specification from design '%s'.

DESCRIPTION

The named design was previously configured for behavioral synthesis targeting an FPGA. You ran a command, such as **unset_fpga** that removed the configuration.

WHAT NEXT

This message is informational only and requires no action on your part.

SEE ALSO

set_fpga (2), **unset_fpga** (2).

HLS-622 (error) Design library '%s' does not exist.

DESCRIPTION

You receive this error message because you tried to use the **-design_library** option of the **compile_preserved_function** command to write to disk the preserved functions in your design. But the design library you specified in the option does not exist.

WHAT NEXT

Use the **define_design_library** command to map a physical directory on your disk to a logical design library of the name you specified. Then invoke **compile_preserved_functions** again.

Or you can correct the design library name you specified and then invoke **compile_preserved_functions** again.

SEE ALSO

compile_preserved_functions (2), **define_design_lib** (2).

HLS-623 (error) Design library '%s' is mapped to disk location

'%s' that is not a directory or is not writable.

DESCRIPTION

You receive this error message because you tried to use the **-write** option of the **compile_preserved_function** command to write to disk the preserved functions in your design. The design library into which you want the preserved functions to be written is not writable for one of the following reasons:

- The location to which the design library is mapped is not a directory.
- The directory to which the design library is mapped does not have permissions that allow the creation of files within it. For example, on a UNIX platform the directory must have write and execute permissions.

WHAT NEXT

Use the **define_design_library** command to map a writable physical directory on your disk to a logical design library of the name you specified. Then invoke **compile_preserved_functions**.

Or you can change the design library you specify to one that is mapped to a writable physical directory, and then invoke **compile_preserved_functions** again.

SEE ALSO

compile_preserved_functions (2), **define_design_lib** (2).

HLS-624 (error) Unable to create a file named '%s' in design library '%s' that is mapped to physical directory '%s'.

DESCRIPTION

You receive this error message because you tried to use the **-write** option of the **compile_preserved_function** command to write to disk the preserved functions in your design. Behavioral synthesis tried to create a file on your disk into which to place the netlists of the compiled preserved functions. However, it is unable to do this for one of the following reasons:

- A directory with the same name as the specified (or default) filename already exists in the physical directory to which the design library is mapped.
- A file with the same name already exists, but the file permissions do not allow

the file to be overwritten. For example, on a UNIX platform the file must have write permissions.

WHAT NEXT

You can fix the problem by doing one of the following:

- Use the **-filename** option of the **compile_preserved_function** command to specify the name of the file you want to write into. Ensure that you are able to create and write into a file of this name.
- Change the permissions of the existing file to allow it to be overwritten.
- Change the design library into which you are writing and ensure that no file name in the physical location of that design library conflicts with the file name in the error message.

SEE ALSO

compile_preserved_functions (2), **report_design_lib** (2).

HLS-625 (error) Unable to write preserved function '%s'.

DESCRIPTION

You receive this error message because you tried, but failed, to use the **-write** option of the **compile_preserved_function** command to write to disk the preserved functions in your design.

WHAT NEXT

This error message is always preceded by one that gives details of the specific failure that occurred. See the man page for that error for more information.

SEE ALSO

compile_preserved_functions (2).

HLS-626 (warning) The dc_shell variable '%s' has no effect on

a design configured for behavioral synthesis to FPGAs.

DESCRIPTION

You receive this warning because you assigned to a **dc_shell** variable a value that has no effect on behavioral synthesis of a design configured with the **set_fpga** command to target FPGAs.

WHAT NEXT

To eliminate the warning message, remove the variable or restore it to its default value. See the man page for the variable, to determine what its default value should be.

SEE ALSO

set_fpga (2), **unset_fpga** (2).

HLS-627 (warning) Design '%s' does not target an FPGA.

DESCRIPTION

You receive this warning because you tried to use the **unset_fpga** command to remove a previous configuration of the named design to target FPGAs in behavioral synthesis.

However, the named design was never configured with the **set_fpga** command to target FPGAs.

WHAT NEXT

This warning indicates that the **unset_fpga** command has no effect on this design. No further action on your part is necessary.

However, this might indicate an earlier error in your synthesis script. For example, an earlier call to the **set_fpga** command may have failed.

SEE ALSO

set_fpga (2), **unset_fpga** (2).

HLS-628 (error) Design '%s' is a behavioral module synthesized for an FPGA implementation. You cannot use the '%s' command

to perform logic synthesis. Use FPGA Compiler II instead.

DESCRIPTION

You receive this error message because you tried to invoke a logic synthesis command, such as **compile** or **reoptimize_design**, on your current design. The design is a behavioral module that was configured with the **set_fpga** command to target an FPGA implementation.

Therefore, you must use FPGA Compiler II, not Design Compiler, to perform logic synthesis on your design.

WHAT NEXT

Write out a synthesizable RTL model of your design. Also create an FPGA Compiler II synthesis script, using the **write_rtl** command,

For example,

```
dc_shell> write_rtl -format verilog \
    -output my_design.v \
    -rtl_script my_design.fc2
```

Then invoke FPGA Compiler II from your UNIX command line to perform logic synthesis.

```
unix% fc2_shell -f my_design.fc2
```

SEE ALSO

set_fpga (2).

HLS-629 (error) FPGA %s cannot be set to '%s' for behavioral synthesis.

DESCRIPTION

You receive this error message because you tried to set an FPGA target, device, or speed to a value that is invalid for behavioral synthesis.

The FPGA specification must identify a fully defined FPGA. For example,

```
dc_shell> set_fpga -target APEX20K -device EP20K400FC672 -speed -3
```

You cannot use an unrestricted FPGA specification, such as the following:

```
dc_shell> set_fpga -target APEX20K -device AUTO -speed FASTEST
```

WHAT NEXT

Change your FPGA specification to identify a fully defined FPGA.

You can use the **-list** option of the **set_fpga** command to view the available FPGAs for behavioral synthesis.

For example,

```
dc_shell> set_fpga -target APEX20K -device "*" -speed "*"
```

SEE ALSO

set_fpga (2).

HLS-630 (error) Preserved function '%s' targets an FPGA and the corresponding design in file '%s' does not.

DESCRIPTION

You receive this error message because you tried to read in an implementation for a preserved function using the **read_preserved_function_netlist** command. The preserved function was not configured for behavioral synthesis targeting an FPGA with the **set_fpga** command.

The **read_preserved_function_netlist** command found a design with the same name as the preserved function in the file from which you are reading. However, this design was mapped to an FPGA using the **set_fpga** command.

You cannot use the design from the file to implement the preserved function.

WHAT NEXT

Do one of the following actions:

- If you have a .db file containing a design for the preserved function that targets the same technology, specify that file as the one to read from.
- Use the **compile_preserved_functions -write** command to compile a new implementation for the preserved function. The **-write** option writes the new implementation to disk so that in future sessions you can read in the new implementation using the **read_preserved_function_netlist** command.
- Use the **set_fpga** command to retarget the design containing the preserved function to the FPGA that the design in the .db file targets.

SEE ALSO

`set_fpga` (2), `read_preserved_function_netlist` (2), `compile_preserved_functions` (2).

HLS-631 (warning) The synthetic component '%s' cannot be timed; operation '%s' will have zero delay.

DESCRIPTION

You receive this warning because the synthetic component '%s' on your design configured for behavioral synthesis targeting an FPGA cannot be timed. This happens for DesignWare that is not from Synopsys and for components the FPGA Compiler II does not recognize.

Scheduling is still possible, but all operations using this component will have zero delay, and other operations will be able to chain into or from it.

WHAT NEXT

Use Synopsys DesignWare components instead. Use the command `set_implementation` to specify an implementation.

If you continue with your currently configured design, you need to take into account timing requirements for this component and set proper scheduling timing constraints on the operations that make use of the component. Use the `dont_chain_operations` command to control chaining into and out of the operation. Use the `set_cycles` command to specify timing for the operation.

SEE ALSO

`dont_chain_operations` (2), `set_cycles` (2), `set_implementation` (2).

ICCSH

ICCSH-001 (information) License queuing is enabled.

DESCRIPTION

You receive this message because you have enabled licensing queuing.

ILM

ILM-01 (error) Could not read model back from '%s' for design '%S'.

DESCRIPTION

You receive this message if **create_ilm** cannot read back an extracted model file that was created by writing the output of **create_ilm** to a user-specified file.

Once ILM extraction is completed, the extracted model is written to the specified output db file, which is subsequently read back in as the current design. If the file cannot be read, this error message is generated.

Some possible reasons why the file cannot be read back could include the following:

- The model was not written to the file specified by the **-output** option of **create_ilm**, either because you did not have write permission for the file or the directory, or because there was insufficient disk space.
- You do not have read permission for the directory that contains the extracted model file.

WHAT NEXT

Ensure that you direct the output db file to a directory with sufficient disk space, in which you have both read and write privileges. Then reexecute the **create_ilm** command and generate the output file.

SEE ALSO

create_ilm (2).

ILM-02 (warning) Could not adjust location for cell: %s.

DESCRIPTION

During ILM extraction, the **create_ilm** command attempts to adjust the cell and port locations so that the (x,y) coordinates are relative to the origin of the block. You receive this message if **create_ilm** could not adjust the location of the specified cell. The most probable reason for the failure is that cells or ports have not been placed prior to ILM extraction.

WHAT_NEXT

Execute **report_cell -physical** and **report_port -physical** and ensure that all cells (except spare cells) and ports have locations. If they do not have locations, you must place them before executing the **create_ilm** command.

SEE_ALSO

create_ilm (2), **report_cell** (2), **report_port** (2).

ILM-03 (error) Design '%s' contains cluster information.

You cannot use the tool to extract ILM when clusters are present.

DESCRIPTION

This error occurs because you used the **create_ilm** command from within the shell to extract an interface logic model (ILM) on a design that contains clusters. The **create_ilm** command in the shell does not accept designs that contain clusters.

WHAT NEXT

Do not attempt to execute the **create_ilm** command from within the shell.

SEE ALSO

create_ilm(2)

ILM-04 (error) Interface logic has not been identified for design: %s

DESCRIPTION

You receive this message if you attempt to execute the extract step of **create_ilm** command on a design for which the interface logic has not been identified or tool has failed to identify interface logic. This interface logic is preserved in the Interface Logic Model (ILM). You cannot do extract ILM step unless you have previously identified the interface logic using the **create_ilm** command.

WHAT_NEXT

The most likely cause of this error is incorrect usage or other error conditions

occured during `create_ilm` command. If you are using `-identify_only` and/or `-extract_only` options of `create_ilm`, make sure `create_ilm -identify_onlyP` is executed successfully without any errors before executing `create_ilm -extract_only`.

SEE ALSO

`create_ilm` (2).

ILM-05 (error) The core area has not been defined for design: %S.

DESCRIPTION

You receive this message if you execute `create_ilm`, but the core area for the specified block has not been defined. If you use the default options, you must have previously defined the core area.

WHAT NEXT

Do the following:

1. Specify the core area in the floorplan.
2. Use the `set_placement_area` command to define the core area.

Then, reexecute `create_ilm`.

SEE ALSO

`create_ilm(2)`, `set_placement_area` (2).

ILM-06 (error) The parent block %S of ILM block %S is not an ILM.

DESCRIPTION

You receive this message if you attempt to execute the optimization command on a design that contains an interface logic model (ILM) block, but the parent block of the ILM block is not an ILM. You cannot perform top-level optimization on a design that contains an ILM block within a non-ILM hierarchical block.

WHAT NEXT

If your design has a hierarchical block that contains an ILM sub-block, use the **create_ilm** command to create an ILM for the hierarchical block also. Nested ILM blocks are permitted as long as the outermost ILM is directly at the top level.

SEE ALSO

create_ilm (2),

ILM-07 (Information) Port '%s' belongs to the ignore list because it fans out to %d%% of the registers on the design.

DESCRIPTION

You receive this message if you execute the **create_ilm** command with the **-auto_ignore** option, and the fanout of the specified input port has a larger percentage of the total number of registers than the percentage specified by the current value of the **ilm_ignore_percentage** variable (default 25). (For example, for the default value of 25, a port's fanout is ignored if the port fans out to 25% or more of the total number of registers in the design.) This message informs you that the specified port's fanout will be ignored.

WHAT NEXT

This is an informational message only; if it is acceptable to you that the specified port is on the ignore list, no action is required on your part. Otherwise, you can query the current value of the **ilm_ignore_percentage** variable by executing the following:

```
psyn_shell printvar ilm_ignore_percentage
```

If you want to set the variable to a higher or lower threshold percentage, execute the following:

```
psyn_shell set ilm_ignore_percentage new_value
```

SEE ALSO

create_ilm (2); **ilm_ignore_percentage** (3).

ILM-08 (error) Cannot specify '%s' with '%s'.

DESCRIPTION

The listed command options are exclusive. Only one of them can be specified.

WHAT NEXT

Look at the manpage for this command for more information on command options.

ILM-09 (error) The orientation of the ILM block %s is not legal.

DESCRIPTION

You receive this message if the orientation of the ILM block in the top level floorplan is not legal. Only 0, 180,0-mirror, 180-mirror orientations are supported for ILM blocks.

WHAT NEXT

Change the orientation of the ILM block to one of the legal orientations and run optimization command again.

SEE ALSO

ILM-10 (error) Unable to propagate attributes for ILM cell %s

DESCRIPTION

You receive this message during propagate_ilm when the attributes are not loaded from the cells of the ILM design to the instance of the top level design.

SEE ALSO

[propagate_ilm \(2\)](#).

ILM-11 (error) Unable to find the location of ILM block %s

DESCRIPTION

You receive this message during `propagate_ilm` if the location of the ILM block is missing from the top level floorplan.

WHAT_NEXT

Check if the pdef contains the location information for ILM block. If no location is specified for the ILM blocks, update floorplan with location specified for ILM block.

SEE ALSO

`propagate_ilm` (2). `physopt` (2).

ILM-12 (Error) Cell '%s' not an ILM block.

DESCRIPTION

The cell provided as argument on the command line is not an ILM block. This command can be used to propagate information for ILM blocks only. If you are using this command to propagate placement information for a non-ILM block, please use the `propagate_placement` command instead.

WHAT NEXT

Please remove any non-ILM cells from cell list or use the `propagate_placement` command.

SEE ALSO

`propagate_ilm`(2), `propagate_placement`(2).

ILM-13 (Error) Cell '%s' not a hierarchical cell.

DESCRIPTION

The cell provided as argument on the command line is not a hierarchical cell. This command works only on hierarchical cells.

WHAT NEXT

Please specify only hierarchical cells in the cell list.

SEE ALSO

`propagate_placement(2)`, `propagate_ilm(2)`.

ILM-14 (error) Location not found for ILM leaf cell %s reference %S.

DESCRIPTION

You receive this error message because a leaf cell inside an ILM block does not have its location specified. All leaf cells inside an ILM block must have locations. The locations of the ILM leaf cells will be automatically propagated when the ILMs are linked at the top level design. You need not use `propogate_ilm` command.

WHAT NEXT

To check if all leaf cells inside ILM block have locations, you can set current design as the reference design of the ILM block instance, and then run the `report_cell -physical` command.

To ensure that all ILM leaf cells have locations, create ILM for the block after the block has been placed.

If you found that this cell instance does not exist in original block or ILM, this could have been incorrectly added by one of the previous optimization commands. Trace back to the actual command causing this problem. If any of the previous optimization commands have abnormally terminated, restart the session.

SEE ALSO

`create_ilm (2)`, `report_cell (2)`.

ILM-15 (error) Invalid options. Must specify '%s' option with '%s'.

DESCRIPTION

The listed command options are dependant. `-keep_macros` option requires `-physical` option.

WHAT NEXT

Look at the manpage for this command for more information on command options.

