TEST-1064 (warning) IO register '%s' is dont_scan, the register is not used to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be used in wrapping the associated input port, if the register has a dont_scan attribute.

WHAT NEXT

If the register needs to be used to wrap the associated port, remove the dont_scan attribute from the register.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1065 (warning) IO register '%s' is dont_touch, the register is not used to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be used in wrapping the associated input port, if the register has a dont_touch attribute.

WHAT NEXT

If the register needs to be used to wrap the associated port, remove the dont_touch attribute from the register.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1066 (warning) IO register '%s' is violated by drc, the

register is not used to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be uresued in wrapping the associated input port, if the register is violated by drc.

WHAT NEXT

If the register needs to be used to wrap the associated port, fix the drc violation with the register.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1067 (warning) IO register '%s' is part of a multi-bit scan segment, the register is not used to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be uresued in wrapping the associated input port, if the register is part of a scan segment of size greater than 1.

WHAT NEXT

If the register needs to be used to wrap the associated port, remove the register from the multi-bit segment specification.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1068 (warning) IO register '%s' is part of an unknown segment, the register is not used to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be uresued in wrapping the associated input port, if the register is part of a scan segment which is not a single bit scan or inferred segment.

WHAT NEXT

Check if the register is part of a structured segment, remove the register from any scan segment specification.

SEE ALSO

`set_core_wrapper_configuration` (2), `set_core_wrapper_cell` (2)

TEST-1069 (error) Can't Synthesize Wrapper Cell, turning off dft insertion.

DESCRIPTION

This error message tells you that the core wrapper insertion couldn't synthesize wrapper cells. Wrapper insertion can't proceed without synthesizing wrapper cells. DFT insertion will be turned off.

WHAT NEXT

Check if link library is setup properly to include the design ware libraries dw04.sldb or dw_foundations.sldb used in mapping the wrapper cells. Check if there are any errors issued during mapping wrapper cells.

SEE ALSO

`insert_dft` (2)

TEST-1070 (warning) Test Model of core instance '%s' is not valid for integration, not creating any top level test modes to test the core.

DESCRIPTION

The system-on-chip (SoC) BIST does not allow integration of unencapsulated cores during core integration. This warning message occurs when a specified core instance of the current design is not encapsulated or not encapsulated properly, so no top level test modes are created during core integration to test the core instance.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, to avoid the warning, make sure that only encapsulated cores are present during core integration. An encapsulated core is defined as follows:

- A scan wrapped core
- A dbist encapsulated core
- An xdbist encapsulated core
- An mbist encapsulated core
- A scan wrapped core with mbist logic.

SEE ALSO

`create_test_schedule (2)`, `preview_dft (2)`, `set_dft_configuration (2)`.

TEST-1071 (Warning) No domain based scan enable specified for sub-design '%s' in hierarchical scan flow.

DESCRIPTION

You receive this warning message because you did not specify domain based scan enable for the given sub-block, and specified domain based scan enable on the top level. This can create issues for domain based scan enable at top level for `preview_dft` or `insert_dft`

WHAT NEXT

Turn on domain based scan enable for sub-blocks using `set_scan_configuration -domain_based_scan_enable` if you have turned it on at the top level.

SEE ALSO

`preview_dft (2)`, `set_scan_configuration (2)`.

TEST-1072 (Warning) Scan enable per domain specified along

with dedicated scan enable for chain'%'s'.

DESCRIPTION

You receive this warning message because you specified domain based scan enable and also specified a separate scan enable for a given chain. This may not give the right results expected.

WHAT NEXT

Remove dedicated scan enable for the scan chain and run the command `preview_dft/insert_dft`

SEE ALSO

`preview_dft (2)`, `set_scan_configuration (2)`.

TEST-1073 (Error) Fan-out limit '%d' specified for pipelining scan enable is less than minimum required '%d'.

DESCRIPTION

You receive this warning message because you specified a pipeline fanout limit specified for pipelining scan-enable is much less than required for driving all the logic driven by scan-enable port and internal pipeline flops. With a single level of pipelining the fanout should be atleast square root of the no of pins that need to be driven by scan enable.

WHAT NEXT

Increase fan-out limit sufficiently to handle all the logic using `set_scan_configuration -pipelining_fanout_limit`.

SEE ALSO

`preview_dft (2)`, `preview_scan (2)`, `set_scan_configuration (2)`.

TEST-1074 (Error) Pipelining Scan enable is not supported with

flow having '%s'.

DESCRIPTION

You receive this warning message because you specified to do pipelining of scan-enable with a mentioned flow. Pipelining scan-enable is supported as of now only for basic scan flow, hss flow with Autofix and bidi fixing.

WHAT NEXT

Change the flow or disable pipelining of scan enables.

SEE ALSO

`preview_dft` (2), `preview_scan` (2), `set_scan_configuration` (2).

TEST-1075 (Error) Internal pins flow is not supported with lbist, core wrapping, for non multiplexed_flip_flop scan styles and Sequential Compression Post-DFT DRC.

DESCRIPTION

You receive this error message because you specified to use internal pins flow with lbist, core wrapping or with a design with non multiplexed_flip_flop scan style or in Post-DFT DRC after Sequential Compression insertion. Internal pins flow is not supported for either of the clients or scan style mentioned above.

WHAT NEXT

Please use the command `set_dft_configuration` to disable the clients mentioned above, or use the command `set_dft_drc_configuration` to disable the internal pins flow or use the command `set_scan_configuration` to set the scan style to multiplexed_flip_flop.

SEE ALSO

`set_dft_configuration` (2), `set_dft_drc_configuration` (2), `set_scan_configuration` (2).

TEST-1076 (Warning) The specification for the hookup signal

%s specified before will be overwritten.

DESCRIPTION

You receive this warning message because you specified a hookup signal which has been specified before as a hookup for a port or an independent hookup signal. The existing hookup signal specification will be overwritten with the new specification.

WHAT NEXT

Please use the command **remove_dft_signal** to remove the existing specification and use the command **set_dft_signal** to give new specifications.

SEE ALSO

set_dft_signal (2), **remove_dft_signal** (2), **set_dft_drc_configuration** (2).

TEST-1077 (Error) Post-insertion DFT DRC is not supported in this mode.

DESCRIPTION

Post insertion **dft_drc** is an optional step to validate scan_chains inserted by **insert_dft**. You receive this error message because you specified to run **dft_drc** after insertion in one of the following unsupported scenarios.

- 1) In ScanCompression mode when internal pins flow is enabled and Internal pins of type ScanDataIn, ScanDataOut and TestMode are used.
- 2) In Multimode when internal pins flow is enabled and Internal pins of type ScanDataIn, ScanDataOut and TestMode are used.
- 3) In ScanCompression mode when hybrid or integration is enabled in hierarchical adaptive scan flow.

WHAT NEXT

You can write out the netlist and protocol file from DFT Compiler and run DRC in TetraMAX.

You can also use the command **set_dft_drc_configuration** to disable the internal pins flow or use the command **remove_dft_signal** to remove the signals of type scan in, scan out and test mode as internal pins, for the first two scenarios.

SEE ALSO

`set_dft_signal` (2), `set_dft_drc_configuration` (2), `remove_dft_signal` (2).

TEST-1078 (warning) Scan core segment %s has no element.

DESCRIPTION

You receive this message if `preview_dft` or `insert_dft` finds that the specified core segment has no element defined.

WHAT NEXT

If you receive this message, check the CTL model attached to your sub-design.

SEE ALSO

`read_test_model` (2), `use_test_model` (2),

TEST-1079 (Warning) Chain %s has both X and Non-X cells.

DESCRIPTION

You receive this message if you have specified a scan path with a mix of X and Non-X cells, using `set_scan_path` command. The scan chain will not be considered as X chain.

WHAT NEXT

If the scan chain not being considered as a X chain is acceptable, no action is required on your part. Otherwise redefine a scan path with only X cells to be considered as X chain.

SEE ALSO

`set_scan_path` (2),

TEST-1080 (error) The sum of strobe time (%10.2f) (specified with test_bsd_default_strobe) and strobe width value (%10.2f) (specified with test_bsd_default_strobe_width) is required to be

less than period value (%10.2f) (specified with test_default_period).

DESCRIPTION

You have specified a strobe time and strobe width value such that the end of the strobe period stretches beyond the period.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

WHAT NEXT

Check your strobe time specifications.

TEST-1081 (error) %s time (%10.2f) (specified with test_bsd_default_delay or test_bsd_default_bidir_delay) must be less than strobe time (%10.2f) (specified with test_bsd_default_strobe).

DESCRIPTION

Data application time/delay must happen before strobe time.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

WHAT NEXT

Change strobe time, and/or delay or bidirectional delay time such that data application time happens before strobe time, and rerun create_bsd_patterns. To set the strobe time use the test_bsd_default_strobe variable, and to set the bidirectional delay time use the test_bsd_default_bidir_delay variable.

TEST-1082 (error) %s time (%1f) (specified with test_bsd_default_delay or test_bsd_default_bidir_delay) must

be less than period (%1f) (specified with test_default_period).

DESCRIPTION

You have specified input or bidir delay time beyond the period.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

WHAT NEXT

Check your input or bidir delay time specifications.

TEST-1083 (error) %s time (%10.2f) (specified with test_bsd_default_delay or test_bsd_default_bidir_delay) must be less than %s (%10.2f).

DESCRIPTION

Data application time/delay must happen before strobe time.

WHAT NEXT

Change strobe time, and/or delay or bidirectional delay time such that data application time happens before strobe time, and rerun create_bsd_patterns.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

SEE ALSO

```
create_test_clock (2), test_bsd_default_delay (3), test_bsd_default_bidir_delay (3),  
test_bsd_default_strobe (3)
```

TEST-1084 (error) %s time (%10.2f) must be less than %s

(%10.2f) (specified with `test_bsd_default_strobe`).

DESCRIPTION

Data application time/delay must happen before strobe time.

WHAT NEXT

Change strobe time, and/or delay or bidirectional delay time such that data application time happens before strobe time, and rerun `create_bsd_patterns`.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

SEE ALSO

```
create_test_clock (2), test_bsd_default_delay (3), test_bsd_default_bidir_delay (3),  
test_bsd_default_strobe (3)
```

TEST-1085 (warning) Bidir delay (%10.2f) (specified with `test_bsd_default_bidir_delay`) must be less than strobe time (%10.2f) (specified with `test_bsd_default_strobe`), setting bidir delay to input delay (%10.2f) (specified with `test_bsd_default_delay`).

DESCRIPTION

You have specified bidirectional delay time greater than the strobe time. Bidirectional delay time is reset to input delay time.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

WHAT NEXT

Check your `test_bsd_default_strobe` and `test_bsd_default_bidir_delay` variables.

SH SEE ALSO `create_bsd_patterns` (2), `test_bsd_default_bidir_delay` (3).

TEST-1086 (warning) Bidir delay (%10.2f) (specified with test_bsd_default_bidir_delay) must be less than period (%10.2f) (specified with test_default_period), setting bidir delay to input delay (%10.2f) (specified with test_bsd_default_delay).

DESCRIPTION

You have specified bidirectional delay time greater than the period. Bidirectional delay time is reset to input delay time.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

WHAT NEXT

Check your test_default_period and test_bsd_default_bidir_delay variables.

SH SEE ALSO **create_bsd_patterns** (2), **test_bsd_default_bidir_delay** (3).

TEST-1087 (warning) Bidir delay (%10.2f) (specified with test_bsd_default_bidir_delay) must be less than TCK rise time (%10.2f), setting bidir delay to input delay (%10.2f) (specified with test_bsd_default_delay).

DESCRIPTION

You have specified bidirectional delay time greater than the TCK rise time. Bidirectional delay time is reset to input delay time.

The following variables are used to set the timing for BSD.

```
test_default_period test_bsd_default_delay test_bsd_default_bidir_delay  
test_bsd_default_strobe test_bsd_default_strobe_width
```

WHAT NEXT

Check your test_bsd_default_bidir_delay variable and rise time of TCK.

SH SEE ALSO **create_bsd_patterns** (2), **test_bsd_default_bidir_delay** (3).

TEST-1088 (Warning) Static X chain isolation is ignored in %s as high xtolerance is not enabled.

DESCRIPTION

You receive this message if you have specified static X chain isolation without high xtolerance in a Scan Compression mode, using **set_scan_compression_configuration** command. Static X Chain isolation will be ignored for this mode.

WHAT NEXT

Enable high xtolerance if you would like the static X chains to be isolated in the Scan Compression mode.

SEE ALSO

set_scan_compression_configuration (2),

TEST-1089 (warning) User defined '%s' is ignored for bsd synthesis.

DESCRIPTION

This message is issued when you have specified a Tap using **define_dft_design** command and not specified **bsd_use_old_tap** variable appropriately.

Dft design of type TAP is used to specify old Tap. Dft design of type TAP_UC is used to specify new Tap.

Old Tap is used in bsd synthesis only when the variable **bsd_use_old_tap** is set to TRUE. New Tap is used in bsd synthesis only when the variable **bsd_use_old_tap** is set to FALSE(default).

WHAT NEXT

Make sure that when old Tap is specified, the variable **bsd_use_old_tap** is set to TRUE. Make sure that when new Tap is specified, either the variable **bsd_use_old_tap** is not specified or set to FALSE.

SH SEE ALSO **insert_dft** (2), **define_dft_design** (2).

TEST-1090 (Error) Too many X cells in design. Cannot isolate

static X cells as seperate X chains.

DESCRIPTION

You receive this message if you have specified static X chain isolation in a Scan Compression mode and more than 20% of valid scan cells have static X (D39) violations.

WHAT NEXT

You could either disable static X isolation or reduce the number of D39 violations.

SEE ALSO

`set_scan_compression_configuration (2)`,

TEST-1091 (Error) Test mode %s cannot be removed after DFT insertion.

DESCRIPTION

You receive this message if you are removing a test mode after DFT insertion.

WHAT NEXT

You cannot remove a test mode in post-DFT insertion.

SEE ALSO

`define_test_mode (2)`.

TEST-1092 (Error) Sequential Compression cannot be generated with the current scan and sccomp configuration.

DESCRIPTION

You receive this message because the current scan configuration and scan compression configuration do not allow a correct implementation of the Sequential compression.

WHAT NEXT

You should change the chain_count in scan configuration or in scan compression configuration.

SEE ALSO

`set_scan_configuration` (2), `set_scan_compression_configuration` (2),

TEST-1110 (information) Values at the TDO port pad pins: %s.

DESCRIPTION

You receive this information message because the values of the TDO port pad pins helps you to determine the reason why the TDO drive is not enabled. The symbolic values and descriptions of the TDO port pad pins are as follows:

0 - logic zero value
1 - logic one value
X - unknown value
Z - high impedance
Di - valid input data
Do - valid output data

WHAT NEXT

Correct the design using this diagnostic information and rerun the `check_bsd` command.

SEE ALSO

`check_bsd` (2).

TEST-1110a (information) This problem occurred because pad cell is missing at the TDO port %s.

DESCRIPTION

You receive this information message because a pad cell at the TDO port is missing, so the TDO driver is not enabled, or a break in the shift register chain is due.

WHAT NEXT

Correct the design using this diagnostic information and then rerun the `check_bsd`

command.

SEE ALSO

`check_bsd` (2).

TEST-1111 (information) Values at the flop %s pins: %s.

DESCRIPTION

You receive this diagnostic information message showing the values at the pins of the shift flip-flop, to help you find the cause of a break in the shift register chain. The symbolic values and their descriptions are as follows:

0	- logic zero value
1	- logic one value
X	- unknown value
Z	- high impedance
Di	- valid input data
Do	- valid output data

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can correct the design and rerun the `check_bsd` command.

SEE ALSO

`check_bsd` (2).

TEST-1112 (information) Break in shift register chain at %s is caused by pin %s of flop %s driving pin %s of flop %s with an unknown value 'X'.

DESCRIPTION

You receive this information message when diagnosing the the cause of a break in the shift register chain.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can correct the design and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1113 (information) Break in shift register chain at %s is caused by a feedback loop from cell %s.

DESCRIPTION

You receive this information message when the cause of a break in a shift register chain is diagnosed as a feedback loop from a specific cell.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can correct the design by removing and and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1114 (information) TDO port %s is driven by the shift flop %s.

DESCRIPTION

You receive this information message when diagnosing the cause of inversion in the shift register chain.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can correct the design and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1115 (information) Data is inverted between TDI and TDO at the following cell(s):

DESCRIPTION

You receive this information message when the cause of inversion in the shift register chain is diagnosed as inverted data between TDI and TDO.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can correct the design and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1116 (information) This problem occurred because BSR cell %s connected to the port does not capture the port data.

DESCRIPTION

You receive this information message when the cause of a missing input BSR cell is diagnosed as a probable BSR cell at the port which is not being able to capture the port data when EXTEST instruction is active. As per section 8.8 of the IEEE 1149.1 std. an input BSR cell should capture the sensed port data in the Capture-DR TAP Controller state for the EXTEST instruction.

WHAT NEXT

If the BSR cell shown in the message is intended to be the input BSR cell at the port, examine the circuit between the input port and the BSR cell and make sure that the path from the port to the BSR cell shift flop is enabled and clocked correctly under the above condition.

Correct the design and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1117 (information) Shift Register cells selected between TDI and TDO by the "all-ones" opcode are: %s.

DESCRIPTION

You receive this information as diagnostic information showing the shift register cells selected between TDI and TDO, when the "all-ones" opcode selects a register of length more than one.

WHAT NEXT

Use this diagnostic information to debug why the all-ones opcode select the displayed cells instead of 1-bit BYPASS register between TDI and TDO.

Correct the design and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1118 (information) This problem occurred because BSR cell %s connected to the port does not drive the port.

DESCRIPTION

You receive this information message when the cause of a missing output BSR cell is diagnosed as a probable BSR cell at the port which is not being able to drive the port when EXTEST instruction is active. As per section 8.8 of the IEEE 1149.1 std. an output BSR cell should drive the port data during the EXTEST instruction.

WHAT NEXT

If the BSR cell shown in the message is intended to be the output BSR cell at the port, examine the circuit between the BSR cell update flop and the output port and make sure that the path is enabled under the above condition. Check that the mode signal for the output mux select has the correct logic.

Correct the design and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1119 (Error) This command works only when Stitch Only option is enabled. Use `set_dft_optimization_configuration -none` to enable Stitch Only option.

DESCRIPTION

You receive this error message because the command typed can be used only with stitch only option. The stitch only option is enabled first by using the `set_dft_optimization_configuration -none` command.

WHAT NEXT

No action is required on your part.

SEE ALSO

`set_dft_optimization_configuration` (2), `insert_scan` (2),

TEST-1121 (information) Input BSR cell at bidirectional port %s is not detected because control BSR cell is missing at the output side of the port %s.

DESCRIPTION

You receive this information message when the input BSR cell is missing at the bidirectional port, because the output side is missing a control BSR.

WHAT NEXT

Correct the design by doing one of the following:

- Insert a control BSR cell at the output side of the port.
- If you intend to use only the input side of the bidirectional port, disable the output side of the port.

Run the `check_bsd` command again.

SEE ALSO

`check_bsd` (2).

TEST-1122 (information) Input BSR cell is not detected at port %s because the pad is not able to propagate data. Values at the pad pins: %s.

DESCRIPTION

You receive this information message when data is stuck at the input pad, preventing input BSR from capturing the data correctly.

WHAT NEXT

Correct the problem at the input pad and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1123 (information) Output BSR cell %s connected to port %s is not detected because the pad is not able to propagate data. Values at the pad pins: %s.

DESCRIPTION

You receive this information message when the data coming from the output BSR cell is stuck at the output pad and cannot be captured at the output port.

WHAT NEXT

Correct the problem at the output pad and rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1124 (information) BSR cell %s connected to port %s is not detected because control BSR cell is not found at the port.

DESCRIPTION

You receive this information message because the output BSR cell is missing at the port due to a missing control BSR.

WHAT NEXT

Correct the design by inserting a control BSR cell at the output port and then running the **check_bsd** command again.

SEE ALSO

check_bsd (2).

TEST-1125 (information) Reason for not able to find BSR cell at port %s

is caused by the BSR cell update stage flop %sr:
%s.

DESCRIPTION

You receive this information message as diagnostic for a missing output BSR cell.

WHAT NEXT

Use this diagnostic information to correct the design and then rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1126 (Error) The scan state is invalid for running this

command. The scan state should be `scan_existing`.

DESCRIPTION

You receive this error message because the scan state should be either `scan_existing` (scan routed) for the `disconnect_scan_chains` command to run. If the current state of the design is not scan existing, this error message prevents `disconnect_scan_chains` command from proceeding.

WHAT NEXT

Set the scan state using the `set_scan_state` command before using the `disconnect_scan_chains` command.

SEE ALSO

`set_dft_optimization_configuration` (2), `disconnect_scan_chains` (2), `insert_dft` (2),

TEST-1128 (information) This problem occurred because following port(s) are not driven by their BSR cell shift stage.

DESCRIPTION

You receive this information message as diagnostic for invalid output conditioning on output BSR cells during EXTEST.

WHAT NEXT

Use this diagnostic information to correct the design and then rerun the `check_bsd` command.

SEE ALSO

`check_bsd` (2).

TEST-1129 (information) Capture descriptor found for the BSR cell %s:

DESCRIPTION

You receive this information message when diagnosing the cause of a nonstandard BSR cell or an invalid number of capture descriptors.

The capture descriptors of a BSR cell are a set of triplets showing the behavior of the BSR cell under the standard instructions, and in the following form:

(<BSR Cell Context>, <Capture Instruction>, <Data Source for the value captured in the Cell>)

Refer to Annex B of the supplement to *IEEE Std 1149.1* for more information on capture descriptors.

WHAT NEXT

Ensure that the BSR cell design is compliant with the *IEEE Std 1149.1* standard and that the BSR cell type is appropriate for the instructions you implement.

TEST-1129a (information) Illegal capture descriptor for the BSR cell %s:

DESCRIPTION

You receive this information message as diagnostic for a nonstandard BSR cell or an illegal number of capture descriptors.

The capture descriptors of a BSR cell are a set of triplets showing the behavior of the BSR cell under the standard instructions, and in the following form:

(<BSR Cell Context>, <Capture Instruction>, <Data Source for the value captured in the Cell>)

Refer to Annex B of the supplement to the *IEEE Std 1149.1* for more information on capture descriptors.

WHAT NEXT

Ensure that the BSR cell design is compliant with the *IEEE Std 1149.1*, and that the BSR cell type is appropriate for the instructions you implement.

TEST-1130 (information) As INTEST instruction is implemented, INPUT BSR cell %s is found to be of type BC_0 instead of BC_4.

DESCRIPTION

You receive this information message as diagnostic for a nonstandard BSR cell. The INTEST instruction is not supported on input by a BSR cell of type BC4.

WHAT NEXT

Use this diagnostic information to correct the design and then rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1131 (information) Specified INTEST instruction is not implemented as BSR cell %s at the output port '%s' is found to be of type BC2.

DESCRIPTION

You receive this information message because an INTEST instruction cannot be implemented when a BSR cell of type BC2 is used on an output port.

This message is the result of the following actions:

- You are executing the **check_bsd** command.
- The **infer_instructions** option of the **set_bsd_configuration** command is set to false, which is the default.
- You specify INTEST instruction on a design having a BSR cell of type BC2 as an output port.

WHAT NEXT

Correct the design by replacing BC2 BSR cell by a BSR cell of type BC1 on the specified output port.

SEE ALSO

`check_bsd` (2), `set_bsd_configuration` (2).

TEST-1133 (information) Values at the port and BSR cell shift flops:

DESCRIPTION

You receive this information message when as diagnostic for a port that is not driven or captured by the BSR cell.

WHAT NEXT

Use this diagnostic information to correct the design and then rerun the `check_bsd` command.

SEE ALSO

`check_bsd` (2).

TEST-1134 (warning) Invalid capture value "%s" for %s instruction.

DESCRIPTION

You get this warning when there is an unknown capture value bit in the IDCODE or USERCODE capture value.

WHAT NEXT

Analyze the design for the cpature value bit position.

If a compliance enable pattern is missing in the specifications, then specify the complaince enable pattern using the `set_bsd_compliance` command and rerun `check_bsd`.

SEE ALSO

`check_bsd` (2). `set_bsd_compliance` (2).

TEST-1136 (information) Following update flops reset illegally:%s.

DESCRIPTION

You receive this information message as diagnostic for update flops and their pin values that reset illegally during RUNBIST or CLAMP.

WHAT NEXT

Use this diagnostic information to correct the design and then rerun the **check_bsd** command.

SEE ALSO

check_bsd (2).

TEST-1137 (information) Values on instruction register update flops after synchronous reset %s.

DESCRIPTION

You receive this information message when the values on an instruction register update flip-flop. The values flip-flop after a synchronizing sequence of five 1s is applied on the test mode select (TMS) port of the test access port (TAP). The symbolic values and their descriptions are as follows:

0 - logic zero value
1 - logic one value
X - unknown value
Z - high impedance
Di - valid input data
Do - valid output data

WHAT NEXT

This is an informational message only. No action is required on your part.

TEST-1138 (information) Values on instruction register update

flops after asynchronous reset %s.

DESCRIPTION

You receive this information message when the values on an instruction register update flip-flop. This occurs after the asynchronous test logic reset port of the test access port (TAP) is set to 0. The symbolic values and their descriptions are as follows:

0	- logic zero value
1	- logic one value
X	- unknown value
Z	- high impedance
Di	- valid input data
Do	- valid output data

WHAT NEXT

This is an informational message only. No action is required on your part.

TEST-1139 (information) This problem occurred because there is no pin which drives the BSR cell's shift flop as well as the BSR cell's primary output when SAMPLE/PRELOAD instruction is loaded.%s

DESCRIPTION

You receive this information message because the primary input of a BSR cell is recognized based upon the cell's behavior under the SAMPLE/PRELOAD instruction, as described in *IEEE Std 1149.1*, section 7.6.

WHAT NEXT

Correct the BSR cell design and rerun the **check_bsd** command. Refer to Chapter 10 of *IEEE Std 1149.1* for guidelines on BSR cell design.

SEE ALSO

check_bsd (2).

TEST-1140 (information) This problem occurred because data

is inverted %s.

DESCRIPTION

This is a diagnostic information about inverting logic between boundary scan cell and a design port. Inversion is considered as a logic. The two consecutive pins are shown between which the data is inverted. Following are the most common design errors leading to this:

1. The port pad inverts the data 2. You are using a differential pad and the attributes "master_complementary_pin", "complementary_pin" & "differential_cell" are NOT correctly set 3. You are using a differential soft macro and the "port" and "port_inverted" signal types are NOT correctly set or are swapped

WHAT NEXT

Correct the design and rerun check_bsd.

SEE ALSO

`check_bsd` (2).

TEST-1141 (error) Incorrect number of arguments specified for bsr_segment '%s' of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify incorrect BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with `define_dft_design` command in XG mode and with `set_bsd_pad_design` in DB mode. BSR segment spec. syntax is as follows.

<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>

The above error is issued as the BSR spec. doesn't contain all the required values.

WHAT NEXT

Reexecute the `define_dft_design` command (XG mode) or `set_bsd_pad_design` command (DB mode) and specify a valid BSR segment spec. for the command.

SEE ALSO

`define_dft_design` (2). `set_bsd_pad_design` (2).

TEST-1142 (error) Incorrect BSR cell type '%s' specified for pad design '%s' in BSR segment spec, Discarding specification.

DESCRIPTION

You receive this error message when you specify incorrect BSR cell type in BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

```
<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>
```

Legal values of <BSR cell type> are :

BC0 BC1 BC2 BC3 BC4 BC5 BC6 BC7 BC8 BC9 BC10 AC1 AC2 AC7 AC8 AC9 AC10 ACSelX ACSelU

The above error is issued as the BSR spec. contains an incorrect BSR cell type.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2). **set_bsd_pad_design (2)**.

TEST-1143 (error) Incorrect bus format '%s' specified for PI/PO of BSR segment spec of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify incorrect bus format for PI/PO in BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

```
<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>
```

Bus format for PI/PO pins are as follows.

```
<name_of_bus_pin>[<start_index>:<end_index>]
```

The above error is issued as the BSR spec. contains an incorrect bus pin.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2). **set_bsd_pad_design** (2).

TEST-1144 (error) Incorrect disable value '%s' specified for a BSR segment spec of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify incorrect disable value in a BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>

Legal values for <BSR cell disable/safe value> field are :

0 1 X Z

The above error is issued as the BSR spec. contains an incorrect disable value.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2). **set_bsd_pad_design** (2).

TEST-1145 (error) Incorrect position field '%s' specified for a

BSR segment spec of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify incorrect BSR cell position in a BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

```
<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>
```

Here <BSR cell position> is a decimal integer.

Here <Position of control BSR cell> can be either '-' or a decimal integer pointing to another BSR cell of the pad.

The above error is issued as the BSR spec. contains a non decimal position field.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2). **set_bsd_pad_design** (2).

TEST-1146 (error) Incorrect Control BSR position '%d' specified for a BSR segment spec of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify incorrect control BSR cell position in a BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

```
<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>
```

Here <Position of control BSR cell> can be either '-' or a decimal integer pointing to another BSR cell of the pad.

The above error is issued as the BSR spec. contains an incorrect control BSR cell

position field.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2). **set_bsd_pad_design** (2).

TEST-1147 (error) Missing PO for Control BSR cell of a BSR segment spec of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify a control BSR cell with no PO in a BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>

The above error is issued as the BSR spec. contains a control BSR cell with no PO.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2). **set_bsd_pad_design** (2).

TEST-1148 (error) Invalid Control BSR cell type '%s' specified for a BSR segment spec of pad design '%s', Discarding specification.

DESCRIPTION

You receive this error message when you specify an incorrect BSR cell type for a

control BSR cell of a BSR segment spec. BSR segment specs are used to describe a BSR cell embedded in a pad. They are specified with **define_dft_design** command in XG mode and with **set_bsd_pad_design** in DB mode. BSR segment spec. syntax is as follows.

```
<BSR cell position> <BSR cell type> <BSR cell PI> <BSR cell PO> <BSR cell disable/safe value> <Position of control BSR cell>
```

A control BSR cell is identified as a BSR cell referenced in another BSR cell spec through <Position of control BSR cell> field.

Only the following BSR cell types are legal for a control BSR cell.

BC1 BC2 AC1 AC2

The above error is issued as the BSR spec. contains an incorrect control BSR cell type.

WHAT NEXT

Reexecute the **define_dft_design** command (XG mode) or **set_bsd_pad_design command (DB mode)** and specify a valid BSR segment spec. for the command.

SEE ALSO

define_dft_design (2), **set_bsd_pad_design (2)**.

TEST-1150 (Warning) Scan Chain '%s' can not be optimized due to a MilkyWay corruption.

DESCRIPTION

You get this error when the scan chain datas are not correct. This may be due to a bad scan DEF file.

WHAT NEXT

Review the scan def file generation.

SEE ALSO

write_scan_def(2), **place_opt(2)**, **report_scan_chain(2)**, **check_scan_chain(2)**,

TEST-1151 (warning) Ignoring the variable '%s' to specify IDCODE capture value, use set_bsd_instruction to specify

IDCODE capture value in XG mode.

DESCRIPTION

You receive this error message when you specify IDCODE capture values using variables `test_bsd_manufacturer_id`, `test_bsd_part_number`, `test_bsd_version_number`. These variables are not used in XG mode to specify IDCODE capture value.

WHAT NEXT

Use `-capture_value` option of command `set_bsd_instruction` to specify IDCODE capture value in XG mode.

SEE ALSO

`set_bsd_instruction` (2).

TEST-1152 (Warning) The IDCODE instruction has been specified, but capture value has not been set to specify a valid, nonzero manufacturer identity.

DESCRIPTION

You receive this message because you have specified the IDCODE instruction but have not assigned a valid capture value to the instruction.

To synthesize a Device Identification register, BSD Compiler requires a valid, nonzero value for manufacturer id.

WHAT NEXT

Do the following:

Assign an appropriate capture value to IDCODE instruction with manufacturer id other than 0 and 127.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `set_bsd_instruction`(2).

TEST-1153 (Error) Pad access pin '%s' is not found in the pad design %s.

DESCRIPTION

You receive this error message because you have not specified a mandatory pad access pin. For all pad designs access pin of type 'port' is mandatory. For differential pads, access pin of type 'port inverted' is also mandatory.

WHAT NEXT

Provide the mandatory pad access pin and rerun **preview_dft** or **insert_dft** command.

SEE ALSO

insert_dft (2), **preview_dft(2)**, **define_dft_design (2)**.

TEST-1154 (Warning) Pad access pin '%s' is not required for the pad design %s, the pin is ignored.

DESCRIPTION

You receive this error message because you have specified a pad access pin which is not required for the specified pad design. This pad pin is ignored. For example pad access pin of type 'port inverted' is not required for a non differential pad design.

WHAT NEXT

Either correct the pad design specification or ignore this message.

SEE ALSO

insert_dft (2), **preview_dft(2)**, **define_dft_design (2)**.

TEST-1155 (warning) Boundary-cell type AC_2 specified for the output port %s cannot be implemented. Ignoring the

specification and using AC_1 type instead.

DESCRIPTION

You receive this warning message when INTEST is implemented and you use the **set_boundary_cell** command to specify AC_2 to be used at an output port.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2), set_boundary_cell(2), set_bsd_instruction(2).`

TEST-1156 (warning) Highz bsd pins are not connected as HIGHZ instruction is not architected.

DESCRIPTION

You receive this warning message when HIGHZ is not implemented and you use the **define_dft_design** command to specify access pins of type **highz** for pad designs.

WHAT NEXT

Specify HIGH instruction if these **highz** pad pins need to be controlled by HIGHZ instruction, otherwise you can ignore the warining message.

SEE ALSO

`insert_dft (2), preview_dft (2), set_boundary_cell(2), set_bsd_instruction(2).`

TEST-1157 (error) '%s' is not a port.

DESCRIPTION

You receive this error message when your autofix element is not a port regarding the bidirectional type definition.

WHAT NEXT

Find the correct port.

SEE ALSO

`set_autofix_element(2)`.

TEST-1160 (Error) Scan Def File is corrupted.

DESCRIPTION

You get this error when the scan def file you are using while performing the `place_opt -reorder_scan`" command is not correct.

WHAT NEXT

Review the scan def file generation.

SEE ALSO

`write_scan_def(2)`,

TEST-1161 (Warning) scan flop replacement has to be set at FALSE.

DESCRIPTION

You receive this warning because the "replace" option of the `"set_scan_configuration"` command is set to TRUE. FALSE value for the option will be considered.

SEE ALSO

`set_scan_configuration(2)`,

TEST-1170 (error) The `-num_cpus` option (%d) conflicts with the value set with '`set_host_options -max_cores`' (%d). The `-num_cpus` option is

obsolete and will be removed in a future release. Please use '`set_host_options -max_cores`' only.

DESCRIPTION

This message indicates that you have used the `-num_cpus` option to the `insert_dft` command, and that the value provided is different than was set with the `set_host_options -max_cores` command. The command cannot proceed. The `-num_cpus` option is obsolete. Please use only the `set_host_options -max_cores` command to set the number of processor cores to use for parallel execution.

WHAT NEXT

Run `set_host_options -max_cores` before running `insert_dft`, and remove the `-num_cpus` option from the `insert_dft` command.

SEE ALSO

`set_host_options(2)`
`insert_dft(2)`

TEST-1171 (information) Running `insert_dft` using a maximum of %d cores.

DESCRIPTION

This information tells the user that `insert_dft` is running in multicore mode. The user may specify the maximum number of CPU cores to be used with the `set_host_options` command.

SEE ALSO

`set_host_options(2)`
`insert_dft(2)`

TEST-1180 (information) No IO registers are found for port '%s', not adding any dedicated wrapper cells to the port.

DESCRIPTION

This informational message is seen during Core Wrapping. DFT Compiler didn't find any IO registers for the specified port. No dedicated wrapper cell is added for such

a port.

WHAT NEXT

If a dedicated wrapper cell is needed for the port, use `set_boundary_cell` command for such specification.

SEE ALSO

`set_wrapper_configuration` (2), `set_boundary_cell` (2)

TEST-1181 (warning) Multiple clocks are used for IO Registers of Port '%S'.

DESCRIPTION

This warning message is seen during Core Wrapping. DFT Compiler found multiple clock domains are used in IO registers associated with a port. If a dedicated wrapper cell is added to the port, the clock domain most used will be used as the clock for the dedicated wrapper cell.

WHAT NEXT

To avoid this warning, make sure that all IO registers of a port use the same clock domain.

SEE ALSO

`set_wrapper_configuration` (2), `set_boundary_cell` (2)

TEST-1182 (information) Using Clock '%s_%d_%d' for the dedicated wrapper cell of port '%S'.

DESCRIPTION

This informational message is seen during Core Wrapping. The message is issued when multiple clock domains are used in IO registers of the port. The message shows the clock doamin used for the dedicated wrapper cell of the port. By default, the clock domain most used will be used as the clock domain for the deidcated wrapper cell.

WHAT NEXT

If a different clock doamin should be used for the dedicated wrapper cell, use set_boundary_cell command for such specification.

SEE ALSO

`set_wrapper_configuration (2)`, `set_boundary_cell (2)`

TEST-1183 (warning) Port '%s' is connected to a clock gating cell '%s', dedicated wrapper cell is added to the port.

DESCRIPTION

This warning message is seen during Core Wrapping. DFT Compiler found a clock gating cell in the fan out cone of a port. A dedicated wrapper cell is added to the port.

WHAT NEXT

If no wraper cell is needed for the port, use set_boundary_cell command for such specification.

SEE ALSO

`set_wrapper_configuration (2)`, `set_boundary_cell (2)`

TEST-1184 (warning) Port '%s' is connected to cell '%s' which is inside a DFT Model, dedicated wrapper cell is added to the port.

DESCRIPTION

This warning message is seen during Core Wrapping. DFT Compiler found an IO register of a port inside a DFT Model cell. A dedicated wrapper cell is added to the port.

WHAT NEXT

If no wraper cell is needed for the port, use set_boundary_cell command for such specification.

SEE ALSO

`set_wrapper_configuration (2)`, `set_boundary_cell (2)`

TEST-1185 (warning) Port '%s' is connected to %d %s registers which exceeds reuse threshold %d, dedicated wrapper cell is added to the port.

DESCRIPTION

This warning message is seen during Core Wrapping. DFT Compiler found more IO registers for a port than the reuse threshold limit specified with '`set_wrapper_configuration -class core_wrapper -reuse_threshold <limit>`'. A dedicated wrapper cell is added to the port.

WHAT NEXT

If all IO registers of the port need to be reused as shared wrapper cells, increase the threshold value.

If all IO registers of all ports need to be reused as shared wrapper cells, specify the threshold as 0 which disables the threshold check and the tool reuses all IO registers in wrapping.

SEE ALSO

`set_wrapper_configuration (2)`, `set_boundary_cell (2)`

TEST-1186 (warning) Port '%s' is connected to %d input registers and %d output registers which exceeds reuse threshold %d, dedicated wrapper cell is added to the port.

DESCRIPTION

This warning message is seen during Core Wrapping. DFT Compiler found more IO registers for a port than the reuse threshold limit specified with '`set_wrapper_configuration -class core_wrapper -reuse_threshold <limit>`'. Both input IO registers and output IO registers detected for the input port are considered for the threshold check. A dedicated wrapper cell is added to the port.

WHAT NEXT

If all IO registers of the port need to be reused as shared wrapper cells, increase the threshold value.

If all IO registers of all ports need to be reused as shared wrapper cells, specify the threshold as 0 which disables the threshold check and the tool reuses all IO registers in wrapping.

SEE ALSO

`set_wrapper_configuration (2)`, `set_boundary_cell (2)`

TEST-1187 (error) Multiple clocks are used for IO Registers of Port '%s'.

DESCRIPTION

This warning message is seen during Core Wrapping. DFT Compiler found multiple clock domains are used in IO registers associated with a port. This error is seen when the wrapper configuration option '`-use_system_clock_for_dedicated_wrp_cells`' is set to enable.

WHAT NEXT

To avoid this error, make sure that all IO registers of a port use the same clock domain.

SEE ALSO

`set_wrapper_configuration (2)`, `set_boundary_cell (2)`

TEST-1201 (warning) The bidirectional port '%s' is degenerated. Please check the test protocol.

DESCRIPTION

This message tells you that the pad associated with a bidirectional port is degenerated. This port does not have bidirectional capabilities, and can only function as an input or an output.

WHAT NEXT

Get the test protocol inferred by DFT Compiler using `write_test_protocol`. Study how it treats the degenerated ports. If it does not treat the port correctly, you need to develop a corrected custom test protocol.

TEST-1202 (warning) The conditioned bidirectional port '%s' is not being forced '%s'. Please check the test protocol.

DESCRIPTION

You can use the `set_scan_bidir` and `set_scan_configuration` commands to control the direction of a bidirectional port in scan shift.

This message tells you that a bidirectional port is turned in a direction opposite to the one specified during scan shift prior to adding disabling logic.

WHAT NEXT

Get the test protocol inferred by DFT Compiler using `write_test_protocol`. Study how it treats the conditioned bidirectional port. If it does not treat it correctly, develop a corrected custom test protocol.

TEST-1203 (error) '%s' is not a valid disable type for the internal tristate net '%s'.

DESCRIPTION

You receive this message if `preview_scan` or `insert_scan` finds an invalid disabling option for an internal tristate net. Valid disabling options are `disable_all`, `enable_one`, or `no_disabling`.

WHAT NEXT

Use the `set_scan_tristate` or `set_scan_configuration` commands to specify a valid disabling option for this internal three-state net and re-issue the `preview_scan` or `insert_scan` command.

SEE ALSO

`insert_scan (2)`, `preview_scan (2)`, `set_scan_configuration (2)`, `set_scan_tristate (2)`.

TEST-1204 (error) '%s' is not an internal or external tristate net.

DESCRIPTION

You receive this message if you execute the **set_scan_tristate** command and specify a net that is not a tristate net, or is a net connected to a bidirectional port. You can use **set_scan_tristate** only on tristate nets.

WHAT NEXT

If the specified net is connected to a bidirectional port, use the **set_scan_bidir** command to specify the bidirectional port conditioning during scan shift. Reexecute **set_scan_tristate** and specify only tristate nets.

SEE ALSO

set_scan_tristate (2).

TEST-1205 (error) Multiple conflicting disabling options found for net.

DESCRIPTION

You receive this error message if you have performed **set_scan_tristate** multiple times on segments of the given net and the disabling options specified for at least two net segments are not the same.

WHAT NEXT

Resolve the conflicting disabling options for the net and reissue **preview_scan** or **insert_scan**.

SEE ALSO

insert_scan (2), **preview_scan** (2) **set_scan_tristate** (2).

TEST-1206 (error) Multiple conflicting bidirectional conditioning

specifications found.

DESCRIPTION

You receive this message if you have issued the **set_scan_bidi** command multiple times and specified different conditioning in scan shift for two or more bidirectional ports connected together. "Conditioning" means specifying whether bidirectional ports are to be configured as inputs or outputs, or be left untouched, during scan shift. This message informs you that you have made conflicting specifications to two or more bidirectional ports that are connected together.

WHAT NEXT

Resolve the conflicting specifications and reissue the **preview_scan** or **insert_scan** command.

SEE ALSO

insert_scan (2), **preview_scan** (2) **set_scan_bidi** (2).

TEST-1207 (warning) Tristate net '%s' has some drivers with the **dont_touch** attribute; cannot add disabling logic.

DESCRIPTION

You receive this message if the **insert_scan** or **insert_dft** command detects a tristate net that contains one or more drivers with the **dont_touch** attribute. By default, **insert_scan** and **insert_dft** attempt to disable all drivers on external tristate nets and all but one driver on internal tristate nets, but they cannot disable drivers with the **dont_touch** attribute. Similarly, **insert_scan** and **insert_dft** cannot perform bidirectional port conditioning for a bidirectional port that has one or more drivers with the **dont_touch** attribute.

WHAT NEXT

If it is acceptable to you for the specified net to have no drivers disabled during scan shift, no action is required on your part. Otherwise, remove the **dont_touch** attribute from the drivers on the specified net, and reissue the **insert_scan** or **insert_dft** command.

SEE ALSO

insert_dft (2), **insert_scan** (2), **remove_attribute** (2), **set_dont_touch** (2),
set_scan_bidi (2), **set_scan_tristate** (2).

TEST-1208 (information) Cells with the **dont_touch** attribute : %S

DESCRIPTION

This informational message lists all hierarchical cells that have the **dont_touch** attribute and also drive a tristate net or a bidirectional port. The **insert_scan** and **insert_dft** commands do not add disabling logic for tristate nets, or conditioning logic to bidirectional ports, if the ports have the **dont_touch** attribute. This message informs you that the cells on this list will not be disabled or conditioned during scan shift.

WHAT NEXT

If it is acceptable to you for tristate nets and bidirectional ports driven by the listed cells to remain enabled during scan shift, no action is required on your part. Otherwise, remove the **dont_touch** attribute from all cells that drive a tristate net or bidirectional port, and reissue the **insert_scan** command.

SEE ALSO

insert_dft (2), **insert_scan** (2), **preview_scan** (2), **remove_attribute** (2),
set_dont_touch (2) **set_scan_bidi** (2), **set_scan_tristate** (2).

TEST-1209 (warning) Clock %s reaches %d flip-flops but does not control them throughout the cycle.

DESCRIPTION

You receive this warning message because the **rtldrc** command has found flip-flops that are not controlled by the specified clock signal. This warning occurs if the flip-flop clocks are controllable at the beginning of the cycle, but cannot be controlled in the opposite state when the clock pulse is active. This prevents scan insertion using the multiplexed flip-flop scan style.

This violation is only checked if the scan style is set to multiplexed flip-flop. The check is not made for other scan styles.

The violation can be caused by not defining or conditioning clocks before running the **rtldrc** command. The **rtldrc** command does not infer clocks, but depends on the **create_test_clock**, **set_signal_type**, and **set_test_hold** commands to define the clocks and condition them to reach their destinations.

If all signal definitions are made correctly before **rtldrc** is run, the warning indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, the registers are unscannable and fault coverage is

reduced.

WHAT NEXT

No action is required on your part. However, you can determine the cause of the violation and correct the error so that the violated registers are scannable and the fault coverage is increased.

Make the corrections either by using Autofix (refer to the **insert_dft** command man page for details), or by following the procedure below.

1. Ensure that the test clocks are defined using **create_test_clock** command and that they are conditioned using **set_signal_type** and **set_test_hold**.
2. Examine the specified flip-flops to determine why they are not controlled by the clock signal and then fix the violations.
3. As an alternative, select a different scan style.
4. Reexecute the **rtldrc** command.

SEE ALSO

```
create_test_clock (2), insert_dft (2), preview (2), rtldrc (2),
set_scan_configuration (2), set_signal_type (2), set_test_hold (2);
test_default_scan_style (3).
```

TEST-1210 (warning) Clock %s reaches %d latches but does not control them throughout the cycle.

DESCRIPTION

You receive this warning message because the **rtldrc** command has found latches that are not controlled by the specified clock signal. The warning occurs if the latch clocks are controllable at the beginning of the cycle, but cannot be controlled in the opposite state when the clock pulse is active. This prevents scan insertion using the multiplexed flip-flop scan style.

The violation is checked with the assumption that the latches should be scanned. This violation is only checked if the scan style is set to multiplexed flip-flop. The check is not made for other scan styles. In addition, the **test_rtldrc_latch_check_style** variable must be set to **scan**.

The warning can be the result of clocks not being defined or conditioned before running the **rtldrc** command. The **rtldrc** command does not infer clocks, but depends on the **create_test_clock**, **set_signal_type**, and **set_test_hold** commands to define the clocks and condition them to reach their destinations.

If all signal definitions are made correctly before **rtldrc** is run, the violation

indicates that there are registers that cannot be controlled by ATPG. If the cause of the violation is not fixed, the registers will be unscannable and fault coverage will be reduced.

WHAT NEXT

No action is required on your part. However, you can determine the cause of the violation and correct the error so that the registers are scannable and the fault coverage is increased.

Make the corrections either by using Autofix (refer to the **insert_dft** command man page for details), or by using the following procedure.

1. Ensure that the test clocks are defined using the **create_test_clock** command and that they are conditioned using **set_signal_type** and **set_test_hold**.
2. Examine the specified latches to determine why they are not controlled by the clock signal and then fix the violations.
3. As an alternative, select a different scan style.
4. Reexecute the **rtldrc** command.

SEE ALSO

```
create_test_clock (2), insert_dft (2), preview (2), rtldrc (2),
set_scan_configuration (2), set_signal_type (2), set_test_hold (2);
test_default_scan_style (3), test_rtldrc_latch_check_style (3).
```

TEST-1211 (warning) Clock %s reaches %d latches but does not hold them transparent at beginning of cycle.

DESCRIPTION

You receive this warning message because the **rtldrc** command has found that the specified clock does not hold the specified latches transparent at the beginning of the cycle. This check is to ensure that a non-scan latch does not introduce sequential behavior into the circuit.

The design is checked with the assumption that the latches should not be scanned. The design is checked for this violation only when the scan style is set to multiplexed flip-flop, unless the **test_rtldrc_latch_check_style** variable is set to **transparent**. The **rtldrc** command checks the design for latch transparency only when specified.

This violation can be caused by clocks not being defined or conditioned before **rtldrc** is run. The **rtldrc** command does not infer clocks, but depends on the **create_test_clock**, **set_signal_type**, and **set_test_hold** commands to define the clocks and condition them to reach their destinations.

If all signal definitions are made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers are hard to control and fault coverage is reduced.

WHAT NEXT

No action is required on your part. However, you can correct this violation as follows:

1. Ensure that the test clocks are defined using the **create_test_clock** command and that they are conditioned using **set_signal_type** and **set_test_hold**.
2. Examine the specified latches to determine why the clock does not hold them transparent, and then fix the violations.
3. As an alternative, enable latch scan ability checks instead of latch transparency checks by changing the value of the **test_rtldrc_latch_check_style** variable to **scan**.
4. Reexecute the **rtldrc** command.

SEE ALSO

create_test_clock (2), **rtldrc** (2), **set_signal_type** (2), **set_test_hold** (2);
test_rtldrc_latch_check_style (3).

TEST-1212 (information) Scan style is '%S'.

DESCRIPTION

You receive this information message when determining the scan style that was used for this **rtldrc** command run.

The scan style is set using either the **set_scan_configuration** command or the **test_default_scan_style** variable. If neither of these is used, the scan style defaults to multiplexed flip-flop.

WHAT NEXT

This is an informational message only. No action is required on your part. However, if the wrong scan style was used, you can change the style and then rerun **rtldrc**.

SEE ALSO

rtldrc (2), **set_scan_configuration** (2); **test_default_scan_style** (3).

TEST-1213 (error) Cell '%s' is not a mapped cell.

DESCRIPTION

You receive this error message because the design used with the `preview_dft` or the `insert_dft` command contains unmapped cells.

WHAT NEXT

Run the `compile` command in `dc_shell` to get a successful compile, and then rerun `preview_dft` or `insert_dft`.

SEE ALSO

`insert_dft` (2), `preview_dft` (2).

TEST-1214 (warning) Following drivers cause contention on bus %S.

DESCRIPTION

You receive this warning message because `rtldrc -tristate` found a bus that might cause a contention state. This occurs when a pattern is found that can simultaneously enable two or more tristate drivers to the same net.

WHAT NEXT

No action is required on your part. However, you can correct your design and eliminate this warning message.

SEE ALSO

`rtldrc` (2).

TEST-1215 (warning) Following drivers cause contention on net %S.

DESCRIPTION

You receive this warning message because `rtldrc -tristate` found a multi-driver net that might cause a contention state. A violation occurs when a pattern is found that

simultaneously drives a different value on the outputs of two gates driving a wire.

WHAT NEXT

No action is required on your part. However, you can correct your design and eliminate the warning message.

SEE ALSO

rtlrdrc (2).

TEST-1216 (warning) Bus '%s' (%s,%s) is capable of being in floating state.

DESCRIPTION

You receive this warning message because **rtlrdrc -tristate** found a bus that is capable of being in a **floating state**. The tool found a pattern that can simultaneously disable all tristate drivers to the same net.

WHAT NEXT

No action is required on your part. However, you can correct your design and eliminate the warning message.

SEE ALSO

rtlrdrc (2).

TEST-1217 (Error) Wrapped core '%s' has '%d' '%s' modes.

DESCRIPTION

You receive this error message because the DFT Compiler found a wrapped core that does not have all of the modes required for core integration. The DFT Compiler requires one or more Internal test modes, one External test mode, one Normal mode, and an optional Isolate mode for a wrapped core to use it in core integration. If Isolate mode is not present, Normal mode is used to put the core in a safe state during core integration.

WHAT NEXT

Verify that Internal test mode, External test mode, and Normal mode are correctly

defined for the specified wrapped core. If any of these test modes are missing, add these test modes. Ensure that there is only one External mode, one Normal mode, and one Isolate mode. before integrating the core.

SEE ALSO

`check_dft` (2).

TEST-1220 (Warning) More than one '%s' mode found on the core '%s', using the '%s' mode '%s' in core integration.

DESCRIPTION

You receive this warning message because the DFT Compiler found more modes than the required number of modes for core integration. The DFT Compiler requires one External test mode, one Normal mode, and an optional Isolate mode for a wrapped core to use it in core integration. If more than one of these modes are found, one of the modes is will be used in core integration.

WHAT NEXT

If the specified mode is not the correct mode, ensure that the model contains only the desired mode of the specified mode type. Otherwise, no action is required on your part.

SEE ALSO

`check_dft` (2).

TEST-1221 (Error) No '%s' mode found for the core '%s'.

DESCRIPTION

You receive this error message because the DFT Compiler cannot find a required mode for core integration. The DFT Compiler requires at least one External test mode and one Normal mode for a wrapped core to use it in core integration.

WHAT NEXT

Add the missing mode to the core so that the core can be used in core integration and then run the command again.

SEE ALSO

`check_dft` (2).

TEST-1222 (Warning) No 'Isolate' mode found for the core '%s', using 'Normal' mode.

DESCRIPTION

You receive this warning message because the DFT Compiler did not find Isolate mode for the specified core. The DFT Compiler requires the optional Isolate mode for all cores to use them in core integration. If an Isolate mode is not found, Normal mode is used for core integration.

WHAT NEXT

If Normal mode is not a safe mode for use with core integration, add Isolate mode to the core before trying core integration again. Otherwise, no action is required on your part.

SEE ALSO

`check_dft` (2).

TEST-1223 (Warning) TCM controller is already inserted for the design '%s', not inserting or modifying the controller logic.

DESCRIPTION

You receive this warning message because the DFT Compiler found TCM controller in the specified design. The DFT Compiler does not modify the existing controller logic or insert a new controller if there is a controller already in the design.

WHAT NEXT

No action is required on your part. However if you intend to run core integration again, run the scan insertion on the design prior to inserting the controller.

SEE ALSO

`check_dft` (2).

TEST-1224 (Error) The scan state is invalid for -physical option in insert_scan, preview_scan, insert_dft and preview_dft

DESCRIPTION

You receive this error message because the scan state should be either **test_ready** (scan replaced) or **scan_existing** (scan routed) for the **-physical** option in the **insert_scan**, **preview_scan**, **insert_dft**, and **preview_dft** commands. If the current state of the design is unknown, this error message prevents a preview or insertion from proceeding.

WHAT NEXT

Set the state using the **set_scan_state** command before using the **-physical** option with the commands mentioned above.

SEE ALSO

insert_dft (2), **insert_scan** (2), **preview_dft** (2), **preview_scan** (2).

TEST-1225 (Error) BIST does not support more than 512 scan chains.

DESCRIPTION

You receive this error message because the BIST Controller supports a maximum of 512 scan chains.

WHAT NEXT

Rerun the BIST Ready step and limit the number of scan chains to less than 512.

SEE ALSO

set_dft_configuration (2), **set_bist_configuration** (2).

TEST-1226 (Error) Could not establish link with Tmax.

DESCRIPTION

You receive this error message because the DFT Compiler is unable to communicate

with the TetraMAX process.

WHAT NEXT

Ensure that the TetraMAX executable is installed and then run the DFT Compiler again.

SEE ALSO

`set_dft_configuration` (2), `set_bist_configuration` (2).

TEST-1227 (Error) Could not access BIST Controller from DesignWare.

DESCRIPTION

You receive this error message because the DFT Compiler is unable to access the BIST Controller from DesignWare.

WHAT NEXT

Check your `search_path` variable and include `dft_lbist.sldb` in your `synthetic_library` variable. Rerun the DFT Compiler.

SEE ALSO

`search_path` (3), `synthetic_library` (3).

TEST-1228 (Error) Could not find "%s" cell in "%s

DESCRIPTION

You receive this error message because the DFT Compiler is unable to find the core cell `core_i` in the TOP design.

WHAT NEXT

If you have instantiated the core design with a cell name other than `core_i` in the TOP design, pass on the core cell name to the `set_bist_configuration` command using the `-core_cell` option.

SEE ALSO

`set_bist_configuration (2)`.

TEST-1229 (Error) Desired cycle compression cannot be achieved. It should be lower than %d.

DESCRIPTION

You receive this error message because your specified cycle compression ratio is too high. It should be lower than the indicated value.

WHAT NEXT

Specify lower cycle compression ratio with `-cycle_compression` option in `set_bist_auto_parameters`.

SEE ALSO

`set_dft_configuration (2)`, `set_bist_configuration (2)`, `set_bist_auto_parameters (2)`.

TEST-1230 (Error) Auto architecting parameters are not specified.

DESCRIPTION

You receive this error message because you specified `-auto` switch in `set_bist_configuration` command, but didn't specify required auto architecting parameters.

WHAT NEXT

Specify auto architecting parameters with `set_bist_auto_parameters` command.

SEE ALSO

`set_dft_configuration (2)`, `set_bist_configuration (2)`, `set_bist_auto_parameters (2)`.

TEST-1231 (Error) Number of fuses '%d' are not sufficient for

the repair chain of length '%d'.

DESCRIPTION

You receive this error message because Core Integration(DFT Compiler - SOC) cannot find sufficient number of fuses to integrate with all MBIST(Tech2) core repair chains. Core Integration requires the number of fusees to be atleast the number of repair bits of all MBIST core repair chains.

WHAT NEXT

Add sufficient fuses for Core Integration to integrate fusees with MBIST core repair chains correctly.

SEE ALSO

```
set_dft_configuration (2). preview_dft (2). insert_dft (2).
```

TEST-1232 (Warning) Fuse Box '%s' segment '%s' is not controlled by a valid clock, ignoring the segment for integration.

DESCRIPTION

You receive this warning message because Core Integration(DFT Compiler - SOC) cannot find a valid clock for the specified fuse box segment. The fuse box segment will be excluded from Core/BSD Integration. Please note that this may cause insufficient number of fuses to integrate with all MBIST(Tech2) core repair chains.

WHAT NEXT

Check if the clock pin of the fuse box segment is connected to a clock port of the current design. If the connected clock port is not recognized by `create_test_protocol`, run `create_test_protocol` with `-infer_clock -infer_async` option. Also make sure that the connected clock port is specified as dft signal of type `bist_clk_lu` so that this clock is also used to connect the MBIST(Tech2) core repair chains. In case of BSD Integration, the connected clock port can also be specified as TAP TCK port.

If the clock pin of fuse box segment is not connected to any clock, Core Integration will automatically connect it to a /fBbist_clk_lu/fP signal if the clock pin has `User snps_bist_clk_lu` attribute in CTL section of the fuse box model for mode type Repair.

If the clock pin of fuse box segment is not connected to any clock, BSD Integration will automatically connect it to TAP TCK port if there is no /fBbist_clk_lu/fP dft signal specified by the user and the fuse box clock pin has `User snps_bist_clk_lu`

attribute in CTL section of the fuse box model for mode type Repair. If there is a / fBbist_clk_lu/fP dft signal, fuse box clock pin is connected to the dft signal.

Fuse Box segment is also not used in integration if the segment is violated by drc. if the segment is violated, fix the violation and rerun integration.

SEE ALSO

`set_dft_configuration` (2), `preview_dft` (2), `insert_dft` (2), `create_test_protocol` (2), `dft_drc` (2).

TEST-1250 (error) No TCK clock information found.

DESCRIPTION

This message is printed out when there is no TCK clock information in the list of input signals in the CTL model.

WHAT NEXT

Make sure that TCK is part of the input signal list in the design.

SEE ALSO

`create_bsd_patterns` (2), `write_test` (2).

TEST-1251 (error) Unable to get BSD waveform table data from CTL.

DESCRIPTION

This message is printed out when the BSD waveform table information is not found in the CTL.

WHAT NEXT

Make sure that BSD waveform data is available in the CTL for the design.

SEE ALSO

`create_bsd_patterns` (2), `write_test` (2).

SEE ALSO

`write_test (2).`

TEST-1281 (error) TCK is not a positive-edge clock.

DESCRIPTION

This message is displayed when a rise time of the TCK is greater than or equal to the fall time of TCK.

WHAT NEXT

Please make sure that the TCK rise & fall times are compatible,

SEE ALSO

`write_test (2).`

TEST-1282 (error) Patterns in CTL refer to unknown signal

groups.

DESCRIPTION

Signal groups should be one of the following: all_inputs, all_outputs or all_bidirectionals. No other signal group labels are recognized.

WHAT NEXT

Please make sure that the signal groups have been named correctly & the signal in each of the group matches the group name.

SEE ALSO

`write_test` (2).

TEST-1301 (warning) No of Chains '%d' exceeds the count supported by the Tester '%d'.

DESCRIPTION

You receive this warning message because the scan chain count exceeds the limits of the Tester specified in the Tester rule file. The warning message occurs when executing the `preview_dft` and `preview_scan` commands.

The warning does not affect the execution of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part. However, you can set the chain count with the `set_scan_configuration` command and then run `preview_dft` or `preview_scan` again.

SEE ALSO

`preview_dft` (2), `preview_scan` (2), `set_scan_configuration` (2).

TEST-1302 (warning) Chain length '%d' for chain '%s' exceeds

the Tester limit '%d'.

DESCRIPTION

You receive this warning message because the scan chain length exceeds the limits of the Tester specified in the Tester rule file. The warning message occurs when executing the **preview_dft** and **preview_scan** commands.

The warning does not affect the results of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part. However, you can set the chain length with the **set_scan_path** command and run **preview_dft** or **preview_scan** again.

SEE ALSO

preview_dft (2), **preview_scan** (2), **set_scan_path** (2).

TEST-1303 (warning) No of pins '%d' exceeds the count supported by Tester '%d'.

DESCRIPTION

You receive this warning message because the pin count exceeds the limits of the Tester specified in the Tester rule file. The warning message occurs when executing the **preview_dft** and **preview_scan** commands.

The warning does not affect the results of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part.

SEE ALSO

preview_dft (2), **preview_scan** (2).

TEST-1304 (warning) Clock period '%f'ns is less than minimum

Tester limit '%f'ns'.

DESCRIPTION

You receive this warning message because the clock period is less than the minimum limit of the Tester specified in the Tester rule file. The warning message occurs when executing the **preview_dft** and **preview_scan** commands.

The warning does not affect the results of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part. However, you can set the clock period with the **test_default_period** environment variable and then run **preview_dft** or **preview_scan** again.

SEE ALSO

[preview_dft \(2\)](#), [preview_scan \(2\)](#); [test_default_period \(3\)](#).

TEST-1305 (warning) Clock period '%f'ns is greater than maximum Tester limit '%f'ns.

DESCRIPTION

You receive this warning message because the clock period is more than the maximum limit of the Tester specified in the Tester rule file. The warning message occurs when executing the **preview_dft** and **preview_scan** commands.

The warning does not affect the results of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part. However, you can set the clock period with the **test_default_period** environment variable and then run **preview_dft** or **preview_scan** again.

SEE ALSO

[preview_dft \(2\)](#), [preview_scan \(2\)](#); [test_default_period \(3\)](#).

TEST-1306 (warning) Shift clock period '%f'ns is less than minimum Tester limit '%f'ns.

DESCRIPTION

You receive this warning message because the test clock period is less than the minimum limit of the Tester specified in the Tester rule file. The warning message occurs when executing the **preview_dft** and **preview_scan**.

The warning does not affect the results of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part. However, you can set the clock period with the **test_default_period** environment variable and then run **preview_dft** or **preview_scan** again.

SEE ALSO

preview_dft (2), **preview_scan** (2); **test_default_period** (3).

TEST-1307 (warning) Shift clock period '%f'ns is greater than maximum Tester limit '%f'ns.

DESCRIPTION

You receive this warning message because the clock period is more than the maximum limit of the Tester specified in the Tester rule file. The warning message occurs when executing the **preview_dft** and **preview_scan** commands.

The warning does not affect the results of the commands that perform tester rule checking.

WHAT NEXT

No action is required on your part. However, you can set the clock period with the **test_default_period** environment variable and then run **preview_dft** or **preview_scan** again.

SEE ALSO

preview_dft (2), **preview_scan** (2); **test_default_period** (3).

TEST-1308 (warning) Checks for Tester '%s' defined in file

DESCRIPTION

You receive this warning message indicating the Tester and the name of the file for which the tester rule checking is done. Tester rule checking is done for the **preview_dft**, **preview_scan**, **insert_dft**, and **insert_scan** commands.

The message appears for **preview_dft** and **preview_scan** only after displaying any messages for violations.

The message does not affect the result of these commands.

WHAT NEXT

No action is required on your part.

SEE ALSO

preview_dft (2), **preview_scan** (2).

TEST-1309 (warning) Tester rule checking violations for Tester '%s' in file %s.

DESCRIPTION

You receive this warning message indicating the Tester and the name of the file for which the tester rule checking is done and the violations found. Tester rule checking is done for the **preview_dft**, **preview_scan**, **insert_dft**, and **insert_scan** commands.

The message appears for **insert_dft** and **insert_scan** only after doing the checks and only if there is a violation.

The message does not affect the result of these commands.

WHAT NEXT

Correct the design using this diagnostic information and run the command again.

SEE ALSO

insert_dft (2), **insert_scan** (2).

TEST-1310 (Error) Invalid test protocol. Create a test protocol again.

DESCRIPTION

You receive this error message because design rule checking is unable to find a valid test protocol for the current design.

The test protocol is created using the **create_test_protocol** command or is specified using the **read_test_protocol** command. Once created, the protocol is invalidated by changes to the design or specifications.

For example, suppose you have created a test protocol in TOP design. Running `insert_dft` in sub designs might invalidate the protocol of TOP design because it might have caused design change, and the protocol no longer matches the changed design.

WHAT NEXT

Check your specifications and recreate the protocol using the **create_test_protocol** command. If necessary, first remove the existing protocol using the **remove_test_protocol** command.

EXAMPLES

The following example removes a existing test protocol, and creates a new test protocol in memory for the current design:

```
dc_shell> remove_test_protocol
dc_shell> create_test_protocol
```

SEE ALSO

create_test_protocol (2), **read_test_protocol** (2), **remove_test_protocol** (2), **dft_drc** (2).

TEST-1311 (Error) Could not perform design rule checking.

DESCRIPTION

You receive this error message because the **dft_drc** command did not complete successfully.

WHAT NEXT

Look at the preceding messages for an explanation. The most common reasons are:

- Invalid protocol
- Bad specification

Correct the condition and rerun the **dft_drc** command.

SEE ALSO

create_test_protocol (2), **insert_dft** (2), **insert_scan** (2), **preview_dft** (2),
preview_scan (2), **read_test_protocol** (2), **remove_test_protocol** (2), **dft_drc** (2).

TEST-1312 (Error) Could not create test protocol.

DESCRIPTION

You receive this error message because the **create_test_protocol** command could not create a test protocol.

WHAT NEXT

Check your design and specification. It is good practice to specify all your clocks and asynchs before creating a test protocol.

SEE ALSO

create_test_protocol (2), **read_test_protocol** (2), **remove_test_protocol** (2), **dft_drc** (2).

TEST-1313 (Error) Could not run pre-dft design rule checking.

DESCRIPTION

You receive this error message because test design rule checking was not performed while running the **preview_dft** or **insert_dft** command.

Test design rule checking is invoked when **preview_dft** or **insert_dft** is run with test-point applications (such as Autofix) specified using the **set_dft_configuration** command.

Test design rule checking performs two functions:

1. Performs pre-DFT test design rule checking
2. Designs test-points for the specified DFT applications.

WHAT NEXT

Review the preceding messages for the cause of the failure. The most common reasons for test design rule checking failure are as follows:

- Invalid test protocol
- Invalid specifications
- Incorrect designs
- Incorrect TMAX installation
- Problem while designing test-points

Correct the condition and rerun the **preview_dft** or **insert_dft** command.

SEE ALSO

create_test_protocol (2), **insert_dft** (2), **insert_scan** (2), **preview_dft** (2),
preview_scan (2), **read_test_protocol** (2), **remove_test_protocol** (2),
set_dft_configuration (2), **dft_drc** (2).

TEST-1314 (Error) Test design rule checking reported FATAL violations.

DESCRIPTION

You receive this error message because test design rule checking (DRC) found test design rule violations that must be corrected.

If the **dft_drc** information is out-of-date, the **preview_scan**, **insert_scan**, **preview_dft**, or **insert_dft** commands invoke the test DRC. The test DRC checks the current design against the test design rules of the scan test implementation specified by the **set_scan_configuration** command with the **-style** and **-methodology** options. When the test DRC completes, it issues this message if the tool found any fatal violations. Fatal violations prevent you from continuing with the **preview_scan**, **insert_scan**, **preview_dft**, or **insert_dft** commands.

WHAT NEXT

Check the violations found by the test DRC. Do not proceed to scan insertion or to ATPG without first checking the violations.

If you did not run **dft_drc** explicitly and the scan insertion or ATPG is unsatisfactory, run the **dft_drc** command. Read the Test Design Rule Violation Summary and the Sequential Cell Summary at the end of the **dft_drc** report. If there are any violations, review the violations and their causes before you proceed. Fatal violations must be fixed before you can proceed.

To understand the violations, read the two Summaries and the more detailed information generated by the **dft_drc** command. If you need details of all of the violations found by **dft_drc**, rerun **dft_drc** in verbose mode (**dft_drc -verbose**).

The best practice is to run **dft_drc** explicitly and read the violation reports before you run **preview_scan** or **insert_scan**. Because **preview_scan** and **insert_scan** only run **dft_drc** if you have not run **dft_drc** explicitly, you do not save any time by not running **dft_drc** explicitly.

SEE ALSO

insert_dft (2), **insert_scan** (2), **preview_dft** (2), **preview_scan** (2),
set_scan_configuration (2), **dft_drc** (2).

TEST-1315 (warning) Ignoring attribute '%s' on pin '%s', because the cell value '%s' does not refer to a valid BIST-wrapped memory.

DESCRIPTION

You receive this warning message when you use the **set_attribute** command to manually specify the mapping of a BIST-wrapped memory cell to the MBIST controller port associated with the pin that holds the attribute. The specified cell is not recognized as a BIST-wrapped memory, so the attribute is ignored.

WHAT NEXT

No action is required on your part if you are satisfied with the current result.

However, to eliminate the warning message, ensure that the cell name used in the attribute is correct. Also ensure that the CTL model is present and correct. The cell is not recognized as a BIST-wrapped memory when the CTL model is missing or incorrect. Use the **read_test_model** command to read the correct model for the BIST-wrapped memory.

SEE ALSO

insert_dft (2), **preview_dft** (2), **read_test_model** (2), **set_attribute** (2),
set_dft_configuration (2).

TEST-1316 (warning) Ignoring attribute '%s' on pin '%s', because the cell value '%s' refers to a BIST-wrapped memory that is incompatible with memory BIST controller port %d.

DESCRIPTION

You receive this warning message when you use the **set_attribute** command to manually specify the mapping of a BIST-wrapped memory cell to the MBIST controller port associated with the pin that holds the attribute. Each port of the MBIST controller is customized to support a particular type of memory. The warning message indicates that the specified BIST-wrapped memory is incompatible with the port associated with the pin attribute, so the attribute is ignored.

WHAT NEXT

No action is required on your part if you expected this result.

However, if you want to eliminate this warning message, use the **preview_dft** command to see how the BIST-wrapped memories are mapped to the ports of the MBIST controller. Determine which ports are assigned to the type of BIST-wrapped memory in this warning message, and use the **set_attribute** command on a pin associated with one of those ports.

SEE ALSO

insert_dft (2), **preview_dft** (2), **set_attribute** (2), **set_dft_configuration** (2).

TEST-1317 (warning) Ignoring attribute '%s' on pin '%s', because the BIST-wrapped memory '%s' is already mapped to port %d of the same memory BIST controller.

DESCRIPTION

You receive this warning message when you use the **set_attribute** command to manually specify the mapping of a BIST-wrapped memory cell to the MBIST controller port associated with the pin that holds the attribute. This warning message indicates that multiple ports of the same MBIST controller refer to the same BIST-wrapped memory cell. Since a BIST-wrapped memory must be associated with exactly one MBIST controller port, the second specification attribute is ignored.

WHAT NEXT

No action is required on your part if you expected this result.

However, to eliminate the warning message, use the **remove_attribute** command to remove excess specifications that refer to this BIST-wrapped memory.

SEE ALSO

insert_dft (2), **preview_dft** (2), **remove_attribute** (2), **set_attribute** (2),
set_dft_configuration (2).

TEST-1318 (warning) Ignoring attribute '%s' on pin '%s', because the cell value '%s' refers to a BIST-wrapped memory that is mapped to another memory BIST controller.

DESCRIPTION

You receive this warning message when you use the **set_attribute** command to manually specify the mapping of a BIST-wrapped memory cell to the MBIST controller port associated with the pin that holds the attribute. This warning message indicates that the same BIST-wrapped memory cell is referenced by multiple MBIST controllers. Since a BIST-wrapped memory must be associated with exactly one MBIST controller port, the second specification attribute is ignored.

WHAT NEXT

No action is required on your part if you expected this result.

However, to avoid the warning message, use the **remove_attribute** command to eliminate excess specifications that refer to this BIST-wrapped memory.

SEE ALSO

insert_dft (2), **preview_dft** (2), **remove_attribute** (2), **set_attribute** (2),
set_dft_configuration (2).

TEST-1319 (warning) MBIST controller port %d for cell %s is not connected to a BIST-wrapped memory.

DESCRIPTION

You receive this warning message when all available BIST-wrapped memories are assigned to the MBIST controller, and there are control ports remaining. The MBIST controller and BIST-wrapped memories are always generated so that there are no leftover control ports.

WHAT NEXT

No action is required on your part if you expected this result.

However, to avoid the warning message, ensure that all of the BIST-wrapped memory instances are instantiated in your design. Use the `read_test_model` command to read the correct models for all BIST-wrapped memories.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1320 (warning) BIST-wrapped memory '%s' is not connected to an MBIST controller.

DESCRIPTION

You receive this warning message because the BIST-wrapped memory could not be assigned to an MBIST controller. The warning message occurs if you load the incorrect model for the MBIST controller and/or the BIST-wrapped memory. The message also occurs when you instantiate more instances of the memory than were specified when you generated the MBIST logic.

WHAT NEXT

No action is required on your part if you expected this result.

However, to eliminate the warning message, examine your design to ensure that the MBIST controller and BIST-wrapped memories match what was specified during MBIST generation. Also, verify that you are loading the correct models by running the `read_test_model` command.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1321 (error) Port '%s' can not drive core cell '%s' pin '%s' and core cell '%s' pin '%s' in test mode '%s', because the cell designs are different.

DESCRIPTION

You receive this error message when you try to test two cores in parallel, but pins

from each core require potentially different input values on the same top-level port. In this case, the fact that the cells are different implies that the patterns are different, which causes the data conflict on the port.

WHAT NEXT

Use the `define_test_mode` and `set_test_target` commands to test these cores in separate test modes.

SEE ALSO

`define_test_mode (2)`, `set_test_target (2)`.

TEST-1322 (error) Port '%s' can not drive core cell '%s' pin '%s' and core cell '%s' pin '%s' in test mode '%s', because the pins are different.

DESCRIPTION

You receive this error message when you try to test two cores in parallel, but pins from each core require potentially different input values on the same top-level port. In this case, the fact that the pins are different implies that the pattern data for each pin is different, which causes the data conflict on the port.

WHAT NEXT

Use the `define_test_mode` and `set_test_target` commands to test these cores in separate test modes.

SEE ALSO

`define_test_mode (2)`, `set_test_target (2)`.

TEST-1323 (error) Port '%s' can not drive core cell '%s' pin '%s' and core cell '%s' pin '%s' in test mode '%s', because the core modes '%s' and '%s' are different.

DESCRIPTION

You receive this error message when you try to test two cores in parallel, but pins from each core require potentially different input values on the same top-level

port. In this case, the cells are the same and the pins are the same, but the cells are tested in different modes. The fact that the modes are different implies that the patterns are different, which causes the data conflict on the port.

WHAT NEXT

Use the `define_test_mode` and `set_test_target` commands to test these cores in separate test modes. You can also use the `set_test_target` command to test the cores in the same core mode.

SEE ALSO

`define_test_mode` (2), `set_test_target` (2).

TEST-1324 (error) Signal type is either invalid or bi-directional for signal %s in the CTL model for memory '%s'.

DESCRIPTION

You receive this message because either the signal type specified in the memory CTL model is invalid or the signal has been defined as a bidirectional pin. MBIST insertion flow does not accept either of the above two cases.

WHAT NEXT

Please change the signal type in the CTL model.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1325 (error) Value Range for all the address pins should be same in the CTL model for memory '%s'.

DESCRIPTION

You receive this message because the value range specified for all the address pins in the memory CTL model is not same. MBIST insertion flow requires the value range of all the address pins to be same.

WHAT NEXT

Please change the value range for the address pins in the CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1326 (error) For every ‘Read’ port, there should be a separate ‘Write’ port in the CTL model for memory ‘%s’.

DESCRIPTION

You receive this message because the ports specified in the memory CTL model have either a common enable signal, an address port, a read port or a write port. The ports specified can only have a common clock signal. For every read port there should be a separate write port and vice versa.

WHAT NEXT

Please remove the common signal or port from the port declaration in the CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1327 (error) %s port in the CTL model for memory ‘%s’ has invalid synchronous behavior.

DESCRIPTION

You receive this message because the output or input port(s) specified in the memory CTL model have invalid synchronous behavior. The output/input port(s) can be specified as synchronous under the following conditions.

- a. If one input port is synchronous, all input ports should be synchronous.
- b. If one output port is synchronous, all output ports should be synchronous.
- c. If one output port is synchronous, all input ports should be synchronous.

WHAT NEXT

Please correct the synchronous behavior of the port in the CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1328 (error) DelayCycles cannot be specified for data %s in the CTL model for memory '%s'.

DESCRIPTION

You receive this message because DelayCycles cannot be specified in the memory CTL model for Tech1 output or input ports that are not Synchronous. Tech2 does not support DelayCycles at all (the value, if present, must be 0).

WHAT NEXT

Please remove the DelayCycles specification from the CTL model or, for Tech1, you can declare the signal as Synchronous.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1329 (error) Invalid signal 'ActiveState' specified for %s in the CTL model for memory '%s'.

DESCRIPTION

You receive this message because the signal Active State specified in the memory CTL model is invalid. The ActiveState should be either ForceUp or ForceDown.

WHAT NEXT

Please change the signal ActiveState in the CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1330 (error) Signal 'ActiveState' specified is not same for

all the control signals in the CTL model for memory '%s'.

DESCRIPTION

You receive this message because the signal Active State specified in the memory CTL model is different for the control signals of a port. For each port, the ActiveState for all control signals should be either ForceUp or ForceDown.

WHAT NEXT

Please change the signal ActiveState in the CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1331 (error) The mode type for current test mode "%s" is not valid.

DESCRIPTION

You receive this message because the mode type for the current test mode is not "InternalTestMode" or "DebugMode".

WHAT NEXT

Change the current test mode to a mode mode that has a valid test mode.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1332 (error) The current test mode is not a valid MBIST test mode.

DESCRIPTION

You receive this message because the family specified in the test model is not "SNPS_MBIST_encapsulated". This could be because the design does not correspond to a memory, the family has been wrongly specified or the current test mode is not a valid MBIST test mode.

WHAT NEXT

Please change the current test mode to a valid test mode or change the family name in the CTL test model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1333 (error) The integer constant %s is not defined in the encapsulated memory CTL model.

DESCRIPTION

You receive this message because the integer constant is not specified in the test model. This could be because either it is not specified or it is wrongly spelled in the CTL model for the current test mode.

WHAT NEXT

Please specify the integer constant in the current test mode in the CTL test model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1334 (error) Delay cycles value %s is more than 2 for data %s in the CTL model for memory '%s.

DESCRIPTION

You receive this message because delay cycles value cannot be greater than 2 in the memory CTL model for output or input ports.

WHAT NEXT

Please remove the delay cycles specified for the port in the CTL model or declare the port delay cycles to be less than 2.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1335 (error) Signal %s is not declared in the internal block of mode %s in the CTL model for memory %s.

DESCRIPTION

You receive this message because the signal declaration is missing in the internal block in the ctl model.

WHAT NEXT

Please remove the signal from the the CTL model or add declaration for the signal in the internal block. For muxed memories, BIST_mode must contain all signals - including the system signals that are bypassed by the embedded mux and all bypass signals. When in doubt, add the signal as DataType Unused.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1336 (error) Error: Memory %s signal %s is CTL DataType %s which must have Signals direction IN.

DESCRIPTION

You receive this message because the signal direction is not defined IN in the signals block of the ctl model.

WHAT NEXT

Please change the signal direction in the signals block of the CTL model or change the DataType for the signal in the internal block.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1337 (error) Memory %s signal %s is CTL DataType %s

which must have Signals direction OUT.

DESCRIPTION

You receive this message because the signal direction is not defined OUT in the signals block of the ctl model.

WHAT NEXT

Please change the signal direction in the signals block of the CTL model or change the DataType for the signal in the internal block.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1338 (error) Memory %s signal %s is CTL DataType %s which must have Signals direction IN or OUT.

DESCRIPTION

You receive this message because the signal direction should be either defined IN or OUT in the signals block of the ctl model.

WHAT NEXT

Please change the signal direction in the signals block of the CTL model or change the DataType for the signal in the internal block.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1339 (error) Memory %s CTL mode %s signal %s has unsupported DataType %s.

DESCRIPTION

You receive this message because the signal DataType specified for the signal in the ctl model is not supported. The valid DataTypes are MasterClock, CoreSelect, MemAddr, MemWrite, Constant, TestMode, MemData, Functional and Synchronous.

WHAT NEXT

Please change the DataType for the signal in the CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1340 (error) DataType MemoryData is mandatory for port %d in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signal of DataType MemoryData is not specified in the CTL model. The memory port in the CTL model should have atleast one signal of DataType MemoryData with signal direction IN and one signal of DataType MemoryData with signal direction OUT.

WHAT NEXT

Please add the signal of DataType MemoryData in the CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1341 (error) Port %d with input bus of DataType MemoryData must have a signal with DataType MemoryWrite in the Ctl model of memory %s.

DESCRIPTION

You receive this message because a port that has a signal of DataType MemoryData and signal direction IN is required to have a signal of DataType MemoryWrite in the CTL model.

WHAT NEXT

Please add the signal of DataType MemoryWrite to the port in the CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1342 (error) Port %d with signal DataType MemoryWrite should have input bus of DataType MemoryData in the Ctl model of memory %s.

DESCRIPTION

You receive this message because a port that has a signal of DataType MemoryWrite is required to have a signal of DataType MemoryData and signal direction IN in the CTL model.

WHAT NEXT

Please add the signal of DataType MemoryData with signal direction IN to the port in the CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1343 (error) No address bus defined for port %d in the Ctl model of memory %s.

DESCRIPTION

You receive this message because a port is required to have a signal of DataType Memoryaddr in the CTL model.

WHAT NEXT

Please add the signal of DataType MemoryAddr to the port in the CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1344 (error) Relation block does not exist in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the relation block that contains the port specifications is missing in the memory CTL model.

WHAT NEXT

Please add port declaration and the relation block in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1345 (error) No ports are defined in the relation block of the Ctl model of memory %s.

DESCRIPTION

You receive this message because the relation block does not contain the port specifications in the memory CTL model.

WHAT NEXT

Please add port declaration in the relation block in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1346 (error) MasterClock must be defined for all of the Relation Ports, no Relation Ports, or just the write Relation Ports in the Ctl model for %s.

DESCRIPTION

You receive this message because the MasterClocks are inconsistent membership in the

Relation Ports of your memory model. You can explicitly include a MasterClock on every Port. Alternatively, you can exclude the MasterClock from all Ports. In this case, the MasterClocks are considered global to all Ports. In the special case where a memory has synchronous write and asynchronous read, you can assign MasterClocks only to write Ports.

WHAT NEXT

Please modify the Port declaration in the Relation block in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1347 (error) Signal %s of DataType MemData has not been assigned to any port in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signal declared in the Signals block of DataType MemData has not been assigned to any port in the Relation block in the memory CTL model. All the signals of DataType MemData have to be assigned to a port.

WHAT NEXT

Please assign the signal to a port in the relation block in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1348 (error) Signal %s of DataType %s can not have value range in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signal declared in the Internal block cannot have ValueRange specified in the memory CTL model. ValueRange can be specified only for signals of DataType MemAddr.

WHAT NEXT

Please remove the ValueRange for the signal in the internal block in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1349 (error) Signal %s of DataType %s can not be defined to be synchronous in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signal declared in the Internal block cannot be specified to be Synchronous in the memory CTL model. Signals of DataType MemData only can be specified to be Synchronous.

WHAT NEXT

Please specify the signal in the internal block as non-synchronous in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1350 (error) Signal %s of signalType Pseudo can not be defined in the port %d declaration of the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signal declared in the port is of type Pseudo in the memory CTL model. Signals of type Pseudo cannot be specified in a port declaration.

WHAT NEXT

Please remove the signal from the port declaration in the memory CTL model.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1351 (error) Signal %s cannot be shared in port %d and port %d of the Ctl model of memory %s.

DESCRIPTION

You receive this message because the control signal declared in the port cannot be shared amongst different ports in the memory CTL model. The signals that fall in this category are of DataType MemWrite and CoreSelect.

WHAT NEXT

Please remove the signal that is being shared from the port declaration in the memory CTL model.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1352 (error) Width %d of signal %s of DataType %s does not match width %d of signal %s in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signals of the DataType declared in the memory CTL model have different widths. The valid CTL models require all the widths of the signals of the DataType MemAddr to be the same and the widths of all the signals of DataType MemData to be the same.

WHAT NEXT

Please change the widths to be the same for all the signals of the DataType in the memory CTL model.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1353 (error) Width %d of signal %s of DataType %s is not in the specified range of %d to %d bits in the Ctl model of memory %s.

DESCRIPTION

You receive this message because the signal of the DataType declared in the memory CTL model has a signal width that is not valid. The valid CTL models require all the widths of the signals of the DataType MemoryAddress to be in the range of 3 to 24 bits. The widths of all the signals of DataType MemoryData should be in the range 3 to 256 bits. When the MBIST technology is tech1 and a ValueRange is specified in the CTL model for a memory address buss, then the corresponding signal of DataType MemoryAddress must be in the range of 4 to 24 bits.

WHAT NEXT

Please change the widths for all the signals of the DataType in the memory CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), set_mbist_configuration (2), read_test_model (2),  
set_dft_configuration (2).
```

TEST-1354 (error) Memory %s is missing required BIST_mode with TestMode InternalTest and required Mission_mode with TestMode Normal.

DESCRIPTION

You receive this message because the Environment block in the CTL model is missing the Mission_mode and the BIST_mode blocks. The Normal, SNPS_memory, and InternalTest tokens are required in the Mission_mode and BIST_mode blocks for MBIST automation to recognize the memory.

WHAT NEXT

Please add the Mission_mode and BIST_mode blocks in the memory CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1355 (error) Signal %s of DataType Constant cannot have an ActiveState in memory CTL model %s.

DESCRIPTION

You receive this message because the signal in the CTL model of DataType Constant cannot have an ActiveState.

WHAT NEXT

Please change the signal DataType or remove the ActiveState for the signal in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1356 (error) Signal %s of DataType Constant can only have signal direction In in memory CTL model %s

DESCRIPTION

You receive this message because the signal in the CTL model of DataType Constant does not have the signal direction In.

WHAT NEXT

Please change the signal DataType or change the the signal direction to In in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1357 (error) No. of controllers specified in the '-num_controllers' switch more than the no. of available

memories.

DESCRIPTION

You receive this message because the number of controllers that you want to create are more than the total number of memories available for MBIST insertion. MBIST insertion requires every controller to be connected to atleast one memory. This could be because you have already assigned all the memories to the user defined controllers.

WHAT NEXT

Please specify a lower number of controllers using 'set_mbist_configuration' command or remove some of the memories from the list of memories assigned to the user specified controllers.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_mbist_configuration (2).  
set_dft_configuration (2).
```

TEST-1358 (error) All the memory BIST algorithms cannot be switched off simultaneously.

DESCRIPTION

You receive this message because you have turned off all the three MBIST algorithms i.e., Marchlr, Marchc and Mats. MBIST flow requires atleast one algorithm to be switched on.

WHAT NEXT

Please specify the MBIST algorithms to run using 'set_mbist_run' (or 'set_testbench_parameters' in XG mode) command.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_mbist_configuration (2).  
set_dft_configuration (2).
```

TEST-1359 (error) All the memories cannot be disabled

simultaneously in the current test mode.

DESCRIPTION

You receive this message because you have disabled all the memories connected to a controller in the current test mode. MBIST flow requires atleast one memory to be enabled.

WHAT NEXT

Please specify the memories to be enabled using 'set_mbist_run' (or 'set_testbench_parameters' in XG mode) command.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_mbist_configuration (2).  
set_dft_configuration (2).
```

TEST-1360 (error) Upper value %d for the ValueRange specified for signal %s of DataType %s is greater than %d in the memory Ctl model %s.

DESCRIPTION

You receive this message because the signal of the DataType MemAddr declared in the memory CTL model has an upper value for the ValueRange higher than the specified limit. The upper limit for the ValueRange for an address bus of width 'w' should not exceed $(2^w - 1)$.

WHAT NEXT

Please change the ValueRange for the signal of the DataType in the memory CTL model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1361 (error) Signal %s of DataType %s is specified in

both %s and Bypass_mode.

DESCRIPTION

You receive this message because the signal of a particular DataType is also specified in a mode other than Bypass_mode in the memory CTL model. The signals declared in the Bypass mode of DataType MemAddr, MemData, MemWrite and CoreSelect should be specified as Unused in all the other modes.

WHAT NEXT

Please change the DataType of the signal in other modes in the memory CTL model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1362 (error) Port %d in Bypass_mode should have at least one signal of DataType TestMode for memories with embedded multiplexer.

DESCRIPTION

You receive this message because the output port of the muxed-memory is missing the signal of DataType TestMode in the memory CTL model. Since the Bypass_mode has been declared, the output port should have a control signal to bypass the memory output.

WHAT NEXT

Please add a signal of DataType TestMode to the reported port in the Bypass_mode of the memory Ctl model.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1363 (error) The input data bus width %d and output data bus width %d are not same for the Read/Write port %d in

memory Ctl model %s.

DESCRIPTION

You receive this message because the read/write port specified in the memory Ctl model has unequal widths for signals of DataType MemoryData. You either described a signal wrongly as of DataType MemoryData in Internal block and included it in the port declaration or you have specified multiple data buses for the same port by mistake. For example, if a two port memory has DA and DB as input buses and QA and QB as output buses, the correct declaration for the two ports is:

```
Port 'CLKA+CENA+OENA+WENA+AA[10..0]+DA[7..0]+QA[7..0]' 0; Port  
'CLKB+CENB+OENB+WENB+AB[10..0]+DB[7..0]+QB[7..0]' 1;
```

Here the input data bus width = output data bus width = 8. The wrong port declaration is:

```
Port 'CLKA+CENA+OENA+WENA+AA[10..0]+DA[7..0]+QA[7..0]' 0; Port  
'CLKB+CENB+OENB+WENB+AB[10..0]]+DA[7..0]+DB[7..0]+QB[7..0]' 1;
```

Here the input data bus width = 16 and output data bus width = 8.

WHAT NEXT

Please specify the signals of DataType MemoryData correctly in the port in the memory Ctl model.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1370 (error) The first rising or falling edge of clock '%s' should be greater than 0.0 (rise time = %.2f, fall_time = %.2f).

DESCRIPTION

You receive this error message because the timing waveform of any clock should have rising or falling edge greater than 0.

WHAT NEXT

Check your protocol file or your script file that specifies timing waveforms of clocks.