ILM-16 (error) Cell/Port '%s' does not have a location.

DESCRIPTION

You receive this message if **create_ilm** cannot find the locations of all the cells and ports of the design.

WHAT NEXT

Ensure that the design is placed and all the cells and ports of the current design have valid locations and then rerun **create_ilm**.

SEE ALSO

create_ilm (2).

ILM-17 (error) Design '%s' has sequential elements but there are no clocks defined on it.

DESCRIPTION

You receive this message if **create_ilm** cannot find any clocks defined on the design, but the design has sequential elements.

WHAT NEXT

Ensure that there are clocks defined on the design and then rerun **create_ilm**. Use the **create_clock** command to create the clocks.

SEE ALSO

create_ilm (2), **create_clock** (2).

ILM-18 (information) Design '%s' has no sequential elements.

DESCRIPTION

You receive this message if **create_ilm** cannot find any sequential elements in the design in which case the ILM generated will be of the same size as the original design.

WHAT NEXT

This is information message only. No action needed.

SEE ALSO

create_ilm (2).

ILM-19 (error) Found non-uniquified hierarchy '%s'. Run uniquify command before running this command.

DESCRIPTION

You receive this error message if the **create_ilm** command finds one or more non-uniquified designs. Uniquify the designs before running this command.

WHAT NEXT

Run the **uniquify** command before running this command. In addition, you can remove don't touch attributes using the **set_dont_touch** command before running **uniquify** to reduce the resultant ILM size.

If you want to remove all don't touch attributes and run **create_ilm**, use the following set of commands:

```
psyn_shell-t> set_dont_touch [get_designs *] FALSE
psyn_shell-t> uniquify
psyn_shell-t> create_ilm
```

SEE ALSO

create_ilm(2)
set_dont_touch(2)
uniquify(2)

ILM-20 (warning) Preserving the '%s hierarchy '%s' completely. This may increase ILM size.

DESCRIPTION

You receive this message if the `create_ilm` command finds one or more don't touch designs or ununiquified designs. If `create_ilm` finds a don't touch design or ununiquified design it retains the design completely in ILM. This can potentially increase the size of the ILM.

WHAT NEXT

Remove the don't touch attributes using the `set_dont_touch` command and run the `uniquify` command before running `create_ilm`. For example, if you want to remove the don't touch attribute for all designs, use the commands:

```
psyn_shell-t> set_dont_touch [get_designs *] FALSE  
psyn_shell-t> uniquify  
psyn_shell-t> create_ilm
```

SEE ALSO

`create_ilm(2)`
`set_dont_touch(2)`
`uniquify(2)`

ILM-21 (error) The current design '%s' has ILM blocks in it. `compile_physical` does not support ILMs.

DESCRIPTION

The `compile_physical` command does not support designs with instances of ILMs in it.

WHAT NEXT

Instead of ILMs instantiate the entire block.

SEE ALSO

`compile_physical(2)`.

ILM-22 (warning) Side_load type has been changed from '%s' to

'all' since **-keep_parasitics** option is specified.

DESCRIPTION

You will see this message if you specify **none** or **boundary** for **-include_side_load** when **-keep_parasitics** option is specified. For accurate Interface Logic Model creation it is recommended to use **-include_side_load all** when **-keep_parasitics** option is used. Thus the tool automatically adjusts the **-include_side_load** setting.

WHAT NEXT

This automatic setting can not be over ruled. No action is required.

SEE ALSO

[create_ilm](#) (2).

ILM-23 (error) ILM '%s' does not have required parasitics (%s) file.

DESCRIPTION

You will see this message if the reported ILM view does not have required parasitics file. The RC parasitics file is attached to the ILM during ILM creation if the design is partially or fully routed. This file is needed to combine block-level and top-level post-route parasitics. This file is required during top-level extraction when the top-level design is partially or fully routed.

By default, The CC parasitics file is attached to the ILM during ILM creation a. if **-include_xtalk** option is used for [create_ilm](#) b. SI option(s) are turned ON.

If design is neither track assigned nor detail routed, the CC parasitics file will not be attached with ILM.

These files get generated when extraction runs successfully during ILM creation. ILM-29 information message is printed if these files are successfully generated and attached.

For example,

- If RC parasitic file is missing for A.ILM, you will get "ILM 'A' does not have required parasitics (RC) file" error message.
- If CC parasitic file is missing for A.ILM, you will get "ILM 'A' does not have required parasitics (CC) file" error message.

WHAT NEXT

Check the options and output of **create_ilm** command that is used to create the reported ILM. Check if ILM-29 message is printed. Watch out for ILM-90 and ILM-92 message. Re-run with the correct settings.

SEE ALSO

create_ilm (2), **ILM-29** (n), **ILM-90** (n), **ILM-92** (n).

ILM-24 (error) Missing parasitics data for routed design '%s'.

DESCRIPTION

You will see this message if the top-design is routed but neither **extract_rc** command is run nor **parasitics** present in the corresponding PARA view.

WHAT NEXT

Check/set TLUplus file settings, run **extract_rc** and run the command again.

SEE ALSO

set_tlu_plus_files (2), **extract_rc** (2), **propagate_ilm** (2).

ILM-25 (error) Missing parasitics data. '%s' option has failed.

DESCRIPTION

You will see this message during **create_ilm** if **extract_rc** command is not run on the design and PARA view does not contain parasitics file. Parasitics data is required for running **-keep_parasitics** option of **create_ilm**.

WHAT NEXT

Check/set TLUplus file settings, run **extract_rc** and run **create_ilm** again.

SEE ALSO

set_tlu_plus_files (2), **extract_rc** (2), **create_ilm** (2).

ILM-26 (information) Using parasitics (%s) file from '%s.ILM'

DESCRIPTION

You will see this message during top-level flow when ILM parasitics are used to stitch with the top-level parasitics.

WHAT NEXT

This is informative message. No action required.

SEE ALSO

`set_tlu_plus_files (2)`, `extract_rc (2)`, `create_ilm (2)`.

ILM-27 (information) Using parasitics (%s) from PARA view for design '%s'

DESCRIPTION

You will see this message during `create_ilm` if the parasitics are being used from corresponding PARA view.

WHAT NEXT

This is informative message, no action is required.

SEE ALSO

`set_tlu_plus_files (2)`, `extract_rc (2)`, `create_ilm (2)`.

ILM-28 (error) Failed to save parasitics (%s) file for design '%s'

DESCRIPTION

You will see this message during `create_ilm` if RC extraction has failed.

WHAT NEXT

Check if any error issued by RC extraction. Check/set tlu_plus file settings, run `extract_rc` and run `create_ilm` again.

SEE ALSO

`set_tlu_plus_files (2)`, `extract_rc (2)`, `create_ilm (2)`.

ILM-29 (information) Generated and attached parasitics (%s) file to '%s.%s'.

DESCRIPTION

This message is issued by `create_ilm` to indicate successful generation and storage of parasitics in ILM view. RC indicates parasitic file for timing while CC indicates coupling cap parasitics.

WHAT NEXT

This is informative message, no action is required.

SEE ALSO

`set_tlu_plus_files (2)`, `extract_rc (2)`, `create_ilm (2)`.

ILM-30 (error) Failed to generate or attach parasitics for ILM '%s'

DESCRIPTION

You will see this message if parasitics generation or saving them to MW has failed.

WHAT NEXT

Check if any error messages issued by RC extraction, `create_ilm` to find out possible causes. Check/set TLUPlus file settings, run `extract_rc` and run `create_ilm` again.

SEE ALSO

`set_tlu_plus_files (2)`, `extract_rc (2)`, `create_ilm (2)`.

ILM-31 (information) Generated and attached SI aggressor info

file to %s.%s.

DESCRIPTION

This message is issued by `create_ilm` to indicate successful generation and storage of SI aggressor info file to the ILM.

WHAT NEXT

This is informative message, no action is required.

SEE ALSO

`set_tlu_plus_files` (2), `extract_rc` (2), `create_ilm` (2).

ILM-32 (error) ILM '%s' does not have required (%s) file.

DESCRIPTION

You will see this message if one or more of the ILM instances do not have SI aggressor info file in the associated ILM view. This could be due to, not using `-include_xtalk` option of `create_ilm` or some errors occurred during `create_ilm -include_xtalk`. All ILMs will need to have SI aggressor info files in the respective ILM views for top-level SI analysis to consume SI information from ILM. This command will however continue without the SI aggressor file but the SI analysis may be inaccurate due to not accounting for aggressors from removed logic during ILM creation.

WHAT NEXT

Check the options and output of `create_ilm` command used to create the reported ILM. Re-run with the corrected settings.

SEE ALSO

`create_ilm` (2).

ILM-33 (error) Failed to save SI aggressor info file for design

'%S'

DESCRIPTION

You will see this message during **create_ilm** if RC extraction has failed.

WHAT NEXT

Check if any error issued by RC extraction. Check/set TLUplus file settings. Check if the design has been routed. Check if the si_options are properly set using the set_si_options command. Check if hierarchical SI flow has been enabled using the enable_hier_si variable. Check if the necessary licenses are available.

SEE ALSO

set_tlu_plus_files (2), **extract_rc** (2), **create_ilm** (2).

ILM-34 (error) Invalid options. Cannot specify '%s' option with '%S'.

DESCRIPTION

The listed command options are dependant. -keep_macros can not be specified with -no_physical option.

WHAT NEXT

Look at the manpage for this command for more information on command options.

ILM-35 (Warning) Master cell of macro %s is not %s.FRAM.

DESCRIPTION

You will see this message during **propagate_ilm** if the block does not have a FRAM view or even if the block has a FRAM view, but the master of the instance is not the FRAM view. Block boundary will be read from ILM view. All metal layers over the block will be blocked for top-level routes.

WHAT NEXT

Create a FRAM view for the macro block if it does not exist. Change the master of the macro instance to FRAM view using the command **change_macro_view**.

SEE_ALSO

`change_macro_view (2), create_ilm (2).`

ILM-36 (error) TLUPlus files (for parasitic corner #*%d*) did not match between Top design and ILM.

Top design: %s

ILM (%s): %s

DESCRIPTION

You are seeing this message because the TLUPlus files for the Top design and the reported ILM did not match. This can happen, if the total number or names of TLUplus files used for active scenarios when the ILM is created do not match with the total number or names of TLUplus files used when extract_rc is run at the top-level.

WHAT NEXT

Review the scenarios and TLUPlus settings used for create_ilm and top-level to check if they are according to the ILM/MCMM flow usage recommendations.

SEE_ALSO

`set_tlu_plus_files (2) report_tlu_plus_files(2) ILM-37(n) ILM-68(n) ILM-69(n)`

ILM-37 (warning) Potential mismatch of TLUPlus files (for parasitic corner #*%d*) for Top design and the ILM since they are from two different directories:

Top design: %s,

ILM(%s): %s

DESCRIPTION

You are seeing this message because the TLUPlus files used for the top design and the reported ILM have same names but are residing in two different directories. ILM/MCMM flow requires the consistent use of TLUPlus files at the block level when ILM was created and at the top-level when ILM was used. The difference of directory may actually mean a different TLUPlus file being used for create_ilm and top-level extract_rc and can lead to inconsistent use of RC for ILM nets.

WHAT NEXT

Review the TLUPlus files reported and make sure they are actually represent the same parasitic corner. If the TLUPlus file names meant for different corner happen to have the same name, rename the TLUPlus file so that file names are unique.

Review the scenarios and TLUPlus settings used for `create_ilm` and top-level to check if they are according to the ILM/MCMM flow usage recommendations.

SEE ALSO

`set_tlu_plus_files` (2) `report_tlu_plus_files` (2) [ILM-36\(n\)](#) [ILM-68\(n\)](#) [ILM-69\(n\)](#)

ILM-38 (warning) %s nets do not have delays calculated.
Running `extract_rc` to extract RC and calculate delays.

DESCRIPTION

This warning message occurs when some nets do not have delays calculated. This scenario can occur due to use of some commands that remove delays from nets like `remove_annotated_delay`, `set_delay_calculation`, `remove_sdc` commands. `create_ilm` command checks for nets not having delays and runs `extract_rc estimate` and `extract_rc` (if the design is routed) commands as a corrective measure to calculate the delays.

WHAT NEXT

Review the commands that were run prior to `create_ilm` to find out the reason for some nets not having delays. Run recommended commands like `extract_rc` to calculate the delays. No action is required if the corrective action of running `extract_rc estimate` and `extract_rc` is sufficient for the flow.

SEE ALSO

ILM-39 (error) Failed to save TLUPlus signature file for design '%S'

DESCRIPTION

You will see this message during `create_ilm` if saving the TLUPlus signature file has failed. TLUPlus signature file is different from TLUPlus files. TLUPlus signature file has a mapping between the extraction data and the TLUPlus files and temperature used for extraction. For example: If there are two TLUPlus files TLUP1, TLUP2 and extraction is done using TLUP1 for temperatures 25,40 and extraction is done using

TLUP2 for temperatures 25, 40 and 80, the TLUplus signature file has extraction data mapped to each of the (TLUP1,25), (TLUP1,40), (TLUP2,25), (TLUP2,40), (TLUP2,80) pairs. This mapping information is needed to match the extraction data from ILM with top-level and successfully stitch the ILM RC with top-level RC data. This file is automatically generated by the tool when extraction runs successfully. This error may happen because of attached TLUplus file.

WHAT NEXT

Set the TLUplus files using the **set_tlu_plus_files** command after linking the deisgn. Run **create_ilm** again and watch out for RCEX-046 message.

SEE ALSO

set_tlu_plus_files (2), **extract_rc** (2), **create_ilm** (2), **RCEX-046(n)**.

ILM-40 (information) %s to include the netlist from the ILMs into current_design.

DESCRIPTION

You will see this message as information of start or end of flattening during **create_ilm** when netlist from the ILMs will be included into the current_design.

WHAT NEXT

This is informative message. No action required.

SEE ALSO

create_ilm (2).

ILM-41 (Error) Cell '%s' an ILM block.

DESCRIPTION

The cell provided as argument on the command line is an ILM block. This command can be used to propagate information for non-ILM blocks only. If you are using this command to propagate placement or annotated delay information for an ILM block, please use the **propagate_ilm** command instead.

WHAT NEXT

Please remove any ILM cells from cell list or use the **propagate_ilm** command.

SEE ALSO

`propagate_ilm(2)`, `propagate_annotated_delay_up(2)`. `propagate_placement(2)`.

ILM-42 (Error) This command is obsolete, use propagate_ilm.

DESCRIPTION

This command is obsolete. If you are using this command to propagate delay information for an ILM block, please use the **propagate_ilm** command instead.

WHAT NEXT

Use the **propagate_ilm** command.

SEE ALSO

`propagate_ilm(2)`.

ILM-43 (error) No ILM sub-designs in current design.

DESCRIPTION

You are trying to run a command which works on Interface Logic Model sub-designs in the current design. As there are none, this command is issuing this error.

WHAT NEXT

Please read in db files for the ILM sub-designs, link the design and try this command again.

SEE ALSO

`propagate_ilm (2)`, `propagate_placement (2)`.

ILM-44 (warning) Nested ILM sub-design %s has dont_touch

attribute.

DESCRIPTION

You receive this message if **create_ilm** command has detected nested ILM blocks having **dont_touch** attribute. During ILM extraction, the **create_ilm** command will retain all logic in blocks with **dont_touch** attribute so this can cause the extracted ILM to contain unnecessary extra logic.

WHAT_NEXT

For each ILM sub-design nested in the current design, set the current design to the nested ILM sub-design and execute **set_dont_touch [current_design] false** command. Then, with the current design set to the original top design, run the **create_ilm** command.

SEE_ALSO

create_ilm (2).

ILM-45 (Error) Interface logic of design '%s' has already been identified.

DESCRIPTION

The interface logic of the design has already been identified. The **create_ilm** command was already executed on this design perhaps with a different set of options. This command should not be executed multiple times on the same design.

WHAT NEXT

Read in the original design and then run the **create_ilm** command with the appropriate options.

SEE ALSO

create_ilm(2), **propagate_ilm(2)**.

ILM-46 (Error) The -output option of create_ilm command is

obsolete, use write command to save ILM.

DESCRIPTION

The `-output` option of `create_ilm` commands is obsolete and no longer supported. Instead use `write` command to save ILM into a file.

WHAT NEXT

Use `write` command to save ILM into a file.

Suppose, your script has following lines: `create_ilm -output block_ilm.db`

the following change is required. `create_ilm write -f db -hier -output block_ilm.db`

If you are running the tool in XG mode, you can save the created ILM to the Milkyway design library, for example:

```
create_ilm write_milkyway -output block
```

Refer to the latest Application Notes for more details of ILM flow when using XG mode.

SEE ALSO

`create_ilm(2)`, `write(2)`, `write_milkyway(2)`.

ILM-47 (error) Missing -ilm_core option.

DESCRIPTION

You receive this message if you execute `create_ilm` or `create_ilm` with the `-optimizable` option, but the `-ilm_core` option is omitted. If you use the `-optimizable` option, you must specify a `ilm_core` file used for saving core design for later merging.

WHAT NEXT

Specify file name for storing `ilm_core` file using `-ilm_core` option.

SEE ALSO

`create_ilm(2)`, `merge_ilm(2)`.

ILM-48 (warning) Assigned (0,0) location to Port '%s'. Reason: Either dangling port or PG port with no location.

DESCRIPTION

You receive this message in either of the following cases: if a PG port's location is missing or if a dangling non-PG port's location is missing. Dangling port is a port which is not connected to any other cell inside the block. In general, all ports and cells will need to have physical location to run `create_ilm` and avoid problems in top-level.

WHAT NEXT

Review the floorplan and set port location accordingly and rerun `create_ilm`

SEE ALSO

`create_ilm` (2). **ILM-16** (n)

ILM-49 (warning) Failed to find mw_id information for %s : '%s' to associate RC information while using ILMs.

DESCRIPTION

You will see this message if current command fails to find `mw_id` information for net or pin while trying to associate RC data while using ILMs. This can happen for multiple reasons:

- 1) This may be a dummy/floating or constant net where RC is not available/not required. In this case you may ignore this message.
- 2) The pin/net does not exist in ILM and for some reason started showing up at the top-level. In this case the most likely cause would be one of the optimization commands run prior to this command have inserted a net/cell into ILM.
- 3) Some command in the flow has abnormally terminated. In such a case you can fix the issue and re-start the flow with good version of database.

WHAT NEXT

Watch for the RCEX-060 messages later in the flow. If you find RCEX-060, check the routing and RC data of reported nets at the block-level and at the top-level. In case of boundary nets, ensure that both portions of the net (inside and outside the ILM) are routed. In case this error is issued due to abnormal termination of some prior command, fix the reported issue of that command and re-start the flow with good version of database.

SEE_ALSO

extract_rc (2), **create_ilm** (2).

ILM-50 (warning) ILM design or sub-design %s in file %s has same name as another design. Renamed it as %s.

DESCRIPTION

You will see this message if any ILM design or sub-design is renamed. If the **link** command detects multiple ILM designs or sub designs with same name in the **link_library**, the link automatically renames the design and then updates the instances in the ILM file containing the design, to refer to the renamed design (**ILM-51**) .

WHAT NEXT

If **link** has chosen the design you want to use, you do not need to take any action.

SEE_ALSO

ILM-51 (n), **link** (2).

ILM-51 (warning) Instance '%s' in design '%s' is updated to refer to renamed design '%s'.

DESCRIPTION

You will see this message if any ILM design or sub-design is renamed. If the **link** command detects multiple ILM designs or sub designs with same name in the **link_library**, the link automatically renames the design (**ILM-50**) and then updates the instances in the ILM file containing the design, to refer to the renamed design.

WHAT NEXT

If **link** has chosen the design you want to use, you do not need to take any action.

SEE_ALSO

ILM-50 (n), **link** (2).

ILM-52 (Error) The specified cel name (%s) does not match with current design name (%s). Failed to save ILM to Milkyway.

DESCRIPTION

The MW cel name specified for ILM storage does not match with the ILM design name. This mismatch can lead to "link" errors when top-design and ILMs are being linked for top-level optimization.

WHAT NEXT

Specify the ILM design name as MW cel name for storing ILM.

Suppose, your ILM design name is 'foo', use the following command to store ILM to milkyway.

```
psyn_shell-t> current_design foo psyn_shell-t> write -format milkyway -output foo
```

SEE ALSO

write (2), **read_file** (2).

ILM-53 (Warning) The design name (%s) of the loaded ILM does not match with the cel name (%s). This can potentially lead to "link" errors later.

DESCRIPTION

The design name of the ILM loaded from Milkyway does not match with the cel name. This can potentially lead to "Unresolved references" errors when top-design and ILMs are being linked for top-level optimization.

WHAT NEXT

Rename the design if you see problems during "link".

SEE ALSO

write (2), **read_file** (2), **ILM-52** (n).

ILM-54 (error) Found feed-through or multiple-port net '%s'. This

net must be buffered before creating ILM.

DESCRIPTION

This error message occurs when the design has a net connected to more than one port and you are trying to create ILM for that design. The reported net could be a net driving multiple output ports or it could be a feed-through net connecting input and output ports (feed-through pins) directly. These nets must be buffered to make them connect only one port before creating the ILM.

WHAT NEXT

Use `set_fix_multiple_port_nets` command to fix these nets so that no net is connected to more than one port. Rerun the command after fixing the reported nets.

SEE ALSO

`set_fix_multiple_port_nets(2)`.

ILM-55 (error) Failed to check top and ILM TLUPlus consistency.

DESCRIPTION

You will see this error if the tool has failed to check if TLUPlus settings are consistently used between the top-level and the ILM.

WHAT NEXT

Review the errors issued prior to this error and fix the reported problem.

Review the scenarios and TLUPlus settings used for `create_ilm` and top-level to check if they are according to the ILM/MCMM flow usage recommendations.

SEE ALSO

`report_tlu_plus_files(2)`, `set_tlu_plus_files(2)`, `ILM-39(n)`.

ILM-56 (error) ILM '%s' does not have required TLUPlus

signature file.

DESCRIPTION

You will see this error if the TLUPlus signature file attached to the reported ILM is not found. TLUPlus signature file is different from TLUPlus files. TLUPlus signature file has a mapping between the extraction data and the TLUPlus files and temperature used for extraction. For example: If there are two TLUPlus files TLUP1, TLUP2 and extraction is done using TLUP1 for temperatures 25,40 and extraction is done using TLUP2 for temperatures 25, 40 and 80, the TLUPlus signature file has extraction data mapped to each of the (TLUP1,25), (TLUP1,40), (TLUP2,25), (TLUP2,40), (TLUP2,80) pairs. This mapping information is needed to match the extraction data from ILM with top-level and successfully stitch the ILM RC with top-level RC data. This file is automatically generated by the tool when extraction runs successfully. Most likely there are one or more errors during `create_ilm` in generating the TLUPlus signature file.

WHAT NEXT

Set the TLUPlus files for the block using the `set_tlu_plus_files` command after linking the design. If the design uses MCMM scenarios, review the scenarios and TLUPlus settings. Recreate ILM for that block. Watch for RCEX-046 and ILM-39 messages. Use the newly created ILM at the top-level.

SEE ALSO

`report_tlu_plus_files(2)`, `set_tlu_plus_files(2)`, `create_ilm(2)`, `ILM-39(n)`, `RCEX-046(n)`.

ILM-57 (error) Mismatch of total number of TLUPlus files used in ILM %s and Top.Äù

DESCRIPTION

You will see this error if the total number of TLUPlus files used for extraction is different for the reported ILM and Top design.

WHAT NEXT

Review the TLUPlus file settings used for the reported ILM and make sure that they match between the top design and the ILM.

Review the scenarios and TLUPlus settings used for `create_ilm` and top-level to check if they are according to the ILM/MCMM flow usage recommendations.

SEE ALSO

`report_tlu_plus_files(2), set_tlu_plus_files(2).`

ILM-58 (error) Level shifter pin %s is not connected to any other leaf load/driver pin. check_mv_design at top-level may fail.

DESCRIPTION

You will see this error if level shifter pin is not connected to any other leaf load/driver pin or it is connected to logic hierarchy. If the level shifter pin is connected to logic hierarchy and have the operating condition defined on that logic hierarchy then such connection may not exist at top level. This is because logic hierarchy is retained only if it is a non-empty hierarchy.

WHAT NEXT

You may need to attach the level shifter pin to some load and re-run the `create_ilm`.

SEE ALSO

`create_ilm(2), check_mv_design(2).`

ILM-60 (error) Design is a route-cache.

DESCRIPTION

The design being used is a route-cache. Using a route-cache with this flow is not supported. A real design, loaded from a Milkyway design library, on disk, is required to continue.

WHAT NEXT

To continue you need to write the design to disk using the `write_milkyway` command. After this is done, you may proceed as usual.

SEE ALSO

`write_milkyway(2).`

ILM-61 (error) Design contains data from previous optimization/

`extract_rc` run.

DESCRIPTION

The design that you are trying to run On-Route optimization/`extract_rc` on has data from a previous run. This might have occurred due to interruption of a previous run of the command.

WHAT NEXT

ILM-62 (error) Could not read ILM '%s.%s'.

DESCRIPTION

This error occurs because the tool was unable to open the specified interface logic model (ILM) so it cannot proceed. This could be due to several reasons, such as insufficient permissions for reading or the design being locked.

WHAT NEXT

Ensure that The ILM block specified is the one that should be read and that it is readable. (It requires sufficient UNIX permissions.) Ensure that the block and design are not locked.

ILM-63 (error) Could not get block location/offset for block '%s'.

DESCRIPTION

This error occurs because the tool was unable to retrieve either the location or offset of this block or both. These values must be set before On-Route optimization can proceed.

WHAT NEXT

You should read the location for the block from the top-level Design Exchange Format (DEF) or Physical Design Exchange Format (PDEF) file or set it by using the `set_cell_location` command.

SEE ALSO

`set_cell_location(2)`

ILM-64 (error) Die/core area not defined for '%s'.

DESCRIPTION

This error occurs because the tool was unable to retrieve either the die area or the core area of the specified block or both. These are necessary in order to proceed.

WHAT NEXT

You can read the block die and core areas from the Design Exchange Format (DEF) or Physical Design Exchange Format (PDEF) file or use the **set_die_area** and **set_placement_area** commands to manually set them.

SEE ALSO

set_die_area(2)
set_placement_area(2)

ILM-65 (error) ILM block '%s' does not contain route data.

DESCRIPTION

The specified ILM block contains no routing data. For On-Route optimization to proceed, an ILM of the routed block is required.

WHAT NEXT

Make sure that the CEL view of the block is routed, read it in using **read_milkyway**, and re-create the ILM using the **create_ilm** command.

SEE ALSO

create_ilm(2), **read_milkyway(2)**.

ILM-66 (error) Invalid or absent layer information.

DESCRIPTION

This error occurs when the tool is unable to retrieve the physical information for one or more layers.

WHAT NEXT

Ensure that the layer data is present in the library, and then rerun the last command.

ILM-67 (error) Could not get data for port '%s' from the Milkyway database.

DESCRIPTION

This error occurs because the tool was unable to retrieve data for the specified interface logic model (ILM) port from the Milkyway database. Without this information, On-Route optimization cannot continue.

WHAT NEXT

Ensure that all the port data for the block is included in the ILM and that this data is stored in the ILM view of the block.

ILM-68 (error) Mismatch in '%s' TLUPlus setting between Top design and ILM in scenario '%s'

Top TLUPlus file : '%s'

Block ('%s') TLUPlus file: '%s'

DESCRIPTION

You will see this error if the TLUPlus file name setting for the given condition (e.g. min or max) is different between the top-level and the given ILM in a particular scenario.

WHAT NEXT

Review the TLUplus file settings used for the reported scenario make sure that they match between the top design and the ILM.

Review the scenarios and TLUPlus settings used for create_ilm and top-level to check if they are according to the ILM/MCMM flow usage recommendations.

SEE ALSO

`create_ilm(2), report_tlu_plus_files(2), set_tlu_plus_files(2).` **ILM-69(n)**

ILM-69 (warning) Potential mismatch in '%s' TLUPlus setting between Top design and ILM in scenario '%s' since they are from two different directories.

Top design: %s,
ILM (%s): %s

DESCRIPTION

You are seeing this message because the TLUPlus files used for the top design and the reported ILM have same names but are residing in two different directories. ILM/MCMM flow requires the consistent use of TLUPlus files at the block level when ILM was created and at the top-level when ILM was used. The difference of directory may actually mean a different TLUPlus file being used for create_ilm and top-level extract_rc and can lead to inconsistent use of RC for ILM nets.

WHAT NEXT

Review the TLUPlus files reported and make sure they are actually represent the same parasitic corner. If the TLUPlus file names meant for different corner happen to have the same name, rename the TLUPlus file so that file names are unique.

Review the scenarios and TLUPlus settings used for create_ilm and top-level to check if they are according to the ILM/MCMM flow usage recommendations.

SEE ALSO

`create_ilm(2), report_tlu_plus_files(2), set_tlu_plus_files(2)`. **ILM-68(n)**

ILM-70 (error) Scenario '%s' is not available in %s

DESCRIPTION

You will see this error if the scenarios present in the top-level design does not match with the scenarios present in ILM by name. ILM can have additional scenarios which are not defined in the top-level design.

WHAT NEXT

To fix this error, you must create the scenario for the given(sub)design. Note that if you are changing the set of scenarios in an ILM, you must load the entire block-level design, define scenarios as appropriate, and then recreate the ILM for that block using the `create_ilm` command.

SEE ALSO

`create_ilm(2)`, `create_scenario(2)`, `remove_scenario(2)`.

ILM-71 (Warning) Unconnected pin '%s' has different case values across scenarios. `set_case_analysis` are applied automatically to this ILM pin. These should be made available at the top level using `propagate_constraints`. Details: %s

DESCRIPTION

You will see this message if there is some pin in the block for which you are creating an ILM, which has different case values across scenarios. For example, a given pin might have a case value '0' in scenario 'scenel' and case value '1' in scenario 'scene2'. The `case_values` on the reported pin might have been as a result of user case settings on ports or other pins and propagated to this pin. At the unconnected pins, which are as a result of logic removal, `create_ilm` uses the case values to create logic0/1 cells based on the `case_value` at this pin. In case of conflicting values, it applied `set_case_analysis` constraint instead of creating logic0/1 cell connections for this pin. Note that these values will **not** be available at the top level unless you use the `propagate_constraints -case_analysis` command.

WHAT NEXT

Use the `propagate_constraints -case_analysis` command at the top level to propagate these values to top-level.

SEE ALSO

`create_ilm(2)`, `propagate_constraints(2)`.

ILM-72 (error) Multi-mode/Multi-corner flow is not supported with ILMs.

DESCRIPTION

You will see this error if your try to create an ILM for a design which has multiple scenarios. Concurrent Multi-mode and Multi-corner optimization are currently not supported in the ILM flow.

WHAT NEXT

Support for multiple modes/corners will be added in an upcoming release.

SEE ALSO

`create_ilm(2)`.

ILM-73 (error) Inconsistent use of ILM %s in MCMM flow. %s has scenarios defined while %s does not have scenarios defined.

DESCRIPTION

You receive this message if the top-design has scenarios defined and the reported ILM does not have scenarios defined or vice versa.