SEE ALSO

`create_test_protocol` (2), `create_test_clock` (2), `dft_drc` (2).

TEST-1371 (error) Strobe time %.2f is in the active state of clock '%s' (rise_time = %.2f, fall_time = %.2f)

DESCRIPTION

You receive this error message because strobe time is in the active state of clock period. Strobe time should be before or after the active state of clock period.

WHAT NEXT

Check the value of variable 'test_default_strobe' and change it to specify correct timing.

SEE ALSO

`create_test_protocol` (2), `create_test_clock` (2), `dft_drc` (2).

TEST-1372 (error) Strobe time %.2f is between (clock A start time = %.2f, clock B end time = %.2f)

DESCRIPTION

You receive this error message because strobe time is in the active states of two LSSD clocks. The strobe time must be before or after the active state of clock period.

WHAT NEXT

Check the value of variable 'test_default_strobe' and change it to specify correct timing.

SEE ALSO

`create_test_protocol` (2), `create_test_clock` (2), `dft_drc` (2).

TEST-1373 (error) Cannot use PLL_BYPASS option if the

design does not support PLL.

DESCRIPTION

You receive this error message because you specified the PLL_BYPASS option in the command **set_mbist_run** (or **set_testbench_parameters** in XG mode). The use of this parameter is allowed only when the design supports PLL.

WHAT NEXT

Delete the PLL_BYPASS option specified in the command **set_mbist_run** (or **set_testbench_parameters** in XG mode) .

SEE ALSO

preview_dft (2), **set_mbist_run** (2). **set_testbench_parameters** (2).

TEST-1374 (error) enable|disable are the only allowed values of PLL_BYPASS option.

DESCRIPTION

You receive this error message because you specified a wrong value of the PLL_BYPASS option in the command **set_mbist_run** (or **set_testbench_parameters** in XG mode). ENABLE|DISABLE are the only allowed values of PLL_BYPASS option.

WHAT NEXT

Use ENABLE|DISABLE as right values of the PLL_BYPASS option in the command **set_mbist_run** (or **set_testbench_parameters** in XG mode).

SEE ALSO

preview_dft (2), **set_mbist_run** (2). **set_testbench_parameters** (2).

TEST-1375 (error) Signal %s is a reference clock with a period which is different from the default tester period.

DESCRIPTION

You receive this message because you have specified another type on a signal

previously declared as reference clock. This reference clock signal has a period different from the default tester period (`test_default_period`). The command is therefore rejected.

WHAT NEXT

Please change the period of the reference clock to match the `test_default_period` value, using `-period` option. Or do not specify another type for this signal.

SEE ALSO

`remove_dft_signal` (2), `report_dft_signal` (2).

TEST-1376 (error) The `-period` option can only be used for signals of type refclock.

DESCRIPTION

You receive this message because you specified a period value for a signal which is not of type refclock.

WHAT NEXT

Please remove the `-period` option or change the type of your signal.

SEE ALSO

`remove_dft_signal` (2), `report_dft_signal` (2).

TEST-1377 (warning) Ignoring period specification.

DESCRIPTION

You receive this warning because you declare as a reference clock a port previously specified otherwise. In this case, a period different than the default test period is rejected.

WHAT NEXT

You can go through the rest of the flow (in this case, the period of the reference clock is the default tester period (`default_test_period`) or remove the previous specification of this signal.

SEE ALSO

`remove_dft_signal (2)`, `report_dft_signal (2)`.

TEST-1378 (information) Unspecified timing is set to `rise_time = %.3f` and `fall_time = %.3f`.

DESCRIPTION

You receive this message because you did not specify the timing of your reference clock signal. The default value for the rise time is $0.25 * \text{period}$ and for the fall time $0.75 * \text{period}$.

WHAT NEXT

You can go through the rest of the flow or use "-timing

SEE ALSO

`remove_dft_signal (2)`, `report_dft_signal (2)`.

TEST-1379 (information) Unspecified timing has been set to `rise_time = %.3f` and `fall_time = %.3f`.

DESCRIPTION

You receive this message because you did not specify the timing of a reference clock. Its timing has been set to the previously specified timing.

SEE ALSO

`remove_dft_signal (2)`, `report_dft_signal (2)`.

TEST-1380 (warning) This signal should also be defined as MasterClock for dual usage.

DESCRIPTION

You receive this message because your reference clock has the default tester period.

Or you did not specify the period of your reference clock signal. In this case, you should also declare this signal as a MasterClock to avoid DRC errors.

WHAT NEXT

Please, specify the reference clock as a MasterClock in case of dual usage.

SEE ALSO

`remove_dft_signal (2)`, `report_dft_signal (2)`.

TEST-1381 (error) Incorrect size of the clock controller bit list.

DESCRIPTION

You receive this message because you have used an incorrect number of elements to specify the clock controller bit list. The size of the clock controller bit list should be a multiple of three.

WHAT NEXT

You can go through the rest of the flow or use "-ctrl_bits

SEE ALSO

`set_dft_signal (2)`,

TEST-1382 (error) Incorrect cycle number %s in the clock controller bit list.

DESCRIPTION

You receive this message because you have specified at least one incorrect cycle number in the clock controller bit list. The type of the cycles should be an alpha numeric value.

WHAT NEXT

You can go through the rest of the flow or use "-ctrl_bits

SEE ALSO

`set_dft_signal (2),`

TEST-1383 (error) Pin %s doesn't exist in the design.

DESCRIPTION

You receive this message because you have specified an nonexistent pin name in the clock controller bit list.

WHAT NEXT

You can go through the rest of the flow or use "-ctrl_bits

SEE ALSO

`set_dft_signal (2),`

TEST-1384 (error) Invalid active value %s for a clock controller bit.

DESCRIPTION

You receive this message because you have specified an invalid active value for at least one clock controller bit. The active value of clock controller bits should be either 0 or 1.

WHAT NEXT

You can go through the rest of the flow or use "-ctrl_bits

SEE ALSO

`set_dft_signal (2),`

TEST-1385 (error) Clock generator %s not defined.

DESCRIPTION

You receive this message because the clock generator was not specified. The clock generator should be specified using "set_dft_signal" as a ScanMasterClock and as an Oscillator before using it in the "-pll_clock

SEE ALSO

`set_dft_signal (2),`

TEST-1386 (error) Clock controller bits not specified.

DESCRIPTION

You receive this message because the clock controller bits were not specified. The clock controller bits should be specified using "-ctrl_bits" switch of the "set_dft_signal

SEE ALSO

`set_dft_signal (2),`

TEST-1387 (warning) The %s value of signal %s has been changed to %.2f.

DESCRIPTION

You receive this message because the resolution of your reference clock signal exceeds Picosecond unit.

WHAT NEXT

DFT tool has automatically set the value to the corresponding integer value in Picosecond. User can always re-specify the reference clock timing values using `set_dft_signal` command.

SEE ALSO

`remove_dft_signal (2), report_dft_signal (2).`

TEST-1401 (warning) a protocol already exists in mode '%s' and will be deleted.

DESCRIPTION

This warning is issued when DFTC reads a new test protocol when it has a test protocol already. The DFTC will delete the existing test proocol and read the new test protocol.

WHAT NEXT

Check whether the new test protocol is compatible with other test modes.

SEE ALSO

`read_test_protocol(2), remove_test_protocol(2).`

TEST-1402 (warning) a protocol already exists in mode '%s.' Please use `remove_test_protocol` command to delete the existing test protocol.

DESCRIPTION

This warning is issued when DFTC attempts to read a new test protocol when it has a test protocol already. The DFTC cannot overwrite the existing test proocol.

WHAT NEXT

Check whether to delete the existing protocol or not. Use `remove_test_protocol` command to delete the protocol.

SEE ALSO

`read_test_protocol(2), create_test_protocol(2), remove_test_protocol(2).`

TEST-1403 (error) cannot delete protocol from the mode '%s'.

DESCRIPTION

This error is issued when DFTC cannot delete a test protocol from the specified test

mode. One of the common reasons is that this test mode has a protocol inherited from 'all_dft' mode, and there are more than one test modes that have test protocols inherited from the 'all_dft' mode.

WHAT NEXT

Check other test modes and see if their protocols are inherited from the parent test mode of this mode. Then, remove the test protocol from 'all_dft' mode.

You can always delete a protocol from 'all_dft' mode.

SEE ALSO

`read_test_protocol(2), list_test_modes(2), create_test_protocol(2),
remove_test_protocol(2).`

TEST-1410 (error) PLL clock %s test model is missing or incomplete. Please check if you have a correct test model.

DESCRIPTION

This error is issued when DFTC cannot find a test model for clock controller/chain. You might have read a wrong test model or did not read any of them.

One of the common reasons is that the test model is missing 'SNPS_CLOCK_chain' or 'SNPS_CLOCK_controller' family type in the test model. Please check the model and consult with the CTL test model guide line.

WHAT NEXT

Check if you have read a test model for the clock controller/chain correctly. Check if there are any error messages during reading.

SEE ALSO

`read_test_model(2), write_test_model(2), list_test_modes(2).`

TEST-1500 (error) Specified test program "%s

DESCRIPTION

You receive this message because you have specified a test program that does not exists in the current CTL model or in the specified CTL model (if you called the 'define_mbist_program' command with the '-model' parameter). In order to copy test

programs in the current CTL model you have to use the "define_mbist_program" command.

WHAT NEXT

Please copy the MBIST test programs you want to use using the "define_mbist_program" command.

SEE ALSO

```
define_mbist_program (2) set_mbist_configuration (2) insert_dft (2), preview_dft  
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1501 (error) Using different test programs types for a controller

DESCRIPTION

You receive this message because you have specified different test programs types for a controller (e.g. single port and multiple port test programs)

WHAT NEXT

Specify the same type of test algorithms for a controller

SEE ALSO

```
define_mbist_program (2) set_mbist_configuration (2) insert_dft (2), preview_dft  
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1502 (error) Invalid test program "%s

DESCRIPTION

You receive this message because you have specified a test program that does not contain any algorithm or background or the algorithm is empty.

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (XG) set_mbist_configuration (2) insert_dft (2),  
preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1503 (error) Too many sequences in the test "%s

DESCRIPTION

You receive this message because the number of sequences of the specified test exceeds the supported range.

WHAT NEXT

Specify a canned algorithm or create a new one with fewer sequences and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1504 (error) Empty Sequence %d of test "%s

DESCRIPTION

You receive this message because the sequence is empty.

WHAT NEXT

Specify a valid and not empty test sequence.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1505 (error) Number of ports must be the same for all test

sequences of program "%s

DESCRIPTION

You receive this message because you specified a test that has different number of port sections for sequences.

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1506 (error) Too many port sections in test "%s

DESCRIPTION

You receive this message because you specified a test that has too many port sections in at least one sequence.

WHAT NEXT

Specify a valid test sequence.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1507 (error) Invalid port section %d in sequence %d of test "%s

DESCRIPTION

You receive this message because you specified a test that has an invalid port section

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1508 (error) Invalid number of operations in test "%s

DESCRIPTION

You receive this message because you specified a test that contains a MarchSweep sequence where not all port sections have the same number of operations. Reported port/sequence number starts from 0.

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1509 (error) Too many operations in test "%s

DESCRIPTION

You receive this message because you specified a test that contains a port section with too many operations

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1510 (error) Test data background value of test "%s

DESCRIPTION

You receive this message because you specified a test that contains an invalid test data background value

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1511 (error) Test data background size of test "%s

DESCRIPTION

You receive this message because you specified a test that contains an invalid test data background size or the specified test data background size is too small to code the test data background value

WHAT NEXT

Specify a canned algorithm or create a new one and use "define_mbist_program" command to copy it in the current CTL model.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_run (2) or  
set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft  
(2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1512 (error) Test background sizes must be the same for all the tests of the controller

DESCRIPTION

You receive this message because you have specified multiple test programs for a controller but tests using different test background sizes.

WHAT NEXT

Specify tests using the same test background size or create new test backgrounds using "define_mbist_program" command.

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1513 (error) Invalid value for the CNTRL_SEL or CONTROL_SEL_<CORE_ID> parameter: %s

DESCRIPTION

This is issued from the command **set_mbist_run** (or **set_testbench_parameters** in XG mode) because the CNTRL_SEL or CONTROL_SEL_<CORE_ID> parameter is not valid. The CNTRL_SEL and CONTROL_SEL_<CORE_ID> parameters control which controllers are enabled on reset. The value is a hexadecimal digit in which each bit represents a controller. By default, all controllers are enabled on reset.

WHAT NEXT

Run "preview_dft" to see how controllers are mapped.

SEE ALSO

```
set_mbist_controller (2) set_mbist_configuration (2) insert_dft (2), preview_dft
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1514 (error) Invalid value for the FAIL_LIMIT parameter

DESCRIPTION

You receive this message because you have specified a wrong value for the FAIL_LIMIT parameter or the specified value does not address a valid controller in the current design. Should be a integer positive value greater than zero.

WHAT NEXT

Specify a positive integer value.

SEE ALSO

`set_mbist_configuration (2)` `set_mbist_controller (2)` `insert_dft (2)`, `preview_dft (2)`, `read_test_model (2)`, `set_dft_configuration (2)`.

TEST-1515 (error) Invalid memory IP parameter entry "%s

DESCRIPTION

You receive this message because you have specified a wrong memory IP parameter

WHAT NEXT

Re-specify the IP parameters

SEE ALSO

`set_mbist_element (2)` or `set_mbist_wrapper (2)` (XG) `define_mbist_program (2)`,
`set_mbist_configuration (2)` `insert_dft (2)`, `preview_dft (2)`, `read_test_model (2)`,
`set_dft_configuration (2)`.

TEST-1516 (error) Invalid controller IP parameter entry "%s

DESCRIPTION

You receive this message because you have specified a wrong controller IP parameter

WHAT NEXT

Re-specify the IP parameters, using the "set_mbist_controller" command

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1517 (error) Specification of incompatible parameters

DESCRIPTION

You receive this message because you have specified in the "define_mbist_program" command the parameter "-CTL" simultaneously with "-algorithm_name" or "-background_name".

WHAT NEXT

Re-specify the command by using only the "-CTL" parameter

SEE ALSO

```
define_mbist_program (2) set_mbist_configuration (2) insert_dft (2), preview_dft
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1518 (error) Wrong Test in controller "%s" as the number of ports of test "%s"

DESCRIPTION

You receive this message because you have specified a test program that contains a different ports number than the memories inside the controller.

WHAT NEXT

Re-specify the test programs for that controller

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1519 (error) Invalid value for the NUM_FAULTS_SWEEP

parameter

DESCRIPTION

You receive this message because you specified an invalid integer value for the NUMFAULTS_SWEEPn parameter

WHAT NEXT

Specify an integer positive value

SEE ALSO

`set_mbist_run (2) or set_testbench_parameters (2)` (in **XG** mode)
`set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2),`
`set_dft_configuration (2).`

TEST-1520 (error) Incorrect number of memories %d assigned to controller "%s

DESCRIPTION

You receive this message because you specified an incorrect number of memories for a controller

WHAT NEXT

Re-specify the memories for that controller

SEE ALSO

`set_mbist_controller (2) set_mbist_configuration (2) insert_dft (2), preview_dft (2),`
`read_test_model (2), set_dft_configuration (2).`

TEST-1521 (error) Invalid Memory "%s" in Controller "%s

DESCRIPTION

You receive this message because you specified a memory with an incompatible number of test ports for the specified controller

WHAT NEXT

Re-specify the memories for that controller

SEE ALSO

```
set_mbist_controller (2) set_mbist_configuration (2) insert_dft (2), preview_dft  
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1522 (error) Memory "%s" sizes of controller "%s"

DESCRIPTION

You receive this message because you specified a memory which is incompatible with the MBIST IP technology

WHAT NEXT

Do not read the test model for that memory design.

SEE ALSO

```
set_mbist_controller (2) set_mbist_configuration (2) insert_dft (2), preview_dft  
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1523 (error) Invalid Read Operation index %d in Port %d of MarchSweep %d of Test %s %s

DESCRIPTION

You receive this message because you specified an incorrect test algorithm that reads invalid data. There are two possible causes:

- 1) There is a Read Foreground operation after a Write Background or a Read Background after a Write Foreground.
- 2) The Read Operation is invalid, because the Read was performed before the Write Operation initialized the memory. This usually occurs on the first MarchSweep of the Algorithm when the memory is uninitialized. It may also occur during a MarchSweep that changes the Data Pattern, when the memory is initialized with a different pattern than the one you are trying to read.

WHAT NEXT

Re-specify the algorithm of the test program

SEE ALSO

```
define_mbist_program (2) set_mbist_controller (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1524 (error) Multiple WRITE operations on the same port offsets operation index %d in port %d of sequence %d of test %s

DESCRIPTION

You receive this message because you specified an incorrect test algorithm. There are simultaneous WRITE operations on ports having the same row and column offsets

WHAT NEXT

Re-specify the algorithm of the test program

SEE ALSO

```
define_mbist_program (2) set_mbist_controller (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1525 (error) Diagnosis specific parameter "%s"

DESCRIPTION

You receive this message because you have specified a parameter that is valid only for diagnosis modes

WHAT NEXT

Do not specify this parameter in a non-diagnosis mode.

SEE ALSO

```
set_mbist_run (2) or set_testbench_parameters (2) (in XG mode)
set_mbist_configuration (2) set_mbist_controller (2) insert_dft (2), preview_dft
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1526 (error) The root clock period must be at least twice than the controller %d clock period when runtime programmability is enabled "%dns" "%dns

DESCRIPTION

You receive this message because you specified a wrong clock period for a controller. The clock of the controller must be at least two times faster than the clock of the root.

WHAT NEXT

Re-specify the controller clock or the root clock

SEE ALSO

```
set_mbist_run (2) or set_testbench_parameters (2) (in XG mode)
set_mbist_configuration (2) set_mbist_controller (2) insert_dft (2), preview_dft
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1527 (error) The parameter FAIL_LIMIT is not valid when specifying a runtime programmable test program

DESCRIPTION

You receive this message because you specified the FAIL_LIMIT simultaneously with a runtime test program

WHAT NEXT

Re-specify the parameters

SEE ALSO

```
set_mbist_run (2) or set_testbench_parameters (2) (in XG mode)
set_mbist_configuration (2) set_mbist_controller (2) insert_dft (2), preview_dft
(2), read_test_model (2), set_dft_configuration (2).
```

TEST-1528 (error) The parameter NUM_FAULTS_SWEEP is valid only when specifying a runtime programmable test

program

DESCRIPTION

You receive this message because you specified the FAIL_LIMIT without specifying a test program

WHAT NEXT

Re-specify the parameters

SEE ALSO

`set_mbist_run (2) or set_testbench_parameters (2)` (in **XG** mode)
`set_mbist_configuration (2) set_mbist_controller (2) insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1529 (error) Unknown MBIST Technology. Aborting the command

DESCRIPTION

You receive this message because you did not specify a MBIST Technology.

WHAT NEXT

Specify the MBIST Technology using the "set_mbist_configuration" command with the parameter "-tech"

SEE ALSO

`set_mbist_configuration (2) set_mbist_controller (2) insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1530 (error) Missing test program name

DESCRIPTION

You receive this message because you did not specify a name for the MBIST program definition

WHAT NEXT

Specify a name

SEE ALSO

```
define_mbist_program (2) set_mbist_configuration (2) set_mbist_controller (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1531 (error) Invalid ValueRange specified for signal %s of
DataType %s for the MBIST Technology tech2 in the memory
CTL model %s

DESCRIPTION

You receive this message because the signal of the DataType MemAddr declared in the memory CTL model has an invalid ValueRange specified. The ValueRange must be in the range 0 to $2^{\text{addr_width}} - 1$.

WHAT NEXT

Please set the ValueRange for the signal of the DataType MemAddr in the memory CTL model to be within the acceptable range.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1532 (error) Invalid offsets specified for port section %d in
sequence %d of test "%s

DESCRIPTION

You receive this message because you specified a row or column offsets for the first port section or an invalid value for these for the second port section. The row and the column offsets are only valid for the second or more port section, as it represents a value relative to the port section one. The row and column offsets can be 0 or 1.

WHAT NEXT

Specify the correct values for the row and column offsets (for the second port

section, not for the first one).

SEE ALSO

```
define_mbist_program (2) set_mbist_run (2) or set_testbench_parameters (2) (in XG mode) set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1533 (error) Pipeline option can not be activated for memory "%s" because it is disabled in the containing controller "%s

DESCRIPTION

You receive this message because you activated the pipeline option for a memory but not for the controller which tests this memory.

WHAT NEXT

In order to use this option for the memory, you have to enable it first in the controller

SEE ALSO

```
set_mbist_element (2) or set_mbist_wrapper (2) (XG) set_mbist_controller (2) set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1534 (error) Asynchronous Memory "%s

DESCRIPTION

You receive this message because you are using an asynchronous memory with the MBIST technology tech2. This kind of memories are not yet supported by tech2.

WHAT NEXT

You should set the NOTOUCH option for this memory using the set_mbist_element command. Or in XG mode, you should exclude the memory using the set_mbist_configuration command.

SEE ALSO

```
set_mbist_element (2) or set_mbist_wrapper (2) (XG) set_mbist_controller (2)
set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2),
set_dft_configuration (2).
```

TEST-1535 (error) Invalid ColumnMultiplexing value "%d" in the MemoryProperties block of memory "%s

DESCRIPTION

You receive this message because you are using MBIST tech2 and the value for ColumnMultiplexing in your memory is invalid or missing. Here are conditions for ColumnMultiplexing:

- ColumnMultiplexing must always be specified - there is no default value.
- The maximum value is 64.
- The value must be a power of 2.
- The value must be an integer divisor of the number of words in your memory.

WHAT NEXT

You should set the NOTOUCH option for this memory using the set_mbist_element command. Or in XG mode, you should exclude the memory using the set_mbist_configuration command.

SEE ALSO

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1536 (error) Man page not used any more

DESCRIPTION

You receive this message because...

WHAT NEXT

Re-specify the algorithm of the test program.

SEE ALSO

```
define_mbist_program (2) set_mbist_controller (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1537 (error) Invalid NOP Operation index %d in Port %d of MarchSweep %d of Test %s. NOP not allowed for single-port Algorithms.

DESCRIPTION

You receive this message because you specified an incorrect single-port test algorithm. The NOP Operation is not supported for single-port Algorithms. In this case, the MBIST IP is designed to continuously read or write to the memory.

WHAT NEXT

Re-specify the algorithm of the test program.

SEE ALSO

```
define_mbist_program (2) set_mbist_controller (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1538 (error) MBIST clock signal %s was specified without a corresponding scan clock definition.

DESCRIPTION

You receive this message because you specified an MBIST clock without specifying a corresponding scan clock. This is required to identify the clock for DRC clock tracing that maps the clock port to memory clock pins.

WHAT NEXT

Use the `create_test_clock` command to specify a scan clock for the same clock signal.

SEE ALSO

```
set_mbist_configuration (2) create_test_clock (2) test_default_period (3)
```

TEST-1539 (error) Clock period for MBIST clock signal %s is not twice as fast as the test default period.

DESCRIPTION

You receive this message because you either didn't specify an MBIST clock for the given signal, or you specified an MBIST clock that runs at the same frequency as the tester period (test default period). For MBIST Tech2, the memory clock must be at least twice as fast as the tester clock that drives the MBIST root module. The clock differential is required to support the handshaking between the MBIST root and the MBIST controller(s).

WHAT NEXT

Use the `create_test_clock` command to specify a faster MBIST clock.

SEE ALSO

`set_mbist_configuration` (2) `create_test_clock` (2) `test_default_period` (3)

TEST-1540 (error) Simultaneous read and write operations from Test "%s" Operation index %d of MarchSweep %d are not supported by the global SimultaneousReadWrite capabilities "%s" of the controller "%s

DESCRIPTION

You receive this message because you specified an incorrect dual-port test algorithm for the respective controller. The memories contained controlled by this controller are not supporting the specified simultaneous read and write operations. Note that when combining memories with both SimultaneousRWStyle LaterVal and FormerVal capabilities, the simultaneous operation beside the read operation for a Write can only be a NOP, a Read DontCare or a Read Expected operation.

WHAT NEXT

Re-specify the algorithm of the test program or choose another test program. Try using Read Expected when not sure about the Read operation value.

SEE ALSO

`define_mbist_program` (2) `set_mbist_controller` (2) `set_mbist_configuration` (2)
`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1541 (error) Expected data in Operation %d in Port %d of MarchSweep %d of Test "%s

DESCRIPTION

You receive this message because you specified a test algorithm which is containing operations using expected data. This is not supported in the current release.

WHAT NEXT

Re-specify the algorithm of the test program or choose another test program.

SEE ALSO

```
define_mbist_program (2) set_mbist_controller (2) set_mbist_configuration (2)  
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1542 (error) Sequence %d of test %s does not contain enough operations. At least %d operations are required.

DESCRIPTION

You receive this message because you specified a run-time test algorithm with sequences that are too short for the chosen group of memories. When memories are very small, or the MBIST clock is very fast, the test sequence execution can complete before the programming stream has finished loading the next sequence. In this case, the MBIST IP restarts the original sequence and becomes unsynchronized with the protocol. If the estimated required number of operations depasses the maximal number of operations allowed per sequence, that you should try to lower the MBIST clock.

WHAT NEXT

Re-specify the algorithm of the test program or choose another test program.

SEE ALSO

```
define_mbist_program (2) set_mbist_run (2) or set_testbench_parameters (2) (in XG  
mode) set_mbist_controller (2) set_mbist_configuration (2) insert_dft (2),  
preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1543 (error) Port section %d of MarchSweep %d of test

%s contains column offsets specification which is not supported for dual port RAMs from controller "%s

DESCRIPTION

You receive this message because you specified a test algorithm with sequences that contains port sections with column offsets specification for a controller that contains dual port memories with ColumnMultiplexing=1.

WHAT NEXT

Re-specify the algorithm of the test program or choose another test program.

SEE ALSO

```
define_mbist_program (2) set_mbist_controller (2) set_mbist_configuration (2)
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1544 (error) Memory signal "%s" of type %s is shared accross ports in the Relation section of the CTL model of memory "%s

DESCRIPTION

You received this message because you specified a CTL model that contains a Relation block incompatible with the MBIST IP technology.

WHAT NEXT

Re-specify the CTL model of the memory.

SEE ALSO

```
set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2),
set_dft_configuration (2).
```

TEST-1545 (error) Invalid MBIST configuration parameter entry

"%S

DESCRIPTION

You receive this message because you have specified an invalid MBIST configuration parameter. The parameter you specified may be an unrecognized parameter name or value, or it may be invalid for the MBIST technology that you have chosen.

WHAT NEXT

Review the valid parameters for your MBIST technology using the "man set_mbist_configuration" command, and re-specify the parameters.

SEE ALSO

`set_mbist_configuration` (2) `insert_dft` (2), `preview_dft` (2), `read_test_model` (2),
`set_dft_configuration` (2).

TEST-1546 (Error) Unable to read ROM initialization file "%S

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode). The command is not able to read the file specified due to errors given before.

WHAT NEXT

Check the content file syntax against the supported standard.

TEST-1547 (Error) Unable to find address and/or data out in CTL model for "%S

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode). The command is not able to find the definition of the data (MemoryData) output signal or/and the address (MemoryAddress) signals in the InternalTest section of the CTL memory model.

WHAT NEXT

Review the CTL memory model file corresponding to the memory instance.

SEE ALSO

`read_test_model (2)`

TEST-1548 (Error) The memory instance list includes RAM and ROM.

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode). The command cannot manage RAM and ROM instances in the same list because each ROM instance needs a corresponding content file.

WHAT NEXT

Split the `set_mbist_element` command line into two (or more) fB `set_mbist_element` command lines with different memory instance lists by taking care of not mixing RAM with ROM instances inside each list.

SEE ALSO

`set_mbist_element (2) set_mbist_wrapper (2) (for XG mode)`

TEST-1549 (Error) Content file list specified for RAM instances.

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because the content file list is specified for RAM instances. The content file list has to be specified only for ROM instances.

WHAT NEXT

Delete the content file list or change the RAM instance list to a ROM instance list.

SEE ALSO

`set_mbist_element (2) set_mbist_wrapper (2) (XG)`

TEST-1550 (Error) Unable to find content file list.

DESCRIPTION

This is issued from the command **set_mbist_element** (or **set_mbist_wrapper** in XG mode). The command is not able to find the content file list used to describe the ROM instance list.

WHAT NEXT

Add a content file name into the content file list for each ROM instance.

SEE ALSO

set_mbist_element (2) **set_mbist_wrapper** (2) (**XG**)

TEST-1551 (Error) Invalid content file list.

DESCRIPTION

This is issued from the command **set_mbist_element** (or **set_mbist_wrapper** in XG mode) because the content file number is not equal to the ROM instance number.

WHAT NEXT

Review the content file list or the ROM instance list.

SEE ALSO

set_mbist_element (2) **set_mbist_wrapper** (2) (**XG**)

TEST-1552 (error) Invalid value for the RETENTION parameter

DESCRIPTION

You receive this message because you did not specify a correct value for the RETENTION parameter. YES and NO are the only valid values. The default value for RETENTION is NO.

WHAT NEXT

Run "preview_dft" to see the algorithms that support retention test.

SEE ALSO

`set_mbist_element (2) or set_mbist_wrapper (2) (XG) set_mbist_controller (2)`
`set_mbist_configuration (2)`

TEST-1553 (error) No retention test in diagnosis mode.

DESCRIPTION

You receive this message because you specified the RETENTION parameter in diagnosis mode. This version of Memory BIST Compiler supports retention test only in go nogo mode.

WHAT NEXT

Change the diagnosis mode in go nogo mode.

SEE ALSO

`set_mbist_element (2) or set_mbist_wrapper (2) (XG) set_mbist_controller (2)`
`set_mbist_configuration (2)`

TEST-1554 (error) No retention test for Programmable BIST.

DESCRIPTION

You receive this message because you specify the RETENTION parameter for Programmable BIST. This version of Memory BIST Compiler supports retention test only for Synthesis BIST.

WHAT NEXT

Delete the RT_TEST parameter in order to perform retention test for Synthesis BIST.

SEE ALSO

`set_mbist_element (2) or set_mbist_wrapper (2) (XG) set_mbist_controller (2)`
`set_mbist_configuration (2)`

TEST-1555 (Warning) the fail limit value is different from the

maximum number of test in a ROM controller ('%d' in this case)

DESCRIPTION

You received this message because you specified a fail limit value smaller or greater than the maximum number of ROM controller tests. This fail limit value does not allow to run all the ROM tests (if smaller) or it waste test time (if greater) in the case of only ROM's controllers.

WHAT NEXT

Review the Memory BIST preview and modify the fail limit value.

SEE ALSO

`preview_dft` (2)

TEST-1556 (Error) Invalid character %c detected at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the specified file contains illegal characters.

WHAT NEXT

Review the content of the trace file.

SEE ALSO

`report_mbist_trace` (2)

TEST-1557 (Error) An error occurred in the translation of the diagnosis %s packet timer at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the trace file does not match the current design

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace (2)`

TEST-1558 (Error) Invalid test algorithm %s used for a DPRAM memory at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the usage of an invalid algorithm has been detected.

WHAT NEXT

Review the content of the trace file or re-specify the algorithm

SEE ALSO

`report_mbist_trace (2)`

TEST-1559 (Error) Cannot extract field %s from trace file at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the trace file is invalid for the current design

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace (2)`

TEST-1560 (Warning) Ignoring the value of Background field in test "%s

DESCRIPTION

You received this message because you specified a run-time test program that contains a value for the Background of the Test program different than zero. For the run-time programmability only the Background value zero is considered.

WHAT NEXT

Review the test program

SEE ALSO

`define_mbist_program` (2) `set_mbist_run` (2) or `set_testbench_parameters` (2) (in **XG** mode)

TEST-1561 (Error) Unknown diagnosis trace version %d detected at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the trace file is invalid for the current design

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace` (2)

TEST-1562 (Error) Invalid value for the memory ID field %d detected at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the

trace file is invalid for the current design. The memory ID should be smaller than the total number of memories from the specified controller.

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace` (2)

TEST-1563 (Error) Invalid value for the packet ID field %d detected at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the trace file is invalid for the current design. The packet ID field specifies the memory type SRAM or ROM.

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace` (2)

TEST-1564 (Error) Can not recover the test algorithm index %d of controller index %d from the current CTL model at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the trace file is invalid for the current design. The packet ID field specifies the memory type SRAM or ROM.

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace (2)`

TEST-1565 (Error) The specified test program is not compatible with the controller index %d

DESCRIPTION

You received this message because you specified an SP-RAM test algorithm for a DP-RAM controller or vice versa.

WHAT NEXT

Specify a compatible test algorithm

SEE ALSO

`report_mbist_trace (2)`

TEST-1566 (Error) Operation %s is not supported in SPRAM test program "%s"

DESCRIPTION

You received this message because you specified an Expected or DontCare Operation types inside a SP-RAM test algorithm.

WHAT NEXT

Rewrite the SP-RAM test algorithm without using Expected or DontCare Operation types.

SEE ALSO

`define_mbist_program (2)`

TEST-1567 (Error) Invalid %s Operation type for Write Operation %d of port %d in MarchSweep %d of test program

"%S

DESCRIPTION

You received this message because you specified an Expected or DontCare Operation types for a Write Operation.

WHAT NEXT

Rewrite the test algorithm without using Write Expected or Write DontCare Operation.

SEE ALSO

`define_mbist_program` (2)

TEST-1568 (Warning) Grouping Memories with incompatible R/W ports (Memory "%s" simultaneous read/write style is not compatible with the Controller "%s")

DESCRIPTION

You received this message because you grouped memories with different simultaneous read/write capabilities in the same controller. This limits the simultaneous read/write test capabilities of the respective controller.

WHAT NEXT

Regroup the memories in different controllers.

SEE ALSO

`set_mbist_controller` (2) `preview_dft` (2)

TEST-1569 (Error) %d port memory "%s" is assigned to the controller "%s"

DESCRIPTION

You received this message because you tried to group multiport memories in a controller with run-time programability capabilities.

WHAT NEXT

Regrop the memories in different controllers.

SEE ALSO

`set_mbist_controller` (2) `preview_dft` (2)

TEST-1570 (Error) The specified algorithm contains PAUSE sequences and can not be used for run-time programmability

DESCRIPTION

You received this message because you tried use a test program containing PAUSE sequences in run-time mode

WHAT NEXT

Respecify the test program

SEE ALSO

`set_mbist_run` (2) or `set_testbench_parameters` (2) (in `XG` mode) `report_mbist_trace` (2) `define_mbist_program` (2)

TEST-1571 (Error) Cannot use content_file or content_format arguments

DESCRIPTION

You received this message because you tried to specify the `content_file` or `content_format` as arguments of `set_mbist_element` (or `set_mbist_wrapper` in `XG` mode). Those arguments are valid only for Memory BIST Compiler Tech 2

WHAT NEXT

Delete `content_file` or `content_format` arguments if you are using Memory BIST Compiler Tech 1 otherwise set the Memory BIST Compiler Tech 2 by using the `set_mbist_configuration` command

SEE ALSO

`set_mbist_configuration (2)`

TEST-1572 (error) %s Port %d of memories inside controller "%s" can not perform operation type %s index %d from Port section %d of MarchSweep sequence %d of test program "%s"

DESCRIPTION

You receive this message because you specified a test algorithm that tries to Read from a Write Only memory port or to Write in a Read Only memory port. The controller global Read/Write properties correspond to the lowest capable memory inside that controller.

WHAT NEXT

Specify another test program

SEE ALSO

`define_mbist_program (2)` `set_mbist_controller (2)` `set_mbist_run (2)` or
`set_testbench_parameters (2)` (in **XG** mode)

TEST-1573 (error) misr_size parameter value %d must be in the range 2 to 128.

DESCRIPTION

You receive this message because you have specified an invalid misr_size parameter value.

WHAT NEXT

Specify a misr_size that is in the range 2 to 128.

SEE ALSO

`set_mbist_element (2)` or `set_mbist_wrapper (2)` (XG)

TEST-1574 (error) Test with no Background "%s" is not compatible with RAM controller "%s

DESCRIPTION

You receive this message because you have specified a test program that does not contain a background specification for a RAM controller. This kind of tests can be used only with controller of type ROM.

WHAT NEXT

Re-specify the test programs for that controller

SEE ALSO

```
set_mbist_controller (2) define_mbist_program (2) set_mbist_configuration (2)  
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

TEST-1575 (error) No contents file specified for ROM instance %s.

DESCRIPTION

You must specify the contents file for every ROM instance with the **set_mbist_element** (or **set_mbist_wrapper** in XG mode) command. The contents are used to calculate the expected MISR signature.

WHAT NEXT

Use the **set_mbist_element** command to specify the contents file for this ROM instance. If you think this memory is being erroneously treated as a ROM, check the model to make sure it has a data input port.

SEE ALSO

```
set_mbist_element (2) or set_mbist_wrapper (2) (XG)
```

TEST-1576 (error) Could not find any valid memories for MBIST

insertion.

DESCRIPTION

You received this message because the MBIST dft configuration is enabled, but no memories were identified for testing. Memories are identified through their CTL test models. The flow for using these models depends on which dc_shell mode you are using.

Flow for dcsh and dctcl modes

1) Enable test models

```
dc_shell> set test_use_test_models true
```

2) Use the **read_test_model** command to load test models for all of your memory designs.

3) Link your design after you have read the test models.

Flow for dcxg mode

1) Enable test models

```
dc_shell> set test_xg_use_models true
```

2) Use the **read_test_model** command to load test models for all of your memory designs.

3) Use the **use_test_model** command to use the memory test models instead of the gate-level design.

4) Link your design at any time.

WHAT NEXT

Use the correct test model flow for your memory designs.

SEE ALSO

```
read_test_model (2), use_test_model (2), set_dft_configuration (2),  
set_mbist_element (2) or set_mbist_wrapper (2) (XG)
```

TEST-1577 (error) Memory %s is a %s, but controller %s can only test %ss.

DESCRIPTION

You received this message because you attempted to test RAMs and ROMs with the same

controller. A given controller can test either SPRAMs, DPRAMs or ROMs.

WHAT NEXT

Use the /fBset_mbist_controller/fP command to assign RAMs and ROMs to separate controllers.

SEE ALSO

`set_mbist_controller` (2)

TEST-1578 (error) Test "%s" is not compatible with ROM controller "%s"

DESCRIPTION

You receive this message because you have specified a test program that contains a background specification, which cannot be used by a ROM controller. ROM Tests must contain only an Algorithm.

WHAT NEXT

Re-specify the test programs for that controller

SEE ALSO

`set_mbist_controller` (2) `define_mbist_program` (2) `set_mbist_configuration` (2)
`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

TEST-1579 (Error) Invalid value for the controller ID field %d detected at line %d

DESCRIPTION

This is issued from the command `report_mbist_trace` because the content of the trace file is invalid for the current design. The controller ID should be smaller than the total number of controllers from the specified design.

WHAT NEXT

Review the content of the trace file

SEE ALSO

`report_mbist_trace (2)`

TEST-1580 (error) Scramble map %s is an invalid map type in the ScrambleMaps section of the CTL model of memory %. The left-hand side of the scramble map must be LA (logical address).

DESCRIPTION

You received this message because you specified a CTL model with a ScrambleMaps block that is incompatible with the MBIST IP technology. Only topological address to logical address maps are supported. These maps are of the form:

`LA[n] = TA[n];`

WHAT NEXT

Re-specify the ScrambleMaps block of the CTL model of the memory.

If your memory requires data scramble maps, Memory BIST Compiler can not support your memory at this time. You should not load this memory model and leave the memory un-BISTed.

SEE ALSO

`set_mbist_configuration (2)` `insert_dft (2)`, `preview_dft (2)`, `read_test_model (2)`,
`set_dft_configuration (2)`.

TEST-1581 (error) Scramble map %s has an incompatible right-hand side term %s in the ScrambleMaps section of the CTL model of memory %s.

DESCRIPTION

You received this message because you specified a CTL model with a semantically incorrect ScrambleMaps block. There can be two causes for this error.

- 1) You specified a data bit (LD or TD) on the right-hand side of an address expression (LA). Address expressions can only have address terms on the right-hand side.
- 2) You specified the same topology (either L or T) on both sides of the assignment.

If the left-hand side is logical, all of the right-hand side terms must be topological.

WHAT NEXT

Re-specify the ScrambleMaps block of the CTL model of the memory.

SEE ALSO

```
set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2),
set_dft_configuration (2).
```

TEST-1582 (error) Scramble map %s is repeated in the ScrambleMaps section of the CTL model of memory %s.

DESCRIPTION

You received this message because you specified a CTL model with a ScrambleMaps block that contains a repeated scramble map. Each left-hand side term can be used only once.

WHAT NEXT

Remove the redundant map from the ScrambleMaps block of the CTL model of the memory.

SEE ALSO

```
set_mbist_configuration (2) insert_dft (2), preview_dft (2), read_test_model (2),
set_dft_configuration (2).
```

TEST-1583 (error) Scramble map term %s index is out of range in the ScrambleMaps section of the CTL model of memory %s. The index value must be in the range 0 to %d.

DESCRIPTION

You received this message because you specified a CTL model with a semantically incorrect ScrambleMaps block. The bit index refers to an address or data signal that doesn't exist.

WHAT NEXT

Re-specify the ScrambleMaps block of the CTL model of the memory.

SEE ALSO

define_mbist_program (2) set_mbist_run (2) or set_testbench_parameters (2) (in XG mode) report_mbist_trace (2)
```

TEST-1594 (Error) Wrong Memory "%s

DESCRIPTION

You received this message because you specified more than one mask in the CTL model of the memory. You must use only one specification, either use a write enable bus with size greater than 1 (or 2 for DPRAMs), either use a signal of type "User snps_memory_write_mask both in the same time.

WHAT NEXT

Re-specify the test program

SEE ALSO

```
define_mbist_program (2) set_mbist_run (2) or set_testbench_parameters (2) (in XG mode) report_mbist_trace (2)
```

TEST-1595 (Error) FixedAddress statements are not supported

in ROM like algorithm "%s

DESCRIPTION

You received this message because you specified FixedAddress statements inside an algorithm that does not contain Write operations, which is most likely a ROM test program. FixedAddress statements are only supported for RAMs for now.

WHAT NEXT

Re-specify the test program

SEE ALSO

`define_mbist_program (2) set_mbist_run (2) or set_testbench_parameters (2)` (in **XG** mode) `report_mbist_trace (2)`

TEST-1596 (Error) Memory "%s

DESCRIPTION

You received this message because you specified a memory to be part of more controllers in the same time. This is not allowed.

WHAT NEXT

Re-specify the controller configuration

SEE ALSO

`set_mbist_controller (2)`

TEST-1597 (error) No pause in controller's hardwired algorithms.

DESCRIPTION

You receive this message because you set the RETENTION parameter to ON but there are no controller's hardwired algorithms with pause.

WHAT NEXT

Look at the Memory BIST preview and specify an algorithm with pause for at least one controller.

SEE ALSO

`preview_dft (2)` `set_mbist_controller (2)`

TEST-1599 (error) Cannot specify AddressValue statements of type Absolute for test "%s"

DESCRIPTION

You receive this message because you specified an AddressValue statement of type Absolute in the test program. This option is not yet supported in this release.

WHAT NEXT

Use Min or Max options instead.

SEE ALSO

`define_mbist_program (2)`

TEST-1600 (error) Can not enable "%s" and "%s" in the same time for memory "%s"

DESCRIPTION

You receive this message because you specified an sequential bypass when the shadow logic is disabled. Shadow logic must be enabled in order to use the sequential bypass.

WHAT NEXT

Enable the shadow logic for the respective memory.

SEE ALSO

`set_mbist_element (2)` **or** `set_mbist_wrapper (2)` (XG)

TEST-1601 (error) Cannot architect load compressor with the given parameters: scan_inputs = %d and minimum_compression = %d. You should either increase the number of scan-inputs or decrease the compression factor.

DESCRIPTION

You receive this message because load compressor architecting failed for the given set of scan inputs and for the given minimum compression. The number of scan-inputs is derived from set_scan_configuration -chain_count. The minimum_compression is specified with the set_scan_compression_configuration command. The number of chains in the scan-compression mode is calculated based on these numbers.

WHAT NEXT

You should either increase the number of scan-inputs or decrease the compression factor.

SEE ALSO

`set_scan_configuration (2)` `set_scan_compression_configuration (2)` `insert_dft (2)`,
`preview_dft (2)`, `set_dft_configuration (2)`.

TEST-1602 (warning) Architecting of %s compressor failed with the given set of parameters. The number of Internal Scan Chains are reduced to %d.

DESCRIPTION

You receive this message because compressor architecting is not possible for the given set of paramemters.

WHAT NEXT

Load compressor architecting depends on number of scan input pins and number of internal chains. Please try either by increasing the number of scan inputs or by reducing the minimum_compression value.

Unload compressor architecting depends on the number of scan-ouputs, number of internal chains and and whether a compressor with diagnostics capability is being built. Please increse either the number of outputs or reduce the minimum_compression or disable compressed diagnostics with `set_scan_compression_configuration` command. Please note that disabling compressed diagnostics may also result in lower coverage.

Please rerun `preview_dft` to verify if the compressors with new parameters can be architected.

SEE ALSO

```
set_scan_configuration (2) set_scan_compression_configuration (2) insert_dft (2),
preview_dft (2), set_dft_configuration (2).
```

TEST-1603 (warning) Compressor generated may have lower diagnostics precision.

DESCRIPTION

You receive this message because given the resources, a compressor cannot be architected to provide full diagnostics support. The compressor that is architected will have lower diagnostics precision.

If the `-force_diagnosis` switch of `set_scan_compression_configuration` is set to true, this becomes an error condition and the command will exit.

WHAT NEXT

Unload compressor architecting depends on the number of scan-outputs, number of internal chains and whether a compressor with diagnostics capability is being built. Please increase either the number of outputs or reduce number of internal chains or disable compressed diagnostics with `set_scan_compression_configuration` command. Please note that disabling compressed diagnostics may also result in lower coverage.

Please rerun `preview_dft` to verify if the compressors with new parameters can be architected.

SEE ALSO

```
set_scan_configuration (2) set_scan_compression_configuration (2) insert_dft (2),
preview_dft (2), set_dft_configuration (2).
```

TEST-1604 (error) Scan Compression requires minimum of %d Scan Inputs. Design has %d Scan Inputs.

DESCRIPTION

You receive this message because architecting for scan compression failed for the given set of inputs.

TEST
5126

WHAT NEXT

You should either increase the number of scan-inputs or decrease the compression factor.

SEE ALSO

```
set_scan_configuration (2) set_scan_compression_configuration (2) insert_dft (2),  
preview_dft (2), set_dft_configuration (2).
```

TEST-1605 (error) Equal number of decompressor inputs and outputs '%d'

DESCRIPTION

You receive this message because architecting for scan compression resulted in equal number of decompressor inputs and outputs. This can be because the same number of chains was specified for the scan compression mode and reconfigurable scan mode

WHAT NEXT

Check the chain count specifications

SEE ALSO

```
set_scan_configuration (2) set_scan_compression_configuration (2) insert_dft (2),  
preview_dft (2), set_dft_configuration (2).
```

TEST-1606 (Error) The parameter "%s" of the decompressor IP does not match the one computed during scan compression architecting.

DESCRIPTION

You receive this message because architecting for scan compression failed for the given decompressor IP.

WHAT NEXT

Some options of the scan configuration and of the scan compression configuration should not be changed between the first pass run generating the decompressor and decompressor IPs and the second pass run loading these IPs and implementing them.

Option modifications might have an impact on the IP parameters, structures and the scan compression architecting will fail.

SEE ALSO

```
set_scan_configuration (2) set_scan_compression_configuration (2)
set_dft_insertion_configuration (2) insert_dft (2), preview_dft (2),
set_dft_configuration (2).
```

TEST-1607 (Error) The parameter "%s" of the compressor IP does not match the one computed during scan compression architecting.

DESCRIPTION

You receive this message because architecting for scan compression failed for the given compressor IP.

WHAT NEXT

Some options of the scan configuration and of the scan compression configuration should not be changed between the first pass run generating the decompressor and decompressor IPs and the second pass run loading these IPs and implementing them. Option modifications might have an impact on the IP parameters, structures and the scan compression architecting will fail.

SEE ALSO

```
set_scan_configuration (2) set_scan_compression_configuration (2)
set_dft_insertion_configuration (2) insert_dft (2), preview_dft (2),
set_dft_configuration (2).
```

TEST-1608 (Warning) Decompressor/Compressor IP parameters are not available in the decompressor/compressor IP model to perform parameter validation.

DESCRIPTION

You receive this message because architecting for scan compression cannot perform IP parameter validation for the decompressor and the compressor.

WHAT NEXT

While generating the IP RTL and the IP model, IP parameters should be part of the IP model in order to validate the parameters while architecting the scan compression.

SEE ALSO

`set_scan_configuration (2)` `set_scan_compression_configuration (2)`
`set_dft_insertion_configuration (2)` `insert_dft (2)`, `preview_dft (2)`,
`set_dft_configuration (2)`.

TEST-1609 (Warning) ip_parameter %s is repeated. The accepted value is

DESCRIPTION

You receive this message because you are overriding the value that you previously specified for the given parameter. This occurs when you repeat a parameter within the same command, or across different commands for the same controller.

WHAT NEXT

You can avoid this message by specifying each parameter only once per controller.

SEE ALSO

`set_mbist_controller (2)` `set_mbist_element (2)` or `set_mbist_wrapper (2)` (XG)

TEST-1610 (Warning) Cell %s/%s in chain %s not found.

DESCRIPTION

You receive this message because the preview_dft command showed the given cell, but it does not exist in the netlist. This happens when the CTL model for the IP block that contains the cell does not accurately predict some synthesis optimizations. This discrepancy may cause some slightly non-optimal scan chain balancing, because it is based on the DFT plan that is shown in preview_dft instead of the actual netlist. This issue has no effect on scan fault coverage.

WHAT NEXT

No action is required.

SEE ALSO

`insert_dft` (2), `preview_dft` (2).

TEST-1611 (error) Parameter %s is invalid, because memory-driven specification mode is enabled.

DESCRIPTION

Memory-driven specification mode was enabled by the `test_mbc_memory_driven_spec` environment variable. This imposes a requirement on the memory models to describe all the tests for that memory.

WHAT NEXT

All memory models should contain complete test specifications. You can not specify any tests with the `set_mbist_controller` command. This means all test parameters (ie `test0`, `test1`, ...) are invalid.

SEE ALSO

`set_scan_configuration` (2) `set_dft_insertion_configuration` (2) `insert_dft` (2),
`preview_dft` (2), `set_dft_configuration` (2).

TEST-1612 (error) Memory %s has %d tests defined in the CTL model. The valid range is 1 to %d tests for memory-driven specification mode.

DESCRIPTION

Memory-driven specification mode was enabled by the `test_mbc_memory_driven_spec` environment variable. This imposes a requirement on the memory models to describe all the tests for that memory. In this case, your memory has the wrong number of tests in the `MemoryTests` block.

WHAT NEXT

Either add or remove tests from the `MemoryTests` block of the specified memory to make it within the supported range.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_mbist_configuration` (2),
`set_mbist_controller` (2), `test_mbc_memory_driven_spec` (3), `test_variables` (3).

TEST-1613 (error) Memory %s is incompatible with controller %s, because its MemoryTests block does not match other memories that share the controller. This is a restriction of memory-driven specification mode.

DESCRIPTION

Memory-driven specification mode was enabled by the `test_mbc_memory_driven_spec` environment variable. This imposes a requirement that memories can only share a controller when their MemoryTests blocks are identical. They must contain the same tests in the same order.

WHAT NEXT

Change your memory to controller assignments using the `set_mbist_controller` command, so that only memories with identical MemoryTests blocks share the same controller. If the required change is not obvious, you should omit all memory to controller assignments and use the `preview_dft` command to show which memories can share the same controller.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_mbist_configuration` (2),
`set_mbist_controller` (2), `test_mbc_memory_driven_spec` (3), `test_variables` (3).

TEST-1614 (error) ROM controller %s has %d tests. The maximum number is %d.

DESCRIPTION

You specified more tests than the MBIST ROM controller can support.

WHAT NEXT

Use the `remove_mbist_configuration` command to remove the extra tests (along with any other MBIST specifications you may have made). Then specify only the supported number of tests.

SEE ALSO

`set_mbist_configuration` (2), `remove_mbist_configuration` (2), `set_mbist_controller` (2).

TEST-1615 (error) Invalid RepairResource %s in the CTL model for memory %s. Reason: %s.

DESCRIPTION

The specified RepairResource block of the given memory model does not comply with Synopsys standards. This is usually caused by an error in creating the model, or a repair configuration that is not supported by Memory BIST Compiler.

Each message includes a specific reason for the error. There are many reasons why you get this message, so the reasons are identified with a letter a through v. You can look up the reason letter in the following section to find more details about the error.

- a) An unexpected character was found in the AddressMap.
 - For row repair:
 - the page and column address bits must be x
 - the row address that corresponds to the row repair address must be r, with log2 (width) LSBs optionally x
 - the bank address must be 1 or 0 to select the bank that is associated with this row
 - For column repair:
 - the page address bits (if any) must all be r
 - the column address bits must be all r, but log2 (width) column LSBs must be x.
- b) The only supported RepairTypes are Row, Column and DataBit. Page repair is not supported.
- c) AccessCells is for memories where the repair resources are accessed through a serial chain. This is not supported.
- d) All signals in the AccessSignals list must be declared as DataType User snps_repair_enable or snps_repair_address in the anonymous CTL block. Column and DataBit resources can also have DataType snps_repair_data_bit.
- e) AccessSignals must be unique to each resource. They can not be members of multiple repair resources.
- f) The AccessSignals list must contain a signal that is declared as DataType User snps_repair_enable in the anonymous CTL block.
- g) The AddressMap shows how each address bit is used by or affected by the repair resource. You must either provide a complete map with all address bits, or omit the AddressMap and use the default.
- h) For row resources, the AccessSignals must contain an r for every repair address bit. When the repair address is shorter than the row address, the remaining LSBs must in the AddressMap must be x.
- i) The DataBitMap is not used by row repair resources, and must be omitted.
- j) Only row resources of width 1 or 2 are supported.
- k) When row resources are allocated on a per bank basis, the width must be 1. Double rows are not supported in this case.

- l) When row resources are allocated on a per bank basis, the AddressMap must be included to show the bank association for this row resource. This is accomplished by putting 1s and 0s in the bank bits of the AddressMap.
- m) When row resources are allocated on a per bank basis, each bank value in the AddressMap must be unique. Multiple rows in the same bank are not supported.
- n) Any signal that is declared in an AccessSignals list of a RepairResource must only be declared in the Internal block of the anonymous mode, because their function is not mode dependent.
- o) Column resource width must be a power of 2 less than or equal to the value of ColumnMultiplexing.
- p) For column resources where the memory has a page address, all of the page bits in the AddressMap must be r, and the remainder of the AddressMap must be x.
- q) For column resources where the memory has a page address, the width must be equal to the value of ColumnMultiplexing. MBC only supports replacing a full bit's worth of columns in each page.
- r) For column resources, the number of repair data bits signals in the AccessSignals be ceil (log2 (1 bits in the DataBitMap)). This means that you must have exactly enough repair data bits to encode the target data bit within the bank of this resource.
- s) For column resources, the DataBitMap must contain either 1s for each data bit (all Fs), or partition the data bus into two contiguous banks (i.e. one column resource has F0 and the other has OF).
- t) When column resources are allocated on a per bank basis, each DataBitMap value must be unique. Multiple column resources in the same bank are not supported.
- u) For databit resources, the AddressMap should not be specified.
- v) For databit resources, width, if specified, can not be greater than 1.
- x) For databit resources, snps_repair_address signals should not be specified in the AccessSignals list.
- y) Each repair signal specified in the AccessSignals list should have a unique repair type.
- z) For databit resources, the DataBitMap is optional and if specified must be enabled (set to F..F value).

WHAT NEXT

Edit your memory model to comply with the Synopsys memory model standards. If your memory uses unsupported repair features, you should model the repair resource signals as DataType Constant to make Memory BIST Compiler pass them directly through the wrapper. In this case, it is the user's responsibility to disable these signals externally.

SEE ALSO

`insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).`

TEST-1616 (error) Invalid value for the REPAIR_ENABLE or

REPAIR_VERIFY or REPAIR_UNLOAD parameter

DESCRIPTION

You receive this message because you did not specify a correct value for the REPAIR_ENABLE or REPAIR_VERIFY or REPAIR_UNLOAD parameter. YES and NO are the only valid values. The default value is NO.

WHAT NEXT

Run "preview_dft" to see if the system supports repair.

SEE ALSO

```

TEST-1619 (error) The value specified with the %s parameter mismatches with the one represented using %s characters in the AddressOrg MemoryProperties field for %s

DESCRIPTION

You received this message because you are using multiple specifications for the same memory property with different values. RowCount, PageCount and BankCount parameters can be determined from the AddressOrg field.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL.

SEE ALSO

```
preview_dft (2) insert_dft (2)
```

TEST-1620 (error) Invalid value for %s parameter of memory %s, the valid range for this parameter is [1..%d]

DESCRIPTION

You received this message because the value of the specified parameter is not in the valid range.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL.

SEE ALSO

`preview_dft (2) insert_dft (2)`

TEST-1621 (error) Mismatch between the number of 'C' characters in AddressOrg field of MemoryProperties and the ColumnMultiplexing value for memory %s

DESCRIPTION

You received this message because the number of 'C' characters from AddressOrg should be equal to round up from $\log_2(\text{ColumnMultiplexing})$.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL.

SEE ALSO

`preview_dft (2) insert_dft (2)`

TEST-1622 (error) RowCount or AddressOrg and ValueRange can not be used together in memory %s

DESCRIPTION

You received this message because you used two parameters that can not be used together, as their values may be conflicting. Please use only one of them.

RowCount and AddressOrg are the preferred address specification. ValueRange is supported for backward compatibility, but should not be used in new memory models.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL. It is best to remove ValueRange and use RowCount and AddressOrg as your address specification.

SEE ALSO

`preview_dft (2) insert_dft (2)`

TEST-1623 (error) Invalid length for the AddressOrg parameter of memory %s (%d instead of %d)

DESCRIPTION

You received this message because you specified a wrong AddressOrg string in the MemoryProperties section of the memory CTL.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL.

SEE ALSO

`preview_dft` (2) `insert_dft` (2)

TEST-1624 (error) AddressOrg field must be specified in the MemoryProperties CTL model of the memory %s as %s

DESCRIPTION

You received this message because you forgot to specify the AddressOrg field in the MemoryProperties of the memory CTL model. For the specified case, this field is mandatory.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL.

TEST-1627 (error) Cannot run all the MBIST cores in parallel because some of them share the same diagnosis output ports.

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the CONTROL_SEL_<CORE_ID> parameter is not specified. In fact some cores share the same diagnosis output port; so they cannot be run in parallel in the case of diagnosis mode or ROMs controllers with external signature comparison in go_nogo mode. By default, all MBIST cores are run in parallel.

WHAT NEXT

Run "preview_dft" to see how MBIST core are mapped and use the CONTROL_SEL_<CORE_ID> parameter of the command `set_mbist_run` (or `set_testbench_parameters` in XG mode).

SEE ALSO

`preview_dft (2)`, `set_mbist_run (2)`.

TEST-1628 (error) CNTRL_SEL parameter cannot be used in the case of Core Integration

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the CNTRL_SEL parameter is not valid in the case of Core Integration.

WHAT NEXT

Use CONTROL_SEL_<CORE_ID> parameter if you want select a subset of controllers of one specific MBIST core.

SEE ALSO

`set_mbist_run (2)`

TEST-1629 (error) invalid CORE_ID value of CONTROL_SEL_<CORE_ID> parameter

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the <CORE_ID> value specified in the CONTROL_SEL_<CORE_ID> parameter is not valid.

WHAT NEXT

Run "preview_dft" to see how MBIST cores are mapped.

SEE ALSO

`preview_dft (2)`, `set_mbist_run (2)`.

TEST-1630 (error) CONTROL_SEL_<CORE_ID> parameter

can be used only with Core Integration

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the `CONTROL_SEL_<CORE_ID>` parameter is specified not in the case of Core Integration.

WHAT NEXT

Use the `CNTRL_SEL` parameter of `set_mbist_run` (or `set_testbench_parameters` in XG mode) if you want to select a subset of controllers in the case of model level protocol.

SEE ALSO

`preview_dft` (2), `set_mbist_run` (2).

TEST-1631 (error) REPAIR_ENABLE cannot be set to yes when a subset of controllers is specified or when Run Time Programmable BIST is selected

DESCRIPTION

You receive this message because you set the `REPAIR_ENABLE` parameter to YES in the case of subset of controller selection or Run Time Programmable BIST.

WHAT NEXT

Change the `set_mbist_run` command parameter setting.

SEE ALSO

`set_mbist_run` (2)

TEST-1632 (error) Test program %s contains sequences that requires that controller %s has enable_page_testing set to

TRUE

DESCRIPTION

Test programs containing sequences of type OneDimensionalAddress can only be assigned to controllers that has the Page testing enabled.

WHAT NEXT

Enable the page testing for the respective controller.

SEE ALSO

`set_mbist_controller (2)`,

TEST-1633 (error) At least one memory containing AddressOrg property must be assigned to controller %s as %s is required

DESCRIPTION

When the page testing for a controller is required, at least one of his assigned memory models should have an AddressOrg statement.

WHAT NEXT

Specify the AddressOrg in the MemoryProperties block of the memory models.

SEE ALSO

`set_mbist_controller (2)`,

TEST-1634 (error) Invalid position for the 'C' characters in AddressOrg field of MemoryProperties for memory %s

DESCRIPTION

You received this message because the 'C' characters should be the LSBs of the AddressOrg specified field.

WHAT NEXT

Re-specify the memory parameters in the MemoryProperties section of the memory CTL.

SEE ALSO

`preview_dft` (2) `insert_dft` (2)

TEST-1635 (error) Page testing is not allowed for ROM controller %s

DESCRIPTION

You received this message because the page testing is not allowed for ROM controllers

WHAT NEXT

Re-specify the controller parameters

SEE ALSO

`preview_dft` (2) `insert_dft` (2)

TEST-1636 (error) Run-time programability is not allowed for ROM controller %s

DESCRIPTION

You received this message because the run-time programability is not allowed for ROM controllers

WHAT NEXT

Re-specify the controller parameters

SEE ALSO

`preview_dft` (2) `insert_dft` (2)

TEST-1637 (error) invalid DIAG_OUT parameter value: only TDO and SCAN_OUT are valid values

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because you specified a wrong value of the DIAG_OUT parameter. Only TDO and SCAN_OUT are valid values.

WHAT NEXT

Modify the value of the DIAG_OUT parameter.

SEE ALSO

`set_mbist_run` (2).

TEST-1638 (error) Cannot specify TDO port to stream out diagnosis data in the case of multiple MBIST core run

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the DIAG_OUT parameter is set to TDO. In fact the TDO BSD port cannot be used to stream out diagnosis data in the case of multiple MBIST cores run in parallel.

WHAT NEXT

Run "preview_dft" to see how MBIST core are mapped and use the CONTROL_SEL_<CORE_ID> parameter or modify the DIAG_OUT parameter value of the command `set_mbist_run` (or `set_testbench_parameters` in XG mode).

SEE ALSO

`preview_dft` (2), `set_mbist_run` (2).

TEST-1639 (error) Cannot set REPAIR_ENABLE to YES and

REPAIR_VERIFY to NO in diagnosis mode

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because you set REPAIR_ENABLE to YES and REPAIR_VERIFY to NO in diagnosis mode. In fact, you have to set REPAIR_ENABLE and REPAIR_VERIFY to YES to generate a correct STIL test bench in diagnosis mode.

WHAT NEXT

Set the REPAIR_VERIFY parameter value to YES in the command `set_mbist_run` (or `set_testbench_parameters` in XG mode).

SEE ALSO

`set_mbist_run` (2).

TEST-1640 (error) Can not specify the diagnosis output mode to tdo when the boundary scan is not implemented

DESCRIPTION

You received this message because you specified a diagnosis output mode which is not implemented in your current configuration. The tdo is only valid when boundary scan is present.

WHAT NEXT

Specify another diagnosis output mode.

SEE ALSO

`preview_dft` (2), `report_mbist_trace` (2), `set_mbist_run` (2) or
`set_testbench_parameters` (2) (XG mode)

TEST-1641 (error) Can not recover the name of the equivalent

signal for mbist_diag_out at top level from the current CTL

DESCRIPTION

You received this message because the command was not able to recover the name of the equivalent mbist_diag_out signal. This may come from a wrong specification of the report_mbist_trace parameters. Be sure to use options equivalent to the ones used with set_mbist_run (set_testbench_parameters in XG mode) command.

WHAT NEXT

Specify the correct options for report_mbist_trace.

SEE ALSO

`preview_dft (2)`, `report_mbist_trace (2)`, `set_mbist_run (2)` or
`set_testbench_parameters (2) (XG mode)`

TEST-1642 (error) Parameter core_index is required when core integration is implemented

DESCRIPTION

You received this message because you did not specify a greater or equal with zero value for the core_index parameter of the report_mbist_trace command. This parameter is required when core integration is implemented.

WHAT NEXT

Specify a -core_index for report_mbist_trace command

SEE ALSO

`preview_dft (2)`, `report_mbist_trace (2)`,

TEST-1643 (error) Test program %s must start with a Write operation %s

DESCRIPTION

You received this message because you did not specify a Write operation as the first

operation of the specified test. This is required to initialize the memory content. This situation is triggered also when you are specifying a ROM algorithm for a RAM controller.

WHAT NEXT

Specify a Write operation as the first operation of the test program.

SEE ALSO

`preview_dft (2)`, `define_mbist_program (2)`,

TEST-1644 (Warning) The default protocol in %s mode runs only the MBIST core of ID 0 because some cores share the same diagnosis output ports.

DESCRIPTION

You receive this warning message because some MBIST cores share the same diagnosis output ports. So they cannot be run in parallel in the case of diagnosis mode or ROMs controllers with external signature comparison in go_nogo mode. In those cases the default protocol runs only the MBIST core of ID 0.

WHAT NEXT

Use the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) to select one or more MBIST cores to be run in parallel.

SEE ALSO

`preview_dft (2)`, `set_mbist_run (2)`.

TEST-1645 (Warning) the value '%s' of the controller selection parameter specifies %d among %d controllers; the non specified controllers will not be selected

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the number of bits, which the controller selection value is coded, is less than the controller number. The remaining controllers will not be selected.

WHAT NEXT

Specify a correct controller selection value.

SEE ALSO

`preview_dft (2)`, `set_mbist_run (2)`.

TEST-1646 (error) cannot find %s port/s in CTL top level model

DESCRIPTION

This is issued while MBISTC tries to build a new STIL test bench. The tool is not able to find the specified port/s in the CTL top level model. The generated STIL test bench is not correct.

WHAT NEXT

Verify the CTL top level model and re-run the `set_mbist_run` (or `set_testbench_parameters` in XG mode) UI command to build a new STIL test bench. If the problem subsist contact the Synopsys support.

SEE ALSO

`preview_dft (2)`, `set_mbist_run (2)`.

TEST-1647 (error) Background test program %s of type %s requires a Pattern specification

DESCRIPTION

You received this message because you did not specify a Pattern statement for an Background test program of type AlgorithmBased, which is required in this case.

WHAT NEXT

Specify a Pattern statement for the respective test program.

SEE ALSO

`preview_dft (2)`, `define_mbist_program (2)`,

TEST-1648 (warning) Can not find %s for -parameter %s.

DESCRIPTION

You received this message because you specified a test that does not exist. As the specified test program has not been found, a default test program will be implemented instead of it.

WHAT NEXT

Use the `define_mbist_program` command to define the test.

SEE ALSO

`set_mbist_controller` (2), `define_mbist_program` (2), `preview_dft` (2), `insert_dft` (2).

TEST-1649 (warning) Controller %s is empty and deleted.

DESCRIPTION

You received this message because you created an MBIST controller specification with the `set_mbist_controller` command, but there were no memories available to be tested by that controller. The controller specification is removed from the plan, because there is nothing for it to do.

WHAT NEXT

It is safe to ignore this warning, or you can prevent this warning by not creating the controller in the first place. Alternatively, you can ensure the controller's existence by assigning it at least one memory.

SEE ALSO

`set_mbist_controller` (2), `preview_dft` (2), `insert_dft` (2).

TEST-1650 (warning) Number of controllers specified is too big. Not enough memories to assign.

DESCRIPTION

You received this message because you specified more MBIST controllers than were needed, based on the number of memories to be tested.

WHAT NEXT

It is safe to ignore this warning, or you can prevent this warning by specifying a smaller number of controllers with the **set_mbist_configuration** command, or not specifying a number of controllers at all.

SEE ALSO

set_mbist_configuration (2), **preview_dft** (2), **insert_dft** (2).

TEST-1651 (warning) Number of controllers specified (%d) is too small to accomodate all the memories, %d controllers are created.

DESCRIPTION

You received this message because you specified fewer MBIST controllers than were needed, based on the number of memories to be tested.

WHAT NEXT

It is safe to ignore this warning, or you can prevent this warning by specifying a larger number of controllers with the **set_mbist_configuration** command, or not specifying a number of controllers at all.

SEE ALSO

set_mbist_configuration (2), **preview_dft** (2), **insert_dft** (2).

TEST-1652 (error) Parameter %s defined multiple times.

DESCRIPTION

You received this message because you repeated a port definition.

WHAT NEXT

Combine all signal definitions for each port into one parameter.

SEE ALSO

create_dft_model (2).

TEST-1653 (warning) Ignoring memory instance %s from MBIST insertion because it is not a valid memory.

DESCRIPTION

You received this message because you used the **set_mbist_controller** command to assign a memory to a controller, but the instance is not recognized as a memory.

WHAT NEXT

It is safe to ignore this warning, or you can prevent this warning by not assigning this instance to a controller. If this instance really is a memory, make sure it has a valid CTL memory model. In XG mode, be sure to use the **use_test_model** command for all memory models.

SEE ALSO

read_test_model (2), **use_test_model** (2), **set_mbist_controller** (2), **preview_dft** (2), **insert_dft** (2).

TEST-1654 (error) MBIST architect couldn't get scan clock info. MBC does not support the -no_scan option.

DESCRIPTION

You received this message because MBIST architect could not get the scan clock info for the design. This information is used to assign memories to controllers, based on memory clock sources.

WHAT NEXT

Do not use the -no_scan option with MBIST.

SEE ALSO

preview_dft (2), **insert_dft** (2).

TEST-1655 (information) Memory is being treated as a non_muxed memory as signal %s is defined of type %s in both

Mission and BIST mode.

DESCRIPTION

You received this message because your memory model appeared to support embedded multiplexers, but the indicated signal is not multiplexed.

WHAT NEXT

If your memory has embedded multiplexers, modify your memory model so that the indicated signal is declared in only one mode.

SEE ALSO

`read_test_model` (2) `preview_dft` (2), `insert_dft` (2).

TEST-1656 (Error) The following cores have scan compression logic already inserted: %s

DESCRIPTION

You receive this message because you have not enabled scan compression integration but you have some cores in your design that contain scan compression logic.

WHAT NEXT

Check your specifications. Enable scan compression integration if required.

SEE ALSO

`set_scan_compression_configuration` (2) `insert_dft` (2), `preview_dft` (2),
`set_dft_configuration` (2).

TEST-1657 (Error) Cell %s has %d scan compression modes and %d reconfigurable scan modes

DESCRIPTION

You received this message because you have enabled scan compression integration on a design that contains cores with more than one scan compression mode or more than one reconfigurable scan mode.

WHAT NEXT

Check your design. Scan Compression integration does not permit cores with more than one Scan Compression mode or more than one reconfigurable scan mode.

SEE ALSO

```
set_scan_compression_configuration (2) insert_dft (2), preview_dft (2),  
set_dft_configuration (2).
```

TEST-1658 (Error) Design has chip-level scan structures

DESCRIPTION

WHAT NEXT

SEE ALSO

```
set_scan_compression_configuration (2) insert_dft (2), preview_dft (2),  
set_dft_configuration (2).
```

TEST-1659 (Error) Design does not contain any cores with scan compression logic

DESCRIPTION

You receive this message because you have enabled scan compression integration but your design does not have any cores with scan compression logic.

WHAT NEXT

Check your specifications. Disable scan compression integration if required.

SEE ALSO

```
set_scan_compression_configuration (2) insert_dft (2), preview_dft (2),  
set_dft_configuration (2).
```

TEST-1660 (Warning) The DIAG_OUT parameter is ignored

because the use of this parameter is allowed only in the case of Boundary-Scan.

DESCRIPTION

You receive this warning message because you specified the DIAG_OUT parameter in the command `set_mbist_run` (or `set_testbench_parameters` in XG mode). The use of this parameter is allowed only in the case of Boundary-Scan.

WHAT NEXT

Delete the DIAG_OUT parameter specified in the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) .

SEE ALSO

`preview_dft` (2), `set_mbist_run` (2).

TEST-1661 (error) invalid BURN_IN parameter value: only YES and NO are valid values

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because you specified a wrong value of the BURN_IN parameter. Only YES and NO are valid values.

WHAT NEXT

Modify the value of the BURN_IN parameter.

SEE ALSO

`set_mbist_run` (2).

TEST-1662 (error) Invalid value for the BURN_IN_DURATION

parameter

DESCRIPTION

This is issued from the command **set_mbist_run** (or **set_testbench_parameters** in XG mode) because you specified a wrong value for BURN_IN_DURATION parameter. Should be a positive integer value.

WHAT NEXT

Specify a positive integer value for BURN_IN_DURATION parameter.

SEE ALSO

set_mbist_run (2).

TEST-1663 (error) No BURN_IN support in MBIST system.

DESCRIPTION

This is issued from the command **set_mbist_run** (or **set_testbench_parameters** in XG mode) because you set the BURN_IN parameter to YES but there is no BURN_IN support in MBIST system.

WHAT NEXT

Generate a MBIST system with BURN_IN support.

SEE ALSO

set_mbist_configuration (2) **preview_dft** (2)

TEST-1664 (error) No burn in test in diagnosis mode.

DESCRIPTION

This is issued from the command **set_mbist_run** (or **set_testbench_parameters** in XG mode) because you specify the BURN_IN parameter in diagnosis mode. This version of Memory BIST Compiler supports burn_in test only in go nogo mode.

WHAT NEXT

Change the diagnosis mode in go nogo mode.

SEE ALSO

`set_mbist_configuration` (2) `preview_dft` (2)

TEST-1665 (error) No burn in test with run-time programmable test, retention test, repair test and controller selection.

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because you specified the BURN_IN parameter with run-time programmable test or retention test or repair test or controller selection. This version of Memory BIST Compiler supports burn in test only for Synthesis BIST with all controls run in parallel.

WHAT NEXT

Delete the RT_TEST, RETENTION and CNTRL_SEL parameter in order to perform burn in test.

SEE ALSO

`set_mbist_configuration` (2) `preview_dft` (2)

TEST-1666 (Warning) the MBIST core of ID '%d' will not be run because it does not support burn in

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the specified core does not support burn in test. The burn in test will run only MBIST cores with burn in support.

WHAT NEXT

Look at preview_dft report

SEE ALSO

`preview_dft` (2), `set_mbist_run` (2).

TEST-1667 (Warning) %s

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because the specified controller tests ROM/s with external signature computation. This version of Memory BIST Compiler does not support burn in test for ROMs with external signature computation.

WHAT NEXT

Look at `preview_dft` report

SEE ALSO

`preview_dft` (2), `set_mbist_run` (2).

TEST-1668 (Error) The reported diagnosis package is inconsistent

DESCRIPTION

You receive this message because the just printed diagnosis package contains inconsistent information. This may be caused by invalid input files, by an incorrect usage of the mbist report trace command or by an internal error.

WHAT NEXT

Check the input files and the command line.

SEE ALSO

`insert_dft` (2), `preview_dft` (2),

TEST-1669 (error) cannot use BURN_IN_DURATION

parameter without BURN_IN parameter set to YES.

DESCRIPTION

This is issued from the command **set_mbist_run** (or **set_testbench_parameters** in XG mode) because you specified the BURN_IN_DURATION parameter without BURN_IN parameter set to YES.

WHAT NEXT

Specify BURN_IN parameter set to YES.

SEE ALSO

set_mbist_configuration (2) **preview_dft** (2) **set_mbist_run** (2)

TEST-1670 (Warning) the MBIST controller '%s' does not support burn in test because it tests ROMs with external signature computation.

DESCRIPTION

This is issued from the command **preview_dft** because the specified controller tests ROM/s with external signature computation. This version of Memory BIST Compiler does not support burn in test for ROMs with external signature computation.

WHAT NEXT

Change EXTERNAL to INTERNAL signature computation to run the ROM controller during the burn in test.

SEE ALSO

set_mbist_controller (2), **preview_dft** (2), **set_mbist_run** (2).

TEST-1671 (Warning) the BURN_IN_DURATION parameter

value is too small.

DESCRIPTION

This is issued from the command **preview_dft** because the specified BURN_IN_DURATION parameter value is too small and does not allow to perform one complete memory test.

WHAT NEXT

Change BURN_IN_DURATION parameter value.

SEE ALSO

set_mbist_controller (2), **preview_dft** (2), **set_mbist_run** (2).

TEST-1672 (Warning) the '%s' MBIST Controller is not optimal for burn-in test.

DESCRIPTION

You received this warning message because you specified a MBIST architecting setting that is not optimal for burn-in test. The condition for an optimal burn-in test is that the ratio between the biggest memory size and the smallest one within the same BIST Controller is lower or equal to 2.

WHAT NEXT

Modify the MBIST controller user architecting setting.

SEE ALSO

set_mbist_controller (2), **preview_dft** (2),

TEST-1673 (information) read_data_delayed parameter value for memory %s has been changed to NO due to diag_faulty_data_bits set to YES

DESCRIPTION

This message is issued when the read_data_delayed and diag_faulty_data_bits IP

parameters are both specified to YES (or 1) in the -ip_parameters (-parameters in XG mode) list. When enabled simultaneously, the diag_faulty_data_bits parameter has the priority.

WHAT NEXT

Nothing.

SEE ALSO

`set_mbist_element (2)`, `set_mbist_wrapper (2)` (in XG mode).

TEST-1674 (Error) Incomplete MBIST controllers selection burn-in test

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because you use the CONTROL_SEL_<CORE ID> parameter to specify only some controllers of the selected MBIST core for the burn-in test. When you select a MBIST core for burn-in test, you must select all its controller.

WHAT NEXT

Modify the CONTROL_SEL_<CORE ID> parameter value to select all the controllers of the specified MBIST core.

SEE ALSO

`set_mbist_run (2)`, `preview_dft (2)`,

TEST-1675 (Information) the '%s' controller will test ROM/s with INTERNAL signature computation to support burn in.

DESCRIPTION

When the burn-in test is supported, the MBIST architect uses the INTERNAL signature computation (instead of the EXTERNAL) as default value.

WHAT NEXT

Use the `set_mbist_controller` if you want to use the EXTERNAL signature computation

for ROMs.

SEE ALSO

`set_mbist_controller` (2) . `preview_dft` (2) .

TEST-1676 (Warning) BURN_IN parameter will be ignored because all the MBIST controllers support ROM/s with external signature comparison.

DESCRIPTION

You received this warning message because you specified a burn-in test support (in the `set_mbist_controller` UI command) and all the MBIST controllers support ROM/s with external signature comparison. This version of MBISTC does not support burn-in test for controllers that test ROMs with external signature comparison, so the BURN_IN parameter will be ignored.

WHAT NEXT

Nothing

SEE ALSO

`set_mbist_configuration` (2) , `set_mbist_controller` (2) , `preview_dft` (2) ,

TEST-1677 (error) Cannot set REPAIR_UNLOAD or REPAIR_VERIFY to YES because REPAIR_ENABLE is disabled.

DESCRIPTION

This is issued from the command `set_mbist_run` (or `set_testbench_parameters` in XG mode) because you set the REPAIR_UNLOAD or REPAIR_VERIFY parameters to YES but the REPAIR_ENABLE parameter is disabled.

WHAT NEXT

Set REPAIR_ENABLE parameter to YES.

SEE ALSO

`preview_dft` (2) `set_mbist_run` (2)

TEST-1678 (error) Can not recover the CLK value from line %d of the processed log, the resulted diagnosis stream may be corrupted

DESCRIPTION

You received this message because an error occurred during the simulation log conversion. This can be caused by a corrupted log file.

WHAT NEXT

Check the testbench and regenerate the log file.

SEE ALSO

`set_mbist_run` (2) `set_testbench_configuration` (2) (**XG** mode)

TEST-1679 (error) invalid wrapper specification (%s)

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because you have specified a non existing wrapper.

WHAT NEXT

Look at the MBIST and Core Integration previews and specify an existing wrapper.

SEE ALSO

`preview_dft` (2).

TEST-1680 (error) the specified wrapper (%s) does not test

ROM with external signature computation

DESCRIPTION

This is issued from the command **set_mbist_element** (or **set_mbist_wrapper** in XG mode) because the specified wrapper does not test ROM with external signature computation.

WHAT NEXT

Look at the MBIST and Core Integration previews and specify a wrapper that tests ROM with external signature computation.

SEE ALSO

preview_dft (2).

TEST-1681 (error) invalid '%s' parameter

DESCRIPTION

This is issued from the command **set_mbist_element** (or **set_mbist_wrapper** in XG mode) because you specified an invalid parameter of 'mem_id' option. 'root_id' (in the case of Core Integration), 'cntrl_id' and 'wrap_id' are the only valid parameters of 'mem_id' option.

WHAT NEXT

Look at **set_mbist_element** (or **set_mbist_wrapper** in XG mode) man page.

SEE ALSO

set_mbist_element (2). **set_mbist_wrapper** (2).

TEST-1682 (error) Can not recover the name of the equivalent signal for repair chain scan out at top level from the current CTL

DESCRIPTION

You received this message because the command was not able to recover the name of the equivalent repair chain scan out signal. This may come from a wrong specification of the report_mbist_trace parameters. Be sure to use options equivalent to the ones used with **set_mbist_run** (**set_testbench_parameters** in XG mode)

command.

WHAT NEXT

Specify the correct options for `report_mbist_trace`.

SEE ALSO

`preview_dft` (2), `report_mbist_trace` (2), `set_mbist_run` (2) or
`set_testbench_parameters` (2) (XG mode)

TEST-1683 (error) '%s' parameter missing in 'mem_id' option

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because the tool can not correctly identify a MBIST wrapper. 'root_id' (in the case of Core Integration), 'cntrl_id' and 'wrap_id' are the only valid parameters of 'mem_id' option.

WHAT NEXT

Specify the missing parameter in the 'mem_id' option.

SEE ALSO

`set_mbist_element` (2). `set_mbist_wrapper` (2).

TEST-1684 (error) 'root_id' parameter can be used only in the case of core integration

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because the 'root_id' can be used only in the case of core integration.

WHAT NEXT

Use 'cntrl_id' and 'wrap_id' as parameters of 'mem_id' option.

SEE ALSO

`preview_dft (2). set_mbist_element (2). set_mbist_wrapper (2).`

TEST-1685 (error) Invalid RepairResource %s in the CTL model for memory %s as Column repair resource with no repair address is really data bit repair

DESCRIPTION

You received this message as a Column repair resource with no repair address is really data bit repair. The type of the specified RepairResource should be changed to DataBit.

WHAT NEXT

Change the CTL model for the respective memory to use the DataBit repair type instead.

TEST-1686 (information) Width for RepairResource %s of memory %s is set to 1

DESCRIPTION

You received this message because the Width for the specified RepairResource has not been specified or it has been specified with an invalid integer value smaller than 1. In this case the value of the Width parameter is automatically set to 1.

WHAT NEXT

Set a correct value for the Width statement in the CTL model of the specified memory.

SEE ALSO

`preview_dft (2) insert_dft (2)`

TEST-1687 (error) Empty Test Algorithm "%s

DESCRIPTION

You received this message because you are using empty Algorithm CTL block with no sequences defined in it. These kind of algorithms can not be used in the MBIST flow.

WHAT NEXT

Change the CTL description of your test program.

TEST-1688 (error) Can not use the reserved name %s to define a test program

DESCRIPTION

You received this message because you are using a reserved name as the name of your test program. This test program with this name is internally defined and it is used for open address decoder faults detection.

WHAT NEXT

Use a different name for your test program.

SEE ALSO

`define_mbist_program (2)`

TEST-1689 (Information) The detailed description of the %s algorithm is provided in the MBISTC UG

DESCRIPTION

You received this message because you are using an internally predefined algorithm that tests for the open address decoder faults. The definition of this algorithm can be found in the MBISTC User Guide.

WHAT NEXT

See the User Guide for the algorithm detailed description.

SEE ALSO

`preview_dft (2)`. `define_mbist_program (2)`. `report_mbist_program (2)`.

TEST-1690 (error) Can not use the %s algorithm in the controller "%S

DESCRIPTION

You received this message because you are using an algorithm that was not designed for the ROM memories.

WHAT NEXT

Use a different test program for the ROM controller.

SEE ALSO

`set_mbist_controller (2)`. `define_mbist_program (2)`. `report_mbist_program (2)`.

TEST-1691 (error) DFT configuration clock controller is not compatible with the RTL flow.

DESCRIPTION

You receive this error message because you invoked the RTL insertion flow with the `preview_dft -rtl` or `insert_dft -rtl` command, but you also enabled the PLL clock controller flow with the `set_dft_configuration -clock_controller enable` command. The clock controller flow is an integral part of the scan insertion flow, but scan is not inserted at the RT level.

WHAT NEXT

You should activate the clock controller flow in the second pass of the RTL insertion flow. For now, you should `set_dft_configuration -clock_controller disable`.

SEE ALSO

`set_dft_configuration (2)`, `preview_dft (2)`, `insert_dft (2)`.

TEST-1692 (error) Specified test program %s is not yet supported in the runtime programmable BIST

DESCRIPTION

You received this message because you are using a test program specific for open address decoder faults detection which is not yet supported in the runtime programmable BIST.

WHAT NEXT

Use a different test program for the runtime programmable BIST.

SEE ALSO

`define_mbist_program (2)` `set_mbist_run (2)` or `set_testbench_parameters (2)` (in **XG** mode) `report_mbist_trace (2)`

TEST-1693 (warning) Test program %s will not be redefined, using the existing definition from the MBIST test programs database

DESCRIPTION

You received this message because you are using a reserved name as the name of your test program. This test program with this name is internally defined and it is used for open address decoder faults detection. The internal definition of this test will be used instead of the specified custom definition.

WHAT NEXT

Use a different name for your test program if this is not the intended behaviour.

SEE ALSO

`define_mbist_program (2)`

TEST-1694 (error) Can not use the %s algorithm in the controller

%s containing only memories with write only and read only ports

DESCRIPTION

You received this message because you are using an algorithm that has been designed to work with controllers having at least one memory with a read/write port.

WHAT NEXT

Use a different test program for the specified controller.

SEE ALSO

`set_mbist_controller (2)`. `define_mbist_program (2)`. `report_mbist_program (2)`.

TEST-1695 (Error) must specify content file name and memory IDs for ROM external signature change.

DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode). The command needs content file name and memory IDs for ROM external signature change.

WHAT NEXT

Specify the content file name and memory IDs.

SEE ALSO

`set_mbist_element (2)` or `set_mbist_wrapper (2)` (XG)

TEST-1696 (Error) The value specified for parameter '-core_index' is out of the valid range (%d..%d)

DESCRIPTION

This is issued from the command `report_mbist_trace` as the specified core_index value is bigger than the maximal value accepted for this parameter.

WHAT NEXT

Specify a correct core_index value.

SEE ALSO

`report_mbist_trace (2)`

TEST-1697 (information) The value specified for parameter '-core_index' is ignored when core integration is not present

DESCRIPTION

This is issued from the command `report_mbist_trace` as the value specified for core_index is ignored when there is no core integration.

WHAT NEXT

Don't use this parameter when there is no core integration

SEE ALSO

`report_mbist_trace (2)`

TEST-1698 (error) The current design already has MBIST T2 encapsulated.

DESCRIPTION

The tool detects the presence of MBIST Tech 2 IPs in the current design. Cannot run MBISTC tool twice on the same design.

WHAT NEXT

Change input design.

SEE ALSO

`preview_dft (2) insert_dft (2)`

TEST-1699 (warning) Could not find mode %s in the model bin

DESCRIPTION

You receive this message because the specified mode can not be retrieved correctly from the model bin.

WHAT NEXT

Use the dft_drc supported flow instead by setting the test_enable_dft_drc variable to true and create a test protocol before running preview_dft or insert_dft.

SEE ALSO

`preview_dft` (2) `insert_dft` (2)

TEST-1700 (error) Number of scan paths specified with pipeline registers '%d' and scan chains specified '%d' mismatch.

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. You have defined a number of scan paths with their corresponding head and tail pipeline registers. But this number does not match the number of scan chains specified with `set_scan_configuration -chain_count`. Because of this, `preview_dft` or `insert_dft` will not proceed.

WHAT NEXT

Correct the chain count value in `set_scan_configuration` or specify additional scan paths with `set_scan_path`

SEE ALSO

`set_scan_configuration` (2). `set_scan_path` (2).

TEST-1701 (error) %s pipeline register '%s' is not a valid

sequential cell, check the dft_drc report

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. The head or tail pipeling register specified with the `set_scan_path` command was violated during test design rule checking. Because of this, `preview_dft` or `insert_dft` will not proceed.

WHAT NEXT

Run `dft_drc -verbose` again and analyze why the corresponding head or tail pipeline register is not valid.

SEE ALSO

`set_scan_configuration` (2). `set_scan_path` (2). `dft_drc` (2).

TEST-1702 (error) No scan %s port specified for chain '%s' with pipeline registers

DESCRIPTION

You receive this message when the pipeline scan data feaure is enabled. You have specified a scan path with its corresponding head and tail registers. But you did not associate a scan in port and a scan out port for this scan path. Because of this, `preview_dft` or `insert_dft` will not proceed.

WHAT NEXT

Define a scan input and a scan output port. Associate them with the scan path mentioned in this error message.

SEE ALSO

`set_scan_path` (2).

TEST-1703 (error) %s pipeline register '%s' does not exist in the

current design

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. You have specified a scan path with its corresponding head and tail registers. But the head or tail register cell you specified does not exist in the design.

WHAT NEXT

Verify with `get_cells` whether the cell instance name is right. Modify your specification accordingly.

SEE ALSO

`set_scan_path (2)`. `get_cells (2)`.

TEST-1704 (error) %s pipeline register '%s' is triggered by a different clock from previously specified %s register

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. You have specified several scan paths with their corresponding head and tail registers. All the head pipeline registers must be triggered by the same clock signal. All the tail pipeline registers must be triggered by the same clock signal. However, the head or tail register cell mentioned in the error message is triggered by a different clock.

WHAT NEXT

Verify that all head or tail pipeline registers get their clock from the same signal.

SEE ALSO

`set_scan_path (2)`.

TEST-1705 (error) Unbalanced pipeline head or tail register

specifications

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. You have specified several scan paths with their corresponding head and tail registers. But the number of head pipeline stages is not the same across all chains or the number of tail pipeline stages is not the same across all chains.

WHAT NEXT

Verify the log from your set_scan_path commands. You probably got a UIT-911 error message.

SEE ALSO

`set_scan_path` (2).

TEST-1706 (Warning) Pipeline scan data feature is not supported with the current DFT configuration and will be ignored.

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. Pipeline scan data feature is only supported with Scan compression DFT client. Pipeline scan data feature is only supported with `multiplexed_flip_flop` scan style. A configuration setting any other client or scan style generates this message and the pipeline scan data feature is automatically disabled for the current command.

WHAT NEXT

Change your configuration with `set_dft_configuration` and `set_scan_configuration` commands

SEE ALSO

`set_dft_configuration` (2), `set_scan_configuration` (2), `preview_dft` (2), `insert_dft` (2),

TEST-1707 (error) The option '-background_type' must be

explicitly set to 'algorithm_based' when specifying '-pattern'

DESCRIPTION

You receive this message because you are trying to create a mbist program of type background using a pattern specification and the default value for the background type, which is topological. As a background of type topological is ignoring the specified pattern, you must explicitly set the value of the background type to 'algorithm_based' in order to use the '-pattern' option.

WHAT NEXT

Add the option '-background_type algorithm_based' to your define_mbist_program command.

SEE ALSO

`define_mbist_program` (2)

TEST-1708 (error) The MBIST Spec does not exists

DESCRIPTION

You receive this message because there is no MBIST spec to be reseted/removed

WHAT NEXT

Nothing.

SEE ALSO

`set_mbist_configuration` (2) `reset_mbist_configuration` (2) (**XG mode**)
`remove_mbist_configuration` (2) (**DB mode**)

TEST-1709 (warning) Option %s is not available for ROM memory %s

DESCRIPTION

You receive this message because the specified option is not available on ROMs. The option will be automatically turned off.

WHAT NEXT

For better readability, you should not use this option in your scripts (commands: `set_mbist_element` in DB Mode or `set_mbist_wrapper` in XG mode)

SEE ALSO

`set_mbist_element` (2) (DB mode) `set_mbist_wrapper` (2) (XG mode) `preview_dft` (2)
`insert_dft` (2)

TEST-1710 (warning) Diagnosis information can not be processed for test mode %s

DESCRIPTION

You receive this message because the specified test mode is not an MBIST diagnosis one. The '`-trace_file`' argument can only be processed for MBIST diagnosis test modes. The '`-trace_file`' argument will be automatically disabled.

WHAT NEXT

Specify an MBIST diagnosis test mode.

SEE ALSO

`report_mbist_trace` (2) `preview_dft` (2) `insert_dft` (2)

TEST-1711 (information) repair_algorithm will be ignored if the 2D repair is not enabled

DESCRIPTION

You received this message because the '`repair_algorithm`' parameter is only valid for the 2D repair. The 2D repair is enabled by setting the '`repair_type`' option to '`row_column`'.

WHAT NEXT

No user action required.

SEE ALSO

`set_mbist_wrapper (2)` `preview_dft (2)` `insert_dft (2)`

TEST-1712 (Error) Design does not contain any chip level scan logic

DESCRIPTION

You received this message because you enable the hybrid flow for scan compression but the design does not have any scan logic that is not driven by scan compression structures

WHAT NEXT

Check your design. If you just want to integrate adaptive scan cores, use `set_scan_compression_configuration -integration_only`

SEE ALSO

`set_scan_compression_configuration (2)` `insert_dft (2)`, `preview_dft (2)`,
`set_dft_configuration (2)`.

TEST-1713 (Error) The Memory BIST product is no longer supported in DFT Compiler.

DESCRIPTION

You received this message because you tried to use an MBIST UI specific switch or command.

List of MBIST disabled specific switches: `set_dft_configuration -mbist`
`set_dft_signal -freq_mult` `create_test_clock -mbist_clock` `preview_dft -mbist`
`preview_dft -rtl` `insert_dft -rtl`

List of MBIST disabled specific commands: `set_mbist_configuration`
`reset_mbist_configuration` `remove_mbist_configuration` `set_mbist_controller`
`reset_mbist_controller` `set_mbist_element` `set_mbist_wrapper` `reset_mbist_wrapper`
`set_mbist_run` `set_testbench_parameters` `report_mbist_trace` `define_mbist_program`
`report_mbist_program` `reset_mbist_programs` `create_mbist_standalone`

WHAT NEXT

Don't use MBIST specific switches or commands.

SEE ALSO

`set_dft_configuration (2)`, `insert_dft (2)`, `preview_dft (2)`,
`set_dft_signal (2)`,
`create_test_clock (2)`

TEST-1714 (warning) Reading in a test protocol after specifying signals will cause the signals to be cleared from the protocol and the model.

DESCRIPTION

You received this warning message to alert you; if you have specified signals using the `set_dft_signal` command prior to a `read_test_protocol` the signals will be removed once the `read_test_protocol` is executed.

WHAT NEXT

Always specify the signals after `read_test_protocol` to ensure that they will be present in the protocol and the model.

SEE ALSO

`set_dft_signal (2)`, `read_test_protocol(2)`

TEST-1715 (error) The specification for the hookup signal nor the differential clock will not be accepted. They are mutually exclusive.

DESCRIPTION

You receive this error message because you specified a differential clock as a hookup pin. However, a differential clock must be specified with primary input ports.

WHAT NEXT

Remove the `-hookup_pin` and its corresponding port name in the command `set_dft_signal`. Instead specify a primary input port for the differential clock in the `-port` option of the `set_dft_signal` command.

SEE ALSO

`set_dft_signal (2)`,

TEST-1716 (error) The specification for a differential clock can only have one reference clock port and one differential clock port. The specification of multiple reference clock ports and/or differential clock ports will be discarded.

DESCRIPTION

You receive this error message because you specified multiple ports for the reference clock port and/or differential clock port. A differential clock specification may only have a single reference clock port and differential clock port, and both should not have been used in another differential clock specification.

WHAT NEXT

Remove the extra ports specified for the reference clock and/or the differential clock, and replace them with a single reference clock port and differential clock port in the `set_dft_signal`.

SEE ALSO

`set_dft_signal (2)`,

TEST-1718 (warning) The specification for a differential clock does not require the user to specify the timing. The differential clock port will receive the complementary waveform of the reference clock supplied. The specification of the timing waveform will be ignored.

DESCRIPTION

You received this warning message because you specified a timing waveform for the differential clock port. However, the timing waveform for this port is unnecessary.

WHAT NEXT

You may choose to remove the timing specification for the differential clock when using the `set_dft_signal` to specify a differential clock, so that you will no longer receive the warning message.

SEE ALSO

`set_dft_signal (2)`,

TEST-1719 (error) The port %s was previously used, however the specification for a differential clock cannot have a port that was previously used to declare another differential clock signal. The specification will be discarded.

DESCRIPTION

You received this error message because you specified a port that was previously used to declare another differential clock signal. A unique pair of ports must be used to specify each differential clock.

WHAT NEXT

You must specify a pair of ports that has not been used to specify another differential clock when using the `set_dft_signal`.

SEE ALSO

`set_dft_signal (2)`,

TEST-1720 (Error) Could not access %s component from DesignWare.

DESCRIPTION

You receive this error message because the DFT Compiler is unable to access the

WHAT NEXT

Check your `search_path` variable and include `dft_lbist.sldb` in your `synthetic_library` variable. Rerun the DFT Compiler.

SEE ALSO

`search_path` (3), `synthetic_library` (3).

TEST-1721 (error) %s pipeline register '%s' was specified as a non scan element. Check your scan specifications

DESCRIPTION

You receive this message when the pipeline scan data feature is enabled. The head or tail pipeling register specified with the `set_scan_path` command have been previously specified as non scan element through the command `set_scan_element` or `set_scan_configuration -exclude`. Because of this `preview_dft` or `insert_dft` will not proceed. Head and tail register are automatically handled by the tool. You should not explicitly declare them as non scan element.

WHAT NEXT

Declare your head or tail pipeling register as regular scan element using the command `set_scan_element` or `set_scan_configuration -exclude`

SEE ALSO

`set_scan_configuration` (2).

TEST-1730 (information) Clock generator input '%s' is driven by clock generator output '%s'. The path is preserved.

DESCRIPTION

You receive this message when the on-chip clocking control feature is enabled. DFT Compiler has detected a path between two cells identified as clock generator cells. The second clock generator cell may drive a clock signal to the first clock generator cell. This clock signal may be used as a reference in the first clock generator cell. DFT Comiler will not insert a clock controller cell on a clock signal path between two clocks generator cells. DFT Compiler will preserve the connectivity between both cells. The net name linking them may change.

WHAT NEXT

Verify that you have identified the clock generator output pins at the right level of hierarchy.

SEE ALSO

set_dft_signal (2).

TEST-1731 (information) The specified rule '%s' has been ignored.

DESCRIPTION

You have received this message because you have specified a wrong rule violation or a not supported rule.

WHAT NEXT

Please, check the violated rules list and re-run the `report_dft_drcViolation` command.

SEE ALSO

dft_drc (2).

TEST-1732 (error) Violations cannot be reported because the design has changed since last `dft_drc` command.

DESCRIPTION

You receive this message because you have run a DC command and your design has changed since the last `dft_drc` command.

WHAT NEXT

Please, run `dft_drc` command, then re-run `report_dft_drc_violations`.

SEE ALSO

dft_drc (2).

TEST-1733 (error) Violations cannot be reported. Please, run

dft_drc command first.

DESCRIPTION

You receive this message because you have run `report_dft_drc_violations` command before running `dft_drc` command.

WHAT NEXT

Please, run `dft_drc` command, then re-run `report_dft_drc_violations`.

SEE ALSO

dft_drc (2).

TEST-1734 (error) Scan group '%s' cannot have the -class occ option set when SNPS clock controller insertion is selected.

DESCRIPTION

This error message occurs when you enable clock controller insertion and you select the SNPS clock controller IP for insertion. In this flow, the **-class occ** option of the `set_scan_group` command cannot be specified. It is only meant to identify existing clock control bits segments in the user-defined clock controller flow.

WHAT NEXT

Run the `set_scan_group` command without the **-class occ** option.

SEE ALSO

`set_dft_clock_controller`(2)
`set_dft_configuration`(2)
`set_scan_group`(2)

TEST-1800 (error) encoding specifications for modes '%s' and '%s' are identical.

DESCRIPTION

The encoding specification must be unique. User must re-define the encoding specification for the mode by using the `define_test_mode -encoding` command.

TEST-1850 (error) Required BSD design not found.

DESCRIPTION

BSD design information is to be made available for the `read_bsdl` command to execute successfully.

WHAT NEXT

Verify the BSD design information is available to the BSD Compiler before running the `read_bsdl` command.

SEE ALSO

`read_bsdl(2)`

TEST-1851 (error) Required DC design not found.

DESCRIPTION

DC design information is to be made available for the `read_bsdl` command to execute successfully.

WHAT NEXT

Verify the DC design information is available to the BSD Compiler before running the `read_bsdl` command.

SEE ALSO

`read_bsdl (2)`

TEST-1852 (error) BSD design name ('%s') is NOT same as the name of the top module specified in the input netlist ('%s').

DESCRIPTION

The BSD design name specified as part of the "entity" construct in the BSDL file should be the same as the name of the top module as specified in the input netlist.

WHAT NEXT

Make sure the above mentioned names are identical before running the `read_bsdl` command.

SEE ALSO

`read_bsdl(2)`

TEST-1853 (error) Incorrect ENTITY declaration in the input BSDL file. (Check if source file is BSDL).

DESCRIPTION

The `read_bsdl` command has detected a potential syntax error in the ENTITY specification in the input BSDL file. It is also likely that the input file does not contain valid BSDL syntax.

WHAT NEXT

Make sure the input file is a valid BSDL file and that the ENTITY declaration has no syntax errors.

SEE ALSO

`read_bsdl(2)`

TEST-1854 (error) Incorrect END_BSDL declaration in the input BSDL file.

DESCRIPTION

The `read_bsdl` command has detected a potential syntax error in the END_BSDL specification in the input BSDL file.

WHAT NEXT

Make sure that the END_BSDL declaration has no syntax errors in the input BSDL file.

SEE ALSO

`read_bsdl(2)`

TEST-1855 (error) Incorrect PORT declaration in the input BSDL file.

DESCRIPTION

The `read_bsdl` command has detected a potential syntax error in the PORT specification in the input BSDL file.

WHAT NEXT

Make sure that the PORT declaration has no syntax errors in the input BSDL file.

SEE ALSO

`read_bsdl(2)`

TEST-1856 (error) Incorrect PIN_MAP declaration in the input BSDL file.

DESCRIPTION

The `read_bsdl` command has detected a potential syntax error in the PIN_MAP specification in the input BSDL file.

WHAT NEXT

Make sure that the PIN_MAP declaration has no syntax errors in the input BSDL file.

SEE ALSO

`read_bsdl(2)`

TEST-1857 (error) Error in creation of BSD linkage port '%s'.

DESCRIPTION

After reading the contents of the input BSDL file, BSD linkage ports are created in the design. This error pertains to issues in creation of the specified BSD linkage port.

SEE ALSO

`read_bsdl(2)`

TEST-1858 (error) Error in creation of BSD port '%s'.

DESCRIPTION

After reading the contents of the input BSDL file, BSD ports are created in the design. This error pertains to issues in creation of the specified BSD port.

SEE ALSO

`read_bsdl(2)`

TEST-1859 (error) Incorrect port specifier attribute in the input BSDL file. '%s' is not a valid port specifier.

DESCRIPTION

In BSDL, valid port attribute values are "in", "inout", "out", "linkage" or "buffer". Any other values or syntax errors would result in the generation of this error message.

WHAT NEXT

Make sure the port specifier attribute matches one of the above mentioned values.

SEE ALSO

`read_bsdl(2)`

TEST-1860 (error) Incorrect USE declaration in the input BSDL file.

DESCRIPTION

The `read_bsdl` command has detected a potential syntax error in the USE specification in the input BSDL file.

WHAT NEXT

Make sure that the USE declaration has no syntax errors in the input BSDL file.

SEE ALSO

TEST-1891 (error) Error in processing the TAP_SCAN_CLOCK attribute specified in the input BSDL file.

DESCRIPTION

An error was encountered in processing the TAP_SCAN_CLOCK attribute specified in the input BSDL file.

WHAT NEXT

Make sure that the syntax of the TAP_SCAN_CLOCK specification is correct.

SEE ALSO

`read_bsdl(2)`

TEST-1892 (error) Error in processing the **RUNBIST_EXECUTION** attribute specified in the input BSDL file.

DESCRIPTION

This error message indicates that an error occurred when processing the **RUNBIST_EXECUTION** attribute specified in the input BSDL file.

WHAT NEXT

See the IEEE Std 1149.1-2001 for the correct syntax. Make sure that the syntax of the **RUNBIST_EXECUTION** attribute specification is correct and then run the command again.

SEE ALSO

`read_bsdl(2)`

TEST-1893 (error) Error in processing the **INTEST_EXECUTION** attribute specified in the input BSDL file.

DESCRIPTION

This error message indicates that an error occurred when processing the **INTEST_EXECUTION** attribute specified in the input BSDL file.

WHAT NEXT

See the IEEE Std 1149.1-2001 for the correct syntax. Make sure that the syntax of the **INTEST_EXECUTION** attribute specification is correct and then run the command again.

SEE ALSO

`read_bsdl(2)`

TEST-1894 (Error) Design contains cores with xtolerant and non-xtolerant compression logic.

DESCRIPTION

You receive this message because you have enabled scan compression integration/hybrid flow but your design has cores with both xtolerant and non-xtolerant compression logic. The mixing of cores with both xtolerant and non-xtolerant compression logic is only supported at the top level. If a core has been integrated at a deeper hierarchy, it should not contain both xtolerant and non-xtolerant compression/decompression (CODEC) logic.

For example, if a design TOP has three cores core_a, core_b and core_c, each of these cores individually can only have either xtolerant or non-xtolerant CODECs inside them. Let's say core_a has all non-xtolerant CODECs while core_b and core_c have all xtolerant CODECs, respectively. In this case, integration at the top level can be performed. However, if say core_c itself has 2 xtolerant and one non-xtolerant CODEC, in that case integration/hybrid flow cannot not be run at the top level.

WHAT NEXT

Generate cores with homogenous CODECs so as to integrate at the top level.

set_dft_configuration (2).
```