WHAT NEXT

If you intend to use MCMM flow with ILM, make sure that you create scenarios in top level as well as ILM as per the recommended flow. If you are using non MCMM flow make sure that there are no scenarios in either ILM or TOP. Mixing non-MCMM top with MCMM ILM is not allowed and mixing MCMM top with non-MCMM ILM is also not allowed .

SEE ALSO

ILM-74 (warning) ILM does not contain required information related to MCMM. Re-generate the ILM with latest image.

DESCRIPTION

You receive this message if you have created ILM with an older version of IC compiler. The tool did not find required information from this ILM You need to recreate the ilms. If you are using non-MCMM flow you may safely ignore this warning.

WHAT NEXT

Recreate the ilm.

ILM-75 (error) Unable to find location of the cell %s. Failed to propagate.

DESCRIPTION

You receive this message if the tool is not able to find and propagate the location information of a cell from ILM to top-level design.

WHAT NEXT

To check if all leaf cells inside ILM block have locations, you can set current design as the reference design of the ILM block instance, and then run the **report_cell -physical** command.

To ensure that all ILM leaf cells have locations, create ILM for the block after the block has been placed.

If you find that this cell instance does not exist in original block or ILM, this could have been incorrectly added by one of the previous optimization commands. Trace back to the actual command causing this problem. If any of the previous optimization commands have abnormally terminated, restart the session.

ILM-76 (warning) Scenario %s is not active and will not be saved in the ILM.

DESCRIPTION

You receive this message if there are some scenarios which are not active during ILM creation. **create_ilm** saves scenario data of only active scenarios.

WHAT NEXT

Activate the scenarios which are not active by using the command **set_active_scenarios** and run **create_ilm** again.

SEE ALSO

set_active_scenarios (2), **create_ilm** (2).

ILM-77 (error) create_ilm command cannot be run on an

auto_cel CEL.

DESCRIPTION

You receive this message if the current_mw_cel is an auto_cel.

WHAT NEXT

Save the current_mw_cel to a valid cel using the command save_mw_cel with the -as option. Then run create_ilm.

ILM-78 (error) ILM loading failed because latest version of %s.%s is more recent than the latest version of %s.%s.

DESCRIPTION

You receive this message if you have modified the CEL view after creating the ILM. This check is to prevent loading an outdated ILM.

WHAT NEXT

Check your create_ilm/block-level script and avoid save_mw_cel after create_ilm. Alternatively recreate the ILM and load it at the top-level.

ILM-79 (error) Option -in_context can be used only with -compact <output/all> option.

DESCRIPTION

You receive this message if you are using -in_context without the -compact <output/all> option in create_ilm_models command. The option -in_context generates compact ILMs that are in context with the top level timing.

WHAT NEXT

Use -compact <output/all> along with -in_context option of create_ilm_models.

SEE ALSO

`create_ilm_models (2)`,

ILM-80 (Error) Unconnected pin '%s' has different case values across scenarios. Recommend re-creating ILM with '-case_controlled_ports' or '-compact none -traverse_disabled_arcs' to avoid the problem.

DESCRIPTION

You will see this message if there is some pin in the block for which you are creating an ILM, which has different case values across scenarios. For example, a given pin might have a case value '0' in scenario 'scene1' and case value '1' in scenario 'scene2'. The case_values on the reported pin might have been as a result of user case settings on ports or other pins and propagated to this pin. At the unconnected pins, which are as a result of logic removal, create_ilm uses the case values to create logic0/1 cells based on the case_value at this pin. In case of conflicting values, it can not create such logic0/1 cell to connect to unconnected input pin. You can avoid this problem by re-creating ILM with additional '-case_controlled_ports' or '-compact none -traverse_disabled_arcs' options.

WHAT NEXT

Recreate ILM with the recommended options.

SEE ALSO

`create_ilm(2)`.

ILM-81 (information) Skipping net %s for ILM preprocessing as it is %s net.

DESCRIPTION

This message is generated while preprocessing ILMs for high fanout synthesis. You will see this information message if a buffer can not be inserted in net.

The current preprocessing of ILMs does not insert buffers if the net is . an ideal . dont touch . three state bus . tristate . drc disabled . multiple driver . constant

WHAT NEXT

This is an information. No action required.

SEE ALSO

ILM-82 ILM-83

ILM-82 (information) Inserted buffer on net %s for isolating ILM pin %s.

DESCRIPTION

This message is generated while preprocessing ILMs for high fanout synthesis. You will see this information message when the preprocessing step inserts a buffer to isolate the ILM pin.

WHAT NEXT

This is an information. No action required.

SEE ALSO

ILM-81 ILM-83

ILM-83 (error) No suitable buffer found for isolating %s pin.

DESCRIPTION

This message is generated while preprocessing ILMs for high fanout synthesis. You are seeing this message because preprocessing step was not able to find a suitable buffer in the library to isolate the ILM pin.

WHAT NEXT

Make sure that you have buffer definitions in the library and rerun the high fanout synthesis command.

SEE ALSO

ILM-81 ILM-82

ILM-85 (error) No current design found. Please open the top

level design.

DESCRIPTION

You receive this message if you are using `create_ilm_models -in_context` without opening any top level design. The option `-in_context` needs a top level design which has been linked with existing ILM blocks.

WHAT NEXT

Use `open_mw_cel` to open the top design and rerun the `create_ilm_models` commands.

SEE ALSO

`create_ilm_models` (2),

ILM-86 (error) No ILMs found in the design.

DESCRIPTION

You receive this message if you are using `create_ilm_models -in_context` on a design that has not been linked with existing ILMs.

WHAT NEXT

Create the ILMs using `create_ilm_models` or `create_ilm`. Open the top design and link them with ILMs created in the previous step. Now run `create_ilm_models -in_context` to create the `in_context` ILMs.

SEE ALSO

`create_ilm_models` (2),

ILM-87 (error) Failed to open temporary file:%s for write

DESCRIPTION

An error has occurred while the tool was trying to write the file.

WHAT NEXT

Please make sure that the disk has enough space for the file to be written. Please

check the write permissions for the the file and directory and rerun the command.

SEE_ALSO

ILM-88 (error) ILM '%s' does not have required 'min' TLUPlus setting/data.

DESCRIPTION

You will see this message if the reported ILM does not have required 'min' corner parasitics. To use 'min' corner parasitics at the Top-level, the ILM must be extracted with 'min' TLUPlus setting. Otherwise the top-level extraction fails.

WHAT NEXT

Use report_tlu_plus_files and report_ilm commands to check the tluplus settings of TOP and ILM. If you do not intend to use 'min' corner, you may remove the min_tlu_plus option of the set_tlu_plus_files commands. Alternatively, you can re-create the ILM with both max and min TLUPlus settings and re-run commands at the top-level.

SEE_ALSO

`create_ilm (2), report_ilm (2), report_tlu_plus_files (2), set_tlu_plus_files (2).`

ILM-89 (error) Top design does not have required 'min' TLUPlus setting/extracted data to combine with ILM %s 'min' extracted data.

DESCRIPTION

You will see this message if the Top design does not have required 'min' corner extracted parasitics and one of the ILMs has such setting/data. To combine ILM and top-level extracted parasitics correctly either both ILM and TOP need to use 'min' TLUPlus setting or both should not use. Otherwise the top-level extraction fails.

Note that if you specify 'min' TLUPlus at the Top level then each of the ILMs are expected to have 'min' TLUPlus settings/data.

WHAT NEXT

Use report_tlu_plus_files and report_ilm commands to check the TLUpplus settings of

TOP and ILM. If you do not intend to use 'min' corner, you may remove the min_tlu_plus option of the set_tlu_plus_files commands. Alternatively, you can re-create the ILM with corrected TLUPplus settings and re-run commands at the top-level.

SEE ALSO

`create_ilm (2)`, `report_ilm (2)`, `report_tlu_plus_files (2)`, `set_tlu_plus_files (2)`.

ILM-90 (warning) The -include_xtalk option can't be used if design is '%s'. The coupling capacitance can be included only if design is either track assigned or detailed routed.

DESCRIPTION

You are seeing this message because the command expects the design to be either track assigned or detail routed for including the coupling capacitance and SI effective aggressor information in the ILM.

WHAT NEXT

Remove the -include_xtalk option while running `create_ilm`. Alternatively you can perform track assignment or detailed routing and run the `create_ilm` with -include_xtalk option.

SEE ALSO

`create_ilm(2)`, `route_global (2)` `route_opt (2)`

ILM-91 (error) Found '%s.ILM' generated with older version of the tool. Please re-generate the ILM using latest version of the tool.

DESCRIPTION

You are seeing this message because the ILM used was generated with older version of the tool. Due to a backward compatibility issue, the older ILM is no longer usable in the later versions of the tool.

WHAT NEXT

Re-create the ILM with latest version of the tool. Check and ensure correct TLUPplus

settings before running `create_ilm`.

SEE ALSO

`create_ilm(2)`,

ILM-92 (warning) The `-keep_parasitics` option can't be used if design is not routed. The ILM creation will be continued without `-keep_parasitics` option.

DESCRIPTION

You are seeing this message because the command expects the design to be routed (either partially or fully) for including the RC tree information in the ILM. The `ilm` creation will be continued without `-keep_parasitics` option.

WHAT NEXT

If you want to include detailed RC parasitic information in ILM, then perform routing and run the `create_ilm` command.

SEE ALSO

`create_ilm(2)`, `route_global (2)` `route_opt (2)`

ILM-93 (warning) Found '%s.ILM' generated with older version of the tool. The tool will automatically process the TLUPlus signature file attached to the ILM to maintain backward compatibility.

DESCRIPTION

You are seeing this message because the ILM used was generated with older version of the tool. TLUPplus signature file has a mapping between the extraction data and the TLUPplus files and temperature used for extraction. For example: If there are two TLUPplus files TLUP1, TLUP2 and extraction is done using TLUP1 for temperatures 25,40 and extraction is done using TLUP2 for temperatures 25, 40 and 80, the TLUPplus signature file has extraction data mapped to each of the (TLUP1,25), (TLUP1,40), (TLUP2,25), (TLUP2,40), (TLUP2,80) pairs. The tool automatically detects and takes corrective action to appropriately use the extraction related data from the ILM. This is to maintain supporting backward compatibility of reading older ILMs.

WHAT NEXT

This is a warning message and it will not affect the flow since the tool automatically detects and takes corrective action. Optionally, you can re-create the ILM with latest version of the tool to avoid this message.

SEE ALSO

`create_ilm(2)`

ILM-95 (error) Could not find TLUPlus signature file attached to top level '%s'

DESCRIPTION

You will see this error if the TLUPlus signature file attached to the top-level design is not found. TLUplus signature file is different from TLUplus files. TLUplus signature file has a mapping between the extraction data and the TLUPlus files and temperature used for extraction. For example: If there are two TLUPlus files TLUP1, TLUP2 and extraction is done using TLUP1 for temperatures 25,40 and extraction is done using TLUP2 for temperatures 25, 40 and 80, the TLUPlus signature file has extraction data mapped to each of the (TLUP1,25), (TLUP1,40), (TLUP2,25), (TLUP2,40), (TLUP2,80) pairs. This mapping information is needed to match the extraction data from ILM with top-level and successfully stitch the ILM RC with top-level RC data. This file is automatically generated by the tool when top-level extraction runs successfully.

WHAT NEXT

If the design is non-MCMM, please make sure setting TLUPlus files using `set_tlu_plus_files` command. If the design uses MCMM scenarios, review the scenarios and TLUplus settings used. Please check for RCEX-046 warning messages and make sure you are not using any attached TLUPlus files. Make sure `set_tlu_plus_files` command is applied after design is linked.

SEE ALSO

`report_tlu_plus_files(2)`, `set_tlu_plus_files(2)`, `RCEX-046(n)`.

ILM-96 (warning) Top level TLUPlus file name %s matches with more than one TLUPlus file names in ILM %s. The details of ILM

TLUPlus files: %s

DESCRIPTION

You will see this message during top level if the top level TLUPlus file name matches with more than one TLUPlus file names in ILM. For matching the top level TLUPlus file name with ILM TLUPlus file name, the tool considers only the basename of the TLUPlus file name. If you have two different TLUPlus files with same basename but in different directories, it will cause this warning.

WHAT NEXT

Check or set TLUPlus file settings to avoid such situation, rename the TLUPlus file to make them distinct and run **create_ilm** again.

SEE ALSO

set_tlu_plus_files (2), **extract_rc** (2), **create_ilm** (2).

ILM-97 (warning) At the top level, in scenario %s TLUPlus file %s is associated with emulation TLUPlus file %s. In some other scenario, the same emulation TLUPlus file %s is associated with different TLUPlus file %s. Only the first association will be honored.

DESCRIPTION

This is happening for MCMM case and may be scenario are using conflicting TLUPlus setting across scenario.

WHAT NEXT

Correct the TLUPlus setting to avoid the conflicts. Check or set TLUPlus file properly and re-run the top level flow.

SEE ALSO

set_tlu_plus_files (2), **extract_rc** (2), **create_ilm** (2).

ILM-98 (warning) At the top level, in scenario %s the emulation

TLUPlus file %s is associated with TLUPlus file %s. In some other scenario, the same TLUPlus file %s is associated with different emulation TLUPlus file %s. Only the first association will be honored.

DESCRIPTION

This is happening for MCMM case and may be scenario are using conflicting TLUPlus setting across scenario.

WHAT NEXT

Correct the TLUPlus setting to avoid the conflicts. Check or set TLUPlus file properly and re-run the top level flow.

SEE ALSO

```
set_tlu_plus_files (2), extract_rc (2), create_ilm (2).
```

ILM-99 (error) Top level TLUPlus file %s does not have corresponding data in ILM %.s. RC stitching of top and ILM will fail.

DESCRIPTION

You will see this message during top level if the top level TLUPlus does not have corresponding data in ILM. This may happen because of improper setting of TLUPlus files at the block or top level.

WHAT NEXT

Watch for ILM-97 and ILM-98 and review TLUPlus plus setting at block and top level.

SEE ALSO

```
set_tlu_plus_files (2), extract_rc (2), create_ilm (2), ILM-97(n), ILM-98(n).
```

ILM-100 (Error) ICC ILM flow is not supported in DC-T in

2008.09.

DESCRIPTION

You receive this message when you use the ICC ILM flow in DCT in B2008.09 release.

WHAT NEXT

SEE ALSO

`write_milklyway (2)`

ILM-101 (Information) Loading link library %s.ILM from Milkyway library %s ...

DESCRIPTION

You receive this information message if you have ICC generated ILMs specified in your link_library variable. When you have ILM names specified in the link_library, the **link** command loads specified ILM from the MW design library or MW reference library. If you are loading ILM in IC Compiler, the recommended method is to use auto-load of ILMs by not specifying ILMs in the link_library variable.

WHAT NEXT

This is information message. If you are using IC Compiler, please remove the ILM from the link_library to allow the tool to auto load the ILM. If you are using other tools, no action is needed.

SEE ALSO

`ILM-102 (n)`

ILM-102 (Information) Auto loading %s.ILM from Milkyway library %s ...

DESCRIPTION

You receive this information message if you have a cell instance in the design which is not linked to any of the library cells or designs specified in the link_library, and the tool has searched and loaded matching ILM from the MW design library or MW

reference library. If you are loading ILM in IC Compiler, this is the recommended method of ILM loading.

WHAT NEXT

This is information message. No action is needed.

SEE ALSO

`create_ilm(2)`

ILM-103 (Information) Saving ILM to milkyway view %s.ILM

DESCRIPTION

You receive this information message when ILM gets saved to Milkyway with the name specified in the information message.

WHAT NEXT

If you intend to save ILM with a different name, use appropriate command after `create_ilm` to save the design along with all the views to the name desired.

SEE ALSO

`create_ilm(2)`,
`save_mw_cel(2)`
`write_milkyway(2)`

ILM-104 (Error) Unable to find %s of the ILM cell %s

DESCRIPTION

You receive this message when the location or dimension of the specified ILM cell cannot be found out. This can be due to missing location in the floorplan or not reading the floorplan. This will result in not propagating the physical information from the corresponding ILM.

WHAT NEXT

Check the floorplan of the design or check/set location on the reported cell. You may run `propagate_ilm -keepout -placement` after correcting the cell location to force tool to propagate the physical information from the ILMs. If you are using IC Compiler the physical information gets propagated automatically.

SEE ALSO

`propagate_ilm (2)`

ILM-105 (Error) The physical library has not been initialized.

DESCRIPTION

You receive this message if you have not specified the physical library to the tool or the tool failed to get physical information from the library.

WHAT NEXT

Follow the tool recommendation to provide the information of physical library. Check your physical library for any problems.

SEE ALSO

ILM-106 (Error) Failed to propagate keepouts from ILM

DESCRIPTION

You receive this message when the tool failed to propagate keepouts from the ILM.

WHAT NEXT

Check for any error messages issued prior to this message to get detailed information of the problem. Re-run this command after correcting the problem.

SEE ALSO

`propagate_ilm(2).`

ILM-107 (Error) Unable to find die area or core area of the design %s.

DESCRIPTION

You receive this message if die area or core area could not be obtained for the reported design/block.

WHAT NEXT

Check your floorplan data to find out why core area and die area are missing. Correct your floorplan data and re-run the flow with corrected design.

SEE ALSO

`set_placement_area(2)`
`set_die_area(2)`

ILM-108 (Warning) ILM will not contain physical information. Use `-physical` switch to create ILM with physical information.

DESCRIPTION

You receive this message if ILM is not created with physical information.

WHAT NEXT

Use `-physical` switch to create ILM with physical information.

SEE ALSO

`create_ilm(2)`

ILM-109 (Error) Cannot use `include_xtalk` option since hierarchical-SI feature is not enabled.

DESCRIPTION

You receive this message if you run `create_ilm -include_xtalk` but have the hierarchical-SI feature disabled by setting `set enable_hier_si false`.

WHAT NEXT

Please check your script to remove setting of `enable_hier_si` variable. The hierarchical-SI feature is ON by default and you need not set `enable_hier_si` variable to enable it.

SEE ALSO

`enable_hier_si(3)`

ILM-110 (error) Cannot specify '%s' without specifying '%s'.

DESCRIPTION

The listed command options are to be given together. Please use both options to avoid this error.

WHAT NEXT

Look at the manpage for this command for more information on command options.

ILM-111 (error) Net %s does not have extracted parasitics information.

DESCRIPTION

You will see this message if reported net don't have extracted parasitics during create_ilm. This could be due to reasons that include design is not routed or tool is not run as per recommended methodology or some other error occurred prior to this message. In general, the design must be routed prior to generating ILM with post-route extraction data. The nets having driver(s) or having connection to more than one pin are checked for existence of parasitics.

WHAT NEXT

Run extract_rc prior to create_ilm and save parasitics in SPEF format to isolate the problem.

SEE ALSO

`extract_rc (2)`, `write_parasitics (2)`.

ILM-112 (information) Total %s (%s) nets have extracted parasitics information.

DESCRIPTION

The message indicate that total number of nets having extracted parasitics. Only the nets having a driver or having connection to more than one pin are considered for this reporting. If there are some nets not having extracted parasitics, this could be due to reasons that include design is not routed or tool is not run as per recommended methodology or some other error occurred prior to this message.

WHAT NEXT

To debug the nets with missing parasitics run `extract_rc` prior to `create_ilm` and save parasitics in SPEF format to isolate the problem.

SEE ALSO

`extract_rc (2)`, `write_parasitics (2)`.

ILM-121 (Error) %s attribute incorrectly set to false on ILM %s '%s'.

DESCRIPTION

The specified ILM instance or design has `dont_touch` attribute set to false. Ideally, all the ILM instances in the top-level needs to have `dont_touch` attribute set to true.

WHAT NEXT

Set the `dont_touch` attribute on the specified ILM to true and rerun the command.

SEE ALSO

`set_dont_touch(2)`, `all_dont_touch(2)`.

ILM-122 (Error) dont_touch value incorrectly set to false on %s '%s' inside ILM hierarchy '%s'.

DESCRIPTION

The specified cell or net inside the specified ILM hierarchy has `dont_touch` value set to false. Ideally, all the cells and nets inside ILM hierarchy needs to have `dont_touch` value set to true.

WHAT NEXT

Remove the `dont_touch` attribute on the specified cell or net or set the `dont_touch` attribute to true on the specified cell or net and rerun the command.

SEE ALSO

```
set_dont_touch(2), all_dont_touch(2), remove_attribute(2), ILM-121(n).
```

ILM-123 (Error) Mismatch in case_analysis setting on the ILM boundary pin '%s' between ILM '%s' and top-level design '%s': block-level value: %s, top-level value: %s

DESCRIPTION

There is a mismatch in the case analysis value set on the ILM boundary pin from the top-level and the case analysis value set on the corresponding port in the block from which ILM was created. Ideally both the case analysis value should match unless while creating the ILM, the particular port was specified in the port list for the case_controlled_ports option of **create_ilm** command.

WHAT NEXT

Either change the case analysis value on the specified pin in the top-level or change the case analysis value in the block for the corresponding port and recreate ILM.

SEE ALSO

```
set_case_analysis(2), remove_case_analysis(2), report_case_analysis(2),
create_ilm(2).
```

ILM-125 (Error) Net '%s' is not clock tree synthesized.

DESCRIPTION

You receive this error message if the specified clock net is not clock tree synthesized. Clock tree synthesis for all clock trees had not been done in the block prior to ILM creation.

WHAT NEXT

If you need to use the ILM for top-level `clock_opt`, perform clock tree synthesis in the block, recreate ILM using **create_ilm** and use it in the top-level.

ILM-150 (error) Top-level `extract_rc` has extracted for more

temperatures %s for TLUPlus file %s compared to ILM.
Top-level: TLUPlus file: %s, Temperatures: %s
ILM (%s) : TLUPlus file: %s, Temperatures: %s

DESCRIPTION

You will see this error message if the top level has additional set_operating_conditions applied compared to reported ILM. This leads to extract_rc not finding matching RC data in ILM for it to successfully stitch the ILM RC with top-level RC data. RC data between Top and ILM is matched by combination of TLUPlus file name and Temperature. If you have used emulation TLUPlus files at the top-level but not at the block-level or vice versa, tool will automatically match based any of TLUPlus file name or emulation TLUPlus file name. In such a case it is mandatory to specify both TLUPlus files and emulation TLUPlus files using set_tlu_plus_files command.

WHAT NEXT

Please verify the set_operating_conditions and set_tlu_plus_files settings at the top-level and block-level and make sure the settings used at the top-level are used while creating each of the ILMs. Correct the settings at the top-level and/or block-level. Re-create the ILM if block-level settings are changed.

SEE ALSO

```
report_tlu_plus_files(2), set_tlu_plus_files(2), report_lib(2),  
set_operating_conditions(2),
```

ILM-161 (information) Using mixed RC for boundary nets of ILM %S.

DESCRIPTION

You will see this message during top-level flow when Mixed RC is used for boundary nets of ILM.

WHAT NEXT

This is informative message. No action required.

SEE ALSO

```
set_tlu_plus_files (2), extract_rc (2), create_ilm (2).
```

ILM-300 (Error) ICC ILM is temporarily not supported in this version of 2008.09 Design Compiler Release.

DESCRIPTION

You receive this message when you use the ICC ILM flow in DCT in B2008.09 release.

WHAT NEXT

For further details on support of ICC ILMs please contact Synopsys Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

SEE ALSO

write_milklyway (2)

ILM-301 (error) The %s.ILM's data model version is newer than what is supported by this application.

DESCRIPTION

This ILM was created with an application using a newer data model version. You are attempting to open the ILM using an application that uses an older and incompatible version of the data model.

The data model version is not a user accessible attribute.

WHAT NEXT

Use a newer version of the application to open the ILM.

ILM-302 (error) The %s.ILM's data model version is older than what is supported by this application. User must re-create the ILM using this version of the application.

DESCRIPTION

The ILM was created with an application using an older data model version. In order to open this ILM, the ILM must be updated to the current application's data model version.

The data model version is not a user accessible attribute.

WHAT NEXT

Use the latest version of the application to re-create the ILM.

ILM-303 (information) The ILM %s was created using the command:%s

DESCRIPTION

This message will report the options using which the ILMs were created through the command `create_ilm`.

WHAT NEXT

This is an informative message. No action required.

SEE ALSO

[ILM-301](#) [ILM-302](#)

ILM-305 (Warning) Option -keep_macros is not supported for DC netlist.

DESCRIPTION

You receive this message if you issue `-keep_macros` on a netlist that has been created using `compile` in non DC Topographical mode.

Please use this command with DC Topographical netlist.

WHAT NEXT

Please run `compile_ultra` in DC Topographical before you use `-keep_macro`

SEE ALSO

`create_ilm(2)`

ILM-351 (warning) Path to/from port: %s (%s) is unconstrained. Retaining worst paths based on arrival time.

DESCRIPTION

Path reaching to or starting from port %s (%s) is unconstrained. Compact ILM retain worst paths based on the slack value computation. Since the path reaching or starting from reported port is unconstrained slack value computation is not possible so compact ILM will retain paths based on the arrival times. The unconstrained paths can be due to SDC constraints like set_false_path, missing set_input_delay/ set_output_delay, missing clocks etc.

WHAT NEXT

Check the constraints applied on the design. Correct the SDC constraints and recreate the ILM. If you do not have SDC file or the SDC file is incomplete/ incorrect, please use '-compact none'.

ILM-352 (warning) No clocks found in design %s. Creating non-compact ILM.

DESCRIPTION

You will see this message if the design has no clocks defined and create_ilm is attempting to create a compact ILM (default). Compact ILM retains critical path based logic based on timing analysis. If the SDC is not provided or SDC is incomplete/incorrect it can produce inaccurate model. To avoid this problem, the tool has automatically switched to non-compact ILM.

No clock is defined in the design %s. Compact ILM retains logic based on timing analysis. Since no clock is present in the design, timing analysis cannot be done accurately. For the accuracy of model non-compact ILM will be created for the design.

WHAT NEXT

Create clocks in the design.

ILM-353 (error) Option '-traverse_disabled_arcs' cannot be used with option '-compact all/output'. Use '-

`case_controlled_ports`' instead.

DESCRIPTION

The option '`-traverse_disabled_arcs`' is incompatible with option '`-compact all/output`' in `create_ilm` command. The option '`-traverse_disabled_arcs`' disables the `case_analysis`. Disabling the case analysis values effect the timing critical paths. Since only four timing critical paths are retained from each port in case of compact ILM (all/output), this option is not applicable for '`-compact all/output`'. Note that '`-compact all`' is default option for `create_ilm` command.

Use '`-case_controlled_ports`' in place of '`-traverse_disabled_arcs`' if you want to create case independent ILM.

WHAT NEXT

To create case independent compact ILM use '`-case_controlled_ports`' in place of '`-traverse_disabled_arcs`'.

SEE ALSO

`create_ilm(2)`.

ILM-401 (Information) Macro instance %s (ref %s) has an ILM view in MW library %s. Link libraries will be scanned for presence of any library cells.

DESCRIPTION

You receive this information message if a MW design library or MW reference library has an ILM view present for a macro cell instance of a MW design. For such instances, all the link libraries will be scanned to find out if there is a library cell present for them. If library cells are not found then these instances are considered as a candidate to be linked to ILMs later.

WHAT NEXT

This is information message. No action is needed.

SEE ALSO

`create_ilm(2)`

ILM-402 (Information) Macro instance %s (ref %s) will be linked to an ILM from MW library %s since no matching library cell is found in link libraries.

DESCRIPTION

You receive this information message if a MW design library or MW reference library has an ILM view present for a macro cell instance of a MW design and for such instances there is no matching library cell present in any of the specified link libraries. All such instances are considered as a candidate to be linked to ILMs later.

WHAT NEXT

This is information message. No action is needed.

SEE ALSO

`create_ilm(2)`

ILM-403 (Information) Macro instance %s (ref %s) will not be linked to an ILM since there is a matching library cell found in the link library %s.

DESCRIPTION

You receive this information message if a MW design library or MW reference library has an ILM view present for a macro cell instance of a MW design but for such instances there is also a matching library cell present in one of the specified link libraries. Such instances will not be considered as candidates to be linked to ILMs later.

WHAT NEXT

This is information message. No action is needed.

SEE ALSO

`create_ilm(2)`

IMPT

IMPT-1 (error) The variable '%s' isn't defined.

DESCRIPTION

WHAT NEXT

IMPT-2 (error) The variable '%s' is of an unsupported external import option type.

DESCRIPTION

WHAT NEXT

IMPT-3 (error) Unknown import format '%s'.

DESCRIPTION

This error is generated when the **read** command encounters an invalid read (import) format.

WHAT NEXT

Invoke the **read -help** command for valid read (import) formats. Identify and correct format, then reinvoke the **read** command.

IMPT-4 (error) Cannot execute '%s'.

DESCRIPTION

WHAT NEXT

IMPT-5 (warning) The variable 'edifin_lib_%s_symbol' isn't

defined.

DESCRIPTION

WHAT NEXT

IMPT-12 (error) Expected a list. Found '%s'.

DESCRIPTION

WHAT NEXT

IMPT-13 (error) Each list must contain three elements: sheet name, orientation and symbol name.

DESCRIPTION

WHAT NEXT

IMPT-14 (error) Sheet orientation must be 'landscape' or 'portrait'. '%s' is invalid.

DESCRIPTION

WHAT NEXT

INFO

INFO-100 (information) Variable '%s' is obsolete and is being ignored.

DESCRIPTION

This version does not support the requested variable. This variable is being ignored.

WHAT NEXT

SEE ALSO

INFO-101 (information) Use of Variable '%s' is not recommended. This variable will be obsolete in a future release.

DESCRIPTION

Although this version support the requested variable. This variable will be obsolete in a future release.

WHAT NEXT

SEE ALSO

INFO-102 (information) Command '%s' is obsolete and is being ignored.

DESCRIPTION

This version does not support the requested command. This command is being ignored.

WHAT NEXT

SEE ALSO

INFO-103 (information) Use of command '%s' is not recommended. This command will be obsolete in a future release.

DESCRIPTION

Although this version support the requested command. This command will be obsolete in a future release.

WHAT NEXT

SEE ALSO

INFO-104 (information) This option "-cts_mode" is obsolete, use report_clock_tree for clocktree related information.

DESCRIPTION

If you wish to obtain clock network delay (clock latency) to any clock sink in CTS context, use report_clock_tree -to option.

WHAT NEXT

SEE ALSO

INFO-105 (information) Variable '%s' does not have any effect in compile_ultra.

DESCRIPTION

This variable is only applicable in **compile**.

WHAT NEXT

SEE ALSO

INFO-106 (information) Command '%s' does not have any effect in compile_ultra.

DESCRIPTION

This command is only applicable in **compile**.

WHAT NEXT

SEE ALSO

INFO-107 (information) Command '%s' is not available in '%s'.

DESCRIPTION

This message occurs when the specified command is not available. The requested command is only available in dc_shell.

WHAT NEXT

This is only an information message. No action is required.

INFO-108 (information) Variable '%s' has been consolidated under the variable '%s'.

DESCRIPTION

This variable has been consolidated under another variable in this version. Please refer to the man page of the later one for more detail.