TEST-1900 (warning) Pipelining scan data is not supported for multiple compression modes in user defined pipeline flow.

DESCRIPTION

You receive this warning message if you have enabled user defined pipelining scan data in multimode flow. Pipelining scan data is supported for only for multiple scan modes and not multiple compression modes.

WHAT NEXT

Pipelining scan data is not supported for multimode flows. You can either disable pipelining scan data or have only one compression mode.

SEE ALSO

`set_dft_configuration remove_test_mode`

TEST-1901 (Warning) User defined pipeline scan data flow is enabled using `set_scan_configuration` command. Auto pipelining scan data will be disabled.

DESCRIPTION

You receive this message if you have enabled pipelining scan data using both `set_dft_configuration` and `set_scan_configuration` commands. Auto pipelining will be disabled. All specifications in `set_pipeline_scan_data_configuration` will be ignored.

WHAT NEXT

If you have specified head/tail pipeline registers using `set_scan_path` command, then you don't need to do anything. The scan-ins/scan-outs of the scan paths will be hooked up to their corresponding head/tail pipeline registers. If pipeline registers are not defined, you should disable pipeline scan data in scan configuration using `set_scan_configuration -pipeline_scan_data FALSE`. The tool will automatically insert pipeline registers.

SEE ALSO

`set_scan_configuration` `set_dft_configuration` `set_pipeline_scan_data_configuration`
`set_scan_path`

TEST-1902 (Error) Pipelining scan data not enabled for design with pipelined compression cores.

DESCRIPTION

You receive this error message in hierarchical adaptive synthesis flow, if the design has compression cores with pipeline scan data registers and scan data pipelining is not enabled at the top level.

WHAT NEXT

Enable pipeline scan data using `set_dft_configuration`. Specify head/tail depths using `set_pipeline_scan_data_configuration`.

SEE ALSO

`set_pipeline_scan_data_configuration` `set_dft_configuration`

TEST-1903 (warning) Pipeline scan data registers are user defined. Pipeline scan data configuration specifications will be ignored.

DESCRIPTION

You receive this warning message if you have defined pipeline registers for scan paths and also enabled auto pipelining scan data. All specifications in `set_pipeline_scan_data_configuration` will be ignored.

WHAT NEXT

You don't need to do anything. The scan-ins/scan-outs of the scan paths will be hooked up to their corresponding head/tail pipeline registers.

SEE ALSO

`set_pipeline_scan_data_configuration` `set_scan_path` `set_dft_configuration`

TEST-1904 (Error) Auto pipelining scan data failed.

DESCRIPTION

You receive this error message if auto pipelining scan data failed.

WHAT NEXT

TEST-1905 (warning) The specified number of Head and Tail pipeline scan data stages is 0. Pipeline registers will not be inserted.

DESCRIPTION

You receive this warning message if you have enabled pipeline san data using

`set_dft_configuration` command and defined the number of both head and tail pipeline stages as 0.

WHAT NEXT

You don't need to do anything, if this intended. Alternatively, you can specify head and tail pipeline depth using the `set_pipeline_scan_data_configuration` command to insert pipeline stages.

SEE ALSO

`set_pipeline_scan_data_configuration` `set_dft_configuration`

TEST-1906 (error) No of internal chains %d is less than no of inputs %d.

DESCRIPTION

You receive this message because load decompressor architecting failed for the given set of scan inputs and for the given minimum compression. The number of scan-inputs is derived from `set_scan_configuration -chain_count` for the base mode. The `minimum_compression` is specified with the `set_scan_compression_configuration` command. The number of chains in the scan-compression mode is either calculated based on these numbers or derived from the `set_scan_configuration -chain_count` for the user defined compression mode.

WHAT NEXT

The number of scan inputs should be less than the number of compression mode chains. You can increase the number of compression mode chains, by either varying minimum compression or chain count for the compression mode. Also, check mode specific scan path and chain count specifications.

SEE ALSO

`set_scan_configuration` (2), `set_scan_compression_configuration` (2), `set_scan_path` (2), `insert_dft` (2), `preview_dft` (2), `set_dft_configuration` (2).

TEST-1907 (error) No of internal chains %d is less than no of

outputs %d.

DESCRIPTION

You receive this message because unload compressor architecting failed for the given set of scan outputs and for the given minimum compression. The number of scan-outputs is derived from `set_scan_configuration -chain_count` for the base mode. The `minimum_compression` is specified with the `set_scan_compression_configuration` command. The number of chains in the scan-compression mode is either calculated based on these numbers or derived from the `set_scan_configuration -chain_count` for the user defined compression mode.

WHAT NEXT

The number of scan outputs should be less than the number of compression mode chains. You can increase the number of compression mode chains, by either varying minimum compression or chain count for the compression mode. Also, check mode specific scan path and chain count specifications.

SEE ALSO

`set_scan_configuration (2)`, `set_scan_compression_configuration (2)`, `set_scan_path (2)`, `insert_dft (2)`, `preview_dft (2)`, `set_dft_configuration (2)`.

TEST-1908 (Error) %s pipeline stages mismatch. Core %s has %d pipeline stages. Top level requires %d pipeline stages.

DESCRIPTION

You receive this message if you have enabled pipelining scan data in hierarchical adaptive synthesis flow and there is a mismatch between the number of pipeline stages in a core with scan compression, and the top level . All cores should have the same number of head and/or tail pipeline stages, which should be specified at the top level.

WHAT NEXT

Specify the number of head and/or tail pipeline stages at the top level using `set_pipeline_scan_data_configuration` command.

SEE ALSO

`set_pipeline_scan_data_configuration (2)`

TEST-1909 (Error) Top %s pipeline clock %s not compatible with core pipeline clock.

DESCRIPTION

You receive this message if you have enabled pipelining scan data in hierarchical adaptive synthesis flow and the specified top pipeline clock is incompatible with a core pipeline clock. When a pipeline clock is not specified, the tool creates a rise-to-1 clock "SNPS_PipeClk" for the pipeline registers. This error message is triggered when no pipeline clock is specified at the core level and the top pipeline clock is a rise-to-0 clock, which is incompatible with the core "SNPS_PipeClk" clock. Hence, the core "SNPS_PipeClk" clock cannot be stitched to the specified top level pipeline clock.

WHAT NEXT

Specify a pipeline clock that is compatible to the core pipeline clock using **set_pipeline_scan_data_configuration** command at the top level.

SEE ALSO

set_pipeline_scan_data_configuration (2), **set_dft_signal** (2)

TEST-1910 (Error) Stitching top pipeline clock to core pipeline clock failed.

DESCRIPTION

You receive this error message if stitching top pipeline clock to core pipeline clock "SNPS_PipeClk" failed.

WHAT NEXT

TEST-1911 (Error) Cannot architect load decompressor with %d inputs.

DESCRIPTION

You receive this message because load decompressor architecting failed with the given number of scan-ins. This message indicates that there are not sufficient number of scan-ins for the load decompressor to architect the required number of

internal chains.

WHAT NEXT

You can increase the number of scan-ins for the load decompressor by increasing the base mode chain count. You can decrease the number of internal chains by decreasing minimum compression or chain count for the compression mode. Also, check compression mode scan path specifications. It is recommended, to specify the scan-ins and scan-outs only in the all_dft or base mode. The scan compression mode scan-in/scan-out specifications are used to guide the tool to build scan chains outside the codec and hence are not available for the load decompressor.

SEE ALSO

`set_scan_configuration (2)`, `set_scan_compression_configuration (2)`, `set_scan_path (2)`, `set_dft_signal (2)`, `insert_dft (2)`, `preview_dft (2)`, `set_dft_configuration (2)`.

TEST-1912 (Error) Too small period (period=%d < nload_inputs=%d).

DESCRIPTION

You receive this message because there are not sufficient number of scan-ins for the load decompressor to architect the required number of internal chains.

WHAT NEXT

You can increase the number of scan-ins for the load decompressor by increasing the base mode chain count. You can decrease the number of internal chains by decreasing minimum compression or chain count for the compression mode. Also, check compression mode scan path specifications. It is recommended, to specify the scan-ins and scan-outs only in the all_dft or base mode. The scan compression mode scan-in/scan-out specifications are used to guide the tool to build scan chains outside the codec and hence are not available for the load decompressor.

SEE ALSO

TEST-2000 (Warning) There is no scan IN port for the Scan

Chain '%s'.

DESCRIPTION

You get this Warning message when the scan IN pin of the scan Chain does not exist in the design.

WHAT NEXT

Review the scan def file and the design.

SEE ALSO

`write_scan_def(2)`, `place_opt(2)`, `report_scan_chain(2)`, `check_scan_chain(2)`,

TEST-2001 (Warning) There is no scan OUT port for the Scan Chain '%s'.

DESCRIPTION

You get this Warning message when the scan OUT pin of the scan Chain does not exist in the design.

WHAT NEXT

Review the scan def file and the design.

SEE ALSO

`write_scan_def(2)`, `place_opt(2)`, `report_scan_chain(2)`, `check_scan_chain(2)`,

TEST-2002 (Warning) The direction of the pin '%s' is not correct.

DESCRIPTION

You get this Warning message when the direction (input or output) of the expected pin is not correct.

WHAT NEXT

Review the scan def file and the design.

SEE ALSO

`read_def(2)`, `optimize_dft(2)`, `report_scan_chain(2)`, `check_scan_chain(2)`,

TEST-2003 (Error) Boundary-Scan has already been inserted using 'insert_dft' command.

DESCRIPTION

This message is issued when boundary scan is already inserted into the design with `insert_dft` command and user runs `insert_dft` command again to insert boundary scan logic or user runs `preview_dft` to preview boundary scan logic. **Boundary scan logic can only be inserted once with insert_dft command.** And `preview_dft` can be used to preview boundary scan logic before inserting boundary scan.

WHAT NEXT

If user wants to change the boundary scan logic of the design, they need to run `insert_dft` on pre-boundary scan netlist.

TEST-2004 (Error) No pattern block found in the CTL for the design.

DESCRIPTION

This error is flagged when the `write_test` command does not see any pattern information in the CTL.

WHAT NEXT

Make sure that the `create_bsd_patterns` command was completed successfully.

SEE ALSO

`create_bsd_patterns (2)`.

TEST-2005 (Error) No CTL and/or DC design information found

for this design.

DESCRIPTION

This error is flagged when there is no valid CTL data or the DC design information is missing.

WHAT NEXT

Make sure that the `create_bsd_patterns` command was completed successfully.

SEE ALSO

`create_bsd_patterns` (2).

TEST-2006 (error) No valid library cell specified.

DESCRIPTION

This error message occurs when the tool cannot identify the specified library cell. The name of the library cell is either incorrect or the library cell does not exist.

WHAT NEXT

Make sure that all of the library cells needed for the design are completely specified and available in the search path. After making any changes, run the command again.

TEST-2008 (Error) -usage clock_gating is invalid when feature to connect unconnected test pins of clock gating cells is disabled.

DESCRIPTION

You received this error message because you disabled the feature to connect unconnected test pins of clock gating cells and are using the `-usage clock_gating` option with the `set_dft_signal` command.

WHAT NEXT

Enable the Clock gating feature using the `set_dft_configuration` -

connect_clock_gating enable command and rerun. If you do not intend to connect test signal to the clock gating cells and have thus disabled the connect_clock_gating feature then remove the -usage clock_gating option from the set_dft_signal command.

SEE ALSO

`set_dft_configuration(2)`
`set_dft_signal(2)`

TEST-2009 (Error) Invalid usage '%s'.

DESCRIPTION

You received this error message because you have specified a wrong usage for a DFT Signal with -usage option of the `set_dft_signal` command.

WHAT NEXT

Specify a valid usage and issue the command again. See help for `set_dft_signal` command for valid usages.

SEE ALSO

`set_dft_signal(2)`

TEST-2010 (Error) -usage option is valid only with -type ScanEnable or -type TestMode.

DESCRIPTION

You received this error message because you have specified -type other than ScanEnable or TestMode to the `set_dft_signal` command when using the -usage option.

WHAT NEXT

The -usage option for the `set_dft_signal` command can only be used for -type ScanEnable or TestMode. Change the -type to one of these.

SEE ALSO

`set_dft_signal(2)`

TEST-2011 (Error) -usage option is invalid with -test_mode option.

DESCRIPTION

You received this error message because you have used the -usage option to the set_dft_signal command and have also specified the -test_mode option.

WHAT NEXT

The -usage option for the set_dft_signal command cannot be mode specific. Remove the -test_mode option to the set_dft_signal command when using -usage.

SEE ALSO

`set_dft_signal(2)`

TEST-2012 (Error) -usage option is invalid within the scope of a test mode.

DESCRIPTION

You received this error message because you have used the -usage option to the set_dft_signal command within the scope of a test mode.

WHAT NEXT

The -usage option for the set_dft_signal command cannot be mode specific. Remove it from the scope of test mode and rerun the command.

SEE ALSO

`set_dft_signal(2)`

TEST-2013 (Error) -usage option cannot be specified in existing_dft view.

DESCRIPTION

You received this error message because you have used the -usage option to the set_dft_signal command and have specified the -view as existing_dft.

WHAT NEXT

The -usage option for the set_dft_signal command can only be used if the -view is specification. Change the -view of the set_dft_signal command to -view specification

SEE ALSO

set_dft_signal(2)

TEST-2014 (Information) You are not running topographical mode. set_scan_compression_configuration congestion_optimization option has no effect.

DESCRIPTION

This message shows that your are not running DC-Topographic mode and you are setting congestion_optimization option to true for set_scan_compression_configuration. The "congestion_optimization" option only work for DC-Topographic. Hence, in non DC-Topographic mode, it has no effect.

WHAT NEXT

If you need to congestion optimization for DFT insertion, use DC-Topographic instead.

TEST-2015 (Error) To remove dft connectivity specification either a specification Label or -all must be specified.

DESCRIPTION

You received this warning message because you issued remove_dft_connect command without specifying, either a dft connectivity specification Label or -all. Any one of them is required. Both dft connectivity specification Label and -all are not allowed at the same time.

WHAT NEXT

Please specify either a dft connectivity specification Label or -all and issue the command again.

SEE ALSO

set_dft_connect(2)

```
remove_dft_connect(2)
```

TEST-2016 (Warning) Overwriting existing specification with same label '%s'

DESCRIPTION

You received this warning message because you specified set_dft_connect command with a label that has already been used earlier.

WHAT NEXT

If you did not want to overwrite earlier specification then specify a new label and run the command again. Otherwise no action is required.

SEE ALSO

```
set_dft_connect(2)
```

TEST-2017 (Error) Invalid usage of signal.

DESCRIPTION

You received this error message because you specified set_dft_connect command with a source which has either not been defined with -usage switch of set_dft_signal command or defined with a usage not valid for current use.

Specified source should be a ScanEnable or TestMode defined with valid -usage switch of set_dft_signal command.

A ScanEnable or TestMode port with usage "clock_gating" is required to specify DFT connectivity of clock gating cells by set_dft_connect command.

A ScanEnable with usage "scan" is required to specify DFT connectivity of scan cells by set_dft_connect command.

WHAT NEXT

Define ScanEnable or TestMode port and use it to specify connectivity again.

SEE ALSO

```
set_dft_connect(2)  
set_dft_signal(2)
```

TEST-2018 (Error) Removal failed as no DFT connectivity specification exist.

DESCRIPTION

You received this error message because you tried to remove DFT connectivity specification which does not exist.

WHAT NEXT

You cannot remove a specification which does not exist. Use this command to remove an existing DFT connectivity specification.

SEE ALSO

```
set_dft_connect(2)  
remove_dft_connect(2)
```

TEST-2019 (Error) Removal failed as no DFT connectivity specification with label '%s'.

DESCRIPTION

You received this error message because you tried to remove DFT connectivity specification which does not exist.

WHAT NEXT

You cannot remove a specification which does not exist. Specify a valid label and run the command again.

SEE ALSO

```
set_dft_connect(2)  
remove_dft_connect(2)
```

TEST-2020 (Warning) Cell '%s' belongs to CTL modeled design

instance. It will be ignored.

DESCRIPTION

You received this warning message because you specified a cell with CTL model in either target or exclude list of objects of set_dft_connect command. It will be ignored.

WHAT NEXT

The cell is ignored by command. No action is required.

SEE ALSO

`set_dft_connect(2)`

TEST-2036 (Information) You have enabled a compression type that is not supported with congestion optimization. DFT MAX Compression Congestion Optimization is disabled.

DESCRIPTION

This message shows that your are enabling both compression type and congestion optimization. The congestion optimization is disabled.

WHAT NEXT

TEST-2037 (Information) You have enabled DFT MAX Compression Congestion Optimization. This option is supported only if you start with a design that was compiled with congestion optimization enabled. DFT MAX Compression Congestion Optimization is disabled.

DESCRIPTION

This message shows that your are enabling DFT MAX congestion optimization for a design that was not compiled with "-congestion". DFT MAX Compression Congestion Optimization is disabled.

WHAT NEXT

You can re-compile the design with "-congestion" option.

TEST-2038 (Error) DFT signals of type CompressionClock can not be defined in the view "existing".

DESCRIPTION

You get this message because you are defining a signal of type CompressionClock with the option "-view" set to existing.

WHAT NEXT

You must set the option "-view" to "spec" for the command to be accepted. You may specify a given timing for your port of type CompressionClock using the command "set_dft_signal -view existing -type ScanClock -timing ...".

TEST-2039 (Error) -usage scan is valid only with -type ScanEnable.

DESCRIPTION

You received this error message because set_dft_signal command was issued with

signal type other than -type ScanEnable along with -usage scan option. Only ScanEnable signal can be used with -usage scan.

WHAT NEXT

Change the signal type to ScanEnable and issue the command.

SEE ALSO

set_dft_signal(2)

TEST-2040 (Warning) dont_touch_network attribute on scan-enable port or signal '%s' can result in QoR degradation after scan insertion.

DESCRIPTION

There is a dont_touch_network attribute set on a scan-enable port or signal which can lead to QoR degradation after scan insertion in the following cases:

- * When shift-registers are identified in the design and logic is inserted on the scan-enable signal during scan insertion
- * When the functional output of scan flip-flops is gated to reduce power with the set_scan_suppress_toggling command

In these cases the extra logic added on the scan-enable signal, during scan insertion, leads to shared paths between the scan-enable signal and the functional logic. A dont_touch_network attribute on the scan-enable signal would propagate into functional logic paths which would prevent optimization of those paths and could lead to QoR degradation.

WHAT NEXT

Do not use a dont_touch_network attribute on scan-enable ports or signals. Instead, to disable timing optimization, use set_case_analysis on scan-enable ports. To disable DRC fixing, use set_ideal_network on the scan-enable ports. If a dont_touch_network attribute must be used, then use dont_touch_network,_Äino_propagate instead, to avoid propagation of the dont_touch attribute into functional logic.

SEE ALSO

compile_seqmap_identify_shift_registers_with_synchronous_logic(2)
set_case_analysis
set_dont_touch_network
set_ideal_network
set_scan_suppress_toggling

TEST-11120 (Error) The CTL model for the design '%s' does not have a mode of type 'Normal'. The model obtained after `insert_dft` may not be accurate.

DESCRIPTION

Core wrapping and Core Integration flows require that the test model for the current design have a mode with type 'Normal'. You get this message because the model found on the design does not have a normal mode. This typically occurs when you are in a scan chain re-ordering flow when you want to first infer scan structures and then re-order. The correct way to do this is to first run DRC to infer the mission mode of operation. This can be done by the command '`dft_drc -pre_dft`'. Then you can infer the scan structures with the command '`dft_drc -infer_scan_structures`'. Note that it must be done in two passes.

WHAT NEXT

Run 2 passes of DRC as explained above.

SEE ALSO

`dft_drc` (2) , `insert_dft` (2) ,

TESTDB

TESTDB-1 (warning) Overwriting existing scan style %s.

DESCRIPTION

This warning tells you that you have overwritten the current scan style using a **set_scan_configuration -style** or **set_scan_style** command. Note that you see this warning if you overwrite the existing scan style with the same scan style.

WHAT NEXT

Check the setting of the scan style with **report_test -configuration**. If the scan style is correct, no action is necessary. However, if you accidentally set the wrong scan style, use the **set_scan_configuration** command to set the correct scan style.

TESTDB-2 (error) Unable to create test vectors database file.

DESCRIPTION

This message is created if there is some system constraint which does not allow creation of the .vdb file in the specified directory. For instance, if the user does not have write privilege to the target directory, if the disk is full, or if the target machine is inaccessible.

WHAT NEXT

Check the possible causes listed above ensuring that the target directory is accessible, writable and not full.

TESTDB-3 (error) Unable to read test vectors database file '%s'.

DESCRIPTION

The **create_test_patterns** command creates a database file (a vdb file) that contains the generated test patterns. The **write_test** command reads the test patterns from this vdb file then writes the test patterns out to another file in the format you specified.

When **write_test** cannot read the vdb file, it issues this **TESTDB-3** message. This means that either **write_test** could not find the vdb file or it was unable to open the vdb file. Possible causes are

1. You specified an incorrect path name for the vdb file using the -input option of **write_test**.
2. There is some system problem that prevents **write_test** from accessing those vdb file you specified using the -input option of **write_test**. For example, you set protections on the vdb file that do not allow **write_test** to access the file.
3. You didn't run **create_test_patterns**, so no vdb file exists.
4. You created a vdb file in a previous dc_shell session but you didn't specify the name of this vdb file using the -input option of **write_test**.

WHAT NEXT

Identify the problem, correct the cause, then rerun the **write_test** command.

If you specified a vdb file using the -input option of **write_test**,

- * Check that you gave the correct path name for the vdb file.
- * Check that the file is accessible if it is on a remote machine.
- * Check that the protections on the file allow DFT Compiler to read the file.

If you didn't run **create_test_patterns** to create a vdb file, run **create_test_patterns**.

If you created the vdb file in a previous dc_shell session, explicitly specify the pathname of the vdb file using the -input option of **write_test**.

SEE ALSO

create_test_patterns (2), **write_test** (2).

TESTDB-4 (error) Invalid test vector database file '%s'.

DESCRIPTION

You see this message when **write_test** has opened, but is unable to process the vdb file you specified with the command's -input option. If you do not explicitly specify a vdb file with -input, the current vdb file that you created with **create_test_patterns** in the same dc_shell session will be opened.

If **write_test** is unable to process the file, either no vectors are saved in the vdb file or the vdb file is somehow corrupted.

WHAT NEXT

Review the output from the **create_test_patterns** command that created the vdb file.

If **create_test_patterns** did not save any patterns, you get a warning message that gives you details as to why no patterns were saved. Identify and correct the cause then rerun **create_test_patterns** and **write_test**.

In particular, note that if the design's scan configuration indicates that a design is pre-scan, **create_test_patterns** will not save any patterns since without a scan chain the patterns cannot be applied to the design. You can check the scan state of a design with **report_test -scan_status**. If you did not insert scan into the design and there is no existing scan in the design, you must run **insert_scan** to insert scan before you can generate and save test patterns. If the design is an ASCII netlist with existing scan, you need to issue the command **set_scan_configuration -existing_scan true** and rerun **check_test** before **create_test_patterns** will save any patterns.

If **create_test_patterns** did save vectors, but **write_test_patterns** cannot process the file, either there is a defect in **create_test_patterns** or in some way the vdb file was corrupted after its creation, such as a bad disk. The vdb file is stored in a binary format, which you should not edit or modify. Try rerunning **fbcreate_test_patterns** and **write_test**. If the problem persists, contact local Synopsys support.

TESTDB-5 (warning) User defined test protocol deleted.

DESCRIPTION

This message indicates that a test protocol for the current design previously read in using the **read_test_protocol** command has been deleted. Deletion of the protocol occurs automatically if it becomes obsolete, which typically happens because the ports of the design have changed. An example is when the **insert_test** command is run, which adds extra ports for test signals. If further test commands are executed, for example **create_test_patterns**, a new protocol will be automatically inferred. However, this protocol may not have the same behavior as the previous user-supplied protocol.

WHAT NEXT

Assuming the **read_test_protocol** command had been used to supply a custom test protocol specifically developed for the design, it is necessary to re-execute the **read_test_protocol** command to read in the custom protocol. If the ports of the design have changed, for example, if additional scan test ports have been added by the **insert_test** command, then it may be necessary to edit the protocol file before it can be read.

TESTDB-6 (error) Port '%s' has an undefined direction.

Unpredictable behavior might result.

DESCRIPTION

If DFT Compiler encounters a port with unknown direction, DFT Compiler might exhibit unpredictable behavior during test-protocol generation and design-rule checking.

WHAT NEXT

Determine why the port was assigned an unknown direction. One possible cause is that if a hierarchical design has been read using Verilog, but a lower level of hierarchy has not be read in, the direction of a signal defined in the lower level will be unknown.

TESTDB-100 (warning) Renaming port from '%s' to '%s'.

DESCRIPTION

The `write_test` command issues this warning when a port name in the netlist does not conform to the naming rules of the vector format you specified with the `-format` option. The warning message shows you both the port name in the netlist format and the port name in the vector file it is creating.

WHAT NEXT

If your ASIC Vendor's sign-off flow can accept the different names in the netlist and in the vectors, no action is necessary. Otherwise, you need to change the names of the ports in the netlist so that the netlist and vector files use the same port names. You can achieve this by setting appropriate naming rules with the `define_name_rules` and the `bus_naming_style` variables and the `change_names` command.

If you use one of the CTV Formats, consult the CTV Formats Reference Manual for guidance. For other formats, consult your ASIC Vendor for guidance on port naming rules.

SEE ALSO

`write_test` (2), `define_name_rule` (2), `bus_naming_style`, (2), `change_names` (2).

TESTDB-223 (error) Value of attribute '%s' must be a float (line:

%d).

DESCRIPTION

The value should be a float number.

WHAT NEXT

Check your test protocol.

TESTDB-224 (error) Value of attribute '%s' must be a list of two float values (line: %d).

DESCRIPTION

The value of the attribute must be a list of two floating point values.

WHAT NEXT

Check your test protocol.

TESTDB-225 (error) Value of attribute '%s' must not be less than zero (line: %d).

DESCRIPTION

The value should be less than zero.

WHAT NEXT

TESTDB-254 (error) Scan chain specification '%s' includes repeated elements.

DESCRIPTION

A scan chain is a connected sequence of scan elements (scan cells, segments, links and design instances). A scan element can only appear at exactly one chain position. Scan chain specifications that include repeated elements are in error.

WHAT NEXT

Remove repeated elements from the chain, and reapply the `set_scan_path` command.

TESTDB-255 (warning) Scan chain '%s' overwrites an earlier specification.

DESCRIPTION

DFT Compiler does not allow scan chains to be specified using multiple `set_scan_path` commands. This warning tells you that an earlier specification is being overwritten.

WHAT NEXT

Establish whether you want the specification to be overwritten. If not, combine the two specifications into one `set_scan_path` command.

TESTDB-256 (error) Scan chains '%s' and '%s' have common elements.

DESCRIPTION

DFT Compiler does not let scan chains share scan elements (cells or design instances). This error tells you that some elements belong to more than one chain.

WHAT NEXT

If the common elements can be removed from the scan chain you're specifying, remove them and reapply the `set_scan_path` command. Otherwise, apply the `remove_scan_specifications` command and start again.

TESTDB-257 (warning) Overwriting previously specified '%s' port '%s'.

DESCRIPTION

DFT Compiler uses one scan enable signal to enable scan mode and one test mode signal to enable test mode. This message warns that either you used the `set_scan_signal` command to specify more than one scan enable, or you used the `set_dft_signal` command to specify more than one test mode signal. The second

specification overwrites the first.

WHAT NEXT

Verify that you do want to overwrite the specification. Repeat both the newest specification and the corrected specification if the overwrite was mistaken.

TESTDB-258 (warning) Overwriting previously specified signal on port '%s'. Signal type '%s' conflicts with old type '%s'.

DESCRIPTION

DFT Compiler only associates exactly one signal type with a design port. This message warns that you used the `set_scan_signal` or `set_dft_signal` command to associate a second type with a design port, and that the second specification has overwritten the first.

WHAT NEXT

Check that you do want to overwrite the specification. Repeat both it and the corrected specification if the overwrite was mistaken.

TESTDB-259 (warning) Overwriting previously specified scan signal on port '%s'. Access pin '%s' conflicts with old pin '%s'.

DESCRIPTION

DFT Compiler only associates exactly one access pin with a design port. This message warns that you have used the `set_scan_signal` command to associate a second access pin with a design port, and that the second specification has overwritten the first.

WHAT NEXT

Check that you do want to overwrite the specification. Repeat both it and the corrected specification if the overwrite was mistaken.

TESTDB-260 (warning) Overwriting previously specified '%s' for

chain '%s'.

DESCRIPTION

DFT Compiler only associates exactly one scan signal with a particular type to a scan chain. This message warns that you have used the **set_scan_signal** command to associate a second scan signal of a particular type with a scan chain, and that the second specification has overwritten the first.

WHAT NEXT

Check that you do want to overwrite the specification. Repeat both it and the corrected specification if the overwrite was mistaken.

TESTDB-261 (warning) Overwriting scan signal '%s'. Can not share access pin '%s' with signal '%s'.

DESCRIPTION

DFT Compiler only lets you associate a scan access pin with exactly one scan signal. This message warnings you that you have used the **set_scan_signal** command to associate a scan access pin with a second scan signal. The first specification is overwritten.

WHAT NEXT

Check that you do want to overwrite the specification. Repeat both it and the corrected specification if the overwrite was mistaken.

TESTDB-262 (warning) '%s' is the name of an existing scan link. It will be overwritten.

DESCRIPTION

You receive this message because you have used the **set_scan_link** command to specify a scan link that has the same name as an existing scan link. You cannot have more than one scan link with the same name. DFT Compiler is overwriting the previous specification with the current one.

WHAT NEXT

If you intended to overwrite the previous scan link specification, then no further

action is necessary. However, if the overwrite is not intended, determine and correct the cause of the error and use the **set_scan_link** command to respecify both scan links.

SEE ALSO

set_scan_link (2).

TESTDB-263 (error) Scan chains '%s' and '%s' have common elements. Segment states are considered.

DESCRIPTION

DFT Compiler does not let scan chains share scan elements (cells or design instances). This error tells you that some elements belong to more than one chain. Furthermore the conflict is only visible when segments states are considered. This mean that one chain has an element that belongs to a segment in another chain.

WHAT NEXT

If the common elements can be removed from the scan chain you're specifying, remove them and reapply the **set_scan_path** command. Otherwise, apply the **remove_scan_specifications** command or **set_scan_segment** commands and start again.

TESTDB-264 (error) An existing scan segment has the name '%s'. Scan link specification is discarded.

DESCRIPTION

When you specify a scan link, DFT Compiler checks that no scan segment has the same name. Otherwise scan chain specifications will be ambiguous. This message tells you that you have specified a scan link using the same name as an existing scan segment. Your scan link specification is discarded.

WHAT NEXT

Change the name of your scan link. Alternatively, apply the **remove_scan_specifications** command and start again.

TESTDB-265 (error) Scan segment specification '%s' includes

repeated elements.

DESCRIPTION

A scan segment is a connected sequence of scan elements (scan cells and design instances). A scan element can only appear at exactly one segment position. Scan segment specifications that include repeated elements are in error.

WHAT NEXT

Remove repeated elements from the segment, and reapply the **set_scan_segment** command.

TESTDB-266 (warning) Scan segment '%s' updates an earlier specification.

DESCRIPTION

DFT Compiler lets you specify scan segments using multiple **set_scan_segment** commands. This warning tells you that an earlier specification is being updated.

WHAT NEXT

Establish that you want the specification to be updated. If not, remove the scan segment using the **remove_scan_specifications** command, or specify the scan segment you want using a different name.

TESTDB-267 (error) Scan segments '%s' and '%s' have common elements.

DESCRIPTION

DFT Compiler does not let scan segments share scan elements (cells or design instances). This error tells you that some elements belong to more than one segments.

WHAT NEXT

If the common elements can be removed from the scan segments you're specifying, remove them and reapply the **set_scan_segments** command. Otherwise, apply the **remove_scan_specifications** command and start again.

TESTDB-268 (error) An existing scan link has the name '%s'. Scan segment specification is discarded.

DESCRIPTION

When you specify a scan segment, DFT Compiler checks that no scan link has the same name. Otherwise scan chain specifications will be ambiguous. This message tells you that you have specified a scan segment using the same name as an existing scan link. Your scan segment specification is discarded.

WHAT NEXT

Change the name of your scan segment. Alternatively, apply the **remove_scan_specifications** command and start again.

TESTDB-269 (warning) Scan segment '%s' shares elements with chain '%s'. Cannot use segment to specify chains.

DESCRIPTION

When you specify a scan segment, DFT Compiler checks that it shares no states with an existing scan chain. Otherwise you will not be able to use the segment to specify a scan chain until common elements are removed. This message tells you that you have specified a scan segment that shares elements with an existing scan chain.

WHAT NEXT

Specify your scan segment again, eliminating common elements, or remove common elements from the scan chain specification.

TESTDB-270 (warning) Scan segment '%s' overwrites an earlier specification that has a different scan style.

DESCRIPTION

DFT Compiler lets you specify scan segments using multiple **set_scan_segment** commands. This warning tells you that an earlier specification is being overwritten because it has a different scan style.

WHAT NEXT

Establish that you want the specification to be overwritten. If not, remove the scan segment using the `remove_scan_specifications` command, or specify the scan segment you want using a different name.

TESTDB-271 (warning) Your scan chain specification includes a sequence of %d scan links. All but the first is discarded.

DESCRIPTION

DFT Compiler lets you include scan links in scan chain specifications. These tell DFT Compiler how to connect two chain elements together. It makes no sense to use a sequence of scan links to connect scan elements. This message tells you that this condition has been identified. All but the first link is discarded.

WHAT NEXT

Check that you do want all but the first scan link discarded. If not, enter the correct specification.

TESTDB-272 (error) Scan chain specification '%s' includes repeated elements when segments are expanded.

DESCRIPTION

A scan chain is a connected sequence of scan elements (scan cells, segments, links and design instances). A scan element can only appear at exactly one chain position. Scan chain specifications that include repeated elements are in error, even if those elements are hidden by a segment specification.

WHAT NEXT

Remove repeated elements from the chain or segment, and reapply the `set_scan_path` command.

TESTDB-273 (warning) Net '%s' specified in trace_nets()

statement does not exist in the design (line: %d).

DESCRIPTION

The net specified by trace_nets() statement does not exist in the design.

WHAT NEXT

Check your design if the net exists.

TESTDB-274 (warning) Could not delete signal_type attribute on port '%s'.

DESCRIPTION

This warning message indicates that **remove_scan_specifications** could not remove the **signal_type** attribute from the specified port, probably because there is no **signal_type** attribute on that port.

WHAT NEXT

Verify that there is no **signal_type** attribute on the port.

TESTDB-275 (warning) Can not find scan chain '%s' to delete it.

DESCRIPTION

The **remove_scan_specifications** command deletes named scan chains. You see the following message when you've asked DFT Compiler to remove a scan chain, but DFT Compiler can't find it. This means that there is no such chain.

WHAT NEXT

Check the way you've spelled the scan chain name, and reapply the **remove_scan_specifications** command. If this doesn't work, make sure that you haven't removed the chain already.

TESTDB-276 (warning) Can not find scan segment '%s' to

delete it.

DESCRIPTION

The remove_scan_specifications command deletes named scan segments. You see the following message when you've asked DFT Compiler to remove a scan segment, but DFT Compiler can't find it. This means that there is no such segment.

WHAT NEXT

Check the way you've spelled the scan segment name, and reapply the remove_scan_specifications command. If this doesn't work, make sure that you haven't removed the segment already.

TESTDB-277 (warning) Can not find scan link '%s' to delete it.

DESCRIPTION

The remove_scan_specifications command deletes named scan links. You see the following message when you've asked DFT Compiler to remove a scan link, but DFT Compiler can't find it. This means that there is no such link.

WHAT NEXT

Check the way you've spelled the scan link name, and reapply the remove_scan_specifications command. If this doesn't work, make sure that you haven't removed the link already.

TESTDB-278 (warning) Can not find scan signal on port '%s' to delete it.

DESCRIPTION

The remove_scan_specifications command deletes scan signals associated with named ports. You see the following message when you've asked DFT Compiler to remove a scan signal, but DFT Compiler can't find it. This means that there is no such signal.

WHAT NEXT

Check the way you've spelled the port name, and reapply the remove_scan_specifications command. If this doesn't work, make sure that you haven't removed the signal already.

TESTDB-279 (information) Using default scan style '%s'.

DESCRIPTION

If you do not use the **set_scan_configuration** command to tell DFT Compiler what scan style to use, DFT Compiler will choose a default scan style by looking at the value of an environment variable. This message tells you that this has happened.

WHAT NEXT

If you don't like the scan style, specify another using the **set_scan_configuration** command, or change your environment.

TESTDB-281 (error) Unable to open '%s' for reading.

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. If the port-to-pin map file cannot be opened for reading, the **read_pin_map** command produces this error message.

WHAT NEXT

Ensure that the port-to-pin map file specified exists and has read permissions.

TESTDB-282 (error) %s at or near token '%s' (Line: %d).

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. If there is an error while parsing the port-to-pin map file, the **read_pin_map** command produces this error.

WHAT NEXT

Fix the syntax error in the port-to-pin map file and reissue the **read_pin_map** command.

TESTDB-283 (warning) The '%s' port does not map to any

package pin.

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. Each signal port in the design must map to a package pin. If a signal port in the design does not map to any package pin, the **read_pin_map** command produces this warning message.

WHAT NEXT

Specify a pin mapping for the port in the port-to-pin map file if necessary.

TESTDB-284 (error) The '%s' port maps to %d package pins.

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. Each signal port in the design must map to a single package pin. If a signal port in the design maps to multiple package pins, the **read_pin_map** command produces this error message.

WHAT NEXT

Ensure that the port maps to a single package pin in the port-to-pin map file.

TESTDB-285 (error) Multiple (%d) design ports map to the '%s' package pin.

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. Each signal port in the design must map to a single package pin. If multiple design ports map to the same package pin, the **read_pin_map** command produces this error message.

WHAT NEXT

Ensure that multiple ports do not map to a single package pin in the port-to-pin map file.

TESTDB-286 (error) No package command found in the pin map file.

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. If the package name is missing from the port-to-pin map file, the **read_pin_map** command produces this error message.

WHAT NEXT

Add a package record to the port-to-pin map file.

TESTDB-287 (error) The '%s' index of the '%s' bus in the pin map file is inconsistent with the bounds for the corresponding design bus.

DESCRIPTION

The **read_pin_map** lets you read the port-to-pin map files for Boundary Scan Designs. If the bounds for a signal bus in a port-to-pin map file are not consistent with the bounds for the signal bus in the db design, the **read_pin_map** command produces this error message.

WHAT NEXT

Make sure that the bounds specified for the signal bus in the port-to-pin map file are consistent with those in the db design.

TESTDB-288 (error) The number of package pins specified (%d) does not match the width (%d) of the bus '%s'.

DESCRIPTION

The **read_pin_map** command lets you read the port-to-pin map files for Boundary Scan Designs. If the number of package pins specified for a bus is not equal to the width of the bus, the **read_pin_map** command produces this error message.

WHAT NEXT

Ensure that the number of package pins for a bus in the pin map file equals the width of the bus.

TESTDB-289 (warning) Overwriting the scan state of the design from '%s' to '%s'.

DESCRIPTION

Scan state is used to store the state of scan circuitry inserted. This scan state will be automatically updated when executing `insert_scan`. However, it can be unconditionally changed when the user adds attributes to the design to indicate that the design is `test_ready`, `scan_replaced`, or `test_cell`. You can use `report_test -state` to report the current scan state of a design.

WHAT NEXT

Changing the scan state of a design by setting attributes is not encouraged. Use the command `set_scan_configuration -existing_scan false` which can reset the design into its initial scan state.

TESTDB-290 (warning) The client %s specified is not a valid dft client.

DESCRIPTION

You receive this message during execution of `preview_dft` or `insert_dft` if the environment variable `test_default_client_order` is set with an invalid value for the dft client. Valid values are `autofix`, to specify the Autofix utility as dft client; or `wrapper`, to specify the Shadow LogicDFT utility as dft client.

WHAT NEXT

Set the `test_default_client_order` variable with a valid value. Then reexecute `preview_dft` or `insert_dft`.

SEE ALSO

`insert_dft` (2), `preview_dft` (2); `test_default_client_order` (3).

TESTDB-291 (information) reverting value of environment variable '%s' to its default value. The default value is set to no client.

DESCRIPTION

You receive this message during execution of `preview_dft` or `insert_dft` if the environment variable `test_default_client_order` is set with an invalid value for the dft client. Valid values are `autofix`, to specify the Autofix utility as client; and `wrapper`, to specify the Shadow LogicDFT utility as client. The default is the empty string {}, meaning that there is no client. This message informs you that the environment variable is being set to its default value.

WHAT NEXT

If it is acceptable to you that the `test_default_client_order` environment variable is set to the empty string, no action is required on your part. Otherwise, set the `test_default_client_order` variable with a valid nondefault value and reexecute `preview_dft` or `insert_dft`.

SEE ALSO

`insert_dft` (2), `preview_dft` (2); `test_default_client_order` (3).

TESTDB-292 (Warning) The test model does not match the '%s' interface.

DESCRIPTION

The Signals of the test model don't match the ports of the design. In order for a test model to be valid, its Signals must match one to one the ports of the design, by name and by direction.

WHAT NEXT

The next message tells you what the tool has done with the model.

SEE ALSO

TESTDB-293 (Information) The test model is %s.

DESCRIPTION

The tool has detected some inconsistency between the test model and the design. This message indicates what action the tool has taken.

WHAT NEXT

You may wish to review your scripts to understand the root cause of the inconsistency. If the action was 'deleted', the tool will attempt to regenerate a model. You should check the accuracy of this new model.

SEE ALSO

"

TESTDB-294 (error) Could not find bus bit '%s[%d]'.

DESCRIPTION

The `read_pin_map` command lets you read the port-to-pin map files for Boundary Scan Designs. You get this error message when the pin map file refers to a bus bit that `read_pin_map` cannot find in the design.

WHAT NEXT

Check to see if the bus bit in the error message indeed exists in the design. If not, fix the pin map file and re-issue the `read_pin_map` command.

"

TESTDB-295 (error) Could not find bus '%s'.

DESCRIPTION

The `read_pin_map` command lets you read the port-to-pin map files for Boundary Scan Designs. If the pin map file contains a line that maps an object to a list of pins, the `read_pin_map` command assumes that the object is a bus. You get this error message when the pin map file refers to a bus that that `read_pin_map` cannot find in

the design.

WHAT NEXT

Check to see if the object referred to in the error message is indeed a bus. If not, fix the pin map file and re-issue the **read_pin_map** command.

TESTDB-301 (warning) Can not find wrapper chain '%s' to delete it.

DESCRIPTION

The **remove_core_wrapper_specification** command deletes named wrapper chains. You see the following message when you've asked DFT Compiler to remove a wrapper chain, but DFT Compiler can't find it. This means that there is no such chain.

WHAT NEXT

Check the way you've spelled the wrapper chain name, and reapply the **remove_core_wrapper_specification** command. If this doesn't work, make sure that you haven't removed the chain already.

TESTDB-302 (error) Wrapper chains '%s' and '%s' have common elements.

DESCRIPTION

DFT Compiler does not let wrapper chains share wrapper cell elements. This error tells you that some elements belong to more than one chain.

WHAT NEXT

If the common elements can be removed from the wrapper chain you're specifying, remove them and reapply the **set_core_wrapper_path** command. Otherwise, apply the **remove_core_wrapper_specification** command and start again.

TESTDB-303 (warning) Wrapper chain '%s' overwrites an

earlier specification.

DESCRIPTION

DFT Compiler does not allow wrapper chains to be specified using multiple `set_core_wrapper_path` commands. This warning tells you that an earlier specification is being overwritten.

WHAT NEXT

Establish whether you want the specification to be overwritten. If not, combine the two specifications into one `set_core_wrapper_path` command.

TESTDB-304 (error) Wrapper chain specification '%s' includes repeated elements.

DESCRIPTION

A wrapper chain is a connected sequence of wrapper cell elements. A wrapper cell element can only appear at exactly one chain position. Wrapper chain specifications that include repeated elements are in error.

WHAT NEXT

Remove repeated elements from the chain, and reapply the `set_core_wrapper_path` command.

TESTDB-501 (error) Incorrect number of ports and signal values in the test protocol.

DESCRIPTION

The ports and signal values specified in the test protocol does not match with the design.

WHAT NEXT

Check your design and the test protocol whether they have the same number of ports and signals, and the names are equivalent.

TESTGEN

TESTGEN-1 (information) reverting value of environment variable '%s' to its default value '%s'.

DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable value is invalid. DFT Compiler supplies a default.

WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

TESTGEN-2 (Warning) '%s' is not a valid scan style.

DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable that needs to specify a scan style specifies an invalid one. DFT Compiler will use a default scan style.

WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

TESTGEN-3 (Warning) '%s' is not 'true' or 'false'.

DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable that needs to specify either 'true' or 'false' specifies something else. DFT Compiler will use a default value.

WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

TESTGEN-4 (warning) Cannot associate a '%s' signal with chain '%S'.

DESCRIPTION

DFT Compiler uses one scan enable signal to enable scan mode. This message warns that you used the **set_scan_signal** command to associate a scan enable with a specific scan chain. Because the scan enable is associated with all scan chains, the specific association is ignored.

WHAT NEXT

Remove the association to suppress the warning.

TESTGEN-5 (information) reverting value of environment variable '%d' to its default value '%d'.

DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable value is invalid. DFT Compiler supplies a default.

WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

TESTGEN-6 (Warning) '%s' does not include the substring '%%S'.

DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable that needs include the substring "%s" does not. DFT Compiler will use a default value.

WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

TESTGEN-7 (warning) Hookup sense value '%s' conflicts with the old value '%s'.

DESCRIPTION

DFT Compiler only associates exactly one hookup sense between a design port and an internal hookup pin. This message warns that you have used the **set_scan_signal** command to associate a second hookup sense, and that the second specification has overwritten the first.

WHAT NEXT

Check that you do want to overwrite the specification. Repeat the correct specification if the overwrite was mistaken.

TESTXG

TESTXG-1 (error) Invalid Timing specification [%f, %f] or timing is not specified for the clock signal

DESCRIPTION

The rise time and fall time values specified by the -timing switch of the set_dft_signal command are not valid or not specified. Also the timing specification should be provided when -view option of set_dft_signal is existing_dft and not spec.

WHAT NEXT

Please check the timing values

SEE ALSO

set_dft_signal

TESTXG-2 (Warning) Model is user defined

DESCRIPTION

This message indicates that the model has been specified through a read_test_model command. Users must specify a complete model or let the tool create one. A user defined model cannot be modified through other command such as DFT signal specifications or scan path specifications.

WHAT NEXT

Check the specified model to ensure it is the one desired. Else remove the model and let the tool create one for you.

SEE ALSO

remove_test_model create_test_protocol set_dft_signal set_scan_path

TESTXG-3 (Error) Cannot associate multiple ports with hookup

pin

DESCRIPTION

This message indicates that an attempt has been made to associate more than one port to hookup pins using the set_dft_signal command. When using the -hookup option, only one port may be specified.

WHAT NEXT

Specify a single port or do not specify the -hookup option

SEE ALSO

remove_dft_signal

TESTXG-4 (Error) Scan-in and Scan-out ports not specified

DESCRIPTION

This message indicates that a set_scan_path -view existing_dft command has been issued to specify a scan chain, but the scan-in and scan-out ports for the chain have not been specified. The -view existing_dft option implies that the scan chain already exists in the design; therefore you must associate the scan access terminals with this scan chain.

WHAT NEXT

Specify the scan-in and scan-out ports for this scan path OR Remove the -view existing_dft specification

SEE ALSO

set_dft_signal remove_dft_signal remove_scan_path

TESTXG-5 (Error) Invalid design specification

DESCRIPTION

This message indicates that a design specification is required or that the specified design cannot be found

WHAT NEXT

Specify a valid design

SEE ALSO

`read_test_model` `write_test_model`

TESTXG-6 (Error) Mode %s already exists in view %s

DESCRIPTION

This message indicates that an attempt has been made to define a mode that already exists, in the specified view.

WHAT NEXT

Change the name of the mode to be defined or remove the existing mode first.

SEE ALSO

`define_test_mode` `list_test_modes` `remove_test_mode`

TESTXG-7 (Error) Mode %s does not exist

DESCRIPTION

This message indicates that the specified mode does not exist

WHAT NEXT

Check the name of the mode specified

SEE ALSO

`list_test_modes`

TESTXG-8 (Warning) Specifications will apply to custom

protocol

DESCRIPTION

This message indicates that the specification will apply to the custom protocol only and will be removed when the custom protocol is removed through a remove_test_protocol command. This message occurs when a specification is made after a custom protocol is read using the read_test_protocol command.

WHAT NEXT

Check the name of the mode specified

SEE ALSO

list_test_modes

TESTXG-9 (Error) Scan Path %s does not exist

DESCRIPTION

This message indicates that the specified scan path does not exist

WHAT NEXT

Check the name of the specified scan path

SEE ALSO

TESTXG-10 (Error) TestMode or ScanEnable signal type not specified for the port %s.

DESCRIPTION

This message indicates that a set_ autofix_configuration -control_signal command or a set_ autofix_element -control_signal command has been issued, but the TestMode or the ScanEnable signal type has not been specified for the port. Note that a ScanEnable port can only be used for the type set or reset and for the method gate.

WHAT NEXT

Specify the TestMode or the ScanEnable signal type for the port.

SEE ALSO

```
set_dft_signal reset_dft_signal set_ autofix_configuration  
reset_ autofix_configuration set_ autofix_element reset_ autofix_element
```

TESTXG-11 (Error) TestData signal type not specified for the port %s.

DESCRIPTION

This message indicates that a set_ autofix_configuration -test_data command or a set_ autofix_element -test_data command has been issued, but the TestData signal type has not been specified for the port.

WHAT NEXT

Specify the TestData signal type for the port.

SEE ALSO

```
set_dft_signal reset_dft_signal set_ autofix_configuration  
reset_ autofix_configuration set_ autofix_element reset_ autofix_element
```

TESTXG-12 (Error) ScanEnable signal cannot be used as a control signal for the method %s.

DESCRIPTION

This message indicates that a set_ autofix_configuration -control command or a set_ autofix_element -control command has been issued, but a ScanEnable signal can only be used as a control signal to autofix sets and resets when the specified method is gate.

WHAT NEXT

Specify a TestMode signal OR Specify a gate method when the type is set or reset .

SEE ALSO

```
set_dft_signal reset_dft_signal set_ autofix_configuration  
reset_ autofix_configuration set_ autofix_element reset_ autofix_element
```

TESTXG-13 (Error) The method cannot be specified for the type %S.

DESCRIPTION

This message indicates that a `set_ autofix_configuration -method` command or a `set_ autofix_element -method` command has been issued, but either the `-method` option cannot not be specified for the specified type or the specified method is not correct for the specified type.

WHAT NEXT

Remove the `-method` option if you cannot define the `-method` option for the specified type OR Specify a method, which is allowed by the specified type.

SEE ALSO

```
set_dft_signal reset_dft_signal set_ autofix_configuration  
reset_ autofix_configuration set_ autofix_element reset_ autofix_element
```

TESTXG-14 (Error) This option cannot be used with the type %S.

DESCRIPTION

This message indicates that a `set_ autofix_configuration -fix_latch` or `-fix_data` command or a `set_ autofix_element -fix_latch` or `-fix_data` command has been issued, but these options cannot be used with the specified type. These options are valid for the following types: `set`, `reset` and `clock`.

WHAT NEXT

Remove the `-fix_latch` and/or the `-fix_data` options.

SEE ALSO

```
set_ autofix_configuration reset_ autofix_configuration set_ autofix_element  
reset_ autofix_element
```

TESTXG-15 (Error) A clock signal type has been specified for the port %s.

DESCRIPTION

This message indicates that a set_autofix_configuration -type set/reset -test_data command or set_autofix_element -type set/reset -test_data command has been issued, but the port to be used as a source to autofix asynchronous signals has been specified as a clock signal type.

WHAT NEXT

Specify another port which does not have a clock signal type OR Remove the clock signal type from the port and re-issue the command.

SEE ALSO

```
set_dft_signal reset_dft_signal set_autofix_configuration  
reset_autofix_configuration set_autofix_element reset_autofix_element
```

TESTXG-16 (Error) The element %s cannot be specified in both include_elements and exclude_elements options.

DESCRIPTION

This message indicates that a set_autofix_configuration -include_elements -exclude_elements command has been issued, but an element cannot included and excluded from being autofixed.

WHAT NEXT

Remove the element from exclude_elements, if you want the element to be autofixed OR Remove the element from include_elements, if you do not want the element to be autofixed.

SEE ALSO

```
set_autofix_configuration reset_autofix_configuration
```

TESTXG-17 (Error) The element %s is not in the

include_elements of the autofix configuration.

DESCRIPTION

This message indicates that a `set_autofix_element` command has been issued, but the element was not specified in the `set_autofix_configuration -include_elements` command for the specified type.

WHAT NEXT

Add the element to the `include_elements` of the autofix configuration for the specified type OR Remove the element from the elements of the `set_autofix_element` command.

SEE ALSO

`set_autofix_configuration` `reset_autofix_configuration` `set_autofix_element`

DESCRIPTION

This message indicates that a set_test_point_element command has been issued, but the type is not a valid type for the command.

WHAT NEXT

Check the valid types in the manpage of the `set_test_point_element`, modify the type and re-issue the command.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-42 (Warning) The -scan_test_point_enable option is ignored for the type %s.

DESCRIPTION

This message indicates that a set_test_point_element command has been issued, but the -scan_test_point_enable option is not an option that can be specified for the type and the option is ignored. The -scan_test_point_enable option is a valid option for the control types.

WHAT NEXT

Remove the -scan_test_point_enable option.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-43 (Warning) The `-test_point_enable` option is ignored for the type `%s`.

DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued, but the `-test_point_enable` option is not an option that can be specified for the type and the option is ignored. The `-test_point_enable` option is a valid option for the control types.

WHAT NEXT

Remove the `-test_point_enable` option.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-44 (Warning) The `-test_points_per_test_point_enable` option is ignored for the type `%s`.

DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued, but the `-test_points_per_test_point_enable` option is not an option that can be specified for the type and the option is ignored. The `-test_points_per_test_point_enable` option is a valid option for the control types.

WHAT NEXT

Remove the `-test_points_per_test_point_enable` option.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-45 (Error) A set_test_point_element command has already been specified for the pin %s and for the type %s.

DESCRIPTION

The pin has already been specified to be a candidate for a test point of this type. Two test points of the same type cannot be inserted on the same pin location.

WHAT NEXT

Remove the pin from the list OR Remove the previous test point element specification for this pin and this type with the remove_test_point_element command.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-46 (Error) The parameter for the %s option has to be enable or disable.

DESCRIPTION

This message indicates that a set_test_point_element command has been issued, but the parameter for the option is not a valid one. The valid parameters are enable or disable.

WHAT NEXT

Change the parameter for the option and re-issue the command.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-47 (Error) The port or the pin %s does not have the correct direction.

DESCRIPTION

This message indicates that a set_test_point_element command has been issued, but

the port or the pin does not have the correct direction according to the option in which the port or the pin has been specified.

WHAT NEXT

Specify another port or another pin with the correct direction and re-issue the command.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-48 (Warning) The port or the pin %s is already connected, it cannot be used to observe data.

DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued for the type `observe`, but the port or the pin specified for the `-source_or_sink` option is already connected. As a consequence, the port or the pin cannot be used to observe data. DFT Compiler will either insert an `observe` register or create a new output port depending of the `scan_source_or_sink` value. By default, data are observed through an `observe` scan register.

WHAT NEXT

Specify another port or another pin that could be used to observe data and re-issue the command OR Let DFT Compiler insert a new `observe` scan register or create a new output port.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-49 (Error) The pin %s does not have the correct direction for a test point location.

DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued, but a pin from the list does not have the correct direction. A test point location has to be an output pin.

WHAT NEXT

Specify another pin with the correct direction for the test point location and re-issue the command.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-51 (Error) The output port %s cannot be specified for a test point location.

DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued, but an output port cannot be the location of a test point. A test point location has to be an input port or an output internal pin.

WHAT NEXT

Specify an input port or an internal output pin and re-issue the command.

SEE ALSO

`set_test_point_element` `remove_test_point_element`

TESTXG-52 (Error) The clock type %s is not a valid clock type for the testability configuration.

DESCRIPTION

This message indicates that a `set_testability_configuration` command has been issued, but the specified clock type is not a valid one for the testability configuration. The valid clock types are dominant or dedicated.

WHAT NEXT

Specify a valid clock type and re-issue the `set_testability_configuration` command.

SEE ALSO

`set_testability_configuration` `reset_testability_configuration`

```
report_testability_configuration
```

TESTXG-53 (Warning) Protocol generated after insertion in Internal Pins Flow is not accurate and can not be used.

DESCRIPTION

The Ctl model and the protocol available after insertion in the internal pins flow are not complete. They cannot be directly used by any other tool.

However, they are used internally by DFTCompiler for running post dft drc for basic scan flows if the internal pins flow is enabled. Post dft drc cannot be run when multi mode and scan compression are enabled with the internal pins flow.

WHAT NEXT

If the design has no internal pins, please disable the internal pins flow by using the **set_dft_drc_configuration** command.

SEE ALSO

```
set_dft_drc_configuration set_dft_signal
```

TESTXG-54 (Error) DFT insertion in DC-Topographical flow is only supported for basic scan and adaptive scan flows.

DESCRIPTION

You get this error message because you are trying to use a DFT client that is not supported in the DC Topographical flow. The DFT clients that are valid are basic scan and adaptive scan. Following are the unsupported clients:

1. PLL
2. User defined test points
3. Logic BIST
4. Memory BIST
5. Core Wrapping
6. SOC
7. Boundary scan

WHAT NEXT

Please disable the unsupported client using the **set_dft_configuration** or the **remove_test_point_element** command.

SEE ALSO

```
set_dft_configuration set_scan_configuration remove_test_point_element
```

TESTXG-55 (Error) Scan configuration option -%s is not valid for DC-Topographical flow.

DESCRIPTION

You get this error message because you are trying to use the scan configuration option that is not supported for the DFT insertion in DC-Topological flow. The options that are not supported are:

1. minimize_hold_time_violations

WHAT NEXT

Please remove the unsupported option from the command **set_scan_configuration** and rerun the script.

SEE ALSO

`set_dft_configuration set_scan_configuration remove_test_point_element`

TESTXG-56 (warning) The multi-clock protocol requires that the strobe time be before a clock's pulse if it is used for transition fault testing.

DESCRIPTION

You received this message because you are trying to strobe after the clock pulse. If you are performing transition fault testing then the multi-clock protocol requires that you strobe before the clock pulse for optimal results.

WHAT NEXT

If you wish to create a multi-clock protocol for transition fault testing set the variable `test_default_strobe` to a value less than the pulse of the clock(s). If you do not wish to create a multi-clock protocol then do not specify the option `-capture_procedure` with `create_test_protocol`.

SEE ALSO

`create_test_protocol (2)`

TESTXG-57 (warning) Scan compression xmasking requires that the strobe time be before a clock's pulse.

DESCRIPTION

You received this message because you are trying to strobe after the clock pulse. However, the scan compression xmasking requires that you strobe before the clock pulse for optimal results.

WHAT NEXT

If you wish to perform scan compression with xmasking set the variable `test_default_strobe` to a value less than the pulse of the clock(s). If you do not wish to perform xmasking with scan compression set `xmask` to false in `set_scan_compression_configuration`.

SEE ALSO

`set_scan_compression_configuration` (2)

TESTXG-58 (Warning) insert_dft does not perform synthesis optimization in DC-Topographical mode. Run incremental compile to reoptimize the design after insert_dft.

DESCRIPTION

You received this warning message because you are trying to use synthesis optimizations during `insert_dft` command with the DC-Topographical flow, which is not supported.

WHAT NEXT

The tool had turned off all synthesis optimizations. Please remove the unsupported option from the command `set_dft_insertion_configuration` and rerun the script. And please run incremental compile to reoptimize the design once `insert_dft` completes.

SEE ALSO

`set_dft_insertion_configuration`

TESTXG-59 (error) The transition fault protocol does not

support on chip clocking.

DESCRIPTION

You received this message because you are trying to use on chip clocking, and a transition fault protocol. However, the transition fault protocol created by DFT Compiler does not support on chip clocking.

WHAT NEXT

If you wish to create a transition fault protocol disable on chip clocking and then re-create the protocol. If you do not want to create a transition fault protocol then issue the `create_test_protocol` command without the `-transition` option.

SEE ALSO

`set_dft_configuration` (2)

TESTXG-60 (Warning) Tetramax '%s' option for `dft_drc` command is being overwritten.

DESCRIPTION

When `set_dft_drc_configuration` command is used to pass an option to Tetramax for `dft_drc`, this message indicates that an earlier specification is being overwritten.

For a single command if multiple options are to be passed to Tetramax DRC Engine then they must be separated by pipe "|"

Example: User wants to pass following 3 options to Tetramax "set drc" command.

```
set_drc -nodelete_unused_gates -merge equivalent_dlat_dff
```

```
set drc -pipeline -clock 12clk
```

```
set drc -oscillation 20 -store_setup
```

In DFT script user must write:

```
set_dft_drc_configuration -tmax_set_drc "-nodelete_unused_gates -merge  
equivalent_dlat_dff | -pipeline -clock 12clk | -oscillation 20 -store_setup"
```

If user issues commands:

```
set_dft_drc_configuration -tmax_set_drc "-nodelete_unused_gates -merge  
equivalent_dlat_dff "
```

```
set_dft_drc_configuration -tmax_set_drc "-pipeline -clock 12clk "
set_dft_drc_configuration -tmax_set_drc "-oscillation 20 -store_setup"
then TESTXG-60 will be issued after 2nd and 3rd commands.
```

WHAT NEXT

Check the script for any conflicts. If multiple directives are to be passed tp Tetramax DRC engine then above described methodology must be followed.

set_test_point_element

TESTXG-62 (Warning) The scan compression mode %s is exactly the same as %s.

DESCRIPTION

The two scan compression modes reported in the message have the same specifications and would lead to the creation of duplicate scan compression modes. This will cause more area overhead and routing congestion with no additional benefits in compression or pin count. Please remove one of the compression modes or change the

specifications.

WHAT NEXT

Please modify the scan compression specification using the **set_scan_compression_configuration** command.

SEE ALSO

`set_dft_configuration` `set_scan_configuration` `set_scan_compression_configuration`

TESTXG-63 (Information) Autofix cannot jump clock gating cell %S.

DESCRIPTION

This message indicates that autofix was unable to jump reported clock gating cell during test point optimization. Either the clock pin, net or clock pin or driver pin of this net are not accessible.

WHAT NEXT

Check the reported clock gating cell.

SEE ALSO

TESTXG-64 (Error) Scan path specification with pipeline registers is missing associated scan ports

DESCRIPTION

This message indicates that a `set_scan_path` command has been issued to specify pipeline registers for a scan chain, but the associated scan ports have not been specified. This is an incomplete specification.

WHAT NEXT

Specify the scan-in and scan-out ports associated with the corresponding pipeline registers.

SEE ALSO

set_dft_signal remove_dft_signal remove_scan_path

TESTXG-65 (warning) Specification for -synchronize_chains will be ignored, as %s is enabled.

DESCRIPTION

This warning message occurs when you specify a value using the **set_scan_compression_configuration -synchronize_chains** command to synchronize internal chains of the compression mode. The specification is ignored, as either pipelining or terminal lockup insertion is enabled.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, disable terminal lockup insertion or pipelining to honor the **-synchronize_chains** specification.

TESTXG-66 (information) Synchronizing %s of chains in %s.

DESCRIPTION

This information message occurs when you specify a non-default value for the **set_scan_compression_configuration -synchronize_chains** command. The tool inserts lockup latches at the head and/or tail of internal compression chains to operate on the same clock edge, as per the specification. This message indicates that the <head/tail> of internal compression chains in <mode_name> are synchronized.

WHAT NEXT

This is only an information message. No action is required.

However, you can disable or selectively synchronize the head or tail of compression chains using the options in **set_scan_compression_configuration -synchronize_chains**.

SEE ALSO

`set_scan_compression_configuration(2)`

TESTXG-67 (Information) Synchronization not needed for chains.

DESCRIPTION

This message indicates that the user has specified a value using `set_scan_compression_configuration -synchronize_chains` to synchronize head/tail of internal compression chains. However, synchronization is not needed as the head/tail of internal chains operate at the same clock edge. Hence, no lockup latches are inserted for synchronization in this mode.

WHAT NEXT

SEE ALSO

`set_scan_compression_configuration`

TESTXG-68 (error) Test model for core %s has internal pins and cannot be used for hierarchical integration.

DESCRIPTION

This error message occurs when a core that is being used for integration has internal pins specified in the corresponding core test model. Cores with internal pins cannot be integrated at the top level.

WHAT NEXT

Remove the specific core from the top level for integration or generate the test model for the core with internal pins turned off.

SEE ALSO

`set_dft_drc_configuration(2)`
`use_test_model(2)`

TESTXG-69 (error) Timing specifications are outside of the

default period %f ns.

DESCRIPTION

This error message occurs when the rise and/or fall timing values are not within the default period value.

WHAT NEXT

Specify the rise and fall time with values less than the default period value and rerun the command.

SEE ALSO

TIM

TIM-001 (Error) There are no arcs from pin '%s' to pin '%s' on cell '%s'.

DESCRIPTION

No timing arcs exist between these pins of the cell. Therefore, we cannot time between them. We will either report no paths or for unmapped logic, assume 0.

WHAT NEXT

Fix the library to create the proper timing arcs.

TIM-002 (information) Timing loop detected.

DESCRIPTION

The design contains at least one timing loop. This message is followed by a list of pins on one loop, and then messages indicating which timing arcs are being automatically disabled to break the loop.

WHAT NEXT

To view all timing loops in your design, use **report_timing -loops**. To manually break loops, use **disable_timing**.

TIM-003 (warning) Disabling timing arc between pins '%s' and '%s' on cell '%s'%s

DESCRIPTION

This message is displayed when timing arcs are disabled by tool to break combinational feedback loops. It is not displayed for arcs that are manually disabled with the **set_disable_timing** command.

WHAT NEXT

If you want to manually break a timing loop, examine the design to see why there is combinational feedback and then choose a different point at which to break the loop.

To do this, use the **set_disable_timing** command instead of letting the tool automatically break the loop.

EXAMPLE MESSAGE

Warning: Disabling timing arc between pins 'A' and 'Z' on cell 'u10' to break a timing loop (TIM-003)

TIM-004 (error) The pin '%s' which is a derived clock pin is either in a loop or is in the fanout of two clock sources

DESCRIPTION

The derived clock pin is either in a loop or is in the fanout of two clock sources. You cannot have loops in the clock network or can you have a derived clock in the fanout of two clock sources.

WHAT NEXT

If it is a loop, break the loop. If the derived clock is in the fanout of two clock sources, try to isolate it or use internal clocks.

TIM-005 (information) Invalidating all auto-disabled timing arcs.

DESCRIPTION

Some arcs have been enabled, forcing the tool to do loop detection from scratch. Therefore, the tool enables all auto-disabled arcs.

WHAT NEXT

To view all timing loops in your design, use **check_timing -loops**. To manually break the loops, use **disable_timing**.

TIM-006 (error) report_delay_calculation is not enabled for library '%s'.

DESCRIPTION

The delay calculation report shows detailed performance information about library

cells. By default, cell delay reporting is disabled. The technology library vendor can enable delay calculation for a library by specifying the following in the **.lib** source:

```
library_features(report_delay_calculation);
```

WHAT NEXT

Contact your library vendor to request a library with this feature enabled.

TIM-007 (error) The master clock %s has %d edges in a period. Cannot do frequency multiplication.

DESCRIPTION

If the master clock of a generated clock has more than 3 edges in a period, you cannot generate a frequency multiplied clock from that master clock.

WHAT NEXT

You can use -edges option to generate the clock.

TIM-008 (error) The generated clock '%s' is in the fanout of clock source %s.

DESCRIPTION

A generated clock can only be in the fanout of a clock source from which it is generated. Here the generated clock is found to be in the fanout of some other clock source.

WHAT NEXT

Generate this clock from a clock in whose fanout it is in.

TIM-009 (error) Generated clock '%s' is not in the fanout of its

master clock.

DESCRIPTION

The generated clock is not in the fanout of the master clock with respect to which it has been defined. A generated clock must be in the fanout of its master clock.

WHAT NEXT

Please check the design and redefine the generated clock to be in the fanout of its master clock.

TIM-010 (warning) The generated clock '%s' has not been expanded,
please create its master clock.

DESCRIPTION

A generated clock will not expand if the master clock from which it is generated has not been created.

WHAT NEXT

Please create the master of the generated clock.

TIM-011 (error) The following generated clocks '%s' form a loop.

DESCRIPTION

The generated clock listed are defined in a loop. A loop of generated clocks is formed in that there is a circular dependency of generated clock to master clock.

For example, if A and B are generated clocks, and A is generated from B, and B is generated from A, there is a circular dependency.

WHAT NEXT

Remove circular dependency in the generated clock sources.

TIM-012 (error) The master of the generated clock '%s' is not

connected to any clock source.

DESCRIPTION

The master clock of a generated clock must be either a clock source, or must be connected to a clock source. If it is neither, it is an error.

WHAT NEXT

Make sure that the master source from which the clock is generated is a clock source or is connected to a clock source.

TIM-013 (information) Found %d generated clock master pins that are not connected to clock sources.

DESCRIPTION

It gives a summary of the number of generated clock master pins that are not connected to clock sources.

WHAT NEXT

For a more detailed description of which generated clock master pins are not connected to any source, do `check_timing -with -verbose` option.

TIM-014 (information) Found %d loops in the generated clock network.

DESCRIPTION

This message gives a summary of the number of loops in the generated clock network. If there is a circular dependency of generated clock sources and its master, there will be a loop in the generated clock network.

WHAT NEXT

To get a more detailed description of where the generated clock loops are, use `check_timing -verbose`.

TIM-015 (Error) The -edges spec of generated clock '%s' has

edge number

less than 1, the edge number should be from 1 up.

DESCRIPTION

The -edge specification in `creat_generated_clock` command should use edge number of the master clock which should be from 1 up. Zero or negative number are not allowed.

WHAT NEXT

Change your -edge spec in `create_generated_clock` command.

TIM-016 (Error) In the -edge specification of `create_generated_clock`

'%s', the edge numbers must be in increasing order.

DESCRIPTION

In the -edge specification of a `create_generated_clock` command, the edge numbers specified must be in increasing order.

WHAT NEXT

Check the -edge spec in `create_generated_clock` command and edge numbers increasing.

TIM-017 (warning) The master source of the generated clock '%s' is not known. Ignoring generated clock '%s'.

DESCRIPTION

You receive this warning because you did not specify the master clock source of the named generated clock. The master clock of a generated clock must be a specified clock source or be connected to a clock source. Otherwise, this error occurs.

WHAT NEXT

Make sure that the master source from which the clock is generated is a clock source or is connected to a clock source. See the man page for the `create_generated_clock` command.

SEE ALSO

`create_generated_clock (2)`.

TIM-018 (warning) The source of the generated clock '%s' is not known. Ignoring generated_clock '%s'.

DESCRIPTION

You receive this warning because you did not specify the source of a generated clock. The source of a generated clock can be a list of ports or pins.

WHAT NEXT

Make sure that the generated clock has a source object. See the man page for the `create_generated_clock` command.

SEE ALSO

`create_generated_clock (2)`.

TIM-019 (warning) Ignoring incorrectly specified library generated_clock '%s' in library cell '%s/%s'.

DESCRIPTION

You receive this warning because the library generated clock description does not have complete specification for creating the derived waveform. A generated_clock must have a 'master_pin', source 'clock_pin', and specification for 'divide_by' or 'multiply_by' or 'edge_spec'.

WHAT NEXT

Fix the description in the library to completely specify the generated_clock.

SEE ALSO

`create_generated_clock (2)`.

TIM-020 (Error) '%s' is not a legal value for '%s'. The value

defaults to '%s'.

DESCRIPTION

You have specified an invalid value for the variable. Therefore, the default value described will be used.

WHAT NEXT

If you do not want the default value, please specify a valid value for this variable.

TIM-021 (warning) The generated clock '%s' is being removed because the pin '%s' has been deleted and the clock no longer has a %s.

DESCRIPTION

Generated clocks require a master_pin and at least one clock source. If either of these is deleted, then the generated clock is deleted as well.

WHAT NEXT

Create a new generated clock with the same name using remaining pins.

SEE ALSO

`create_generated_clock` (2) `remove_cell` (2).

TIM-024 (information) Using CCS timing libraries.

DESCRIPTION

This message is produced if any libraries containing CCS timing information are used. It is only produced once per session when the first ccs timing library is read.

WHAT NEXT

No action is needed. This information may be helpful when determining whether a library contains ccs timing data.

TIM-025 (information) Using CCS timing info.

DESCRIPTION

This message is produced if any CCS delay information is used. It is only produced once per session when the first cell with CCS timing is loaded for delay calculation.

WHAT NEXT

No action is needed. This information may be helpful when examining delay correlation issues.

TIM-052 (warning) A non-unate path in clock network for clock '%s' from pin '%s' is detected.

DESCRIPTION

The clock tree for the specified clock contains non-unate paths. Clock networks normally do not contain cells such as exclusive-OR gates which have non-unate behavior. This implies that both inverting and noninverting clock waveforms reach the specified pin. The sense that is propagated from this pin is non-deterministic.

WHAT NEXT

Since there is ambiguity on which sense to choose to propagate, the tool picks one arbitrarily to propagate. If this is not acceptable, create a clock using the output of the non-unate gate as a source.

TIM-98 (Error) Minimum version must be a different library.

DESCRIPTION

The **set_min_library** command was used to set the minimum version of a library to be the same as the maximum version. This is not allowed.

WHAT NEXT

Enter the correct name of the minimum library, or use the '-none' option to revert to using the same library for both minimum and maximum analysis.

TIM-099 (Information) There are %d clock pins driven by multiple clocks, and some of them are driven by up-to %d clocks.

DESCRIPTION

`timing_enable_multiple_clocks_per_reg` is TRUE, and all clocks reaching the register are asserted simultaneously. Concurrent analysis of multiple clocks can result in significant runtime increase due to increased timing complexity. To improve runtime, the interactions between multiple clocks should be analyzed and `set_false_path` be used to remove invalid interactions between mutually exclusive clocks or use `set_clock_groups` to specify logically exclusive clocks.

WHAT NEXT

Analyze interaction between clock domains due to multiple clocks per register and use `set_false_path` or `set_clock_groups` to improve runtime. If concurrent analysis of multiple clocks per register is not required then set `timing_enable_multiple_clocks_per_reg` to FALSE or use `set_case_analysis` or `set_disable_timing` to select the clocks for driving the register.

TIM-100 (error) Unable to obtain a DC-Expert license.

DESCRIPTION

Timing commands such as `report_timing` or `highlight_path` require that a DC-Expert key, other appropriate technology key, or both be checked out.

WHAT NEXT

To determine who is using the DC-Expert, use the `license_users` command. Should problems occur with the license server, contact your system administrator.

TIM-101 (error) The '%s' command is not supported in dt_shell.

DESCRIPTION

This error occurs when a valid Design Compiler command is used, but the command is not supported in `dt_shell`, the timing analysis user interface. Commands such as `compile` are supported only in `dc_shell`, and are ignored in `dt_shell`.

WHAT NEXT

If you need to use the command, use the `dc_shell` program instead of `dt_shell`.

TIM-102 (Error) Ultra license is required for true path reporting.

DESCRIPTION

The **-justify** and **-true** options of **report_timing** require an Ultra license.

WHAT NEXT

TIM-103 (Warning) Reference %s contains internal pins with clock attribute.

DESCRIPTION

The reference contains internal/generated clocks on some internal pins which are not accessible to user to create clocks.

WHAT NEXT

~

TIM-104 (Warning) Worst timing paths might not be returned.

DESCRIPTION

Design Compiler static timing verifier is optimized for finding the longest paths (max delay) and the shortest paths (min delay) in the design. The timing verifier cannot always efficiently compute the longest path in the design, which is shorter than a given amount or the shortest path in the design, which is longer than a given amount. This warning indicates that the current **report_timing** command has made such a request that cannot be satisfied efficiently.

In this case, **report_timing** uses the **-nworst** option to limit its search for paths meeting the **-greater** or **-lesser** criteria. There is no guarantee that the paths returned will be the worst ones in the design that meet the criteria specified in the **report_timing** command. In fact, it is possible that no paths will be returned even though a path meeting the report_timing criteria does exist in the design.

WHAT NEXT

Increasing the number of paths to return using the **-nworst** option of **report_timing** increases the likelihood that the worst paths will be found. However, increasing this value also increases the memory and runtime needed by **report_timing**.

TIM-105 (Information) Converting time units for library '%s' since those in library '%s' differ.

DESCRIPTION

The time units specified in the first library differ from those in the second library. The second library is Design Compiler's "main" library and determines DC's default time units. DC reports use these units and all time values annotated on the design (using `create_clock`, `set_input_delay`, and so on.) are assumed to be in these units.

The informational message notifies you that Design Compiler is handling conversion of units so that delay calculation using cells in the first library use time values in its native units.

Design Compiler's "main" library is determined as follows: During reporting the main library is the first library in the link path that contains a cell that is used in the design. During optimization the main library is the first target library specified.

WHAT NEXT

To see the units that are specified for a library, use the `report_lib` command.

TIM-106 (Information) Converting capacitance units for library '%s' since those in library '%s' differ.

DESCRIPTION

The capacitance units specified in the first library differ from those in the second library. The second library is Design Compiler's "main" library and determines DC's default capacitance units. DC reports will use these units and all capacitance values annotated on the design (using `set_load`) are assumed to be in these units.

The informational message notifies you that Design Compiler is handling conversion of units so that delay calculation using cells in the first library will use capacitance values in its native units.

Design Compiler's "main" library is determined as follows: During reporting the main library is the first library in the link path that contains a cell that is used in the design. During optimization the main library is the first target library specified.

WHAT NEXT

To see the units that are specified for a library, use the `report_lib` command.

TIM-107 (Warning) Main library '%s' has no time units specified, but library '%s' does.

DESCRIPTION

Time units were not specified in the first (main) library, but time units were specified in the second library.

Design Compiler uses the main library to determine the default time units. The default time units are used in reports and all time values annotated on the design (using `create_clock`, `set_input_delay`, and so on.) are assumed to be in these units. However, this main library has no time units and as a result DC runs in a "unitless" mode. No time unit conversion is performed. This can result in incorrect analysis if different time units are actually required.

DC's main library is determined as follows: During reporting the main library is the first library in the link path that contains a cell that is used in the design. During optimization the main library is the first target library specified.

WHAT NEXT

To see the units that are specified for a library, use the `report_lib` command.

To change the main library to a different one with units specified, remove the `local_link_library` attribute on the current design if one is present and put the desired library first in the `link_library` or `link_path` variables.

To add units to a unitless library, the library source (.lib) must be modified and the library must be read in using `read_lib`.

TIM-108 (Warning) Main library '%s' has no capacitance units specified, but library '%s' does.

DESCRIPTION

Capacitance units were not specified in the first (main) library, but capacitance units were specified in the second library.

Design Compiler uses the main library to determine the default capacitance units. The default capacitance units are used in reports and all capacitance values annotated on the design (using `set_load`) are assumed to be in these units. However this main library has no capacitance units and as a result DC runs in a "unitless" mode. No capacitance unit conversion is performed. This can result in incorrect analysis if different capacitance units are actually required.

DC's main library is determined as follows: During reporting the main library is the first library in the link path that contains a cell that is used in the design.

During optimization the main library is the first target library specified.

WHAT NEXT

To see the units that are specified for a library, use the `report_lib` command.

To change the main library to a different one with units specified, remove the `local_link_library` attribute on the current design if one is present and put the desired library first in the `link_library` or `link_path` variables.

To add units to a unitless library, the library source (.lib) must be modified and the library must be read in using `read_lib`.

TIM-109 (Warning) Cell '%s' cannot be optimized because it has conflicting timing exceptions on pins '%s' and '%s'.

DESCRIPTION

The identified cell has multiple input pins with conflicting point-to-point timing exceptions on them. During optimization this cell is `dont_touch`'ed to prevent the point-to-point exceptions from being lost if the cell gets remapped to a configuration with fewer input pins. An example of such an optimization is pulling a multiplexer out of a mux'ed flip-flop. In this case, conflicts in timing exceptions could not be accurately resolved in the new, single input configuration.

Commands which create timing exceptions are `set_max_delay`, `set_min_delay`, `set_false_path`, `set_multicycle_path`, and `group_path`.

WHAT NEXT

To allow optimization to be performed on this cell, set timing exceptions on the cell such that both of the indicated pins have matching timing constraints. To analyze the timing exceptions that currently exist on the design, use the commands `report_timing_requirements` and `report_path_group`.

TIM-110 (Warning) Cell '%s' is being `dont_touch`'ed because of timing constraints on pin '%s'.

DESCRIPTION

The identified cell has timing constraints which cannot always be transferred to another cell during optimization. As a result, the cell is `dont_touched` to prevent it from being replaced and to prevent the timing constraints from being lost.

WHAT NEXT

To view the timing constraints set on the pin, use `report_timing_requirements`. If the cell is sequential, verify that the library cell has the correct timing arcs.

TIM-111 (warning) Clock port '%s' is assigned input delay relative to clock '%s'.

DESCRIPTION

This issue will be issued when setting an input delay on clock port, and it is not specified relative to the same clock.

WHAT NEXT

Remove the unneeded input delay value using the `remove_input_delay` command.

SEE ALSO

`remove_input_delay(2)`

TIM-112 (Information) Input delay ('%s') on clock port '%s' will be added to the clock's propagated skew.

DESCRIPTION

An input delay set on a clock port is interpreted as clock tree delay between the ideal clock source and the input port.

WHAT NEXT

If you don't want to have the input delay on the clock added to the clock skew, unset the input delay using the `remove_input_delay` command.

TIM-113 (Information) set_input_delay values are added to the propagated clock skew.

DESCRIPTION

When setting input delay on a clock signal, this value is added to the clock network

delay when calculating the skew at the clock pins.

WHAT NEXT

If you don't want to have the input delay on the clock added to the clock skew, unset the input delay using the `remove_input_delay` command.

TIM-114 (Warning) File '%s' could not be opened.

DESCRIPTION

You receive this warning message because the log file specified by the `case_analysis_log_file` variable could not be opened. The case analysis information will not be output to a log file.

WHAT NEXT

Specify a valid file that can be opened by the `case_analysis_log_file` variable.

SEE ALSO

`report_timing` (2), `set_case_analysis` (2); `case_analysis_log_file` (3).

TIM-120 (Error) Cannot find library file named '%s'.

DESCRIPTION

The file specified cannot be found or is not readable.

WHAT NEXT

Check to make sure that the filename exists, permissions are set correctly, and the `search_path` variable contains the directories that should be searched.

TIM-121 (warning) The -locations option of the `report_timing` command is now obsolete. Use the -physical option instead.

DESCRIPTION

You receive this message if you have issued `report_timing -locations`. This message

informs you that the **-locations** option is now obsolete and has been replaced by the **-physical** option. **-locations** continues to be supported for backward compatibility.

WHAT NEXT

Unless you need to use the **-locations** option for backward compatibility, the next time you use **report_timing**, use **-physical** instead of **-locations**.

SEE ALSO

report_timing (2).

TIM-125 (error) The pin '%s', which is a generated clock pin, is either in a loop or is in the fanout of two clock sources.

DESCRIPTION

The generated clock pin is in a loop or is in the fanout of two clock sources. You cannot have loops in the clock network, or can you have a generated clock in the fanout of two clock sources.

WHAT NEXT

If it is a loop, break the loop. If the generated clock is in the fanout of two clock sources, try to isolate it or use internal clocks instead.

TIM-128 (warning) No controlling value could be found for the clock gating cell '%s' for the clock pin '%s'.

DESCRIPTION

You receive this warning message because you executed the **set_clock_gating_check** command but did not specify a controlling value for the pin of the clock gating cell driven by the clock. Normally, clock gating checks are performed for the interval where the clock does not have the controlling value. If no controlling value can be determined, no clock gating check will be performed.

WHAT NEXT

Use the **-high** or **-low** option with the **set_clock_gating_check** command to specify the noncontrolling interval for the clock pin.

set_clock_gating_check (2).

TIM-129 (warning) User specified controlling value is different.

DESCRIPTION

User defined controlling value for the clock gating cell '%s' for the clock pin '%s' conflicts with the one calculated by the tool. But the user specified value takes precedence over the calculated value.

WHAT NEXT

The clock gating check is performed for the interval of the clock pin depending on the controlling value. See the manual page for the command **set_clock_gating_check** for detailed instructions on using -high and -low options.

TIM-130 (warning) The attribute '%s' is not supported.

DESCRIPTION

You receive this message because the attribute specified in the `ftiming_report_attributes` variable is not supported by the **report_timing** command with the **-attributes** option. Currently, only the **dont_touch**, **dont_use**, **map_only**, **ideal_net** and **size_only** attributes are supported.

The **timing_report_attributes** variable is in the system .synopsys_dc.setup file.

WHAT NEXT

Modify the **timing_report_attributes** variable.

SEE ALSO

report_timing (2).

TIM-131 (warning) There are no specified attributes to report.

DESCRIPTION

You receive this message because you used the the **report_timing** command with the **-attributes** option; but, because there was no variable in the **timing_report_attributes** variable, no attributes are printed.

The **timing_report_attributes** variable specifies the attributes to be reported by the **report_timing** command with the **-attributes** option. Currently, only the **dont_touch**, **dont_use**, **map_only**, **ideal_net** and **size_only** attributes are supported.

The **timing_report_attributes** variable is in the system .synopsys_dc.setup file.

WHAT NEXT

Modify the **timing_report_attributes** variable.

SEE ALSO

report_timing (2).

TIM-133 (warning) Setting clock gating check on multiplexer '%S'.

DESCRIPTION

You receive this warning message because you have executed the **set_clock_gating_check** command and specified a controlling value for a clock for a multiplexer. Generally, clock gating checks ensure that the enable signal does not change during the interval when the clock input has a noncontrolling value.

A multiplexer is a cell that has no controlling value. To perform a clock gating check on a multiplexer, you must specify the noncontrolling interval for the clock. Use the **-high** and **-low** options carefully, as the tool does not perform detailed analysis to determine if the selected signal changes only in the safe intervals.

WHAT NEXT

Use the **-high** or **-low** option for performing clock gating checks carefully on cells like multiplexers after understanding when it is safe to change the selected signal. There can be situations when there is no interval when it is safe to change the selected signal. Carefully analyze the consequences before using these options on cells like multiplexers.

SEE ALSO

set_clock_gating_check (2).

TIM-134 (warning) Design '%s' contains %d high-fanout nets. A fanout number of %d will be used for delay calculations involving

these nets.

DESCRIPTION

The design contains high-fanout nets whose delays will be computed using a simplified delay model that assumes a fixed fanout number. The rationale behind this is that delays of high-fanout nets are expensive to compute, but such nets are often unconstrained (as in the case of global reset nets, scan enable nets, and so on). Those high-fanout nets that are constrained should eventually be replaced by buffer trees. In both cases, detailed delay calculations are expensive and unnecessary.

The simplified net delay model is used only when computing data delays. Propagated clock latencies are always computed using the full accuracy net delay model.

WHAT NEXT

You can control the load pin threshold for high-fanout nets using the **high_fanout_net_threshold** variable. Setting the threshold to 0 (or to a very large number) ensures that no nets will be treated as high-fanout nets. However, you should be aware that forcing fully accurate delay calculations on all nets can significantly increase compilation runtime in some cases.

The pin capacitance for high-fanout nets is computed by multiplying the capacitance specified by the **high_fanout_net_pin_capacitance** variable times the high-fanout threshold.

EXAMPLE MESSAGE

Warning: Design 'reg_top' contains 3 high-fanout nets. A fanout number of 1000 will be used for delay calculations involving these nets. (TIM-134)

SEE ALSO

`high_fanout_net_threshold (3)`, `high_fanout_net_pin_capacitance (3)`.

TIM-135 (Warning) Net '%s' exceeds the high-fanout threshold. Using a fanout number of %d to calculate net delay and load.

DESCRIPTION

The named net is classified as a high-fanout net because its fanout number exceeds the threshold specified by the **high_fanout_net_threshold** variable. Delays of high-fanout nets are computed using a simplified delay model that assumes a fixed fanout number. The rationale behind this is that delays of high-fanout nets are expensive to compute, but such nets are often unconstrained (as in the case of global reset nets, scan enable nets, and so on). Those high-fanout nets that are constrained

should eventually be replaced by buffer trees. In both cases, detailed delay calculations are expensive and unnecessary.

The simplified net delay model is used only when computing data delays. Propagated clock latencies are always computed using the full accuracy net delay model.

WHAT NEXT

You can control the load pin threshold for high-fanout nets using the **high_fanout_net_threshold** variable. Setting the threshold to 0 (or to a very large number) ensures that no nets will be treated as high-fanout nets. However, you should be aware that forcing fully accurate delay calculations on all nets can significantly increase compilation runtime in some cases.

The pin capacitance for high-fanout nets is computed by multiplying the capacitance specified by the **high_fanout_net_pin_capacitance** variable times the high-fanout threshold.

SEE ALSO

`high_fanout_net_threshold` (3), `high_fanout_net_pin_capacitance` (3).

TIM-140 (warning) Gated clock latch is not created for pin '%s' because pin has a connection to a clock.

DESCRIPTION

You receive this warning because the tool has detected that you set the **set_clock_gating_check** command on a pin that is driven by a clock. Clock-gating checks are normally performed on the enable pins of the clock-gating cell. Setting a clock-gating check on a pin driven by the clock in the clock-gating cell has no effect.

WHAT NEXT

If you are not sure which pin to set the clock-gating check on, consider setting the check on the clock-gating cell. The clock-gating cell performs clock-gating checks on all the enable pins of the cell. See the man page for the **set_clock_gating_check** command for more detailed information on this command.

`set_clock_gating_check` (2).

TIM-141 (warning) Gated clock latch is not created for cell '%s'

on pin '%s' in design '%s'.

DESCRIPTION

You receive this warning because the tool has detected that you set the **set_clock_gating_check** command on a pin that is either a non-input pin or is driven by a clock. Clock-gating checks should be performed on input enable pins of the clock-gating cell. Setting clock-gating check on the pins driven by the clock in the clock-gating cell has no effect. Similarly, setting clock-gating check on an output pin has no effect.

WHAT NEXT

If you are not sure which pin to set the clock gating check on, consider setting the check on the clock-gating cell, which will then perform clock-gating checks on all the enable pins of the cell. See the man page for the **set_clock_gating_check** command for detailed information on this command.

SEE ALSO

set_clock_gating_check (2).

TIM-142 (warning) No gated clock latch created for cell '%s'.

DESCRIPTION

You receive this warning because the tool has detected that you set the **set_clock_gating_check** command on a pin that is a non-input pin or is driven by a clock. Clock-gating checks should be performed on input enable pins of the clock-gating cell. Setting a clock-gating check on the pins driven by the clock in the clock-gating cell has no effect. Similarly, setting clock-gating check on an output pin has no effect.

WHAT NEXT

If you are not sure which pin to set the clock-gating check on, consider setting the check on the clock-gating cell, which will then perform clock-gating checks on all the enable pins of the cell. See the man page for the **set_clock_gating_check** command for more detailed information.

SEE ALSO

set_clock_gating_check (2).

TIM-143 (warning) Converting propagated clock at '%s' to ideal clock.

DESCRIPTION

You receive this warning to let you know that because you set the **set_clock_latency** command on a propagated clock object, that clock object will be changed to ideal.

WHAT NEXT

If you want the clock to be propagated, do *not* specify **set_clock_latency** on the propagated clock object.

TIM-144 (warning) Ideal timing is specified on the non-ideal pin '%S'.

DESCRIPTION

Ideal latency and ideal transition are ignored if they are set on a non-ideal network.

WHAT NEXT

If the user wants to use ideal latency or ideal transition on a pin object, it must be marked as ideal.

TIM-149 (warning) Cannot preserve timing constraints on IO pin '%s' during ungroup.

DESCRIPTION

This warning message occurs when the **ungroup** command cannot move constraints from an IO pin that has more than one driver or more than one receiver. Timing constraints on that pin are not preserved after the ungrouping.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`ungroup (2)`

TIM-150 (warning) Cannot preserve timing constraints on pin '%s' during ungroup.

DESCRIPTION

You receive this warning to let you know that the `ungroup` command could not find the named pin and therefore cannot move constraints to that pin.

This warning message reports the situation. The pin might not be connected.

WHAT NEXT

Verify that you set the constraint on the correct pin. Then invoke the `ungroup` command again.

SEE ALSO

`ungroup (2)`.

TIM-151 (warning) Cannot preserve the clock at source pin '%s' during ungroup.

DESCRIPTION

This warning lets you know that a clock with a hierarchical source pin cannot be preserved because the source cannot be moved to another pin on the same net. The clock source might not be connected. Or possibly you have defined another clock on the same net.

WHAT NEXT

Check to see if the clock source is unconnected or if there is another clock defined on the same net. Make any necessary corrections, and invoke the command again.

SEE ALSO

`ungroup (2)`.

TIM-152 (warning) Cannot preserve the generated clock source pin '%s' during ungroup.

DESCRIPTION

You receive this warning to let you know that the generated clock with a hierarchical source pin will not be preserved because it is not possible to move the source pin to another pin on the same net.

WHAT NEXT

The **ungroup** command will automatically remove the generated clock.

SEE ALSO

ungroup (2).

TIM-154 (warning) Generated clock '%s' will be lost after ungroup.

DESCRIPTION

You receive this warning to let you know that the tool is not preserving a generated clock with a hierarchical master pin or hierarchical source pin, because it is not possible to move the source pin or the master pin to another pin on the same net.

WHAT NEXT

The **ungroup** command will automatically remove the generated clock.

SEE ALSO

ungroup (2).

TIM-155 (warning) The disable_timing constraint on pin '%s' will be lost after ungroup.

DESCRIPTION

You receive this warning to let you know that the disable_timing constraint that is

set on a hierarchical pin cannot be preserved because the **ungroup** command cannot find another pin on the same net where the constraint can be set.

WHAT NEXT

This is a warning only and requires no action on your part.

SEE ALSO

ungroup (2).

TIM-156 (warning) Case analysis on pin '%s' will be lost after ungroup.

DESCRIPTION

You receive this warning to let you know that the case-analysis value that you set on the named hierarchical pin cannot be preserved, because the **ungroup** command cannot find another pin in the same net on which to set the constraint.

WHAT NEXT

This is a warning only and requires no action on your part.

SEE ALSO

ungroup (2).

TIM-157 (warning) Generated clock '%s' will be lost after ungroup.

DESCRIPTION

You receive this warning because the named generated clock that has a hierarchical master pin or hierarchical source pin will not be preserved, because it is not possible to move either the source pin or the master pin to another pin on the same net.

WHAT NEXT

The **ungroup** command will automatically remove the generated clock.

SEE ALSO

ungroup (2).

TIM-158 (warning) Input/output delay on pin '%s' will be lost after ungroup.

DESCRIPTION

You receive this warning to let you know that the input delay or output delay that you set on a hierarchical pin will not be preserved because the **ungroup** command could not find another pin in the same net on which to set the constraint.

WHAT NEXT

This is a warning only and requires no action on your part.

SEE ALSO

ungroup (2).

TIM-159 (warning) Exception through pin '%s' is lost after ungroup.

DESCRIPTION

You receive this warning to let you know that timing exception through a hierarchical pin will not be preserved after the ungroup process because the **ungroup** command cannot find another pin in the same net on which to set the constraint.

WHAT NEXT

This is a warning only and requires no action on your part.

SEE ALSO

ungroup (2).

TIM-160 (warning) The variable named %s is set to an illegal

value (%g) and will be ignored.

DESCRIPTION

This warning message occurs when a variable is set to a value that is not within the range of acceptable values. The variable setting is ignored.

The following shows an example of the warning message.

Warning: The variable named rc_input_threshold_pct_rise is set to an illegal value (150) and will be ignored. (TIM-160)

WHAT NEXT

This is only a warning message. No action is required.

However, if you do not want the variable value to be ignored, reset the variable to an acceptable value. Refer to the man page for the variable shown in the message to determine the acceptable values. After making your changes, run the command again.

TIM-161 (warning) The variable named %s is set to a very low value (%g).

DESCRIPTION

This warning message occurs when a variable is set to a legal value that is well below the range of values that are normally used. This message warns you to check the variable's value to make sure that it is correct.

The following shows an example of the warning message.

Warning: The variable named rc_input_threshold_pct_rise is set to a very low value (0.50). (TIM-161)

WHAT NEXT

This is only a warning message. No action is required.

However, if the value of the variable is not the value you want, reset the variable to the correct value. Refer to the man page for the variable shown in the message to determine the range of values. After making your changes, run the command again.

TIM-162 (warning) The value of variable '%s' (%g) overrides the

original value (%g) in library '%s'.

DESCRIPTION

This warning message occurs when you set the named variable because you are overriding a library parameter that is specified by the creator of the library. This is not considered best practice because it can cause inaccurate or incorrect results.

Consult the creator of the library before attempting to override a library parameter.

The following shows an example of the warning message.

Warning: The value of variable 'rc_input_threshold_pct_rise' (80) overrides the original value (50) in library 'cmos_013_comb'. (TIM-162)

WHAT NEXT

This is a warning message only. If you are sure you want to override the library parameter value, no action is required.

However, to use the value defined in the library, unassign the variable and remove the variable assignment from any scripts. After completing your changes, rerun the command.

TIM-163 (warning) The library named %s specifies a very small trip-point value (%g).

DESCRIPTION

This warning message occurs when the library contains a trip-point value that is legal, but is well below the range of values that are typically used.

The following shows an example of the warning message.

Warning: The library named cmos_013_comb specifies a very small trip-point value (0.5). (TIM-163)

WHAT NEXT

This is a warning message only. No action is required.

However, it is best practice to ask the library creator to check the trip-point values in the library. You can use the **report_lib** command to see the trip-point values in the library.

SEE ALSO

`report_lib(2)`

TIM-164 (warning) The trip points for the library named %s differ from those in the library named %s.

DESCRIPTION

This warning message occurs when two libraries with different trip-point values are being used. This may result in a loss of timing accuracy when cells from one library are connected to cells of the other library.

The following shows an example of the warning message.

Warning: The trip points for the library named cmos_013_comb differ from those in the library named cmos_013_fflop. (TIM-164)

WHAT NEXT

This is a warning message only. No action is required.

However, you can check the trip points for a library using the `report_lib` command. It is best practice to use libraries that use the same trip-point values when cells from different libraries will be connected.

SEE ALSO

`report_lib(2)`

TIM-165 (warning) The library named %s contains an illegal trip-point value (%g) that will be ignored.

DESCRIPTION

This warning message occurs when a library contains an illegal trip-point specification that is ignored.

The following shows an example of the warning message.

Warning: The library named cmos_013_comb contains an illegal trip-point value (150) that will be ignored. (TIM-165)

WHAT NEXT

This is only a warning message. No action is required.

However, you can check the trip points for a library using the **report_lib** command. Inform the library creator of the illegal trip-point value, because improper trip-point specifications may cause inaccurate timing results.

SEE ALSO

`report_lib(2)`

TIM-166 (error) For the library named %s, the lower %s slew trip point (%g) is larger than the upper trip point (%g). The trip points will be interchanged.

DESCRIPTION

This error message occurs when a lower slew trip point is set to a larger value than the corresponding upper trip point. This is not allowed. The upper trip point must always be larger than the lower trip point (even for falling transitions).

The following shows an example of the error message.

Error: For the library named cmos_013_comb, the lower fall slew trip point (75) is larger than the upper trip point (25). The trip points will be interchanged. (TIM-166)

WHAT NEXT

Check the trip points for the library using the **report_lib** command.

- If the incorrect values are specified in the library, inform the library creator.
- If the trip-point values are not coming from the library, they were set using variables such as **rc_slew_lower_threshold_pct_rise**. In this case, reset the variables to the correct values.

SEE ALSO

`report_lib(2)`
`rc_slew_lower_threshold_pct_rise(3)`

TIM-167 (error) For the library named %s, the lower %s slew trip point (%g) is the same as the upper trip point. The default values

of %g and %g will be used.

DESCRIPTION

This error message occurs when a lower slew trip point is set to the corresponding upper trip point of the same value. This is not allowed because it makes all transition times zero.

The following shows an example of the error message.

Error: For the library named cmos_013_comb, the lower fall slew trip point (75) is the same as the upper trip point. The default values of 20 and 80 will be used.
(TIM-167)

WHAT NEXT

Check the trip points for the library using the **report_lib** command.

- If the incorrect values were specified in the library, inform the library creator.
- If the trip-point values are not coming from the library, they were set using variables such as **rc_slew_lower_threshold_pct_rise**. In this case reset the variables to the correct values.

SEE ALSO

`report_lib(2)`
`rc_slew_lower_threshold_pct_rise(3)`

TIM-168 (information) There are logic constants set for unused pins.

DESCRIPTION

This information message occurs when there are unused (hanging) pins in the design. The tool binds the unused pins to logic constants that may affect case analysis, arc disabling, and report_timing.

WHAT NEXT

This is only an information message. No action is required.

However, the tool ignores this setting if you set the **dont_bind_unused_pins_to_logic_constant** variable to true.

SEE ALSO

`dont_bind_unused_pins_to_logic_constant(3)`

TIM-169 (warning) Clock '%s' does not have edge values monotonically increasing, so waveform is adjusted.

DESCRIPTION

You receive this warning to let you know that the edge values of the clock is not in a monotonically increasing sequence. The reason that this is a TIM message instead of an UID message suggests that the waveform inferred from input delays could be violating the condition. In order to proceed with the analysis, the waveform edge values of the clock are adjusted.

WHAT NEXT

Clearly define the clock waveform to meet the conditions, or adjust external delays that could have led to this violation.

SEE ALSO

`create_clock (2)`.

TIM-170 (warning) Restored the timing arcs disabled by loop breaking.

DESCRIPTION

When the timing graph is changed, the internally disabled timing arcs for loop breaking is restored.

WHAT NEXT

Exam the timing arcs to be sure they are correct for loop breaking.

SEE ALSO

`set_disable_timing (2)`.

TIM-171 (warning) The hierarchical cell named %s that is being

ungrouped has derate. This derate will be set on the lower level leaf cells if the leaf cell does not have a derate itself. This may cause timing inconsistency before and after ungrouping.

DESCRIPTION

This warning message occurs when ungrouping a cell that has derate. The cell's derate factors are set on the lower level cells if the lower level cells do not have their own derate factors. Because the derate factor of library cells has higher priority than hierarchical cells, this setting may cause the derate factors used in delay calculation to change after ungrouping.

WHAT NEXT

This is only a warning message. No action is required.

However, if this is not the result you intended, use the `set_timing_derate` command to change the derate factors.

SEE ALSO

`set_timing_derate(2)`

TIM-172 (error) For library pin %s, the lower %s slew trip point (%g) is larger than the upper trip point (%g). The trip points will be interchanged.

DESCRIPTION

This error message occurs when a lower slew trip point is set to a larger value than the corresponding upper trip point. This is not allowed. The upper trip point must be larger than the lower trip point (even for falling transitions).

The following shows an example error message:

```
error: For library pin clk, the lower fall slew trip point (75) is larger than the
upper trip point (25). The trip points will be interchanged. (TIM-172)
```

WHAT NEXT

Check the trip points for the library pin. If the incorrect values are specified in the library, inform the library creator.

TIM-173 (error) For library pin %s, the lower %s slew trip point (%g) is the same as the upper trip point. The default values of %g and %g will be used.

DESCRIPTION

This error message occurs when a lower slew trip point is set to the same value corresponding upper trip point. This is not allowed, because it makes all transition times zero.

The following shows an example error message:

```
error: For library pin clk, the lower fall slew trip point (75) is the same as the
upper trip point. The default values of 20 and 80 will be used. (TIM-173)
```

WHAT NEXT

Check the trip points for the library pin. If the incorrect values are specified in the library, inform the library creator.

TIM-175 (Warning) Breaking the timing path through pin '%s' due to user timing constraints.

DESCRIPTION

Some timing constraint commands can cause timing paths to be broken when placed on pins which are not normal timing startpoints or endpoints. Examples include **set_max_delay**, **set_min_delay**, **set_multicycle_path**, **set_false_path**, and **group_path**. Paths are broken by making the pin an endpoint for all timing paths leading to the pin. In addition, the pin becomes a startpoint for all timing paths going out of the pin.

WHAT NEXT

To avoid broken timing paths, try to set timing exceptions on ports and register clock or data input pins. For other types of pins, use -through pin exceptions rather than -from and -to pin exceptions. The major difference between the -from, -to, and -through options is that -from causes the path to be broken if the pin is not a normal timing startpoint, -to causes the path to be broken if the pin is not a normal timing endpoint, and -through does not break paths.

SEE ALSO

set_max_delay (2), **set_min_delay** (2), **set_multicycle_path** (2), **set_false_path** (2), **group_path** (2).

TIM-176 (information) Timer is not in zero interconnect delay mode.

DESCRIPTION

This information message advises you that the timer is no longer working in the zero interconnect delay mode. The timer is in normal mode so the net wire capacitance is restored from the back annotation or from the wire load model.

WHAT NEXT

This is an informational message only. No action is required.

However, if the result is not what you intended, you can enable zero interconnect delay mode by setting **set_zero_interconnect_delay_mode** to **true**.

SEE ALSO

`get_zero_interconnect_delay_mode(2)`
`set_zero_interconnect_delay_mode(2)`

TIM-177 (warning) Timer is in zero interconnect delay mode.

DESCRIPTION

This warning message occurs when the timer is working in the zero interconnect delay mode. The net wire capacitance is 0 when calculating the delay, for example, $C_w = 0$.

When you run the **set_zero_interconnect_delay_mode** command without specifying **true** or **false**, zero interconnect delay mode is enabled by default.

After you set the interconnect delay mode to zero, the **report_timing**, **report_constraint**, and all commands that use the wire delay reflect the zero C_w . This also affects optimization.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, it is considered best practice to set **set_zero_interconnect_delay_mode** to **false** before the timing optimization. Otherwise, the optimization does not see the interconnect delay, even if the design has the wire load model specified, the design is back annotated, or the design is routed.

WHAT NEXT

```
get_zero_interconnect_delay_mode(2)
set_zero_interconnect_delay_mode(2)
```

TIM-178 (warning) This '%s' constraint is no longer applicable to any path.

DESCRIPTION

This warning message occurs when pins or clocks have been removed from the timing path constraint to the extent that the constraint cannot be applied. For example, a false path from {A B} to {C D} is dropped if both C and D have been removed from the design.

This message is also issued when an ungroup is performed by first changing the current_design to a subdesign, and then back to top. The timing constraints set from the top level design might not apply after the ungroup and can be lost.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you expected, check the constraint file for any redundancies. If the message occurs because the ungroup was performed from a subdesign, run the **ungroup** command from the top level using the **-all_instances** option, if needed.

SEE ALSO

ungroup(2)

TIM-179 (warning) '%s' constraint made a reference '%s %s' which no longer exists.

DESCRIPTION

This warning message occurs when the pin or object specified in the timing constraint has been removed as the result of an optimization or constraint propagation. This can cause the constraint to no longer apply to the design.

This message is also issued when an ungroup is performed by first changing the current_design to a subdesign, and then back to top. The timing constraints set from the top level design might not apply after the ungroup and can be lost.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you expected, check the constraint file for any redundancies. If the message occurs because the ungroup was performed from a subdesign, run the **ungroup** command from the top level using the **-all_instances** option, if needed.

SEE ALSO

`ungroup (2)`

TIM-180 (information) Total %d nets in the design, %d nets have timing window.

DESCRIPTION

This message gives a summary of the number of nets in the design and how many of them have timing windows. This message is issued during timing update when SI analysis is enabled and timing windows are considered in SI analysis.

WHAT NEXT

This is an informational message only. No action is required.

TIM-181 (Error) Relationship between clocks %s and %s is already defined to be %s by group %s

DESCRIPTION

The clock pair already has a relationship defined by a `set_clock_groups` command prior to the current `set_clock_groups` command.

WHAT NEXT

If you want to change the clock relationship, remove the existing relationship by using the `remove_clock_groups` command. You can use `report_clock` command with `fb-groups` option to see more details.

SEE ALSO

`set_clock_groups (2)`, `remove_clock_groups (2)`, `report_clock (2)`.

TIM-182 (Warning) Clock group %s has all design clocks in one group.

DESCRIPTION

The current `set_clock_groups` command specifies all the clocks in the same group. This is a valid setting if you plan to add more clocks. This command serves no purpose otherwise.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

TIM-183 (Warning) False path got overridden by `set_clock_groups`.

DESCRIPTION

The current `set_clock_groups` command overrode an existing false path between the specified clocks. The clocks are from different groups of `set_clock_groups` command.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_timing_requirements` (2), `report_clock` (2).

TIM-184 (Error) Clock group settings for %s and %s conflict with previously set clock group settings.

DESCRIPTION

This error message occurs when a `set_clock_groups` command conflicts with a previous `set_clock_groups` command. For example, if a previous command has specified a false path between a pair of asynchronous clocks, then a new command tries to allow paths between the pair of clocks, you will see this error message. Use `report_clock -groups` to see all clock groups. Remove the existing clock group if you want to change the clock group settings for the clock pair.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

TIM-185 (Error) Clock group %s not found.

DESCRIPTION

The error occurs if the clock group of given name is not found by remove_clock_group command. Use report_clock with -groups option to list all clock groups.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

TIM-186 (Error) Clock group %s already exists.

DESCRIPTION

The error occurs if the clock group of given name and given type already exists. Use report_clock with -groups option to list all clock groups.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

TIM-187 (Error) Clock group setting clash with false path settings of group %s (%s).

DESCRIPTION

The current set_clock_groups command conflicts with an earlier set_clock_groups setting issued for the group of clocks. This message usually occurs when all clocks in the design have been specified in the same group and their false path settings clash with another set_clock_groups command. For example, a previous set_clock_groups command specifies false path but the current command allows timing paths. Use report_clock -groups to see all clock groups. Remove the existing clock group if you want to change the clock group settings for the set of clocks.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

TIM-188 (Error) Clock group %s already defines the %s

relationship for given clocks.

DESCRIPTION

This error message occurs when a `set_clock_groups` command tries to redefine a relationship for the set of clocks. Use `remove_clock_groups` remove the existing clock group if you want to change the clock group settings. Use `report_clock -groups` to report all clock groups.

SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

TIM-189 (warning) there are conflicting senses converging for clock '%s' from pin '%s' in the clock network.

DESCRIPTION

The clock tree for the specified clock contains paths that have conflicting senses merging. This clock will not be propagated forward starting from this pin.

WHAT NEXT

Since there is ambiguity on which sense to choose to propagate, user could use `set_clock_sense` to pick which sense to propagate for the clock.

TIM-190 (warning) sense defined on pin '%s' cannot be honored for clock '%s'.

DESCRIPTION

The sense defined on the pin is not available and cannot be honored. This happens when the clock senses propagated to this pin doesn't contain the sense user has chosen. The defined sense is ignored and the original senses are propagated forward.

WHAT NEXT

A feasible clock sense has to be set by `set_clock_sense`, otherwise the defined sense is ignored.

TIM-193 (info) Generated Clock (%s) has non_unate sense on master source pin.

DESCRIPTION

For a generated clock if the master source pin has a non-unate sense, then by default the tool will only propagate the positive sense waveform from the generated clock source pin to the clock pins. This information will help the user understand which generated clock has non-unate sense on their master source pin.

WHAT NEXT

The user can create an additional generated clock with a `-preinvert` option to propagate the negative sense.

TIM-196 (error) Clock group %s already defines the relationship for the given set of clocks.

DESCRIPTION

This error message occurs when the clock group for the specified set of clocks and type already exists.

WHAT NEXT

Use the `report_clock` command with the `-groups` option to list all clock groups. Rerun the command with either a new clock group, or a new set of clocks.

SEE ALSO

```
remove_clock_groups(2)  
report_clock(2)  
set_clock_groups(2)
```

TIM-197 (error) Cannot find the definition of mode '%s'.

DESCRIPTION

This error message occurs when user tries to set an invalid mode value to cell, which is not defined in the reference library.

WHAT NEXT

Use the `report_mode` command to list all modes to look for which mode is you wanted.

SEE ALSO

TIM-200 (warning) Data Checks from-pin (%s) and to-pin (%s) are the same pin. Ignoring

DESCRIPTION

Datacheck from pin and to pin cannot be the same pin. The tool will ignore the data-check constraint in that case.

WHAT NEXT

Tool will issue a warning message and skip the constraint.

TIM-201 (Error) Generated clock (%s) (%s) is not satisfiable; zero source latency will be used.

DESCRIPTION

This is an error message whenever the clock network traverse can not find a path which satisfies the sense relationship defined by `create_generated_clock` command.

WHAT NEXT

Check for the generated clock definition to see if the generated clock is correctly defined. One example is that a `divided_by 2` generated clock is driven by a inverter only. In this case, generated clock should be redefined with `-invert` with `-divided_by 1`. Another example is a `divided_by 2` generated clock with preinverting. If master clock source pin is used as generated clock source pin, the warning message will be issued. In this case, generated clock source pin should be redefined to clock pin of divider.

TIM-202 (Error) The master of the following generated clock is

not connected to any clock source.

DESCRIPTION

This error message occurs when check_timing command finds generated clock in the design is not connect to any clock source.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-203 (Error) The following generated clocks form a loop.

DESCRIPTION

This error message occurs when check_timing command finds generated clocks in the design form a loop. For example, when the source pin of G_CLK1 is the definition point of G_CLK2, meanwhile the source pin of G_CLK2 is the definition point of G_CLK1, the tow generated clocks form a loop.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-204 (Warning) The following generated clock has no path to its master clock.

DESCRIPTION

This Warning message occurs when check_timing command finds the definition point of generated clock has no path to its master clock. For example, master clock CLK1 defines on point A, and its generated clock GCLK1 defines on B, if there's no path from A to B, the Warning message will be printed out.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-205 (Warning) cross clocks found.

DESCRIPTION

This Warning message occurs when check_timing command finds clock interactions. If a clock launches one or more paths, which are captured by other clocks, it will have an entry in clock crossing report. If all paths between two clocks are false paths or the are exclusive/asynchronous clocks, the path is marked by *. If only part of paths are set as false paths, the path is marked by #.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-206 (Warning) following data check register reference pins are not driven by clocked signal.

DESCRIPTION

This warning message occurs when check_timing command finds no clocked signal reaches a data check register reference pin.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-207 (Warning) following data check register reference pins are driven by multiple clocked signals.

DESCRIPTION

This warning message occurs when check_timing command finds multiple clocked signals reach a data check register reference pin.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-208 (Warning) the following input ports have no

`clock_relative` delay specified. Since the variable ‘`timing_input_port_default_clock`’ is ‘true’, a default input port clock will be assumed for these ports.

DESCRIPTION

This warning message occurs when `check_timing` command finds no clock related delay specified on an input port, where it propagates to a clocked latch or output port. Note that with `timing_input_port_default_clock` set to ‘true’, a default clock will be assumed for the input port. Otherwise it will not be clocked, and the paths are unconstrained. In this case, if there is no input delay specified, `check_timing` will not generate warnings.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-209 (Warning) timing loops detected.

DESCRIPTION

This warning message occurs when `check_timing` command finds combinational feedback loops.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-210 (Warning) there are %d input ports without driving cell specified.

DESCRIPTION

This warning message occurs when `check_timing` command finds no driving cell specified on an input port. In such case, the accuracy of delay calculation could be impacted, as a default strong driver is assumed in absence of driving cell definition. Especially, in presence of crosstalk, a port with no driving cell could act as a strong aggressor which could lead to significant amount of pessimism in the analysis. Also, a port with no driving cell could act as a strong victim, which could underestimate the crosstalk effect. Command `set_driving_cell` could be used to specify a library cell or pin to drive ports.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-211 (Warning) there are %d ideal clocks.

DESCRIPTION

This warning message occurs when `check_timing` command finds ideal clocks. Generally, all clocks should be propagated so that the clock network timing is accurately calculated. Especially, in presence of crosstalk, the delay changes induced by other nets on the clock network will not be reflected in the calculated slacks in the design. Command `set_propagated_clock` could be used to define clock as propagated.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-212 (Warning) there are %d input ports that only have partial input delay specified.

DESCRIPTION

This warning message occurs when `check_timing` command finds partial input delay specified on an input port. This happens when `set_input_delay -min` is applied on a port to set the min input delay with respect to a clock, however no `set_input_delay -max` is applied to that port to specify the max delay, or vice versa. As a result, some paths starting from the port with partially defined input delay may become unconstrained and some potential violations could be missed. Command `set_input_delay` could be used to set both min and max delay on the port.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-213 (warning) the specific arc is in clock path, report_delay_calculation result may not match with timing report

or clock skew report for this arc.

DESCRIPTION

This warning message occurs when both from pin and to pin are in clock network. In clock skew/latency calculation, tool use the slew from clock propagation path to calculate delay result. While in report_delay_calculation command, tool use the worst slew to calculate delay. This may cause different delay results.

SEE ALSO

`report_delay_calculation` (2),

TIM-214 (Warning) there are %d nets without driver pins.

DESCRIPTION

This warning message occurs when check_timing command finds nets without driver pins.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-215 (Warning) there are %d nets without timing arcs on driver pins.

DESCRIPTION

This warning message occurs when check_timing command finds no timing arcs defined on the driver pins of the net.

SEE ALSO

`check_timing` (2), `timing_check_defaults` (3).

TIM-300 (Error) Could not %s timing data %s %s: %s.

Falling back to full update.

DESCRIPTION

The application sometimes saves timing data to a temporary file. Something went wrong either saving or restoring this data. For example, if the target disk was full, you would get this message. The program will continue as though the temporary directory was unavailable, possibly with some performance penalty.

WHAT NEXT

Files are saved either to /tmp or the value of the TMPDIR environment variable. If the message indicates that saving was in progress, most likely the temporary directory does not exist, you don't have permissions to write to it, or it is full. The message will indicate the cause. In most cases, the disk is full. Either delete some files, or find a different temporary directory and set the TMPDIR environment variable to point at it. A problem during restore is rare. It might be that someone accidentally deleted the file or the file became corrupt.

SEE ALSO

TM

TM-001 (information) Design is in trace mode

DESCRIPTION

This message indicates that the design is in trace mode and the netlist is partially loaded into memory.

WHAT NEXT

```
set_fp_trace_mode(2) end_fp_trace_mode(2)
```

TM-002 (information) Design is not in trace mode

DESCRIPTION

This message indicates that the design is not in trace mode and the netlist is fully loaded into memory.

WHAT NEXT

```
set_fp_trace_mode(2) end_fp_trace_mode(2)
```

TM-003 (information) full netlist not loaded yet... Next command that needs full netlist will load it

DESCRIPTION

This message indicates that the design netlist is not loaded after we ended trace mode. The netlist was merely removed from memory, and will be loaded when the next command that needs the netlist is executed.

WHAT NEXT

```
set_fp_trace_mode(2) end_fp_trace_mode(2)
```

TPM

TPM-10 (error) Test program '%s' does not match the design '%S'.

Test program was not restored.

DESCRIPTION

This message indicates that the test program does not match the design. The design has probably been changed since the test program was written.

WHAT NEXT

If you need to use this test program, you must change the design back to what it was when the test program was written out. Otherwise, the test program cannot be used and a new one will have to be generated.

TPM-20 (error) '%s' is not a valid name for the test program because it matches the name of one of the test programs in the current sequence.

DESCRIPTION

This test generation or fault simulation run is an incremental run. This message indicates that the name being assigned to the incremental test program is not valid. (The `-output` option specifies the test program name. If you have not specified the name, then the default is the 'design' name). This is because the name is the same as that of one of the test programs in the sequence that this incremental test program depends on.

You should see this message when you are using TestManager and when the `multi_pass_test_generation` variable has the value TRUE.

WHAT NEXT

If you want this run to be an incremental run, then use a different name for this incremental test program.

If this is a new run targetting the entire fault list (i.e. it is not intended to be an incremental run), then first execute the command `delete_test` to remove the current test program.

You should set the `multi_pass_test_generation` variable to FALSE if you want every

run to be an independent run targetting the entire fault list.

TPM-30 (error) '%s' %s. It cannot be restored.

DESCRIPTION

The vdb file that is being restored does not have any fault information so it cannot be restored. Either this is a 3.0 format vdb or it has been corrupted.

WHAT NEXT

Regenerate the vdb file using the current version of DFT Compiler.

TPM-31 (warning) File '%s' contains only fault information but no vectors.

DESCRIPTION

The testprogram contained in this vdb file was probably created without scan insertion; hence, the vectors were not saved.

WHAT NEXT

If you want to save vectors in the **vdb** file for later fault simulation, first perform scan insertion using **insert_test** and then run **create_test_patterns**.

TPM-40 (warning) Deleting current test program '%s' because it is not consistent with the current design.

DESCRIPTION

The current test program is not compatible with the current design. This could be because you have changed the design or switched to another design.

The current test program will be deleted from memory and the next ATPG or fault simulation run will use a new initial fault list for the current design.

Note that the test program that was just deleted from memory is still available on disk.

WHAT NEXT

If you wish to restore the previous test program which was just automatically deleted, first restore the current design to its original state (i.e. its state when that test program was created), and then use the `restore_test` command.

TPM-41 (warning) Deleting current test program '%s' because it was generated

for the design '%s' but the current design is '%s'.

DESCRIPTION

The current test program is not compatible with the current design. This could be because you have changed the design or switched to another design.

The current test program will be deleted from memory and the next ATPG or fault simulation run will use a new initial fault list for the current design.

Note that the test program that was just deleted from memory is still available on disk.

WHAT NEXT

If you wish to restore the test program which was just automatically deleted, first restore the current design to its original state (i.e. its state when that test program was created), and then use the `restore_test` command.

TPM-50 (error) Current design is '%s', but trying to restore a test program for design '%s'.

DESCRIPTION

The current design name and the design name for the test program you are trying to restore are different.

WHAT NEXT

If you wish to restore the specified test program, first set the current design to the one in the specified test program and then use the `restore_test` command.

TPM-60 (information) This %s run is an incremental run. It will

**target
the faults left undetected by the preceding test program.**

DESCRIPTION

This message informs you that this test generation or fault simulation run will be an incremental run. It will target only the faults which were not detected by the previous runs.

You will see this message when you are using TestManager and when the **multi_pass_test_generation** variable has the value TRUE.

WHAT NEXT

You should set this variable to FALSE if you want every run to be an independent run targetting the entire fault list.

TRANS

TRANS-1 (warning) Cell '%s' (%s) not translated.

DESCRIPTION

The named cell could not be translated into the target_library. This error happens most often when the cell is specified with a **dont_touch** attribute; the cell has unknown functionality; or no replacement exists in the target_library.

WHAT NEXT

If the cell was not translated because of a **dont_touch** attribute, remove that attribute and translate again.

If the library cell has the **dont_use** attribute in the target_library, then you can consider removing that attribute from the library cell and translating again; otherwise, you must remove the **dont_touch** attribute from the cell and translate again.

If the cell was not translated because it has unknown functionality, either hand-translate the cell or functionally model it in the original technology library.

If the cell was not translated because no replacement exists in the target_library, then either the target_library actually doesn't have a replacement and you must add one; or the replacement is not functionally modeled and you must model it.

This error will not occur with combinational cells. If it understands the functionality, **translate** can map a combinational cell to a cell in the target_library. This error may occur with sequential cells if the original cell has a preset or clear and there is no similar cell in the target_library; or if the similar cell is not sequentially modeled.

Three-state cells might not translate if the target_library contains no three-state cells or the three-states cells are not functionally modeled. In these two cases the cells are left as generic flip-flops or generic three-states. You must add the correctly modeled cells to the target_library, or hand-translate the cells.

To hand-translate cells, create a netlist with the same port interface and name as the cell to be translated and instantiate the translation (cells from the target_library) inside this netlist. Then execute **link -all** to link this netlist in place of the cells from the original library so that they now appear as a level of hierarchy with the translation inside. Ungroup these levels of hierarchy to finish the translation.

This error may also occur with designs which contain references to synthetic library parts if the link_library variable does not list the proper synthetic library file.

TRANS-2 (warning) Flip-flop '%s' (%s) cannot be translated exactly into '%s'.

DESCRIPTION

The named flip-flop could not be translated into the type of cell specified with `set_register_type -exact` command. This error happens most often when the exact specified replacement does not match the asynchronous requirements of the original cell.

WHAT NEXT

If you do not require an exact replacement, consider this message informational and ignore it; the cell will be translated, but not into the exact specified cell.

If you want the cell to be translated into the exact replacement, check the modeling of the replacement cell in the target_library to make sure it is correctly modeled. If this is the case, fix the sequential modeling of this cell in the target_library.

TRANS-3 (warning) Flip-flop '%s' (%s) cannot be translated to requested type.

DESCRIPTION

The named flip-flop could not be translated into the type of cell specified with `set_register_type` command. This error happens most often when no cell exists in the target_library that matches the specified type and asynchronous requirements of the original cell.

WHAT NEXT

If you do not require the specified replacement type, consider this message informational and ignore it.; the cell will be translated to something close but not the exact specified replacement type.

If you want the cell translated into the exact replacement type, check the modeling of the replacement cell in the target_library to make sure it is correctly modeled.

TRANS-4 (warning) Target library contains no replacement for

register '%s' (%s).

DESCRIPTION

The named register could not be translated into the target_library. The most likely reason is that no cell exists in the target_library that matches the asynchronous requirements of the original cell. Another possible reason is that the target_library contains no registers, or has not been sequentially modeled. The register is left as a generic flip-flop (**FFGEN**).

WHAT NEXT

Add a correctly-modeled sequential element to the target_library with the same asynchronous requirements as the cell that was not translated.

TRANS-5 (warning) Unable to determine wired-logic type for multiple-driver net '%s'.

DESCRIPTION

The named net has more than one driver, but Design Compiler was unable to determine whether this should be considered a wired-AND, wired-OR, or three_state bus. This happens if all the cells connected to the net are unmapped or black boxes, and the technology cannot be determined.

WHAT NEXT

Design Compiler assumes the net is a wired-AND. If it is not, place an attribute on the net indicating the wired-logic function. To do this, use the *set_attribute* command to set one of the following Boolean attributes to *TRUE* on the net: *wired_and*, *wired_or*, or *three_state*.

TRANS-6 (information) Assuming multiple-driver net '%s' is a %s.

DESCRIPTION

The wired-logic type of the named net could not be determined. This usually occurs if the net's drivers are unmapped cells or black-boxes. It may also occur if the wired-logic types of the drivers conflict. In these cases, Design Compiler assumes that the net is a wired-AND.

WHAT NEXT

If this is not the desired behavior, you should check the drivers of the net and make sure that they are correctly modeled to drive the desired wired-logic type.

TRANS-7 (warning) Net '%s' is not a legal wired_logic net.
However, it
will not be replaced because this is an in-place optimization.

DESCRIPTION

The named net was considered an illegal wired-logic net. Some of the reasons this may occur are: (1) if there is a wired-connection-class conflict on the net, or (2) if the number of emitters on the net exceeds max_wired_emitters, or (3) if any of the wired-logic drivers are not allowed to drive wired-logic. During a full or incremental compile, ECL Compiler would normally replace this illegal wired-logic net with the appropriate functionality. However, in this case, an in-place optimization has been requested, and, therefore, ECL Compiler can not change nets in that way. Instead, the net will be preserved in its illegal state. In-place optimization may sometimes correct wired-logic nets, but that can not always be guaranteed.

WHAT NEXT

Run the 'check_design' command for more information about the illegal net. In some cases, this warning message may be due to incorrect modeling of wired-logic in the technology library.

TRANS-8 (warning) Combinational cell '%s' (%s) cannot be translated exactly into '%s'.

DESCRIPTION

The named combinational cell could not be translated into the type of cell specified with *set_combinational_type* command. This warning happens most often when the exact specified replacement does not match the function of the original cell.

WHAT NEXT

If you do not require an exact replacement, consider this message informational and ignore it; the cell will be translated, but not into the exact specified cell.

If you want the cell to be translated into the exact replacement, check the modeling of the replacement cell in the target_library to make sure it is correctly modeled. If

this is the case, fix the functional modeling of this cell in the target_library.

TRANS-9 (warning) Cell '%s' (%s) cannot be exactly translated 1 for 1 into target library. Ignoring set_compile_directives.

DESCRIPTION

The named cell could not be translated 1 for 1 into a corresponding cell in the target library. Therefore, the cell will be translated and the directives specified with **set_compile_directives** command will be ignored.

WHAT NEXT

set_size_only or **set_compile_directives** must not be applied on this cell.

TRANS-10 (warning) Cell '%s' (%s) has use_for_size_only attribute and cannot be translated 1 for 1 into target library .

DESCRIPTION

The named cell could not be translated 1 for 1 into a corresponding cell in the target library. Therefore, the cell will not be translated.

WHAT NEXT

This cell has to be translated manually.

TRANS-11 (warning) Target library contains no replacement for isolation cell '%s' (%s); it was not translated.

DESCRIPTION

The named isolation cell could not be translated into the target_library during the translate or compile commands. This error can happen when the cell is specified with a **dont_touch** attribute, or when no suitable replacement exists in the target_library. If voltages on the input and output of the isolation cell are the same, then a suitable replacement is a cell from the target_library with the same functionality as the named cell, which carries the **is_isolation_cell** attribute. If input and output voltages differ, a suitable replacement cell is one from the target_library with the same functionality, with the **is_level_shifter** and

`is_isolation_cell` attributes, and input and output voltages that match the voltages on the cell being translated, .

WHAT NEXT

If the cell was not translated because of a `dont_touch` attribute, remove that attribute and translate again.

If the library cell has the `dont_use` attribute in the target_library, then you can consider removing that attribute from the library cell and translating again.

If the cell was not translated because no replacement exists in the target_library, then verify that the operating conditions on the cell are set correctly. If operating conditions are set correctly, but no matching cell exists in target_library, then replace the cell with one whose functionality and operating conditions are available in the library.

TRANS-12 (warning) Target library contains no replacement for level shifter cell '%s' (%s); it was not translated.

DESCRIPTION

The named level shifter cell could not be translated into the target_library during the translate or compile commands. This error can happen when the cell is specified with a `dont_touch` attribute, or when no suitable replacement exists in the target_library. A suitable replacement is a cell from the target_library with the same functionality as the current cell; with the `is_level_shifter` and `is_isolation_cell` attributes; and input and output voltages that match the voltages on the cell being translated.

WHAT NEXT

If the cell was not translated because of a `dont_touch` attribute, remove that attribute and translate again.

If the library cell has the `dont_use` attribute in the target_library, then consider removing that attribute from the library cell and translating again.

If the cell was not translated because no replacement exists in the target_library, then verify that the operating conditions on the cell are set correctly. If operating conditions are set correctly, but no matching cell exists in target_library, then replace the cell with one whose functionality and operating conditions are available in the library.

TRANS-99 (error) Cell '%s' cannot be used in the relative placement group because it cannot be exactly translated 1 for 1

into the target library.

DESCRIPTION

This error message occurs when the named cell cannot be translated 1 for 1 into a corresponding cell in the target library. Therefore, the cell cannot be used in the relative placement group.

WHAT NEXT

Remove the cell from the relative placement group and run the command again.

TRANS-100 (information) Translate terminated abnormally.

DESCRIPTION

This message indicates that the **translate** command terminated and did not write the intermediate design back to the database. Since the design was not written back to the database, the original design remains unchanged. The reason for the abnormal termination should have appeared in an error message prior to this message. Some of the reasons include: licensing problems, problems loading the technology library(ies), the target library failed to meet minimum requirements, a user interrupt, or problems loading the design.

WHAT NEXT

Look for the error message immediately prior to this one for an indication of the source of the problem.

TRC

TRC-301 (warning) Direction given for Supply but ignored.

DESCRIPTION

This warning is generated when the user specifies the direction for signal of Supply type. The direction information is ignored.

WHAT NEXT

Remove the direction field if the signal is of type Supply.

TRC-302 (warning) Clock setting invalid in TRC block.

DESCRIPTION

This warning is generated when user specifies invalid signal type for a clock, e.g. Out or both In and Out. The setting will be ignored and type will set as ClockIn.

WHAT NEXT

Remove the incorrect setting for Clock TRC block.

TRC-303 (warning) Invalid Supply definition in TRC block.

DESCRIPTION

This warning is generated when the Supply is defined together with other Signal types in TRC block. The definition was ignored. Supply should be defined seperately.

WHAT NEXT

Define the supply seperately.

UCN

UCN-1 (warning) In the design %s, net '%s' is connecting multiple ports.

DESCRIPTION

This warning message indicates that the specified net is connecting to multiple ports. The net name is changed to a simpler name, which only contain alpha-numeric and underscore.

WHAT NEXT

Check your design and make the appropriate changes to avoid this warning.

SEE ALSO

`change_names (2)`.

UCN-2 (Info) Please make sure that you have run the 'change_names' command on your design before saving files to disk.

DESCRIPTION

To ensure a smooth translation of data between tools in your flow, it is suggested that 'change_names' is ran prior to writing out any formatted file to disk. By applying 'change_names' to your design, you can make certain that the design DB netlist description matches the file description in other file formats, for example Verilog, VHDL, or EDIF. So, your steps would be :- compile or optimize your design run change_names write out your design DB write out your Verilog/VHDL/PDEF, etc.

If your flow is Verilog based, use `change_names -rules verilog -hierarchy`

If your flow is VHDL based, use `change_names -rules vhdl -hierarchy`

WHAT NEXT

Please reload the design DB and run `change_names` with the appropriate rule

SEE ALSO

`change_names (2)`.

UCN-3 (Warning) The specified replacement character (%c) is conflicting with the specified set of allow characters.

DESCRIPTION

The replacement character either using the default value (x) or user specified is not a part of the allow character set for the object.

WHAT NEXT

Re-specify the replacement character that is within range of the allow characters by using `define_name_rules -replacement_char`.

SEE ALSO

`change_names (2)`. `define_name_rules (2)`.

UCN-4 (Warning) The specified replacement character (%c) is conflicting with the specified allowed or restricted character.

DESCRIPTION

The replacement character either using the default value (_) or user specified is not part of the allowed character set or is a part of the restricted character set. For some designs this might not be an issue. However, it is best to have the replacement character to be part of the allow character set and not the same as either first or last restricted character. NOTE: Verilog naming rule does not allow '_' to be the leading character, this warning will be issued if `change_names -rule verilog` is used.

WHAT NEXT

Re-specify the replacement character that is within range of the allow characters by using `define_name_rules -replacement_char`.

SEE ALSO

`change_names (2)`. `define_name_rules (2)`.

UCN-5 (warning) There are two different dummy net naming conventions defined in name rule '%s'. '%s' defined in option "-add_dummy_nets_in_verilog_out" or "-add_dummy_nets_in_vhdl_out" will take precedence over '%s' defined in option "-dummy_net_prefix".

DESCRIPTION

There is a conflict in the dummy net naming convention created by two options in the define_name_rules command. The naming format defined in "-add_dummy_nets_in_verilog_out" or "-add_dummy_nets_in_vhdl_out" option will take precedence over the format defined in "-dummy_net_prefix" option.

WHAT NEXT

Use report_name_rules command to determine which name format you want. Then use the define_name_rules command to set the dummy net naming format with the "-add_dummy_nets_in_verilog_out" or "-add_dummy_nets_in_vhdl_out" option instead of the "-dummy_net_prefix" option.

SEE ALSO

`define_name_rules (2).` `report_name_rules (2).`

UCN-6 (warning) Running change_names without the "-hierarchy" option turned on may result in bad logic.

DESCRIPTION

Change_names will create bad logic in hierarchical designs if the "-hierarchy" switch is not used. Without using the "-hierarchy" switch, name changes cannot propagate to lower levels of hierarchy.

WHAT NEXT

Rerun change_names with the "-hierarchy" switch on.

SEE ALSO

UCN-7 (Info) Options "-add_dummy_nets_in_verilog" and "-

`add_dummy_nets_in_vhdl`" have been deprecated in `define_name_rules`. Please use "`-add_dummy_nets`" in the future.

DESCRIPTION

Since options "`-add_dummy_nets_in_verilog`" and "`-add_dummy_nets_in_vhdl`" both create dummy nets to all unconnected pins, they have been combined to one option named "`-add_dummy_nets`". They have also been combined in the `report_name_rules` command.

WHAT NEXT

Use option "`-add_dummy_nets`" in future scripts/runs.

SEE ALSO

`report_name_rules` (2).

UCN-8 (warning) The first restricted character list conflicts with the name prefix(%s). The name prefix will still be used in change names.

DESCRIPTION

The first character of the name prefix is one of the characters of the first restricted characters list. The conflict will be ignored and the prefix will be used.

WHAT NEXT

Resolve the problem by changing the prefix or the first restricted characters list.

SEE ALSO

`define_name_rules`(2).

UCN-9 (error) Command options of `change_names -instance`

are wrong.

DESCRIPTION

This error message occurs when `change_names -instance` command options are wrong.

WHAT NEXT

Correct the command options and re-issue it.

SEE ALSO

`change_names` (2).

UCN-10 (error) New name '%s' for `change_names -instance` is not legal.

DESCRIPTION

This error message occurs when new name specified with `-new_name` option is not legal.

WHAT NEXT

Specify a legal new name and re-issue the command.

SEE ALSO

`change_names` (2).

UCN-11 (error) New name '%s' already exists as instance, port or net name in the design.

DESCRIPTION

This error message occurs when new name specified with `-new_name` option already exists as instance name or port name.

WHAT NEXT

Specify a legal new name and re-issue the command.

SEE ALSO

`change_names (2)`.

UCN-15 (Error) Name too long (>%d bytes) in name_file %s.

DESCRIPTION

This error message occurs when the name in the name_file is too long and over the allowed range.

WHAT NEXT

Re-specify the name that is within range of the allow name in name_file. The allowed name length is 0~2047.

SEE ALSO

UCN-16 (Error) Invalid type "%s

DESCRIPTION

This error message occurs when the type is invalid.

WHAT NEXT

Re-specify the type in name_file that must be port, cell, or net .

SEE ALSO

`change_names (2)`.

UCN-17 (Error) Can not specify both -allowed and -restricted

options. The rule is not created.

DESCRIPTION

This error message occurs when both -allowed and -restricted options are specified.

WHAT NEXT

Re-define the name rule by using `define_name_rules -allowed` or `define_name_rules -restricted`.

SEE ALSO

`change_names (2)`. `define_name_rules (2)`.

UCN-18 (Error) -type %s is not supported. Please specify it to be port, cell or net.

DESCRIPTION

This error message occurs when the specified rule type is not port or cell or net, we don't support this type.

WHAT NEXT

Re-specify the rule type "-type", that must be port, cell or net.

SEE ALSO

`change_names (2)`. `define_name_rules (2)`.

UCN-19 (Error) dummy_net_prefix is invalid in format.

DESCRIPTION

This error message occurs when the format of the specified dummy_net_prefix is invalid.

WHAT NEXT

Re-specify dummy_net_prefix in correct format.

SEE ALSO

`change_names (2)`. `define_name_rules (2)`.

UCN-20 (Warning) Net '%s' is connected to more than one port.
Equal ports and nets rule cannot be satisfied.

DESCRIPTION

If a net is connected to more than one port, the rule `-equal_ports_nets` cannot be satisfied. The net's name is not changed.

WHAT NEXT

SEE ALSO

`change_names (2)`. `define_name_rules (3)`.

UI

UI-1 (error) Variable '%s' is undefined.

DESCRIPTION

The command referred to a variable that is not defined.

WHAT NEXT

Recheck the name of the variable you referred to. Use the **list** command to list the variables that are currently defined.

UI-2 (error) No manual entry for '%s'.

DESCRIPTION

WHAT NEXT

UI-3 (error) Number of commands to display must be an integer.

DESCRIPTION

WHAT NEXT

UI-4 (error) Invalid alias list.

DESCRIPTION

WHAT NEXT

UI-5 (warning) Alias '%s' is not defined.

DESCRIPTION

WHAT NEXT

UI-6 (error) Variable group '%s' is undefined.

DESCRIPTION

WHAT NEXT

UI-7 (error) Could not change directory to '%s'.

DESCRIPTION

WHAT NEXT

UI-8 (error) Cannot issue the 'ls' command.

DESCRIPTION

WHAT NEXT

UI-9 (error) Cannot issue the '%s' command.

DESCRIPTION

WHAT NEXT

UI-10 (error) '%s' not a valid type.

DESCRIPTION

WHAT NEXT

UI-11 (error) Line %d: argument '%s' of command '%s' is the

wrong type.

DESCRIPTION

WHAT NEXT

UI-12 (error) Synopsys software was incorrectly installed.

DESCRIPTION

WHAT NEXT

UI-13 (warning) The variable '%s' must be defined before

Design Compiler can be run.

DESCRIPTION

WHAT NEXT

UI-14 (error) Argument '%s' of command '%s' is the wrong type.

DESCRIPTION

WHAT NEXT

UI-15 (error) '%s' is expecting a %s, not a %s.

DESCRIPTION

WHAT NEXT

UI-16 (error) Line %d: missing arguments to command '%s'.

DESCRIPTION

WHAT NEXT

UI-17 (error) Missing arguments to command '%s'.

DESCRIPTION

WHAT NEXT

UI-18 (warning) Expecting '%s'.

DESCRIPTION

WHAT NEXT

UI-19 (error) The name of a file to include was not specified.

DESCRIPTION

WHAT NEXT

UI-20 (error) Include file '%s' could not be opened.

DESCRIPTION

WHAT NEXT

UI-21 (error) Execution of include file '%s' was terminated because an error was generated.

DESCRIPTION

The **include** file was not 100% executed, because of an error generated by one of the commands contained in the file. The execution was terminated at the offending command.

WHAT NEXT

Examine the **include** file to determine why the command failed. Edit the **include** file to correct any errors, and re-execute **include**.

UI-22 (error) Log file '%s' could not be opened.

DESCRIPTION

WHAT NEXT

UI-23 (error) Log file '%s' was not completely written due to an error.

DESCRIPTION

WHAT NEXT

UI-24 (error) Aliases may contain only letters, digits or underscores.

DESCRIPTION

WHAT NEXT

UI-25 (error) The 'alias' and 'unalias' commands may not be

aliased.

DESCRIPTION

WHAT NEXT

UI-26 (error) Log file '%s' can't be included.

DESCRIPTION

WHAT NEXT

UI-27 (error) You need write permissions on the current or home

directory to read an HDL file.

DESCRIPTION

WHAT NEXT

UI-30 (error) Unrecognized feature name '%s'.

DESCRIPTION

WHAT NEXT

UI-31 (information) You already have a '%s' license.

DESCRIPTION

WHAT NEXT

UI-32 (error) You don't have a '%s' license to remove.

DESCRIPTION

WHAT NEXT

UI-33 (error) List function '-%s' is not available.

DESCRIPTION

WHAT NEXT

UI-34 (error) Invalid feature list.

DESCRIPTION

A parameter to the **license_users** command is not a valid Synopsys licensed feature.

WHAT NEXT

Refer to the Synopsys Installation Reference Manual for a list of features supported by the current release, or determine from the key file all the licensed features at your site.

1

UI-35 (error) Bad value '%s' specified for compatibility_version.

DESCRIPTION

WHAT NEXT

UI-36 (information) Acceptable values must look like 'v1.3',
'v2.0' (up to 'v3.5'),
or '1997.01'...

DESCRIPTION

WHAT NEXT

UI-37 (error) Value '%s' is greater than the current

`product_version`.

DESCRIPTION

WHAT NEXT

UI-38 (information) Value must be less than or equal to '`%s`'.

DESCRIPTION

WHAT NEXT

UI-39 (error) Variable '`%s`' cannot be set; it is read-only.

DESCRIPTION

You attempted to set a read-only product variable. It automatically changes itself back. Variables like the date, the product version, and the synopsys root directory cannot be reset from a command line.

WHAT NEXT

Check this parameter in your environment before restarting the tool.

UI-40 (error) Cannot read include file '%s'; it's a directory.

DESCRIPTION

WHAT NEXT

UI-41 (error) Previous error has stopped execution of %s.

DESCRIPTION

WHAT NEXT

UI-42 (error) Can't find the %s '%s' in memory.

DESCRIPTION

WHAT NEXT

UI-43 (error) No %s were specified to be deleted.

DESCRIPTION

WHAT NEXT

UI-44 (error) You can't specify both a %s list and -all.

DESCRIPTION

WHAT NEXT

UI-45 (error) No %s were specified to be reported on.

DESCRIPTION

WHAT NEXT

UI-46 (error) Can't remove system variable '%s'.

DESCRIPTION

WHAT NEXT

UI-47 (error) Value required for the '<variable_name>'

argument.

DESCRIPTION

WHAT NEXT

UI-48 (error) Unexpected arguments.

DESCRIPTION

WHAT NEXT

UI-49 (error) Bad variable name specified.

DESCRIPTION

WHAT NEXT

UI-50 (error) The '%s' command may not be aliased.

DESCRIPTION

WHAT NEXT

UI-51 (error) License '%s' is required by design '%s'.
You must remove the design before you can remove the license.

DESCRIPTION

WHAT NEXT

UI-52 (error) Design '%s' is a limited design and cannot be

written out.

DESCRIPTION

DESCRIPTION

A design can be limited for either of two reasons: (1) The design is fully licensed, but it has not yet been mapped. (2) The only licence that could be checked out for the design was a limited license. A limited design can not be written out to disk.

WHAT NEXT

If the design is simply not mapped, then compiling the design will allow you write it to disk. If the design is limited because of licenses, then the only way to get access to the design is to check out a license that gives full access.

UI-53 (error) Design '%s' has not been mapped yet and you can only write it out in db format.

DESCRIPTION

WHAT NEXT

UI-56 (warning) Illegal setting '%s' for the 'hdl_preferred_license' variable.

DESCRIPTION

Legal values are "VHDL" or "verilog".

WHAT NEXT

UI-57 (warning) The preferred license '%s' is already checked

out, it will try to get other equivalent sets of licenses.

DESCRIPTION

The possible values for BC preferred licenses are "bc_verilog", "bc_vhdl" , "bc_fpga_vhdl" or "bc_fpga_hdl".

WHAT NEXT

UI-58 (information) Created bus '%s':
Start index '%d' is connected to '%s'.
End index '%d' is connected to '%s'.

DESCRIPTION

WHAT NEXT

UI-60 (error) '%s' is an invalid value for the list variable '%s'. The variable value has not been changed.

DESCRIPTION

WHAT NEXT

UI-61 (error) Cannot create temporary files in current working directory '%s'.

DESCRIPTION

This error message informs you that you do not have permission to create the required temporary files in the current working directory.

WHAT NEXT

Change your current working directory to a directory in which you have the necessary permissions, or change the permissions of the current working directory. To

determine which permission is missing, see UI-62.n.

SEE ALSO

UI-62(n)

UI-62 (information) You do not have %s permission on this directory.

DESCRIPTION

This message indicates the type of permission (read, write, or execute) that you do not have on the current working directory. This man page accompanies other error messages.

WHAT NEXT

You can use this message to determine the type of permission missing on the directory, and change the permissions accordingly.

SEE ALSO

UI-61(n)

UI-63 (error) Invalid value '%s' for variable '%s'. Setting the variable to its default value, '%s'.

DESCRIPTION

You receive this message if you attempt to set an environment variable with a value that is not a valid value for that variable. Valid values are listed in each variable's manual page, or in the group manual page for all variables in a particular group. This message informs you that the specified variable is currently being set to its default value.

WHAT NEXT

If it is acceptable to you that the specified variable is set to its default value, no action is required on your part. Otherwise, refer to the variable's manual page, choose a valid value, and set the variable accordingly.

SEE ALSO

`compile_variables (3)`.

UI-64 (information) Replacing old license key '%s' with new license key '%s'.

DESCRIPTION

You receive this message if you attempt to check out an old license key that has been replaced by the new license key. This message informs you that the new license key is being checked out instead of the old one.

WHAT NEXT

This is an informational message only. No action is required on your part.

UI-65 (warning) File %s is not readable and/or not writable and cannot be appended to. Creating new file %s.

DESCRIPTION

This warning message occurs when you are running the `set_svf` command and you attempt to append to a file that is not readable, not writable, or both.

WHAT NEXT

This is a warning message only. No action is required on your part. A new file is created in which to record changes.

However, you can avoid this warning message in the future by verifying that the file you want to append to has the correct read and write permissions before you use the `-append` option.

SEE ALSO

`set_svf(2)`

UI-66 (warning) File %s does not exist and so cannot be

appended to. Creating new file %s.

DESCRIPTION

This warning message occurs when you are running the **set_svf** command and you attempt to append to a file that does not exist.

WHAT NEXT

This is a warning message only. No action is required on your part. A new file is automatically created.

However, you can avoid this warning message in the future by making sure a file exists before using the **-append** option.

SEE ALSO

[set_svf\(2\)](#)

UI-67 (error) License %s is required by XG mode. You must end XG mode to remove the license.

DESCRIPTION

This error message occurs if you attempt to remove the license feature that is needed to enable XG mode operation.

WHAT NEXT

Quit XG mode or exit the product to make one token of this license feature available again.

UI-68 (error) -compress accepts only gzip for db output format.

DESCRIPTION

You receive this message if the output format is db and you specified a compression format other than gzip. Only gzip compression is supported for db files.

WHAT NEXT

Specify gzip for the compression format.

UI-69 (warning) The -compress option can only be used with the .ddc format.

DESCRIPTION

This warning message occurs when the **write** command is used with the **-compress** option for formats other than .ddc. The **write** command completes normally, but compression is not performed.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, and the file format is not .ddc, rerun the command without the **-compress** option.

SEE ALSO

`write(2)`

UI-70 (warning) Compression is turned on by default.

DESCRIPTION

You receive this message if you have already set `write_compressed_db_files` to true.

WHAT NEXT

Setting this variable makes all db files to be written out compressed. Use this only if you want db files in all subsequent write commands to be compressed. If you want compressed db in only one particular write command, then unset this variable and use **-compress** switch of `write`.

UI-71 (error) No permission to write into this %s directory

DESCRIPTION

This error message occurs when there is no read or write permission on this directory.

WHAT NEXT

Change the read and write permissions on the specified directory to allow new files and directories to be created inside the directory.

SEE ALSO

`set_svf(2)`

UI-72 (Error) Failed to create a directory %s to store multipliers' netlists.

DESCRIPTION

This error message occurs when the tool cannot create a subdirectory in the specified directory to store multipliers' netlists, possibly due to limitations of the UNIX system.

WHAT NEXT

Check the permissions on the file system and also check the limitations of the UNIX system.

SEE ALSO

`set_svf(2)`

UI-73 (error) Failed to write an architectures' db at %s.

DESCRIPTION

The Synopsys verification file (SVF) failed to write out the multipliers' DB due to an internal error.

WHAT NEXT

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

SEE ALSO

`set_svf(2)`

UI-74 (Warning) Cannot use command line editor for terminal type '%s'.

DESCRIPTION

Command line editor has failed to initialize for terminal type '%s'. This can occur when terminfo database could not be found or the database does not have entry for terminal type '%s'. If this message is printed then advanced shell editing capabilities can not be used.

WHAT NEXT

Please see Design Compiler Command Line Interface Guide for more details.

UI-75 (Error) Command line length can not be more than %d characters.

DESCRIPTION

You see this message when you have typed in a long command line.

WHAT NEXT

When you enter long command with many options and arguments, you can split it across more than one line using the backslash (\) continue character.

UI-82 (error) -compress accepts only gzip or none for ddc output format.

DESCRIPTION

You receive this message when the output format is ddc and you have specified a compression format other than gzip or none. Compression is enabled by default for ddc files, so gzip normally has no effect. You may use "none" as the compression format to disable ddc compression.

WHAT NEXT

Specify gzip or none for the compression format.

UI-83 (Warning) Ignoring the cell_list parameter due to the presence of the '%s' switch.

DESCRIPTION

The switch to reset loop breaking does not need an argument.

WHAT NEXT

Consider whether the parameter was meant to be included. If the intent was to reattach a single arc, consider using remove_timing_disable. If the intent was to reset all loop breaking arcs, then the parameter is not necessary.

SEE ALSO

UI-84 (Error) The cell list is required.

DESCRIPTION

The cell list is a required parameter to the %s command, except when using the %s switch.

WHAT NEXT

SEE ALSO

UI-87 (error) ICC cannot use or check-out non Galaxy-key (legacy) license key '%s'.

DESCRIPTION

You receive this message if you attempt to check out a non Galaxy-key / legacy license key in ICC shell. ICC shell only use Galaxy-keys.

WHAT NEXT

Please consult admin or Synopsys for Galaxy-keys.

UI-88 (error) The tool is not authorized to check out the '%s' license key.

DESCRIPTION

This error occurs because the tool attempted to check out a certain license key or functionality that the tool prohibits, so the command failed. If you must run that particular functionality, please run it under the normal shell mode.

WHAT NEXT

Consider running the tool in full-mode.

UI-89 (error) ICC psyn-mode is not authorized to check out '%s' license key.

DESCRIPTION

You receive this message if you attempt to check out certain license key / functionality which is prohibited in ICC psyn. This message informs you that the command failed. If you need to run that particular functionality, please run them under normal ICC shell.

WHAT NEXT

Consider running ICC full-mode.

UI-90 (error) ICC dp-mode is not authorized to check out '%s' license key.

DESCRIPTION

You receive this message if you attempt to check out certain license key / functionality which is prohibited in ICC dp-shell. This message informs you that the command failed. If you need to run that particular functionality, please run them under normal ICC shell.

WHAT NEXT

Consider running ICC full-mode.

UI-91 (warning) No SVF file is currently open. Therefore, Formality recording cannot be turned off.

DESCRIPTION

This warning message occurs when you are running the **set_svf -off** command with an attempt to turn off Formality recording without a SVF file being currently active.

WHAT NEXT

Please check you indeed have a SVF file active prior to turning off recording. You can avoid this warning message in the future by making sure a file exists and is active for recording before using the **-off** option.

SEE ALSO

`set_svf(2)`

UI-92 (error) Command is not allowed in checkpointed design

DESCRIPTION

This error message occurs when you try to run commands that are not allowed on a checkpointed design. A checkpointed design is a snapshot of a design during optimization, and reoptimization on the snapshot is not allowed. Only analysis commands and non-optimization commands are allowed.

WHAT NEXT

Run only analysis or non-optimization commands

SEE ALSO

`set_checkpoint_strategy(2)`

UI-100 (Error) No net on pin %s.

DESCRIPTION

This error occurs because the pin specified is not connected to any net. It maybe a floating pin.

WHAT NEXT

Please check the pin list specified and the pin connections.

UI-101 (Error) Did not find any %s.

DESCRIPTION

This error message occurs when the above mentioned objects are not found.

WHAT NEXT

Please check object list specified.

UI-102 (Error) Missing or bad '%s' option.

DESCRIPTION

This error message occurs when the mentioned option is not provided or the specified argument is not in the required form.

WHAT NEXT

Please check the argument given for the option and also check the command man-page for further details about the option.

UI-103 (Error) Could not get name of %s.

DESCRIPTION

This error message occurs when the full name of the mentioned object is not found.

WHAT NEXT

Please check the object given in the command and also refer the command man-page.

UI-200 (Error) On Demand CCS library loading failed for %s: %s.

Falling back to standard mode.

DESCRIPTION

The application tried to load a db library which had CCS data and it failed to complete when making use of on demand loading of timing data. On demand loading of CCS libraries is enabled by setting of the variable **timing_ccs_load_on_demand** to TRUE.

The message will give a reason for the failure, which can be categorized as either a data error or file system error. A data error should be rare and indicates a corrupt or incompatible library. Since CCS library demand loading uses a temporary directory, a file system error will typically be due to insufficient space on the disk or permission problems.

WHAT NEXT

If library loading fails at this time, the library is still available, however, the on demand loading ability will be disabled for this library. This causes the entire CCS library to loaded at once, which can have an impact on memory usage. For a data error, you should contact the provider of the library to verify that the CCS data is specified correctly. For a file system error, check your TMPDIR environment variable and make sure you have write access to the temporary directory. Also ensure that there is sufficient space on that disk.

SEE ALSO

[timing_ccs_load_on_demand\(3\)](#)

UIAT

UIAT-1 (error) Cannot specify %s for '%s' type.

DESCRIPTION

While defining a new user attribute, you specified (a) either or both of the options that define a range, but did not specify a data type that supports ranges, or (b) an option limiting a string type to a set of values without using a string data type.

WHAT NEXT

Ranges only work with integer and double data types. Limiting an attribute to a set of strings only works with the string data type.

UIAT-2 (error) Min of range (%s) cannot be greater than max (%s).

DESCRIPTION

While defining a new user attribute, you specified a numeric range, and the minimum value was greater than the maximum value.

WHAT NEXT

Complete ranges require that the max value is greater than min.

UIAT-4 (warning) Attribute '%s' is already defined in class '%s'

DESCRIPTION

While defining a new user attribute, you specified an attribute name that is already defined. There is no mechanism to change an attribute definition.

WHAT NEXT

UIAT-5 (warning) Cannot get attribute for more than one object.

DESCRIPTION

While getting the value of an attribute, you specified more than one object. You can only get the attribute for a single object.

WHAT NEXT

Specify a single object.

UIAT-7 (warning) Cannot import user attributes for %ss.

DESCRIPTION

While defining a new user attribute, you specified that the attribute should be imported from db files. However, the class of objects for which you are defining the attribute does not allow attributes to be imported.

WHAT NEXT

UIAT-8 (warning) Attribute '%s' is already defined as %s for another class.

DESCRIPTION

While defining a new user attribute, you specified an attribute name which is in use for another object class, but the data type which you specified was not the same as for the other object class. An attribute must have the same data type for all object classes for which it is defined.

WHAT NEXT

Determine which is the correct data type, and re-define the attribute for each affected class.

UIBS

UIBS-1 (error) No valid objects specified.

DESCRIPTION

WHAT NEXT

UIBS-2 (error) Objects must be either all ports or all nets.

DESCRIPTION

WHAT NEXT

UIBS-3 (error) Only ports of the same direction can be grouped.

DESCRIPTION

WHAT NEXT

UIBS-4 (error) Only port or net objects can be grouped.

DESCRIPTION

WHAT NEXT

UIBS-5 (error) Bus name '%s' conflicts with existing names.

DESCRIPTION

WHAT NEXT

UIBS-6 (error) All objects must be from the same design.

DESCRIPTION

WHAT NEXT

UIBS-7 (error) Type name '%s' conflicts with existing type.

DESCRIPTION

WHAT NEXT

UIBS-8 (error) No valid busses specified.

DESCRIPTION

WHAT NEXT

UIBS-9 (error) '%s' isn't a bus.

DESCRIPTION

WHAT NEXT

UIBS-10 (error) At least one of the %s objects specified is already a member of a bus.

DESCRIPTION

WHAT NEXT

UIBS-11 (error) Cannot use sort and no_sort options in the

same command.

DESCRIPTION

The `-no_sort` option creates a multibit component with the cells in the same order as specified in the command. The `-sort` option sorts them in a lexicographically increasing order. Using both the `-sort` and `-no_sort` options simultaneously is not allowed.

WHAT NEXT

Please reissue the commands using either `-sort` or `-no_sort`.

UIBS-12 (error) Cell '%s' already belongs to a multibit component.

DESCRIPTION

A cell can belong to only one multibit component. This error gets issued when an attempt is made to insert a cell that already is a member of a multibit component into a multibit component.

WHAT NEXT

Please reissue the command without the cell specified in the error message. Alternatively, you can use `remove_multibit` to remove the cell from its current multibit component then reissue this command.

UIBS-13 (error) Multibit component '%s' already exists.

DESCRIPTION

Two multibit components in the same design are not allowed to have the same name. This prevents the tool from uniquely determining a multibit component from the name.

WHAT NEXT

Please reissue the command with a different name in the `-name` option.

UIBS-14 (warning) Set of cells specified have differing

functionality.

DESCRIPTION

The cells passed as argument to **create_multibit** are checked to verify that all of them have exactly the same functionality. This warning is issued if all cells do not have the same functionality.

A multibit component is created for the cells if none of them is a MUX_OP. If they do not share the same functionality, multibit mapping will not operate on the created component.

The references are compared on the basis of their single-bit functionality. Thus, a single-bit D flip-flop and a eight-bit wide D flop-flop will be not be considered as differing references.

WHAT NEXT

If the multibit component created is the one desired, then you can ignore this command. Otherwise, delete the created multibit component using the **remove_multibit** command, modify the set of cells passed as argument so that every cell has the same functionality, and invoke **create_multibit**.

UIBS-15 (warning) Duplicates in list of cells to create_multibit with no_sort option.

DESCRIPTION

The list of cells given as input has duplicates. The position of a multiply specified cell in the multibit component to be created is ambiguous if the -no_sort option is used with the command. The command uses the position of the first occurrence of every cell in determining the position in the multibit component.

WHAT NEXT

If the position for a cell in the created multibit component is not what was intended, remove the multibit component using **remove_multibit** and create a new one without multiply listed cells.

UIBS-16 (error) The '%s' command was not executed because

design '%s' could not be linked.

DESCRIPTION

The current design has to be linked in order to be able to run the **create_multibit** and **remove_multibit** commands. If the attempt to link the design fails, the command is terminated.

WHAT NEXT

Remove link errors and run the command again.

UIBS-17 (error) specified range is different from number of objects to be bussed.

DESCRIPTION

WHAT NEXT

UIBS-18 (error) At least one of the objects specified is already a member of a bus or there is conflict between the members.

DESCRIPTION

This error message is displayed if an attempt is made to insert an object that belongs to a bus into a new bus or there is conflict between the members.

WHAT NEXT

Re-issue the command with objects that do not belong to an existing bus or with objects that do not have conflicts.

UIBS-19 (error) Bus name %s conflicts with name of %s object of the design

DESCRIPTION

This error message is displayed if an attempt is made to create a bus whose name is

same as the name of the object of same type in the design.

WHAT NEXT

Re-issue the command with a different name for the bus.

UIC

UIC-1 (error) Cannot execute this command.

DESCRIPTION

No *current_design* has been specified, so the specified command cannot be executed.

WHAT NEXT

Specify a design explicitly or set the *current_design*.

UIC-2 (error) The design '%s' has no clusters.

DESCRIPTION

Attempted to execute a command which requires a design which has had associated with it clusters (via the *read_clusters* command). The design specified has no clusters.

WHAT NEXT

Try again.

UIC-3 (error) The file '%s' cannot be opened for writing.

DESCRIPTION

Attempted to execute the *write_clusters* command, but the file into which the clusters were to be written could not be opened.

WHAT NEXT

Specify a different file name, one which can be opened for writing by the command.

UIC-4 (information) No new cells were written to the file '%s'.

DESCRIPTION

In executing the `write_clusters` command with the `-new_cells_only` option, there were no new cells created by synthesis to report. Therefore, the PDEF file produced by `write_clusters` is an empty shell of clusters with no new instances. Such a file needn't be passed along, as it conveys no useful information to the floor-planning tool.

WHAT NEXT

Nothing needs to be done. This message merely relates that no new cells were introduced during optimization, so there is no new information to pass to the floor-planning tool via PDEF.

UIC-5 (warning) You need a DC-Expert license to compile or create wire loads using clusters.

DESCRIPTION

The `read_clusters` command and the `write_clusters` command are the interface to transfer cluster information to and from Design Compiler. To compile with clusters, you need a DC-Expert license.

WHAT NEXT

To save memory, remove the annotated clusters with `remove_clusters`.

UIC-6 (warning) The leaf cell '%s' cannot be annotated with clusters.

DESCRIPTION

The `update_clusters` command can only update the clusters associated with the `current_design` with clusters from cells which are themselves associated with designs. The cell specified is a leaf cell, and can have no clusters associated with it.

WHAT NEXT

Specify a different cell, one which has previously been characterized and which is

not a leaf cell.

UIC-7 (warning) The clusters associated with cell '%s' are not compatible with those associated with the current_design.

DESCRIPTION

The **update_clusters** command updates the clusters associated with the **current_design** by examining the clusters associated with the cells specified and seeing how they're different. The basic structure of the clusters of each cell must be a subset of the clusters associated with the **current_design**, or else it will not be clear how the clusters should be updated. In this case, a cluster was found on this cell's design which had no matching cluster on the top-level design.

WHAT NEXT

Use the **report_clusters** command to determine why differences exist between the clusters associated with the **current_design** and those associated with the cell specified.

UIC-8 (warning) Writing LOC attribute to a PDEF 1.x file.

DESCRIPTION

LOC attribute is defined only for version 2.0 and later. The current design contains LOC attributes but has PDEFVERSION attribute set to 1.x. This may either cause problems for other application or if other application ignores the LOC attributes in the PDEF file without warning the user, it may result in an unpredictable/inaccurate flow.

WHAT NEXT

The PDEFVERSION attribute on the design is set while reading in a PDEF file. The inconsistency here is mainly due to inconsistency in the original PDEF file (this application must have flagged a warning (PDEFP-22) on reading that file). Make sure that the PDEF writer that generated the file writes out correct PDEFVERSION. If you have a .db file with the PDEF information already annotated in it, you may manually modify the PDEFVERSION attribute to 2.0.

UIC-9 (warning) Can not find the reference design for cell '%s'.

DESCRIPTION

In the db, it is missing design description for this cell.

WHAT NEXT

Do report_referece to check list of references.

UIC-10 (warning) This %s '%s' does not have an assigned location.

DESCRIPTION

This message indicates that the defined object does not have a location assigned to it. After performing the **physopt** command or the **create_placement** command, every cell should have an assigned location. If not, this error message appears.

WHAT NEXT

Be sure you have performed the appropriate command for your design. If the error occurs again, there is a problem with the tool.

SEE ALSO

physopt (2), **create_placement** (2).

UIC-11 (warning) Original PDEF file is read but not used for identifying new cells added during reoptimization.

DESCRIPTION

You receive this message because the **pdefout_diff_original** variable is set to **false**, so the original pdef file is not used for identifying new cells. Instead, new cells added in the last run of the **reoptimize_design** command are written.

WHAT NEXT

See the man page for the **pdefout_diff_original** variable, and determine if you want to set the value of this variable to **true**.

SEE ALSO

`reoptimize_design` (2), `pdefout_diff_original` (3).

UIC-12 (warning) The routes in db have wire extensions which will be ignored.

DESCRIPTION

This message indicates that the internal database has wire extension values on the route segments of nets. The PDEF does not support wire extensions in its syntax. The wire extension values will be ignored by the `write_pdef`.

WHAT NEXT

You may see disconnects in the routes if you use the PDEF thus written out. You may want to consider other flow methodologies if you need the wire extensions to be in the routes.

SEE ALSO

`write_pdef` (2), `write_def` (2).

UID

UID-2 (error) There are no designs to be linked.

DESCRIPTION

WHAT NEXT

UID-3 (warning) Can't read link_library file '%s'.

DESCRIPTION

This warning message will be printed out if the given link library file is protected or doesn't exist. In the absense of the given library file, there will be some unresolved references during linking.

WHAT NEXT

Check the link_library and the search_path variables and set their value accordingly.

UID-4 (error) Current design is not defined.

DESCRIPTION

This error is generated when current design is not defined in the dc_shell.

WHAT NEXT

Use **list_designs** commands to see whether any design in the memory or use **read** command to read a design in. Then invoke **current_design** command to set the desired current design.

UID-5 (error) Current design '%s' has no schematic.

DESCRIPTION

The current design does not have a schematic.

WHAT NEXT

You can create a schematic with the `create_schematic` command. Check the man page by typing `help create_schematic`.

UID-6 (error) Technology library has not been specified.

DESCRIPTION

WHAT NEXT

UID-7 (error) Couldn't read technology library '%s'.

DESCRIPTION

WHAT NEXT

UID-8 (error) Technology library '%s' is not a library.

DESCRIPTION

WHAT NEXT

UID-9 (error) Can't read '%s' files '%s'.

DESCRIPTION

WHAT NEXT

UID-10 (error) Cannot specify output port %s as a path

startpoint.

DESCRIPTION

This error message occurs when the specified output ports are not valid as path startpoints. Output ports cannot be the startpoint for a timing path.

WHAT NEXT

Examine the design to determine the correct startpoint for the path. After correcting the startpoint, run the command again.

UID-11 (error) Cannot specify input port %s as a path endpoint.

DESCRIPTION

This error message occurs when an input port is specified as a path endpoint. Input ports are not valid as timing path endpoints.

WHAT NEXT

Examine the design to determine the correct endpoint for the path. After correcting the endpoint, run the command again.

UID-12 (error) Cannot specify hierarchical cell %s as a path named %s.

DESCRIPTION

This error message occurs because hierarchical cell names are not valid as path startpoints or endpoints.

WHAT NEXT

Use a clock, port, leaf or hierarchical pin, or leaf cell as the path startpoint or endpoint.

UID-13 (error) '%s' doesn't specify a unique design

Please use complete specification: full_file_name:design_name

DESCRIPTION

WHAT NEXT

UID-14 (error) Design '%s' is not in the system.

DESCRIPTION

This error indicates that the current command cannot find the design in the system.

WHAT NEXT

Provide the design in the system or load in a design.

UID-15 (error) '%s' doesn't specify a unique library

Please use complete specification: full_file_name:library_name

DESCRIPTION

WHAT NEXT

UID-16 (warning) No input ports on design '%s'.

DESCRIPTION

WHAT NEXT

UID-17 (warning) No output ports on design '%s'.

DESCRIPTION

WHAT NEXT

UID-18 (error) Invalid pin list.

DESCRIPTION

WHAT NEXT

UID-19 (error) '%s' doesn't specify a unique instance

DESCRIPTION

The instance name given matches more than one instance.