WHAT NEXT

SEE ALSO

INFO-109 (information) Use of option '%s' is not recommended. This option will be removed in a future release. Please see the manpage for more information.

DESCRIPTION

Although this option is supported in this version of the tool, it is considered obsolete and will be removed in a future release.

WHAT NEXT

Consult the command's manpage for further information.

SEE ALSO

INFO-110 (information) Option '%s' is obsolete and is being ignored.

DESCRIPTION

This information message occurs because this version does not support the requested option. The option is ignored.

WHAT NEXT

This is only an information message. No action is required.

INT

INT-1 (fatal) Unknown interrupt signal '%d' encountered.

DESCRIPTION

WHAT NEXT

INT-2 (information) Interrupting current command.

DESCRIPTION

WHAT NEXT

INT-3 (information) One more interrupt will exit process.

DESCRIPTION

WHAT NEXT

INT-4 (information) Process terminated by interrupt.

DESCRIPTION

WHAT NEXT

INT-5 (information) Preparing to interrupt optimization...

DESCRIPTION

This message indicates that a Control-c (SIGINT) was received by the process during the trials phase of compile, and compile is preparing to either print out a menu (interactive mode) or to write a checkpoint file (background mode). Compile must finish the current transform before the menu or checkpoint file can be written. It

may take a few minutes to finish the current transform, so please wait until you see that the checkpoint file has been written before hitting Ctrl-C again.

WHAT NEXT

No action is required on your part. If you want to abort the current compile, hit Control-c twice.

INT-6 (information) Aborting optimization...

DESCRIPTION

This message indicates that two Control-c signals (SIGINT) were received by the process after the Delay Optimization phase of compile, so compile will abort. **compile** will end optimization and return the design in its current state.

WHAT NEXT

No action is required on your part. If you want to abort the process, press Control-c three times.

INT-7 (information) Ignoring interrupt signal since the design is being mapped. One more interrupt will abort optimization without transferring the design...

DESCRIPTION

This message indicates that one Ctrl-C signal (SIGINT) was received by the process before the Delay Optimization phase of compile. Since the design is being mapped, compile will ignore the first interrupt signal. The second Ctrl-C will abort compile and not write out the design.

If you want to abort the process, then hit Ctrl-C three times in a row.

WHAT NEXT

INT-8 (information) Aborting optimization without transferring

the design...

DESCRIPTION

This message indicates that two Ctrl-C signals (SIGINT) were received by the process before the Delay Optimization phase of compile, so compile is going to abort. Compile will end optimization but not return the design in its current state because the design has not been fully mapped.

If you want to abort the process, then hit Ctrl-C three times in a row.

WHAT NEXT

LBDB

LBDB-1 (error) The '%s' function requires %d arguments.

DESCRIPTION

This message indicates that the number of arguments passed to the specified function or the complex attribute is wrong. The Library Compiler expects a specific number of arguments for various functions and complex attributes. For example, the define_cell_area and the capacitive_load_unit require two arguments. A common cause of this error is the argument's syntax definition. For example, the pin_equal complex attribute requires one quoted string as an argument instead of multiple strings

```
pin_equal("Q", "XQ");wrong  
pin_equal("Q" "XQ");wrong  
pin_equal("Q XQ");correct
```

WHAT NEXT

Change the technology library to correct the number of arguments. Refer to the "Library Compiler Reference Manual" for the syntax description.

EXAMPLES

```
/* Try the wrong number of arguments to these functions. */  
define_cell_area(my_area,pad_slots,extra_junk);  
capacitive_load_unit(1, pf, pf);
```

EXAMPLE MESSAGE

Error: Line 23, The 'define_cell_area' function requires 2 arguments. (LBDB-1)

LBDB-2 (error) The value of argument %d of the '%s' function is of the wrong type. A value of '%s' type is required.

DESCRIPTION

This message indicates that the wrong value type has been set to the specified function argument. A common cause of this error is the alteration of argument order. For example, the capacitive_load_unit attribute expects a floating-point value then a unit of string type.

```
capacitive_load_unit( pf, 1);      wrong  
capacitive_load_unit( 1, pf);      correct
```

WHAT NEXT

Change the technology library to correct the arguments. Refer to the "Library Compiler Reference Manual" for the syntax description.

EXAMPLES

```
capacitive_load_unit( pf, 1);
```

In this case, the arguments of the capacitive_load_unit need to be switched.

EXAMPLE MESSAGE

Error: Line 17, The value of argument 1 of the 'capacitive_load_unit' function is of the wrong type. A value of 'floating-point' type is required. (LBDB-2)

LBDB-3 (error) The '%s' value is invalid for the '%s' attribute. Its valid values are %s.

DESCRIPTION

This message indicates that the specified string value is not included in the list of accepted values. This error is often caused by a typo in the valid enumerated string value.

WHAT NEXT

Change the technology library to correct the invalid value.

EXAMPLES

```
default_wire_load_mode : enclose;
```

In this case, the value should be 'enclosed'.

EXAMPLE MESSAGE

Error: Line 15, The 'enclose' value is invalid for the 'default_wire_load_mode' attribute.

Its valid values are top, segmented and enclosed. (LBDB-3)

LBDB-4 (error) The %s '%s' cannot be specified during

the update_lib command.

DESCRIPTION

Only library-level group statements can be added to an existing library using the update_lib command.

This message indicates that an invalid data (function, attribute, or group) has been found in the library to be added.

WHAT NEXT

Check the "Library Compiler User Guide" for valid data that can be added to existing libraries. Change the library to be updated appropriately.

EXAMPLES

Existing library

```
default_wire_load_mode      : top;
```

You cannot specify the default_wire_load_mode attribute to be added to an existing library.

EXAMPLE MESSAGE

```
Error: Line 8, The group 'default_wire_load_mode' cannot be specified during  
the update_lib command. (LBDB-4)
```

LBDB-5 (error) The library already has a '%s' attribute. It cannot be overwritten during the update_lib command.

DESCRIPTION

Only library-level group statements can be added to an existing library using the update_lib command.

This message indicates that an attribute has been found in the library to be added.

WHAT NEXT

Remove the existing attribute from the technology file.

LBDB-6 (error) The library already has a '%s' group; it cannot be overwritten during the update_lib command because it is permanent.

DESCRIPTION

This message indicates that an existing group is being overwritten in the library; the existing group is permanent. You cannot overwrite existing groups because their definitions might already have affected subsequent group declarations in the library. You can, however, add new ones.

WHAT NEXT

Change the library file to either remove the group or modify its name.

EXAMPLES

```
wire_load("05x05") {  
    resistance : 0 ;  
    capacitance : 1 ;  
    area : 0 ;  
    slope : 0.186 ;  
    fanout_length(1,0.39) ;  
}
```

EXAMPLE MESSAGE

Error: Line 1, The library already has a '05x05' group; it cannot be overwritten during the update_lib command because it is permanent. (LBDB-6)

LBDB-8 (information) The %s '%s' group has been successfully %s
in the library.

DESCRIPTION

The **update_lib** command updates library groups in a given library. This message is for information purposes only and concerns cell and operating_conditions groups. However, if a wire-load model group is updated in a library, designs using that wire-load model must be reassigned a wire-load model.

WHAT NEXT

Use **set_wire_load_model** to set the wire-load model on designs using the modified

wire-load models.

EXAMPLE MESSAGE

Information: Line 1, The operating_conditions 'BCMIL' group has been successfully added

in the library. (LBDB-8)

Information: Line 8, The cell 'lbdb8' group has been successfully added
in the library. (LBDB-8)

LBDB-11 (warning) The same '%s' attribute is defined twice and is ignored the second time.

DESCRIPTION

This message indicates that an attribute has been registered twice. The Library Compiler ignores the second value.

WHAT NEXT

Make sure that the attribute is defined only once.

LBDB-12 (warning) The '%s' attribute is the wrong type for the '%s' object.

DESCRIPTION

This message indicates that an attribute's value had a wrong type. The Library Compiler ignores the value.

WHAT NEXT

Make sure that the attribute's value is of the correct type.

LBDB-13 (warning) The '%s' enum has been defined twice and is being ignored.

DESCRIPTION

This message indicates that an enumeration value registered with an attribute has

been defined twice.

WHAT NEXT

Make sure that the enumeration value is defined only once.

LBDB-14 (error) The library already has a '%s' group; the library cannot be overwritten unless the -overwrite option is specified.

DESCRIPTION

This message indicates that a group has already been added by the **update_lib** command, and you are trying to overwrite it using the **update_lib** command again without specifying the -overwrite option.

WHAT NEXT

Either specify the -overwrite option to the update_lib command if you want to overwrite the same group or change the name of the group.

EXAMPLE MESSAGE

```
Error: Line 2, The library already has a 'lbdb14' group; the library cannot be overwritten unless the -overwrite option is specified. (LBDB-14)
```

LBDB-16 (warning) Found a duplicate %s attribute. Using the latest value.

DESCRIPTION

This message indicates an attribute has been defined twice. The first definition is ignored.

WHAT NEXT

Remove the duplicate definition of the attribute.

EXAMPLES

```
pin(Q) {  
    direction : output;  
    function : "1";  
    function : "1";
```

```
}
```

EXAMPLE MESSAGE

Warning: Line 59, Found a duplicate function attribute. Using the latest value. (LB DB-16)

LBDB-17 (error) The library already has a type named '%s'.

Type
groups can never be overwritten.

DESCRIPTION

This message indicates that a type group already exists in the original library, and you are trying to overwrite it using the **update_lib** command again.

WHAT NEXT

Either remove the type group from the added library or change the name of the group in the file used for update.

EXAMPLES

```
type(bus2) {
    base_type : array;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
}
```

The type named bus2 is defined in the library to be updated and the file used to update.

EXAMPLE MESSAGE

Error: Line 1, The Library already has a type named 'bus2'. Type
groups can never be overwritten. (LBDB-17)

LBDB-18 (warning) In the '%s' library, the environment attribute

%s's value is out of range.

DESCRIPTION

This message indicates that the nominal source voltage value defined in the library using nom_voltage attribute is less than 0. The library compiler ignores the value and takes the default nominal voltage. For a CMOS library, the default nominal voltage value is 5 volts.

WHAT NEXT

Change the value of the nom_voltage attribute to be greater than zero.

EXAMPLES

```
nom_voltage : -5;
```

EXAMPLE MESSAGE

```
Warning: Line 29, In the library 'lbdb18', the environment attribute
nom_voltage's value is out of range. (LBDB-18)
```

LBDB-19 (warning) Can't find a pin named '%s' in the '%s' cell.

DESCRIPTION

This message indicates that one of the pin names in the list of the **pin_equal** or **pin_opposite** attribute or **gate_leakage** group is not defined in the cell. This often happens when there is a typo in the pin name.

WHAT NEXT

Check to see if there is a typo in the pin name. Otherwise, declare the pin in the technology library.

EXAMPLES

```
cell(lbdb19) {
    area : 13;
    pin_opposite("Q", "XQ");
    pin(Q, YQ) {
        direction : output;
        function : "1";
    }
}
cell(lbdb19_1) {
    area : 13;
```

```

pin(Q, YQ) {
    direction : input;
    function : "1";
}
leakage_current() {
    gate_leakage(XQ) {
        input_high_value : 7.1;
        input_low_value : -8.7;
    }
}
}
}

```

EXAMPLE MESSAGE

Warning: Line 28, Can't find a pin named 'XQ' in the 'lbdb19' cell. (LBDB-19)
 Warning: Line 218, Can't find a pin named 'XQ' in the 'lbdb19_1' cell. (LBDB-19)

LBDB-20 (warning) Cannot process 'pin_opposite' for the '%s' cell.

DESCRIPTION

This message indicates that the pins used in the list of the **pin_opposite** attribute are not found in the cell.

WHAT NEXT

Fix the pin names in the list of the pin_opposite attribute.

EXAMPLES

```

cell(lbdb20) {
    area : 13;
    pin_opposite("Q", "XQ");
    pin(Q, YQ) {
direction : output;
function : "1";
    }
    pin(YQ) {
direction : output;
function : "0";
    }
}

```

In this case, the pins defined in the cell are 'Q' and 'YQ'. However, the pins listed in the pin_opposite attribute are 'Q' and 'XQ'.

EXAMPLE MESSAGE

Warning: Line 28, Can't process 'pin_opposite' for the 'lbdb20' cell. (LBDB-20)

LBDB-23 (error) There is a missing timing arc between pins '%s' and '%s' in the '%s' cell.

DESCRIPTION

This message indicates there is a missing timing arc from an input or inout pin to an output pin.

For a combinational cell, the Library Compiler checks that

- * An output port with a function statement has timing arcs to all functionally related inputs
- * An output port with a three_state attribute has timing arcs to all three_state related inputs
- * If all timing arcs are conditional, a default timing arc without any condition is required.

WHAT NEXT

Add the missing timing group between the two pins.

EXAMPLES

```
cell(lbdb23) {  
    area : 1;  
    pin(A) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(B) {  
        direction : input;  
        capacitance : 1;  
    }  
    pin(Z) {  
        direction : output;  
        function : "(A B)’";  
        timing() {  
            intrinsic_rise : 1.0;  
            intrinsic_fall : 1.0;  
            rise_resistance : 0.1;  
            fall_resistance : 0.1;  
            related_pin : "A";  
        }  
    }  
}
```

```
}
```

In this case, a timing arc is missing between the pin 'Z' and 'B'. To fix the problem, add the following timing group:

```
timing() {  
intrinsic_rise : 1.0;  
intrinsic_fall : 1.0;  
rise_resistance : 0.1;  
fall_resistance : 0.1;  
related_pin : "B";  
}
```

EXAMPLE MESSAGE

Error: Line 12, There is a missing timing arc between pins 'A' and 'Z' in the 'lbdb23' cell. (LBDB-23)

LBDB-24 (warning) The '%s' symbol is used but is not defined.

DESCRIPTION

This message indicates that in a symbol library, you assigned an undefined symbol name to a special symbol.

WHAT NEXT

Either define the symbol assigned to the special symbol, or correct the name if it is wrong.

EXAMPLES

```
logic_1_symbol : "mylogic_1";
```

In this example, the symbol 'my_logic_1' is not defined. To fix the problem, define the symbol:

```
symbol(mylogic_1) {  
    line(0,0,0,1.5);  
    line(0,1.5,.5,2);  
    line(0,1.5,-.5,2);  
    pin(a,0,0,RIGHT);  
}
```

EXAMPLE MESSAGE

Warning: Line 38, The 'mylogic_1' symbol is used but is not defined. (LBDB-24)

LBDB-27 (error) An invalid attribute is found.

DESCRIPTION

This error message occurs when a bus **function**, **three_state**, or **state_function** attribute value is not valid.

This message is also used to notify you when the **level_shifter_enable_pin** attribute is not specified for the input pin of a level shifter cell, or when the **isolation_cell_enable_pin** attribute is not specified for the input pin of an isolation cell.

WHAT NEXT

Correct the value of the attribute and rerun the command.

LBDB-28 (error) The '%s' attribute is supplied with %d arguments.

Only %d arguments are expected.

DESCRIPTION

This message indicates that a command or an attribute got the wrong number of arguments.

WHAT NEXT

Fix the arguments of the attribute.

EXAMPLES

```
define("lbdb28", "library", "string", "integer");
```

EXAMPLE MESSAGE

Error: Line 61, The 'define' attribute is supplied with 4 arguments.
Only 3 arguments are expected. (LBDB-28)

LBDB-29 (warning) The '%s' attribute is already defined for %s groups.

It cannot be redefined.

DESCRIPTION

This message indicates that the user's defined attribute has been already defined. The Library Compiler ignores the second definition.

WHAT NEXT

Remove the redundant definition or rename the second definition.