WHAT NEXT

Specify a unique name for the instance you want.

UID-20 (error) Write command is not available.

DESCRIPTION

WHAT NEXT

UID-21 (error) Invalid file or design list.

DESCRIPTION

WHAT NEXT

UID-22 (error) No files or designs were specified.

DESCRIPTION

This error message is displayed when no files or design objects have been supplied to the **write** command, or when the specified files or design objects are not in memory.

WHAT NEXT

Re-issue the **write** command, correctly specifying the files or designs to be written.

UID-23 (error) Only designs can be specified with "-hierarchy

File '%s' is ignored.

DESCRIPTION

WHAT NEXT

UID-24 (error) No valid designs or design files were specified.

DESCRIPTION

WHAT NEXT

UID-25 (error) Write command failed.

DESCRIPTION

This error is generated when the **write** command failed. Errors include

- an invalid format (see EXPT-3), - writing to a write permission denied directory.
- (see UID-30)
- no valid designs or design files. (see UID-24)
- other causes during writing.

WHAT NEXT

Identify and correct the cause of the write command failed and reinvoke the **write** command.

UID-26 (warning) Can't find in memory specified design or design file '%s'.

DESCRIPTION

This error is generated when there is no specified design or design file in memory, but invoke the **write** command.

WHAT NEXT

Use **list_designs** commands to see whether given design in the memory or use **read**

command to read a design in. Then invoke **current_design** command to set the desired current design and reinvode **write** command.

UID-27 (error) '%s' doesn't specify a unique design file Please use complete path name to specify this file.

DESCRIPTION

The specified file is present in more than on directories listed in the search path.

WHAT NEXT

One possible solution is to use the complete path name to specify the file. Alternately, the search path can be modified so that only one of the directories in the path has the specified file.

UID-28 (error) Can't write design '%s', to '%s'.

DESCRIPTION

Failed to open or write to the specified file. There can be several reasons for this. The most common reasons are you do not have write permissions in the directory, the disk is full, or you already have a file with the same name that can't be deleted.

WHAT NEXT

Try to create a file with the same name from the C shell. Fix any problem that you might encounter. Make sure that there is sufficient disk space available. Delete the file and invoke the dc_shell command again.

UID-29 (error) Can't write file '%s'.

DESCRIPTION

Failed to open or write to the specified file. There can be several reasons for this. The most common reasons are: the user does not have write permissions in the directory, the disk is full or the user already has a file with the same name which can't be deleted.

WHAT NEXT

Try to create a file with the same name from the C shell. Fix any problem that you might encounter. Make sure that there is sufficient disk space available. Delete the file and invoke the dc_shell command again.

UID-30 (error) Couldn't write specified designs to '%s'.

DESCRIPTION

Failed to open or write to the specified file. There can be several reasons for this. The most common reasons are: the user does not have write permissions in the directory, the disk is full or the user already has a file with the same name which can't be deleted.

WHAT NEXT

Try to create a file with the same name from the C shell. Fix any problem that you might encounter. Make sure that there is sufficient disk space available. Delete the file and invoke the dc_shell command again.

UID-31 (error) Multiple designs per file are not permitted by '%s' format.

DESCRIPTION

WHAT NEXT

UID-32 (error) Format '%s' is not a valid write format.

DESCRIPTION

This error is generated when **write** command encounters an invalid write format.

WHAT NEXT

Invoke **write -help** command for valid write formats. Identify and correct format, then reinvoke the **write** command.

UID-33 (error) LSI Netlist format is not enabled.

DESCRIPTION

The LSI Netlist format is not enabled.

WHAT NEXT

The LSI Netlist format is not enabled. Check your permissions.

UID-34 (error) TDL Netlist format is not enabled.

DESCRIPTION

The TDL Netlist format is not enabled.

WHAT NEXT

The TDL Netlist format is not enabled. Check your permissions.

UID-35 (warning) Option -add when timing_enable_multiple_clocks_per_reg is not set to true, creates the clock but analysis is not done with multiple clocks

DESCRIPTION

WHAT NEXT

Set variable timing_enable_multiple_clocks_per_reg to be true

UID-36 (error) Verilog netlist format is not enabled.

DESCRIPTION

The Verilog netlist format is not enabled.

WHAT NEXT

The Verilog netlist format is not enabled. Check your permissions.

UID-37 (error) Mentor format is not enabled.

DESCRIPTION

The Mentor format is not enabled.

WHAT NEXT

The Mentor format is not enabled. Check your permissions.

UID-38 (error) EDIF format is not enabled.

DESCRIPTION

The EDIF format is not enabled.

WHAT NEXT

The EDIF format is not enabled. Check your permissions.

UID-39 (error) Design '%s' isn't mapped.

DESCRIPTION

You are trying to write the current design to other format other than synopsys db format, but the design isn't mapped.

WHAT NEXT

Invoke compile -map_effort for mapping the current design, then reinvoke write command.

UID-40 (error) Wire load '%s' not found.

DESCRIPTION

WHAT NEXT

UID-41 (error) No files are specified.

DESCRIPTION

WHAT NEXT

UID-42 (error) Invalid file list.

DESCRIPTION

WHAT NEXT

UID-43 (warning) File '%s' was not found in the search_path.

DESCRIPTION

WHAT NEXT

UID-44 (error) Either -all or cell_list must be specified.

DESCRIPTION

WHAT NEXT

UID-45 (error) Invalid cell list.

DESCRIPTION

WHAT NEXT

UID-46 (error) No valid cells are specified for ungrouping.

DESCRIPTION

The ungroup command was called without any valid cells being specified for ungrouping.

WHAT NEXT

Call the ungroup command with a set of valid cells.

UID-47 (warning) Can't %s unmapped logic cell '%s'.

DESCRIPTION

Only hierarchical cells can be ungrouped. The cell mentioned in the error message is not hierarchical and so will be ignored by the ungroup command.

WHAT NEXT

No further action is required, this is merely a warning message.

UID-48 (warning) Can't %s logic one cell '%s'.

DESCRIPTION

Only hierarchical cells can be ungrouped. The cell mentioned in the error message is not hierarchical and so will be ignored by the ungroup command.

WHAT NEXT

No further action is required, this is merely a warning message.

UID-49 (warning) Can't %s logic zero cell '%s'.

DESCRIPTION

Only hierarchical cells can be ungrouped. The cell mentioned in the error message is not hierarchical and so will be ignored by the ungroup command.

WHAT NEXT

No further action is required, this is merely a warning message.

UID-50 (warning) Can't %s cell '%s'; its reference is unresolved.

DESCRIPTION

This error message is generated when you try to invoke a command on a cell that doesn't have a reference.

WHAT NEXT

Use the **link** command, then reinvoke the current command.

UID-51 (warning) Can't %s leaf cell '%s'.

DESCRIPTION

Only hierarchical cells can be ungrouped. The cell mentioned in the error message is not hierarchical and so will be ignored by the ungroup command.

WHAT NEXT

No further action is required, this is merely a warning message.

UID-052 (warning) A non-unate path in clock network for clock '%s'

from pin '%s' is detected.

DESCRIPTION

The clock tree for the specified clock contains non-unate paths. Clock networks normally do not contain cells such as exclusive-OR gates which have non-unate behavior. This implies that both inverting and noninverting clock waveforms reach the specified pin. The sense that is propagated from this pin is non-deterministic.

WHAT NEXT

Since there is ambiguity on which sense to choose to propagate, the tool picks one arbitrarily to propagate. If this is not acceptable, create a clock using the output of the non-unate gate as a source.

UID-53 (error) Cannot create_cell of type '%s' because the physical library cell has a non-power/ground pin '%s'. The cell type must be in the logical library for types with non-power/ground pins.

DESCRIPTION

This error occurs because you are trying to create a logical netlist cell with the wrong notation or you are using the **create_cell** command on a cell type that is only in the physical library, but has a non-power/ground pin. (In this tool, **create_cell** requires that any cell type with a non-power/ground pin be in the logical library.)

WHAT NEXT

If you are trying to create a logical netlist cell, you might have to specify a library by using the slash (/) notation; for example:

```
create_cell my_cell library_name/AND4.
```

If you are using the **create_cell** command on a cell type that is only in the physical library, but has a non-power/ground pin , add a logical library cell type to the logical library and rerun.

SEE ALSO

`create_cell(2)`

UID-56 (error) Read format '%s' is not supported.

DESCRIPTION

The specified read format is not supported.

WHAT NEXT

Please enter a valid read format.

UID-57 (error) No design file specified to read.

DESCRIPTION

WHAT NEXT

UID-58 (error) Cannot read file '%s'.

DESCRIPTION

This error is generated when you try to read a file which is protected or does not exist.

WHAT NEXT

Check and correct search_path, then reinvoke the read command.

UID-59 (error) Can't read '%s' file '%s'.

DESCRIPTION

This error is generated when reading a given format file unsuccessfully.

This error is generated when a file cannot be read successfully using the specified format.

WHAT NEXT

Check to make sure the correct file format is being specified and reinvoke the **read**

command. The problem persists, check the file contents.

UID-60 (error) Verilog HDL Compiler is not enabled.

DESCRIPTION

A license is not available for Verilog HDL Compiler.

WHAT NEXT

Check too see if your licenses have run out.

UID-61 (error) Invalid list of operating conditions.

DESCRIPTION

WHAT NEXT

UID-62 (error) No operating conditions were found.

DESCRIPTION

The named operating condition was not found in specified library or in any of the link libraries.

WHAT NEXT

Use the 'report_lib' command to see names of operating conditions available in your libraries.

UID-63 (warning) Operating conditions '%s' not found.

DESCRIPTION

The named operating condition was not found in specified library or in any of the link libraries.

WHAT NEXT

Use the 'report_lib' command to see names of operating conditions available in your libraries.

UID-64 (error) Only one of: cell list, -pla, -leaf, -logic, -fsm, -hdl_all_blocks

or -hdl_bussed can be specified. -hdl_block can only be used separately

or with -hdl_all_blocks or -hdl_bussed.

DESCRIPTION

WHAT NEXT

UID-65 (error) Either cell list or -pla or -leaf or -logic must be specified.

DESCRIPTION

WHAT NEXT

UID-66 (error) No valid cells are specified for grouping.

DESCRIPTION

WHAT NEXT

UID-67 (error) A design with name '%s' already exists in the same

design file as the given design: '%s'.

DESCRIPTION

The design name you specified in the -design_name option of the 'group' command is already being used. The 'group' command needs to create a new design to represent the new level of hierarchy, so the name you specify must not conflict with existing designs in the system.

WHAT NEXT

Specify a unique design name.

UID-68 (error) A cell %s already exists in design '%s'.

DESCRIPTION

The cell name you specified in the -cell_name option of the 'group' command is already being used for another cell in the design. The 'group' command needs to create a new cell in the design to represent the new level of hierarchy, so the name you specify must not conflict with any existing cells in the design.

WHAT NEXT

Specify a unique cell name.

UID-69 (error) Except set option cannot be used with -hdl_block, -hdl_all, or -hdl_bussed option.

DESCRIPTION

WHAT NEXT

UID-70 (error) Can't find HDL block %s.

DESCRIPTION

The block name specified in the -hdl_block option of the 'group' command could not be found in the current_design. The named block needs to have been specified in the

HDL description using block labels. Block labels are separated by a backslash (/), for example, my_process/my_function.

WHAT NEXT

UID-71 (warning) No designs or libraries are available to free.

DESCRIPTION

WHAT NEXT

UID-72 (error) Only one type of object allowed.

DESCRIPTION

WHAT NEXT

UID-73 (error) Invalid %s list.

DESCRIPTION

WHAT NEXT

UID-74 (error) No valid %ss specified.

DESCRIPTION

WHAT NEXT

UID-75 (error) Unknown port '%s'.

DESCRIPTION

WHAT NEXT

UID-79 (warning) Timing options specified without -timing.

DESCRIPTION

WHAT NEXT

UID-80 (error) Illegal -path option of '%s'.

DESCRIPTION

Valid options for -path are "short", "full", "only", "end". Type help 'report_timing' to see a description of the options.

WHAT NEXT

Re-type command with correct options.

UID-81 (error) Illegal -delay option of '%s'.

DESCRIPTION

Valid option strings for the -delay option are "min", "min_rise", "min_fall", "max", "max_rise", "max_fall". Type help 'report_timing' to see a description of the options.

WHAT NEXT

Re-type command with correct options.

UID-82 (error) -max_paths cannot be negative.

DESCRIPTION

WHAT NEXT

UID-84 (warning) Hierarchy options specified without -hierarchy.

DESCRIPTION

WHAT NEXT

UID-85 (information) Updating design information...

DESCRIPTION

This information message confirms that the design information update is in progress.

WHAT NEXT

This is only an information message. No action is required.

UID-86 (error) Could not update the design.

DESCRIPTION

Could not complete timing analysis because of an error.

WHAT NEXT

There should be another error message describing what went wrong.

UID-87 (error) Cannot read this library, it is old.

DESCRIPTION

WHAT NEXT

UID-88 (error) Invalid port list.

DESCRIPTION

WHAT NEXT

UID-89 (error) 'set_unconnected' cannot be set on an input port '%S'.

DESCRIPTION

WHAT NEXT

UID-90 (error) 'set_unconnected' cannot be set on an unknown

port '%s'.

DESCRIPTION

WHAT NEXT

UID-91 (error) '%s' cannot be set on an output port '%s'.

DESCRIPTION

WHAT NEXT

UID-92 (error) '%s' cannot be set on an unknown port '%s'.

DESCRIPTION

WHAT NEXT

UID-93 (error) Invalid object list.

DESCRIPTION

WHAT NEXT

UID-94 (error) '%s' is not a valid attribute type.

DESCRIPTION

WHAT NEXT

UID-95 (warning) Can't find %s '%s' in design '%s'.

DESCRIPTION

This error message is generated when you try to find a non existing object of a given type in the specified design or the design is hidden and so the object cannot be shown.

WHAT NEXT

Check the object by invoke report_<object>, then reinvoke the current command.

UID-96 (information) Creating new attribute '%s' on %s '%s'.

DESCRIPTION

WHAT NEXT

UID-97 (error) '%s' doesn't have an attribute '%s' type '%s'.

DESCRIPTION

WHAT NEXT

UID-98 (error) Invalid attribute type.

DESCRIPTION

WHAT NEXT

UID-99 (error) Attribute '%s' on %s '%s' is type boolean;

cannot be set to '%s'.

DESCRIPTION

WHAT NEXT

UID-100 (warning) '%s' is not a valid object type.

DESCRIPTION

WHAT NEXT

UID-101 (warning) Attribute '%s' does not exist on %s '%s'.

DESCRIPTION

This error message is issued by commands related to attributes of objects in a design like `get_attribute`, `remove_attribute`, or `report_attribute`. When the command does not find the given attribute, the tool prints out this warning message.

WHAT NEXT

Provide a correct attribute name for this object. If you are not sure about attribute names, do not specify this attribute.

UID-102 (warning) Ignoring %s '%s' type.

DESCRIPTION

This error message is issued when the type of object is not supported by the command you are running.

WHAT NEXT

Run the command with the `-help` option or check the man page of the current command for supported types of objects.

UID-103 (fatal) Synopsys database corrupted.

DESCRIPTION

WHAT NEXT

UID-104 (error) Design '%s' not found in target library.

DESCRIPTION

The design specified was not found in the target library which is specified by the variable target_library.

WHAT NEXT

Verify that the specified design is the correct one, set the correct target_library variable.

UID-105 (error) Example design '%s' is not a flip-flop.

DESCRIPTION

WHAT NEXT

UID-106 (error) Cannot determine flip-flop type of design '%s'.

DESCRIPTION

WHAT NEXT

UID-107 (warning) Multiple operating conditions specified;

only '%s' accepted.

DESCRIPTION

This error message is issued by the **set_operating_conditions** command. It prints out this message when it can not process the command with multiple operating conditions. The command only accepts one of them.

WHAT NEXT

None.

UID-108 (error) Can't find timing range '%s'.

DESCRIPTION

The timing range specified could not be found in the specified library or in the local_link_library or link_library.

WHAT NEXT

Check that the correct timing range is specified and then check the library to make sure the timing range is present.

UID-109 (error) Can't find %s '%s'.

DESCRIPTION

The object of the specified type could not be found.

WHAT NEXT

Check the man page for the current command.

UID-110 (error) VHDL HDL Compiler is not enabled.

DESCRIPTION

WHAT NEXT

UID-111 (error) Can't check security for format '%s'.

DESCRIPTION

WHAT NEXT

UID-112 (error) '%s' is an invalid %s.

DESCRIPTION

WHAT NEXT

UID-113 (error) No report section specified.

DESCRIPTION

This error is issued by report_test command because there is an incorrect or missing option.

WHAT NEXT

Check the man page for report_test command.

UID-114 (warning) %s exists on port '%s'. Cannot %s.

DESCRIPTION

This warning message is displayed when a conflict is found between a logic value that has already been set on a port and a command such as **set_logic_one**, **set_logic_zero**, or **set_logic_dc** attempting to set a different logical attribute

value. Each of these commands checks for pre-existing logic attributes, and issues this warning message when such attributes are found.

WHAT NEXT

Remove the conflicting logic attribute from the port via the **remove_attribute** or **reset_design** commands.

UID-115 (warning) '%s' is not a library cell.

DESCRIPTION

This error message is issued by the **set_prefer** command. The message is printed out when the command cannot find this cell in the target library.

WHAT NEXT

Use the **find** command to check for library cells in the target library, then reenter the **set_prefer** command with the correct library cell.

UID-117 (warning) Can't find %s '%s' in library '%s'.

DESCRIPTION

This message is issued when the current command cannot find this object in the specified library. Therefore, it does not perform the current command on this object.

WHAT NEXT

Provide the correct object in the specified library. You can use the **find** command to find objects in the library.

UID-118 (error) Port '%s' is in design '%s', but port '%s' is in design '%s'.

DESCRIPTION

This error message is displayed when ports in different designs are supplied as arguments to the **set_equal** or **set_opposite** command. These commands require their port arguments to be in the same design.

WHAT NEXT

Modify the arguments to only include ports on the same design and re-issue the command.

UID-119 (warning) %s '%s' is of the wrong type.

DESCRIPTION

This error message is generated when a command is called with wrong type object.

For example, the command all_connected accepts net, pin, or port object; but it is called with cell.

```
dc_shell> all_connected find(cell, U0) Warning: cell 'U0' is of the wrong type.  
(UID-119) {}
```

WHAT NEXT

Reinvoke the command with -help option to check for the correct type. Then recall the command.

UID-120 (error) The clock period value can't be negative.

DESCRIPTION

The clock period value specified in your command is negative. The command doesn't accept a negative clock period value.

WHAT NEXT

Provide the valid value.

UID-121 (error) Invalid timing range list; specify one or two timing range names.

DESCRIPTION

This error message is issued by the **set_timing_ranges** command. The command accepts only one or two timing range names.

WHAT NEXT

Provide the valid timing range list.

UID-122 (error) The '-exact' option must be used when the example design is a latch.

DESCRIPTION

This error message is displayed when an example latch is given to the `set_register_type` command without using the command line switch '-exact'. The `set_register_type` command requires that the '-exact' switch is used when specifying an example latch.

WHAT NEXT

Re-issue the `set_register_type` command using the '-exact' command line switch.

UID-123 (error) Can't set flip-flop type on non sequential cell '%S'.

DESCRIPTION

This error message is displayed because the `set_register_type` command requires that the components in the `cell_or_design_list` be valid sequential cells (latches or flip flops). Non-sequential cells are not valid arguments for the command.

WHAT NEXT

Modify the argument list so that it only includes valid sequential components.

UID-124 (error) Design '%s' is of "unknown" flip-flop type.

DESCRIPTION

This error message is displayed when an example flip flop given to the `set_register_type` command is not of the correct sequential type.

WHAT NEXT

Re-issue the command with a different example device.

UID-125 (error) Attribute '%s' can't be %s on this %s with this command.

DESCRIPTION

WHAT NEXT

UID-126 (warning) Design '%s' is in state table format. Writing only port information.

DESCRIPTION

This error message is issued by the **write** command. When the command finds the design is in state table format, it writes only port information.

WHAT NEXT

None.

UID-127 (error) Can't find library pin '%s'.

DESCRIPTION

WHAT NEXT

UID-128 (error) No drive specified on library pin '%s'.

DESCRIPTION

This message is issued by the **drive_of** command. The command prints out the message when it finds no drive on the specified pin.

WHAT NEXT

Provide the drive for the specified library.

UID-129 (error) Either wire load model or mode has to be specified.

DESCRIPTION

This error message is issued by the **set_wire_load** command. The command prints out this message when the wire load model or mode is missing in your current command input.

WHAT NEXT

Provide either wire load model or mode for the command.

UID-130 (error) Mode named %s is not a legal mode.

DESCRIPTION

This error message occurs if the argument to the **-mode** option of the **set_wire_load** command is not one of the recognized modes. The recognized modes are top, enclosed, or segmented.

WHAT NEXT

Check for a spelling mistake or missing argument for the **-mode** option of the **set_wire_load** command.

SEE ALSO

`set_wire_load(2)`

UID-131 (error) Can't find the specified library '%s' in memory.

DESCRIPTION

This error indicates that the current command cannot find the specified library in the current memory database of the program.

WHAT NEXT

Check the `search_path` to include the path to the library. Otherwise, read in the library and rerun the command if you need the information in the specified library to complete your work.

UID-132 (error) The write command cannot be used:

-- with the "-format %s" option

Use the "-hierarchy" option.

DESCRIPTION

For the `edif` and `vhdl` formats, there are restrictions when the design list must have only a single design. See the `write` command for details.

WHAT NEXT

Review the details in the help page for the `write` command for the format you have selected, and reissue the command either with the `-hierarchy` option or with a design list of only one design.

UID-133 (error) Attribute flag value must be either true or false.

DESCRIPTION

This error indicates the command you ran required an attribute flag value of either true or false.

WHAT NEXT

Provide the valid attribute flag value.

UID-134 (error) Clock '%s' is undefined for design '%s'.

DESCRIPTION

This error indicates that the command cannot find the clock in the design.

WHAT NEXT

Provide the clock that is defined in the design.

UID-135 (error) No clock specified for remove_clock().

DESCRIPTION

This error is issued by the `remove_clock` command when a clock is missing in the command input.

WHAT NEXT

Provide the clock name for the command.

UID-136 (error) Non-boolean type in expression.

DESCRIPTION

The second argument to a filter command must be a Boolean expression which returns 1 for objects which pass the filter.

WHAT NEXT

Refer to the EXAMPLES section of the help page for `filter` and the help page for `dc_shell` for a description of Boolean expressions (also called conditional or logical expressions in some places).

UID-137 (error) Error in expression. '%c' must be followed by an attribute name.

DESCRIPTION

This error is issued by the `filter` command when the attribute is missing after the indicator in the expression.

WHAT NEXT

Provide the attribute name after the filter indicator.

UID-138 (warning) Attribute '%s' does not exist for %s '%s'.

DESCRIPTION

This error message is issued by commands related to attributes of objects in a design like `get_attribute`, `remove_attribute`, or `report_attribute`. When the command does not find the given attribute, it prints out this warning message.

WHAT NEXT

Provide a correct attribute name for this object. If you are not sure about attribute names, do not specify this attribute.

UID-139 (error) Invalid inferred bus naming style specification.

DESCRIPTION

The setting of the environment variable "bus_inference_style" is invalid, so the bussing of ports could not be inferred on the design which was read.

WHAT NEXT

Correct the setting of the "bus_inference_style" variable.

UID-140 (error) You cannot set the '%s' variable.

DESCRIPTION

The variable indicated is a derived variable. Its value is derived from some other information, so you cannot change its value directly.

WHAT NEXT

None.

UID-141 (error) Can not set -min_block_size if mode is not

"enclosed".

DESCRIPTION

Cannot use the `-min_block_size` option to **set_wire_load** without specifying `-mode enclosed`. The `-min_block_size` option makes sense only when used on a hierarchical design whose top level `-mode` is *enclosed*.

WHAT NEXT

Use `-mode enclosed` along with the `-min_block_size` option.

UID-142 (warning) Could not convert '%s' into a piece_index for library pin '%s'. Using '%s' for index value instead.

DESCRIPTION

This error message is issued by the **drive_of** command when it cannot convert the piece index string for the library pin. The command uses the index value instead.

WHAT NEXT

None.

UID-143 (error) Cannot set a wire_load mode on a port. Only a wire_load model can be set on a port.

DESCRIPTION

This error message is issued by the **set_wire_load** command when it only accepts a wire_load model on a port.

WHAT NEXT

Provide the correct model to be set on a port.

UID-144 (error) %s not allowed in object_list.

DESCRIPTION

Objects of the specified type are not allowed in the command's *object_list*.

WHAT NEXT

Remove objects of the specified type from the *object_list* and try the command again. Please refer to the command's man-page for more information on the command's usage.

UID-145 (information) Truncating parameter value '%f' to '%d'.

DESCRIPTION

Some commands (and command options) only accept integer arguments. This information message informs the user that an integer is expected, but a floating-point value was supplied. As a result, the floating-point value will be truncated to the integer portion only.

WHAT NEXT

The parameter has been automatically truncated.

UID-146 (error) Invalid combination of options enabled.

DESCRIPTION

Not all options may be utilized simultaneously for certain commands. The specific combination of options that were enabled for this command was invalid.

WHAT NEXT

Please refer to the command's man-page for more information on the command's usage and valid option combinations.

UID-147 (error) Can not set a wire_load on a port

and a cluster at the same time.

DESCRIPTION

Tried to use both the port and the `-cluster` options to `set_wire_load_model` command simultaneously. The `-port` option can only be used when the wire_load is being set on a design; clusters do not have explicit ports.

WHAT NEXT

Specify either port or `-cluster`, as desired.

UID-148 (error) Cannot set a wire_load mode on a cluster.

DESCRIPTION

It does not make sense to set a `-mode` on a cluster, as mode makes sense only for a top-level design. On a cluster, it is meaningless.

WHAT NEXT

Remove the `-mode` switch from the command and run it again.

UID-149 (error) The design '%s' does not have a cluster named '%S'.

DESCRIPTION

Could not find the cluster specified in the design indicated.

WHAT NEXT

Run the `report_clusters` command to find out what clusters exist in this design, then re-execute the command which failed.

UID-150 (warning) Duplicate signals ignored.

DESCRIPTION

WHAT NEXT

UID-151 (error) Undeclared optional signals.

DESCRIPTION

WHAT NEXT

UID-152 (error) You cannot set a selection group on a port. Only a wire_load model can be set on a port.

DESCRIPTION

The **set_wire_load** command was used on a port and the **-selection_group** option was used. This combination is not valid.

WHAT NEXT

Either remove the **-selection_group** option or specify a design or cluster instead of a port.

UID-153 (error) You cannot set a selection group if the mode is not "enclosed".

DESCRIPTION

An attempt was made to use the **set_wire_load** command with the **-selection_group** option when the wire load mode was not "enclosed". This is not valid.

WHAT NEXT

Either change the wire load mode, or else do not use the **-selection_group** option.

UID-154 (error) Specified selection group '%s' not found.

DESCRIPTION

The wire load selection group name specified was not found in the user specified library or in the first library in the link library path. Therefore, it was not set on the design/cluster.

WHAT NEXT

Verify that the specified name is the correct one, specify on the command line the library which contains the selection group, or update the link library path such that the named group can be found.

UID-155 (error) Specified path group %s not found.

DESCRIPTION

This error message occurs when the specified path group name is not found. The path group must first be created with the **group_path** command.

WHAT NEXT

Verify that the specified name is correct. Use the **report_path_group** command to determine if the path group was created correctly. You can recreate the group using the **group_path** command.

SEE ALSO

group_path(2)
report_path_group(2)

UID-156 (error) Either -path_group or object list must be specified.

DESCRIPTION

This error message occurs when the **set_noise_slack_range** command requires that either a path group or a object list be specified.

WHAT NEXT

Execute the **set_noise_slack_range** command again and specify a path group with the **-path_group** option, an object list with the **object_list** option, or both a path group and an object list.

SEE ALSO

`set_noise_slack_range(2)`

UID-157 (error) '-to' option must be specified for bidirectional pin.

DESCRIPTION

The **set_annotated_delay** command requires that when a delay is annotated on a net from a bidirectional pin, that the load pin or pins also must be specified with the '-to' option.

WHAT NEXT

Use the '-to' option to specify the loads on the net that should be annotated.

UID-158 (warning) %s is a library. Use the find %s command.

DESCRIPTION

This warning message occurs because the **find** command in dc_shell-xg does not accept an object type cell when attempting to find a lib_cell, nor does it accept a pin when trying to find a lib_pin.

WHAT NEXT

This is a only a warning message. No action is required.

However, if this is not the result you expected, execute the **find** command again using either **find lib_cell** or **find lib_pin**.

SEE ALSO

`find(2)`

UID-159 (warning) Predefined methodology selected, other options ignored.

DESCRIPTION

WHAT NEXT

UID-160 (error) Pin %s is not a scan-out pin.

DESCRIPTION

WHAT NEXT

UID-161 (error) Cell %s does not have a scan-out pin.

DESCRIPTION

WHAT NEXT

UID-162 (error) Duplicate cell entries found in test routing order.

DESCRIPTION

The pin list to the `set_test_routing_order` contains some duplicates, which means the scan chain order is not well defined.

WHAT NEXT

Revise the pin list so that each pin occurs at most once. See the help page for `set_test_routing_order`.

UID-163 (error) Unrecognized test methodology %s.

DESCRIPTION

WHAT NEXT

UID-164 (error) Test report options selected without -test.

DESCRIPTION

WHAT NEXT

UID-165 (warning) Unknown test fault class, all classes will be displayed.

DESCRIPTION

WHAT NEXT

UID-166 (error) Fault report options selected without -fault.

DESCRIPTION

The **report_test** options "-class", "-incremental", and "-inst" only apply when selecting the "-fault" reporting option.

WHAT NEXT

Review the help page for **report_test**, and correct the options to the command. The most likely change is to add the "-fault" option.

UID-167 (error) Scan-chain index must be positive.

DESCRIPTION

WHAT NEXT

UID-168 (error) Non-sequential cell/reference %s can not be in a scan-chain.

DESCRIPTION

The reported cell or cell reference was in the argument list to a **set_scan_chain** command but it is not sequential. See the help page for **set_scan_chain**.

WHAT NEXT

One possibility is that the name of the cell is incorrect, such as forgetting some levels of hierarchy or a typing error, and a nonsequential cell has been selected by mistake. Either correct the name or remove it from the cell list.

UID-169 (error) Non-sequential cell/reference/design %s can not be made scannable.

DESCRIPTION

The design object list for the **set_scan** and **set_scan_element** commands must consist of sequential cells only. The indicated object is not sequential. See the help page for the command for details.

WHAT NEXT

One possibility is that the name of the cell is incorrect, such as forgetting some levels of hierarchy or a typing error, and a nonsequential cell has been selected by mistake. Either correct the name or remove it from the cell list.

UID-170 (warning) '%s' cannot be interpreted as a list of local

link library files.

DESCRIPTION

WHAT NEXT

UID-171 (warning) Design '%s' contains parameterized ECL components.

Writing this design to the '%s' netlist format will cause a loss of parameterized information.

DESCRIPTION

WHAT NEXT

UID-172 (information) Writing synthetic library implementations for design '%s'.

Use "write -no_implicit" to get just the design.

DESCRIPTION

WHAT NEXT

UID-173 (warning) Can't %s an uncompiled synthetic cell '%s'.

DESCRIPTION

WHAT NEXT

UID-174 (error) Syntax error in line '%s'.

DESCRIPTION

WHAT NEXT

UID-175 (warning) Design '%s' contains unmapped components.

The description might not simulate and might not be read back

into Design Compiler.

DESCRIPTION

WHAT NEXT

SEE ALSO

UID-177 (error) File '%s' is a directory name.

DESCRIPTION

WHAT NEXT

UID-178 (error) The '%s' attribute of a %s cannot be set with this command.

DESCRIPTION

WHAT NEXT

UID-179 (error) %s format is not enabled.

DESCRIPTION

WHAT NEXT

Invoke the **read -help** command for valid read formats. Identify and correct format, then reinvoke the **read** command.

UID-181 (warning) Can't write sequential_type for %s '%s'.

Cannot find example design in target_library.

DESCRIPTION

WHAT NEXT

UID-182 (warning) %s '%s' is of the wrong type. It seems to work but may not work in the future releases. Please fix the script.

DESCRIPTION

This error message is generated when a command is called with wrong type object. XG's backward compatibility mode for Tcl does a object search based on name, but wants to warn users to fix their Tcl scripts.

For example, the command all_connected accepts net, pin, or port object; but it is called with cell.

```
dc_shell-xg-t> get_clocks [get_ports A] Warning: port 'A' is of the wrong type. It seems to work but may not work in the future releases. Please fix the script. (UID-182) {}
```

WHAT NEXT

Reinvoke the command with -help option to check for the correct type. Then recall the command.

UID-183 (error) Unrecognized scan style '%s'.

DESCRIPTION

The specified scan style is not recognized by the **set_test_methodology** command.

WHAT NEXT

Review the help page for **set_test_methodology** for a description of the recognized styles, and correct the command.

UID-184 (error) Minimum fault coverage must be at least 80

percent.

DESCRIPTION

WHAT NEXT

UID-185 (error) Minimum fault coverage cannot exceed 100 percent.

DESCRIPTION

WHAT NEXT

UID-186 (information) Attribute '%s' is set on %d objects.

DESCRIPTION

WHAT NEXT

UID-188 (error) Data type '%s' does not match attribute type '%S'.

DESCRIPTION

This error message is displayed if The data type for an attribute does not match predefined attribute type.

WHAT NEXT

Re-issue the command with correct data type.

UID-190 (error) The -design_name and -cell_name options are not used with the

-hdl_all_blocks or -hdl_bussed options.

DESCRIPTION

The **group** command has been used with conflicting options.

WHAT NEXT

Review the help page for the **group** command if necessary and change the options being used. The most likely change is to remove the use of the "-design_name" and "-cell_name" options.

**UID-191 (error) The -design_name option is required unless you are using the
-hdl_all_blocks, -hdl_bussed, or -hdl_block options.**

DESCRIPTION

The "-design_name" option is required for the **group** command unless you have specified one of the following options: "-hdl_all_blocks", "-hdl_bussed", or "-hdl_block".

WHAT NEXT

Review the help page for the group **command if necessary, and then correct the options to your group command.**

UID-192 (error) -all_instances option must be used with instance cells when the parent instance is not unique.

DESCRIPTION

The **set_size_only** or **change_link** command has been used with conflicting options.

WHAT NEXT

Use -all_instances option together with cell instances. Either add -all_instances option to set_size_only command or uniquify the parent design instance of the cell before calling set_size_only.

UID-193 (information) %s %s for all instances of cell '%s' in subdesign '%s'.

DESCRIPTION

The **set_size_only** or **change_link** command has been applied to all instances of the cell in a design.

WHAT NEXT

UID-194 (error) -all_instances option must be used with instance cells.

DESCRIPTION

The **set_size_only** command has been used with conflicting options.

WHAT NEXT

Use **-all_instances** option together with cell instances. The most likely change is to add **-all_instances** option.

WARNING MESSAGE:

UID-195 (error) Cannot change current_design from '%s' to '%s' after Milkyway CEL has been written by IC Compiler.

DESCRIPTION

You receive this message if you are trying to change the **current_design** after a Milkyway CEL has already been written by IC Compiler. IC Compiler writes a Milkyway CEL automatically during **link**, **write_milkyway**, and some other commands.

Once a MW CEL is written the **current_design** cannot be changed to a sub-design.

WHAT NEXT

Utilize **current_design** to apply constraints, write reports, etc. without linking or writing to a Milkyway CEL. Then set the **current_design** to be the top-level design for physical synthesis. Perform **link** to write the Milkyway CEL and then proceed with physical synthesis commands.

You may also use `close_mw_cel` and `remove_design -all` to start again and establish a new `current_design`.

SEE ALSO

UID-200 (warning) Signal index values can not be negative.

DESCRIPTION

WHAT NEXT

UID-201 (warning) Cannot rename nets in buffer tree.

DESCRIPTION

When the variable `icc_track_net_names` is TRUE, IC Compiler renames the nets during `create_buffer_tree` and other optimizations so that the resulting nets have names with the same prefix as the original driving net. Note that nets touching (hierarchical) ports must have names the same as the (hierarchical) port name, so those nets cannot be renamed.

`report_net_changes` reports the groups of nets that are associated by being the result of the same optimization.

WHAT NEXT

Report the problem to Synopsys if it is important to have the net names in the buffer tree share the same prefix.

UID-202 (error) Design contains only combinational cells but scan style is not set to "combinational"; test patterns cannot be saved.

DESCRIPTION

You receive this message from `set_scan_configuration` if your design contains only combinational cells but the scan style is set to some value other than `combinational`. Although this condition does not prevent the `check_test` or `create_test_patterns` commands from running, `create_test_patterns` cannot save test patterns.

By default, DFT Compiler uses the scan style defined by the variable **test_default_scan_style**; the default value of this variable is *multiplexed_flip_flop*. You use **set_scan_configuration -style** to override the value of the **test_default_scan_style** variable for the current design. You have attempted to set a non-combinational scan style on a design with no sequential cell. The specification is rejected and the scan style remains unchanged.

You may specify the scan style for a design using the **set_scan_configuration -style** design. If you do not specify the scan style directly then DFT Compiler uses the default value defined in the variable **test_default_scan_style**.

WHAT NEXT

To avoid receiving this message, and to allow **create_test_patterns** to save the test patterns, explicitly set the scan style of the current design to *combinational* using the **set_scan_configuration -style combinational** command.

If you want only to run **check_test**, or if you want only to run **create_test_patterns** to analyze your design without saving the test patterns, you can ignore this message and continue.

SEE ALSO

check_test (2), **create_test_patterns** (2), **set_scan_configuration** (2);
test_default_scan_style (3).

You can avoid this message by explicitly setting the scan style to *combinational* using the command **set_scan_configuration -style combinational**.

If you ignore this message, the scan style will remain unchanged. **Check_test** will run and report zero sequential cells. **Test generation** will run but will not save the vectors.

UID-207 (error) The %s command is only supported in xg mode.

DESCRIPTION

This error message occurs when the specified command is not supported in the **dc_shell** mode.

WHAT NEXT

Start the shell in **xg** mode and run your scripts again.

UID-208 (error) The cell %s is combinational. It cannot be the

startpoint or endpoint of an ignore-path for retiming.

DESCRIPTION

This error message occurs when a combinational cell is specified as the startpoint or endpoint of an ignore-path for retiming. Only ports, sequential cells, pins of sequential cells, and clocks can be startpoints and endpoints of ignore-paths for retiming.

WHAT NEXT

Use a suitable startpoint or endpoint for the path and reissue the command.

UID-209 (error) A %s license must be authorized for the set_retimig_ignore_path command.

DESCRIPTION

This error message occurs because the `set_retimig_ignore_path` command requires the authorization for the specified license.

WHAT NEXT

Check your license key file.

SEE ALSO

`set_retimig_ignore_path(2)`

UID-210 (error) Proprietary design '%s' can't become the

current design.

DESCRIPTION

WHAT NEXT

UID-211 (warning) Can't write proprietary design '%s'.

DESCRIPTION

Proprietary designs cannot be written in the selected format, so the named design was skipped. This might occur for example if you try to do a hierarchical write on a design which instantiates a proprietary design.

WHAT NEXT

Normally there is nothing to do, but if the warning is unexpected, you can review the link step in case there is a problem, e.g., with the search path, which is causing a proprietary design to be linked when you were expecting a non-proprietary design.

UID-220 (error) Unrecognized test assert value '%s', (use one of "0","1").

DESCRIPTION

WHAT NEXT

UID-221 (error) Can't set assume value as direction of pin %s not out/inout.

DESCRIPTION

This error message is displayed when a pin in the pin list supplied to the `set_test_assume` command is neither an output pin nor an inout pin. The `set_test_assume` command requires that all pin arguments have directions that are either 'out' or 'inout'.

WHAT NEXT

Re-issue the **set_test_assume** command using only pins that have direction 'out' or 'inout'.

UID-222 (error) Can't set assume value as pin %s from a combinational cell.

DESCRIPTION

This error message is displayed when a pin in the pin list supplied to the **set_test_assume** command belongs to a combinational component. The **set_test_assume** command requires that none of its pin arguments are part of combinational components in the design.

WHAT NEXT

Re-issue the **set_test_assume** command without a pin list containing combinational pins.

UID-223 (error) Can't set assume value on pin %s as not test isolated.

DESCRIPTION

This error message is displayed when a pin in the pin list supplied to the **set_test_assume** command belongs to a sequential component which has not been marked as being test isolated via the **set_test_isolate** command. The **set_test_assume** command may only be used on pins of a sequential component if those pins (or their cells) have been marked as logically isolated via **set_test_isolate**.

WHAT NEXT

Remove the named pin from the argument list and then re-issue the **set_test_assume** command. Or, if it is correct to do so, use the **set_test_isolate** command on the pin or its cell, indicating that it is logically isolated and should be considered untestable during test design rule checking

UID-224 (error) Can't set hold value as port %s is not an input.

DESCRIPTION

This error message is displayed when a port in the port list supplied to the **set_test_hold** command is not an input port. The **set_test_hold** command requires that all port arguments have direction 'in'.

WHAT NEXT

Re-issue the **set_test_hold** command using only ports that have direction 'in'.

UID-225 (error) Can't set require value as direction of pin %s not in/out.

DESCRIPTION

This error message is displayed when a pin in the pin list supplied to the **set_test_require** command is neither an output pin nor an input pin. The **set_test_require** command requires that all pin arguments have directions that are either 'out' or 'in'.

WHAT NEXT

Re-issue the **set_test_require** command, using only input or output pins in the list of pin arguments.

UID-226 (error) Can't set require value as pin %s is test isolated.

DESCRIPTION

This error message is displayed when a pin in the pin list supplied to the **set_test_require** command belongs to a sequential component which has been marked as being test isolated via the **set_test_isolate** command. The **set_test_require** command may only be used on pins of a sequential component if those pins (or their cells) have not been marked as logically isolated via **set_test_isolate**.

WHAT NEXT

Remove the named pin from the argument list and then re-issue the **set_test_require** command. Or, if it is correct to do so, use the **remove_attribute** command on the pin or its cell, removing the `test_isolate` attribute.

UID-227 (error) Can't set require value as pin %s from an unknown cell.

DESCRIPTION

This error message is displayed when a pin in the pin list supplied to the **set_test_require** command belongs to an unknown component. The **set_test_require** command may only be used on pins of a component which can be recognized by Design Compiler.

WHAT NEXT

Remove the named pin from the argument list and then re-issue the **set_test_require** command.

UID-228 (warning) Design has no hierarchy. No cells can be ungrouped.

DESCRIPTION

This warning message is displayed when the **ungroup** command is issued without a valid cell list, or in a design that contains no hierarchy. It indicates that without at least one valid hierarchical cell to operate on, the **ungroup** command will do nothing.

WHAT NEXT

Verify that the arguments supplied are correct, and that the design does indeed have hierarchy. Then, re-issue the **ungroup** command.

UID-229 (warning) All hierarchical cells are don't touched. No cells can be ungrouped.

DESCRIPTION

WHAT NEXT

UID-230 (warning) All specified hierarchical cells are don't

touched. No cells can be ungrouped.

DESCRIPTION

WHAT NEXT

UID-231 (warning) All designs specified are un-changed and not written.

DESCRIPTION

WHAT NEXT

UID-232 (information) Updating design information for flat timing report...

DESCRIPTION

WHAT NEXT

UID-233 (warning) Can't resolve reference '%s' for cell '%s'

DESCRIPTION

This error is generated when there is no design reference for the given cell.

WHAT NEXT

Check and correct the link_library and search_path. Invoke **link** command, then reinvoke the current command.

UID-234 (error) Invalid port direction '%s'.

DESCRIPTION

This error message is displayed when the **create_port** command is issued with an invalid port direction. Valid port directions for the **create_port** command are 'in', 'out', or 'inout'.

WHAT NEXT

Re-issue the **create_port** command using a valid direction argument.

UID-235 (error) Port '%s' already exists.

DESCRIPTION

WHAT NEXT

UID-236 (error) Cannot specify port_list with -unused.

DESCRIPTION

It is illegal to specify a port_list when using the "-unused" argument.

WHAT NEXT

Reissue the command either without the port list or without the "-unused" argument.

UID-237 (error) Unable to remove port '%s'.

DESCRIPTION

This error message is displayed when a port cannot be removed from a design. Ports which are bussed may not be removed individually from a design.

WHAT NEXT

Reissue the command without the named port.

UID-238 (error) The '-associated_clock' switch can only be used with 'clocked_on_also' signal type.

DESCRIPTION

This error message is displayed when the **set_signal_type** command has been issued with the '-associated_clock' switch and the signal type being set is not 'clocked_on_also'. This is because the '-associated_clock' switch makes sense only in the context of defining Master and Slave clock ports with the 'clocked_on_also' signal type.

WHAT NEXT

Re-issue the **set_signal_type** command either removing the '-associated_clock' switch, or changing the signal type to be 'clocked_on_also'.

UID-239 (error) Cannot run this command without the -mpc option.

DESCRIPTION

This error message is displayed when the **write_physical_script** command is called without the **-mpc** option.

The **write_physical_script** command will be enhanced in the future to print physical information other than mpc options. Always use the **-mpc** option to this command to avoid breaking the script later.

WHAT NEXT

Run the command again with the **-mpc** option.

SEE ALSO

write_physical_script(2)

UID-240 (error) Either the '-flip_flop' or the '-latch' argument

must be used.

DESCRIPTION

WHAT NEXT

UID-241 (error) Unable to find example %s '%s'.

DESCRIPTION

This error message is displayed when an example gate given to the `set_register_type` command cannot be found in the current target library. The `set_register_type` command requires that the example gate given with the '-latch' or '-flip_flop' switches exist in the target library.

WHAT NEXT

Change the target library, or change the argument given as an example gate to `set_register_type` and reissue the command.

UID-242 (error) Example design '%s' is not a %s.

DESCRIPTION

This error message is displayed when an example gate given to the `set_register_type` command is not a valid example component. The `set_register_type` command requires that the example gate given with the '-latch' or '-flip_flop' switches actually be a valid latch, or flip flop, respectively.

WHAT NEXT

Change the argument given as an example gate to `set_register_type` and reissue the command.

UID-243 (error) The %s design '%s' is of "unknown" sequential

type.

DESCRIPTION

This error message is displayed if the latch or flip-flop specified to the `set_register_type` command cannot be recognized by **Design Compiler**.

WHAT NEXT

Re-issue the `set_register_type` command with a recognizable sequential device.

UID-244 (error) Cell '%s' is a latch.

The latch type was NOT specified on the command line.

DESCRIPTION

WHAT NEXT

UID-245 (error) Cell '%s' is a flip-flop.

The flip-flop type was NOT specified on the command line.

DESCRIPTION

WHAT NEXT

UID-246 (error) Cell '%s' is neither a latch nor a flip flop.

DESCRIPTION

WHAT NEXT

UID-247 (error) Non-sequential cell/reference/design %s can

not be made transparent.

DESCRIPTION

Only level-sensitive sequential elements can be made transparent for ATPG.

WHAT NEXT

Verify that the list of devices given to the **set_scan_transparent** are all level-sensitive. The **all_registers** command can be used to get a list of such registers in the design.

UID-248 (error) The '%s' design '%s' is of "unknown" combinational type.

DESCRIPTION

The replacement gate in the set_combinational_type command does not have a recognized combinational function which can be used for exact replacement.

WHAT NEXT

The set_combinational_type command requires the replacement gate to have a recognized combinational function that can be used for exact replacement. Specify another gate as the replacement_gate for set_combinational_type.

UID-249 (error) Cell '%s' is not a combinational gate.

DESCRIPTION

One of the cells specified in the cell_list for set_combinational_type is not a combinational gate. All of these cells must be combinational gates. Set_combinational_type will only work on those cells in the cell list which are combinational.

WHAT NEXT

Only specify combinational cells in the cell list for set_combinational_type.

UID-250 (error) Cannot find %s '%s'.

DESCRIPTION

This error message occurs if the object of the given type and name could not be found.

WHAT NEXT

Correct the type or name of the object passed to the issued command and re-issue it.

UID-251 (error) Cannot specify both %s and %S.

DESCRIPTION

This error message is issued if a command is invoked with two incompatible options.

WHAT NEXT

Issue the command with only one of the two options displayed in the error message.

UID-252 (error) '%s' is not an instance of design '%s'.

DESCRIPTION

This error message is issued if a path to an instance does not represent a valid instance of the design.

WHAT NEXT

Correct the path to the instance and re-issue the command.

UID-253 (error) Cannot specify %s without %s.

DESCRIPTION

This error message is displayed if only one of two options, which need to be specified together, is specified.

WHAT NEXT

Specify both the options displayed in the error message and re-issue the command.

UID-254 (error) Invalid delay direction for port '%s'.

DESCRIPTION

This error message is displayed if a port argument to a command has a direction which is not valid for the command.

WHAT NEXT

Re-issue the command with ports of the required directions only.

UID-255 (error) Value for %s cannot be negative.

DESCRIPTION

WHAT NEXT

UID-256 (error) Either %s or %s must be specified.

DESCRIPTION

This error message is issued if a command is issued without one of the two mandatory options being specified.

WHAT NEXT

Re-issue the command with one of the two options in the error message.

UID-257 (error) Invalid waveform. Edges must be an even number of monotonically

increasing values less than one period in duration.

DESCRIPTION

This error message is displayed if the waveform specified for a clock is invalid. There must be an even number of numbers specifying the waveform of the clock. In addition, these numbers must be in a monotonically increasing sequence. This error message is issued if either of these rules is violated.

WHAT NEXT

Re-issue the **create_clock** command with a valid specification for the waveform.

UID-258 (error) Group weight must be between 0.0 and 100.0.

DESCRIPTION

WHAT NEXT

UID-259 (error) Must specify one of %S, %s, or %s.

DESCRIPTION

This error message is displayed if none of the three mandatory options for a command are specified.

WHAT NEXT

Re-issue the command by specifying one of the three options in the error message.

UID-260 (error) The '%s' command is obsolete. It is ignored.

DESCRIPTION

WHAT NEXT

UID-261 (error) Cannot set current instance to object '%s'.

DESCRIPTION

This error message is displayed if the **current_design** does not own the instance which is being set as the **current_instance**.

WHAT NEXT

Re-issue the **current_instance** command using an instance that is owned by the **current_design**.

UID-262 (error) '%s' doesn't specify a unique object.

DESCRIPTION

This error message is displayed if multiple objects are passed as an argument to a command that requires a single object only.

WHAT NEXT

Re-issue the command by specifying only a single object as argument.

UID-263 (error) Cannot specify multiple objects for command %S.

DESCRIPTION

This error message is displayed if multiple objects are specified as an argument to a command that requires only a single object.

WHAT NEXT

Re-issue the command with a single object as argument.

UID-264 (error) Cannot specify multiple objects.

DESCRIPTION

The error message is displayed if multiple objects are specified as an argument to a command that requires a single object.

WHAT NEXT

Re-issue the command with a single object as argument.

UID-265 (error) Cannot specify library object '%s' for command %s.

DESCRIPTION

This error message is displayed if library objects (library, library design, or library pin) are passed as an argument to a command that does not accept them.

WHAT NEXT

Re-issue the command without library objects in the argument.

UID-266 (error) Cannot specify library object '%s'.

DESCRIPTION

WHAT NEXT

UID-267 (error) Command %s cannot be performed on instance %s within a hierarchy.

Please re-issue the command in the design referenced by the

current instance.

DESCRIPTION

WHAT NEXT

UID-268 (error) Cannot perform this command on instance %s within a hierarchy.

Please re-issue the command in the design referenced by the current instance.

DESCRIPTION

WHAT NEXT

UID-269 (error) Can't find design corresponding to instance '%s'.

DESCRIPTION

WHAT NEXT

UID-270 (error) Can't write script file '%s'.

DESCRIPTION

Failed to open a script file in write mode. There can be several reasons for this. The most common reasons are: the user does not have write permissions in the directory, the disk is full or the user already has a file with the same name which can't be deleted.

WHAT NEXT

Try to create a file with the same name from the C shell. Fix any problem that you might encounter. Delete the file and invoke the dc_shell command again.

UID-271 (error) Current instance is not defined.

DESCRIPTION

WHAT NEXT

UID-272 (error) Cannot set current design to library design '%s'.

DESCRIPTION

The current design can only be set to a non-library designs.

WHAT NEXT

check if the specified design is correct. Try specifying the complete path to the design as follows:

```
current_design = <db_file_name>:<design_name>
```

UID-273 (error) Command '%s' cannot be performed within a hierarchy.

Please re-issue the command in the design referenced by the current instance or the top-level of the current design.

DESCRIPTION

The specified command can only be invoked from the top-level of the hierarchy. If the current instance is set to a subdesign, the command will fail.

WHAT NEXT

If you want to execute the command in the design referred by the current instance, set the current design to point to the design current instance is pointing to. Now invoke the command. Otherwise, set current instance to the top-level design. See the man pages for commands current_design and current_instance for further details.

UID-274 (error) This command cannot be performed within a

hierarchy. Please re-issue it
in the design referenced by the current instance or the top-level
of
the current design.

DESCRIPTION

The specified command can only be invoked from the top-level of the hierarchy. If the current instance is set to a subdesign, the command will fail.

WHAT NEXT

If you want to execute the command in the design referred by the current instance, set the current design to point to the design current instance is pointing to. Now invoke the command. Otherwise, set current instance to the top-level design. See the man pages for commands `current_design` and `current_instance` for further details.

UID-275 (warning) No %s to list.

DESCRIPTION

WHAT NEXT

UID-276 (error) Can't set current instance to leaf cell '%s'.

DESCRIPTION

The `current_instance` command does not work on leaf cells. If you attempt to run `current_instance` on a leaf cell, you get this error.

WHAT NEXT

Make sure when you use `current_instance` the cell you specify is not a leaf cell.

UID-277 (warning) No library contain the wire load model '%s'

set on design '%s'.

DESCRIPTION

The indicated design has a wire-load model that could not be found in the libraries in the search path. This situation can occur if the wire-load model was created with **create_wire_load**, which creates wire-load models and saves them on designs.

WHAT NEXT

To report on the specified wire load model, use **report_wire_load -name**. Here is an example of a report for a wire-load model:

```
*****
Report : wire loads
Design : counter
Version: v3.1-development
Date   : Mon Jan 25 10:47:24 1993
*****  
  
Wire load model:    counter_wl
Location      :    counter
Resistance     :    2
Capacitance   :    1
Area          :    0
Slope         : 1.333
                                         Average  Standard  % Standard
Fanout    Length    Points      Cap    Deviation  Deviation
-----  
 1        0.58    1565       0.58     0.01      0.99
 2        1.46     168       1.46     0.04      2.78
 3        2.40      64       2.40     0.12      4.80
 4        3.33      56       3.33     0.15      4.59
 5        4.03      30       4.03     0.24      5.88
-----  
Weighted Average Standard Deviation:           2.08
```

Write a technology file describing the wire-load model, and update this file into a library on your search path with **update_lib**.

Here is an example of a technology file with a wire-load model described in the previous report:

```
wire_Load("counter_wl") {
resistance : 2;
capacitance : 1;
area : 0;
slope : 1.333;
fanout_length(1,0.58);
fanout_length(2,1.46);
fanout_length(3,2.4);
fanout_length(4,3.33);
```

```
fanout_length(5,4.03);  
}
```

If the design still has the annotated capacitances that were used to create the wire-load model, use **create_wire_load -output** to write the wire-load model directly to a technology file.

With **report_wire_load -name**, you can verify that the technology file describes the same model as the one described.

Then use **update_lib** to update the technology file into a library on your search path. The **set_wire_load_model** line in the script written can then be updated with the **-library** option to identify the library where the wire-load model can be found.

UID-278 (error) No annotated timing check information was removed.

DESCRIPTION

The timing checks defined in **remove_annotated_check** did not exist, and **remove_annotated_check** could not succeed.

WHAT NEXT

Use **report_annotated_check** to verify what timing checks are annotated.

UID-279 (error) Cannot have current_instance set for this command.

DESCRIPTION

This error message is displayed if the **current_instance** is defined. **Write_script** and **write_sdc** cannot recognize the **current_instance** because these commands write out information relative to the **current_design**.

WHAT NEXT

Re-issue the **current_instance** with no instance specified.

UID-280 (error) Period value conflicts with waveform on clock

'%S'.

DESCRIPTION

WHAT NEXT

UID-281 (warning) Path group '%s' has no paths; it will not affect optimization.

DESCRIPTION

The **group_path** command can be used to create or modify path groups. You can use **group_path -name clock -weight 5** to change the weight of an existing group. This warning is to let you know when you have created a path group that has no paths. This path group will not affect optimization unless paths are added to it by additional **group_path** commands.

WHAT NEXT

You should use **group_path -name clock -to clock** if you wish to include all paths to object "clock" in the path group. Use **report_path_group** to see the path groups that are currently defined.

UID-282 (information) Annotated '%s' delays are assumed to include load delay.

DESCRIPTION

Load delay (also known as extra source gate delay) is the portion of cell delay which is due to the capacitive load of the net being driven. Some SDF interfaces include load delay as part of the net delay - others include it as part of the cell delay. By default, Design Compiler assumes that load delay is included in cell delays.

WHAT NEXT

Make sure that you understand how both your SDF reader and writer will treat load delay. Use the **-load_delay** option of the **read_timing**, **write_timing**, **write_constraints**, or **set_annotated_delay** commands to specify whether Design Compiler should include load delay in cell or net delays.

UID-283 (error) Load delay location '%s' should be 'cell' or 'net'.

DESCRIPTION

Load delay (also known as extra source gate delay) is the portion of cell delay which is due to the capacitive load of the net being driven. Some SDF interfaces include load delay as part of the net delay - others include it as part of the cell delay. By default, Design Compiler assumes that load delay is included in cell delays.

WHAT NEXT

The allowable values for the `-load_delay` option are "cell" or "net".

UID-284 (warning) In ICC, use `remove_buffer_tree` instead of `clean_buffer_tree`.

DESCRIPTION

ICC does not support the `clean_buffer_tree` command.

Please use `remove_buffer_tree` instead.

WHAT NEXT

UID-285 (warning) '%f' value is negative.

DESCRIPTION

You receive this error message when a negative value has been specified with the `set_annotated_delay` command. Annotated delay values are usually positive, but negative delay values will be accepted.

WHAT NEXT

If you do not want the value to be negative, re-execute the `set_annotated_delay` command and specify a positive value.

UID-286 (error) Rise/fall exceptions not supported.

DESCRIPTION

You receive this error message when a **-rise_to**, **-fall_to**, **-rise_from**, **-fall_from**, **-rise_through**, or **-fall_through** option has been specified with any of the exception commands. Although these options are supported in PrimeTime, they are not supported in Design Compiler.

WHAT NEXT

Reexecute the desired command and specify the **-rise**, **-fall**, and **-through** options as necessary.

UID-290 (error) Can't set test assertion on hierarchical object %S.

DESCRIPTION

WHAT NEXT

UID-295 (error) The command set_clock_skew is obsolete.
It has been replaced by **set_clock_latency**,
set_clock_uncertainty
and **set_propagated_clock** commands.

DESCRIPTION

The **set_clock_skew** command has been obsoleted. The functionality has been replaced by a set of commands, which have capability beyond the **set_clock_skew** command had implemented.

The **set_clock_skew** command has been replaced by the following commands:

set_propagated_clock replaces the **-propagated** option of **set_clock_skew**

set_clock_latency replaces the **-delay** option of **set_clock_skew**

set_clock_uncertainty replaces the **-uncertainty** options of **set_clock_skew**

Example:

```
set_clock_skew -propagated -delay 1.0 -plus_uncertainty 2.1 clk
```

should be replaced as:

```
set_propagated_clock clk
set_clock_latency 1.0 clk
set_clock_uncertainty -hold 2.1 clk
```

WHAT NEXT

You should substitute the **set_clock_skew** command with the equivalent commands as suggested above. Please consult the man pages for **set_clock_latency**, **set_clock_uncertainty** and **set_propagated_clock**.

SEE ALSO

```
set_propagated_clock (2), set_clock_latency (2), set_clock_uncertainty (2).
```

UID-296 (error) The option **-cell** is obsolete. Please use **-lib_cell** instead.

DESCRIPTION

The option **-cell** for the command **set_driving_cell** has been obsolete and will not be supported in XG mode. Please use the **-lib_cell** option instead.

WHAT NEXT

You should substitute the **-cell** option with **-lib_cell** option for all **set_driving_cell** commands. Please refer to the **set_driving_cell** man page for detailed information on obsolete options for this command.

SEE ALSO

```
set_driving_cell (2).
```

UID-297 (error) The command **set_wire_load** is obsolete in XG mode.

It has been replaced by **set_wire_load_model**,
set_wire_load_mode,

`set_wire_load_selection_group`, and
`set_wire_load_min_block_size`
commands.

DESCRIPTION

The `set_wire_load` command has been obsoleted in XG mode. The functionality has been replaced by a set of commands, which have capability beyond the `set_wire_load` command had implemented.

The `set_wire_load` command has been replaced by the following commands:

```
set_wire_load_model  
set_wire_load_mode  
set_wire_load_selection_group  
set_wire_load_min_block_size
```

WHAT NEXT

You should substitute the `set_wire_load` command with the equivalent commands as suggested above. Please consult the man pages for `set_wire_load_model`, `set_wire_load_mode`, `set_wire_load_selection_group` and `set_wire_load_min_block_size`.

SEE ALSO

```
set_wire_load_model (2), set_wire_load_mode (2), set_wire_load_selection_group(2),  
set_wire_load_min_block_size(2).
```

UID-300 (error) Cannot use hdl options with the soft option.

DESCRIPTION

WHAT NEXT

UID-301 (error) 'get_attribute' can't get value for unknown

attribute type.

DESCRIPTION

WHAT NEXT

UID-302 (warning) Invalid value for link_force_case variable:
default value check_reference will be used.

DESCRIPTION

WHAT NEXT

UID-303 (error) Cannot set initial value on pin %s from a non-scan cell.

DESCRIPTION

WHAT NEXT

UID-304 (error) Cannot set initial value on pin %s from an

unknown cell.

DESCRIPTION

WHAT NEXT

UID-305 (error) Period value unspecified.

DESCRIPTION

WHAT NEXT

UID-306 (error) Waveform set unspecified.

DESCRIPTION

WHAT NEXT

UID-307 (error) Waveform set must consist of two floating point values.

DESCRIPTION

WHAT NEXT

UID-308 (error) Period value cannot be zero.

DESCRIPTION

WHAT NEXT

UID-309 (error) Value for period is different from the default

value specified by test_default_period/custom test protocol.

DESCRIPTION

Period is the length of time required for each test vector cycle on a tester. Typically, only a single period is defined for a test set. Therefore, all the test clocks you created for a particular ATPG run should have same value for the period as the one specified by the test_default_period variable or in a custom test protocol.

WHAT NEXT

Omit the period specification, or specify the same value as the test_default_period variable.

UID-310 (error) Port '%s' is not an input port.

DESCRIPTION

The definition of the timing of a clock can only be applied to input ports.

WHAT NEXT

Use the `report_port` command to find the complete list of input ports. Select the correct port for applying the clock constraints. Reissue the command with the new port.

UID-311 (error) Cannot set testsim_input_delay on port '%s'. It is not an input or bidirectional port. Command ignored.

DESCRIPTION

WHAT NEXT

UID-312 (error) Cannot set testsim_output_strobe on port '%s'.

It is not an output or bidirectional port. Command ignored.

DESCRIPTION

WHAT NEXT

UID-313 (error) The specified input delay %5.2f is more than the period %5.2f. Command ignored.

DESCRIPTION

The input delay must be less than the clock period.

WHAT NEXT

The currently specified input delay has been ignored. Specify the input delay value again and ensure that the new value is less than the clock period.

UID-314 (error) The specified output strobe %5.2f is more than the period %5.2f. Command ignored.

DESCRIPTION

The output strobe must be less than the clock period.

WHAT NEXT

The currently specified output strobe value has been ignored. Specify the output strobe value again and ensure that the new value is less than the clock period.

UID-315 (error) The specified input delay %5.2f is negative. Command ignored.

DESCRIPTION

The input delay must be greater than or equal to zero.

WHAT NEXT

UID-316 (error) The specified output strobe %5.2f is negative. Command ignored.

DESCRIPTION

The output strobe must be greater than or equal to zero.

WHAT NEXT

The currently specified output strobe value has been ignored. Specify the output strobe value again and ensure that the new value is a non-negative real number.

UID-317 (error) Attribute '%s' has not been defined for %s.

DESCRIPTION

The `set_user_attribute` command requires that the attribute first be defined using either the `define_user_attribute` command or the `set_attribute` command.

WHAT NEXT

Check that the attribute name is correct and define the attribute using `define_user_attribute`, or else just use `set_attribute`.

UID-318 (error) Object class '%s' is not supported.

DESCRIPTION

The `-class` argument to the command requires a recognized object class such as design, cell, or net.

WHAT NEXT

Use the `-help` option of the command or see the command man page to find out what object classes are supported by the command.

UID-319 (error) Attribute '%s' is already defined as type %s for

object class %s.

DESCRIPTION

The attribute data type for a **define_user_attribute** or **set_attribute** command does not match the data type already defined for this attribute.

WHAT NEXT

Check the attribute name and data type against any previous attribute definitions, and correct the command.

UID-325 (warning) Option '%s' is ignored because '%s' is not specified.

DESCRIPTION

You receive this warning message because you have specified only one option with the **balance_buffer** command. You must specify both options or specify no options. The specified option is ignored.

WHAT NEXT

Reissue the **balance_buffer** command and specify both options or do not specify either option.

SEE ALSO

balance_buffer (2).

UID-326 (error) Can't find pin '%s' on cell '%s'.

DESCRIPTION

WHAT NEXT

UID-327 (warning) Arcs dont exist or have been disabled from

pin '%s' to pin '%s' on cell '%s'.

DESCRIPTION

It is invalid to disable timing arcs between two pins where there are no arcs between the pins. Either the pins dont exist on the library cell or they have been disabled for some reason.

WHAT NEXT

UID-330 (error) '%s' in command `get_design_parameter` is not a valid parameter name for the current design. Valid parameter names are '%s'.

DESCRIPTION

The specified parameter name in the `get_design_parameter` command is not one of the parameters for the current design.

WHAT NEXT

Check your spelling of the parameter name, or check the current design.

UID-331 (error) Parameter '%s' does not have a value.

DESCRIPTION

The specified parameter for the current design has not been assigned a value, and has no default value.

WHAT NEXT

Specify a default value for this parameter in the library, or elaborate the cell with a value for this parameter.

UID-332 (error) The `-library` option is only valid with the db

format.

DESCRIPTION

The `-library` option is used to write db designs into a design library.

WHAT NEXT

To store vhdl or verilog designs in a design library, use the `analyze` command.
(Currently, only vhdl, verilog, and db designs can be stored in a design library.)

UID-333 (error) The -out flag cannot be used with the -library flag.

DESCRIPTION

When you write a db design into a library, the filename and path are determined from the db design name and the library name respectively. As a result, it is illegal to use the `-out` flag when the `-library` flag is specified.

WHAT NEXT

Re-issue the command, using only one of these flags.

UID-334 (error) Tried to write the root object '%s' into a design library.

DESCRIPTION

It is illegal to write root objects into a design library.

WHAT NEXT

On the command line, specify the individual designs that you would like to write, instead of the root object.

UID-335 (warning) The assignment operator "=" appears in the

filter string.

DESCRIPTION

The assignment operator is illegal in a filter string.

WHAT NEXT

You may have typed the assignment operator "=" in place of the comparison operator "==" (is equal to). Try the filter command again, but be sure to use "==" for comparison.

UID-336 (error) You cannot perform the command '%s' on design '%s'
because it is a limited design.

DESCRIPTION

Access to a design can be limited for either of two reasons: (1) The design is fully licensed, but it has not yet been mapped. (2) The only licence that could be checked out for the design was a limited license. As a result, the internals of the design are hidden. You cannot write the design out, view a schematic, or execute any commands that would allow you to see the internals. There are also certain commands (such as group) that do not apply to limited designs.

WHAT NEXT

If the design is simply not mapped, then compiling the design will allow you access to it. If the design is limited because of licenses, then the only way to get access to the design is to check out a license that gives full access.

UID-337 (error) You cannot perform the command '%s' on design '%s'
because it contains the limited design '%s'.

DESCRIPTION

Access to a design can be limited for either of two reasons: (1) The design is fully licensed, but it has not yet been mapped. (2) The only licence that could be checked out for the design was a limited license. As a result, the internals of the design are hidden. You cannot write the design out, view a schematic, or execute any

commands that would allow you to see the internals. There are also certain commands (such as group) that do not apply to limited designs.

WHAT NEXT

If the design is simply not mapped, then compiling the design will allow you access to it. If the design is limited because of licenses, then the only way to get access to the design is to check out a license that gives full access.

UID-338 (error) Cannot access design parameters on object '%s'.

Design parameter values are only valid on designs and references.

DESCRIPTION

By convention an attribute name beginning with a dollar sign (\$) indicates a design parameter (i.e. VHDL generic or Verilog parameter). Design parameters only exist on design or reference objects.

WHAT NEXT

Either specify a valid design or reference, or don't use ''\$'' in your attribute name. You may need to specify objects using the command *find(design, my_des)* or *find(reference, my_ref)* to insure that you are working on a design or reference.

UID-339 (warning) Can't remove attribute '%s' from object '%s'.

DESCRIPTION

You cannot remove a static or a derived attribute from this object.

WHAT NEXT

Don't try to remove a static or derived attribute.

UID-340 (error) The connection class attribute can be set only

on design ports.

DESCRIPTION

The `set_connection_class` command works only on ports that are connected to a design. You can't use this command to change the connection class attribute for ports in a library.

WHAT NEXT

To change the connection class for library ports, you need to change the text file description of the library (usually in a '.lib' file) and run Library Compiler on that library. If you intended to set the connection class for ports in a design, check that you have specified the port(s) correctly.

UID-341 (warning) Design '%s' has '%d' unresolved references.
For more detailed information, use the "link" command.

DESCRIPTION

WHAT NEXT

UID-342 (error) The cell '%s' is not a synthetic library module, so `set_implementation` was not applied to it.

DESCRIPTION

Implementations can only be set on synthetic library modules. You cannot use `set_implementation` on non-synthetic library parts. You also cannot use `set_implementation` on synthetic library operators. It works for modules, not for operators. Use `report_cell` to see which cells are synthetic library modules.

This error can sometimes arise if the synthetic library in which this implementation resides has not been referred to in the `link_library` variable.

WHAT NEXT

Check the setting of the `link_library` variable to make sure it lists the synthetic library in which the module to which the cell refers resides. If not, update `link_library` and re-issue the `set_implementation` command.

If you want to set the implementation of a synthetic library operator, you can

include directives in your HDL source.

UID-343 (error) Invalid read_timing context. Valid contexts are vhdl, verilog.

DESCRIPTION

WHAT NEXT

UID-344 (warning) Can't %s synthetic operator '%s'.

DESCRIPTION

WHAT NEXT

UID-345 (error) The value for the 'max_levels' argument should be between 1 and %d for design '%s'.

DESCRIPTION

WHAT NEXT

UID-346 (warning) The -max_levels argument is ignored when -hierarchy

option is not given.

DESCRIPTION

WHAT NEXT

UID-347 (warning) Can't link reference '%s' to design '%s'.

DESCRIPTION

WHAT NEXT

UID-348 (warning) Creating virtual clock named '%s' with no sources.

DESCRIPTION

This warning occurs when a virtual clock is created. A virtual clock has a name but no sources. This means it is not applied to any ports or pins in the design. A virtual clock may be used to specify input or output delay.

WHAT NEXT

The command `create_clock -period 10 -name CLK` does not apply the clock to any sources. If you want to apply the clock to a pin or port, you must specify the pin or port as in `create_clock -period 10 CLK` or `create_clock -period 10 -name CLK ff1/CP`.

UID-349 (warning) Could not read any link_library files. The

link_library setting %s may be invalid.

DESCRIPTION

WHAT NEXT

UID-350 (warning) Could not infer bus %s for design %s, because its index range does not match its width.

DESCRIPTION

WHAT NEXT

UID-351 (warning) The variable '%s' is obsolete. Use %s.

DESCRIPTION

This variable has been replaced and no longer has any effect.

WHAT NEXT

In your script, replace the setting of this variable with the new setting.

UID-352 (error) At least one argument must be specified with this command.

DESCRIPTION

This command requires at least one argument. Please refer to the man page for the command for more information.

WHAT NEXT

UID-353 (error) Arguments '%s' and '%s' are mutually exclusive.

DESCRIPTION

Some of the arguments specified in the command are mutually exclusive. Please refer to the man page for the command for more information.

WHAT NEXT

UID-354 (error) '%s' is a bad option. Please specify '%s'.

DESCRIPTION

The argument is not what is expected by the command. Please refer to the man page for the command for more information.

WHAT NEXT

UID-360 (error) Options -transparent and -user only valid when setting scan FALSE.

DESCRIPTION

WHAT NEXT

UID-361 (error) Options -transparent and -user can not both be

specified.

DESCRIPTION

WHAT NEXT

UID-362 (error) Option -transparent can not be specified with non-latch cell/design %s.

DESCRIPTION

WHAT NEXT

UID-363 (warning) Port information will be listed for the design of the current instance. This information is not used for analysis or optimization unless `current_design` is set to '%s'.

DESCRIPTION

Attributes on subdesign ports are not considered for timing or optimization. Only those attributes on ports at the top level (as specified by the `current_design` command) are used. The `report_port` command shows the attributes for the design of the `current_instance`, but these attributes will not have an effect unless `current_design` is used to change the top-level design.

WHAT NEXT

If you want information on the ports of the current design, use the `current_instance` command, with no arguments, before issuing the `report_port` command. If you want the information about ports for the design of the current instance, you can ignore this warning message.

UID-364 (error) The `current_instance` is not a unique instantiation

of design %s. Please rerun command %s after running uniquify.

DESCRIPTION

WHAT NEXT

UID-365 (error) Cell %s is not owned by the current_instance.
Only cells in the current_instance can be specified.

DESCRIPTION

WHAT NEXT

UID-366 (error) Cell %s is not owned by the current_design.
Only cells in the current_design can be specified.

DESCRIPTION

WHAT NEXT

UID-367 (error) Design %s is not referenced by any cell in
current_design.
Only designs referenced in current_design can be specified.

DESCRIPTION

WHAT NEXT

UID-368 (error)
Only one design can be specified for top-down copying of

attributes.

DESCRIPTION

WHAT NEXT

UID-369 (warning)

The `-all` option to the `link` command is now obsolete.

Please add "*" at the head of your `link_library` variable to get this functionality.

DESCRIPTION

Make sure the astericks is in quotes when using the "*" option. A valid `link_library` setting is

```
link_library = {your_library.db, "*"}  
link_library = {your_library.db, "/*"}
```

WHAT NEXT

Use the "*" in your `link_library` variable instead of the `-all` option.

UID-370 (error) The design '%s' has clusters and cannot be modified by the 'group' command. Use the `remove_clusters` command to remove the clusters from the design first.

DESCRIPTION

The `group` command cannot be executed on a design with physical hierarchy because this would result in the hierarchical names of the design's cells changing. This situation would make it impossible for the tool that created the physical hierarchy to recognize the names.

WHAT NEXT

If appropriate, run the `remove_clusters` command to remove clusters from the design.

After the **group** command creates a new hierarchy, you may have to update your PDEF file so that the clusters in it correspond to the new logical hierarchy.

UID-371 (error) The '.' implementation can only be used with mapped synthetic modules.

DESCRIPTION

Using '.' as the implementation name locks a module to keep its current implementation. Since unmapped modules do not yet have their implementation chosen, it is impossible to know what implementation choice to lock.

WHAT NEXT

Use **compile** or **replace_synthetic** first to pick module implementations.

UID-372 (warning)

No cells found to copy attributes from.

DESCRIPTION

WHAT NEXT

UID-373 (error)

The specified range is different from the number of specified objects.

DESCRIPTION

WHAT NEXT

UID-374 (error)

No cells in design '%s' reference any of the specified designs.

DESCRIPTION

WHAT NEXT

UID-375 (error) Cannot use '%s' clock skew option on object '%s'
because the '%s' attribute is already set on that object.

DESCRIPTION

The **rise_delay** and **fall_delay** clock skew attributes are incompatible with the **propagated_clock** attribute. In other words, the network delay to register clock pins is either determined by the delay attributes (ideal), or by evaluating the delays along the clock network (propagated). This error occurs in two situations. If there are already **rise_delay** or **fall_delay** attributes on an object, and **set_clock_skew - propagated** is used, it is an error. Also, it is an error if the **propagated_clock** attribute is present on an object when **set_clock_skew** is used with one of the following options: **-delay**, **-rise_delay**, **-fall_delay**.

WHAT NEXT

The **remove_attribute** command should be used to remove the conflicting attribute before applying the new information.

UID-376 (warning) It is dangerous to create a clock source on inout port '%s'.

DESCRIPTION

A circuit in which a clock signal drives an inout port may be unpredictable. If the port is functioning as an output while the clock is driving, bus contention will occur. If the clock is three-stated, any registers in the clock's fanout may lose state.

WHAT NEXT

Verify that the circuit is safe according to your design rules. DesignTime will assume that the clock is valid

UID-377 (error) Clock '%s' is not ideal. Cannot set clock transition.

DESCRIPTION

The indicated clock has a propagated clock skew. Clock transitions can only be specified for ideal clocks.

WHAT NEXT

To indicate ideal clocks, use `set_clock_skew -ideal`.

UID-378 (error) '%s' is not a valid format.

DESCRIPTION

The format option for the `write_script` command must be either `dctcl` or `dcsh`.

WHAT NEXT

Either specify a valid `-format` option for `write_script` or don't specify that option and the result will be in the same format that the shell is currently being run in.

UID-379 (error) Cannot perform %s on the instance %s because parent is not a unique instantiation of design %s. Please rerun the command after uniquifying the instance.

DESCRIPTION

You have issued the command when the parent design is not unique. This command expects the parent design to be unique to make sure that the reference of the design is consistent.

WHAT NEXT

If the instance was passed by mistake please rerun the command after fixing it. Otherwise call `uniquify` command with `-cell` option to uniquify the parent instance and rerun the command.

UID-380 (error) Invalid minimum porosity constraint, must be between 0 and 90.

DESCRIPTION

The **set_min_porosity** command sets the minimum porosity constraint on the design. The minimum porosity constraint value must be a number between 0 and 90. If set to 0, no porosity optimization will be done. The maximum porosity constraint is 90. For example, if set to 20, Design Compiler optimizes the design so that, on average, 20% of the total cell area is available for over-the-cell routing.

WHAT NEXT

Use **set_min_porosity** with a number between 0 and 90.

UID-381 (error) You are not licensed to run routability optimization.

DESCRIPTION

The **set_min_porosity** command sets the minimum porosity constraint on the design. That is, it constrains the design for a minimum over-the-cell routing area. The routing layers use the over-the-cell routing area to route the design. Design Compiler can improve the routability of designs by favoring cells with over-the-cell routing.

WHAT NEXT

To improve the routability of your design, contact your sales representative to acquire a license to run optimization.

UID-382 (warning) Setting a minimum porosity constraint to less than the default %g in link libraries.

DESCRIPTION

The **set_min_porosity** command sets the minimum porosity constraint on the design. That is, it constrains the design for a minimum over-the-cell routing area. The routing layers use the over-the-cell routing area to route the design. The porosity constraint given is less than the default minimum porosity set in the technologies libraries in the link path. **report_constraint** uses the default minimum porosity constraint specified in the link libraries.

WHAT NEXT

With **report_lib**, verify the *default_min_porosity* values in the link libraries. If necessary, set the porosity constraint to a value greater than the minimum default in the link libraries.

UID-383 (error) The porosity constraint value is less than the default %g in target libraries.

DESCRIPTION

The **set_min_porosity** command sets the minimum porosity constraint on the design. That is, it constrains the design for a minimum over-the-cell routing area. The routing layers use the over-the-cell routing area to route the design. The porosity constraint given is less than the default minimum porosity set in the technologies libraries in the target path. **compile -routability** and **reoptimize_design -routability** use the default porosity constraint from the target libraries by default.

WHAT NEXT

Verify with **report_lib** the *default_min_porosity* values in the target libraries. Set the porosity constraint to a value greater than the minimum default in the target libraries if necessary.

UID-384 (error)

Invalid value specified for bus_naming_style : '%s'.

DESCRIPTION

WHAT NEXT

UID-385 (error) Invalid value specified for bus_range_separator_style %s.

DESCRIPTION

This error message occurs when you specify an invalid value for the **bus_range_separator_style** variable.

Invalid values are character strings that contain the following an odd number of % (percent symbols) followed by either the letter d or the letter s. All of the following are invalid values:

```
abc%%%d43  
xv%ssx
```

WHAT NEXT

Provide a valid value for the **bus_range_separator_style** variable and reexecute the command.

SEE ALSO

`create_bus(2)`
`bus_naming_style(3)`

UID-386 (warning) The variable '%s' is now obsolete. The following, equivalent variable is being set:
`%S = "%S"`

DESCRIPTION

This variable no longer has any effect. It has been replaced.

WHAT NEXT

Replace the setting of this variable in your script with the new setting.

UID-387 (warning) The variable '%s' is now obsolete. The following, equivalent variables are being set:
`%S = "%S", and,`
`%S = "%S"`

DESCRIPTION

These variables no longer have any effect. They have been replaced.

WHAT NEXT

Replace the settings of these variables in your script with the new settings.

UID-388 (error) Attribute '%s' does not exist on %s '%s'.

DESCRIPTION

The **set_attribute** command changes the value of existing attributes. If the attribute does not exist, then that attribute's value cannot be changed.

WHAT NEXT

The **set_attribute** command can be used to create a new attribute and set that attribute's value when **set_attribute** is used with the **-type** option. The **-type** option is used to specify the data type of the new attribute to be created. See the **set_attribute** manual page for more information on **set_attribute** and the **-type** option.

UID-389 (warning) Current operating conditions specify best_case_tree as the interconnect model. Annotated resistance will be ignored in this case.

DESCRIPTION

The **best_case_tree** model for interconnect assumes 0 interconnect delay. In this case, all annotated resistance values will be ignored.

WHAT NEXT

If **best_case_tree** is the desired interconnect model, then this message can be ignored. If the resistance values need to be accounted for during timing analysis, then choose a set of operating conditions which do not use the **best_case_tree** model to model the interconnect delay.

UID-390 (warning) All data in the names file '%s' is invalid.

DESCRIPTION

WHAT NEXT

UID-391 (error) The 'create_clock' command cannot be used on output port '%s'.

DESCRIPTION

Clock sources should be input ports or internal pins. In/out ports can be used, but they are not recommended because of bus contention issues.

WHAT NEXT

Identify a valid set of sources and reapply the **create_clock** command.

UID-392 (error) The object '%s' is a hierarchical object. You cannot set an IDQ-invalid condition on a hierarchical object.

DESCRIPTION

Invalid IDQ conditions must be specified in terms of logic values at ports of the design and at cell pins.

WHAT NEXT

UID-393 (error) No valid nodes specified for the **set_iddq_invalid_state** command.

DESCRIPTION

The '**set_iddq_invalid_state**' was used without specifying a pin/port list for either the **-logic_zero** or **-logic_one** conditions. In this case the command does nothing.

WHAT NEXT

Specify a list of ports and/or leaf pins for either the -logic_one or -logic_zero conditions.

UID-394 (error) Error in command input : set_iddq_invalid_state command ignored.

DESCRIPTION

All of the pins specified for the -logic_zero or -logic_one conditions of the 'set_iddq_invalid_state' command were on hierarchical cells. Only leaf pins or ports are allowed for this command.

WHAT NEXT

Specify only leaf pins or ports for the -logic_zero and -logic_one conditions of the 'set_iddq_invalid_state' command.

UID-395 (warning) Could not link design '%s'.

Therefore, the results of the filter command may be incorrect.

DESCRIPTION

The **filter** command automatically attempts to link the design before executing the filtering process. Therefore, this warning message is generated only if there were errors during the link.

If a design is not linked, some derived attributes will revert to their default values instead of having the values expected if the design were linked. Therefore, if the design cannot be linked, the **filter** command might not produce correct results.

For example, for a design that uses some sequential library cells that are not properly linked, the **is_sequential** attribute reverts to its default value of *false*, because there is no way to determine whether or not the design is sequential. This situation could occur if the design has not yet been linked, or if errors during the linking process prevent the sequential library cells from being linked properly.

Once the design is linked properly, however, then the **is_sequential** attribute maintains the correct value, and the **filter** command executes correctly.

WHAT NEXT

Resolve the link errors and then re-execute **filter**.

UID-396 (error) The cell '%s' does not reference a synthetic library operator DW03_mult_n_stage, so set_pipeline_stages was not applied to it.

DESCRIPTION

Cannot apply the 'set_pipeline_stages' command to the cell because it does not reference a synthetic library operator, DW03_mult_n_stage.

WHAT NEXT

Use report_cell to see which cells reference synthetic library operators DW03_mult_n_stage. Check the man page for the 'set_pipeline_stages' command.

UID-397 (error) You must chose one of {fixed min auto}.

DESCRIPTION

WHAT NEXT

UID-398 (warning) Pin '%s' does not belong to a cell in design '%s'.

DESCRIPTION

This warning occurs when calling cell_of command on an instance pin. The given pin belongs to a hierarchical cell of the current design.

WHAT NEXT

Set the current design to the design of that pin, then issue the cell_of command on the pin.

For example, if the message is

Warning: Pin 'U1/U2/U3/A' does not belong to a cell in design 'TOP'

cell_of can accept pins that belong to cells in the design TOP only. You are calling cell_of on an instance pin 'U1/U2/U3/A'. With this example, set current design to the design of instance 'U1/U2', then issue cell_of("U3/A");

UID-399 (error) Cannot perform %s on the instance %s because it is not unique. Please rerun the command after uniquifying the instance.

DESCRIPTION

You have issued the command when the instance is not unique. This command expects the instance to be unique to make sure that the reference of the design is consistent.

WHAT NEXT

If the instance was passed by mistake please rerun the command after fixing it. Otherwise call uniquify command with -cell option to uniquify the parent instance and rerun the command.

UID-400 (error) Design is already scan inserted, scan replaced or test ready.

DESCRIPTION

This error is generated when a design have been scan_replaced , is a test_ready or is scan_inserted. Since in all these cases the design have already been modified to have scan cells with an existing scan style, Hence it is not possible to change the scan style now.

WHAT NEXT

You can re read the design and set the new scan style and repeat the old flow to take into account the new scan_style.

UID-401 (warning) Design rule attributes from the driving cell will be set on the port.

DESCRIPTION

Design rule attributes from the driving cell will be set on the port when the set_driving_cell command is used. This is in addition to timing related parameters that are set on the port.

WHAT NEXT

Use the `-no_design_rule` option for `set_driving_cell` to avoid having design rules inferred.

UID-402 (warning) Specifying an input delay without an associated clock
can cause the port's timing to be analyzed incorrectly.

DESCRIPTION

If a port input delay is specified without reference to a clock, a default clocking waveform is inferred for the port's drivers, based on the flip-flops and latches in the port's transitive fanout. The input data will be assumed to be coming from an edge-triggered flip-flop clocked by the inferred waveform. The program attempts to figure out what the appropriate clock waveform should be, but there is no guarantee that the inferred clock will be appropriate for all cases. Therefore, it is safer to explicitly specify the clock whenever you set an input delay.

WHAT NEXT

To avoid having default clocks inferred, use the `-clock` option with `set_input_delay`. In some cases, the `-level_sensitive` and `-clock_fall` options might also be needed.

UID-403 (error) Can't read in the DB file '%s'.
File '%s' is created using program version '%s'
which is newer than '%s'.

DESCRIPTION

This error indicates that your db file is created using Synopsys program version which is newer than the current program.

WHAT NEXT

Check your db file, make sure it is created with Synopsys product whose version is not newer than the current program you are using.

UID-404 (error) No setup or hold margin was specified.

DESCRIPTION

Because no setup or hold margin was specified, no clock gating checks will be created.

WHAT NEXT

To specify margins for the clock gating checks, use the **-setup** or **-hold** options.

UID-405 (error) The `set_auto_ideal_nets` command is obsolete. Use `set_auto_disable_drc_nets` instead.

DESCRIPTION

Ideal nets are now defined as having ideal timing (zero latency and transition by default), no DRC checking, and **dont_touch** attributes set on them. The now-obsolete **set_auto_ideal_nets** command was not consistent with this definition of ideal, and has therefore been renamed to **set_auto_disable_drc_nets**. This command works in exactly the same way as **set_auto_ideal_nets**; it accepts the same arguments and by default disables DRC on clock and constant nets.

WHAT NEXT

Replace this command with the **set_auto_disable_drc_nets** command. Alternatively, if you want to set nets to be ideal, use **set_ideal_net** or **set_ideal_network** instead.

SEE ALSO

set_auto_disable_drc_nets (2), **set_ideal_net** (2), **set_ideal_network** (2).

UID-406 (information) `set_ideal_net` disables DRC, sets `dont_touch` on the net, and makes its timing ideal.

DESCRIPTION

This message informs you about the current behavior of the **set_ideal_net** command. Since release 2001.08, ideal nets are defined as having ideal timing (zero latency and transition by default), no DRC checking, and **dont_touch** attributes set on them. The previous behavior of the **set_ideal_net** command was only to switch off DRC checking for the net. To revert to the previous behavior, set the variable

use_ideal_net to true.

WHAT NEXT

This is an informational message only. No action on your part is required.

SEE ALSO

set_ideal_net (2), **set_ideal_network** (2); **use_ideal_net** (3).

UID-408 (warning) Current design named %s is hidden.

DESCRIPTION

This warning message occurs only in Incremental Mode.

You receive this warning message if the current design is hidden, either by a limited license or by a don't show reference.

Access to a design can be limited for either of the following reasons:

- The design is fully licensed, but it has not yet been mapped.
- The only license that could be checked out for the design was a limited license.

The result of limited access is that the internals of the design are hidden. You are not permitted to write the design out, view a schematic, or execute any commands that would allow you to see the internals. Certain commands, such as the **group** command, do not apply to limited designs.

WHAT NEXT

This is a warning message only. No action is required.

However if the result is not what you intended, you can do one of the following:

- If the design is not mapped, compile the design.
- If the design is limited because of licenses, check out a license that allows full access.

After making your changes, you can reexecute the command that issued this warning message.

SEE ALSO

set_design_license(2)

UID-409 (error) Cannot group the cell %s because its parent is not %s.

Only cells whose parents are same can be grouped.

DESCRIPTION

You have issued the command when the cells passed to group command have different parents. This command expects all the cells to have the same parent.

WHAT NEXT

Please rerun the command after fixing the error.

UID-410 (error) Unable to find replacement gate '%s'.

DESCRIPTION

The replacement gate specified in the set_combinatorial_type command could not be found in the target library.

WHAT NEXT

Either change the target_library variable to include the library which contains the replacement gate or change the replacement gate.

UID-411 (error) Replacement design '%s' is not a combinational gate.

DESCRIPTION

The replacement_gate in the set_combinatorial_type command is not a combinational gate.

WHAT NEXT

Set_combinatorial_type must have a combinational gate as its replacement gate. Specify a new replacement gate.

UID-412 (warning) Overriding compile directives for cell %s.

DESCRIPTION

The compile directives set by the **set_compile_directives** command are ignored for this cell. The **set_combinational_type** command must override the compile directives to ensure that this cell is only translated into the given replacement cell.

WHAT NEXT

Do not use **set_combinational_type** and **set_compile_directives** on the same cell.

UID-413 (warning) Overriding previous replacement cell for cell %s.

DESCRIPTION

There was a previous **set_combinational_type** command issued for this cell. The old command is ignored.

WHAT NEXT

The **set_combinational_type** overrides any previous **set_combinational_type** commands issued for this cell.

UID-414 (error) Cannot set_compile_directives on cell %s because it already has set_combinational_type

DESCRIPTION

There was a previous **set_combinational_type** command issued for this cell. You cannot **set_compile_directives** for the same cell because the **set_combinational_type** command needs to ensure that this cell is only translated into the particular replacement cell.

WHAT NEXT

Remove the **set_combinational_type** information by doing a remove_attribute <cell_name> combinational_type_exact.

UID-415 (error) Cell list contains generic cell %s.

DESCRIPTION

The **set_compile_directives** command has been called on a list of cells containing generic cells .