EXAMPLES

```
define("lbdb29", "pin", "string");
define("lbdb29", "pin", "integer");
```

EXAMPLE MESSAGE

Warning: Line 62, The 'lbdb29' attribute is already defined for pin groups.
It cannot be redefined. (LBDB-29)

LBDB-30 (warning) There is a sequential timing arc with the %s non-clock pin for a related_pin attribute.

DESCRIPTION

This message warns you if you specified any setup, hold, skew, removal, or edge-triggered timing arcs relative to a nonclock signal.

WHAT NEXT

Make sure the related_pin value is a clock pin, or modify the timing group.

EXAMPLES

```
cell(lbdb30) {
    area : 9;
    pin(D) {
        direction : input;
        capacitance : 1;
        min_pulse_width_high : 1.0;
        min_pulse_width_low : 1.0;
        timing () {
            timing_type : rising_edge;
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
```

```
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    related_pin : "CD";
    }
}
pin(CP) {
    direction : input;
    capacitance : 1;
}
pin(CD) {
    direction : input;
    capacitance : 1;
}
ff("IQ","IQN") {
    next_state : "D";
    clocked_on : "CP";
    clear : "CD' ";
}
}
```

EXAMPLE MESSAGE

Warning: Line 1828, There is a sequential timing arc with the 'CP' non-clock pin for a related_pin attribute. (LBDB-30)

LBDB-31 (information) The %s group has been successfully %s in the library.

DESCRIPTION

This message informs you that a group has been successfully added or overwritten in a library using the **update_lib** command.

WHAT NEXT

No action is required.

EXAMPLE MESSAGE

Information: Line 1, The type group has been successfully added in the library. (LBDB-31)

LBDB-32 (warning) The '%s' group has been defined multiple times in

the '%s' library. Using the last definition encountered.

DESCRIPTION

The library contains more than one definition of a group. The Library Compiler issues this error message, ignores the previous definitions, and takes into consideration the last definition encountered.

WHAT NEXT

Change the group name if it is wrong, or delete the second definition.

EXAMPLES

```
wire_load_selection(lbdb32) {  
    wire_load_from_area(27,100,"10x10");  
    wire_load_from_area(10,25,"05x05");  
}  
wire_load_selection(lbdb32) {  
    wire_load_from_area(27,10,"10x10");  
    wire_load_from_area(27,100,"10x10");  
    wire_load_from_area(0,28,"05x05");  
    wire_load_from_area(2,10,"15x10");  
}
```

EXAMPLE MESSAGE

Warning: Line 50, The 'lbdb32' group has been defined multiple times in the 'lib' library. Using the last definition encountered. (LBDB-32)

LBDB-34 (error) There is a syntax error in the related_bus_pins attribute's value.

DESCRIPTION

This message indicates there is a syntax error in the value of the related_bus_pins attribute. This might be caused by a typo.

WHAT NEXT

Check the "Library Compiler User Guide" for the correct syntax of the value, and fix the technology library source file.

EXAMPLES

```
related_bus_pins : {ADDR} ;
```

In this case, the 'ADDR' name is between parentheses. To fix the error, place the name between quotes.

EXAMPLE MESSAGE

Error: Line 164, There is a syntax error in the related_bus_pins attribute's value.
(LBDB-34)

**LBDB-35 (warning) Missing a timing arc of timing_type
'three_state_disable'
between '%s' and '%s' pins in the '%s' cell.**

DESCRIPTION

To describe the transition from 0->Z or 1->Z, use the timing arc with timing_type of **three_state_disable** for the pin with a three_state attribute.

WHAT NEXT

Add the missing timing group between the two pins.

EXAMPLES

```
cell(BTS4)  {
    area : 3.0;
    pin(Z)  {
        direction : output;
        function : "A";
        three_state : "E";
        timing()  {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "A";
        }
        timing()  {
            intrinsic_rise : 1.0;
            intrinsic_fall : 1.0;
            rise_resistance : 0.1;
            fall_resistance : 0.1;
            related_pin : "E";
        }
    }
    pin(A)  {
        direction : input;
        capacitance : 1.0;
    }
}
```

```
pin(E)  {
    direction : input;
    capacitance : 1.0;
}
}
```

EXAMPLE MESSAGE

Warning: Line 110, Missing a timing arc of timing_type 'three_state_disable' between 'E' and 'Z' pins in the 'lbf35' cell. (LBDB-35)

LBDB-36 (error) The '%s' specifies two variable names.

DESCRIPTION

This error indicates that you specified wrong variable names for a ff, ff_bank, latch, latch_bank, or a statetable group. Examples of wrong variable names are:

- The group name
- An empty string

WHAT NEXT

Check the "Library Compiler User Guide" for the correct syntax, and fix the variable names of the group in the technology library.

EXAMPLES

```
statetable("A", "statetable") {
ff("IQ", "") {
```

EXAMPLE MESSAGE

Error: Line 213, The 'statetable' specifies two variable names. (LBDB-36)

LBDB-37 (warning) The '%s' layer is defined multiple times: Deleting the old definition.

DESCRIPTION

The symbol library contains more than one definition of a layer. The Library Compiler issues this warning message, deletes the previous definition, and takes into consideration the last definition encountered.

WHAT NEXT

In the symbol library file, change the layer name if it is wrong, or delete the second definition.

EXAMPLES

```
library("ds.sdb") {  
  
    layer(lbdb37_layer) {  
        set_font ("1_25.font");  
        visible : TRUE ;  
        line_width : 1 ;  
        red : 65000 ;  
        green : 33000 ;  
        blue : 0 ;  
    }  
  
    layer(lbdb37_layer) { /* A duplicate layer. */  
        set_font ("1_25.font");  
        visible : TRUE ;  
        line_width : 1 ;  
        red : 65000 ;  
        green : 33000 ;  
        blue : 0 ;  
    }  
}
```

EXAMPLE MESSAGE

```
Warning: Line 32, The 'lbdb37_layer' layer is defined multiple times:  
          Deleting the old definition. (LBDB-37)
```

LBDB-39 (error) The '%s' symbol is defined multiple times.

DESCRIPTION

The symbol library contains more than one definition of a symbol. The Library Compiler issues this error message and deletes all the definitions.

WHAT NEXT

Change the symbol name if it is wrong, or delete the second definition.

EXAMPLES

```
symbol(lbdb39_dot) {  
    line( -.25,-.25,.25,-.25);  
    line(.25,.25,.25,-.25);
```

```

line(.25,.25,-.25,.25);
line( -.25,.25,-.25,-.25);
line( -.25,-.25,.25,.25);
line(.25,-.25,-.25,.25);
}

symbol(lbdb39_dot) {
    line( -.25,-.25,.25,-.25);
    line(.25,.25,.25,-.25);
    line(.25,.25,-.25,.25);
    line( -.25,.25,-.25,-.25);
    line( -.25,-.25,.25,.25);
    line(.25,-.25,-.25,.25);
}

```

EXAMPLE MESSAGE

Error: Line 58, The 'lbdb39_dot' symbol is defined multiple times. (LBDB-39)

LBDB-40 (error) In the '%s' symbol, the '%s' and '%s' pins both have the '%s' direction and the same Y location.

DESCRIPTION

The symbol library contains more than one pin with the same direction and the same Y location.

WHAT NEXT

Change the direction or the Y location of any of the pins.

EXAMPLES

```

symbol("lbdb40") {
    set_minimum_boundary(0 , 0 , 8000, 12000);
    pin("P0", 1000, 10000, LEFT);
    pin("P1", 8000, 10000, LEFT);
    pin("P2", 8000, 10000, LEFT);
    line(0, 0, 0, 12000);
    line(0, 12000, 8000, 12000);
    line(8000, 12000, 8000, 0);
    line(8000, 0, 0, 0);
}

```

EXAMPLE MESSAGE

Error: Line 15, In the 'lbdb40' symbol, the 'P2' and 'P0' pins both have the 'LEFT' direction and the same Y location. (LBDB-40)

LBDB-41 (error) In the '%s' symbol, the '%s' and '%s' pins both have the '%s' direction and the same X location.

DESCRIPTION

The symbol library contains more than one pin with the same direction and the same X location.

WHAT NEXT

Change the direction or the X location of any of the pins.

EXAMPLES

```
symbol("lbdb41") {  
    set_minimum_boundary(0 , 0 , 8000, 12000);  
    pin("P0", 10000, 1000, DOWN);  
    pin("P1", 10000, 8000, DOWN);  
    pin("P2", 10000, 8000, DOWN);  
    line(0, 0, 0, 12000);  
    line(0, 12000, 8000, 12000);  
    line(8000, 12000, 8000, 0);  
    line(8000, 0, 0, 0);  
}
```

EXAMPLE MESSAGE

Error: Line 15, In the 'lbdb41' symbol, the 'P2' and 'P0' pins both have the 'DOWN' direction and the same X location. (LBDB-41)

LBDB-42 (error) In the '%s' symbol, the '%s' pin '%s' and the '%s' pin '%s' are uncorrectly positioned.

DESCRIPTION

This error indicates that one of the problems is encountered:

- Both pin P1 and P2 have same direction and same X and Y locations.
- The pin P1 has a LEFT direction, the pin P2 has RIGHT direction, and P1 and P2 have the same Y location. However the X location of P2 is less or equal than to the X location of P1.
- The pin P1 has a UP direction, the pin P2 has DOWN direction, and P1 and P2 have the same X location. However the Y location of P2 is greater or equal than to the Y location of P1.

WHAT NEXT

Change the direction or the locations of any of the pins.

EXAMPLES

```
symbol("lbdb41") {  
    set_minimum_boundary(0 , 0 , 8000, 12000);  
    pin("P0", 10000, 1000, DOWN);  
    pin("P1", 10000, 8000, DOWN);  
    pin("P2", 10000, 8000, DOWN);  
    line(0, 0, 0, 12000);  
    line(0, 12000, 8000, 12000);  
    line(8000, 12000, 8000, 0);  
    line(8000, 0, 0, 0);  
}
```

EXAMPLE MESSAGE

Error: Line 41, In the symbol 'lbdb42', the 'DOWN' pin 'P2' and the 'DOWN' pin 'P1' are uncorrectly positioned. (LBDB-42)

LBDB-43 (error) The '%s' pin is defined multiple times in the '%s' symbol.

DESCRIPTION

The symbol library contains more than one definition of a pin in the specified symbol. The Library Compiler issues this error message and deletes all the definitions.

WHAT NEXT

Change the pin name if it is wrong, or delete the second definition.

EXAMPLES

```
symbol("lbdb43") {  
    set_minimum_boundary(0 , 0 , 8000, 12000);  
    pin("P0", 10000, 1000, DOWN);  
    pin("P0", 10000, 1000, DOWN);  
    line(0, 0, 0, 12000);  
    line(0, 12000, 8000, 12000);  
    line(8000, 12000, 8000, 0);  
    line(8000, 0, 0, 0);  
}
```

EXAMPLE MESSAGE

Error: Line 44, The 'P0' pin is defined multiple times in the 'lbdb43' symbol. (LBD B-43)

LBDB-46 (error) Found an invalid rotation.

DESCRIPTION

This message indicates that the specified string value for the pin's rotation is not included in the list of accepted values. This error is often caused by a typo in the valid enumerated string value.

WHAT NEXT

Change the symbol library to correct the invalid rotation value. The valid values of the rotation are ANY_ROTATION, LEFT, RIGHT, UP, or DOWN.

LBDB-47 (error) The '%s' cell's pin '%s' has a timing arc that has %d matched timing arcs on the scaled_cell(%s,%s).

DESCRIPTION

Each timing arc in the regular cell should have a matched timing arc on the same pin in the scaled_cell group. This message indicates that more than one such matching timing arc has been found in the library source.

WHAT NEXT

Find the duplicate timing group you do not need, and delete it.

EXAMPLES

```
library(lbdb47) {
    operating_conditions(WCCOM) {
process : 1.5 ;
        temperature : 70 ;
voltage : 4.75 ;
tree_type : "worst_case_tree" ;
    }

cell(AND) {
    area : 1;
    pin(A B) {
```

```

direction : input;
capacitance : 1;
}
pin(Z) {
direction : output;
function : "A B";
timing() {
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
slope_rise : 0.0;
slope_fall : 0.0;
related_pin : "A B";
}
}
}

scaled_cell(AND,WCCOM) {
area : 1;
pin(A B) {
direction : input;
capacitance : 1;
}
pin(Z) {
direction : output;
function : "A B";
timing() {
intrinsic_rise : 0.1;
intrinsic_fall : 0.1;
rise_resistance : 0.1;
fall_resistance : 0.1;
slope_rise : 0.0;
slope_fall : 0.0;
related_pin : "A";
}
timing() {
intrinsic_rise : 0.3;
intrinsic_fall : 0.3;
rise_resistance : 0.3;
fall_resistance : 0.3;
slope_rise : 0.0;
slope_fall : 0.0;
related_pin : "A ";
}
}
}
}

```

In this case, The timing arc between 'Z' and 'A' is defined once in the 'AND' cell and twice in the 'AND' scaled_cell. To fix the problem, remove one the timing arcs.

EXAMPLE MESSAGE

Error: Line 42, The 'AND' cell's pin 'Z' has a timing arc that has

```
2 matched timing arcs on the scaled_cell(AND,WCCOM) . (LBDB-47)
```

LBDB-48 (error) The '%s' pin has a %s group whose related_pin is the port itself.

DESCRIPTION

It is not possible to have a timing arc or a power table whose starting point and ending point are the same.

WHAT NEXT

Check the timing arc or the internal power group, and make the appropriate correction.

EXAMPLES

```
cell(lbdb48) {
    area : 1.0;
    pin ( O ) {
direction : output;
function : "1";
timing() {
    timing_sense : non_unate;
    related_pin : "O";
    rise_resistance : 0.1;
    fall_resistance : 0.1;
    intrinsic_rise : 5.0;
        intrinsic_fall : 0.0;
    }
}
}
```

EXAMPLE MESSAGE

```
Error: Line 43, The 'O' pin has a timing group whose related_pin is the port itself. (LBDB-48)
```

LBDB-49 (error) No '%s' attribute has been specified for the library. This attribute is needed in %s libraries.

DESCRIPTION

This message indicates that you did not specify any of the following attributes in the physical library.

```
* distance_unit  
* capacitance_unit  
* resistance_unit
```

WHAT NEXT

Add the missing attribute to the library source file.

EXAMPLES

Add any of the following examples of attributes to the library:

```
distance_unit : "lum";
```

EXAMPLE MESSAGE

Warning: No 'distance_unit' attribute has been specified for the library. This attribute is needed in technology libraries. (LBDB-49)

LBDB-50 (error) In the '%s' cell, the '%s' input pin has a 'function' attribute.

DESCRIPTION

This message indicates that a pin declared as an input, implicitly by omitting the direction or explicitly where the direction is set to input, has a function attribute. Only output and inout ports can have a function attribute.

WHAT NEXT

Either change the direction of the port or remove the function attribute.

EXAMPLES

```
pin(Q) {  
function : "1";  
}
```

In this case, the direction of 'Q' is set implicitly to 'input' and 'Q' has a function statement defined. To fix the problem, either set the direction explicitly to 'output' or 'inout', or delete the function attribute.

EXAMPLE MESSAGE

Error: Line 55, In the 'lbdb50' cell, the 'Q' input pin has a 'function' attribute.
(LBDB-50)

LBDB-51 (warning) No '%s' attribute has been specified for the %s library. It is set to default value '%s'.

DESCRIPTION

This message indicates that you did not specify any of the following attributes in the physical library. And a default value has been assigned.

```
* time_unit
```

WHAT NEXT

Make sure the default value is the desired value.