WHAT NEXT

Use **set_compile_directives** only on list of technology specific cells.

UID-416 (warning) The compile directive given by option %s had already been %s on all specified cells.

DESCRIPTION

A **set_compile_directives** command option has no effect because the corresponding directive had already been set for the specified cells.

WHAT NEXT

Check if the options of **set_compile_directives** are set correctly. Note that the default is TRUE.

UID-417 (error) Cell list contains synthetic operator cell %s.

DESCRIPTION

The **set_compile_directives** command has been called on a list of cells containing synthetic operators.

WHAT NEXT

Use **set_compile_directives** only on list of technology specific cells.

UID-418 (error) Cell list contains cell %s which is control logic of

SELECT_OPs.

DESCRIPTION

The **set_compile_directives** command has been called on a list of cells containing control logic of SELECT_OPs.

WHAT NEXT

Use **set_compile_directives** only on list of technology specific cells.

UID-420 (error) %s cannot be used on port with clock specified.

DESCRIPTION

WHAT NEXT

UID-421 (error) bc_dont_ungroup cannot be applied after the current design is scheduled.

DESCRIPTION

You receive this message if you attempt to use **bc_dont_ungroup** after the current design is scheduled. Currently, you must use **bc_dont_ungroup** before scheduling the current design.

WHAT NEXT

Apply **bc_dont_ungroup** before scheduling your design.

SEE ALSO

bc_dont_ungroup (2), **schedule** (2).

UID-422 (error) get_timing_paths requires a mapped design.

DESCRIPTION

You receive this error message if you attempted to use **get_timing_paths** with an unmapped design. You cannot generate a timing report for an unmapped design because the correct timing arcs are not available.

WHAT NEXT

Compile your design using the **compile** command before executing **get_timing_paths**.

SEE ALSO

compile (2), **get_timing_paths** (2).

UID-423 (error) Invalid path group name %s supplied with -group option.

DESCRIPTION

This error message occurs if you specify a non-existent path group name when using the **-group** option with the **report_timing** command.

WHAT NEXT

Specify a valid (existing) path group name when using the **-group** option and then run the **report_timing** command again.

Path groups are created implicitly according to the clock of the destination register of a path. You can also define a path group with via the **group_path** command. To see a list of all valid path groups, issue the **report_path_group** command. Any of the path group names listed can be supplied with the **-group** option in the **report_timing** command.

SEE ALSO

group_path(2)
report_path_group(2)
report_timing(2)

UID-424 (warning) The min ideal latency is greater than the max ideal latency

for the object '%s'. Using the latest value for both min and max.

DESCRIPTION

You receive this message because you set the minimum ideal latency higher than the maximum ideal latency for the specified object. The max ideal latency must be greater than or equal to the min ideal latency for the same object. The message informs you that the latest value entered is being used for both minimum and maximum ideal latency.

WHAT NEXT

If it is acceptable to you for the latest value to be used for both minimum and maximum ideal latency, no action is required on your part. However, if you want different values for the minimum and maximum ideal latency, reset these values using the **set_ideal_latency** command, and ensure that the maximum value is greater than or equal to the minimum value.

SEE ALSO

set_ideal_latency (2).

UID-425 (warning) You cannot set ideal latency on object %s, f because it is not a pin of a leaf cell or a port of the current design.

DESCRIPTION

You receive this message if you attempt to set an ideal latency on an object that is not a pin of a leaf cell (a cell that does not contain other cells), or a port of the current design. You can set an ideal latency only on leaf cell pins or top-level ports.

WHAT NEXT

Reexecute the **set_ideal_latency** command with an *object_list* that contains only leaf cell pins and/or top-level ports.

SEE ALSO

set_ideal_latency (2).

UID-426 (warning) You cannot set ideal transition time on object %s,

because it is not a pin of a leaf cell or a port of the current design.

DESCRIPTION

You receive this message if you attempt to set an ideal transition time on an object that is not a pin of a leaf cell (a cell that does not contain other cells) or a port of the current design. You can set an ideal transition time only on leaf cell pins or top-level ports.

WHAT NEXT

Reexecute the **set_ideal_transition** command with an *object_list* that contains only leaf cell pins and/or top-level ports.

SEE ALSO

set_ideal_transition (2).

UID-427 (warning) The clock source '%s' has ideal timing specified,

but the clock was just created as an ideal clock.

Ignoring previously-specified ideal timing for this clock source.

DESCRIPTION

You receive this message from the **create_clock** command to warn you that the specified clock source has ideal timing previously specified. Clocks created by the **create_clock** command are ideal clocks, which ignore ideal timing. This message warns you that the previously-specified ideal timing is being ignored for the specified clock source.

An ideal clock uses latency and transition specified by **set_clock_latency** and **set_clock_transition** and ignores an ideal timing. Therefore, you cannot use the **set_ideal_latency** and **set_ideal_transition** commands on this ideal clock.

WHAT NEXT

If it is acceptable to you that the previously-specified ideal timing is ignored for this clock, no action is required on your part. Otherwise, verify that the specified

clock source was the one you intended to use for creating an ideal clock. If so, and if you want to set latency and transition time on the ideal clock, use the **set_clock_latency** and **set_clock_transition** commands.

SEE ALSO

`create_clock (2)`, `set_clock_latency (2)`, `set_clock_transition (2)`, `set_ideal_latency (2)`, `set_ideal_transition (2)`.

UID-428 (warning) You cannot set an ideal latency on the clock source

%s, because it is an ideal clock. Ignoring the specified ideal latency.

DESCRIPTION

You receive this message if you attempt to set an ideal latency on a clock source created using the **create_clock** command. Clocks created using **create_clock** are ideal clocks, and you cannot set an ideal latency on an ideal clock. Instead, to set its latency, use the **set_clock_latency** command.

WHAT NEXT

If it is acceptable to you that the ideal latency is ignored for the specified ideal clock, no action on your part is required. Otherwise, if you want to set latency on the clock, do so using the **set_clock_latency** command.

SEE ALSO

`create_clock (2)`, `set_clock_latency (2)`, `set_ideal_latency (2)`.

UID-429 (warning) You cannot set an ideal transition time on the clock source

%s, because it is an ideal clock. Ignoring the specified ideal transition time.

DESCRIPTION

You receive this message if you attempt to set an ideal transition time on a clock source created using the **create_clock** command. Clocks created using **create_clock** are

ideal clocks, and you cannot set an ideal transition time on an ideal clock. Instead, to set its transition time, use the **set_clock_transition** command.

WHAT NEXT

If it is acceptable to you that the ideal transition time is ignored for the specified ideal clock, no action on your part is required. Otherwise, if you want to set a transition time on the clock, do so using the **set_clock_transition** command.

SEE ALSO

`create_clock` (2), `set_clock_transition` (2), `set_ideal_transition` (2).

UID-430 (error) No object was specified for the **set_clock_uncertainty** command.

DESCRIPTION

The clock uncertainty can be specified on a clock or a clock pin. You can also specify inter-clock uncertainty by using the **-from** and **-to** to specify from which clock to which clock to apply this uncertainty. The **rise_delay** and **fall_delay** clock skew. The source clock latency is the time it takes for a clock signal to propagate from its actual ideal waveform origin point to the clock definition point in the design. This attribute can be set on a clock source, or on the clock itself. In case it is set on the clock, it is applied to all the clock sources.

WHAT NEXT

Reapply the command with the relevant object(s).

UID-431 (error) -to **clock_name** is missing.

DESCRIPTION

This error message occurs when a required clock name is not specified. To set interclock uncertainty, specify a **-from** `from_clock` and **-to** `to_clock` pair. Use the **-from** and **-to** options only for interclock uncertainty.

To set uncertainty on a clock or a clock pin, specify the object name at the end of the command line.

WHAT NEXT

Run the command again using the correct options.

SEE ALSO

`set_clock_uncertainty(2)`

UID-432 (error) -from clock_name is missing.

DESCRIPTION

This error message occurs when the required clock name is missing. To set interclock uncertainty specify both the **-from** *from_clock* and **-to** *to_clock*. The **-from** and **-to** option are used only for interclock uncertainty.

To set uncertainty on a clock or a clock pin, specify the object name at the end of the command line.

WHAT NEXT

Rerun the command using the correct options.

SEE ALSO

`set_clock_uncertainty(2)`

UID-433 (error) Too many objects for inter clock uncertainty.

DESCRIPTION

To set inter-clock uncertainty use **-from** <*from_clock*> and **-to** <*to_clock*> option. To set uncertainty on a clock or a clock pin, just specify the object name at the end of the command line. These 2 different types of clock uncertainty values cannot be set in one command line.

WHAT NEXT

Reapply the command(s) with the correct options.

UID-434 (error) '%s' is not a name of a clock.

DESCRIPTION

To specify inter-clock skew the **-from** and **-to** options should be followed by a clock name. To specify a skew to a register, the object should be specified without the **-from** and **-to** option.

WHAT NEXT

Reapply the command with the correct syntax.

UID-435 (error) Cannot set clock source latency on '%s' . This attribute can be set on a clock or a clock source pin.

DESCRIPTION

The source clock latency is the time it takes for a clock signal to propagate from its actual ideal waveform origin point to the clock definition point in the design. If you receive this message, you have attempted to set clock source latency on an object other than a clock or a clock source pin. This attribute can be set on a clock source, or on the clock itself. If it is set on the clock, the attribute is applied to all clock sources.

WHAT NEXT

If you want to set clock source latency, you need to identify the relevant clock or clock source where you want to set it. If you want to set actual latency on a clock pin, use the **set_clock_latency** command without the **-source** option.

UID-436 (error) '-rise' and '-fall' options are valid only for inter-clock uncertainty

DESCRIPTION

You receive this message if you attempt to specify **-rise** and **-fall** options for an endpoint uncertainty; you can specify only one value for the setup check and one value for the hold check. The value is applied to both the rise and the fall transition. The **-rise** and **-fall** options are valid only for inter-clock uncertainty.

WHAT NEXT

Reapply the command with the correct syntax.

UID-437 (warning) '%s' option is obsoleted. Although it will still function normally now, please use '%s' command to replace this

option in the future.

DESCRIPTION

The specified option is obsolete, although it is still functional in the current software version. In the future, please use the replacement command.

WHAT NEXT

Replace the obsolete option with the specified command.

UID-438 (warning) Attribute '%s' is removed from object '%S'.

DESCRIPTION

The command executed caused the specified attribute to be removed from the specified object, either because the command must proceed without this attribute, or because the value of the attribute is invalid for this command.

WHAT NEXT

This message is for your information. No action is required on your part.

UID-439 (warning) '%s' command is obsoleted. Although it will still function normally now, please use '%s' command to replace this command in the future.

DESCRIPTION

DC is obsoleting this command. However, it is still functional in this version. In the future, please use the replacement command.

WHAT NEXT

Remove the obsolete commands, and replace it with the new command.

UID-440 (error) Can't write constraints file '%s'.

DESCRIPTION

Failed to open a script file in write mode. There can be several reasons for this. The most common reasons are: the user does not have write permissions in the directory, the disk is full or the user already has a file with the same name which can't be deleted.

WHAT NEXT

Try to create a file with the same name from the C shell. Fix any problem that you might encounter. Delete the file and invoke the dc_shell command again.

UID-441 (warning) You cannot specify an input transition time for the %s '%s'

using set_input_transition. Ignoring the transition time for this port.

DESCRIPTION

You receive this message if you specify an input transition for the specified ideal network port or ideal clock source, using **set_input_transition**. You cannot use **set_input_transition** for these objects; you must use **set_ideal_transition** for ideal network ports, and **set_clock_transition** for ideal clock sources. This message informs you that the input transition specified by **set_input_transition** is being ignored for the specified object.

WHAT NEXT

If it is acceptable to you that the input transition time is ignored, no action is required on your part. Otherwise, if you want to set an input transition time, use **set_ideal_transition** for an ideal network port and **set_clock_transition** for a clock source.

SEE ALSO

set_clock_transition (2), **set_ideal_transition** (2), **set_input_transition** (2).

UID-444 (error) '%s' is a PrimeTime option that is not supported

by Design Compiler.

DESCRIPTION

Although this option is supported by PrimeTime, Design Compiler does not currently support this option. You can check which option is supported by Design Compiler by executing "`command -help`" in **dc_shell**.

WHAT NEXT

Remove the option that is not supported.

UID-445 (warning) Ignoring %s objects in collection '%s' because they are not of type %s.

DESCRIPTION

You receive this error message when you specify a collection as an argument to a command, and some objects in the collection are not of a type accepted by the command. For example, you receive this error message if you execute the **report_net** command and not all of the objects in the specified collection are nets.

WHAT NEXT

Use the command **query_objects -verbose** to see the details of the objects in the collection and their types.

UID-446 (Error) For pattern '%s', %s.

DESCRIPTION

A problem has occurred while trying to compile the regular expression pattern shown.

WHAT NEXT

Review the description in the man page for `regexp` to identify and correct the problem. Make sure that you intended the pattern to be a regular expression instead of a simple string match. A common mistake is to mix up the use of the wildcard '*' in string match with the corresponding regular expression '.*'. Also, remember that in regular expressions, the square brackets '[', ']' by default enclose a range of characters, and must be escaped with a backslash to be treated as regular characters.

UID-447 (warning) Your SDC output may contain ambiguous names because you have set the variable `sdc_write_unambiguous_names` to FALSE.

DESCRIPTION

Beginning with version 1.2, the Synopsys Design Constraints (SDC) format has features which ensure that the cell, net, pin, lib_cell, and lib_pin names written to the file are unambiguous. Some third party applications do not understand these features, and to suppress them, you set the variable `sdc_write_unambiguous_names` to FALSE. This warning reminds you that the setting of this variable may cause your SDC output to be ambiguous.

WHAT NEXT

Verify that you really want to disable the writing of unambiguous names. Review the man pages for `write_sdc` and `sdc_write_unambiguous_names`.

UID-448 (warning) The sdc version specified is not valid. Valid options are 1.2, 1.3, 1.4, 1.5, and latest.

DESCRIPTION

You receive this message if you specify an invalid version with the `-version` option of `write_sdc`. Valid values for `-version` are 1.2, 1.3, 1.4, 1.5, and latest (the default). Notice that in this case, specifying latest or 1.5 are equivalent, as is issuing `write_sdc` without the `-version` option.

WHAT NEXT

Reexecute `write_sdc` and either specify a valid version with the `-version` option, or omit the `-version` option and get the latest version.

SEE ALSO

`write_sdc` (2).

UID-449 (warning) The sdc version specified is not valid for db

mode. Valid options are 1.2, 1.3, 1.4, and latest.

DESCRIPTION

You receive this message if you specify an invalid version with the **-version** option of **write_sdc**. When in DB mode the valid values for **-version** are 1.2, 1.3, or 1.4. Notice that in this case, specifying 1.4 is equivalent to issuing **write_sdc** without the **-version** option.

WHAT NEXT

Reexecute **write_sdc** and either specify a valid version with the **-version** option, or omit the **-version** option and get the latest supported version.

SEE ALSO

write_sdc (2)

UID-450 (Warnning) Value for %s is negative.

DESCRIPTION

A negative value was given in the command line; the value was accepted.

WHAT NEXT

It is the user's responsibility to verify that the negative value is a valid value to describe this property.

UID-451 (Warnning) '%s' option is ignored when '%s' argument is present.

DESCRIPTION

The given option is ignored to the current command when the specified argument is present. The command performs without the given option.

WHAT NEXT

UID-452 (Warning) Empty object list.

DESCRIPTION

You receive this message if you execute the **report_net_fanout** command with an empty pair of braces ({}) for the *net_list* argument, or with all members of *net_list* invalid. This condition could be caused by spelling errors or typos, or by listing nets for the wrong instance.

WHAT NEXT

If you want **report_net_fanout** to generate the report for all nets in the current instance, execute the command without the optional *net_list* argument. Otherwise, verify that the net list is correct for the current instance and that the names are spelled correctly. Then reexecute the **report_net_fanout** command.

SEE ALSO

report_net_fanout (2).

UID-453 (error) The argument of the -bound option must be larger than the argument of the -threshold option.

DESCRIPTION

You receive this message if you execute the **report_net_fanout** command and specify a value for the **-bound** option that is smaller than or equal to the value for the **-threshold** option. The **-bound** option represents the upper level of fanout for displaying nets, while the **-threshold** option represents the lower level. Therefore, the value of **-bound** must be larger than the value of **-threshold**.

WHAT NEXT

Reexecute the **report_net_fanout** command and specify a value for the **-bound** option that is larger than the value for the **-threshold** option.

SEE ALSO

report_net_fanout (2).

UID-455 (error) The value %s is not a legal option for the set_transform_for_retimming command.

DESCRIPTION

The `set_transform_for_retimming` command can only have the values `-multiclass`, `-decompose`, or `-dont_retime`.

WHAT NEXT

Check the spelling and choose either the `-multiclass`, `-decompose` or `-dont_retime` option for the `set_transform_for_retimming` command.

UID-456 (error) The value %s is not a legal option for the set_state_for_retimming command.

DESCRIPTION

The comand `set_state_for_retimming` can only have the values `-preserve` or `-dont_care`.

WHAT NEXT

Check the spelling and specify the `-preserve` or `-dont_care` option for the `set_state_for_retimming` command.

UID-457 (error) Cannot set size_only on cell '%s'.

DESCRIPTION

The `set_size_only` command works only on leaf cells.

WHAT NEXT

When you use `set_size_only`, make sure the cell you specify is a leaf cell.

UID-458 (warning) Cannot perform '%s' on object '%s' because

it is not a port.

DESCRIPTION

The specified object is not a port. The command cannot be applied.

WHAT NEXT

UID-459 (warning) Cannot perform '%s' on object '%s' because it is not a port.

DESCRIPTION

The specified object is not a port. The command can not be applied.

WHAT NEXT

Varify that the specified object is not a port.

UID-460 (error) Option '%s' is only available for dc_shell-t.

DESCRIPTION

The indicated option is only available in Tcl mode (dcshell-t).

WHAT NEXT

Start dc_shell as dc_shell-t or dc_shell -tcl_mode.

UID-461 (error) The -xg_mode option is not available.

DESCRIPTION

This error message occurs when the **-xg_mode** option is not available for the current release, or when there is a problem with accessing proper license features.

WHAT NEXT

Start dc_shell without using the `-xg_mode` option.

UID-462 (error) Invalid implementation '%s' for cell '%s'.

DESCRIPTION

The specified implementation for the synthetic cell does not exist in the specified synthetic libraries.

WHAT NEXT

Verify the existence of the specified implementation in the synthetic libraries. You can use the `report_synlib` command to list the contents of the synthetic library.

UID-463 (error) %s name is required to set implementation on operator '%s'.

DESCRIPTION

Either module name or implementation name is missing when setting implementation on operator.

WHAT NEXT

Reissue the `set_implementation` command with the implementation string that contains the module name and implementation name in the "<module_name>/<impl_name>" format.

UID-464 (error) Invalid module '%s' or implementation '%s' for cell '%s'.

DESCRIPTION

The specified module name or implementation name on operator cell does not exist in the synthetic libraries.

WHAT NEXT

Verify the existence of the specified implementation in the synthetic libraries. You

can use the `report_synlib` command to list the contents of the synthetic library.

UID-465 (error) Incorrect arguments to the `set_retimming_bound` command. Choose either the `-forward` or `-backward` option to specify the direction of the `retiming_bound`.

DESCRIPTION

This error message occurs because the `set_retimming_bound` command can only have the value of `-forward` or `-backward`.

WHAT NEXT

Check the spelling and rerun the `set_retimming_bound` command with either `-forward` or the `-backward`.

SEE ALSO

`set_retimming_bound(2)`

UID-466 (error) Missing arguments to command `set_retimming_bound`. Specify the direction of the `retiming_bound` using the `-forward` or `-backward` option.

DESCRIPTION

This error message occurs because the `set_retimming_bound` command requires either the `-forward` or `-backward` option to specify the direction that the registers move.

WHAT NEXT

Rerun the `set_retimming_bound` command with either `-forward` or `-backward`.

SEE ALSO

`set_retimming_bound(2)`

UID-467 (error) The '`%s`' option is not supported in Design

Compiler.

DESCRIPTION

This error message occurs when the specified option is not supported by Design Compiler.

WHAT NEXT

Rerun the command without the option.

SEE ALSO

[report_qor\(2\)](#)

UID-468 (warning) The '%s' option is not supported in Design Compiler and will be ignored.

DESCRIPTION

This warning message occurs when the specified option is not supported by Design Compiler.

WHAT NEXT

Rerun the command without the option.

SEE ALSO

UID-470 (warning) It is dangerous to create a generated clock on an inout port '%s'.

DESCRIPTION

A circuit in which a generated clock drives an inout port may be unpredictable. If the port is functioning as an output while the generated clock is driving, bus contention will occur. If the generated clock is three-stated, any registers in the generated clock's fanout may lose state.

WHAT NEXT

Verify that the circuit is safe according to your design rules. DesignTime will assume that the generated clock is valid.

UID-471 (error) The 'create_generated_clock' command cannot be used on output port '%s'.

DESCRIPTION

Generated clocks should be input ports or internal pins. In/out ports can be used, but they are not recommended because of bus contention issues.

WHAT NEXT

Identify a valid set of sources and reapply the `create_generated_clock` command.

UID-472 (error) You can specify only a single object for master clock source.

DESCRIPTION

The `-source` option takes only a single object as an argument.

WHAT NEXT

You can have a generated clock derived from a single clock. You cannot generate a clock from more than one master clock.

UID-473 (error) The number of edges specified '%d' is not an odd number > 3.

DESCRIPTION

The number of edges to make one period of the generated clock waveform has to be an odd number > 3.

WHAT NEXT

Carefully specify edges and ensure that you specify one full clock cycle using the edges.

UID-474 (Error) In the -edge specification of create_generated_clock

'%s', the edge numbers must be greater than zero and in increasing order.

DESCRIPTION

In the -edge specification of a create_generated_clock command, the edge numbers specified must be in increasing order. The edge numbers should also be greater than zero, since it refers to the edge-number of the master clock.

WHAT NEXT

Check the -edge spec in create_generated_clock command and edge numbers increasing.

UID-475 (Error) The master source must be specified.

DESCRIPTION

For **create_generated_clock**, the -source option must be specified. This option specifies the source of the generated clock.

WHAT NEXT

Specify -source in the create_generated_clock command.

UID-476 (warning) Converting propagated clock at '%s' to ideal clock.

DESCRIPTION

You receive this message if you use **set_clock_latency** to set network latency on a propagated clock. Clocks processed by **set_clock_latency** are automatically converted to ideal clocks. The **set_propagated_clock** command is normally used to set propagated

clock network latency. This message warns you that the specified propagated clock is being converted to an ideal clock.

WHAT NEXT

This is a warning message only. If it is acceptable to you that the specified propagated clock is converted to an ideal clock, no action is required on your part. Otherwise, if you want the clock to be propagated, do not use **set_clock_latency** on the clock; use **set_propagated_clock** to specify a propagated clock latency.

SEE ALSO

set_clock_latency (2), **set_propagated_clock** (2).

UID-477 (warning) Converting ideal clock at '%s' to propagated clock.

DESCRIPTION

You receive this message if you use **set_propagated_clock** to set the **propagated_clock** attribute on a clock on which you previously set latency or transition. Clocks for which latency or transition have been set are automatically considered to be ideal clocks. Setting the **propagated_clock** attribute on an ideal clock converts it to a propagated clock. This message warns you that the specified ideal clock is being converted to a propagated clock, and the previously-specified latency or transition will not be used.

WHAT NEXT

This is a warning message only. If it is acceptable to you that the specified ideal clock is converted to a propagated clock, no action is required on your part. Otherwise, if you want the clock to remain ideal, remove the **propagated_clock** attribute using the **remove_propagated_clock** command, and the previously-specified latency and transition values will be used.

SEE ALSO

remove_ideal_clock (2), **set_clock_latency** (2), **set_propagated_clock** (2).

UID-478 (Error) Virtual clock '%s' cannot be made propagated.

DESCRIPTION

You receive this message if you attempt to set a **propagated_clock** attribute on a

virtual clock. You cannot specify a virtual clock as a propagated clock, because virtual clocks do not have any source and cannot be made propagated.

WHAT NEXT

Review your design to verify your intended clock scheme.

SEE ALSO

`set_propagated_clock` (2).

UID-479 (Error) Clock transition cannot be specified for virtual clock ‘%s’ .

DESCRIPTION

You receive this message if you attempt to use the `set_clock_transition` command on a virtual clock. You cannot specify clock transitions on virtual clocks, because they do not have any source.

WHAT NEXT

Review your design to verify your intended clock scheme.

SEE ALSO

`set_clock_transition` (2).

UID-480 (Warning) Clock transition specified for propagated clock ‘%s’ will be ignored.

DESCRIPTION

You receive this message if you attempt to specify a clock transition on a propagated clock using `set_clock_transition`. You can specify clock transitions only for ideal clocks. This message warns you that the clock transition you specified is being ignored for the clock.

WHAT NEXT

If it is acceptable to you that the clock transition is ignored for this clock, no action is required on your part. Otherwise, if you want to specify a clock

transition for the clock, remove the `propagated_clock` attribute from it using `remove_propagated_clock`. Then reexecute `set_clock_transition`.

SEE ALSO

`remove_propagated_clock` (2), `set_clock_transition` (2).

UID-481 (error) White spaces are not allowed in the string '%s'.

DESCRIPTION

This error message occurs when white spaces appear in the input. This command does not allow any white space, such as tabs or spaces, in the string argument.

WHAT NEXT

Rerun the command without any white space in the string argument.

UID-482 (error) An empty string argument was found.

DESCRIPTION

This error message occurs when an empty string is entered as an argument. This command does not allow empty strings as arguments.

WHAT NEXT

Rerun the command with a non-empty string argument.

UID-483 (error) Not allowed to remove default power (or ground) net '%s'.

DESCRIPTION

This error occurs because the tool attempted to remove from the design the default power net stored in the `mw_logic1_net` variable (or the `mw_logic0_net` variable), which is not allowed. You are allowed to remove other power nets.

WHAT NEXT

Eliminate any command that attempts to remove the default power net.

UID-485 (error) Cannot specify %s without -source.

DESCRIPTION

This error message occurs when a specified command option requires another option, which is omitted.

WHAT NEXT

Refer to the manual page for this command for detailed information on valid options and rerun the command.

UID-486 (warning) The output of the propagate_constraints command is in DCSH mode. Use the UNIX utility dc-transcript to convert DCSH script to DC-Tcl script.

DESCRIPTION

You receive this message because you executed the **propagate_constraints** command from **dc_shell-t**; that is, in DC-Tcl mode. This message warns you that whether you execute the **propagate_constraints** command in DCSH-mode or in DC-Tcl mode, the output is always in DCSH mode. Thus, the script you generate is in DCSH mode.

WHAT NEXT

To convert the script from DCSH format to DC-Tcl format, use the UNIX **dc-transcript** utility.

SEE ALSO

propagate_constraints (2).

UID-487 (warning) The '%s' option is obsolete. It is ignored.

DESCRIPTION

WHAT NEXT

UID-488 (error) Control value '%s' already specified for '%s'.

DESCRIPTION

You receive this error message if you attempt to set the noncontrolling value for a particular object to high or low when you have already specified the opposite noncontrolling value for this object through a previous **set_clock_gating_check** command. This message informs you that you cannot specify both high and low noncontrolling values for the same object.

WHAT NEXT

If you want to reset or change the **-high** or **-low** option, first execute the **remove_clock_gating_check** command, then reexecute the **set_clock_gating_check** command with the desired option. Only use the **-high** or **-low** option when you are certain about the controlling value for a particular cell.

SEE ALSO

set_clock_gating_check (2).

UID-489 (error) Cannot specify %s option for '%s'. Can only specify on cells or pins.

DESCRIPTION

You receive this message if you execute the **set_clock_gating_check** command and specify both the **-hi** and **-low** options on objects that are neither cells nor pins.

WHAT NEXT

Use the **-high** or **-low** options only on cells or pins.

SEE ALSO

`set_clock_gating_check` (2).

UID-490 (error) Cannot specify both high and low for the same object.

DESCRIPTION

You receive this message if you executed the `set_clock_gating_check` command and specified both the `-high` and `-low` options for the same object. This message informs you that you can set the noncontrolling value of the clock for this particular clock gating check to be the high or the low interval of the clock, but not both.

WHAT NEXT

Reexecute the `set_clock_gating_check` command and specify either the `-high` or `-low` option. Use these options only when you are very certain about the controlling value of the clock for a particular cell.

SEE ALSO

`set_clock_gating_check` (2).

UID-491 (error) Only one clock can be specified.

DESCRIPTION

You receive this message if you executed the `set_input_delay`, `set_output_delay`, `remove_input_delay`, or `remove_output_delay` and specified multiple clocks in the `-clocks` option. You can only specify one clock for this option.

WHAT NEXT

Reexecute the command and only choose one clock.

SEE ALSO

`set_input_delay` (2), `set_output_delay` (2), `remove_input_delay` (2),
`remove_output_delay` (2).

UID-492 (error) Object specified in -clock option must be a clock type.

DESCRIPTION

You receive this message if you executed the **set_input_delay**, **set_output_delay**, **remove_input_delay**, or **remove_output_delay** and specified a non-clock object in the -clocks option. You can only specify one clock object for this option.

WHAT NEXT

Reexecute the command and only choose one clock object.

SEE ALSO

set_input_delay (2), **set_output_delay** (2), **remove_input_delay** (2),
remove_output_delay (2).

UID-493 (error) Timing derate value should be bigger than 0 and smaller than 2.0.

DESCRIPTION

This error message occurs when the timing value is not within the acceptable range. The timing derate value must be larger than 0 and smaller than 2.0.

WHAT NEXT

Specify a value within the range of 0 to 2.0 and run the command again.

SEE ALSO

set_timing_derate(2)

UID-494 (warning) No -early or -late option is specified.

DESCRIPTION

This warning message occurs when running the **set_timing_derate** command without specifying either the **-early** or the **-late** option. When neither option is specified, the default is that both are set to **true**, and the derate value is applied to both.

WHAT NEXT

This is only a warning message. No action is required on your part.

However, if you do not want the derate value to apply to both options, run the command again and specify either the **-early** or the **-late** option.

SEE ALSO

`set_timing_derate(2)`

UID-495 (error) Cannot specify %s option with object list.

DESCRIPTION

This error message occurs if you execute the **set_timing_derate** command and specify the **-net_delay** option on the object list.

WHAT NEXT

Execute the command again with the **-net_delay** option but without the object list.

SEE ALSO

`set_timing_derate(2)`

UID-496 (warning) SDC does not allow -min and -max deratings

DESCRIPTION

This warning occurs if you execute the **write_sdc** command and there is a difference between the **-min** and **-max** settings of **set_timing_derate**. These switches are not found in SDC and as a result this information is lost when producing the SDC output. To be safe, the **write_sdc** command will produce the lesser of the two numbers for the early derating, and the greater of these two numbers for the late derating, although this may give overly pessimistic results further downstream.

WHAT NEXT

Examine the instances of **set_timing_derate** in the SDC output to determine whether the values are the most appropriate for tools that will make use of the SDC constraints.

SEE ALSO

`set_timing_derate(2)`, `write_sdc(2)`

UID-499 (warning) The clock %s is not a generated clock. This command removes only generated clocks.

DESCRIPTION

One or more clock(s) specified in your command arguments is not a generated clock. The `remove_generated_clock` command can remove only generated clocks. This is not an error though.

WHAT NEXT

You can use `remove_clock` command to remove non-generated (or Master) clocks. To know more about this, see help for `create_clock`, `create_generated_clock`, `remove_clock`, `remove_generated_clock`.

UID-500 (warning) Pin '%s' is hierarchical and not valid for case analysis.

DESCRIPTION

You receive this warning message because you specified hierarchical pins as objects for `set_case_analysis` and `remove_case_analysis`. Therefore, case analysis is not being set or removed on the specified pin. If there are multiple pins specified in the object_list, case analysis values will still be set or removed on nonhierarchical pins or ports.

WHAT NEXT

Do not specify hierarchical pins for `set_case_analysis` and `remove_case_analysis`.

SEE ALSO

`remove_case_analysis (2)`, `set_case_analysis (2)`.

UID-501 (error) There are no valid objects specified for case

analysis.

DESCRIPTION

You receive this error message because you did not provide a list of nonhierarchical pins or ports when you executed the **set_case_analysis** command or the **remove_case_analysis** command.

WHAT NEXT

Specify a valid set of non-hierarchical pins or ports.

SEE ALSO

remove_case_analysis (2), **set_case_analysis** (2).

UID-502 (error) Value '%s' is not a valid value.

DESCRIPTION

You receive this error message because you did not specify a valid value with the **set_case_analysis** command. Valid values are 0, 1, zero, and one.

WHAT NEXT

Specify a valid value for the **set_case_analysis** command.

SEE ALSO

set_case_analysis (2).

UID-503 (error) Rising and falling values are not currently supported.

DESCRIPTION

You receive this error message because you did not specify valid values with the **set_case_analysis** command. Valid values are 0, 1, zero, and one. Although PrimeTime supports rise, fall, rising, and falling, these options are not currently supported in DesignTime.

WHAT NEXT

Specify valid values for the **set_case_analysis** command.

SEE ALSO

set_case_analysis (2).

UID-504 (error) Must specify either -all or object_list.

DESCRIPTION

You receive this error message because you have not specified a value with the **remove_case_analysis** command. You must specify either an object list or the **-all** option with this command.

WHAT NEXT

Reexecute the **remove_case_analysis** command and specify either an object list or the **-all** option.

SEE ALSO

remove_case_analysis (2).

UID-505 (error) Cannot specify both -all and object_list.

DESCRIPTION

You receive this error message because you have executed the **remove_case_analysis** command and have specified the **-all** option and an object list. You can only specify one of these arguments with the **remove_case_analysis** command.

WHAT NEXT

Reexecute the **remove_case_analysis** command and specify either the **-all** option or an object list.

SEE ALSO

remove_case_analysis (2).

UID-506 (error) Cannot change link for instance cell '%s'.

DESCRIPTION

You receive this error message because you have executed the **change_link** command for an instance cell.

WHAT NEXT

Reexecute the **change_link** command without instance cells.

UID-510 (error) In Dcl mode, you can specify only one mode with the set_mode command.

DESCRIPTION

You receive this error message because you have executed the **set_mode** command and specified more than one mode. This is invalid and, as a result, no modes are set by this command.

WHAT NEXT

Reexecute the **set_mode** command and specify only one mode.

SEE ALSO

set_mode (2).

UID-511 (error) Specified instance %s not valid. Must be a cell.

DESCRIPTION

You receive this error message because you have issued the **set_mode** command on an instance that is not a cell. This is invalid and, as a result, no modes are set by this command.

WHAT NEXT

Reexecute the **set_mode** command and specify a mode on a cell or a cell instance.

SEE ALSO

set_mode (2).

UID-520 (error) Ungroup -start_level does not work when the variable disable_2001_ungroup is true.

DESCRIPTION

This message is issued when the variable disable_2001_ungroup is true and ungroup -start_level option is used. The -start_level option is not supported in the old version of ungroup and so this error message is issued. The same error message will be generated when trying to use ungroup -start_level for Behavioral compiler designs. A Behavioral Compiler design will have the attribute is_post_scheduled_design.

WHAT NEXT

Set the variable disable_2001_ungroup to false. If the error message still occurs, verify that the design is not a Behavioral Compilerdesign. If the design is a BC design, the -start_level option is not supported. To ungroup different levels of the design, use a combination of current_instance and ungroup. See the man page of ungroup for more details.

SEE ALSO

ungroup(2).

UID-521 (error) Ungroup -start_level cannot be used in conjunction with -small option.

DESCRIPTION

This message is issued when the -small and -start_level options are used together with the ungroup command. Both of these two options represent completly different strategies.

WHAT NEXT

Use either the -small option or the -start_level option.

SEE ALSO

[ungroup\(2\)](#).

UID-523 (Warning) Some valid instances of design '%s' are not ungrouped due to dont_touches or other MV-related constraints in other instances.

DESCRIPTION

This message is issued when ungroup -flatten, ungroup -small or ungroup -start_level is used where one or more instances of the design's multiply-instantiated sub-blocks has an instance-specific dont_touch attribute placed on one of its child cells, or has instance specific operating condition that is different from the owner block. Ungroup cannot be performed where it may change certain instances such that all instances of a sub-design can no longer point to the same reference. This problem does not occur if the dont_touches or Mv-related constraint are not instance specific.

WHAT NEXT

If it is not OK, remove the instance specific dont_touch or constraints and run ungroup again. Or use uniquify command to uniquify the design.

SEE ALSO

[ungroup\(2\)](#), [uniquify\(3\)](#).

UID-524 (Warning) Some valid instances of design '%s' are not ungrouped because of some instances outside the start_level"

DESCRIPTION

This message is issued when ungroup -start_level option is used in the case where one or more instances of the design's multiply-instantiated sub-block has a child cell which does not fall into the range of specified levels to be ungrouped. Ungroup cannot be performed where it may change certain instances such that all instances of a sub-design can no longer point to the same reference.

WHAT NEXT

Use ungroup -flatten option to flatten the design. Or, simply use the uniquify command to uniquify the design.

SEE ALSO

`ungroup(2), uniquify(2).`

UID-526 (error) No valid cells to ungroup within the level specified.

DESCRIPTION

This message is issued when there are simply no valid cells to be ungrouped from the specified -start_level downwards. In this case, nothing will be ungrouped.

WHAT NEXT

None.

SEE ALSO

`ungroup(2).`

UID-527 (error) Writing designs in DB format is no longer supported. Option xg_force_db is ignored.

DESCRIPTION

This message is issued when you are trying to write the design in XG mode in DB Format. Due to capacity reasons, it is recommended to write the netlist using DDC format instead of DB format.

WHAT NEXT

Please use a different format such as ddc to write out the netlist.

SEE ALSO

`write(2).`

UID-528 (warning) Writing designs in DB format is no longer

supported.

DESCRIPTION

This message is issued when you are trying to write the design in XG mode in DB Format. Due to capacity reasons, it is recommended to write the netlist using DDC format instead of DB format.

WHAT NEXT

Modify your scripts to write DDC format or ignore this error message if the usage was intentional.

SEE ALSO

`write(2).`

UID-529 (warning) A previous '%s' attribute on net '%s' will be overwritten.

DESCRIPTION

The `set_attribute` command can be used to specify the wired logic type of a net. This warning is given when a previous wire logic type exists and is different from the one being set.

WHAT NEXT

To avoid this warning message, use `remove_attribute` command to remove the existing wired logic attribute before setting the new wired logic attribute on the net.

UID-530 (Error) Writing designs in DB format is no longer supported.

DESCRIPTION

This message is issued when you are trying to write the design in XG mode in DB Format. Due to capacity reasons, it is recommended to write the netlist using DDC format instead of DB format.

WHAT NEXT

Modify your scripts to write DDC format or ignore this error message if the usage was intentional.

SEE ALSO

`write(2)`.

UID-531 (Warning) Some valid instances of design '%s' passed as an argument to ungroup -all_instances option are not ungrouped due to dont_touches in other instances or other MV-related constraints in this instance or other instances.

DESCRIPTION

This message is issued when ungroup -all_instances is used where one or more instances of the design's multiply-instantiated sub-blocks has an instance-specific dont_touch attribute or datapath_optimization attribute placed on one of its child cells, or has instance specific operating condition/ power domains that is different from the owner block. Ungroup cannot be performed where it may change certain instances such that all instances of a sub-design can no longer point to the same reference. This problem does not occur if the dont_touches or Mv-related constraint are not instance specific.

WHAT NEXT

If it is not OK, remove the instance specific dont_touch or constraints and run ungroup again. Or use uniquify command to uniquify the design.

SEE ALSO

`ungroup(2),uniquify(3)`, OPT-774.

UID-540 (error) -scenarios and -active_scenarios may only be used with ddc format

DESCRIPTION

The `-scenarios` and `-active_scenarios` options to the `read_file` command may only be used if `-format ddc` is specified.

WHAT NEXT

Verify that the correct format option has been supplied to the **read_file** command.

SEE ALSO

`read_file(2)`
`read_ddc(2)`

UID-541 (error) -active_scenarios may not be used without -scenarios

DESCRIPTION

The **read_file** command's *-active_scenarios* option may only be used if the *-scenarios* option is also specified.

WHAT NEXT

See **read_file(2)** for more information on controlling which scenarios' constraints are read from the ddc file.

SEE ALSO

`read_file(2)`
`read_ddc(2)`
`set_active_scenarios(2)`
`all_scenarios(2)`
`all_active_scenarios(2)`

UID-542 (error) All scenario names specified in -active_scenarios must also be specified in -scenarios

DESCRIPTION

The **read_file** command's *-active_scenarios* option may only contain scenario names that are also listed in the *-scenarios* option. The *-scenarios* option, however, may contain names that are not included in *-active_scenarios*.

WHAT NEXT

See **read_file(2)** for more information on controlling which scenarios' constraints

are read from the ddc file.

SEE ALSO

```
read_file(2)
read_ddc(2)
set_active_scenarios(2)
all_scenarios(2)
all_active_scenarios(2)
```

UID-550 (error) Unable to read the library '%s' from '%s'.

DESCRIPTION

This error message occurs when the library has been pruned to provide optimal performance of the tool. The library will be re-read from the disk on demand to restore the necessary information to memory.

The library has been removed or moved to a different location. This message occurs because the tool does not expect the library files to be removed within a session.

WHAT NEXT

Copy the library file to the appropriate location and rerun the command.

UID-600 (error) Illegal type '%s'. Must be either "buffer" or "inverter".

DESCRIPTION

You receive this message if you execute the **set_isolate_ports** command and use an invalid argument for the **-type** option. Valid arguments for **-type** are "buffer" and "inverter". To see a listing of options and arguments, from within dc_shell enter **set_isolate_ports -help**.

WHAT NEXT

Reexecute **set_isolate_ports** and use a valid argument for the **-type** option.

UID-601 (error) Cannot isolate port '%s' because it is an '%s'

port; only input or output ports can be isolated.

DESCRIPTION

You receive this message if you execute **set_isolate_ports** and specify a port that is an inout port. You can isolate only input or output ports.

WHAT NEXT

Reexecute the **set_output_ports** command and ensure that the list of ports contains only input or output ports.

UID-602 (error) Can't specify <power_value> or <power_unit> when -delete_all is specified

DESCRIPTION

You receive this message if you specify <power_value> or <power_unit> along with '-delete_all' option to **set_cell_internal_power** command.

WHAT NEXT

Reexecute the **set_cell_internal_power** command and ensure that you specify either '-delete_all' option or <power_value> and/or <power_unit>.

UID-603 (error) There are no valid objects specified for set_cell_internal_power command.

DESCRIPTION

You receive this message if you do not specify <pin_objects> or '-delete_all' option to **set_cell_internal_power** command.

WHAT NEXT

Re-execute the **set_cell_internal_power** command and ensure that you specify either '-delete_all' option or list of pins where you want to annotate the power number.

UID-604 (information) It is recommended to use

set_ideal_network command instead of set_ideal_net.

DESCRIPTION

This information message occurs because the **set_ideal_net** and **set_ideal_network** commands are being combined. The **set_ideal_network** command is replacing **set_ideal_net**.

In the 2004.12 release, the **set_ideal_net** command is replaced by the following command, which is applied to the same objects:

```
set_ideal_network -no_propagate
```

WHAT NEXT

This is only an informational message. No action is required.

SEE ALSO

```
set_ideal_net(2)  
set_ideal_network(2)  
use_old_ideal_net(3)
```

UID-605 (warning) Replacing set_ideal_net command with set_ideal_network -no_propagate command.

DESCRIPTION

This warning message occurs because the **set_ideal_net** and **set_ideal_network** commands are being combined. The **set_ideal_network** command is replacing **set_ideal_net**.

The attributes are applied on the global driver pins of the specified nets, instead of applying the *ideal_net* attribute on the specified nets.

In the 2004.12 release, the **set_ideal_net** command is replaced by the following command, which is applied to the same objects:

```
set_ideal_network -no_propagate
```

WHAT NEXT

This is only an informational message. No action is required.

SEE ALSO

```
set_ideal_net(2)
set_ideal_network(2)
use_old_ideal_net(3)
```

UID-606 (warning) Transferring ideal_net attribute onto the driver pin %s of net %s.

DESCRIPTION

This warning message occurs because the **set_ideal_net** and **set_ideal_network** commands are being combined. The **set_ideal_network** command is replacing **set_ideal_net**.

In the 2004.12 release, the **set_ideal_net** command is replaced by the following command:

```
set_ideal_network -no_propagate
```

The attribute for *ideal_net* is transferred from the specified nets to the global driver pins of those nets, and is translated to the corresponding ideal network attributes.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

```
set_ideal_net(2)
set_ideal_network(2)
use_old_ideal_net(3)
```

UID-607 (error) The option -instance is obsolete in XG mode. Please use the complete path to the net instance with the %s command instead.

DESCRIPTION

You have used the option *-instance* which is obsolete in XG mode. In XG mode one can use the complete hierarchical net name to perform *remove_net* and *create_net* operations. Please check the man page of these commands for details and examples.

WHAT NEXT

Please re-issue the command with the new format.

UID-608 (information) Performing automatic 'set_ideal_net' on net '%s'.

DESCRIPTION

This message occurs because **set_ideal_net** is being automatically performed at the named net. This behavior can be controlled using the following variables:

icc_auto_ideal_nets (default is false) **icc_auto_ideal_fanout_threshold** (default is 500) **icc_auto_ideal_multi_driver_threshold** (default is 100)

This feature is meant to provide better default behavior during optimization for high-fanout nets that cannot be decomposed by buffering (for example, because they are `dont_touch`).

WHAT NEXT

No action is required.

SEE ALSO

`set_ideal_net(2)`
`set_ideal_network(2)`

UID-610 (error) '%s' is not a supported value for option '%s'.

DESCRIPTION

You have specified an illegal or unsupported value for a command option. You can check which options and values are supported by Design Compiler by executing "`command -help`" in **dc_shell**.

WHAT NEXT

Change the option value to one that is supported.

UID-611 (warning) Analysis type '%s' is not supported. Using

'%s' instead.

DESCRIPTION

The requested analysis type is not currently supported in Design Compiler. So we will use the closest available analysis type, which should be suitable in most cases. You can check which options are supported by Design Compiler by executing "command -help" in **dc_shell**.

WHAT NEXT

Verify that the substituted analysis type is acceptable for your purposes.

UID-620 (error) Number of pins on the cell being changed is not same as the number of pins on the new reference cell.

DESCRIPTION

You receive this error message because the number of pins on the cell or reference being changed with `change_link`, does not match the number of pins on the new reference.

WHAT NEXT

Please provide a compatible reference library cell for `change_link` to work correctly

UID-660 (error) Option%s is mutually exclusive to option%s.

DESCRIPTION

You receive this error message if you specify two or more options on one command line that have adverse effects and are therefore mutually exclusive.

WHAT NEXT

Refer to the man page for the command that you invoked for information about the options. Do not use options that cannot be specified together on one command line.

UID-661 (warning) Data missing for physically aware net delay

estimation.

DESCRIPTION

This warning message occurs when you start to use the physically aware net model without all of the essential data.

Any of the following causes the warning message:

- The physical library is not specified.
- The library is specified, but it could not be read in successfully.
- The library did not provide all of the necessary data, including the site's row_height, average wire_width, capacitance, and resistance per unit length.

WHAT NEXT

This is only a warning message. No action is required.

However, you can do any of the following:

- Continue using the conventional wire load mode
- Make sure that you have specified a valid physical library.

SEE ALSO

UID-662 (warning) %s data missing in physical library.

DESCRIPTION

You receive this warning message when the physical library currently set does not define all of the values necessary to correctly activate the physically aware wire load estimation method.

WHAT NEXT

This is only a warning message. No action is required.

However, you can check that you are using the correct physical library.

SEE ALSO

UID-663 (warning) Physical library not specified.

DESCRIPTION

You receive this warning message when the **physical_library** variable is not set or the specified libraries cannot be loaded.

WHAT NEXT

This is only a warning message. No action is required.

However, you can check that you are using the correct physical library.

SEE ALSO

`physical_library(3)`

UID-665 (error) P/G net %s used in command %s.

DESCRIPTION

P/G nets can not be manipulated using `connect_net` or `disconnect_net` commands. `connect_net` and `disconnect_net` can only be used for signal nets.

WHAT NEXT

Use one of `connect_pg_nets` , `connect_logic_zero` or `connect_logic_one` commands to do the necessary netlist changes for P/G nets.

UID-666 (error) No Milkyway library is open.

DESCRIPTION

This error is generated when an ascii design is being read in without opening a Milkyway library first.

WHAT NEXT

Use `open_mw_lib` command to open an existing Milkyway library Use `create_mw_lib`

command to create a Milkyway library if one does not exist. Run the read command again.

UID-667 (error) Some clocks have been specified in multiple groups.

DESCRIPTION

The messages prior to this show the clock that has been specified multiple times.

WHAT NEXT

A clock should be specified only once.

UID-668 (error) Can not specify -allow_paths with - logically_exclusive or -physically_exclusive.

DESCRIPTION

The allow_paths option is invalid for logically_exclusive or physically_exclusive option of set_clock_groups.

WHAT NEXT

Logically exclusive relationship has no SI impact and only sets the false paths between the specified clocks. Hence -allow_paths does not make sense with - logically_exclusive option.

Physically exclusive clocks imply that clocks are not present at the same time and paths between the clocks can not exist.

UID-670 (error) Design CEL is already read-in and created. Please close current CEL before reading in another design.

DESCRIPTION

The design CEL design is already read and created, so can't create another design.

WHAT NEXT

The command `read_ddc` will create the design CEL, so if you want to load more than one ddc files, make sure read them in at once.

UID-820 (error) Floorplan block '%s' is not defined.

DESCRIPTION

You have specified a command which works on an existing fp_block. The block you specified could not be found.

WHAT NEXT

Double check the names of defined blocks with `write_fp_script`.

UID-821 (error) Floorplan atom '%s' is not defined.

DESCRIPTION

You have specified a command which works on an existing fp_atom. The atom you specified could not be found.

WHAT NEXT

Double check the names of defined atoms with `write_fp_script`.

UID-822 (error) Atom '%s' is already defined.

DESCRIPTION

You are trying to redefine the binding of a floorplan atom which is already bound to another cell.

WHAT NEXT

Use a different atom name, or first undefine the atom name in question using "`define_fp_atom -name atom_name -undef`".

UID-823 (error) Atom '%s' is already defined for cell '%s'.

DESCRIPTION

You are attempting to redefine the atom for a cell of the netlist.

WHAT NEXT

Define the new atom for a different cell, or first undefine the current atom using "define_fp_atom -name old_atom_name -undef".

UID-824 (error) Design '%s' (instance '%s') is multiply instantiated.

Floorplan atoms are only permitted within unqualified hierarchies.

DESCRIPTION

You have attempted to define an atom in a part of the hierarchy which is instantiated multiple times. The designs for atoms may only be instantiated once in your design.

WHAT NEXT

Use the "uniquify" command to force the multiple copies of the same design to be changed into multiple designs.

UID-825 (error) You must specify an atom name or cell name.

DESCRIPTION

You have used define_fp_atom without specifying -name flag or a cell name. This is not supported.

WHAT NEXT

Specify a -name flag.

UID-826 (error) The floorplan abstracts have not been created or are out of date.

Please (re)run create_fp_abstracts.

DESCRIPTION

This command requires create_fp_abstracts to be run before it can execute.

WHAT NEXT

Please re(run) create_fp_abstracts.

UID-827 (error) The floorplan abstract placement has not been created or is out of date.

Please (re)run place_fp_abstracts.

DESCRIPTION

This command requires place_fp_abstracts to be run before it can execute.

WHAT NEXT

Please re(run) place_fp_abstracts.

UID-828 (error) You can only select one of -select, -flyline, -expand, and -unexpand

DESCRIPTION

Only one of the given flags may be specified in a single command call.

WHAT NEXT

Specify only one of these flags per call.

UID-829 (error) You must specify a cell for -expand or -

unexpand

DESCRIPTION

The -expand and -unexpand options require you to specify a cell to work on.

WHAT NEXT

Specify a cell name.

UID-830 (error) You must specify an abstract name for -select abstract

DESCRIPTION

The -select abstract option requires you to also specify the name of the abstract that you want to select.

WHAT NEXT

Specify the name of an abstract.

UID-831 (warning) Cell '%s' has been assigned an abstract area of zero

DESCRIPTION

You have either omitted the -area flag or explicitly specified zero to the -area flag. This will cause the given cell to be ignored for area analysis of the floorplan.

WHAT NEXT

If you have assigned a zero area in error, you can either redefine the area by running "define_fp_abstract" again, or you can remove the abstract by using "define_fp_abstract -remove".

UID-832 (warning) You need to define floorplan atoms or trial

atoms before running this command

DESCRIPTION

This command analyzes design statistics based on the currently defined floorplan atoms and trial atoms. Without these, there is nothing to report.

WHAT NEXT

Create floorplan atoms with `define_fp_atom`. Create trial atoms with `define_trial_atoms`.

UID-833 (error) Floorplan block '%s' has no bound logic

DESCRIPTION

The specified floorplan block is currently empty. So there is nothing to show.

WHAT NEXT

Select a different floorplan block as a connection source, or do not specify any connection source.

UID-834 (error) Cannot use '%s' as the clock reference. The clock reference used must be a clock object.

DESCRIPTION

The clock network latency is the time it takes a clock signal to propagate from the clock definition point to a register clock pin. In the case of multiple clocks pass through the same pin or port object, clock network latency can be specified on this object with respect to a specific clock. In this way, different values can be applied as clock network latency for different clocks. With the `-clock` option, a clock object must be provided to specify which clock the clock network latency is referring to. Note, the clock network latency is only applied on ideal clock network.

WHAT NEXT

Make sure to provide a clock object when using `-clock` option. Use `report_clock` to report all clocks in the current design.

UID-835 (warning) Cannot use clock object '%s' in the object list when -clock option is provided. The -clock option will be ignored for '%s'.

DESCRIPTION

The clock network latency is the time it takes a clock signal to propagate from the clock definition point to a register clock pin. In the case of multiple clocks pass through the same pin or port object, clock network latency can be specified on this object with respect to a specific clock. In this way, different values can be applied as clock network latency for different clocks. With the **-clock** option, only non-clock object can be provided in the object list. Otherwise, the **-clock** option will be ignored for these objects.

WHAT NEXT

Make sure to provide non-clock object in object list when using **-clock** option. Use **report_clock** to report all clocks in the current design.

UID-836 (error) Cannot use -clock option and any of the options -source, -early and -late at the same time.

DESCRIPTION

See **set_clock_latency** man page for the differerence between clock network latency and clock source latency.

WHAT NEXT

Only set clock network latency or clock soruce latency at one time.

UID-841 (error) Fail to rebuild timing design from database

DESCRIPTION

Failed to load the timing design from the database. This is usually caused by database corruption.

WHAT NEXT

Quit and restart the session. Save the database to a new name to avoid corrupting

the previously valid database. If you are using CEL as input, check the CEL by opening in the new session.

UID-842 (warning) Command is not trace-mode compliant, and is ignored

DESCRIPTION

You are running a trace-mode session, and the command executed is not trace-mode compliant. The command will be ignored.

WHAT NEXT

If you want to execute this command, please end the trace-mode session.

UID-900 (error) The -type argument must provide at least one cell.

DESCRIPTION

You receive this error message if you issue **set_scan_register_type -type** without an argument for the required **-type** switch. The **set_scan_register_type** command requires that at least one example cell be given with **-type**.

WHAT NEXT

Reissue **set_scan_register_type -type** with at least one name of a valid example cell from the target library, as the argument to **-type**.

SEE ALSO

set_scan_register_type (2).

UID-901 (error) The %s cell already has the set_register_type attribute set.

DESCRIPTION

You can only use **set_scan_register_type** after removing the **set_register_type**

attribute.

WHAT NEXT

Remove the **set_register_type** attribute and reissue the command.

UID-902 (error) The cell %s issued as an argument to **set_scan_register_type -type** or **set_scan_replacement** options **-lssd**, **-muxd**, or **-clocked_scan** is a non-scan cell.

DESCRIPTION

You receive this error message when you issue the name of a non-scan cell as an argument to the **set_scan_register_type -type** command or the **set_scan_replacement** command with the **-lssd**, **-muxd**, or **-clocked_scan** option.

The **set_scan_register_type** command **-type** switch requires a scan cell as an argument. The **-type** switch must specify a list of scan cells for the **insert_scan** or the **compile -scan** command to use for scan replacement of non-scan sequential cells or designs.

The **set_scan_replacement** command with the **-lssd**, **-muxd**, or **-clocked_scan** switches requires a scan cell as an argument. These switches specify a scan replacement for each scan style for the set of non-scan cells specified through the **-nonscan** option.

WHAT NEXT

Reexecute the **set_scan_register_type** command and specify a scan cell as an argument.

SEE ALSO

`compile(2)`
`insert_scan(2)`
`set_scan_register_type(2)`
`set_scan_replacement(2)`

UID-903 (error) The %s cell is not valid for the methodology specified.

DESCRIPTION

You receive this error message when an example cell issued as an argument to the **set_scan_register_type -type** command or the **set_scan_replacement** command with the -

lssd, **-muxd**, or **-clocked_scan** option is not valid for the methodology defined.

The methodology for the **set_scan_register_type** command is the one for the current design. The methodology for the **set_scan_replacement** command is specified by the option.

WHAT NEXT

Verify the defined methodology using the **report_test -methodology** command.

You can reexecute the **set_scan_register_type** command with the **-type** argument, specifying only cells that are valid for that methodology for the **-type** argument.

Find the valid cell for the methodology and then you can reissue the **set_scan_replacement** command.

SEE ALSO

report_test(2)
set_scan_register_type(2)
set_scan_replacement(2)

UID-904 (error) Unable to find example %s '%s'.

DESCRIPTION

You receive this error message if an example cell you issued as an argument to **set_scan_register_type -type** could not be found in the target library. All example cells given as arguments to **-type** must exist in the target library.

Possible causes for this error condition might be a typo or spelling error when you entered the example cell name; or the wrong target library specified in the **target_library** environment variable.

WHAT NEXT

To correct this error, proceed as follows:

1. Verify that the **target_library** environment variable is set with the target library that contains the specified example cell, by executing **list target_library** within **dc_shell**.
2. If necessary, reset **target_library** so that it contains the name of the appropriate target library.
3. Verify the correct capitalization and spelling of the example cell names, and reissue **set_scan_register_type**.

SEE ALSO

`compile` (2), `insert_scan` (2), `set_scan_register_type` (2); `target_library` (3).

UID-905 (error) The %s design named %s is of "unknown" sequential type.

DESCRIPTION

You receive this error message if the type specified to the `set_scan_register_type` command or the `set_scan_replacement` command options cannot be recognized by the tool.

WHAT NEXT

Reissue the `set_scan_register_type` or the `set_scan_replacement` command with a recognizable sequential device.

SEE ALSO

`set_scan_register_type`(2)
`set_scan_replacement`(2)

UID-906 (error) There are no valid cells specified on which to assert `set_scan_register_type`.

DESCRIPTION

You receive this error message if you issue `set_scan_register_type` with the `cell_or_design_list` argument, but none of the cells on the list are valid. There is nothing for the command to operate on.

WHAT NEXT

Examine the list of cells you entered, verify the spelling and capitalization of the names, or otherwise determine the reason why the cells were invalid. Then reissue the `set_scan_register_type` command with a list of valid cells for `cell_or_design_list`.

SEE ALSO

`compile` (2), `insert_scan` (2), `set_scan_register_type` (2).

UID-907 (warning) Cell '%s' is not a sequential cell.

DESCRIPTION

You receive this message if you issue **set_scan_register_type** with a nonsequential cell in the *cell_or_design_list*. **set_scan_register_type** must specify only sequential cells for **insert_scan** or **compile -scan** to replace with their scan equivalents.

WHAT NEXT

Reissue **set_scan_register_type** using only sequential cells in the *cell_or_design_list*.

SEE ALSO

compile(2), **insert_scan(2)**, **set_scan_register_type(2)**.

UID-908 (warning) Cell '%s' has the dont touch attribute set on it; cannot scan-replace.

DESCRIPTION

You receive this message if **insert_scan** or **compile -scan** encounters a sequential cell that has the **dont_touch** attribute set to *true* on it. **insert_scan** and **compile -scan** attempt to perform scan replacement on your design by replacing each sequential cell with its scan equivalent. The **dont_touch** attribute is designed to protect cells from being modified or optimized, so cells that have this attribute cannot be scan replaced. This message informs you that the specified cell was not scan replaced.

WHAT NEXT

If you intended to protect the specified cell from scan replacement, no action is required on your part. However, if you want the specified cell to be scan replaced, first remove the **dont_touch** attribute, either with **remove_attribute** or by executing **set_dont_touch false**. Then reissue **insert_scan** or **compile -scan**.

SEE ALSO

compile (2), **insert_scan (2)**, **remove_attribute (2)**, **set_dont_touch (2)**.

UID-909 (error) %s cannot be set on an input port %s.

DESCRIPTION

This error message occurs when you attempt to set a **model_load** attribute on an input port. This attribute can only be set on output or inout ports.

WHAT NEXT

Reexecute the **set_model_load** command and ensure that the *port_list* contains only output and inout ports.

SEE ALSO

[set_model_load\(2\)](#)

UID-910 (error) The argument of the -bound option must be larger than the argument of the -threshold option.

DESCRIPTION

You receive this error message when you execute the **compare_rc** or **estimate_rc** command and specify a value for the **-bound** option that is smaller than or equal to the value for the **-threshold** option. The **-bound** option represents the upper level of back-annotated capacitance, and the **-threshold** option represents the lower level. For this reason, the value of the **-bound** must be larger than the value of the **-threshold** option.

WHAT NEXT

Reexecute the **compare_rc** or the **estimate_rc** command and specify a value for the **-bound** option that is larger than the value for the **-threshold** option.

SEE ALSO

[compare_rc\(2\)](#)
[estimate_rc\(2\)](#)

UID-911 (error) The -nonscan option requires at least one cell

when mapping is specified.

DESCRIPTION

You receive this error message if you do not specify at least one nonscan cell for the **-nonscan** option in the **set_scan_replacement** command for mapping.

WHAT NEXT

Reissue the **set_scan_replacement** command and specify a nonscan cell as an argument for the **-nonscan** option. The **-nonscan** argument is not needed when you use the **-remove** option alone.

SEE ALSO

```
compile(2)
insert_scan(2)
set_scan_replacement(2)
```

UID-912 (error) The replacement cell specified for the methodology %s is not a valid scan cell for the methodology.

DESCRIPTION

You receive this error message for the **set_scan_Replacement** command when the scannable cell you specified for a given scan style is not a valid scan cell. The scan cell might not be valid for the scan style (**-lssd**, **-muxd**, or **clocked_scan**) that you specified.

WHAT NEXT

Reissue the **set_scan_replacement** command and specify a valid scan cell as an argument for the scan style option.

SEE ALSO

```
compile(2)
insert_scan(2)
set_scan_replacement(2)
```

UID-913 (error) One of the **-lssd**, **-muxd**, and **-clocked_scan**

options should have at least one cell when mapping is specified.

DESCRIPTION

You receive this error message when you do not specify at least one scannable cell for any of the **-lssd**, **-muxd**, or **clocked_scan** mapping options in the **set_scan_replacement** command.

WHAT NEXT

Reissue the **set_scan_replacement** command and specify a scannable cell as an argument for the **-lssd**, **-muxd**, or **clocked_scan** option. These arguments are not needed when you use the **-remove** option alone.

SEE ALSO

`compile(2)`
`insert_scan(2)`
`set_scan_replacement(2)`

UID-914 (error) Cannot find target_library.

DESCRIPTION

This error message occurs when you do not specify a target library.

WHAT NEXT

Set the **target_library** variable to the appropriate library and run the command again.

SEE ALSO

`compile(2)`
`insert_scan(2)`
`set_scan_replacement(2)`

UID-915 (error) Cannot find %s gate in the target_library

DESCRIPTION

You receive this message if you do not specify a flop that exists in the target library in any of the options of **set_scan_replacement**.

WHAT NEXT

Reissue **set_scan_replacement** , and specify a valid scan cell as an argument for the options. These arguments are not needed for -remove alone.

SEE ALSO

`compile(2)`, `insert_scan(2)`, `set_scan_replacement(2)`.

UID-916 (error) Non-scan cell %s has more functional pins than the scan cell %s.

DESCRIPTION

You receive this message if a non-scan flop specified for -nonscan option of `set_scan_replacement` has more no of pins than a scan flop specified in one of the options . For example the non-scan flop might have async pins while scan flop is a simple scan flop without async pins.This is an error, since if scan replacement tries to use this to swap in a scan flop, it will result in bad logic.

WHAT NEXT

Re-issue **set_scan_replacement** , and specify a proper scan cell as an argument for the options.

SEE ALSO

`compile(2)`, `insert_scan(2)`, `set_scan_replacement(2)`.

UID-917 (warning) Non-scan cell %s has less functional pins than the non-scan cell %s.

DESCRIPTION

You receive this message if a scan flop specified for any of the options of `set_scan_replacement` has more no of pins than the non-scan flop. For example the scan flop might have async pins while non-scan flop is a plain D flip-flop.

WHAT NEXT

Re-issue **set_scan_replacement** , and specify a proper scan cell as an argument for the options. If not scan replacement will tie these pins to their default values.

SEE ALSO

`compile(2), insert_scan(2), set_scan_replacement(2).`

UID-918 (information) The timing reported below is an estimate. Please run vendor P&R tool to find out the actual design performance.

DESCRIPTION

During timing analysis, DC FPGA uses cell delays and routing delays to calculate the path delays. Cell delays are provided by FPGA vendor and are thus accurate. The routing delays are estimates because DC FPGA does not have information on the cell placement and routing. Therefore, the timing reported by DC FPGA is an estimate. It is recommended that you always run vendor Place and Route tool to determine the actual design performance. Based on P&R timing result, you then decide whether and how you take the next step to improve timing.

WHAT NEXT

This is an informational message only. No action is required on your part.

UID-919 (Error) The -exact option has a list of cells to use for mapping.

DESCRIPTION

This is shown when the -exact option in set_scan_register_type has a list of cells provided for mapping. Only a single cell newm should be provided.

WHAT NEXT

Use a single cell for -exact option and re-execute the command.

UID-920 (error) The %s command is not allowed in an interface

logic model (ILM). This %s is in an ILM: '%s'.

DESCRIPTION

This error occurs because the tool does not support netlist editing within an ILM. The restricted commands are the following:

```
create_cell  
create_net  
create_port  
connect_net  
disconnect_net  
connect_pin  
connect_logic_zero  
connect_logic_one  
remove_port  
remove_cell  
remove_net  
insert_buffer  
remove_buffer  
size_cell
```

WHAT NEXT

Restrict the collection of objects that you are editing to exclude any objects inside ILMs and reapply the netlist editing commands.

SEE ALSO

```
create_cell(2)  
create_net(2)  
create_port(2)  
connect_net(2)  
disconnect_net(2)  
connect_pin(2)  
connect_logic_zero(2)  
connect_logic_one(2)  
remove_port(2)  
remove_cell(2)  
remove_net(2)  
insert_buffer(2)  
remove_buffer(2)  
size_cell(2)
```

UID-950 (error) Unsupported pin name '%s' or its synonym '%s'.

DESCRIPTION

This error message occurs when the pin name or its synonym has unsupported characters. Wildcards and regular expressions are not supported. Forward slash '/' is also not supported for simple pin name synonyms.

WHAT NEXT

Correct pin name or synonym string.

UID-951 (error) Pin name synonym '%s' exists already.

DESCRIPTION

This error message occurs when there is a conflict in pin name synonym. Multiple synonym definitions for a pin name synonym is not supported.

WHAT NEXT

Use '--force' switch to over-write the existing synonym. Use command report_pin_name_synonym to check the existing synonyms.

UID-952 (information) Synonym '%s' not found.

DESCRIPTION

This error message occurs when trying to delete a pin name synonym that does not exist.

WHAT NEXT

Use command report_pin_name_synonym to check the existing pin name synonyms.

UID-990 (error) Command '%s' is obsolete. Please use

command '%s' instead.

DESCRIPTION

The command is obsolete. Please try the alternative command.

WHAT NEXT

Try the alternative command.

UID-991 (error) The driving cell %s has multiple inputs, and -from_pin is required when -input_transition_rise or -input_transition_fall is specified.

DESCRIPTION

This error message is displayed if only one of two options, which need to be specified together in case of multiple input cells, is specified.

WHAT NEXT

This error message is displayed if -input_transition_rise or -input_transition_fall is specified, without specifying -from_pin for driving cells with multiple input pins.

UID-992 (warning) Cannot find the top design for object %s.

DESCRIPTION

The top design for the given object could not be found. This may be caused either by a naming mismatch or an inconsistency in the hierarchy. As a result, the **setup** and **hold** attributes will not be propagated for this cell.

WHAT NEXT

Report this problem to Synopsys.

UID-993 (error) Cannot find the specified driving cell in memory.

DESCRIPTION

WHAT NEXT

Please use a driving cell from link library or from target library.

UID-995 (error) Cannot find the target library.

DESCRIPTION

The specified target library could not be found. This may be caused by incomplete search path. As a result, the **set_driving_cell** will not be performed.

WHAT NEXT

Please make sure the specified target library exists through search_path.

UID-996 (error) Cannot find the output pin '%s'.

DESCRIPTION

This error message is issued by the **set_driving_cell** command. You receive this message if the specified driving pin is not found or its type is not output. This could be caused by a spelling error or typo.

WHAT NEXT

Verify the correct name of the specified output pin, then reexecute **set_driving_cell** with the correct name.

SEE ALSO

set_driving_cell (2).

UID-997 (warning) The set_dont_touch_network command is

used for clock %s, for which no sources are specified.

DESCRIPTION

This warning message occurs when the **set_dont_touch_network** command is used for a clock and the **dont_touch** attribute is assigned to the transitive fanout of the ports of the clock. The clock is created without specifying a list of ports, and the **set_dont_touch_network** command has no effect for this clock.

WHAT NEXT

This is only a warning message. No action is required.

Refer to the man pages for the **create_clock** command for more information.

SEE ALSO

`create_clock(2)`
`set_dont_touch_network(2)`

UID-998 (warning) Buffer tree at driver pin %s has cells or nets with dont_touch attribute.

DESCRIPTION

This warning message occurs when the **clean_buffer_tree** command is applied to a buffer tree that has buffers, inverters, or nets with the **dont_touch** attribute. The specified cells and the cells that follow will not be removed.

WHAT NEXT

This is only a warning message. No action is required.

Refer to the man page for the **clean_buffer_tree** command for more information.

SEE ALSO

`clean_buffer_tree(2)`
`set_dont_touch(2)`
`set_dont_touch_network(2)`

UID-999 (error) Must specify either %s or %S.

DESCRIPTION

This error message occurs when neither of the two mandatory options for a command are specified.

WHAT NEXT

Reissue the command and specify one of the two options in the error message.

UID-1000 (error) Invalid scenario name.

DESCRIPTION

This error is generated when providing an invalid scenario name.

WHAT NEXT

Use `all_scenarios` to see the names of the currently defined scenarios.

UID-1001 (error) Current scenario is not defined.

DESCRIPTION

This error is generated when current scenario is not defined.

WHAT NEXT

Use `all_scenarios` to see the names of the currently defined scenarios. Then invoke `current_scenario` to set the desired current_scenario.

UID-1002 (information) Cell %s is a special cell with always on pins and it is preserved with size_only attribute.

DESCRIPTION

The tool issues this message to inform that cells with always on pins are marked with size_only attribute. Preserving these cells during optimization ensures power

management logic is synthesized correctly. Only cells that are in power down regions are considered. Also, cells that are marked dont_touch and cells that are already marked size_only are not considered. TCL variable mark_always_on_logic_size_only can be used to turn off size_only marking of such cells. The default value of this variable is true.

WHAT NEXT

If you want to turn off automatic marking of size_only attribute on such cells, set TCL variable mark_always_on_logic_size_only to false.

UID-1003 (warning) Driving cell was specified without the -library option. Using library_cell %s from library %s:%s.

DESCRIPTION

This warning message is displayed if the set_driving_cell command is issued without the -library option.

WHAT NEXT

Specify the library for the driving cell using the -library option. This is very important for multi voltage designs where library cell of a given name may be present in multiple libraries. It is important for user to check if the correct library cell was picked.

UID-1004 (error) Cannot use the '%s' option of save_mw_cel after ILM creation

DESCRIPTION

This error is seen when, after creating an ILM, you run **save_mw_cel** with an option that is not supported. Currently, this includes only the '-overwrite' options.

WHAT NEXT

The '-overwrite' option is not currently supported after **create_ilm** is run. A fresh version of the ILM view must be created.

SEE ALSO

create_ilm(2), **save_mw_cel(2)**.

UID-1005 (error) Format '%s' is not a valid format.

DESCRIPTION

This error is generated when **write** command encounters an invalid write format. Please note that -power option works only for "verilog" format.

WHAT NEXT

Identify and correct format, then reinvoke the **write** command.

UID-1006 (information) Existing back annotation will be deleted.

DESCRIPTION

This message informs the user that the existing back annotation will be deleted.

WHAT NEXT

This is only an information message. No action is required.

UID-1007 (error) Static noise calculation requires 'set_si_options -static_noise true' setting. Please set 'set_si_options -static_noise true' and then run report_noise and report_noise_calculation.

DESCRIPTION

This error message occurs when the `report_noise` or `report_noise_calculation` is called without setting `-static_noise` option to true.

WHAT NEXT

Use '`set_si_options -static_noise true`' and then run `report_noise` and `report_noise_calculation` command.

UID-1008 (warning) Discarding all scenario specific information

previously defined in this session.

DESCRIPTION

When issue the `create_scenario` command to create the first scenario, this warning will appear to remind you that any previously created scenario specific information will be discarded, and will not carry over into the context of the first scenario.

WHAT NEXT

No action is required, though you may want to review your script to ensure that scenario specific constraints are not erroneously created prior to the first `create_scenario` command.

SEE ALSO

`create_scenario(2)`

UID-1009 (warning) Current scenario changed to '%s'.

DESCRIPTION

This warning is generated when current scenario changes without explicit use of the `current_scenario` command.

WHAT NEXT

Confirm that the new current scenario is the correct scenario for your purposes.

UID-1010 (error) Invalid scenario '%s'.

DESCRIPTION

This error is generated when a non-existent scenario is specified.

WHAT NEXT

Use `all_scenarios` to see the names of the currently defined scenarios.

UID-1011 (error) Scenario is not active.

DESCRIPTION

This error is generated when a non active scenario is specified for current scenario. Only active scenarios can be set as the current scenario.

WHAT NEXT

Use `all_active_scenarios` to see the names of the currently active scenarios.

UID-1015 (warning) Resetting 'min_delta_delay' to false when 'delta_delay' is set to false.

DESCRIPTION

This warning message occurs when the `-delta_delay` option is being set to false while '`min_delta_delay`' option is set to true.

WHAT NEXT

This is only a warning message. No action is required.

UID-1016 (error) Cannot set 'min_delta_delay' to true without having 'delta_delay' option set to true.

DESCRIPTION

This error message is displayed if the option '`-min_delta_delay`' is specified to be true without having '`delta_delay`' set to true.

WHAT NEXT

Set both '`-min_delta_delay`' and '`-delat_delay`' options to true, and re-run the command.

UID-1017 (warning) Using the command-line option `-nocase` in

fuzzy matching could cause a high runtime.

DESCRIPTION

This warning message occurs when using the `set_fuzzy_query_options` command with the `-nocase` option.

During fuzzy matching, switching the case-sensitivity mode using the command-line option `-nocase` forces fuzzy matching to reconfigure each time the mode is changed, which incurs a high runtime.

WHAT NEXT

This is only a warning message. No action is required.

However, to avoid incurring a high runtime do one of the following:

- Set the `find_ignore_case` variable to true so that fuzzy matching always works in case-insensitive mode.
- Set the `find_ignore_case` variable to false and do not use the `-nocase` option with any command, so that fuzzy matching always works in case-sensitive mode.

SEE ALSO

`set_fuzzy_query_options(2)`
`find_ignore_case(3)`

UID-1018 (error) Cannot set 'timing_window' to true without having 'delta_delay' or 'static_noise' option set to true.

DESCRIPTION

This error message is displayed if the option '`-timing_window`' is specified to be true without having '`delta_delay`' or '`static_noise`' option set to true.

WHAT NEXT

Set '`-static_noise`' or '`-delat_delay`' option to true, and re-run the command.

UID-1019 (warning) Resetting 'timing_window' to false when

'delta_delay' and 'static_noise' are both set to false.

DESCRIPTION

This warning message occurs when the **-delta_delay** option and **-static_noise** are being set to false while 'timing_window' option is set to true.

WHAT NEXT

This is only a warning message. No action is required.

UID-1020 (error) the **-all** parameter can't be used with other options.

DESCRIPTION

This error is generated when using the **set_active_scenarios** command, and both a list of scenarios and the **-all** parameter are specified.

WHAT NEXT

Either use **-all** or specify a list of scenario names.

UID-1021 (error) You must specify at least one active scenario.

DESCRIPTION

This error message occurs when using the **set_active_scenarios** command without specifying which scenarios to set active.

WHAT NEXT

Run the command again either using the **-all** option or specifying a list of scenario names.

SEE ALSO

`set_active_scenarios(2)`

UID-1022 (Information) Scenario %s is no longer active.

DESCRIPTION

This messages informs that a given scenario is now in the inactive state, and is not considered for optimization.

UID-1023 (Information) Scenario %s is now active.

DESCRIPTION

This messages informs that a given scenario is now in the active state, and is considered for optimization.

UID-1024 (Information) Removed Scenario %s .

DESCRIPTION

This messages informs that a given scenario was removed from memory. All its associated constraints are lost.

UID-1025 (Information) Mark scenario %s as CTS scenario.

DESCRIPTION

This messages informs that a given scenario was marked as CTS scenario, compile_clock_tree and optimize_clock_tree will work on CTS scenario if CTS scenario is marked.

UID-1026 (Information) Scenario %s is no longer a CTS scenario.

DESCRIPTION

This messages informs that a given scenario was no longer CTS scenario, it happened when another scenario is marked and CTS scenario or the CTS scenario is removed.

UID-1027 (information) CTS scenario %s is already the only active scenario.

DESCRIPTION

This messages issued during compile_clock_tree and optimize_clock_tree to informs that the CTS scenario is the only active scenario inthe flow.

UID-1028 (information) The current scenario has been switched to the CTS scenario %s.

DESCRIPTION

This messages is issued prior to clock tree optimization to inform you that the current scenario has been switched to the CTS scenario. Depending on the command, other scenarios may also be activated or deactivated. These are listed in the log file.

After this command is complete, the current and active scenarios will be restored.

UID-1029 (error) Can't switch to CTS scenario %s, current scenario is %s

DESCRIPTION

This error is generated when compile_clock_tree and optimize_clock_tree trying to switch to CTS scenario but failed.

UID-1030 (error) Cannot restore current scenario to previous value %s, current value is %s

DESCRIPTION

This error is generated when compile_clock_tree and optimize_clock_tree trying to restore current scenario from CTS scenario but failed.

UID-1031 (information) Restore active scenarios, set current

scenario to previous value %s

DESCRIPTION

This message informs you that `compile_clock_tree` and `optimize_clock_tree` have successfully restored the active scenarios and current scenario.

UID-1032 (error) Can't set both leakage-only and hold-only on current scenario!

DESCRIPTION

This error is issued by the `set_scenario_options` command when trying to set both leakage-only and hold-only options on current scenario. The command will return fail and the current setting will be unchanged.

WHAT NEXT

Use `report_scenarios` to check the current setting and fix the problem in script.

SEE ALSO

`report_scenarios(2)`.

UID-1033 (information) Using default format ddc because -format was not specified.

DESCRIPTION

This information message occurs because the `-format` option of the `read_file` command was not specified. The file type cannot be inferred from the file name, so the default format of ddc is being used. It is good practice to always specify the format on the command line by using the `-format` option.

WHAT NEXT

This is an informational message. No action is required.

SEE ALSO

`read_file(2)`
UID-1034(n)

UID-1034 (information) Inferring file format %s based on file name extension(s).

DESCRIPTION

This information message occurs because the **-format** option of the **read_file** command was not specified. The command inferred the format based on the file name extension. It is good practice to always specify the format on the command line by using the **-format** option.

WHAT NEXT

This is an informational message. No action is required.

SEE ALSO

`read_file(2)`
`UID-1033 (n)`

UID-1035 (error) Can't set leakage-only or hold-only on scenario %S.

DESCRIPTION

This error is issued by the **set_scenario_options** command when trying to set leakage-only or hold-only options on an inactive scenario. The command will return fail and the current setting will be unchanged.

WHAT NEXT

Use **report_scenario_options** to check the current setting and fix the problem in script.

SEE ALSO

`report_scenario_options(2)`. `report_scenarios(2)`.

UID-1036 (warning) Can't find scenario %s.

DESCRIPTION

This warning is issued by the **set_scenario_options** command when an invalid scenario

name is passed to the -scenarios option. The command will skip the entry and continue with other scenarios in the list.

WHAT NEXT

Use **all_scenarios** to check all valid scenario names and fix the problem in script.

SEE ALSO

all_scenarios(2). **report_scenario_options(2)**.

UID-1037 (warning) Setting dynamic_power to false for scenario %S.

DESCRIPTION

This warning is issued by the **set_scenario_options** command when trying to set dynamic_power to true without setting setup to true or when setup is set to false with dynamic_power left to true. Dynamic power computation needs scenario options setup and dynamic_power both set to true, to work properly. The command will finish successfully but will force dynamic_power to false. Set dynamic_power and setup to true to avoid this warning and enable dynamic power.

WHAT NEXT

Use **report_scenario_options** to report the current settings and fix the problem in script.

SEE ALSO

report_scenario_options(2).

UID-1038 (error) Can't set cts_mode to true for scenario %S.

DESCRIPTION

This error is issued by the **set_scenario_options** command when trying to set option cts_mode to true when either the scenario option setup or hold is set to false or option leakage_only or hold_only is set to true. The command will return fail and the current setting will be left unchanged.

WHAT NEXT

Use `report_scenario_options` to check the current settings and fix the problem in script.

SEE ALSO

`report_scenario_options(2)`.

UID-1050 (error) Only %d character string is accepted as %s.

DESCRIPTION

The `-hierarchical_separators` option only accepts a list of single character strings; The `-bus_name_notations` option only accepts a list of two character strings.

WHAT NEXT

Fix the value of option `-hierarchical_separators` or `-bus_name_notations` and re-issue the command `set_query_options`.

UID-1051 (error) '%s' is not supported as %s.

DESCRIPTION

The `-hierarchical_separators` option does not accept the following characters: 0-9, a-z, A-Z, *, ?, \, +, (,), [,], ^. The `-bus_name_notations` option does not accept the following characters 0-9, a-z, A-Z, *, ?, \, +, ^. The `-bus_name_notations` option does not accept unpaired brackets such as "][", "(_".

WHAT NEXT

Fix the value of option `-hierarchical_separators` or `-bus_name_notations` and re-issue the command `set_query_options`.

UID-1052 (warning) %s is missing as %s. This may cause incorrect result and long runtime.

DESCRIPTION

'/' is often used as hierarchical separator for in-memory netlist; "[]" is often

used as bus name notation for in-memory netlist. Not including them in the fuzzy matching options may cause the program fail to find the object.

WHAT NEXT

Consider adding '/' in the **-hierarchical_separators** list, and "[]" in the **-bus_name_notations** list.

UID-1053 (error) Learning_effort must be one of: low, medium, high.

DESCRIPTION

WHAT NEXT

Fix the value of option *-learning_effort* and re-issue the command *set_query_options*.

UID-1054 (error) Only cell, pin, port and net are supported.

DESCRIPTION

WHAT NEXT

Fix the value of option *-class* and re-issue the command *set_query_options*.

UID-1055 (information) %d %s objects are matched according to fuzzy query options.

DESCRIPTION

This message is issued in verbose mode in case query had matched some object according to the options set by command *set_query_options*.

WHAT NEXT

UID-1056 (information) Fuzzy matching enabled. Please turn it

off once fuzzy matching is no longer needed.

DESCRIPTION

Fuzzy matching could slow down the program considerably, and use more memory. To avoid runtime and memory overhead, turn it off once it is no longer needed.

WHAT NEXT

UID-1057 (error) '-reset' option can not be used together with other options except for '-show'.

DESCRIPTION

WHAT NEXT

UID-1058 (error) There must be at least 2 elements in %s list.

DESCRIPTION

WHAT NEXT

UID-1059 (information) Scenario %s either not exists or is inactive. %s will skip it.

DESCRIPTION

WHAT NEXT

UID-1060 (error) There must be at least 3 elements in %s list.

DESCRIPTION

This error is generated when there are not enough elements for -regsub option for

Design Compiler command 'set_fuzzy_query_options'.

WHAT NEXT

Check out the man page for Tcl Built-In regsub then reset the options for this.

UID-1061 (warning) '-regsub' option can not be used together with '-exhaustive' option, '-regsub' option will be ignored.

DESCRIPTION

When '-exhaustive' is specified, '-regsub' will not be supported for run time concern.

WHAT NEXT

Set one of the two options only and rerun the command.

UID-1062 (information) Object %s is found using matching pattern %s.

DESCRIPTION

The tool issues this message to inform that object is found with which pattern during fuzzy matching. This information can be used to double check the correctness of the SDC file sourcing.

WHAT NEXT

If you want to disable this message, turn off verbose mode by command set_fuzzy_query_options.

SEE ALSO

set_fuzzy_query_options (2).

UID-1063 (warning) Design %s doesn't have scenario %s

DESCRIPTION

This warning is generated by `report_scenario` when a scenario exists in the session but the top level design doesn't have that scenario. If the design is hierarchical, the scenario may exist in some hierarchical block. Or the scenario is created on other designs which has been closed. For hierarchical design, you may need to create the scenario for top-level design explicitly using `create_scenario`. Or, you may want to remove the scenario using `remove_scenario` to reduce memory.

UID-1064 (error) Save operation not allowed for ILM designs.

DESCRIPTION

This error occurred because the design being saved is an ILM design. ILM designs are not allowed to be saved with `save_mw_cel`.

WHAT NEXT

Use `create_ilm` to generate a new ILM view.

SEE ALSO

`create_ilm(2)`.

UID-1065 (information) Overwrite is already the default. You do not need to specify this option.

DESCRIPTION

As of 2007.12, by default, `save_mw_cel` will overwrite a cell, so this option is no longer needed.

WHAT NEXT

You do not need to specify this option.

SEE ALSO

`save_mw_cel(2)`.

UID-1072 (information) Object %s is found using matching pattern %s.

DESCRIPTION

The tool issues this message to inform that object is found with which pattern during fuzzy matching. This information can be used to double check the correctness of the SDC file sourcing.

WHAT NEXT

If you want to disable this message, turn off verbose mode by command `set_fuzzy_query_options`.

SEE ALSO

`set_fuzzy_query_options` (2).

UID-1098 (error) Need to specify one and only one port type.

DESCRIPTION

This error is generated when `set_output_clock_port_type` command without specifying correct port type.

WHAT NEXT

Please specify port type using one and only one option -clock or -data.

UID-1099 (error) Need to specify port_list or use -all option.

DESCRIPTION

This error is generated when `set_output_clock_port_type` command without correctly specifying `port_list`.

WHAT NEXT

Please specify `port_list`, or use `-all` option to apply the port type to all output ports.

UID-1100 (warning) Don't apply this command on input port. Ignore it.

DESCRIPTION

This error is generated when user apply `set_output_clock_port_type` command on input port. Ignore this setting.

WHAT NEXT

UID-1101 (error) The design '%s' has physical/floorplan data and cannot be modified by the 'group' command. Use the `merge_fp_hierarchy` command instead.

DESCRIPTION

The `group` command cannot be executed on a design with physical hierarchy.

WHAT NEXT

Please use `merge_fp_hierarchy` command instead.

SEE ALSO

`merge_fp_hierarchy(2)`

UID-1102 (information) This version of snapshot utility does not support MCMM design.

DESCRIPTION

This error message occurs when using the older version of snapshot utility on a MCMM design.

WHAT NEXT

Switch to using the newer version of snapshot utility by setting the variable `enable_concise_qor_snapshot` to TRUE (default).

SEE ALSO

`create_qor_snapshot(2)`
`report_qor_snapshot(2)`
`remove_qor_snapshot(2)`

UID-1103 (information) This newer version of snapshot utility does not support these options:

DESCRIPTION

This error message occurs when running the qor snapshot command with the above options

WHAT NEXT

User can ignore the message or re-run without the options.

SEE ALSO

`create_qor_snapshot(2)`
`report_qor_snapshot(2)`
`remove_qor_snapshot(2)`

UID-1104 (error) Not able to perform command due to read/write permission issue.

DESCRIPTION

Read/Write permission problem. There can be several reasons for this. The most common reasons are: the user does not have read/write permissions in the directory, the disk is full or the user already has a file with the same name which can't be deleted.

WHAT NEXT

Try to create a file with the same name from the ICC shell. Fix any problem that you might encounter. Delete the file and invoke the `icc_shell` command again.

UID-1200 (error) cannot recognize the given value for option

'%s' in this SI command.

DESCRIPTION

check the command and give a valid value for the option.

UID-1201 (warning) Overriding result from previous set_ideal_network command on object %s.

DESCRIPTION

The previous setting of the ideal network on an object is being over-written.

WHAT NEXT

This is only a warning message. No action is required.

UIDBG

UIDBG-1 (error) The attach '%s' does not exist.

DESCRIPTION

WHAT NEXT

UIDBG-2 (error) The object '%s' is not attached via the '%s' attach.

DESCRIPTION

WHAT NEXT

UIDBG-3 (error) More than one object is attached via the '%s'

attach.

DESCRIPTION

WHAT NEXT

UIDBG-4 (error) No objects are attached via the '%s' attach.

DESCRIPTION

WHAT NEXT

UIDBG-5 (error) It's illegal to specify both a library and a design.

DESCRIPTION

WHAT NEXT

UIDBG-6 (error) You must specify either a library or a design.

DESCRIPTION

WHAT NEXT

UIDBG-7 (error) You must invoke 'db_debug_start' before issuing this command.

DESCRIPTION

WHAT NEXT

UIDPCM

UIDPCM-1 (error) '%s' is not a valid calc_mode.

DESCRIPTION

In DPCM, only "worst_case", "nominal" and "best_case" are valid calc_mode options.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: "case" is not a valid calc_mode. (UIDPCM-1)

UIDPCM-2 (error) One or more rail voltage names or values are invalid in library '%s'

DESCRIPTION

The set_dpcm_operating_condition requires that the command line arguments for -rail_voltages option assign voltage values to all rail voltages in the specified library. This message is issued when the following error condition is detected in the command line: - not enough entries for all rail voltages; - incorrect rail voltage name; - missing value for one or more rail voltages; - multiple values for one rail voltage;

WHAT NEXT

Use "report_dpcm_lib" command to get a list of valid rail voltage names in the library. And try the command again.

EXAMPLES

EXAMPLE MESSAGE

Error: One or more rail voltage names or values are invalid in library "test". (UIDPCM-2)

UIDPCM-4 (warning) '%s' is not a valid level. Setting level to default level, performance. The valid levels are accurate and performance.

DESCRIPTION

In DPCM, only "performance" and "accurate" are valid level options.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: "global" is not a valid level. Setting level to default level, performance.
The valid levels are accurate and performance. (UIDPCM-4)

UIDPCM-5 (warning) '%s' is not a valid mode. Setting level to default mode,global. The valid modes are global and instance.

DESCRIPTION

In DPCM, only "global" and "instance" are valid mode options.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: "performance" is not a valid mode. Setting level to default mode,global. The valid modes are global and instance (UIDPCM-5)

UIDPCM-6 (error) DPCM Library '%s' not loaded.

DESCRIPTION

You receive this message if the **dpcm_libraries** variable contains the specified library but that library is not loaded. You can set the **dpcm_libraries** variable only

if a DPCM library is available for the specified library.

WHAT NEXT

Verify the correct spelling and path of the specified DPCM library in the **dpcm_libraries** variable. Set the **dpcm_rulepath** variable and others as specified by the dpcm vendor for the equivalent libraries specified in the **dpcm_libraries** variable.

SEE ALSO

dpcm_libraries (3), **dpcm_rulepath** (3), **dpcm_variables** (3).

UIDPCM-7 (error) '%s' is not a valid process factor.