EXAMPLES

Add any of the following examples of attributes to the library:

```
distance_unit : lum ;
```

EXAMPLE MESSAGE

Warning: No 'time_unit' attribute has been specified for the library. It is set to default value '1ns'. (LBDB-51)

LBDB-53 (error) The '%s' attribute, which expects values of %s type, is being supplied a value of %s type.

DESCRIPTION

This message indicate that the attribute has been supplied with the wrong value. Library Compiler ignores the value.

WHAT NEXT

Check the "Library Compiler User Guide" for the correct type of attribute, and change the value accordingly.

EXAMPLES

```
dont_touch : 1;
```

In this case, the 'dont_touch' attribute expects a boolean value such as true or false.

EXAMPLE MESSAGE

Error: Line 53, The 'dont_touch' attribute, which expects values of boolean type, is being supplied a value of integer type. (LBDB-53)

LBDB-54 (error) The define attribute has an invalid '%s' type. The valid types are 'string', 'integer', 'float', and 'boolean'.

DESCRIPTION

This message indicates that an invalid type is specified for the define attribute. Library Compiler ignores the invalid type.

WHAT NEXT

Change the type to string, integer, float, or boolean in the library.

EXAMPLES

```
library(lbdb54) {  
    define( "glorp", "library", "my_type" );  
}
```

EXAMPLE MESSAGE

Error: Line 2, The define attribute has an invalid 'my_type' type.
The valid types are 'string', 'integer', 'float', and 'boolean'. (LBDB-54)

LBDB-55 (error) The '%s' technology license is not installed.

DESCRIPTION

This message indicates that the specified technology license is missing during a read_lib command. Given the technology, the missing license feature is matched as follows:

- * CMOS technology needs a Design-Compiler feature.
- * FPGA technology needs an FPGA-Compiler feature.

If your site is without a valid technology license, the library is read in, and all functional information is removed. All cells are black boxes, and optimization with this library is disabled.

WHAT NEXT

Make sure that you have a license and that the license is properly installed before next trying to read the specified technology library.

EXAMPLE MESSAGE

Error: Line 2, The 'cmos' technology license is not installed. (LBDB-55)

LBDB-57 (error) The 'generic' technology can only be read by Synopsys.

DESCRIPTION

The generic technology library supplies simple combinational and sequential cells that are useful for technology-independent component instantiation. This message indicates that you specified 'generic' as the technology type in the technology library source file. This technology type is reserved for Synopsys generic technology library. Only Synopsys is allowed to compile a generic technology library.

WHAT NEXT

Do not use 'generic' as the technology type in your technology library source. Choose the correct technology type from current supporting types, for example, CMOS or FPGA.

LBDB-58 (warning) The '%s' pin is a multicell_pad_pin, but it has no connection_class information.

DESCRIPTION

This message indicates that you have a pin in a multicell pad with the multicell_pad_pin attribute defined but the connection_class attribute is missing.

If your library uses multicell pads, Design Compiler needs to know which pins on the various cells to connect to implement the pad properly. Two attributes give this information:

- * The multicell_pad_pin attribute identifies the pins to connect to create a working multicell pad. Use this attribute to flag all the pins to connect on a pad or an auxiliary pad cell.
- * The connection_class attribute indicates the pins to be connected to pins on other cells.

WHAT NEXT

Add the connection_class attribute to the specified pin.

EXAMPLES

```
cell (lbdb58) {
    pad_cell : true;
    area : 0.0;
    pin (A) {
direction : input;
capacitance : 1.0;
fanout_load : 1.0;
    }
    pin (GZ) {
direction : input;
capacitance : 1.0;
fanout_load : 1.0;
    }
    pin(Y) {
direction : output;
capacitance : 1.0;
driver_type : open_drain;
is_pad : true;
multicell_pad_pin : true;
slew_control : low;
drive_current : 1.0;
output_voltage : STD_CMOS; /* defined in the library */
function : "A";
three_state : "GZ";
timing () {
    intrinsic_rise : 0.0;
    rise_resistance : 0.0;
    intrinsic_fall : 1.0;
    fall_resistance : 0.1;
    related_pin : "A";
}
timing () {
    intrinsic_rise : 0.0;
    rise_resistance : 0.0;
    intrinsic_fall : 1.0;
    fall_resistance : 0.1;
    related_pin : "GZ";
}
max_transition : 0.1;
    }
}
```

In this case, the 'Y' pin has the multicell_pad_pin attribute defined. To fix the problem, add the connection_class attribute.

EXAMPLE MESSAGE

Warning: Line 41, The 'Y' pin is a multicell_pad_pin, but

```
has no connection_class information. (LBDB-58)
```

LBDB-59 (error) The '%s' found in the %s attribute is invalid.

DESCRIPTION

This message indicates that the specified pin, bus, or bundle name defined in a related_inputs or related_outputs attribute does not exist in the library.

WHAT NEXT

Add the port definition if it is missing in the library, or fix the name if it is a typographical error.

EXAMPLES

```
/* Specify non-existence output pin */
internal_power(lbdb59) {
    values("0.1, 1.2, 0.3, 0.4");
    related_outputs : "X";
}
```

EXAMPLE MESSAGE

Error: Line 46, The 'X' found in the related_inputs or related_outputs attribute is invalid. (LBDB-59)

LBDB-60 (warning) The wire_load or wire_load_table '%s' group has no '%s'. Using the default value of (%d, %3.1f).

DESCRIPTION

This message indicates that the specified attribute is not specified in the wire_load or wire_load_table group. The default value of the attribute is used. The missing attribute can be

- * A fanout_length
- * A fanout_capacitance
- * A fanout_resistance
- * A fanout_area

WHAT NEXT

If you do not want to apply the default to the attribute indicated in the warning message, specify the attribute in the indicated group.

EXAMPLES

```
wire_load_table("lbdb60") {  
    fanout_length(1, 0.2) ;  
    fanout_resistance(1, 0.17) ;  
    fanout_area(1, 0.2) ;  
}
```

In this case, the fanout_capacitance is missing in the wire_load_table. If you do not want the default value, add the following attribute:

```
fanout_capacitance(1, 0.15);
```

EXAMPLE MESSAGE

```
Warning: Line 10, The wire_load or wire_load_table 'lbdb60' group has no  
'fanout_capacitance'. Using the default value of (1, 0.0). (LBDB-60)
```

LBDB-61 (warning) Template '%s' is defined in old library syntax.

DESCRIPTION

This message indicates that a special symbol in the symbol library file is written using an old library syntax.

WHAT NEXT

Check the "Library Compiler User Guide" for the correct syntax of symbols.

LBDB-62 (error) The '%s' symbol is a duplicate '%s' template.

DESCRIPTION

This message indicates that the specified symbol is a duplicate symbol in the symbol library file. Library Compiler ignores the duplicate symbol.

WHAT NEXT

Remove the duplicate symbol from the symbol library, or change the name if it is a typo.

LBDB-66 (error) The '%s' attribute cannot be supplied a nonpositive value (%f).

DESCRIPTION

This message indicates that the specified attribute cannot have a nonpositive value.

WHAT NEXT

Change the value of the attribute to positive in the technology library file.

EXAMPLES

```
capacitive_load_unit( -1,pf );
```

EXAMPLE MESSAGE

Error: Line 18, The 'capacitive_load_unit' attribute cannot be supplied a nonpositive value (-1.000000). (LBDB-66)

LBDB-69 (error) Missing a %s name.

DESCRIPTION

This message indicates that a group name is missing in the technology or symbol library file. The Library Compiler ignores the library.

WHAT NEXT

Add the group name to the technology or symbol library file.

EXAMPLES

```
cell() {  
    area : 9;  
}
```

EXAMPLE MESSAGE

Error: Line 63, Missing a cell name. (LBDB-69)

LBDB-70 (error) The '%s' group name is defined multiple times for the '%s' parent.

DESCRIPTION

The technology library contains more than one definition of a define_group attribute with the same name. The Library Compiler issues this error message and deletes all the definitions.

WHAT NEXT

Change the group name if it is wrong, or delete the second definition.

EXAMPLES

```
define_group(lbdb70, cell);
define_group(lbdb70, cell);
```

EXAMPLE MESSAGE

Error: Line 58, The 'lbdb70' group name is defined multiple times for the 'cell' parent. (LBDB-70)

LBDB-72 (error) Undefined module_pin '%s' referenced in pin_association '%s' in %s '%s'.

DESCRIPTION

The name given to a pin_association group within a binding group or a state group names a pin that must be defined by a pin group within the module. This error arises when the name given to the pin_association group does not have a corresponding pin group on the module. For example, in the following synthetic library, the pin_association group named 'MY_B' attempts to bind the operator pin 'B' to the module pin 'MY_B'. However, the pin 'MY_B' is not defined for the module, which causes an error to occur.

```
library (example.sldb) { module (my_module) { design_library : "MYLIB";
parameter(width) { hdl_parameter : TRUE; } pin (MY_A) { direction : input; bit_width
```

```
: "width"; } pin (MY_Z) { direction : output; bit_width : "width"; } binding (b1) {
bound_operator : "ADD_UNS_OP"; pin_association(MY_A) { oper_pin : A ; }

/* The following line creates an error: */ pin_association(MY_B) { oper_pin : B ; }

pin_association(MY_Z) { oper_pin : Z ; } } }
```

In this case you can fix the error by adding a pin group to the module:

```
pin (MY_B) { direction : input; bit_width : "width"; }
```

WHAT NEXT

Remove the pin_association group that refers to the nonexistent module pin. Alternately, you can add a module pin group with the name of the referenced pin in the pin_association group.

LBDB-73 (error) The '%s' cell has more than one sequential function (seq, latch, or ff) declaration.

DESCRIPTION

This message indicates there is more than one declaration of a sequential function group.

WHAT NEXT

Leave only one sequential function group declaration; remove the rest of the declarations.

LBDB-74 (error) The %s value, '%s', is either not defined or it is defined after this line.

DESCRIPTION

This error message occurs when the **default_operating_conditions** or **default_wire_load** attribute refers to an undefined the operating_conditions or wire_load group name in the library.

This message can also report the **related_power_rail** attribute references and the undefined power_rail values in the power_supply group.

The following example shows the 05x05 wire_load group defined after the **default_wire_load** attribute and the resulting error message:

```
default_wire_load : 05x05;
wire_load("05x05") {
    resistance : 0 ;
    capacitance : 1 ;
    area : 0 ;
    slope : 0.186 ;
    fanout_length(1,0.39) ;
}
```

Error: Line 57, The default_wire_load value, '05x05',
has not been defined or it is defined after this line. (LBDB-74)

WHAT NEXT

Check your library to determine if you have defined the group name. If the group name exists in the library, make sure it is defined before it is used.

**LBDB-75 (warning) There is an extra timing arc between '%s' and
'%s' pins in the '%s' cell.**

DESCRIPTION

Timing arcs are allowed for pins that are related to each other. To be related to each other, the input pin has to be in the **function** or **three_state** attribute of the output/input pin. This message is issued if the timing arc identified between pins does not fall into the categories described previously. In addition, the VHDL generator fails and the timing verifier times through this timing arc, which you probably do not intend.

WHAT NEXT

Check your library to see whether you have generated the timing group by mistake, whether the **related_pin** field is wrong or the **function** attribute value is not recognized.

EXAMPLES

```
pin(Z) {
    direction : output;
    function : "B";
    timing() {
intrinsic_rise : 1.0;
intrinsic_fall : 1.0;
rise_resistance : 0.1;
fall_resistance : 0.1;
related_pin : "A";
}
```

```
}
```

In this case, you defined a timing arc between the 'A' and 'Z' pins, even though the 'A' pin is not functionally related to the 'Z' pin. Either remove the timing arc or change the function statement of 'Z' to include 'A'.

EXAMPLE MESSAGE

Warning: Line 73, There is an extra timing arc between 'A' and 'Z' pins in the 'lbd75' cell. (LBDB-75)

LBDB-76 (error) The '%s' %s cannot be specified here.

DESCRIPTION

This message indicates that you specified an attribute outside its context. When processing the current context, Library Compiler flags invalid attributes.

It can also be used to indicate that you have specified an attribute/groups which conflicts with the other attributes/groups of the object. For example, if you specify 'io_type' attribute on a cell in the FPGA library which is based on fpga_isd information, the LBDB-76 will be issued and the 'io_type' attribute should be removed.

WHAT NEXT

Change the technology library source file to either delete the specified attribute or move the attribute to its correct context.

EXAMPLES

```
pin(D) {
    direction : input;
    capacitance : 1.0;
    current_unit : "1mA";
}
```

In this case, the 'current_unit' attribute is defined at the pin level. To fix the problem, move the attribute to the library context.

EXAMPLE MESSAGE

Error: Line 69, The 'current_unit' attribute cannot be specified here. (LBDB-76)

LBDB-79 (error) The 'ripped_pin' name is not defined.

DESCRIPTION

This message indicates that you specified an undefined pin name for the ripped_pin attribute in a symbol library file.

WHAT NEXT

Change the symbol library to either define the pin name before you use it in the ripped_pin attribute or fix the pin name if it is a typo.

EXAMPLES

```
symbol("lbdb79") {  
    ripped_pin : "bus_pin" ;  
    ripped_bits_property : "EDIF_property" ;  
    line(0 , 50, 50, 0);  
    line(50, 0, 0, -50);  
    line(-50, 0 , 100, 0);  
    pin("wire_pin", 100 , 0 , ANY_ROTATION);  
}
```

In this case, the 'bus_pin' pin is not defined.

EXAMPLE MESSAGE

```
Error: Line 69, The 'ripped_pin' name is not defined. (LBDB-79)
```

LBDB-80 (error) The '%s' port name is either undefined or its group definition is invalid.

DESCRIPTION

This message indicates that the specified port name is either not defined in the library source file or Library Compiler did not read the port group definition successfully. This might often be caused by a problem in the pin bus or a bundle group definition.

WHAT NEXT

Change the library source file to define the port.

EXAMPLES

```
cell (lbdb80) {
```

```

area : 3.0;
bus (D) {
    bus_type : BUS4;
    direction : input;
    capacitance : 1.0;
}
pin (CK) {
    direction : input;
    capacitance : 1.0;
}
ff_bank (IQ,IQN,4) {
    next_state : "D" ;
    clocked_on : "CK";
}
pin (Q) {
    direction : output ;
    function : "D[0] CK" ;
}
}
}

```

In this case, the 'BUS4' type is not defined in the library. Thus, the 'D' bus is not recognized, and the next_state value is considered to be not defined. Fix the problem by adding the 'BUS4' type group definition.

EXAMPLE MESSAGE

Error: Line 186, The 'D' port name is either undefined or its group definition is invalid. (LBDB-80)

LBDB-81 (error) The base type in the type group is invalid.

DESCRIPTION

This message indicates that the specified base_type name in the type group is invalid. This might be caused by a typo in the name. Library Compiler only supports the **array** base_type.

WHAT NEXT

Check the "Library Compiler User Guide" and fix the name of the base_type.

EXAMPLES

```

type(bus2) {
    base_type : afrray;
    data_type : bit;
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
}

```

```
}
```

In this case, there is a typo in the base_type value. change afrray to **array**.

EXAMPLE MESSAGE

Error: Line 30, The base type in the type group is invalid. (LBDB-81)

LBDB-82 (error) The data type in the type group is invalid.

DESCRIPTION

This message indicates that the specified data_type name in the type group is invalid. This might be caused by a typo in the name. Library Compiler only supports the **bit** data_type.

WHAT NEXT

Check the "Library Compiler User Guide" and fix the name of the data_type.

WHAT NEXT

EXAMPLES

```
type(bus2) {
    base_type : array;
    data_type : int; /* wrong */
    bit_width : 2;
    bit_from : 0;
    bit_to : 1;
    downto : false;
}
```

In this case, the data_type value is invalid. change int to **bit**.

EXAMPLE MESSAGE