DESCRIPTION

The process factor must be a non-negative floating point number no more than 100.0.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: "-1" is not a valid process factor. (UIDPCM-7)

UIDPCM-8 (error) '%s' is not a valid voltage.

DESCRIPTION

The voltage must be a non-negative floating point number no more than 1000.0.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

Error: "-1" is not a valid voltage. (UIDPCM-8)

UIDPCM-9 (error) '%s' is not a valid tree_type.

DESCRIPTION

Only "worst_case_tree", "balanced" and "best_case_tree" are valid tree_type options.

WHAT NEXT

EXAMPLES

EXAMPLE MESSAGE

```
Error: "case" is not a valid tree_type. (UIDPCM-9)
```

UIDPCM-10 (warning) Invalid value '%s' for dpcm_slewlimit.
The valid values are either FALSE or TRUE. Setting to default
value, FALSE.

DESCRIPTION

You receive this message if the **dpcm_slewlimit** variable is set to some value other than *true* or *false*; these are the only allowed values. This message informs you that the variable is being set to *false*, its default value.

WHAT NEXT

If it is acceptable to you that the **dpcm_slewlimit** variable is set to *false*, no action is required on your part. Otherwise, set the variable to *true*.

SEE ALSO

dpcm_slewlimit (3), **dpcm_variables** (3).

UIDPCM-11 (warning) Invalid value '%d' for dpcm_debuglevel.
The valid values are greater than or equal to zero. Setting to

default value, '0'.

DESCRIPTION

You receive this message if the **dpcm_debuglevel** variable is set to a value that is not an integer of 0 or greater. This message informs you that the variable is being set to 0, its default value.

WHAT NEXT

If it is acceptable to you that the **dpcm_slewlimit** variable is set to 0, no action is required on your part. Otherwise, set the variable to some value greater than 0.

SEE ALSO

dpcm_slewlimit (3), **dpcm_variables** (3).

UIDPCM-12 (warning) DPCM operating condition '%s' not found.

DESCRIPTION

You receive this warning message when the named operating condition was not found in the specified DPCM library.

WHAT NEXT

Use the **report_dpcm_operating_conditions** command to see the names of operating conditions available in the DPCM library.

UIDPCM-13 (error) The command requires the -temp option when the -default or -current options are not used.

DESCRIPTION

You receive this error message when the **-default** or **-current** option is not specified, and the **-temp** option is not specified.

WHAT NEXT

Re-execute the **create_operating_conditions** command with the **-temp** option, or specify the **-default** or **-current** option.

UIDPCM-14 (error) The command requires a rail voltage list when the options **-default** or **-current** are not used.

DESCRIPTION

You receive this error message when the **create_operating_conditions** command does not have the **-rail_voltages** option specified.

WHAT NEXT

Re-execute the **create_operating_conditions** command, and specify the **-rail_voltages** option.

UIDPCM-15 (warning) Invalid value '%s' for **dpcm_arc_sense_mapping**. The valid values are either FALSE or TRUE. Setting to default value, TRUE.

DESCRIPTION

You receive this message if the **dpcm_slewlimit** variable is set to some value other than *true* or *false*; these are the only allowed values. This message informs you that the variable is being set to *true*, its default value.

WHAT NEXT

If it is acceptable to you that the **dpcm_slewlimit** variable is set to *true*, no action is required on your part. Otherwise, set the variable to *false*.

SEE ALSO

dpcm_arc_sense_mapping(3), **dpcm_variables (3)**.

UIED

UIED-1 (error) Bad file '%s' specified.

DESCRIPTION

WHAT NEXT

UIED-2 (error) Design '%s' already exists in file '%s'.

DESCRIPTION

WHAT NEXT

UIED-3 (error) Bad value specified for the -logic option.

DESCRIPTION

WHAT NEXT

UIED-4 (error) Must specify either reference name or -logic

option.

DESCRIPTION

WHAT NEXT

UIED-5 (error) Cell '%s' already exists in design '%s'.

DESCRIPTION

WHAT NEXT

UIED-6 (error) Can't find reference design or library cell '%s'.

DESCRIPTION

WHAT NEXT

UIED-7 (error) Reference '%s' is not unique.

DESCRIPTION

WHAT NEXT

UIED-8 (error) Design '%s' can't refer to itself.
This would cause recursive hierarchy.

DESCRIPTION

WHAT NEXT

UIED-9 (error) Can't reference design '%s' in design '%s'.

This would cause recursive hierarchy.

DESCRIPTION

WHAT NEXT

UIED-10 (error) A reference named '%s' already exists in design

'%s'.

DESCRIPTION

WHAT NEXT

UIED-11 (error) Must specify either cell list or -all option.

DESCRIPTION

WHAT NEXT

UIED-12 (error) Cell '%s' is not contained in design '%s'.

DESCRIPTION

WHAT NEXT

UIED-13 (error) Net '%s' already exists in design '%s'.

DESCRIPTION

WHAT NEXT

UIED-14 (error) Must specify either net list or -all option.

DESCRIPTION

WHAT NEXT

UIED-15 (error) Can't remove net '%s'; it's part of a bus net.

DESCRIPTION**WHAT NEXT**

UIED-16 (error) Net '%s' could not be found.

DESCRIPTION**WHAT NEXT**

UIED-17 (error) Must specify only one net to connect.

DESCRIPTION**WHAT NEXT**

UIED-18 (error) The first argument '%s' is not a net.

DESCRIPTION**WHAT NEXT**

UIED-19 (error) Object '%s' is not a pin or port.

DESCRIPTION**WHAT NEXT**

UIED-20 (error) Object '%s' is not contained in design '%s'.

DESCRIPTION

This error message occurs when you attempt to connect or disconnect a net to

specified pins that cannot be found.

WHAT NEXT

If you get this error message when executing the **connect_net** command, make sure that the pin-net pair is in the same logical hierarchy. Another option is to try to use the **connect_pin** command, which supports the connect operation if the pin-net pair is in a different logical hierarchy.

SEE ALSO

`connect_pin(2)`

UIED-21 (error) Object '%s' is already connected to net '%s'.

DESCRIPTION

WHAT NEXT

UIED-22 (error) Must specify either object list or -all option.

DESCRIPTION

WHAT NEXT

UIED-23 (error) Must specify only one net to disconnect.

DESCRIPTION

WHAT NEXT

UIED-24 (error) Object '%s' is not connected to net '%s'.

DESCRIPTION

This message is issued when either the object is not connected to the net or there are some constraints set on the object.

For ports, the object may have the attributes **driven_by_logic_one** or **driven_by_logic_zero** set on them. The ports can not be disconnected as long as these attributes are set on them.

The command **get_attribute** can be used to check if an attribute is set on an object. The command **remove_attribute** can be used to remove a specific attribute from an object.

WHAT NEXT

Please check to make sure the inputs are correct.

UIED-25 (error) Object '%s' is the wrong type.

Only nets, ports and pins are accepted.

DESCRIPTION

WHAT NEXT

UIED-26 (warning) Net '%s' is not connected to any objects.

DESCRIPTION

WHAT NEXT

UIED-27 (error) Port '%s' already exists in design '%s'.

DESCRIPTION

WHAT NEXT

UIED-28 (error) Can't remove port '%s'; it's part of a bus.

DESCRIPTION

WHAT NEXT

UIED-29 (error) Port '%s' could not be found.

DESCRIPTION

WHAT NEXT

UIED-30 (error) Must specify either port list or -all option.

DESCRIPTION

WHAT NEXT

UIED-31 (warning) The -logic option is ignored when explicit reference is given.

DESCRIPTION

WHAT NEXT

UIED-32 (error) Can't %s for instance '%s' because design '%s' is instantiated %d times.

DESCRIPTION

This error indicates the current command can't perform on this instance because it is instantiated more than once.

WHAT NEXT

Check your instance and reissue the command or you may continue.

UIED-33 (error) Can't %s for instance '%s' which is a leaf cell.

DESCRIPTION

This error indicates the current command can't perform on this instance which is a leaf cell.

WHAT NEXT

Check your instance and reissue the command or you may continue.

UIED-34 (error) Could not find parent cell '%s' for the creation of

'%s'.

DESCRIPTION

You receive this error message when you attempt to create either a cell, net or port in an instance which does not already. This command will not create any new hierarchy except the new leaf object which is specified in the command.

WHAT NEXT

Review the man page for the creation command being used, and try using current_instance to move to the instance within which you wish to create the new object. If you need to create levels of hierarchy, use the create_cell command to create each level one at a time.

UIED-35 (error) The instance '%s' is not a library cell.

DESCRIPTION

You receive this error message when you execute the **remove_cell** command and specify an instance to remove which is not a library cell.

WHAT NEXT

Use the **report_cell** command to examine the cells available for removal, and reissue the command with a library cell specified.

UIED-36 (error) Port '%s' is the last on a design, and may not be removed.

DESCRIPTION

This message is associated with the **remove_port** command and is issued upon an attempt to remove the last port on a design.

WHAT NEXT

Use the **report_port** command to examine the ports on a design.

UIED-37 (error) Objects '%s' and '%s' are at different levels in

the design hierarchy. Nets can be connected only to pins and ports at the same hierarchical level.

DESCRIPTION

You receive this message if you issue the **connect_net** command, and one or more pins or ports in the *object_list* is at a different hierarchical level from that of the specified net. **connect_net** can connect a net only to pins and ports within the same hierarchical level.

WHAT NEXT

Reexecute the **connect_net** command, and ensure that all pins and ports on the *object_list* are at the same hierarchical level as the net you specify. Or use the command **connect_pin**.

SEE ALSO

connect_net (2). **connect_pin** (2).

UIED-38 (error) Conflicting options '%s' and '%s' for size_cell.

DESCRIPTION

The two sets of options listed in the error message are conflicting. Options **-local**, **-fanin** and **-fanout** are for local sizing only, and cannot be mixed with any of the other options.

WHAT NEXT

Review the man page for **size_cell**, and change the options to remove the conflict.

UIED-39 (error) Pin %s is part of a library cell and cannot be removed.

DESCRIPTION

You receive this message if you issue the **remove_port** command and attempt to remove a port that belongs to a vendor library cell. You can remove ports only from non-vendor library designs. In **xg** mode, you specify the design or designs from which ports are to be removed by providing a path to the specific instance. The port or ports are removed from the design of the specified instance, after automatic

uniquification.

WHAT NEXT

If you want to remove a port from a design, reissue the **remove_port** command with a path to a hierarchical cell.

SEE ALSO

remove_port (2).

UIED-40 (error) All ports cannot be deleted from design %s.

DESCRIPTION

You receive this error message because you have attempted to remove all ports from the specified design. A design must contain at least one port. You can remove any port in any order until there is one remaining.

WHAT NEXT

Reexecute the command and specify the port or ports to be removed. Ensure that at least one port will remain in the design.

UIED-41 (error) Only one object is allowed when the -design argument is activated.

DESCRIPTION

You receive this error message because you have specified more than one object with the **-design** option. Only one object can be specified with this option.

WHAT NEXT

Reexecute the command with the **-design** argument and specify only one object.

UIED-42 (error) Design %s could not be found in the hierarchical

path to the specified object.

DESCRIPTION

You receive this error message if you have specified a design using the **-design** argument that could not be found in the path to the specified object.

WHAT NEXT

Verify that, in the hierarchical path to the specified object, there is a design specified using the **-design** switch. For example, in the command **remove_buffer T1/U1/G1/buf1 -design A**, one of the instances T1, U1, or G1 must be an instance of design A.

UIED-43 (error) Pin '%s' is an internal pin.

DESCRIPTION

This error message occurs when you attempt to connect or disconnect a net to specified pins which are internal pins.

WHAT NEXT

If you get this error message when executing the **connect_net** or **connect_pin** command, make sure that the pin specified is not an internal-pin. Internal pin is not supported in netlist editing, and should not be used for netlist connection.

SEE ALSO

UIED-44 (error) Must specify one supportd object.

DESCRIPTION

WHAT NEXT

Make sure specifies object is a net, leaf cell, or hierarchical pin/port

UIED-45 (error) %s is a SYNOPSYS reserved %s.

DESCRIPTION

WHAT NEXT

Please provide correct inputs to the command

UIED-46 (error) No object found for specified type.

DESCRIPTION

WHAT NEXT

Make sure the object specifies has the type matched to -type option

UIED-47 (error) Must specify only one object.

DESCRIPTION

WHAT NEXT

UIED-48 (error) Command %s does not support %s object %s.

DESCRIPTION

WHAT NEXT

See command man page for supported object types

UIED-49 (error) Bad value specified for the -range option.

DESCRIPTION

Example: -range {0 3}

WHAT NEXT

UIED-50 (error) The %s '%s' is of direction inout. Ports/pins of direction inout is not allowed as an argument to connect_pin.

DESCRIPTION

The connect_pin command does not take a port/pin which has a direction inout.

WHAT NEXT

UIED-51 (error) The %s '%s' and %s '%s' of direction out cannot be connected.

DESCRIPTION

Either connect_pin command is issued with two pins/ports which has a direction out or both of them are connected to a net which already has a driver pin.

WHAT NEXT

UIED-52 (information) The pins/ports are already connected.
Nothing to do.

DESCRIPTION

The connect_pin command has been issued and the pins/ports are already connected.

WHAT NEXT

UIED-53 (information) Removing %s from the input to

`connect_pin` since it is already connected to %s.

DESCRIPTION

Some of the pins/ports passed as an argument to `connect_pin` command are already connected to each other. Hence removing one of the pins/ports.

WHAT NEXT

UIED-54 (error) The `port_name` is not specified. Please re-issue the command with `-port_name` option.

DESCRIPTION

The command `connect_pin` has been issued without specifying a `port_name`. The `-port_name` option is required when the connection has to be made between pins/ports from different sub designs.

WHAT NEXT

Re-issue the command with `-port_name` option.

UIED-55 (error) The %s '%s' is already connected to a net.

DESCRIPTION

The command `connect_pin` has been issued with a pin or port specified in the `to_list` which is already connected to a net.

WHAT NEXT

Re-issue the command after disconnecting the pin or port.

UIED-56 (error) The `-only_physical` option is not supported in IC Compiler.

DESCRIPTION

IC Compiler automatically examines the pins on the specified library cell, and if

all the pins are power/ground then that cell becomes physical only, that is, the cell is put in the Milkyway database, but is not part of the timing design used by optimization and, for instance, does not appear in Verilog output.

The user cannot determine that a cell will be physical only. The library analysis does that.

Please be aware that `connect_net` and `disconnect_net` cannot be used to attach physical only cells. `connect_logic_zero` and `connect_logic_one` may be used.

WHAT NEXT

UIED-57 (error) Must specify at least one tie cell.

DESCRIPTION

WHAT NEXT

UIED-58 (error) Pin %s is already disconnected

DESCRIPTION

Pin is not connected.

WHAT NEXT

Pin is not connected. There is no net on this pin to be edited.

UIED-61 (error) Failed to disconnect %s '%s'.

DESCRIPTION

Failed to disconnect pin or port properly.

WHAT NEXT

Check the inputs and try the command with correct inputs. If problems persist, report the problem to Synopsys

UIED-62 (error) Failed to reconnect %s '%s'.

DESCRIPTION

Failed to reconnect pin or port properly.

WHAT NEXT

Check the inputs and try the command with correct inputs. If problems persist, report the problem to Synopsys

UIED-63 (error) only PG nets are supported by this command.

DESCRIPTION

change_tie_connection can only be used to reconnect the existing connection to a new PG net.

WHAT NEXT

Please provide correct inputs to the command

UIED-64 (error) %s is not connected to a PG net.

DESCRIPTION

change_tie_connection can only be used to reconnect the existing connection of pins connected to a PG net to a new PG net.

WHAT NEXT

Please provide correct inputs to the command

UIED-65 (error) PG leaf pin is not supported by this command.

DESCRIPTION

change_tie_connection can only be used to reconnect the existing connection for signal pins connected to a PG net.

WHAT NEXT

Please provide correct inputs to the command

UIED-66 (error) Internal error - %s.

DESCRIPTION

Internal error.

WHAT NEXT

Report the problem to Synopsys

UIED-67 (error) Can not connect a PG net to leaf level output pin.

DESCRIPTION

Leaf level output pins are drivers and connecting them to a PG net would be considered a short. Therefore such connections are not allowed.

WHAT NEXT

Please provide correct inputs to the command

UIED-68 (error) Must specify only one net to reconnect.

DESCRIPTION

WHAT NEXT

UIED-69 (error) No net specified.

DESCRIPTION

change_tie_connection requires a valid net when -net option is used

WHAT NEXT

Please provide correct inputs to the command

UIED-70 (error) Must provide option '%s' or '%s'.

DESCRIPTION

The mentioned options are required in the command.

WHAT NEXT

Please re-issue the command with correct options.

UIED-71 (error) The argument '%s' of option -source is not a valid driver pin.

DESCRIPTION

The pin or port specified as the source of switch network is not of correct type.

WHAT NEXT

Please re-issue the command with valid pin or port as source.

UIED-72 (error) The required option -direction is not specified with -mode daisy.

DESCRIPTION

The option -direction is required in -mode daisy of the command connect_power_switch when using -voltage_area option without -object_list.

WHAT NEXT

Please re-issue the command with options.

UIED-73 (information) Connecting source '%s' to '%d' cells in

'%s' mode.

DESCRIPTION

The command connect_power_switch is performing the connections on the specified number of cells.

WHAT NEXT

UIED-74 (warning) Source has no location, the starting switch cell is chosen arbitrarily.

DESCRIPTION

The source port or pin has no location , thus the nearest switch from the source cannot be found.

WHAT NEXT

UIED-75 (error) %d out of %d cells are invalid for daisy-chain mode,missing switch/acknowledge pins.

DESCRIPTION

The arguments to -object_list contains switch cells that do not have either the switch pins or acknowledge pins for the daisy chain connections.

WHAT NEXT

Please re-issue the command with valid object list.

UIED-78 (warning) No %s matched the %s specification.

DESCRIPTION

No matching objects were found matching the input specification

WHAT NEXT

Please provide correct inputs to the command

UIED-79 (error) No pins or ports specified.

DESCRIPTION

change_tie_connection requires at least one pin or port to work on

WHAT NEXT

Please provide correct inputs to the command

UIED-80 (error) Other side of hierarchical pin is connected to incompatible net.

DESCRIPTION

This error would occur if the net provided as input to change_tie_connection is Power and the other side of the hierarchical pin is connected a Ground net or vice versa.

WHAT NEXT

Please provide correct inputs to the command

UIED-81 (error) Can not connect a PG net to a hierarchical %s, connected to a signal net on the other side

DESCRIPTION

This error would occur if change_tie_connection is used to connect a PG net in following cases - Connecting to a output hierarchical pin, which is connected to a signal net on the inside - Connecting to a input hierarchical pin, which is connected to a signal net on the outside Both the cases would result in two drivers being connected together, if the connection is allowed

WHAT NEXT

Please provide correct inputs to the command

UIED-82 (warning) Option *hier_cell_list* is ignored when option -top is given.

DESCRIPTION

WHAT NEXT

UIED-83 (error) Option *-type* has Invalid object type.

DESCRIPTION

WHAT NEXT

Please specify cell, net, or port for *-type* option

UIED-84 (error) Pins of library cells can not be renamed.

DESCRIPTION

WHAT NEXT

UIED-85 (error) Cannot change the name of a leaf cell pin.

DESCRIPTION

Leaf pin names are defined in libraries and cannot be changed in design by editing commands.

WHAT NEXT

Do not specify a leaf cell pin name that is defined in libraries.

UIED-86 (error) Cannot change the name of a hierarchical cell.

DESCRIPTION

Only leaf cell instance name can be changed.

WHAT NEXT

UIED-87 (error) No valid leaf cell specified.

DESCRIPTION

WHAT NEXT

UIED-91 (error) Pin %s is on a hierarchical instance

DESCRIPTION

The commands connect_logic_zero or connect_logic_one can be used only for leaf cell pins.

WHAT NEXT

Use change_tie_connection for the appropriate operation on this pin

UIED-92 (error) Top level port %s can not be used with this command

DESCRIPTION

The commands connect_logic_zero or connect_logic_one can be used only for leaf cell pins.

WHAT NEXT

Use change_tie_connection for the appropriate operation on this port

UIED-93 (error) Must specify at least one hierarchy cell.

DESCRIPTION

WHAT NEXT

UIED-94 (error) %s '%s' already exists in cell '%s'.

DESCRIPTION

WHAT NEXT

UIED-95 (error) The -create_net option requires either -power or

-ground, but not both.

DESCRIPTION

WHAT NEXT

UIED-96 (error) Must specify only one net.

DESCRIPTION

WHAT NEXT

UIED-97 (error) %s is not a hierarchical cell.

DESCRIPTION

WHAT NEXT

UIED-98 (error) %s %s does not exist in design.

WHAT NEXT

UIED-99 (error) Options %s and %s cannot be used simultaneously.

WHAT NEXT

UIED-100 (error) Net name '%s' for create_pg_network must ba

a base name and cannot contain '/'.

DESCRIPTION

Only base net name is needed. For example, if you want to create net 'M1/VDD' in hierarchical cell instance 'M1', you only need to specify 'VDD'. The command automatically creates the net in 'M1'.

WHAT NEXT

UIED-101 (error) Failed to connect %s '%s'.

DESCRIPTION

WHAT NEXT

UIED-102 (error) PG net can not connect to a tie hier pin.

DESCRIPTION

A Power net is always a driver and a Ground net is a sink. A Tie hier pin is also a driver. Connecting a power net to a tie hier pin is same as connecting two drivers while connecting the tie hier pin to ground would be a short. Therefore such connections are not allowed.

WHAT NEXT

UIED-103 (error) Tie net can be connected only to a signal hier pin.

DESCRIPTION

A tie net is a driver. A tie hier pin is also a driver. A power hier pin is a driver as well. Therefore a tie net can not be connected to either of those hier pins. Connecting a tie net to a ground hier pin would be a short, So a tie net can connect to signal leaf pins or signal hier pins only.

WHAT NEXT

UIED-104 (error) Can not connect a %s net to leaf level PG pin.

DESCRIPTION

Only PG nets can be connected to PG pins of leaf level instances

WHAT NEXT

UIED-105 (error) No objects specified to connect to.

DESCRIPTION

Valid pins or ports must be provided for connect_net to work.

WHAT NEXT

UIED-106 (error) Failed to disconnect %s '%s'.

DESCRIPTION

WHAT NEXT

UIED-107 (error) Reference of a standard cell can not be changed to a physical only cell.

DESCRIPTION

The reference of a standard cell can be changed to another standard lib cell only.
It can not be changed to a physical only library cell.

WHAT NEXT

UIED-108 (error) Can not update reference for cell %s, in MW database.

DESCRIPTION

Internal error.

WHAT NEXT

UIED-109 (error) %s net can not connect to %s of a %s hier pin.

DESCRIPTION

A tie or PG net can only be a driver. So such a net can only be connected to either inside of a output hierarchical pin or outside of a input hierarchical pin.

WHAT NEXT

Please provide correct inputs to the command

UIED-110 (error) Reference of a physical only cell can not be changed to a standard cell.

DESCRIPTION

The reference of a physical only cell can be changed to another physical only lib cell only. It can not be changed to a logical library cell.

WHAT NEXT

UIED-111 (error) Can not connect a %s net to leaf level output

pin.

DESCRIPTION

A tie or PG net can only be a driver. So such a net can not be connected to a leaf level output pin.

WHAT NEXT

Please provide correct inputs to the command

UIED-112 (error) %s pin %s is a PG pin or a hierarchical pin connected to o a PG or tie net.

DESCRIPTION

connect_pin can only connect signal pins and unconnected hierarchical pins or hierarchical pins connected to signal nets.

WHAT NEXT

Please provide correct inputs to the command

UIED-113 (error) Port %s can not be connected to a PG net.

DESCRIPTION

Primary ports can not be connected to PG nets.

WHAT NEXT

Please provide correct inputs to the command

UIED-114 (error) No valid net specified.

DESCRIPTION

This command requires a valid net to work on.

WHAT NEXT

Please provide correct inputs to the command

UIED-115 (error) Default tie %s net can not connect to inside of a hier pin or a top level port.

DESCRIPTION

The default tie nets SNPS_LOGIC1 and SNPS_LOGIC0 are special nets inside ICC. They correspond to 1'b1 and 1'b0 in terms of verilog. There is no valid representation in verilog for such connections. Only named tie nets can be connected in such manner.

WHAT NEXT

Please provide correct inputs to the command

UIED-116 (error) No PG net specified.

DESCRIPTION

recover_tie_connection requires valid PG nets when -net option is used.

WHAT NEXT

Please provide correct inputs to the command.

UIED-117 (error) Net '%s' is not a PG net.

DESCRIPTION

recover_tie_connection requires valid PG nets when -net option is used.

WHAT NEXT

Please provide correct inputs to the command.

UIED-118 (error) No hier cell instance specified.

DESCRIPTION

recover_tie_connection requires valid hier cell instances when -cell option is used.

WHAT NEXT

Please provide correct inputs to the command.

UIED-119 (error) '%s' is not a hier cell instance.

DESCRIPTION

recover_tie_connection requires valid hier cell instances when -cell option is used.

WHAT NEXT

Please provide correct inputs to the command.

UIED-120 (error) A %s net can not connect to a hierarchical pin connected to a %s net on the other side.

DESCRIPTION

A Power or Ground net can only connect to a hierarchical pin connected on the other side, if the net on the other side is of the same type - power or ground.

WHAT NEXT

Please provide correct inputs to the command

UIED-121 (error) Can not change link for hierarchical instance %s.

DESCRIPTION

The change_link command can only work on leaf level instances. The reference of hierarchical instances can not be changed using change_link.

WHAT NEXT

Please provide correct inputs to the command

UIED-122 (error) %s %s is not connected to a PG net.

DESCRIPTION

change_tie_connection can only be used to reconnect the existing connection of pins connected to a PG net to a new PG net.

WHAT NEXT

Please provide correct inputs to the command

UIED-123 (error) Cannot find the specified reference %s.

DESCRIPTION

The specified reference can not be found in any reference library path

WHAT NEXT

Please provide correct inputs to the command

UIED-124 (error) Unsupported view %s specified for "-view" option.

DESCRIPTION

The view specified is not supported. Only FRAM and CEL views are supported by this command.

WHAT NEXT

Please provide correct inputs to the command

UIED-125 (error) No library cell found for physical only library

cell '%s'.

DESCRIPTION

No library cell matching the specified reference was found in the db library. The library cell exists in FRAM library.

WHAT NEXT

Please update the db library to have a reference cell matching this physical only cell.

UIED-126 (error) Pin %s is part of a library cell. Its bus property cannot be modified.

DESCRIPTION

You receive this message if you issue the **define_bus** command and attempt to manipulate a port that belongs to a vendor library cell. You can remove ports only from non-vendor library designs.

WHAT NEXT

If you want to define bus for a port from a design, reissue the **define_bus** command with a path to a hierarchical cell.

SEE ALSO

[remove_port](#) (2).

UIED-127 (error) Can't define %s bus '%s'; it's already part of a bus.

DESCRIPTION

WHAT NEXT

Run `undefine_bus` and reissue `define_bus`.

UIED-128 (error) Can't define %s bus '%s'; %d is not within start index %d and end index %d.

DESCRIPTION

WHAT NEXT

Change start or end index.

UIED-129 (information) %s bus '%s' is already bit blasted.

DESCRIPTION

WHAT NEXT

UIED-130 (information) '%s' has no bus to be %s.

DESCRIPTION

WHAT NEXT

UIED-131 (error) Can't define %s bus '%s'; only %d bits between %d and %d exist in database.

DESCRIPTION

WHAT NEXT

Change start or end index. Or, create additional objects.

UIG

UIG-1 (error) Unable to create %s property for setup data.

DESCRIPTION

This error message occurs when the **search_path** and **link_library** variables and related setup data for this run cannot be saved on the current CEL view.

WHAT NEXT

Make sure that you have write permission for the CEL view and then run the command again.

UIG-2 (error) Cannot get celld for the current design.

DESCRIPTION

This error message occurs when there is an open CEL view, but the tool cannot obtain the CEL view's identification.

WHAT NEXT

This is an internal error. Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

UIG-3 (error) Library is opened in read only mode.

DESCRIPTION

This error message occurs when the the design library is opened in read only mode. In this mode, the CEL view cannot be saved and new CEL views cannot be created.

WHAT NEXT

Close the library and reopen it without the read only option.

UIG-4 (error) Cell is opened in read only mode.

DESCRIPTION

This error message occurs when the design CEL view is opened in read only mode. The design cannot be saved in this mode.

WHAT NEXT

Save the design as a new CEL view using the **-as** switch.

UIG-5 (information) Saved design named %s.

DESCRIPTION

This information message advises you that the design has been saved successfully.

WHAT NEXT

This is an informational message only. No action is required.

UIG-6 (error) Failed to save design %s.

DESCRIPTION

This error message occurs when the tool fails to save the specified design.

WHAT NEXT

Check any error messages issued before this one. Make the necessary corrections and then run the command again.

UIG-7 (error) No CEL view exists in memory. Use the -as option to specify the CEL view name.

DESCRIPTION

This error message occurs when the initial design was read from ASCII input (such as Verilog or .db), so a CEL view does not yet exist.

WHAT NEXT

Save the design as a new CEL view using the **-as** switch.

UIG-8 (error) A Milkyway design library must be specified.

DESCRIPTION

This error message occurs when the design library has not already been opened.

WHAT NEXT

Specify the design library using **-library** option to the **open_mw_cel** command.

You can also open the library with the **open_mw_lib** command before running **open_mw_cel**.

SEE ALSO

[open_mw_cel\(2\)](#)
[open_mw_lib\(2\)](#)

UIG-9 (error) Cannot get libId for current library.

DESCRIPTION

This error message occurs when the design library cannot be found. The library must be open for this command to run properly.

WHAT NEXT

Use the **open_mw_lib** command to open the library and rerun the command.

SEE ALSO

[open_mw_lib\(2\)](#)

UIG-10 (Information) AUTO-RESTORE: Setting variable %s to

%S.

DESCRIPTION

This message is issued when the library setup for the MW CEL is being restored from previously saved values, while opening the MW CEL. You can set the variable **auto_restore_mw_cel_lib_setup** to false if you do not want the setup to be restored from save values.

WHAT NEXT

This is for information only. Please set this variable to a different value if you want to override the current value.

UIG-11 (error) Invalid cell name specified.

DESCRIPTION

This error message occurs when the cell name being specified to save the CEL is not valid.

WHAT NEXT

Use a CEL name without any "." in the name. The only exception is if the name is specified with the extension ".CEL". For example, abc.CEL is valid name but abc.new is not.

UIG-12 (error) Cannot set scan type on pin %s.

DESCRIPTION

This error message occurs when the **set_scan_pin_type** command is not able to set the scan type on the pin or physical lib pin specified as input.

WHAT NEXT

Make sure that a valid pin is specified. If a physical lib pin is specified, then the corresponding physical lib cell must be instantiated in the design.

UIG-13 (Information) Scan type on pin %s, is being changed

from %s to %s.

DESCRIPTION

This message is issued when the input pin to the command `fset_scan_pin_type` has the scan pin type already set to a different value.

WHAT NEXT

This is for information only.

UIG-14 (error) Cannot remove scan type from pin %s.

DESCRIPTION

This error message occurs when the `remove_scan_pin_type` command is not able to remove the scan type from the pin or physical lib pin specified as input.

WHAT NEXT

Make sure that a valid pin is specified. If a physical lib pin is specified, then the corresponding physical lib cell must be instantiated in the design.

UIG-15 (Information) Scan type %s removed from pin %s.

DESCRIPTION

This message is issued when the scan pin type of the input pin to the command `fremove_scan_pin_type` is successfully removed.

WHAT NEXT

This is for information only.

UIG-16 (error) Type must be one of in or out.

DESCRIPTION

The value for type argument in the command `set_scan_pin_type` must be either in or out.

WHAT NEXT

Make sure that a correct value is specified.

UIG-17 (error) No CEL is open, please open a CEL first.

DESCRIPTION

A Milkyway CEL must be opened before running the command `set_scan_pin_type` or `remove_scan_pin_type`

WHAT NEXT

Open a Milkyway CEL and rerun the command

UIG-18 (error) No pin specified.

DESCRIPTION

This error message occurs when neither a pin nor a physical lib pin is specified, while running the `set_scan_pin_type` or `remove_scan_pin_type` command

WHAT NEXT

Make sure that a valid pin is specified.

UIG-19 (error) Specified reference cel %s is not instantiated in the design.

DESCRIPTION

This error message occurs when a physical lib pin is specified as input to the `set_scan_pin_type` command but the corresponding reference cel is not instantiated in the open Milkyway design.

WHAT NEXT

Make sure that the physical lib cell is instantiated in the design.

UIG-20 (warning) Specified reference cel %s is not instantiated in the design.

DESCRIPTION

This warning message occurs when a physical lib pin is specified as input to the **remove_scan_pin_type** command but the corresponding reference cel is not instantiated in the open Milkyway design. The pin does not have the scan_type property set so it can not be removed anyway

WHAT NEXT

Make sure that the physical lib cell is instantiated in the design.

UIG-21 (error) Cannot set the current instance to %s.

DESCRIPTION

This error message occurs when the owning cel-id of the new current_instance is not same as the current top cel. Current instance can only be set to a instance owned by the top cel.

WHAT NEXT

SEE ALSO

[current_mw_cel](#)

UIG-22 (error) Cannot open file %s for %s.

DESCRIPTION

This error message occurs when the options file can not be opened for read or write

WHAT NEXT

SEE ALSO

UIG-30 (error) Cannot find cell: %s.

DESCRIPTION

This error message occurs when dump out internal DataModel, but the tool cannot obtain the cell.

WHAT NEXT

This is an internal error. Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

UIG-31 (error) Cannot find net: %s.

DESCRIPTION

This error message occurs when dump out internal DataModel, but the tool cannot obtain the net.

WHAT NEXT

This is an internal error. Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

UIG-32 (error) Fail at file %s line %d.

DESCRIPTION

This error message occurs while handling the file at special line.

WHAT NEXT

SEE ALSO

UIL

UIL-0 (information) Note that the ".synopsys_lc.setup" init file of lc_shell is a subset of the dc_shell ".synopsys_dc.setup" init file. If a command other than an lc_shell command is encountered in the init file, an error message is issued and the processing might terminate. Refer to the Library Compiler manuals for supported commands.

DESCRIPTION

During the initialization phase, the Library Compiler command line tool **lc_shell** and the graphical tool **library_compiler** read in a setup file **.synopsys_lc.setup**. Both tools perform a subset of the Design Compiler dc_shell commands. If a dc_shell command is encountered such as **read_design** command), Library Compiler tools issue an error. Depending on the semantics of the command read, it might terminate.

WHAT NEXT

Refer to the Library Compiler User Guide and Reference Manuals for supported commands.

UIL-1 (warning) Overwriting an old symbol library '%s' file with a new one.

DESCRIPTION

The symbol library, specified in your **read_lib** command, already exists in the database. The old library is deleted from the database and replaced by the new one. This message is generated when

- Reading a symbol library directly or
- Reading an EDIF file with the "-symbol option" set to the same symbol filename

WHAT NEXT

Use **list -lib** to find all available libraries. No action is required if you decide to overwrite a library name reported by **list -lib**.

EXAMPLES

Reading a symbol library explicitly:

```
lc_shell> read_lib uill_symbol.slib
    Reading '/tmp/uill_symbol.slib' ...
    Symbol library 'uill' read successfully
lc_shell> read_lib uill_symbol.slib
    Reading '/tmp/uill_symbol.slib' ...
    Warning: Overwriting an old symbol library '/tmp/
uill.sdb' file with a new one. (UIL-1)
```

Reading a symbol library though the EDIF file:

```
lc_shell> read_lib -format edif uill.edif -symbol uill_symbol.slib
    Reading '/tmp/uill_symbol.slib' ...
    Symbol library 'uill' read successfully
lc_shell> read_lib -format edif uill.edif -symbol uill_symbol.slib
    Reading '/tmp/uill_symbol.slib' ...
    Warning: Overwriting an old symbol library '/tmp/
uill.sdb' file with a new one. (UIL-1)
```

EXAMPLE MESSAGE

Warning: Overwriting an old symbol library '/tmp/
uill.sdb' file with a new one. (UIL-1)

UIL-2 (warning) Overwriting an old technology library '%s' file with a new one.

DESCRIPTION

The technology library, specified in the **read_lib** command, already exists in the database. The old library is deleted from the database and is replaced by the new one.

WHAT NEXT

Use **list -lib** to find all available libraries. No action is required if you decide to overwrite a library name reported by **list -lib**.

EXAMPLES

```
lc_shell> read_lib uil2.lib
    Reading '/tmp/uil2.lib' ...
    Technology library 'uil2' read successfully
lc_shell> read_lib uil2.lib
    Reading '/tmp/uil2.lib' ...
    Warning: Overwriting an old technology library '/tmp/
```

uil2.db' file with a new one. (UIL-2)

EXAMPLE MESSAGE

Warning: Overwriting an old technology library '/tmp/uil2.db' file with a new one. (UIL-2)

UIL-3 (warning) The '%s' library has not been read in yet.

DESCRIPTION

The command issued tries to access a library that does not exist in the database. A typo in the library name can also result in this problem. Any of the following commands might trigger the generation of this warning: **add_module**, **compare_lib**, **write_lib**, **report_lib** and **update_lib**.

WHAT NEXT

Use **list -lib** to find all available libraries. Make sure the library name is among the ones being reported by **list -lib**. Otherwise, load the library into the database using **read** for a db file, or **read_lib** for a library source file, then reissue the command.

EXAMPLE MESSAGE

Warning: The 'uil3' library has not been read in yet. (UIL-3)

UIL-4 (error) The '%s' library source file is not found.

DESCRIPTION

The library source file is not found either because

- The file is not in the **search_path**, assuming that the full path is not specified or,
- There is a typo in the filename.

WHAT NEXT

Issue the command with the correct file name and the full path. Alternatively, you can add the path to the current **dc_shell** or **lc_shell search_path**, and issue the command with the correct file name.

EXAMPLE MESSAGE

Error: The 'uil4.lib' library source file is not found. (UIL-4)

UIL-5 (error) The read_lib command does not support '%s' as the '-format' switch value. The only format allowed is 'edif'.

DESCRIPTION

Currently, **read_lib** accepts only **edif** as **-format** switch value for reading in symbol library in EDIF format. It is reported as an error if you specify any other **-format** switch value.

WHAT NEXT

If you want to read in an EDIF symbol library, make sure the **read_lib** switch **-format** has the value **edif**. Otherwise, do not specify the **-format** switch with the **read_lib** command. Reinvoke the **read_lib** with the correct switch value. For quick reference, invoking **read_lib** with **-help** switch, causes **read_lib** to print out its legal command syntax.

EXAMPLES

```
dc_shell> read_lib -help
Usage: read_lib
        -format      (EDIF symbol format; default is Synopsys format)
        -symbol      (with EDIF, name of Synopsys library file to create)
        <file_name>  (technology or symbol library file)
        -no_warnings (disable warning messages)
        -names_file  <file_list> (one or more names files)
```

UIL-6 (warning) The Library Compiler is not enabled. The cell functionality is ignored.

DESCRIPTION

This site is not licensed for Library Compiler. The attempt to compile a technology library is restricted to timing information only. All cell functions are removed, so they become black-boxes.

WHAT NEXT

If you are compiling a technology library for timing analysis use only, ignore this

warning message. However, if you want to have full Library Compiler capability, contact your Synopsys system administrator to purchase Library Compiler.

EXAMPLE MESSAGE

Warning: The Library Compiler is not enabled. The cell functionality will be ignored. (UIL-6)

UIL-7 (error) Cannot write the library to the '%s' file.

DESCRIPTION

An attempt to write out a database (db or sdb) file w with **write_lib** failed. The reasons you get this error could be because either

- You do not have write permission to the target directory or,
- There is not enough disk space for the file.

WHAT NEXT

Check disk space and permission of the target directory. Make sure you have enough disk space and write permission before using **write_lib**.

UIL-8 (error) The '%s' pin of the '%s' cell in the '%s' technology library is not found in the same cell of the '%s' symbol library.

DESCRIPTION

The Library Compiler detects unmatched pin names between a technology library and a symbol library using the **compare_lib** command.

WHAT NEXT

Correct the mismatch either in the technology library or the symbol library, and recompile the modified library.

EXAMPLE MESSAGE

Error: The 'D' pin of the 'uil8' cell in the 'techlib' technology library is not found in the same cell of the 'symblib' symbol library. (UIL-8)

UIL-9 (error) The '%s' cell does not exist in the '%s' symbol library.

DESCRIPTION

A correspondent symbol cell cannot be found in the symbol library. This error is caused by a typo in a cell name in either the technology library file or the symbol library file, or a missing symbol cell. This error results in the use of a generic symbol library symbol or a black box symbol in a schematic containing the cell.

WHAT NEXT

If the error is due to a typo, correct the cell name typo. If the error is due to a missing symbol, add it to the symbol library. Recompile the modified library, and run compare_lib command.

EXAMPLE MESSAGE

Error: The 'uil9' cell does not exist in the 'symbplib' symbol library. (UIL-9)

UIL-10 (error) Trying to compare a '%s' library with a '%s' library. compare_lib compares a technology library and a symbol library.

DESCRIPTION

The two libraries submitted to **compare_lib** are not a legitimate combination.
compare_lib compares a technology library and a symbol library.

WHAT NEXT

Use **report_lib** to obtain the types of libraries. Make sure that you compare a symbol library and a technology library.

EXAMPLE MESSAGE

Error: Trying to compare a 'Technology' library with a 'Technology' library.
compare_lib compares a technology library and a symbol library. (UIL-10)

UIL-12 (error) Trying to compare a library with itself. compare_lib

compares a technology library and a symbol library.

DESCRIPTION

The two libraries submitted to **compare_lib** are identical. The **compare_lib** command compares a technology library and a symbol library.

WHAT NEXT

Compare a symbol library and a technology library. If the technology library and symbol library share the same library name, specify the symbol library with its full name in **format file_path:library_name**. For example, the libraries are both named **uill12**. Issue the commands

```
dc_shell> list -library
      Library          File          Path
      -----          ----          -----
      uill12          uill12.db      /synopsys/libraries
      uill12          uill12.sdb      /synopsys/libraries
1
dc_shell> compare_lib uill12.db:uill12 uill12.sdb:uill12
```

EXAMPLES

```
dc_shell> compare_lib uill12 uill12
```

EXAMPLE MESSAGE

Error: Trying to compare a library with itself. compare_lib
compares a technology library and a symbol library. (UIL-12)

UIL-13 (error) The specified '%s' library cannot be found in memory.

DESCRIPTION

You try to access a library that has not been read in yet. This error could result from typos in the library name.

WHAT NEXT

Use **list -lib** to find all available libraries. Make sure that you type in the correct library name with your command. If the library is not reported by the **list -lib** command, load the library with **read_lib** for a library source file, or **read** for a

db file, before reissuing the command.

UIL-15 (warning) No libraries in the '%s' library file.

DESCRIPTION

A file is read in, but no library is found in the file. It is most likely that the file is empty.

WHAT NEXT

Read in the correct file with a library.

UIL-16 (error) Cannot find the '%s' library or library file in memory.

DESCRIPTION

This error is obsoleted.

WHAT NEXT

UIL-17 (error) Could not open the '%s' file for reading.

DESCRIPTION

You do not have read permission of the specified EDIF file.

WHAT NEXT

Check the permissions for the file. Make sure you have read permissions for the file.

EXAMPLE MESSAGE

Error: Could not open the 'uil17.edif' file for reading. (UIL-17)

UIL-18 (error) Could not open the '%s' file for writing.

DESCRIPTION

An attempt to open an output file has failed. This problem might be caused by

1. Trying to write to a directory for which you do not have write permission.
2. Trying to write to an existing file for which you do not have write permission.
3. The output file name specifies a non-existing path.
4. The file system is full.

WHAT NEXT

Check the correctness of file name and path, and make sure you have write permission for the file. If the file system is full, provide more disk space.

UIL-19 (error) The '%s' cell does not exist in the '%s' technology library.

DESCRIPTION

This error message is issued by either **compare_lib** or **report_lib**. In the **compare_lib** case, if it cannot find a matched technology library cell for a symbol component, it reports this error with the message. In the **report_lib** case, if you specify a nonexistent cell in the cell list, this error message is displayed. This error usually is caused by a typo.

WHAT NEXT

Provide a correct name with each cell in a cell list. If you are not sure about cell names, do not specify a cell list.

UIL-20 (error) The '%s' symbol in the '%s' symbol library has an extra '%s' pin.

DESCRIPTION

This error message is issued by the **compare_lib** command. For each cell of a symbol library, Library Compiler checks for pin names in the same cell of the technology library and issues an error if the pin does not exist.

WHAT NEXT

Correct the symbol library by removing the pin name or adding it to the technology library. Use Library Compiler to recompile the modified library, and run the compare_lib command.

UIL-21 (error) The '%s' synthetic module does not exist in the '%s' library.

DESCRIPTION

This error message is issued by the **report_lib** command. You might have specified a nonexistent synthetic module in the module list. This error is usually caused by a typo.

WHAT NEXT

Provide a correct name with each module in a module list. If you are not sure about module names, do not specify a module list.

UIL-23 (error) Invalid output format '%s'.

DESCRIPTION

Currently, for dc_shell **write_lib** accepts only **db**, **edif**, and **vhdl** as **-format** switch value for writing libraries in the specifBed format. For lc_shell, only **db** and **vhdl** switch values are accepted. It is reported as an error if you specify any other **-format** switch value.

WHAT NEXT

If you want to write a db library, do not specify the **-format** switch with the **write_lib** command. Otherwise, make sure that the **write_lib** switch **-format** has the value edif or vhdl.

Reinvoke the **write_lib** with the correct switch value. For quick reference, invoking **write_lib** with the **-help** switch, causes **write_lib** to print out its correct command syntax.

EXAMPLES

```
dc_shell> write_lib -help
Usage: write_lib
        <library_name> (a library already loaded into dc_shell)
        -format      db|edif|vhdl (write library in the specified format;
```

```
           default is db)
-output      <file_name>  (write library to the specified file)
-names_file  <file_list>  (one or more names files)
```

UIL-24 (error) Unacceptable VHDL library generation. You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error is issued when the **write_lib -format vhdl** uses a library read as a db file using the **read** command.

WHAT NEXT

Read in the library from a technology library source file. Reissue the **write_lib -format vhdl** command.

EXAMPLE MESSAGE

```
Error: Unacceptable VHDL library generation.
You must read in the 'uil24' library from a technology library source file. (UIL-24)
```

UIL-25 (error) The '-symbol' option can only be used with the '-format EDIF' option.

DESCRIPTION

Currently, **read_lib** accepts the **-symbol** option only with **edif** as a **-format** switch value for reading in symbol library in EDIF format. It is reported as an error if you specify **-symbol** without the **edif** format.

WHAT NEXT

If you want to read in an EDIF library and select the Synopsys file to create a symbol library, make sure the **read_lib** switch **-format** has the value **edif** followed by the **-symbol filename** option. Otherwise, do not specify the **-symbol** switch with the **read_lib** command. Reinvoke the **read_lib** with the correct switch value. For quick reference, invoking **read_lib** with the **-help** switch, causes **read_lib** to print out its correct command syntax.

EXAMPLES

```
dc_shell> read_lib -help
Usage: read_lib
        -format      (EDIF symbol format; default is Synopsys format)
        -symbol      (with EDIF, name of Synopsys library file to create)
        <file_name>  (technology or symbol library file)
        -no_warnings (disable warning messages)
        -names_file  <file_list>  (one or more names files)
```

UIL-26 (error) Unacceptable list of cells for the '%s' library.

DESCRIPTION

This error message is issued by the **report_lib** command. You might have specified an empty or a corrupted cell list. This error usually is caused by a typo.

WHAT NEXT

Provide a correct name with each cell in a cell list. If you are not sure about cell name, do not specify a cell list.

UIL-27 (error) Invalid technology library timing report.

You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error message is issued by **report_lib -timing_arcs** or **-timing** command. The timing options are used only on a library that has been read from a ".lib" technology library source file by the **read_lib** command.

WHAT NEXT

To use the **report_lib** with the **-timing** option, read in the technology source library instead of the db file.

UIL-28 (warning) The '%s' vendor specific delay model is used in this library.

The library timing report might be incomplete.

DESCRIPTION

This message is issued during a **report_lib -timing** command. The **delay_model** attribute in the technology source file is set to a non-generic delay model, such as **generic_cmos** or **table_lookup**. In the case of a **cmos2**, **report_lib** does not display any information about the slope.

WHAT NEXT

You can choose to ignore the warning or to modify the delay model attribute in the technology source file if you want more timing information. Reread the library, and reissue the **report_lib** command.

EXAMPLE MESSAGE

Warning: The 'cmos2' vendor specific delay model is used in this library.
The library timing report might be incomplete. (UIL-28)

UIL-29 (error) The '%s' library is a synthetic library. Use the report_synlib command.

DESCRIPTION

This error is issued when the **report_lib** command is used for reporting on a synthetic library. A dc_shell command **report_synlib** is used to report on synthetic libraries.

WHAT NEXT

Use **report_synlib** command to report on synthetic libraries.

UIL-30 (error) The '%s' library is not a synthetic library. Use report_lib command.

DESCRIPTION

This error is issued when the **report_synlib** command is used on reporting on a technology library. A Library Compiler command **report_lib** is used to report on technology libraries.

WHAT NEXT

Use **report_lib** command to report on technology libraries.

UIL-32 (warning) The '%s' model library is different from the current link library.

DESCRIPTION

The **model** command might generate this message whenever the model library is different from the current link library. This situation should not occur frequently, but whenever a **model** is used with a 'for' loop construct to get the model library, it is possible that the link library will be different from the model library.

WHAT NEXT

Redefine **link_library** to be the same as the model library.

UIL-33 (error) Invalid technology library state table report.

You must read in library '%s' from a technology library source file.

DESCRIPTION

The **report_lib** options '-table' and '-full_table' require that the technology library source file is read in by **read_lib**. These options print out the state table information in the technology library.

WHAT NEXT

Read the technology library source file, then reissue the **report_lib** command with the **-table** or **-full_table** options.

UIL-34 (information) Updating technology library (please save)

...

DESCRIPTION

Every db technology library written out by a version of Library Compiler older than

4.0, is processed again every time that it is read in. To cut out this very significant amount of overhead, after reading in the db technology library, write the library back out and use the updated library.

The variables 'read_db_lib_warnings' and 'read_translate_msff' control options for this processing step. Please refer to their man pages for more details.

WHAT NEXT

Write the technology library back out by using the **write_lib** command.

UIL-35 (warning) operating conditions '%s' not overwritable in lib '%s'

DESCRIPTION

The command issued tries to overwrite an operating condition group that has been declared permanent before. Create this operating condition with a different name.

WHAT NEXT

Use **report_lib** to find all available operating conditions for that lib. Choose a name which is not there and create a new one.

EXAMPLE MESSAGE

Warning: operating conditions 'WCCOM' not overwritable in lib 'my_lib' (UIL-35)

UIL-36 (warning) operating condition already defined in lib '%s'

DESCRIPTION

The command issued tries to overwrite an existing group with the same name.

WHAT NEXT

Use -overwrite option. If it is still not overwritable use **report_lib** to find all available operating conditions for that lib. Choose a name which is not there and create a new one.

EXAMPLE MESSAGE

operating condition already defined in lib 'mylib' (UIL-36)

UIL-37 (information) The DCM vendor specific delay model is used in this library.

The library report will not contain timing-related information.

DESCRIPTION

This message is issued during a **report_lib** command. The **delay_model** attribute in the technology source file is set to "dcm" delay model. The **report_lib** command does not display any timing information.

WHAT NEXT

EXAMPLE MESSAGE

Information: The DCM vendor specific delay model is used in this library.
The library report will not contain timing-related information. (UIL-37)

UIL-39 (error) The psuedo techonlogy file %s not found.

DESCRIPTION

This message is issued during a **read_lib -format gdsii** command. The given pusedo library file doesn't exist in the directory.

WHAT NEXT

1. Set the **search_path** variable correctly to point to the pusedo library directory.
2. Check to see if the file exists and has read permissions.

EXAMPLE MESSAGE

UIL-40 (warning) The library '%s' is not a physical library. Ignore -macro_only option.

DESCRIPTION

You receive this warning message because you have executed the **write_lib** command with the **-macro_only** option and specified a library that is not a physical library. The **-macro_only** option with the **write_lib** command applies only to the physical

library.

WHAT NEXT

Do not use the **-macro_only** option when writing a non-physical library. Or, ensure that the specified library is in the physical library before executing the **writ_lib -macro_only** argument.

SEE ALSO

write_lib (2).

UIL-41 (error) Invalid technology library noise report.

You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error message is issued by **report_lib -noise** command. The timing options are used only on a library that has been read from a ".lib" technology library source file by the **read_lib** command.

WHAT NEXT

To use the **report_lib** with the **-noise** option, read in the technology source library instead of the db file.

UIL-42 (error) %s '%s' is duplicated.

DESCRIPTION

This error message is issued by **merge_lib** command.

UIL-43 (error) Library '%s' is not a NLDM library and can't be merged.

DESCRIPTION

This error message is issued by the **merge_lib** command.

WHAT NEXT

Only native nldm libraries can be merged.

UIL-44 (error) The '%s' of object '%s' and of object '%s' are different.

DESCRIPTION

This error message is issued by the **merge_lib** command.

WHAT NEXT

Some key properties of the two objects to merge should be the same.

UIL-45 (error) Can not open the Milkyway reference library '%s'.

DESCRIPTION

You receive this warning message because you have executed the **write_lib** command with the **-mw_ref_lib** option and specified a Milkyway reference library. However the Milkyway reference library can not be opened. The generated .db/.pdb file is not written into the Milkyway reference library

WHAT NEXT

Check if the Milkyway reference library specified exists and is not locked by other applications.

SEE ALSO

write_lib (2).

UIL-46 (warning) The operating condition '%s' is not valid. Use the default value of 'min'.

DESCRIPTION

You receive this warning message because you have executed the **write_lib** command with the **-mw_oc_type** option and specified an operating condition that is not valid.

The value of -fB-mw_oc_type can only be 'max', 'min', 'typical' or 'other'.

WHAT NEXT

SEE ALSO

write_lib (2).

UIL-47 (error) The option '-mw_ref_lib' is not specified while using the '-mw_oc_type' option.

DESCRIPTION

You receive this warning message because you have executed the **write_lib** command with the **-mw_oc_type** option and specified an operating condition without specifying a Milkyway reference library.

WHAT NEXT

Specify the '-mw_ref_lib' option along with the option '-mw_oc_type'

SEE ALSO

write_lib (2).

UIL-48 (error) the output format is not in db format while trying to write the output into a Milkyway reference library.

DESCRIPTION

You receive this warning message because you have executed the **write_lib** command with the **-mw_ref_lib** option and specified an output format which is not in db format. Only db format file can be written into an Milkyway reference library by **write_lib**

WHAT NEXT

Do not use the **-mw_ref_lib** option when writing a non-db format file.

SEE ALSO

`write_lib` (2).

UIL-49 (error) Invalid technology library user-defined data report.

The 'report_user_data' library_feature is not specified in the '%s' library.

You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error message is issued by `report_lib -user_defined_data` command. The user-defined_data options are used only on a library that has been read from a ".lib" technology library source file by the `read_lib` command.

WHAT NEXT

To use the `report_lib` with the `-user_defined_data` option, read in the technology source library instead of the db file.

UIL-50 (error) The '%s' cell does not exist in the '%s' physical library.

DESCRIPTION

This error message is issued by `report_lib`. In the `report_lib` case, if you specify a nonexistent cell in the cell list, this error message is displayed. This error usually is caused by a typo.

WHAT NEXT

Provide a correct name with each cell in a cell list. If you are not sure about cell names, do not specify a cell list.

UIL-51 (error) The '%s' library is a symbol library.

It is not supported by the get_lib_attribute command.

DESCRIPTION

This error is issued when the **get_lib_attribute** command is used for a synthetic library. The gerht_lib_attribute command can only be used for technology libraries.

WHAT NEXT

Use **get_attribute** command for synthetic libraries.

UIL-52 (error) The '%s' library is a physical library.

It is not supported by the get_lib_attribute command.

DESCRIPTION

This error is issued when the **get_lib_attribute** command is used for a physical library. The gerht_lib_attribute command can only be used for technology libraries.

WHAT NEXT

Use **get_attribute** command for physical libraries.

UIL-53 (error) Unacceptable list of library objects for the '%s' library.

DESCRIPTION

This error message is issued by the **get_lib_attribute** command. You might have specified an empty or a corrupted library object list. This error usually is caused by a typo.

WHAT NEXT

Provide a correct name with each object in a library object list. If you are not sure about library object name, do not specify a library object list.

UIL-54 (error) The '%s' object does not exist in the '%s'

technology library.

DESCRIPTION

This error message is issued by **get_lib_attribute**. If you specify a nonexistent object in the library object list, this error message is displayed. This error usually is caused by a typo.

WHAT NEXT

Provide a correct name with each object in a libray object list. If you are not sure about object names, do not specify a object list.

UIL-55 (error) The '%s' library_feature is not specified in the '%s' library.

DESCRIPTION

This error message is issued by **set_lib_attribute**. If you use set_lib_attribute command for a library which does not have 'allow_update_attribute' library feature, this error message is displayed.

WHAT NEXT

Set the 'allow_update_attribute' library_feature in the source library as follows:
library(sample) { ... library_features(report_delay_calculation); ... }

UIL-56 (error) The value '%s' is not valid for the attribute '%s', or the attribute '%s' is not modifiable.

DESCRIPTION

This error message is issued by **set_lib_attribute**.

WHAT NEXT

Correct the attribute value.

UIL-57 (error) Invalid technology library power report.

You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error message is issued by the **report_lib -power** command when the library is read from a db file that is not enabled for reporting power information. In such cases, the **-power** option is enabled only if that library is read from a ".lib" technology library source file by the **read_lib** command.

A library db file can be enabled for reporting power information by compiling it from a ".lib" file that enables the library feature **report_power_calculation**.

WHAT NEXT

To use **report_lib** with the **-power** option, read in the technology source library instead of the db file.

UIL-58 (error) The format of the -%s option is incorrect.

DESCRIPTION

Command "merge_lib" requires that the -baseline option define a pair of baseline library name and calc_mode. Command "merge_lib" requires that the -library option define pairs of library name and calc_mode.

UIL-59 (error) Calc_mode '%s' is not valid.

DESCRIPTION

This error message is issued by the **merge_lib** command. 1.If the baseline defines the default_operating_conditions, then the name of that default operating condition can't be used as a calc_mode for other libraries to be merged. 2.If the baseline does not defines the default_operating_conditions, then the name of the baseline library can't be used as a calc_mode for other libraries to be merged. 3. The name of the baseline library plus "_CALC_MODE" can't be used as a calc_mode for other libraries to be merged.

UIL-60 (error) Cannot attach test model to library cell '%s'.

DESCRIPTION

This error is generated because a test model in CTL format is successfully read in but cannot be associated with the named cell because it does not have a CTL interface or it does not exist.

WHAT NEXT

Make sure the named design exists and has the same CTL interface.

SEE ALSO

UIL-61 (warning) Override the test model attached to the library cell '%s'.

DESCRIPTION

The library cell already has a test model attached to it but a newly generated test model is going to override the old one and attach to the library cell.

WHAT NEXT

Make sure it is intended to override a previous attached test model to the library cell

SEE ALSO

UIL-62 (warning) Operating condition '%s' is not found in library '%s'.

DESCRIPTION

The command issued tries to access an operating condition that does not exist in the specified library. A typo in the operating condition name can also result in this problem. Any of the following commands might trigger the generation of this warning: **report_operating_conditions**, **delete_operating_conditions**.

WHAT NEXT

Use `report_operating_conditions -lib` to list all operating conditions. Make sure the operating condition name is among the ones being reported by `report_operating_conditions -lib`.

EXAMPLE MESSAGE

Warning: Operating condition 'OC1' is not found in library 'a_lib'. (UIL-62)

UIL-63 (warning) Operating condition '%s' can't be deleted since it is not created by users using command 'create_operating_conditions'.

DESCRIPTION

Only those operating conditions created by users using command `create_operating_conditionsfp` and not being used by any design can be deleted from a library.

EXAMPLE MESSAGE

Warning: Operating condition 'OC1' can't be deleted since it is not created by user s using command 'create_operating_conditions'. (UIL-63)

UIL-64 (warning) Operating condition '%s' can't be deleted since it's still used by design : %s.

DESCRIPTION

Only those operating conditions created by users using command `create_operating_conditionsfp` and not being used by any design can be deleted from a library.

EXAMPLE MESSAGE

Warning: Operating condition 'OC1' can't be deleted since it's still used by design : DESIGN1 DESIGN2. (UIL-64)

UIL-65 (error) The '%s' library_feature is not specified in the '%s'

library.

DESCRIPTION

This error message is issued by **report_lib -yield**. If you use 'report_lib -yield' command for a library which does not have 'report_yield' library feature, this error message is displayed.

WHAT NEXT

Set the 'report_yield' library_feature in the source library as follows:
library(sample) { ... library_features(report_yield); ... }

UIL-66 (error) Cannot write the library '%s'. The Composite Current Source information has been stripped while reading the library.

DESCRIPTION

This library was read into memory when db_load_ccs_data was set to false. Hence the Composite Current Source driver and receiver model from the library has been stripped while reading. To be able to write the library, the variable db_load_ccs_data has to be set to true before reading the library.

WHAT NEXT

Set the variable db_load_ccs_data to true in a new dc_shell session, read the library and then perform write_lib.

UIL-67 (error) Could not close the '%s' file.

DESCRIPTION

The file cannot be closed.

WHAT NEXT

Check to see if there are any error messages before this file closing operation.

EXAMPLE MESSAGE

Error: Could not close the 'a.lib' file. (UIL-67)

UIL-70 (warning) Cannot load the Composite Current Source information since you are not authorized for the license Galaxy-Beta.

DESCRIPTION

The license Galaxy-Beta is a requirement for using Composite Current Source (CCS) information. This message will be issued when the site is not authorized for Galaxy-Beta license and the user is trying to set the variable db_load_ccs_data to true. The same message will be repeated if he is not authorize for Galaxy-Beta license and he is reading a library with Composite Current Source driver and receiver model when the variable db_load_ccs_data is true.

SEE ALSO

`db_load_ccs_data` (3).

UIL-71 (error) Cannot write the library '%s'. Writing of the library which has Composite Current Source timing information is not supported inside '%s' in this release. Please use lc_shell.

DESCRIPTION

In this release, writing of the library which has CCS timing information is supported only in lc_shell. Hence issue the write_lib command inside lc_shell.

WHAT NEXT

UIL-72 (warning) The Composite Current Source information in the library '%s' is not reported. Reporting of CCS information is not supported inside '%s' in this release.

DESCRIPTION

In this release, report_lib -timing reports the CCS timing information only in lc_shell. If you want to view the CCS timing information, please use lc_shell.

WHAT NEXT

UIL-73 (error) Invalid technology library switch cell report.
You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error message is issued by **report_lib -switch** command. The switch option is used only on a library that has been read from a ".lib" technology library source file by the **read_lib** command.

WHAT NEXT

To use the **report_lib** with the **-switch** option, read in the technology source library instead of the db file.

UIL-74 (error) Invalid technology library pg pin report.
You must read in the '%s' library from a technology library source file.

DESCRIPTION

This error message is issued by **report_lib -pg_pin** command. The **pg_pin** option is used only on a library that has been read from a ".lib" technology library source file by the **read_lib** command.

WHAT NEXT

To use the **report_lib** with the **-pg_pin** option, read in the technology source library instead of the db file.

UIL-75 (warning) The directory '%s' exists and the files with same name under it will be updated.

DESCRIPTION

This message is given if the directory exists. If so, the files with same name under it will be updated.

WHAT NEXT

If you want to keep the old files under this directory, just rename the output directory name by option **datasheet_output_dir** for Datasheet generator or **veriloglib_output_dir** for VERILOG generator.

EXAMPLES

```
datasheet_output_dir=test_datasheet  
write_lib -format datasheet dbvh13
```

OR

```
veriloglib_output_dir=test_verilog  
write_lib -format verilog dbvh13
```

EXAMPLE MESSAGE

Warning: The directory already exists and the files with same name under it will be updated. (UIL-75)

UIL-76 (error) No/Invalid option value specified for '%s'.

DESCRIPTION

In calculate_caa_based_yield2db command, some options have dependency and requirement:

(1) Operating target should be a valid library name (already loaded in Library Compiler), or a valid db file (that can be read into LC successfully). (2) If the operating target is a db file, not a library name, The -output option with a valid db file name should be specified. And the output db file name should be different from input db file. (3) Currently, for '-data_kit_type' option, only 'tsmc' and 'tsmc_encr' are valid values. (4) When there are more than one routing layers defined in the library, The '-layer_dsd_alias' option must be provided. If there is only one routing layer in library, use default {0 0 0 0} as its value. (5) "-layer_dsd_alias" option value must contains 5 integer values, for the value of alias layers: Mx, My, Mz, Mr, Mt by order.

WHAT NEXT

Check the options to this command, specify all necessary and valid options.

EXAMPLES

```
calculate_caa_based_yield2db -data_kit_type tsmc  
-particle_distr_func_file tsmc.ddk a.db -output a.db
```

OR

```
calculate_caa_based_yield2db -data_kit_type tsmc  
-particle_distr_func_file tsmc.ddk -layer_dsd_alias {0 0} test
```

OR

```
calculate_caa_based_yield2db -data_kit_type tsmc  
-particle_distr_func_file tsmc.ddk nonexistent.db
```

EXAMPLE MESSAGE

```
Error: No/Invalid option value specified for '-output'. (UIL-76)  
Error: No/Invalid option value specified for '-layer_dsd_alias'. (UIL-76)  
Error: No/Invalid option value specified for 'nonexist.db'. (UIL-76)
```

UIL-77 (error) The directory '%s' doesn't exist.

DESCRIPTION

This message is given if the directory doesn't exist. If so, the custom function file directory is wrong.

WHAT NEXT

If you want to define the directory for custom function files, define the correct directory name by option **veriloglib_custom_func_dir** for VERILOG generator.

EXAMPLES

```
veriloglib_custom_func_dir=test_dir  
write_lib -format verilog dbvh13
```

EXAMPLE MESSAGE

```
Error: The directory 'test_dir' doesn't exit. (UIL-77)
```

UIL-78 (information) The mapping file "func.map" for custom udp flow doesn't exist.

DESCRIPTION

This message is given if the custom function directory is defined, but "func.map" file doesn't exist in the directory.

In custom UDP flow, verilog generator will check for mapping file "func.map" in the directory first. If the file doesn't exist or there is no mapping information for the

cell, verilog generator will search for file "[cell_name].func" as the single cell function part for the cell. If this file doesn't exit, verilog generator will search for file "[library_name].func", and search the cell's function part in this packet file. If this can't be found either, verilog generator will not use custom UDP flow and comes to the general flow.

WHAT NEXT

Users can ignore this information if they have provided [cell_name].func, or [library_name].func for custom UDP flow, or they haven't provided any kind of function files by don't want to use custom UDP flow. If users want to use mapping file approach in custom UDP flow, you must provide the "func.map" file as in the description part.

UIL-79 (warning) Syntax error of mapping file "%s".

DESCRIPTION

This message is given if the mapping file has some syntax error.

Mapping file must be defined by the following syntax. Each line contains the mapping information of a specific file to multiple cells. Cell name is separate by blank. The bracket is needed here. No comment is applied here.

```
<file name> [<cell name1> <cell name2>]
```

WHAT NEXT

If user want to use mapping file approach in verilog and datasheet , user need to edit the mapping file and correct the syntax error.

EXAMPLES

```
Foo2.func [FDQ1X1 FDQ1X2]
```

UIL-80 (error) The %s format isn't supported by datasheet generator.

DESCRIPTION

This error is given if the format is not "text" and "html".

WHAT NEXT

If user want to generate html format datasheet, set datasheet_enable to "html"; if user want to generate text format datasheet, set datasheet_enable to "text".

EXAMPLES

html format:
set datasheet_enable html

text format:
set datasheet_enable text

UIL-81 (error) The directory [%s] doesn't exist.

DESCRIPTION

This error is given if the directory doesn't exist or there is a typo in the directory name.

WHAT NEXT

check whether the directory exist or type the correct directory name.

EXAMPLES

Error: The directory [/slowfs/xxx] doesn't exist. (UIL-81)

UIL-82 (error) The file [%s] can not be found

DESCRIPTION

This error is given if the file does not exist.

WHAT NEXT

check whether the file exist or type the correct file name.

EXAMPLES

Error: The file [/slowfs/xxx/yunz.txt] can't be found. (UIL-82)

UIM

UIM-1 (error) State '%s' is not a state in the state machine.

DESCRIPTION

This error message is issued for fsm commands where a state needs to be specified and the state specified by the user doesn't exist in the design.

This message can be issued from commands set_fsm_order or set_fsm_encoding.

WHAT NEXT

To obtain the list of states in the design, invoke report_fsm command. Check the spelling state names or need to recheck your original state table or HDL design to make sure that the state is in the design. Then reinvoke the command.

UIM-2 (error) Illegal list of states.

DESCRIPTION

WHAT NEXT

UIM-3 (error) Design must be a state table inorder to set state

order.

DESCRIPTION

WHAT NEXT

UIM-4 (error) Design does not contain any states.

DESCRIPTION

WHAT NEXT

UIM-5 (error) Illegal state vector list.

DESCRIPTION

WHAT NEXT

UIM-6 (error) Non state table designs must have the complete

encoding specified.

DESCRIPTION

WHAT NEXT

UIM-7 (error) Illegal state encoding list.

DESCRIPTION

WHAT NEXT

UIM-8 (error) Invalid encoding style '%s'.

DESCRIPTION

WHAT NEXT

UIM-9 (error) Encoding '%s' used multiple times.

DESCRIPTION

WHAT NEXT

UIM-10 (error) Encodings have inconsistent length.

DESCRIPTION

WHAT NEXT

UIM-11 (error) Encoding '%s' has invalid characters.

DESCRIPTION

WHAT NEXT

UIM-12 (error) Invalid flatten minimize value '%s'.

DESCRIPTION

WHAT NEXT

UIM-13 (error) State '%s' used multiple times in encoding list.

DESCRIPTION

WHAT NEXT

UIM-14 (error) The '%s' command is obsolete in XG mode.

DESCRIPTION

The extract, reduce_fsm, minimize_fsm, and compare_fsm commands are obsolete in XG mode. The functionality that these commands perform is embedded in the ultra optimization flow. You can enable the ultra optimization with command 'set_ultra_optimization'.

WHAT NEXT

Do not use extract, reduce_fsm, minimize_fsm, or compare_fsm commands in XG mode.

SEE ALSO

`set_ultra_optimization(2),`

UIMG

UIMG-1 (error) Cannot %s design over existing design '%s'

DESCRIPTION

There is a conflict with an existing design or library object with the same name.

WHAT NEXT

Check if the destination design or library exists already.

UIMG-2 (error) Cannot %s a design to a file

DESCRIPTION

WHAT NEXT

UIMG-3 (error) Cannot %s design; no access to path '%s'

DESCRIPTION

WHAT NEXT

UIMG-4 (error) Cannot %s multiple designs to a single design

DESCRIPTION

WHAT NEXT

UIMG-5 (error) The 'uniquify_naming_style' variable must be

set to use this command.

DESCRIPTION

WHAT NEXT

UIMG-6 (error) '%s' is not a valid setting for the 'uniquify_naming_style' variable.

DESCRIPTION

WHAT NEXT

UIMG-7 (error) The '-force' option cannot be used if the '-cell', '-reference' or '-new_name' options are used.

DESCRIPTION

WHAT NEXT

UIMG-8 (error) The '-new_name' option can only be used if one cell is specified.

DESCRIPTION

WHAT NEXT

UIMG-9 (error) The '-reference' option cannot be used if

the '-cell' or '-new_name' options are used.

DESCRIPTION

WHAT NEXT

UIMG-10 (error) Could not find the specified cell(s).

DESCRIPTION

This error message is issued by the uniquify command. The specified cells are invalid.

WHAT NEXT

Check the man page for the uniquify command.

UIMG-11 (error) Cannot find design named '%s'.

DESCRIPTION

This error message is issued by the uniquify command. The specified design could not be found.

WHAT NEXT

Check the man page for the uniquify command.

UIMG-12 (error) Cell '%s' is linked to design '%s', which is a library design, so it cannot be uniquified.

DESCRIPTION

This error message is issued by the uniquify command. The specified cell could not be uniquified because it is linked to a library design.

WHAT NEXT

Check the man page for the uniquify command.

UIMG-13 (warning) No cells were unqualified.

DESCRIPTION

This error message is issued by the uniquify command.

WHAT NEXT

Check the man page for the uniquify command.

UIMG-14 (error) Rules '%s' are not defined.

DESCRIPTION

This error is issued either by change_names command or report_names command or define_name_rules command or report_name_rules command. The specified rules cannot be found.

WHAT NEXT

Check for the specified rules file.

UIMG-15 (error) Bad -type option '%s' specified.

DESCRIPTION

This message is issued by define_name_rules command. The type should be either net or port.

WHAT NEXT

Check man page for define_name_rules command.

UIMG-16 (error) Default rules '%s' are not defined.

DESCRIPTION

This message is issued by the report_names command or the change_names command. The specified default rules are not defined.

WHAT NEXT

Check that the variable default_name_rules is set correctly.

UIMG-17 (error) No name rules specified and no default.

Use the -rules option or set the default_name_rules variable.

DESCRIPTION

WHAT NEXT

UIMG-18 (error) Can't open names file '%s'.

DESCRIPTION

WHAT NEXT

UIMG-19 (error) Too many errors in names file '%s'.

DESCRIPTION

WHAT NEXT

UIMG-20 (warning) No valid name changes found in names file

'%S'.

DESCRIPTION

WHAT NEXT

UIMG-21 (error) Invalid class string '%s'.

DESCRIPTION

WHAT NEXT

UIMG-22 (warning) Can't find %s '%s' in %s '%s'.

DESCRIPTION

WHAT NEXT

UIMG-23 (information) Using name rules '%s'.

DESCRIPTION

WHAT NEXT

UIMG-24 (information) No name changes to report in design '%S'.

DESCRIPTION

WHAT NEXT

UIMG-25 (information) %d names changed using names file

'%s'.

DESCRIPTION

WHAT NEXT

UIMG-26 (warning) File %s,
line %d: unsupported class string '%s' in '%s'.

DESCRIPTION

WHAT NEXT

UIMG-27 (warning) File %s,
line %d and
File %s,
line %d : duplicate change for %s '%s'.
Previous change will be overwritten by the latest one.

DESCRIPTION

WHAT NEXT

UIMG-28 (warning) File %s,
line %d: Can't find %s name '%s'.

DESCRIPTION

WHAT NEXT

UIMG-29 (warning) File %s,

line %d and
File %s,
line %d : Unsupported multiple names files.
%s '%s' was the new name of %s '%s' in %s '%s'.

DESCRIPTION

WHAT NEXT

UIMG-30 (warning) File %s,
Line %d:A %s named '%s' already exists in design '%s'.

DESCRIPTION

WHAT NEXT

UIMG-31 (warning) File %s,
Line %d: Can't find %s '%s' in %s '%s'.

DESCRIPTION

WHAT NEXT

UIMG-32 (warning) File %s,
Line %d:ObjectType: %s
BusMemberName: '%s'BusPortName: '%s'
change_names can not be applied to individual BUS MEMBER.
Please specify the BUS PORT NAME instead.

DESCRIPTION

The "change_names" command does not allow bus members changed only. In 3.1a, it used to let users change bus members, and then it would automatically change bus port for

users. Now in 3.1b it does not allow users to change individual bus member. If users change bus, it will automatically change all its member at one time. UIMG-32 is used to warn users can not change bus member only.

WHAT NEXT

UIMG-33 (error) File %s,Line %d:

A DELIMITER '%s' is expected, which stops reading this names file. There are five fields separated by spaces in names_file format.

```
<design_name> <object_type_string> <object_name>  
<new_name> <delimiter>
```

DESCRIPTION

WHAT NEXT

UIMG-34 (error) File %s,Line %d:

A DELIMITER '%s' is not expected, which stops reading this names file.

DESCRIPTION

WHAT NEXT

UIMG-35 (warning) The variable "%s" has set to "%s" from "".

DESCRIPTION

WHAT NEXT

UIMG-36 (warning) In design %s, %s bus member '%s' changed

to '%s'.

DESCRIPTION

WHAT NEXT

UIMG-40 (information) Because you are in the simple compile mode, unquifying the design will result in degradation of runtime.

DESCRIPTION

You receive this informational message if you attempt to manually unquify your design while in the simple compile mode. This mode is intended to be used with non-unquified designs. If you manually unquify your design before using the **compile** command, you lose one of the benefits of the fast optimization mode and experience a longer runtime. For more information, see the man page for the **set_simple_compile_mode** command.

WHAT NEXT

To take full advantage of the fast optimization mode, remove **uniquify** from your script and rerun the script.

SEE ALSO

set_simple_compile_mode (2).

UIMG-41 (error) The variable 'change_names_use_alternative'

must be set to TRUE for xg mode.

DESCRIPTION

WHAT NEXT

UIMG-42 (error) File name cannot end with a slash (/).

DESCRIPTION

This error message occurs when you specify a file name that ends with a slash (/) character, which is illegal.

WHAT NEXT

Specify a legal file name.

The file name can be specified without a path (for the current directory), with a relative path, or with an absolute path.

All of the following file name specifications are legal:

```
adder.db  
../adder.db  
ALU_DESIGNS/adder.db  
/designs/ALU_DESIGNS/adder.db
```

UIMG-43 (error) Cannot %s design %s:%s over existing design %s:%s.

DESCRIPTION

This error message occurs when the target design name is the same as the source design name. You cannot overwrite an existing design using the **copy_design** or the **rename_design** commands.

WHAT NEXT

If you do not specify the target file, you must specify a target design name that is

different than the source design name. If you want to copy or rename the source design to a different file while maintaining the same design name, you can specify both the file name and the design name of the target, such as new_file.db:mydesign.

If the target design already exists and you want to replace it, use the **remove_design** command before performing the copy or rename operation.

Carefully note the file names specified in the error message. Design names may exist in more than one file name.

SEE ALSO

`copy_design(2)`
`remove_design(2)`
`rename_design(2)`

UIMG-44 (error) Multiple designs named %s already exist.

DESCRIPTION

This error message occurs when the target design name already exists in multiple files. You cannot overwrite an existing design using the **copy_design** command or the **rename_design** command.

WHAT NEXT

If you want the target design to keep the same name as the source design, specify a file name in the destination, such as new_file.db:mydesign.

If a design of the same name already exists in the destination file, either delete it using the **remove_design** command, specify a different design name for the target, or specify a different file for the target.

In this case, you did not specify a target file name, and multiple designs with the target design name already exist. Use the **list_designs -show_file** command to see which designs exist in which files.

SEE ALSO

`copy_design(2)`
`list_designs(2)`
`rename_design(2)`

UIMG-45 (information) %s design %s:%s to %s:%s.

DESCRIPTION

This information message reports the file and design names of the design being copied or renamed, along with the file and the design names of the destination design.

WHAT NEXT

This is only an information message. No action is required.

SEE ALSO

`copy_design(2)`
`rename_design(2)`

UIMG-46 (error) Target name must be specified.

DESCRIPTION

This error message occurs when you pass an empty target string to the `copy_design` or the `rename_design` command.

WHAT NEXT

Rerun the command and specify a valid string for the target name.

SEE ALSO

`copy_design(2)`
`rename_design(2)`

UIMG-47 (error) %s does not specify a unique design name.

DESCRIPTION

This error message occurs when `copy_design` or `rename_desing` fails to uniquely identify the design name, because there exists two or more designs across files that share the same name.

WHAT NEXT

Please specify unique design name(file_name:design_name) for **copy_design** or **rename_design** command to continue.

Use the **list_designs -show_file** command to see which designs exist in which files.

SEE ALSO

`list_designs(2)`, `copy_design(2)`, `rename_design(2)`.

UIO

UIO-1 (error) Design Compiler is not enabled.

DESCRIPTION

You don't have the Design-Compiler license available.

WHAT NEXT

Get the Design-Compiler license by invoke the **get_license Design-Compiler** command.

UIO-2 (error) %s must be 'low', 'medium' or 'high'.

DESCRIPTION

The defined command parameter was assigned an invalid value.

WHAT NEXT

Reexecute the command with a valid value for the defined parameter. Assign it to either *low*, *medium*, or *high*.

UIO-3 (error) Could not read the following target libraries:

DESCRIPTION

None.

WHAT NEXT

Check the listed target libraries in the error message.

UIO-4 (error) flatten_minimize strategy must be 'single_output',

'multiple_output' or 'none'.

DESCRIPTION

WHAT NEXT

UIO-5 (error) The library %s already contains a design %s.

DESCRIPTION

None.

WHAT NEXT

Check your design and library.

UIO-6 (error) Background directory %s exists.

DESCRIPTION

None.

WHAT NEXT

Check the listed directory.

UIO-7 (error) Could not create directory %s. Permission denied.

DESCRIPTION

None.

WHAT NEXT

Check 'write' permission of the listed directory.

UIO-8 (error) Could not read the following synthetic library:

DESCRIPTION

A synthetic library is specified in your *synthetic_library* variable, but is not in the directories of your *search_path*. Optimization commands need a full set of synthetic libraries to run.

WHAT NEXT

Add the pathname of the library to your *search_path*, or specify a full path to the library in the command line (as in /usr/joe/my_lib.sldb), or remove the library from your *synthetic_library* variable.

UIO-9 (error) Cannot use '%s' option with the '%s' option.

DESCRIPTION

None.

WHAT NEXT

Please refer to the man page of your original command.

UIO-10 (warning) Overwriting the library '%s' with design '%s'. The library already contained this design and is now modified.

DESCRIPTION

None.

WHAT NEXT

Check the manual page of current command.

UIO-11 (error) None of the target libraries are enabled for

in_place optimization.

DESCRIPTION

The tool issues this error when target libraries are not enabled for **in_place** optimization.

WHAT NEXT

Check libraries specified in variable **target_library** to see if they are enabled for **in_place** optimization.

UIO-12 (information) Choosing a test methodology will restrict the optimization of sequential cells.

DESCRIPTION

None.

WHAT NEXT

Check the manual page of current command.

UIO-13 (error) The design '%s' already exists in library '%s' and cannot be overwritten by the 'model' command.

DESCRIPTION

None.

WHAT NEXT

Check the manual page of command **model**.

UIO-14 (error) Could not read generic technology library '%s'

DESCRIPTION

The generic technology library supplies simple combinational and sequential cells

that are useful for technology-independent component instantiation. Part descriptions, like those in synthetic libraries, use components from the generic technology library. This error only occurs if your installation of Synopsys has been corrupted.

WHAT NEXT

Contact your system administrator.

UIO-15 (warning) No target library specified.

DESCRIPTION

You must define a target library before you issue either the **compile** command or the **reoptimize_design** command.

WHAT NEXT

Use "target_library = ..." to indicate which library the design should be compiled into.

UIO-16 (error) Design '%s' contains cluster information; the compile cannot be run when clusters are present.

DESCRIPTION

The **compile** command does not accept designs that contain clusters. Please use **remove_cluster** to remove all the clusters before compile the desgin. Or, use physopt command to optimize the design containing the cluster (floorplan) information.

WHAT NEXT

Use the **remove_cluster** command to remove the clusters.

UIO-17 (error) Design does not meet the requirements of the reoptimize_design command.

DESCRIPTION

The following are the minimum requirements when using the **reoptimize_design** command:

- 1) Enable the `-post_layout_opto` option.
- 2) Enable the `-in_place` option.
- 3) Define a design that contains cluster information.
- 4) Enable the `-routability` option.
- 5) Specify a design that contains back-annotated capacitance values.

WHAT NEXT

Use one of the above-mentioned options, or modify the design appropriately. Or take a look at the `reoptimize_design` man page for the correct use of the command.

UIO-18 (error) The %s option can only be used in conjunction with the %s option(s).

DESCRIPTION

You have defined an invalid combination of options.

WHAT NEXT

To see the correct use of options, refer to the appropriate documentation.

UIO-19 (error) No routability constraint on design. Use set_min_porosity.

DESCRIPTION

The current design has no routability constraint, and the target libraries have no `default_min_porosity`. The design cannot be optimized for routability. Do not use the `-routability` option with the `compile` command or the `reoptimize_design` command.

WHAT NEXT

Use one `compile` or `reoptimize_design` without the `-routability` option. If you want to optimize the routability of the design, set the minimum porosity constraint on it with the `set_min_porosity` command.

UIO-20 (warning) Porosity constraint on design (%g) overwritten by default

porosity constraint in target libraries (%g). Using the default porosity constraint.

DESCRIPTION

The target libraries have a minimum porosity constraint higher than the porosity constraint set on the design. **compile -routability** and **reoptimize_design -routability** use the minimum porosity constraint from the target libraries.

The attribute *min_porosity* has been overwritten.

WHAT NEXT

To report the porosity of the design, use **report_routability**. To report the porosity constraint of the design, use **report_constraint**. If you want to increase the porosity constraint, use **set_min_porosity** with a value higher than the default porosity constraint in the target libraries. Then run **compile -routability** or **reoptimize_design -routability** again. Use **report_lib** to get the default minimum porosity constraint on a library.

UIO-21 (warning) No routability information in target library '%s'.

DESCRIPTION

The defined target library has no porosity information. It cannot be used to optimize the design for routability. The **compile -routability** command and the **reoptimize_design -routability** command optimize the design for routability. At least one target library defined with **target_library** must contain routability information.

WHAT NEXT

Make sure that at least one target library in the search path has routability information. To list all target libraries on the search path, use **list target_library**. To report library characteristics, including routability information, use **report_lib**.

UIO-22 (error) No target library has routability information.

Design was not optimized.

DESCRIPTION

No target library has routability information. The current design was not optimized because it cannot be optimized for routability with the current target libraries.

WHAT NEXT

To optimize the design, use **compile** or **reoptimize_design** without the *-routability* option.

If you want to compile the design for routability, define a target library with routability information. To report the characteristics of a library, use **report_lib**. To specify a target library, use **target_library**. With Library Compiler, add the routability information in the target library. Without Library Compiler, ask the vendor who owns the library to add routability information.

UIO-23 (error) Design '%s' contains cluster information; the %s command cannot be run when clusters are present.

DESCRIPTION

The **translate**, **balance_registers**, **balance_buffer**, and **replace_fpga** commands do not accept designs that contain clusters. To proceed, use **remove_clusters** to remove the clusters from the design.

WHAT NEXT

Use the **remove_clusters** command to remove the clusters from the current_design. Then reissue the command that failed.

UIO-24 (warning) Design '%s' does not contain back-annotated capacitance and/or resistance values.

DESCRIPTION

Generally, post-layout optimization should be executed on designs that contain back-annotated capacitance or resistance values.

The *post_layout_opto* capability can be run on designs that do not contain back-annotation, but the preferred methodology is to run the design through an incremental compile. If the design contains cluster information, the

reoptimize_design command can be used to incrementally optimize the design. These options give better results than post-layout optimization because they allow the most flexibility.

WHAT NEXT

This is only a warning. No special action is required.

UIO-25 (error) DC-Expert license is not enabled for '%S'.

DESCRIPTION

You need a DC-Expert license to use the **reoptimize_design** and **create_wire_load** commands. Your site might not have acquired a license, or other processes might be using all the available licenses.

WHAT NEXT

To get the DC-Expert license, invoke the **get_license DC-Expert** command, or contact your Synopsys representative.

UIO-26 (error) Floorplan-Management license is not enabled for '%S'.

DESCRIPTION

You need Floorplan-Management license to run **reoptimize_design**, **read_clusters**, **write_clusters**, **create_cluster** and **create_wire_load**. Your site might not have acquired a Floorplan-Management license, or other processes might be using all the licenses available.

WHAT NEXT

To get the Floorplan-Management license, invoke the **get_license Floorplan-Management** command, or call your Synopsys representative.

UIO-27 (warning) Must have a Behavioral Compiler license to

use '%s'.

DESCRIPTION

None.

WHAT NEXT

Get a Behavioral Compiler license.

UIO-28 (error) Design scan style is not supported by the -scan option.

DESCRIPTION

The -scan option makes compile use scan cells. Before invoking the command, the user must associate a supported scan style with the design using the **set_scan_style** command or the **test_default_scan_style** environment variable. This message says that the specified scan style is not supported.

WHAT NEXT

Use the **set_scan_style** command to specify a supported scan style.

UIO-29 (error) You cannot specify polarity unless you use the `async_reset` option.

DESCRIPTION

None.

WHAT NEXT

Check the manual page of command **optimize_registers**.

UIO-30 (error) Cannot find reset_port %s on design %s.

DESCRIPTION

None.

WHAT NEXT

Check the manual page of command `optimize_registers`.

UIO-31 (error) You have to specify the polarity of the reset to be either active high or low.

DESCRIPTION

WHAT NEXT

UIO-32 (error) Unexpected value for polarity. Accepted values are high and low.

DESCRIPTION

WHAT NEXT

UIO-33 (warning) `optimize_registers` no longer flattens the design hierarchy by default. Unless you specify the flatten option, the hierarchy of the design will be preserved.

DESCRIPTION

None.

WHAT NEXT

Check the manual page of command `optimize_registers`.

UIO-35 (error) ECO-Compiler license is not enabled for '%s'.

DESCRIPTION

You need an ECO-Compiler license to use the `eco_analyze_design` and `eco_implement` commands. Your site might not have acquired a license, or other processes might be using all the available licenses.

WHAT NEXT

To get the ECO-Compiler license, invoke the `get_license ECO-Compiler` command, or contact your Synopsys representative.

UIO-37 (error) insert_pads accepts design objects as arguments

DESCRIPTION

The `insert_pads` command accepts as its arguments designs on which I/O pads need to be inserted.

WHAT NEXT

Run the `insert_pads` command with design objects as arguments.

UIO-38 (error) The number of stages you have chosen is lower than two.

DESCRIPTION

For pipelining, at least one level of registers must be inserted into the design, which corresponds to two stages. In general the number of registers is one less than the number of stages.

WHAT NEXT

Choose two stages or more.

UIO-39 (error) You have specified both a synchronous and and

asynchronous reset port.

DESCRIPTION

The registers that are inserted for pipelining can only have one type of reset. Therefore you have to choose between synchronous or asynchronous reset.

WHAT NEXT

Select either '`-async_reset <port_name>`' or '`-sync_reset <port_name>`'.

UIO-40 (error) You have specified a reset polarity but no reset port.

DESCRIPTION

It is only useful to have reset polarity if there is actually a reset port.

WHAT NEXT

Select either '`-async_reset <port_name>`' or '`-sync_reset <port_name>`' or remove the '`-reset_polarity high | low`' option from the command line.

UIO-41 (error) The number of stall ports that you have specified does not match the number of stages.

DESCRIPTION

There can be either one stall port for all inserted registers or one stall port for each inserted row of registers (i.e. the number of stall ports must be either one or one less than the number of stages).

WHAT NEXT

Check the number of pins and the number of stages you have specified.

UIO-42 (error) Two stall ports have the same name ('%s' and

'%s').

DESCRIPTION

Names of stall ports must be unique for a valid design.

WHAT NEXT

Choose another name for one of the ports.

UIO-43 (error) A stall port ('%s') has the same name as the clock port ('%s').

DESCRIPTION

The names of all ports of the design must be unique.

WHAT NEXT

Choose another name for one of the ports.

UIO-44 (error) A stall port ('%s') has the same name as the synchronous
reset port ('%s').

DESCRIPTION

The names of all ports of the design must be unique.

WHAT NEXT

Choose another name for one of the ports.

UIO-45 (error) A stall port ('%s') has the same name as the asynchronous

reset port ('%s').

DESCRIPTION

The names of all ports of the design must be unique.

WHAT NEXT

Choose another name for one of the ports.

UIO-46 (error) The clock port ('%s') has the same name as the synchronous reset port ('%s').

DESCRIPTION

The names of all ports of the design must be unique.

WHAT NEXT

Choose another name for one of the ports.

UIO-47 (error) The clock port ('%s') has the same name as the asynchronous reset port ('%s').

DESCRIPTION

The names of all ports of the design must be unique.

WHAT NEXT

Choose another name for one of the ports.

UIO-48 (error) The reset polarity must be either 'high' or 'low'. '%s' has been specified.

DESCRIPTION

The reset can be either active high or active low.

WHAT NEXT

Choose a valid option.

UIO-49 (error) The stall polarity must be either 'high' or 'low'. '%s' has been specified.

DESCRIPTION

The stall can be either active high or active low.

WHAT NEXT

Choose a valid option.

UIO-50 (error) '%s' has been specified as the clock port, but there is
no such external port in design '%s'.

DESCRIPTION

The name of the clock port specified must match the name of a port of the design.

WHAT NEXT

Check the name's spelling or add an appropriate port to the design.

UIO-51 (error) '%s' has been specified as the reset port, but there is
no such external port in design '%s'.

DESCRIPTION

The name of the reset port specified must match the name of a port of the design.

WHAT NEXT

Check the name's spelling or add an appropriate port to the design.

UIO-52 (error) '%s' has been specified as a stall port, but there is no such external port in design '%s'. If you have a port of the correct name, it must be exactly one bit wide.

DESCRIPTION

The name of the stall ports specified must match the name of a port of the design, and it must be a one bit wide port of the design.

WHAT NEXT

Check the name's spelling; add an appropriate port to the design or reduce the number of bits for the port to one.

UIO-53 (error) The stall port '%s' does not have direction 'in'.

DESCRIPTION

Stall ports must be inputs to the design.

WHAT NEXT

Change the direction to 'in' or specify the direction 'in' if you did not yet specify a direction.

UIO-54 (error) The reset port '%s' does not have direction 'in'.

DESCRIPTION

Reset ports must be inputs to the design.

WHAT NEXT

Change the direction to 'in' or specify the direction 'in' if you did not yet specify a direction.

UIO-55 (error) The clock port '%s' does not have direction 'in'.

DESCRIPTION

Clock ports must be inputs to the design.

WHAT NEXT

Change the direction to 'in' or specify the direction 'in' if you did not yet specify a direction.

UIO-56 (error) The name '%s' is not a legal HDL identifier for a (non-vector) single bit port.

DESCRIPTION

Port names must be simple legal HDL identifier containing only alphanumeric characters and underscores ('_').

WHAT NEXT

Change the name to a legal identifier name. This may mean that you have to split up vector stall ports into single stall ports.

UIO-57 (error) You have specified a stall polarity but no stall port.

DESCRIPTION

It is only useful to have a stall polarity if there is actually a stall port.

WHAT NEXT

Select either '-stall_port <port_list>' or remove the '-stall_polarity high | low' option from the command line.

UIO-58 (warning) As a result of -prioritize_min_path, min_delay

is made a higher priority than `max_delay`.

DESCRIPTION

None.

WHAT NEXT

None.

UIO-59 (warning) Setting attribute '`fix_multiple_port_nets`' on design '`%s`'.

DESCRIPTION

The environment variable `compile_fix_multiple_port_nets` is replaced by the command `set_fix_multiple_port_nets`. For compatibility, if the variable is enabled during `compile` or `report_constraints` but no attribute exists on the design, the attribute is set as if the command `set_fix_multiple_port_nets -all` was used. Once the attribute is set it will not be removed even if the variable is set to FALSE.

WHAT NEXT

Update your compile script to use the `set_fix_multiple_port_nets` command instead of the `compile_fix_multiple_port_nets` variable.

UIO-60 (warning) Ignoring `compile_fix_multiple_port_nets = %S`.

DESCRIPTION

The command `set_fix_multiple_port_netsP` replaces the environment variable `compile_fix_multiple_port_nets`. When both the attribute and the variable are set, the attribute has priority and the variable setting is ignored.

WHAT NEXT

Update your compile scripts to use the `set_fix_multiple_port_nets` command instead of the `compile_fix_multiple_port_nets` variable.

UIO-61 (warning) Setting attribute 'critical_range' on design '%S'.

DESCRIPTION

The environment variable `compile_default_critical_range` is replaced by the command `set_critical_range`. For compatibility, if the variable is enabled during `compile` but no attribute exists on the design, the attribute is set to the current value of the variable. Once the attribute is set it will not be removed even if the environment variable is changed to another value, so that reports correctly show the value which was used during optimization.

WHAT NEXT

Update your script to use the `set_critical_range` command instead of the `compile_default_critical_range` variable.

UIO-62 (warning) Ignoring compile_default_critical_range = %g.

DESCRIPTION

The command `set_critical_range` replaces the environment variable `compile_default_critical_range`. When both the attribute and the variable are set, the attribute has priority and the variable setting is ignored. The warning is issued when the design attribute and the environment variable are set to different values. The attribute might have been set by a previous `compile` of the design. The `compile` command sets the attribute (and issues warning **UIO-61**) if there is no attribute and the environment variable is set, so that subsequent reports see the same value.

WHAT NEXT

Update your scripts to use the `set_critical_range` command instead of the `compile_default_critical_range` variable.

UIO-63 (warning) Setting attribute 'cost_priority' on design '%s'.

DESCRIPTION

The environment variables such as `compile_promote_delay_cost` for changing the optimization cost priority are obsolete, and are replaced by the command `set_cost_priority`. For compatibility, if the variable is set during `compile` but no `cost_priority` attribute exists on the design, the attribute is set to reflect the current value of the variable. Once the attribute is set it will not be removed even

if the environment variable is changed to another value, so that reports correctly show the value that was used during optimization. Once the attribute is set, the variable setting is ignored (indicated by warning **UIO-64**).

WHAT NEXT

Update your script to use the **set_cost_priority** command. Use **report_cost_priority** to see the current attribute setting of a design.

UIO-64 (warning) Attribute 'cost_priority' overrides '%s'.

DESCRIPTION

The command **set_cost_priority** replaces the given environment variable. When both the attribute and the variable are set, the attribute has priority and the variable setting is ignored. The attribute might have been set by a previous **compile** of the design. The **compile** command sets the attribute (and issues warning **UIO-63**) if there is no attribute and the environment variable is set, so that subsequent reports see the same value.

WHAT NEXT

Update your scripts to replace setting of the obsolete variable by the **set_critical_range** command. Use **report_compile_options** to see what cost priority is currently set on a design.

UIO-65 (error) DC ultra license is required to use feature '%s'.

DESCRIPTION

DC ultra license is required to use the features supported in the DC ultra package only. Please see the **set_ultra_optimization** command for a detailed set of these features.

If you are seeing this error message while invoking **compile**, there can be a couple of reasons. You could have used any of the commands supported only by the DC ultra package during the current session. Such commands normally acquire and retain the DC ultra license. However if you use **remove_license** command followed by **compile**, you might get this error if all the DC ultra licenses are in use by other users.

Secondly, you could have read in a db file which had been generated using the DC ultra features. An attribute is added to a db when **compile** is run using the DC ultra license. Hence, you can confirm that the db was generated using a DC ultra license by using the command:

```
get_attribute current_design compiled_with_ultra
```

WHAT NEXT

Use command **set_ultra_optimization [-force]**. This command will try to acquire the DC ultra license.

UIO-66 (error) Command '%s' unable to acquire DC ultra license.

DESCRIPTION

DC ultra license is not available or checked out.

WHAT NEXT

Use command **set_ultra_optimization [-force]**. This command will try to acquire the DC ultra license.

UIO-67 (information) %s mode successfully set.

DESCRIPTION

WHAT NEXT

UIO-68 (warning) %s mode not set.

DESCRIPTION

DC ultra license is not available or checked out.

WHAT NEXT

Use command **set_ultra_optimization [-force]**. This command will try to acquire the DC ultra license.

UIO-69 (error) The async_reset option has been discontinued

because of quality of results and correctness issues. If you need to retime registers with asynchronous clear or preset Please contact the Synopsys Support Center or your Synopsys AC for further support. If you do not want to retime registers with asynchronous clear or preset, please remove the `async_reset` and the polarity option from the command.

DESCRIPTION

Retiming for flip-flops with asynchronous functionality using the `async_reset` option only handled flip-flops directly connected to a reset port. Only one set of registers connected to one port was retimed at an invocation of `he` command. The initial state of the circuit was not preserved. This caused usually bad quality of results or incorrect behavior of the circuit.

WHAT NEXT

Remove the `async_reset` and polarity options from the `optimize_registers` command. Review the manual page of the retiming command for alternative options or contact the Synopsys Support Center or your local Synopsys AC for alternatives.

UIO-70 (warning) The '`verbose`' option has been used without the '`check_design`' option and will be ignored.

DESCRIPTION

The '`verbose`' option indicates that the output of the '`check_design`' option should list individual cells names in the statistics part.

WHAT NEXT

Use '`check_design`' and '`verbose`' together or do not use '`verbose`' with your retiming command.

UIO-71 (information) %s mode successfully reset.

DESCRIPTION

WHAT NEXT

UIO-72 (error) Option '%s' not recognized.

DESCRIPTION

The option mentioned above is not a valid option.

WHAT NEXT

See the man page of the command for a list of valid options.

UIO-73 (information) %s optimization mode successfully set.

DESCRIPTION

WHAT NEXT

UIO-74 (information) %s optimization mode successfully reset.

DESCRIPTION

WHAT NEXT

UIO-75 (error) Instances of design '%s' have inconsistent **dont_touch** attributes.

DESCRIPTION

Running **compile -bottom_up** requires that instances of a design either all have or all do not have the **dont_touch** attribute. If you receive this message, **compile** has

detected that some, but not all, instances of the specified design have the **dont_touch** attribute.

WHAT NEXT

Ensure that all instances of the design either have or do not have the **dont_touch** attribute.

SEE ALSO

`compile(2)`, `set_dont_touch(2)`.

UIO-76 (information) DC simple compile mode successfully set.

DESCRIPTION

WHAT NEXT

UIO-77 (information) DC simple compile mode successfully reset.

DESCRIPTION

WHAT NEXT

UIO-78 (warning) Ignoring '%s' option.

DESCRIPTION

You receive this message if you specify **compile -top** along with the **-no_map**, **-exact_map**, or **-scan** options. **compile -top** does not perform any mapping on the design, so the specified option is ignored.

WHAT NEXT

No action is required.

UIO-80 (error) The '-quickturn' option of compile cannot be used without a Quickturn supplied library.

DESCRIPTION

Your library does not have the required attributes that are placed on Quickturn libraries. You cannot use the -quickturn option of compile.

WHAT NEXT

Contact your Synopsys or Quickturn representative.

UIO-81 (information) Enabling special fast optimization for Quickturn libraries.

DESCRIPTION

A special optimization setting is enabled for Quickturn libraries. This setting is streamlined for shorter runtime.

WHAT NEXT

UIO-85 (warning) Ignoring design cell degradation information.

DESCRIPTION

The cell degradation information present on the design is being ignored. There can be two reasons for this. First reason is DC ultra license is not available or checked out. Secondly, the environment variable `compile_fix_cell_degradation` is set to "false".

WHAT NEXT

Use command `set_ultra_optimization [-force]`. This command will try to acquire the DC ultra license. Also check the environment variable `compile_fix_cell_degradation`.

UIO-86 (warning) Ignoring library cell degradation information.

DESCRIPTION

The cell degradation information present in the library is being ignored. There can be two reasons for this. First reason is DC ultra license is not available or checked out. Secondly, the environment variable compile_fix_cell_degradation is set to "false".

WHAT NEXT

Use command **set_ultra_optimization [-force]**. This command will try to acquire the DC ultra license. Also check the environment variable compile_fix_cell_degradation.

UIO-90 (warning) variable '%s' is obsolete; see the manual page.

DESCRIPTION

The variable being used is obsolete.

WHAT NEXT

See the manual for further details.

UIO-91 (warning) Multiple designs named '%s' occur in the link_library.

None of these designs will be used during link.

Design '%s' ignored.

DESCRIPTION

WHAT NEXT

UIO-92 (warning) Design '%s' comes before design '%s' in the

link_library; '%s' will be ignored.

DESCRIPTION

If the **link** command detects multiple designs with the same name in the **link_library**, **link** uses the first design found, ignores all others, and issues this warning message. **link** uses the first design found to resolve all design references with this name. Often, the design that appears first in the **link_library** was read into memory before other designs with the same name.

WHAT NEXT

Use the **list_designs** command to view a list of the designs that are in memory. If **link** has chosen the design you want to use, you do not need to take any action. Otherwise, keep the design you want and remove all other designs that have the same name, using the **remove_design** command. Then re-link using the **link** command.

To suppress this message and the informational message "UIO-93" in the future, add "UIO-92" to the **suppress_errors** variable in your **.synopsys_dc.setup** file.

SEE ALSO

link(2), **list_designs(2)**, **remove_design(2)**, **link_library(3)**, **suppress_errors(3)**,
.synopsys_dc.setup, **UIO-93(n)**.

UIO-93 (information) Design '%s' is referenced in design '%s'.

DESCRIPTION

The **link** command has detected multiple designs with the same name in the **link_library**; the first design found was used to resolve all design references with this name. This message lists those designs in the design hierarchy that reference the first specified design.

WHAT NEXT

Check the designs that reference the first specified design to verify that the correct design is used in all cases. For more information, see the description for warning "UIO-92".

To suppress this message in the future, add "UIO-93" to the **suppress_errors** variable in your **.synopsys_dc.setup** file.

SEE ALSO

link(2), **link_library(3)**, **suppress_errors(3)**, **.synopsys_dc.setup**, **UIO-92(n)**.

UIO-94 (error) Current design is not defined.

DESCRIPTION

This error message is generated when the current design is not defined in **dc_shell**.

WHAT NEXT

Use the **list_designs** command to display designs in memory; or use **read** to read a design in. Then invoke the **current_design** command to set the current design.

SEE ALSO

current_design (2), **list_designs** (2), **read** (2).

UIO-95 (error) %s must be 'none', 'low', 'medium' or 'high'.

DESCRIPTION

The defined command parameter was assigned an invalid value.

WHAT NEXT

Reexecute the command with a valid value for the defined parameter. Assign it to either *none*, *low*, *medium*, or *high*.

UIO-96 (error) Doing reoptimize_design without back-annotation

DESCRIPTION

reoptimize_design should be used for post-layout optimization. This command needs back-annotation information to perform layout sensitive synthesis. You should provide SDF, net load as well as cell locations (for example, PDEF 2.0) which is required for Location-Based Optimization (LBO).

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more information.

UIO-97 (error) Cannot estimate load or delay without RC coefficients

DESCRIPTION

You need to provided RC coefficients to reoptimize_design through the following four variables:

```
lbo_vertical_resistance lbo_vertical_capacitance lbo_horizontal_resistance  
lbo_horizontal_capacitance
```

WHAT NEXT

Please obtain the RC coefficients. You may also provide necessary

UIO-98 (error) Illegal combination of reoptimize_design options

DESCRIPTION

You can either specify -map_effort or those detailed controls like -sizing, -pin_swap, etc.; but not both.

WHAT NEXT

Please choose the proper combination of options

UIO-99 (warning) options '%s' is obsolete; see the manual page.

DESCRIPTION

The option being used is obsolete.

WHAT NEXT

See the manual for further details.

UIO-100 (warning) Doing compile -in_place without back-

annotation

DESCRIPTION

compile -in_place should be used for post-layout optimization. This command needs back-annotation information to perform layout sensitive synthesis. Ideally, you should provide both SDF and net load. Please also consider using reoptimize_design instead of compile -in_place, since the former does much better optimization and provides the Location-Based Optimization (LBO) capability which could achieve better timing convergence.

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more information.

UIO-101 (error) Doing reoptimize_design without delay back-annotation

DESCRIPTION

reoptimize_design command needs back-annotation information to perform layout sensitive synthesis. You should provide the SDF file in addition to net load and cell locations (for example, PDEF 2.0).

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more information.

UIO-102 (error) Doing reoptimize_design without load back-annotation

DESCRIPTION

reoptimize_design command needs back-annotation information to perform layout sensitive synthesis. You should provide net load information in addition to the SDF file and cell locations (for example, PDEF 2.0).

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more

information.

UIO-109 (error) Doing reoptimize_design without delay back-annotation and cell locations

DESCRIPTION

reoptimize_design command needs back-annotation information to perform layout sensitive synthesis. You should provide the SDF file in addition to net load. You also need to provide cell location information (for example, PDEF 2.0) for Location-Based Optimization (LBO) which could achieve better timing convergence.

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more information.

UIO-110 (error) Doing reoptimize_design without net load back-annotation and cell locations

DESCRIPTION

reoptimize_design command needs back-annotation information to perform layout sensitive synthesis. You should provide net load information in addition to the SDF file. You also need to provide cell location information (for example, PDEF 2.0) for Location-Based Optimization (LBO) which could achieve better timing convergence.

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more information.

UIO-111 (warning) Doing reoptimize_design without cell location

DESCRIPTION

It is highly recommended not to do reoptimize_design without cell locations, in which case wire load model will be used to estimate the capacitance for all new nets added. This could result in inaccurate timing estimation and thus make it harder to

achieve timing convergence.

You should provide cell location information (for example, PDEF 2.0) to perform Location-Based Optimization (LBO).

WHAT NEXT

Obtain back-annotation information. Please refer to the user manual for more information.

UIO-113 (error) Invalid argument for the `-justification_effort` option. Valid arguments are low, medium, or high.

DESCRIPTION

You receive this message if you issue `optimize_registers` or `set_optimize_registers` command with an invalid argument for the `-justification_effort` option. Valid arguments are low, medium, and high.

WHAT NEXT

Reissue the `optimize_registers` or the `set_optimize_registers` command with a valid argument for the `-justification_effort` option.

SEE ALSO

`optimize_registers` (2). `set_optimize_registers` (2).

UIO-127 (error) You cannot use the `-post_route` option without also using the `-incremental` option.

DESCRIPTION

You receive this message if you execute `physopt` with the `-post_route` option, and do not also use the `-incremental` option. You cannot use `-post_route` without `-incremental`. Optimization with post-route annotation requires that all cells have locations.

WHAT NEXT

Reexecute the `physopt` command, either with both the `-post_route` and `-incremental` options, or without `-post_route`.

SEE ALSO

physopt (2).

UIO-128 (error) At least one of the specified pins is of type INOUT.

Only input or output pins can be buffered.

DESCRIPTION

You receive this error message if you have attempted to insert a buffer and specified a pin in the input pin list which is of type INOUT. Only input or output pins can be buffered.

WHAT NEXT

Remove any pins with incorrect directions, and try the command again.

SEE ALSO

UIO-129 (error) Some but not all of the driver pins on a net were specified.

Must specify all or none.

DESCRIPTION

You receive this error message if you have attempted to insert a buffer and specified at least one, but not all of the driver pins of the net. When all driver pins are specified, the new inserted buffer will be driven by all the driver pins together, and the new buffer will in turn drive all of the loads of the original net.

WHAT NEXT

If a net is driven my multiple pins, include all of the driver pins in the pin list.

SEE ALSO

UIO-130 (error) A default buffer in the vendor library could not be

found.

DESCRIPTION

You receive this error message if you have attempted to insert a buffer, but a default buffer could not be found in the vendor library. Since a default buffer is instantiated by the command, it is necessary for a default buffer to be present. It is very unusual for this situation to occur, and suggests a more serious error of some kind, particularly with the vendor library.

WHAT NEXT

Check the correctness of the selected library and insure there is a default buffer in the library.

SEE ALSO

UIO-131 (error) Invalid argument for the `-sync_transform` option. Valid arguments are `decompose`, `multiclass`, or `dont_retime`.

DESCRIPTION

You receive this message if you issue `optimize_registers` or `set_optimize_registers` command with an invalid argument for the `-sync_transform` option. Valid arguments are `decompose`, `multiclass`, and `dont_retime`.

WHAT NEXT

Reissue the `optimize_registers` or the `set_optimize_registers` command with a valid argument for the `-sync_transform` option.

SEE ALSO

`optimize_registers (2)`. `set_optimize_registers (2)`.

UIO-132 (error) Invalid argument for the `-async_transform` option. Valid arguments are `decompose`, `multiclass`, or

dont_retime.

DESCRIPTION

You receive this message if you issue **optimize_registers** or **set_optimize_registers** command with an invalid argument for the **-async_transform** option. Valid arguments are decompose, multiclass, and dont_retime.

WHAT NEXT

Reissue the **optimize_registers** or the **set_optimize_registers** command with a valid argument for the **-async_transform** option.

SEE ALSO

optimize_registers (2). **set_optimize_registers** (2).

UIO-134 (error) Object %s does not have a connected net.

DESCRIPTION

When driver pins are used to specify the loads to be moved in the argument list of the move_load_pins command, they must have a connected net.

WHAT NEXT

SEE ALSO

UIO-135 (error) The specified destination object, %s, is not on a net equivalent to the source net.

DESCRIPTION

You receive this error message if you have specified an logically incorrect destination for the move_load_pins command, and you did not specify the -force option. By default, loads will only be moved to electrically equivalent nets.

WHAT NEXT

SEE ALSO

UIO-136 (error) Cell %s is not a library cell.

DESCRIPTION

You receive this error message if you have specified a cell that is not a library cell (for example, a hierarchical cell). Only library cells can be decomposed.

WHAT NEXT

Reexecute the command and specify only library cells.

UIO-137 (error) Cell %s is not a library cell.

DESCRIPTION

You receive this error message if you have specified a cell which is not a library cell. Only library buffers can be removed with this command.

WHAT NEXT

SEE ALSO

UIO-138 (error) Cell %s is neither a buffer nor an inverter.

DESCRIPTION

You receive this error message if you have specified a cell that is neither a buffer nor an inverter. Only buffers and inverters can be removed with this command. Inverters must be removed in pairs, and listed sequentially in the command argument.

WHAT NEXT

Reexecute the command, and specify only cells that are either buffers or inverters. Ensure that you list inverters in pairs, sequentially in the command argument.

UIO-139 (error) Unable to insert buffer for parallel devices.

DESCRIPTION

You receive this error message if you have attempted to insert a buffer by specifying an input pin on a cell which has an identical parallel cell.

WHAT NEXT

Either remove the specification from the object list, or insert a buffer into all of the parallel devices by specifying all the input pins of the parallel devices in the object list of the command.

SEE ALSO

UIO-140 (error) Could not make %d copies of cell %s.

DESCRIPTION

You receive this error message if you have specified an incorrect argument for the `duplicate_cell` command. Potential problems include an incorrect specification of the number of times to duplicate the cell, or and of the cell objects is incompatible with the command.

WHAT NEXT

SEE ALSO

UIO-141 (error) Object %s and destination object %s reside on different levels of hierarchy.

DESCRIPTION

You receive this error message if you issue the `move_load_pins` command and the source and destination of an object you specify to be moved are at different levels of hierarchy. You can move an object only to a destination that is at the same level of hierarchy as the source.

WHAT NEXT

Reissue the `move_load_pins` command and specify objects to be moved only to a

destination at the same level of hierarchy.

SEE ALSO

`move_load_pins` (2).

UIO-142 (error) At least one of the specified pins is not connected to a net.

DESCRIPTION

You receive this error message if you issue the `insert_buffer` command with a pin list that contains at least one unconnected pin. You cannot insert a buffer on an unconnected pin.

WHAT NEXT

Reissue the `insert_buffer` command and specify only pins that are connected to a net.

SEE ALSO

`insert_buffer` (2).

UIO-143 (error) The specified pin is not on a hierarchical cell

DESCRIPTION

You receive this error message if you have specified a pin which is not on a hierarchical cell. For example, if the pin is on a vendor library cell, or if a port in `current_design` is specified, this error will be issued.

WHAT NEXT

SEE ALSO

UIO-144 (error) Bidirectional pins cannot be duplicated

DESCRIPTION

You receive this error message if you have specified a pin which is marked as bidirectional. Reissue the command with a pin which has a direction specified as either 'in' or 'out'.

WHAT NEXT

SEE ALSO

UIO-145 (error) The number of copies requested is greater than the number of loads driven by the specified pin

DESCRIPTION

You receive this error message if you have specified the creation of too many copies of a pin. The number of copies must not be greater than the number of loads driven by the net of the specified pin.

WHAT NEXT

SEE ALSO

UIO-146 (error) Design %s could not be found in the hierarchical path to the specified object.

DESCRIPTION

You receive this error message if you have specified a design using the -design argument which could not be found in the path to the specified object. This message may be produced by several different commands.

WHAT NEXT

You must insure that somewhere in the hierarchical path to the object can be found the design specified using the -design switch. For example, using the command "remove_buffer T1/U1/G1/buf1 -design A", one of the instances T1, U1, or G1, must be an instance of design A.

SEE ALSO

UIO-147 (error) A single inverter, %s, was specified without a matching inverter. Inverters to be removed must be specified in sequential pairs.

DESCRIPTION

You receive this error message if you have specified the removal of an inverter without a matching inverter. This command removes either buffers or inverter pairs. If an inverter is specified, it must be directly followed in the command argument with its connected matching inverter.

WHAT NEXT

SEE ALSO

UIO-148 (error) Inverter %s does not have a matching inverter which is connected in series.

DESCRIPTION

You receive this error message if you have specified the removal of an inverter pair, but the inverters specified are not connected in series in the netlist. In order to remove inverter pairs, the inverters must be connected in series and specified sequentially in the command argument.

WHAT NEXT

SEE ALSO

UIO-149 (error) Inverter %s is not at the same hierarchical level as its connected matching inverter.

DESCRIPTION

You receive this error message if you have specified the removal of an inverter pair which is connected in series across a hierarchical boundary. Inverters must be connected in series, specified sequentially in the command arguments, and at the same level of hierarchy in order to be removed.

WHAT NEXT

SEE ALSO

UIO-150 (warning) You have chosen the no_compile option of the %s command. The resulting circuit may not show the best possible area and timing yet.

DESCRIPTION

This warning message occurs when you use the **no_compile** option of this command. The resulting circuit may not yet show the best possible area and timing. Run an incremental **compile** or **physopt** command to achieve the best results.

WHAT NEXT

This is only a warning message. No action is required.

However, you can compile the circuit with a command such as **compile -incr** or **physopt -incr**.

SEE ALSO

compile(2)
physopt(2)

UIO-151 (error) Only one object is allowed when the -design argument is activated

DESCRIPTION

Without the -design argument, many commands accept a list of objects on which to operate. With the -design argument, only one object is allowed, whether or not it is specified in list format.

WHAT NEXT

SEE ALSO

UIO-152 (error) Designs with %s are not supported in xg mode.

DESCRIPTION

You receive this message if you execute the **compile** command in xg mode, and the design requires operations that are not yet implemented in xg mode; for example, resource sharing algorithms. Currently, you can use the **compile** command in xg mode only on designs that have only gate-level and generic random logic, to perform simple operations (for example, incremental mapping optimizations or design rule fixing).

WHAT NEXT

If you did not expect the design to have DesignWare or FSMs, make sure that the intended design files were read. Otherwise, you must perform the specified operation in the normal dc_shell-t shell, not in xg mode.

SEE ALSO

compile (2).

UIO-153 (error) Option %s is not supported by the %s command.

DESCRIPTION

You received this message because the option you issued is invalid for the specified command.

WHAT NEXT

For a listing of command options, from within dc_shell execute *command_name -help*. Then reexecute the command using valid options.

UIO-154 (error) Either area or delay must be specified when using the **-auto_ungroup** argument for the **compile** command.

DESCRIPTION

This error message occurs when running the the **compile -auto_ungroup** command without specifying either the **area** or the **delay** argument. One of the two arguments must be specified, since different criteria are used for each case.

WHAT NEXT

Reexecute the **compile -auto_ungroup** command and specify either the **area** or the **delay** argument.

SEE ALSO

`compile(2)`

UIO-155 (error) The fpga_technology '%s' is not supported.

DESCRIPTION

The specified fpga technology is not supported by DC FPGA.

WHAT NEXT

Please see the `set_fpga_defaults` man pages for supported fpga technology.

SEE ALSO

`set_fpga_defaults (2)`,

UIO-156 (error) fpga_technology is not specified.

DESCRIPTION

An "fpga_technology" argument is required to set the default values specific for that "fpga_technology".

WHAT NEXT

Please see the `set_fpga_defaults` man pages for supported fpga technology.

SEE ALSO

`set_fpga_defaults` (2),

UIO-157 (error) Target technology is not 'FPGA'. Using fpga_shell requires that all target technologies be FPGA.

DESCRIPTION

The tool issues this error when it finds that some of the target libraries do not have the target technology of FPGA, or if some of the FPGA based libraries have not been compiled for use with this tool.

WHAT NEXT

You need to add FPGA based libraries into the `target_library` and try again. If you add an FPGA library into the `target_library` field and still observe this error message, ask your vendor to provide an updated library for use with DC-FPGA.

UIO-160 (error) The -size_only switch must be used with the -incremental or -on_route switch option in physopt command.

DESCRIPTION

Optimization with `-size_only` restricts optimization changes to sizing changes only . It should be used only in `-incremental` or `-on_route` mode for `physopt` , since this is a limited optimization stage .

WHAT NEXT

See physopt manpage . For further restricting optimization to minimize eco placement changes , see -in_place_size_only option to physopt .

UIO-161 (warning) Can't execute command '%s' in this context.

DESCRIPTION

This command can not be used as an embedded script in the HDL design. The command can be used as a shell script only. It is disabled as an embedded script.

WHAT NEXT

Remove this embedded command from the HDL design.

UIO-162 (error) Design '%s' has embedded script processing errors.

DESCRIPTION

This error message occurs when there are errors while executing the embedded script for the specified design. The errors may be due to the existence of action commands or syntax errors in the embedded script.

WHAT NEXT

Remove all action commands from the embedded script and fix any syntax errors, if present. Then remove the design from memory and read it back again.

UIO-163 (error) Design '%s' has embedded Tcl commands that are ignored in dcsh mode.

DESCRIPTION

This error message occurs when the specified design has embedded Tcl script that cannot be processed in dcsh mode.

WHAT NEXT

Use the Tcl mode of Design Compiler.

UIO-164 (error) Incomplete embedded Tcl script in design '%s'.

DESCRIPTION

This error message occurs when the specified design has embedded Tcl script which has unmatched braces.

WHAT NEXT

UIO-165 (error) A beta license is required to use the %s feature.

DESCRIPTION

You receive this error message when a beta license is required to use the features supported in the Design Compiler Star beta product. Refer to the `set_dc_star_optimization` command for a detailed set of these features.

This error message can occur while running the `compile` command if you use any of the commands supported only by the Design Compiler Star beta product during the current session. These commands normally acquire and retain the Design Compiler beta license. However, if you use the `remove_license` command followed by the `compile` command, this error occurs if all of the Design Compiler Star beta licenses are in use.

The error message can also occur when you read in a .db file that is generated using the Design Compiler Star product features. An attribute is added to the .db file when the `compile` command is run using the Design Compiler Star beta product. You can confirm that the .db file was generated using a Design Compiler beta license by executing the following command:

```
get_attribute current_design dc_star_enabled
```

WHAT NEXT

Use the `set_dc_star_optimization` command to attempt to acquire the beta license.

SEE ALSO

`compile(2)`
`remove_license(2)`
`set_dc_star_optimization(2)`

UIO-166 (information) %s optimization mode successfully set.

DESCRIPTION

This information message occurs when you set the optimization mode successfully.

WHAT NEXT

This is only an informational message. No action is required.

UIO-167 (information) %s optimization mode successfully reset.

DESCRIPTION

This information message occurs when you successfully reset the optimization mode.

WHAT NEXT

This is only an informational message. No action is required.

UIO-168 (error) DC Ultra cannot be disabled while DC star is active.

DESCRIPTION

DC Ultra is one of the features that gets automatically enabled if you use the `set_dc_star_optimization` command.

WHAT NEXT

Use command `set_dc_star_optimization false` to disable the DC star features.

UIO-170 (error) The -in_place_size_only switch must be used with the -incremental switch option in physopt command.

DESCRIPTION

Optimization with `-in_place_size_only` restricts optimization changes to sizing changes only . It disables optimization tricks that do new cell insertion or

existing cell deletion . The `-in_place_size_only` option , unlike `-size_only` option , is additionally constrained for minimal eco placement changes when it does sizing . With `-in_place_size_only` option , a cell will be sized only if the new sized cell can fit into any available space adjacent to the original cell location , to minimize eco changes . This constraint supercedes any timing or design rule cost improvement . This option should be used only in -incremental mode for physopt and preferably for post-route optimization , since this is a limited optimization stage .

WHAT NEXT

See user manual on post-route methodology.

UIO-171 (error) DC Ultra features requested, required license not available.

DESCRIPTION

You receive this error message when a DC Ultra license is required to use the features supported only in the DC Ultra package. Use the `set_ultra_optimization` command for a detailed set of these features.

This error message may occur when invoking the `compile` command if you use the `set_ultra_optimization` command to set the DC Ultra optimization mode and then cannot check out the DC Ultra license because all of the DC Ultra licenses are in use.

The message can also occur if you use the `remove_license` command to free the DC Ultra license(s) after acquiring them using the `set_ultra_optimization` command.

In either case, DC Ultra license(s) are not available after trying to acquire them using the `set_ultra_optimization` command.

WHAT NEXT

Ensure that a DC Ultra license is checked out when executing the `set_ultra_optimization` command. You can verify that the license is checked out by executing the `list` command. Check that the DC Ultra license is not freed by using the `remove_license` command between executing the `compile` command and the `set_ultra_optimization` command.

SEE ALSO

`compile(2)`
`list(2)`
`remove_license(2)`
`set_ultra_optimization(2)`

UIO-172 (error) Must have a Galaxy license to use '%s' option.

DESCRIPTION

You need a Galaxy license to use the options fyield_recovery and fonly_yield_recovery in physopt command. Your site might not have acquired a license.

WHAT NEXT

To get the Galaxy license, contact your Synopsys representative.

UIO-180 (error) The '%s' option is not supported in default high-effort physopt.

Please try rerunning this command with 'set physopt_disable_new_high_effort_flows true'.

DESCRIPTION

None.

WHAT NEXT

Please refer to the man page of your original command.

UIO-181 (error) The '%s' option is not supported in default high-effort physopt.

Please try running 'physopt -effort high - timing_driven_congestion'.

DESCRIPTION

None.

WHAT NEXT

Please refer to the man page of your original command.

UIO-182 (error) You have used the `-edge` option to `optimize_registers` or `set_optimize_registers` command without using the `-clock` option.

DESCRIPTION

This error message occurs because the `-edge` option must be used with the `-clock` option to the `optimize_registers` or `set_optimize_registers` command.

WHAT NEXT

Rerun the command and specify the name of the clock you want to retime using the `-clock` option. Only use the `-edge` option if you want to retime a single specific clock.

SEE ALSO

`optimize_registers(2)`
`set_optimize_registers(2)`

UIO-183 (error) %s is not a legal value for the `-edge` option to `optimize_registers` or `set_optimize_registers` command.

DESCRIPTION

This error message occurs when you specify an unacceptable value for the `-edge` option to the `optimize_registers` or `set_optimize_registers` command. The permitted values are `rise` and `fall`. No other values are allowed.

WHAT NEXT

Rerun the command and specify either `rise` or `fall` for the value for the `-edge` option.

SEE ALSO

`optimize_registers(2)`
`set_optimize_registers(2)`

UIO-185 (error) You cannot use the `-wire_size` option without the

-on_route option.

DESCRIPTION

You receive this message if you execute **physopt** with the **-wire_size** option, and do not use the **-on_route** option. You cannot use **-wire_size** without **-on_route**. Wire-based optimization requires the input design has routing.

WHAT NEXT

Reexecute the **physopt** command, either with both the **-wire_size** and **-on_route** options, or without **-wire_size**.

SEE ALSO

physopt (2).

UIO-186 (error) You cannot use the **-wire_size_only** option without the **-on_route** option.

DESCRIPTION

You receive this message if you execute **physopt** with the **-wire_size_only** option, and do not use the **-on_route** option. You cannot use **-wire_size_only** without **-on_route**. Wire-based optimization requires the input design has routing.

WHAT NEXT

Reexecute the **physopt** command, either with both the **-wire_size_only** and **-on_route** options, or without **-wire_size_only**.

SEE ALSO

physopt (2).

UIO-187 (error) The flag exclusive is not given.

DESCRIPTION

A single operation is provided on the list. You need to have either two or more operations listed or the flag exclusive on (meaning that the listed operation will not share a resource with other operations). The command

`share_operations_on_one_resouce` will be ignored.

WHAT NEXT

Add the flag exclusive `for that single operation, or add another operation (or both)`.

UIO-188 (error) Listed operation %s is not found in the list of operations in the current design %s.

DESCRIPTION

This error message occurs because the `share_operations_on_one_resource` command requires that the listed cells all be operation cells. The command is ignored.

WHAT NEXT

Rerun the command, using the names of cells that are operation cells.

SEE ALSO

`share_operations_on_one_resource(2)`

UIO-189 (error) Current design %s does not contain cell %s.

DESCRIPTION

This error message occurs when the command requires that all of the listed operation cells belong to the current design.

WHAT NEXT

Rerun the command using the names of cells that belong to the current design.

SEE ALSO

`share_operations_on_one_resource(2)`

UIO-190 (error) The current design does not contain information

related to resource sharing.

DESCRIPTION

This error message occurs when running the `share_operations_on_one_resource` command either before elaboration or after compile.

The design does not contain information related to resource sharing until elaboration is performed. The command is ignored.

WHAT NEXT

Perform the elaboration step first, then run the `share_operations_on_one_resource` command, and then do the compile.

SEE ALSO

`share_operations_on_one_resource(2)`

UIO-191 (error) Listed operations belong to different processes.

DESCRIPTION

This error message occurs because the listed operations must belong to the same process, or they cannot be shared. The command is ignored.

WHAT NEXT

Check that the newly listed operations all belong to the same process and then run the command again.

SEE ALSO

`share_operations_on_one_resource(2)`

UIO-192 (error) An operation that was not listed was found and it was sharing with another listed operation.

DESCRIPTION

This error message occurs because it is required that if a listed operation is already sharing with another operation, then that operation must also be listed.

The operation was either not listed and was sharing with another operation, or it was listed but was sharing with an unlisted operation.

WHAT NEXT

Rerun the command and make sure that sure that any listed operation is accompanied by all of its already-sharing-with operations.

SEE ALSO

`share_operations_on_one_resource(2)`

UIO-193 (error) Some operations groups have conflicting manual or implementation directives (for example, %s and %S). The command is ignored.

DESCRIPTION

This error message occurs when manual and implementation directives conflict for sharing operations.

WHAT NEXT

Check that the manual or implementation directives of the listed operations do not conflict and run the command again.

SEE ALSO

`share_operations_on_one_resource(2)`

UIO-194 (error) Some operations groups have conflicting conflict vectors.

DESCRIPTION

This error message occurs because some operations to be shared have conflicting conflict vectors and some operation groups have conflicting vectors. The command is ignored.

WHAT NEXT

Use operations that can be shared and run the command again.

SEE ALSO

share_operations_on_one_resource(2)

UIO-196 (warning) You have specified a negative delay threshold. Using zero instead.

DESCRIPTION

This warning message occurs because the **-delay_threshold** option to the **optimize_registers** command must have a non-negative value.

WHAT NEXT

If zero is the correct value no action needs to be taken. If you want to specify a positive value run **optimize_registers** again with the correct **-delay_threshold** value.

SEE ALSO

optimize_registers(2)

UIO-197 (warning) You have specified a negative delay step. Using the computed default value instead.

DESCRIPTION

This warning message occurs because the **-delay_step** option to the **optimize_registers** command must have a non-negative value.

WHAT NEXT

If the default value works for you as desired no action needs to be taken. If you want to specify a positive value run **optimize_registers** again with the correct **-delay_step** value.

SEE ALSO

optimize_registers(2)

UIO-198 (error) You have specified delay step without a delay

threshold.

DESCRIPTION

This error message occurs because the **-delay_step** option to the **optimize_registers** command can only be specified if the **-delay_threshold** option is also specified.

WHAT NEXT

If you want to specify a delay threshold run **optimize_registers** with the **-delay_threshold** and **-delay_step** specified.

SEE ALSO

`optimize_registers(2)`

UIO-199 (error) %s must be 'none', 'low', 'medium' or 'high'.

DESCRIPTION

The defined command parameter was assigned an invalid value.

WHAT NEXT

Reexecute the command with a valid value for the defined parameter. Assign it to either *none*, *low*, *medium*, or *high*.

UIO-200 (Error) Command '%s' is not supported for embedded script processing.

DESCRIPTION

This command can not be used in embedded scripts of HDL designs. Valid set of commands that can be used in HDL embedded scripts are listed below.

```
set_attribute  
get_attribute  
set_flatten  
set_implementation  
set_max_delay  
set_model_load  
set_model_drive  
set_structure
```

```
set_design_license
set_local_link_library
set_max_area
current_design
set_ungroup
find
set_map_only
all_outputs
all_inputs
create_clock
set_optimize_registers
set_balance_registers
set_transform_for_retimming
set_boundary_optimization
set_size_only
set_dont_touch
set_dont_use
set_scan_element
set_model_map_effort
set_model_scale
set_wire_load_model
set_dont_touch_network
set_dont_retime
get_cells
get_nets
get_pins
get_ports
load_of
set_compile_directives
```

WHAT NEXT

Remove this embedded command from the HDL design.

UIO-201 (Error) Set of commands
'%s' have one or more unsupported embedded script commands.

DESCRIPTION

Contains one or more commands which can not be used in embedded HDL scripts or one or more commands with syntax errors. Valid set of commands that can be used in HDL embedded scripts are listed below.

```
set_attribute
get_attribute
set_flatten
set_implementation
set_max_delay
```

```
set_model_load
set_model_drive
set_structure
set_design_license
set_local_link_library
set_max_area
current_design
set_ungroup
find
set_map_only
all_outputs
all_inputs
create_clock
set_optimize_registers
set_balance_registers
set_transform_for_retimming
set_boundary_optimization
set_size_only
set_dont_touch
set_dont_use
set_scan_element
set_model_map_effort
set_model_scale
set_wire_load_model
set_dont_touch_network
set_dont_retime
get_cells
get_nets
get_pins
get_ports
load_of
set_compile_directives
```

WHAT NEXT

Remove this embedded command from the HDL design.

UIO-202 (warning) Cannot use the '-edge' option with the '-latch' option.

DESCRIPTION

Using the -latch option and the -edge option of the optimize_registers or set_optimize_registers command does not make sense. When latches are retimed both phases of the latch system are retimed at the same time.

WHAT NEXT

You can ignore the warning for now. For the next run remove the 'edge' option from

the optimize_registers or the set_optimize_registers command.

UIO-205 (warning) 'dont_retime' has been selected as transformation for both synchronous and asynchronous sequential cells.

DESCRIPTION

The transformation option 'dont_retime' has been selected for both synchronous and asynchronous sequential cells. No sequential cells will be moved during retiming unless you have the transform_for_retimig attribute set on specific cells.

WHAT NEXT

If you want to move registers during retiming, make sure you select 'multiclass' or 'decompose' for at least one of the '-sync_trans' or '-async_trans' options. Alternatively you should make sure at least some sequential cells have the transform for retiming attribute set to a value different from 'dont_retime'.

UIO-206 (error) The -layer -availability option is no longer supported under the enhanced router mode. Please use create_route_guide instead.

DESCRIPTION

This option is no longer supported.

WHAT NEXT

Use the create_route_guide command to specify layer availability.

SEE ALSO

`create_route_guide(2)` `placer_enable_enhanced_router(3)`

UIO-207 (error) %s option can be used only in conjunction with

%s option.

DESCRIPTION

None.

WHAT NEXT

Please refer to the man page of your original command.

UIO-208 (warning) Option '**%s**' is obsolete from 2007.03 release. This option will be ignored.

DESCRIPTION

None.

WHAT NEXT

Please refer to the man page of your original command.

UIO-210 (warning) Option **%s** is not supported by the **%s** command in DC Topographical mode. The option will be ignored.

DESCRIPTION

You received this message because the option you issued is not supported for the specified command when running `dc_shell` in Topographical mode.

WHAT NEXT

For a listing of supported command options, from within `dc_shell` execute `man command_name`. Then reexecute the command using supported options.

UIO-212 (warning) Ignoring retiming option.

DESCRIPTION

You receive this message if you specify **compile_ultra -retime** along with the **-top**, **-incremental**, or **-only_design_rule_fix** options. Retiming is not executed when these options are used and therefore the retiming parameter will be ignored.

WHAT NEXT

No action is required.

UIO-213 (Error) Some designs read from file %s are templates, and contain embedded scripts. To process these scripts, please use the "link" command after reading the file.

DESCRIPTION

This error indicates that the link command has to be run prior to execution of this command.

WHAT NEXT

run "link" command after reading the file.

SEE ALSO

UIO-214 (warning) Option '-single_dir_option' is not supported when the option '-repartitioning_method' is set as 'NONE' or 'MULTI_DIRECTIONAL'. The option will be ignored.

DESCRIPTION

You received this message because the option you issued is not supported for the specified setting of option '-repartitioning_method' in 'set_optimize_dft_options'.

WHAT NEXT

Please refer to the man page of `set_optimize_dft_options`.

UIO-215 (warning) Cannot restore original license count of %d for feature %s.

DESCRIPTION

This warning message occurs when the tool encounters a problem checking out the required number of licenses for the parallel flow, and is unable to restore the same number of licenses that were held previously. This may be because there are an insufficient number of available licenses for the specified feature.

WHAT NEXT

Setting a lower level of parallelism with the **set_max_cores** command may reduce the number of licenses that are required.

SEE ALSO

`compile_ultra(2)`
`set_max_cores(2)`

UIO-250 (error) Invalid argument for the %s option. Valid arguments are %s .

DESCRIPTION

You receive this message because you issue a command with an invalid argument for the given option.

WHAT NEXT

Reissue the command with one of the valid arguments for the option.

UIP

UIP-1 (error) The module '%s' could not be found in the library '%S'.

DESCRIPTION

WHAT NEXT

UIP-2 (error) The design '%s' could not be found.

DESCRIPTION

WHAT NEXT

UIP-3 (error) The library '%s' could not be found.

DESCRIPTION

WHAT NEXT

UIP-4 (error) A design named '%s' has already been associated with module '%s'.

DESCRIPTION

WHAT NEXT

UIP-5 (warning) No designs in the library '%s' have been prebuilt

using the technology '%s'.

DESCRIPTION

WHAT NEXT

UIP-6 (error) Could not build the synthetic design '%s'.

DESCRIPTION

WHAT NEXT

UIP-7 (error) The library '%s' is not a valid synthetic library.

DESCRIPTION

WHAT NEXT

UIP-8 (error) The library '%s' is not a valid technology library.

DESCRIPTION

WHAT NEXT

UIP-9 (error) The cell '%s' cannot have its implementation set.

DESCRIPTION

WHAT NEXT

UIP-10 (error) The wire_load model '%s' could not be found in

library '%s'.

DESCRIPTION

WHAT NEXT

UIP-11 (error) '%s' is not a valid argument for set_resource_allocation.

It should be one of 'none', 'area_only', or 'constraint_driven'.

DESCRIPTION

WHAT NEXT

UIP-12 (error) '%s' is not a valid argument for set_resource_implementation.

It shoule be either 'area_only', or 'constraint_driven'.

DESCRIPTION

WHAT NEXT

UIP-101 (error) Cannot find "example" %s '%s'.

DESCRIPTION

Command set_pad_type was invoked with the -example option, but the example pad indicated by the user does not exist in the target library. Therefore, the -example attribute was not set.

WHAT NEXT

Verify that the target library is the one intended. Check the validity of the search_path. Make sure the I/O pad cells were not marked as dont_touch or dont_use.

UIP-102 (error) Cannot find "exact" %s '%s'

DESCRIPTION

Command set_pad_type was invoked with the -exact option, but the exact pad indicated by the user does not exist in the target library. Therefore, the -exact attribute was not set.

WHAT NEXT

Verify that the target library is the one intended. Check the validity of the search_path. Make sure the I/O pad cells were not marked as dont_touch or dont_use.

UIP-103 (error) "example" or "exact" cell '%s' is not an I/O pad.

DESCRIPTION

Command set_pad_type was invoked either with the -example or the -exact option, but the library cell indicated by the user is not an I/O pad. As a result, the -example (or -exact) attribute was not set.

Note that it in the case of Xilinx FPGA designs, it is illegal to use the Xilinx IOB as an example or exact candidate. This is because the IOB pads have all the pad attributes. So, using this device as an example or exact component is equivalent to asking for "all possible pads."

WHAT NEXT

Use command report_lib to have a list of library cells.

UIP-107 (error) No port '%s' in design.

DESCRIPTION

User tried to set I/O pads attributes on an element of the design that is not a port. Only ports can carry I/O pads requirements, which indicate the characteristics of the I/O pad to which the port should be connected.

WHAT NEXT

UIP-108 (error) Cannot set pad attributes on '%s'.

DESCRIPTION

User invoked command `set_pad_type` on an object for which the pad-related attributes could not be set. Possible reasons for this include: nonexistent object, don't touch port, object that is not a port.

WHAT NEXT

UIP-109 (warning) Both "exact" and "example" options used. No attributes set.

DESCRIPTION

User invoked command `set_pad_type` with both the `-exact` and the `-example` options. Only one of the two can be set at a time, since specifying `-exact` indicates which I/O pad of the library HAS to be used. Using both options might involve conflicting requirements. Therefore, in that case, no attributes are set on the target port.

WHAT NEXT

UIPD

UIPD-1 (error) Can't open update file '%s'.

DESCRIPTION

WHAT NEXT

UIPD-2 (error) Can't write update output file '%s'.

DESCRIPTION

WHAT NEXT

UIPD-3 (error) Output file has to be different than the script file '%s' being updated.

DESCRIPTION

WHAT NEXT

UIS

UIS_42 (warning) The value of variable
'gen_bus_%s_naming_style'

ends with the invalid '%%' (single percent sign).

DESCRIPTION

WHAT NEXT

UIS-1 (error) Create_schematic command is not available.

DESCRIPTION

WHAT NEXT

UIS-2 (error) Invalid output order.

DESCRIPTION

WHAT NEXT

UIS-3 (warning) Design '%s' isn't mapped.

DESCRIPTION

WHAT NEXT

UIS-4 (error) Design '%s' could not be linked.

DESCRIPTION

This error is generated if the design could not be linked for highlighting the current design, but the `highlight_path` is invoked.

WHAT NEXT

Try to link the design by calling `link`, then reinvoke the `highlight_path`.

UIS-5 (error) Plot command is not available.

DESCRIPTION

WHAT NEXT

UIS-6 (error) Design %s has no schematic.

DESCRIPTION

WHAT NEXT

UIS-7 (error) Design Compiler is not enabled.

DESCRIPTION

You don't have the Design-Compiler license available.

WHAT NEXT

Get the Design-Compiler license by invoke the **get_license Design-Compiler** command.

UIS-8 (error) Design '%s' could not be timed.

DESCRIPTION

WHAT NEXT

UIS-9 (error) Invalid pin list.

DESCRIPTION

WHAT NEXT

UIS-10 (error) No valid pins/ports specified.

DESCRIPTION

WHAT NEXT

UIS-11 (error) Bad sheet type '%s' specified.

DESCRIPTION

WHAT NEXT

UIS-12 (warning) Design '%s' has no cells!

DESCRIPTION

WHAT NEXT

UIS-46 (error) You cannot specify both the 'object_list' and the 'object_type' arguments.

DESCRIPTION

WHAT NEXT

UIS-47 (error) The '%s' argument must be a list of equations

(strings).

DESCRIPTION

WHAT NEXT

UIS-48 (warning) Schematic for proprietary design '%s' not generated.

DESCRIPTION

WHAT NEXT

UIS-49 (error) The format string must not have more than %d %%s specifications.

DESCRIPTION

WHAT NEXT

UIS-50 (error) The format string contains %d %%s specification(s),
but the value list has %d equation(s).

DESCRIPTION

WHAT NEXT

UIS-51 (error) Could not read either the generic symbol library:
'%s',
or the default library: '%s'.

Your software is probably installed incorrectly.

DESCRIPTION

WHAT NEXT

UIS-52 (warning) Could not read the specified generic symbol library: '%s'.

Had to read the default generic symbol library instead.
Your search_path is probably incorrect or pointing to
an older version of Synopsys software.

DESCRIPTION

WHAT NEXT

UIS-53 (error) Current design '%s' has no symbol view.

DESCRIPTION

This error is generated if there is no symbol view for the current design, but the `plot -symbol_view` is invoked.

WHAT NEXT

Create a symbol view for the current design by calling `create_schematic -symbol_view`, then reinvoke `plot -symbol_view`.

UIS-54 (error) Target system does not allow mixed bus ports.

DESCRIPTION

WHAT NEXT

UIS-55 (error) Target system does not allow compound names.

DESCRIPTION

WHAT NEXT

UIS-56 (error) Target system does not allow rippers.

DESCRIPTION

WHAT NEXT

UIS-57 (error) Unknown target system specified for schematics.

DESCRIPTION

WHAT NEXT

UIS-58 (error) More than one bussing style specified: using

default.

DESCRIPTION

WHAT NEXT

UIS-59 (warning) Net '%s' has no drivers.

DESCRIPTION

WHAT NEXT

UIS-60 (warning) Cell '%s' has no output or bidirect pins.

DESCRIPTION

WHAT NEXT

UIS-61 (error) You cannot use '%s' to highlight schematics.

DESCRIPTION

When using the highlight_path command, you must specify a layer_name that is NOT one of the built-in layer names. For instance, you cannot use the "cell_layer" to highlight schematics.

WHAT NEXT

Typically, you don't need to specify a layer_name with the highlight_path command, it will choose a layer_name for you.

UIS-62 (error) current_highlight_layer is only defined if the

`current_design` is defined.

DESCRIPTION

The `current_highlight_layer` is a derived variable which depends on the `current_design`. If the `current_design` is not defined, then you cannot get or set the `current_highlight_layer` variable.

WHAT NEXT

Set the `current_design` before using the `current_highlight_layer` variable.

UIS-63 (error) There is no layer named "%s

DESCRIPTION

WHAT NEXT

UIS-64 (error) Highlight layer name "%s It should be of the form "highlight_layerN is a positive integer.

DESCRIPTION

The `current_highlight_layer` variable must be of the form "highlight_layerN", where N is a positive integer.

WHAT NEXT

When setting the `current_highlight_layer`, you must use a name of the form "highlight_layerN

UISN

UISN-1 (error) No valid synthetic library specified.

DESCRIPTION

WHAT NEXT

UISN-2 (error) Module '%s' not found.

DESCRIPTION

WHAT NEXT

UISN-3 (error) Verification implementation not found for module '%s'.

DESCRIPTION

WHAT NEXT

UISN-4 (warning) Implementation '%s' not found.

DESCRIPTION

WHAT NEXT

UISN-5 (error) No default check_parameters for module '%s'.

DESCRIPTION

You receive this error message because you have executed the **check_implementations** command, but no **check_parameters** attribute exists in the module group in your

synthetic library source file.

If you want to use default parameters, the module group in your synthetic library source file must contain a **check_parameters** attribute.

WHAT NEXT

Reexecute the **check_implementations** command and specify the **-parameters** option.

SEE ALSO

check_implementations (2).

UISN-6 (warning) Binding '%s' not found.

DESCRIPTION

WHAT NEXT

UISN-7 (error) Parameters may only be specified if all specified bindings

are for a single operator.

DESCRIPTION

WHAT NEXT

UISN-8 (error) No %s for operator '%s'.

DESCRIPTION

WHAT NEXT

UISN-9 (error) Invalid parameter "%s"

DESCRIPTION

WHAT NEXT

UISN-10 (error) Wrong number of pin_widths specified in '%s' for operator '%s'.

DESCRIPTION

You must specify a pin width for each pin of the given operator. You have specified either too few or too many pins.

WHAT NEXT

UISN-11 (error) No such pin '%s' in pin_width '%s' for operator '%s'.

DESCRIPTION

The pin you have specified is not on the operator. Be careful, pin names are case

sensitive.

WHAT NEXT

UISN-12 (error) Pin '%s' in pin_width '%s' for operator '%s' specified twice.

DESCRIPTION

The pin you have specified the given pin twice. In the process, you have omitted some other pin.

WHAT NEXT

UISN-13 (error) At least one option (-priority or -set_id) must be specified.

DESCRIPTION

You receive this error message because you executed the **set_impl_priority** command without specifying the **-priority** or **-set_id** option. You must specify either one or both of these options.

WHAT NEXT

Reexecute the **set_impl_priority** command and specify the **-priority** option, the **-set_id** option, or both.

SEE ALSO

set_impl_priority (2).

UISN-14 (error) set_id cannot be negative.

DESCRIPTION

WHAT NEXT

UISN-15 (error) You can set priority of implementations only.

DESCRIPTION

WHAT NEXT

UISN-16 (error) Environment variable '%s' is an unsupported type.

DESCRIPTION

Only environment variables of types integer, float, string, and list can be retrieved for synthetic library parts. The environment variable requested has a value whose type is not supported.

WHAT NEXT

Check to see that the correct environment variable name has been used. Check to see that the environment variable is set to the expected value.

UISN-17 (warning) Unable to access read cache directory '%s'. It will be ignored.

DESCRIPTION

One of the directory paths on the cache_read list was invalid or couldn't be read.

WHAT NEXT

Check the value of the cache_read environment variable and make sure that all cache filenames are correct.

UISN-18 (warning) Unrecognized key '%s' found in 'synlib_dont_get_license' variable.

DESCRIPTION

The key may either be typoed or not in the key file.

WHAT NEXT

UISN-19 (warning) Library '%s' in 'synlib_preferred_library' variable is not in the synthetic library list.

This library is deleted from the preferred library list.

DESCRIPTION

You receive this warning message because one of the specified names in the preferred library list is not in the synthetic library list.

WHAT NEXT

Reexecute the **synlib_preferred_library** variable and specify a library that is in the synthetic library list.

SEE ALSO

synlib_preferred_library (3).

UISN-20 (error) The dynamic module '%s' does not exist in the dynamic synthetic library.

DESCRIPTION

This error message is issued by the **report_dynamic_synlib** command. The dynamic module is created for HDL 'preserved_function'. You might have specified a nonexistent dynamic module in the module list.

WHAT NEXT

Provide a correct name with each module in the module list. If you are not sure

about module names, do not specify a module list.

UISN-21 (warning) The module '%s' is not a dynamic synthetic module. It is ignored.

DESCRIPTION

You receive this warning message because you have executed the **report_dynamic_synlib** command and specified a module in the module list that is not a dynamic synthetic module. Modules specified in the module list must be dynamic synthetic modules that are created for HDL 'preserved_function'. The nondynamic module is ignored while the rest of the list is reported.

WHAT NEXT

Verify that each module in the module list is a dynamic module. If you are not sure about dynamic module names, do not specify a module list. If you want to report on nondynamic modules, use the **report_synlib** command instead.

SEE ALSO

report_synlib (2).

UISN-22 (error) Unacceptable list of modules for dynamic synthetic library.

DESCRIPTION

This message is issued by the **report_dynamic_synlia** command. You might have specified an empty or a corrupted module list. This error usually is caused by a typo.

WHAT NEXT

Provide a correct name with each module in the module list. If you are not sure about the dynamic module names, do not specify a module list.

UISN-23 (error) Unknown synthetic library check '%s'.

Valid checks are '%s'.

DESCRIPTION

You receive this error message because you executed the **check_synlib** command with the **-group** option, but did not specify a valid group name. This command accepts an optional **-group list** argument that enumerates sets of checks. If you used this option, you might have included an invalid group name in the list of group names you specified. The following example will initiate all standard checks upon the current set of synthetic libraries:

```
dc_shell> check_synlib -group { "all" }
```

WHAT NEXT

Specify a list of valid checks for the **-group** option. If you are unsure about what checks to specify, use **all**, or remove the group argument from the **check_synlib** command.

SEE ALSO

check_synlib (2).

UISN-24 (warning) Skipping check of implementation '%s' for module '%s'.

DESCRIPTION

The **check_implementations** command ignores checks in which the verification implementations checks against itself. If a **check_implementations** command specifies a list of implementations and the list contains the verification implementation, this warning is issued and only non-verification implementations are checked.

For example, the module "MyMod" contains two implementations, "Romulus" and "Remus". A check_implementation group flags the implementation "Romulus" to be the golden implementation for module "MyMod". The command **check_implementations -impl { Romulus Remus } MyMod** generates a warning for implementation "Romulus". The command, however, continues and verifies "Romulus" against "Remus".

WHAT NEXT

Remove any verification implementations specified in the **check_implementations** command. To learn what implementations within a module are the verification implementation, use the **report_synlib** command.

UISN-25 (warning) No implementations to check for module '%S'.

DESCRIPTION

You receive this warning message because the **check_implementations** command found no implementations to check for the specified module. The **check_implementations** command will not verify an implementation marked as the verification implementation. You will also receive this warning message when an empty implementation list is specified for the **-implementations** option.

WHAT NEXT

For more information, see the *DesignWare Reference Manual* and the **check_implementations** manual page.

SEE ALSO

check_implementations (2).

UISN-26 (warning) The following synthetic libraries should be added to the list of link libraries: '%S'.

DESCRIPTION

You receive this warning message because you have executed the **synthetic_library** variable and have specified a library that was not specified with the **link_library** variable. All synthetic libraries specified with the **synthetic_library** variable must also be specified with the **link_library** variable.

For example, if the **synthetic_library** variable specified my_synlib.sldb, then the **link_library** variable should also specify my_synlib.sldb as shown below.

```
target_library = my_techlib.db synthetic_library = my_synlib.sldb link_library = {my_techlib.db my_synlib.sldb}
```

WHAT NEXT

See the *DesignWare User Guide* for more information.

SEE ALSO

`link_library` (3), `synthetic_library` (3).

UISN-27 (information) Evaluating DesignWare library utilization.

DESCRIPTION

This informational message indicates that libraries are being evaluated to determine whether or not synthetic libraries are available for use within a design. Although a library may be marked as available, the implementations contained within that library may or may not be used. Availability in the context of this message means that implementations within the library are candidates for use within the design.

In order for a synthetic library to be available, the following conditions must be satisfied:

- The .sldb file of the synthetic library must be specified using the `synthetic_library` list variable.

- The synthetic library must contain one or more implementations.

- Valid licenses for one or more licensed implementations within the synthetic library must be available for use. Alternatively, one or more single unlicensed implementations may be found within the synthetic library.

Note that, although a synthetic library may be marked as available for use, a case may exist where no implementations defined within the synthetic library will be used. This occurs when the design hierarchy contains no synthetic parts, either inferred or instantiated. This may also be the by-product of module and implementation selection. An available synthetic library may contain implementations which are considered during an exploration phase of synthesis, but are not chosen to implement the final design.

WHAT NEXT

For more information, see the *DesignWare User Guide* and the *DesignWare Developer Guide*.

UISN-28 (error) %s key is required to enable this feature.

DESCRIPTION

This error message occurs when you attempt to use a feature for which you do not have a DC Ultra license and a DesignWare license.

WHAT NEXT

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

UISN-30 (warning) Unrecognized key '%s' found in set_synlib_dont_get_license command.

DESCRIPTION

You receive this warning message when you execute the **set_synlib_dont_get_license** command and specify a key name that either contains a typo or is not listed in the key file.

WHAT NEXT

Verify that there is not a typo in the specified key name and that the key name is listed in the key file.

SEE ALSO

set_synlib_dont_get_license (2).

UISN-32 (information) new key '%s' is added to the '%s' list.

DESCRIPTION

At least one of the keys in the list is an old synlib license key. The old keys will be replaced with the new key. So the new key is added to the list.

The old synlib license keys are: "DesignWare-Foundation", "SynLib-ALU", "SynLib-AdvMath", "SynLib-Control", "SynLib-FltTol", "SynLib-Seq"

WHAT NEXT

The new key file will no longer contain some of the old keys. If there is error message says that the key is unrecognized key, remove it from the list.

UISN-33 (warning) Mixing UDPE & native MC generators is not

supported in the current release.

DESCRIPTION

UDPE datapath generators provide an alternative implementation for MC operators.

If this warning message is printed, UDPE generator usage will be turned off. Only default MC generators will be used.

WHAT NEXT

If you turn on any UDPE generator, turn on all of them.

UISN-34 (warning) license for feature '%s' has already been checked out. 'set_synlib_dont_get_license' on this license is ignored.

DESCRIPTION

You receive this warning message when you execute the **set_synlib_dont_get_license** command and specify a key name that has already been checked out. Or, you defined the list variable **synlib_dont_get_license** and added the name of a feature that has been checked out to the list.

WHAT NEXT

If you do not want the feature to be used, please remove the license from current process using **remove_license** command.

SEE ALSO

set_synlib_dont_get_license (2). **remove_license** (2). **synlib_dont_get_license** (3).

UISN-35 (warning) The target library doesn't have a usable full adder cell. Datapath QOR could be degraded.

DESCRIPTION

If the target library doesn't have a full adder cell, or if all full adder cells are marked as "dont_use", QOR of datapath blocks could be degraded.

WHAT NEXT

To prevent this warning message, use a target library with full adder cells.

UISN-36 (warning) The synthetic libraries in the synthetic_library list are from different versions.

DESCRIPTION

The synthetic libraries in the synthetic_library do not have the same version. You may have used the synthetic libraries from different directories.

WHAT NEXT

Make sure the synthetic libraries are from the same root.

UISN-38 (warning) The datapath optimization feature does not currently support the DPCM delay model. This feature is turned off (by setting the hlo_disable_datapath_optimization variable to true) for this command and subsequent commands.

DESCRIPTION

This warning message occurs because the datapath optimization flow does not support the DPCM delay model. If the DPCM delay model is used in the compile flow, then the **hlo_disable_datapath_optimization** variable is switched to true.

WHAT NEXT

This is a warning message only. No action is required.

However, the **hlo_disable_datapath_optimization** variable is switched to true. If you want to enable the datapath optimization flow, set the **dpcm_libraries** variable to an empty set, and reset the **hlo_disable_datapath_optimization** variable to false.

SEE ALSO

`dpcm_libraries(3)`
`hlo_disable_datapath_optimization(3)`

UISN-40 (Warning) DesignWare synthetic library dw_foundation.sldb is added to the synthetic_library in the current command.

DESCRIPTION

You are using the ultra optimization synthesis flow, but the DesignWare synthetic library is not listed in synthetic_library. This could result in sub-optimal synthesis quality.

For compile_ultra command, dw_foundation.sldb is automatically added to the synthetic_library in the current command. For set_ultra_optimization, if you do not specify the '-no_auto_dwlib' option, dw_foundation.sldb is automatically added to the synthetic_library in the subsequent compile command. Until you set set_ultra_optimization to be false or use '-no_auto_dwlib' option in the set_ultra_optimization command.

You get this message because the dw_foundation.sldb is automatically added to the synthetic_library in the current compile command.

WHAT NEXT

Add DesignWare synthetic library to your synthetic_library and link_library list.

SEE ALSO

set_ultra_optimization(2), compile_ultra(2)

UISN-41 (warning) The 'mc inside dc' datapath flow is obsolete in this release.

DESCRIPTION

The 'mc inside dc' datapath optimization flow has been obsoleted in this release. These datapath generators are now directly integrated into DC for better performance and reliability.

To use the new integrated datapath optimization flow, leave the variable **synlib_enable_dpgen** set at its default value. To use the old 'mc inside dc' flow, set **synlib_enable_dpgen** to false.

WHAT NEXT

Select the desired datapath optimization flow.

SEE ALSO

`synlib_enable_dpgen(3)`.

UISN-42 (warning) Datapath smart generation must be set to true to use smart generation options.

DESCRIPTION

The values of the various datapath smart generation options have no meaning unless datapath smart generation is enabled.

To enable datapath smart generation, the variables `synlib_enable_dpgen` and `synlib_dwgen_smart_generation` must both be set to true.

WHAT NEXT

Select the desired datapath generation flow.

SEE ALSO

`synlib_enable_dpgen(3)`, `synlib_dwgen_smart_generation(3)`.

UISN-43 (warning) Unknown datapath smart generation option '`%S`'

DESCRIPTION

Datapath smart generation option take one of three values: `auto`, `true`, and `false`. The value given was not understood.

Unknown datapath smart generation option values are treated as `false`; meaning that the smart generation option is turned off.

WHAT NEXT

Select the correct datapath smart generation option value.

SEE ALSO

`synlib_dwgen_smart_generation(3)`.

UISN-44 (Warning) Failed to read dw_foundation.sldb for the compile command.

DESCRIPTION

Compile ultra flow tried to read dw_foundation.sldb but failed to do so.

You are using the ultra optimization synthesis flow, but the DesignWare synthetic library is not listed in synthetic_library list. This could result in sub-optimal synthesis quality.

For compile_ultra command, dw_foundation.sldb is automatically added to the synthetic_library in the current command. For set_ultra_optimization, if you do not specify the '-no_auto_dwlib' option, then dw_foundation.sldb is automatically added to the synthetic_library in the subsequent compile command. Until you set set_ultra_optimization to be false or use '-no_auto_dwlib' option in the set_ultra_optimization command.

You get this message because the compile command tried to read the dw_foundation.sldb library but failed to do so.

WHAT NEXT

Add DesignWare synthetic library to your synthetic_library and link_library list and make sure the dw_foundation.sldb is in the search_path.

SEE ALSO

`set_ultra_optimization(2), compile_ultra(2)`

UISN-45 (Warning) Invalid dw naming style %s, the default naming style is used.

DESCRIPTION

The synlib_design_naming_style is set to an invalid value. The default value '%s_%s_%d' is used.

The variable must contain one or two %s, and one %d: If there is one %s, the naming style is <dw_component_name>_<index>; If there are two %s, the naming style is <parent_design_name>_<dw_component_name>_<index>;

If the variable contains less than one %s or more than two %s, or more than one %d, the default naming style will be followed. This variable will be ignored.

The naming style must end with %d, all %s must be in front of the %d.

WHAT NEXT

Set the `synlib_design_naming_style` variable to a valid naming style

SEE ALSO

UISN-46 (Warning) 'synlib_design_name_length' is ignored for %s in %s.

DESCRIPTION

You have set the '`synlib_design_name_length`' to a value that is smaller than the required value. The dw name length limit is ignored.

There is a minimum length requirement for the dw design names: The minimum length is `dw_component_name+user_characters+5`. The 5 chars are used for for "`<index>`". If the limit set by '`synlib_design_name_length`' is smaller than the minimum length, the limit is ignored.

If there is one %s in the `synlib_design_naming_style`, the naming style is `<dw_component_name>_<index>`. In this case, if the dw name length exceeds the limit, the limit is ignored.

If there are two %s, the naming style is `<parent_design_name>_<dw_component_name>_<index>`. If the dw name length exceeds the limit, the parent_design_name will be cut short to meet the limit when the difference is shorter than the length of the parent_design_name. If the difference between the limit and the actual name is bigger than the length of the parent_design_name, the limit will be ignored.

WHAT NEXT

Change your '`synlib_design_naming_style`' setting or set the '`synlib_design_name_length`' to a value that is bigger than the required length.

SEE ALSO

UISN-47 (Warning) The `dw_prefer_mc_inside` feature is obsolete.

DESCRIPTION

You set '`dw_prefer_mc_inside`' to be true. The `dw_prefer_mc_inside` is now obsolete. The `dw_prefer_mc_inside` feature is replaced by '`synlib_enable_dpgen`' feature. The

'dw_prefer_mc_inside' variable is removed.

If you specified dw_prefer_mc_inside to be true and synlib_enable_dpgen to be false, the synlib_enable_dpgen variable will be switched to true to enable the generator flow.

WHAT NEXT

This is a warning message only. No action is required.

SEE ALSO

[synlib_enable_dpgen\(3\)](#).

UISN-48 (Warning) The dw_prefer_mc_inside feature is replaced by the synlib_enable_dpgen feature. Setting 'synlib_enable_dpgen' to 'true'.

DESCRIPTION

You set 'dw_prefer_mc_inside' to be true; and set 'synlib_enable_dpgen' to be false. The dw_prefer_mc_inside feature is now obsolete and replaced by the synlib_enable_dpgen feature.

The 'dw_prefer_mc_inside' variable is removed. The 'synlib_enable_dpgen' variable is set to true.

WHAT NEXT

This is a warning message only. No action is required.

SEE ALSO

[synlib_enable_dpgen\(3\)](#).

UISN-49 (error) The internal rounding value should be equal or smaller than the external rounding value.

DESCRIPTION

You set internal rounding value to be bigger than the external rounding value. This will cause error in the generated netlist.

WHAT NEXT

Set the internal rounding value to be equal or smaller than the external rounding value.

SEE ALSO

`set_dp_int_round(2)`.

UISN-50 (error) Internal rounding can not be set on %s.

DESCRIPTION

Internal rounding position can only be set on nets that are directly driven by the supported DesignWare cells. You try to set the internal rounding position on a net that is not driven by a supported DW cell.

The supported DesignWare cells are: Cells that infer DesignWare operator MULT_UNS_OP and MULT_TC_OP. Cells that instantiate the following DesignWare components: DW02_mult, DW_mult_uns, DW_mult_tc, DW_square, DW02_prod_sum, DW02_prod_sum1, DW_prod_sum_uns, DW_prod_sum_tc, DW02_mac, DW_mac_tc, DW_mac_uns.

WHAT NEXT

Only set internal rounding position on nets that are driven by supported DW cells.

SEE ALSO

`set_dp_int_round(2)`.

UISN-51 (Warning) Internal rounding can not be performed on cell '%s' with forced static implementation '%s/%s'.

DESCRIPTION

You set dp internal rounding position on a DW OP cell. But also set the module and implementation of the cell. The internal rounding feature on a DW OP cell is not supported on cells with forced module and implementation.

WHAT NEXT

If you want to get better QoR by using the internal rounding feature, please remove the implementation set on the cell.

SEE ALSO

`set_dp_int_round(2), remove_attribute(2).`

UISN-52 (error) The internal rounding value should be equal or smaller than the bitwidth of net bus '%s'.

DESCRIPTION

You set internal rounding value to be bigger than the width of the net. The internal rounding value is invalid.

WHAT NEXT

Set the internal rounding value to be equal or smaller than the width of the nets.

SEE ALSO

`set_dp_int_round(2).`

will be obsoleted in the 08.09 release. You should use the super set dw_foundation.sldb synthetic library instead. (UISN-53)

UISN-53 (Warning) The DesignWare libraries '%s' will be obsoleted in the 08.09 release. You should use the super set dw_foundation.sldb synthetic library instead.

DESCRIPTION

You put the obsolete synthetic libraries in the synthetic_library list. The following synthetic libraries will be obsoleted in the 08.09 release: dw01.sldb, dw02.sldb, dw03.sldb, dw04.sldb, dw05.sldb, dw06.sldb, dw07.sldb, dw08.sldb. You should use the super set dw_foundation.sldb synthetic library instead.

WHAT NEXT

Replace the absolute synthetic libraries with dw_foundation.sldb in the synthetic library list.

UISN-55 (error) The low power synthetic library

dw_lp.foundation.sldb is only supported in compile_ultra flow.

DESCRIPTION

You add the low power synthetic library 'dw_lp.foundation.sldb' in the synthetic_library list. The low power DesignWare feature is only supported in compile_ultra flow.

WHAT NEXT

If you intend to use low power DesignWare feature, please use compile_ultra command instead. If you intend to use compile expert flow, please remove dw_lp.foundation.sldb from the synthetic_library list.

UISN-56 (error) The DesignWare-LP license is not available.

DESCRIPTION

This error message occurs when you the DesignWare low power feature by adding the low power synthetic library dw_lp.foundation.sldb in the synthetic_library or link_library list, but you do not have a DesignWare-LP license.

WHAT NEXT

If you intend to use the low power DesignWare feature, make sure you have the DesignWare-LP license. Otherwise, turn off the DesignWare low power feature by removing dw_lp.foundation.sldb from the synthetic_library or link_library list.

UIT

UIT-2 (warning) Unrecognized compaction mode ignored.

DESCRIPTION

You receive this message because you have entered an incorrect value for the **-compaction_effort** option. Valid values for this option are *low*, *medium*, or *high*. Or, you can use the **-no_compaction** option.

The **create_test_patterns** command will continue to run with a default value of *low*.

WHAT NEXT

If you are willing to accept the results of low effort compaction, no action is required on your part. However, using low effort compaction typically results in a higher vector count than is a result of using medium or high effort compaction.

If you want to use **-compaction_effort medium** or **-compaction_effort high**, rerun the **create_test_patterns** command with the appropriate option.

SEE ALSO

create_test_patterns (2).

UIT-3 (error) Unrecognized test program format or missing license key.

DESCRIPTION

You receive this message if **write_test** does not recognize the format you specified with **write_test -format**, or if you do not have a required license key. **write_test** recognizes only formats that are contained in the variable **write_test_formats**; by default, **write_test_formats** contains the formats *synopsys*, *tds*, *wgl*, *verilog*, and *vhdl*. If you want to use a different format (for example, *tdl91*), you must enter it into **write_test_formats** so that **write_test** will recognize it. In addition, the *tdl91* format requires a CTV key.

WHAT NEXT

If you receive this message, do the following:

1. Within **dc_shell**, list the **write_test_formats** variable to see whether it contains the format you want to use.

```
dc_shell> list write_test_formats
write_test_formats = {"synopsys", "tssi_ascii", "tds", "verilog", "vhdl", "wgl"}

2. If the required format (for example, tdl91) is not contained in the variable
write_test_formats, add it, as follows.
```

- ```
dc_shell> write_test_formats = write_test_formats + tdl91

3. Ensure that you have the correct key (in this case, the CTV key).

4. Re-issue the write_test command and specify the required format.
```

```
dc_shell> write_test -format tdl91
```

## SEE ALSO

**write\_test** (2); **write\_test\_formats** (3).

**UIT-4** (warning) You have asked for scan replacement, but attributes show that the design already has scan circuitry. Your request is ignored.

## DESCRIPTION

This message tells you that you have asked DFT Compiler to replace non-scan cells with scan cells. Design attributes tell DFT Compiler that this process has already occurred. Your request is ignored.

## WHAT NEXT

To eliminate the warning, change command options so that you do not ask scan insertion to do scan replacement.

**UIT-5** (warning) No existing test circuitry to route, scan will be inserted.

## DESCRIPTION

You receive this message if you run **insert\_scan** on a design with scan replacement disabled and scan routing enabled, but where attributes on the design show that the design is not scan replaced. For example, you receive this message if you enter the following sequence of commands:

1. **read rtl.v -format verilog.**

```

2. compile.
3. set_scan_configuration -replace false -route true.
4. insert_scan.

The message informs you that insert_scan is overriding your specification to not scan replace the design since insert_scan cannot route a design that is not scan replaced.

You receive this message if you read in a design from an ASCII format (Verilog, VHDL, or EDIF) that you have compiled with test-ready compile (compile -scan) and have run insert_scan with scan replacement disabled and scan routing enabled. Following is another example of a command sequence that will result in the return of this error message:

```

```

1. read rtl.v -format verilog
2. current_design = top
3. compile -scan
4. write -hierarchy -format verilog -out design_tr.v
5. remove_design -designs
6. read -format verilog design_tr.v
7. current_design = top
8. set_scan_configuration -replace false -route true
9. insert_scan

```

After invoking **insert\_scan**, you receive the following message:

```

Warning: No existing test circuitry to route, scan will be inserted. Loading design
'top' Using test design rule information from previous check_test run Architecting
Scan Chains Inserting Scan Cells Routing Global Signals Mapping New Logic
Transferring design 'top' to database 'top.db'

```

This is an invalid flow. You should only save and read the test-ready designs from db format. The scan configuration is correct for a test-ready design that you have saved in db format because the db format includes attributes to indicate to the **insert\_scan** command that the design is scan replaced. However, these attributes are missing from the ASCII format.

## WHAT NEXT

Correct your script to avoid running the **insert\_scan** command with replacement disabled but routing enabled on a design that does not contain the attributes to indicate that the design is scan replaced.

If you intended to perform scan replacement on the design, no action is required on

your part and you can use the resulting design.

If your design was already scan replaced but did not have the necessary attributes, the `insert_scan` command has built valid scan chains (verify this with `check_test`). However, this is not an optimum flow for your design and your design may not be optimum for area and timing. If your design does not meet your area and timing constraints, correct your compile scripts to save the test-ready design in db format and rerun both compilation and scan insertion.

## UIT-6 (error) Cannot load test vector database file.

### DESCRIPTION

The test vector database file cannot be loaded, because of one or more of these errors:

- wrong search path for the file
- nonexistent test vector database file
- misspelled test vector database filename
- the file is write-protected
- the file has wrong permissions set
- the file contains no vectors

### WHAT NEXT

Make sure that the file exists, has the correct search path, correct spelling, appropriate permissions, and contains test vectors.

## UIT-8 (warning) Design has no scan path. Generated vectors will not be saved.

### DESCRIPTION

You receive this message when attributes indicate that a design has no scan chain and the scan style is not set to combinational.

Under these circumstances, DFT Compiler performs a "what if" analysis to predict the coverage if you were to insert scan chains. Without scan chains, the vectors that are generated are meaningless and are not saved.

### WHAT NEXT

If you wish only to check the coverage that DFT Compiler can achieve and do not wish to save the vectors, no action is required on your part. However, you can check what the achievable coverage is more quickly by using the `-dft` option of

`create_test_patterns.`

If your design has an existing scan path, establish attributes that indicate to DFT Compiler that the scan chain exists. To do this, annotate test ports using `set_signal_type`. Then declare the existing scan using the command `set_scan_configuration -existing_scan true` and run `check_test`. For example, for a circuit with an existing multiplexed flip-flop style scan chain and test ports TEST\_SI\_PORT, TEST\_SE\_PORT, and TEST\_SO\_PORT, do the following:

1. Issue the command `set_signal_type test_scan_in TEST_SI_PORT`.
2. Issue the command `set_signal_type test_scan_enable TEST_SE_PORT`.
3. Issue the command `set_signal_type test_scan_out TEST_SO_PORT`.
4. Issue the command `set_scan_configuration -style multiplexed_flip_flop`.
5. Issue the command `set_scan_onfiguration -existing_scan true`.
6. Run `check_test`.
7. Run `create_test_patterns`.

If you have a combinational design and wish to save the ATPG vectors, you must set the combinational scan style using the `set_scan_configuration -style combinational` command.

`check_test (2), create_test_patterns (2), set_scan_configuration (2),  
set_signal_type (2).`

## **UIT-9 (error) Test clock period of %.2f on port '%s' is inconsistent with period of %.2f specified in the test protocol.**

### **DESCRIPTION**

The test clock period on the port is inconsistent with the period you have specified in the test protocol.

### **WHAT NEXT**

Check that your test clock period specification is consistent with your test protocol.

## **UIT-10 (error) internal failure, write\_test\_vector\_formatter (stran)**

**failed.**

## **DESCRIPTION**

Attempt to format vector failed. This may be caused by improperly installed formatter executable, bin\_path which points to the formatter is improperly specified, corrupted formatter executable, formatter executable has been tampered with, not enough disc space to write vectors, formatter run time execution error etc.

## **WHAT NEXT**

Make sure that the formatter executable is properly installed, that your bin\_path is properly set, and that there is sufficient disc space to generate vectors.

## **UIT-11 (error) internal failure, write\_test vector formatter (stran) failed. (%d).**

## **DESCRIPTION**

Vector formatting process was abruptly terminated. Possible causes are: 1. Not enough disc space to continue writing vectors. 2. Formatter executable was accidentally deleted by another process. 3. Does not have write permission to either write to the directory, or to overwrite an existing vector file. 4. Temporary network problems.

## **WHAT NEXT**

Make sure that sufficient disc space is available when generating vectors, all the right permissions are set, then reinvoke write\_test.

## **UIT-13 (Information) The variable atpg\_test\_asynchronous\_pins is obsolete. It has no effect.**

## **DESCRIPTION**

In release 1999.10, the variable atpg\_test\_asynchronous\_pins was made obsolete. The create\_test\_pattern command now always generates tests for faults on asynchronous pins.

## WHAT NEXT

No action required.

## UIT-14 (error) internal error, key error for write\_test formatter (stran).

### DESCRIPTION

Intermediate (SIF) file used as input to the formatter executable contained illegal key. The intermediate file may be corrupted or have been manually tampered with.

### WHAT NEXT

Reinvoke write\_test command

## UIT-15 (error) internal error, write\_test formatter (stran) can not generate '%s' format.

### DESCRIPTION

Unsupported test vector format indicated in the intermediate (SIF) input file for the write\_test formatter executable. The file may be corrupted or may have been manually tampered with.

### WHAT NEXT

Reinvoke write\_test command

## UIT-16 (error) No scan chains extracted for design - patterns cannot be formatted.

### DESCRIPTION

Formatting scan test patterns into a set of manufacturing test vectors requires information about the scan chains within the design. This information includes the cells in each chain, the order in which they are connected, and scan chain inversions.

*DFT Compiler* automatically extracts scan chain information from a design when the

**check\_test** or **create\_test\_patterns** commands are executed. Execution of these two commands stores a copy of the design in **db** format in memory. If the design is saved in **db** format, scan chain information is saved with the design.

If the design is not saved in **db** format, the scan chain information is not available and the **write\_test** command is unable to format the patterns. Typically this happens when a design is read in as a netlist and an existing pattern database file is used as input to the **write\_test** command.

## WHAT NEXT

Run the **check\_test** command to automatically extract the details of the design scan chains; use the **report\_test -scan** command to verify that this information has been extracted. The extracted scan chain information is used by the **write\_test** command to format test patterns.

# UIT-19 (error) No test protocol exists for design '%s'.

## DESCRIPTION

A test protocol is required for the successful completion of the current command. But no test protocol was found for the specified design.

## WHAT NEXT

Install a test protocol.

Test protocols can be user-specified or automatically inferred. To specify a test protocol, use the commands **read\_test\_protocol** or **read\_init\_protocol**. To make DFT Compiler infer a test protocol, use the command **check\_test**.

# UIT-20 (error) Cannot open output test protocol file '%s'.

## DESCRIPTION

You receive this message if you execute the **write\_test\_protocol** command and did not succeed.

## WHAT NEXT

Check if the destination directory has write permission.

## **UIT-21** (warning) Unrecognized backtrack effort '%s' ignored.

### **DESCRIPTION**

You receive this message when you have entered an incorrect value for the `-backtrack_effort` option of `create_test_patterns`. Valid values for this option are *low*, *medium*, and *high*.

The `create_test_patterns` command will continue to run with a default value of *low*.

### **WHAT NEXT**

If you are willing to accept the results of low backtrack effort, no action is required on your part. However, some circuits running `create_test_patterns` with a low backtrack effort may encounter aborted faults when `create_test_patterns` is unable to generate patterns without exceeding the backtrack limit.

If the results of `create_test_patterns` do not meet your fault coverage requirements and there are many aborted faults, re-execute `create_test_patterns` with a backtrack effort of *medium* or *high*.

### **SEE ALSO**

`create_test_patterns` (2).

## **UIT-22** (warning) Only %d% of faults were considered in ATPG run.

### **DESCRIPTION**

You receive this message if you use `restore_test` or `write_test` on a vdb file generated by `create_test_patterns -sample`.

This message reminds you that the vectors were generated only for a sample of faults in the design.

### **WHAT NEXT**

If you wish to generate vectors for all faults, you need to either regenerate the vectors from scratch using `create_test_patterns`, or use the same vdb file again as a starting point for ATPG by using the `-input` option of `create_test_patterns`.

## **UIT-23** (error) No test protocol defined for design - patterns

cannot be formatted.

## DESCRIPTION

Formatting scan test patterns into a set of manufacturing test vectors is controlled by the test protocol defined for a design. The protocol specifies the steps of the scan test sequence (scan-in, parallel measure/capture, and scan-out).

The **check\_test** and **create\_test\_patterns** commands automatically infers a default protocol for a design. If the design is stored in **db** format, this protocol is saved with the design. Custom protocols may be necessary for designs that require preconditioning vectors or designs that employ nonstandard scan test sequences. A custom protocol can be defined for a design and specified using the **read\_test\_protocol** command.

In this case, this information is not available, and the **write\_test** command is unable to format the patterns. Typically this happens when a design is read in as a netlist and an existing pattern database file is used as input to the **write\_test** command.

## WHAT NEXT

Run the **check\_test** command to automatically infer a default protocol for the design. If a custom protocol is read in using the **read\_test\_protocol** command, execute **check\_test** to extract detail's of the design's scan chains.

**Note:** If you create a protocol for a design, make sure that it is the same protocol used when existing pattern database files were created. If the protocols are different, the **write\_test** command fails because the scan test patterns are inconsistent with the protocol. An example of an inconsistency is the use of different scan cells. Ideally, the design and its protocol should always be saved in **db** format after execution of the **create\_test\_patterns** command.

## UIT-24 (warning) vhdlout\_single\_bit="%s" not supported; assuming vhdlout\_single\_bit="VECTOR".

## DESCRIPTION

The **write\_test** command issues this warning if you are writing out your vectors in VHDL format and the **vhdlout\_single\_bit** variable is not set to *VECTOR* or *BIT*. The warning message indicates which value the **vhdlout\_single\_bit** variable is set to.

The **vhdlout\_single\_bit** variable defines whether bussed ports are written as individual single bits in the test pattern. The **write\_test** command only supports *VECTOR* or *BIT* values for this variable. However, the default value for this variable is *USER*. If you use the value *USER*, the **write\_test** command will issue this message and automatically change the **vhdlout\_single\_bit** variable to *VECTOR*. Your vectors will be written out with the ports bussed.

## WHAT NEXT

To avoid this violation, set the **vhdlout\_single\_bit** variable for *VECTOR* or *BIT* before issuing the **write\_test** command.

If you have used the value *USER* and wish to write out your vectors in bit-blasted fashion, you will need to set the **vhdlout\_single\_bit** variable to *BIT* and re-execute the **write\_test** command.

If you have used the value *USER* and wish to write out your vectors in bussed fashion, then no action is required on your part.

## UIT-26 (error) Strobe value is required to be less than period value.

### DESCRIPTION

Your strobe value has exceeded the period value.

### WHAT NEXT

Change your strobe value.

## UIT-27 (error) %s is a serial-only vector format.

### DESCRIPTION

Invalid vectors are generated if you invoke **write\_test** with the *-parallel* option for serial-only vector formats. When such an error occurs, this error message displays.

### WHAT NEXT

for serial-only vector formats, invoke **write\_test** without the *-parallel* option.

## UIT-28 (error) Current test protocol cannot be used with a parallel load format.

### DESCRIPTION

Currently the only protocols inferred by `check_test` can be used with a parallel load format. Therefore any custom test protocols cannot use this format due to the fact

that it is difficult to determine which bits correspond to which registers. This error message is displayed when such an error occurs. This error message will also be issued when it does not make sense to write out vectors in parallel load format, such as trying to write out parallel vectors for a combinational design or for a design which contains no scan element.

## WHAT NEXT

Either let check\_test infer a test protocol to use a parallel load format or do not use the parallel load format.

# UIT-29 (error) No nets have global tracing enabled in design '%S'.

## DESCRIPTION

### BACKGROUND INFORMATION

Using the **check\_test** command, DFT Compiler design rule checking (DRC) is performed by doing a symbolic simulation of the test protocol for a design.

If the data applied at the scan in ports is successfully and predictably loaded into the scan chain, the cells are scan controllable. If data can be captured into the scan cells during the parallel capture cycle, and successfully and predictably unloaded, the cells are scan observable. When sequential cells are neither fully scannable (both scan controllable and scan observable) nor valid nonscan cells (for partial scan designs), fault coverage suffers.

DFT Compiler provides a net tracing capability which allows you to view the results of the symbolic simulation to help in the identification and correction of test protocol problems. DFT Compiler displays the logic values of the nets as information messages. All output from the design rule checker, including information messages, is linked to the design schematic. You can debug your protocol by selecting nets with certain values, then viewing the corresponding section in the schematic through the Design Analyzer.

Net tracing is enabled in either of two fashions. If **trace\_nets** statements are added to vector or stream groups within a custom test protocol supplied by the designer, they enable tracing within a *local* scope limited to that vector or stream group. Alternatively, by specifying nets using the **trace\_nets** command, nets can be traced within the *global* scope of the entire current test protocol. The **untrace\_nets** command only acts on nets specified by the **trace\_nets** command.

### MANIFESTATION

This error message is generated when the **untrace\_nets** command has been invoked when there are *no* nets in the current design which have *global* tracing enabled as a result of a previous **trace\_nets** command.

## WHAT NEXT

This is a benign error message indicating that you have asked that tracing be disabled on nets for which *global* tracing is not enabled. If you are still seeing net tracing for any nets, it must be the result of *local* **trace\_nets** statements in your custom protocol. Remove those statements from the custom protocol.

## UIT-30 (error) Global tracing not enabled for net '%s' in design '%s'.

### DESCRIPTION

#### BACKGROUND INFORMATION

Using the **check\_test** command, DFT Compiler design rule checking (DRC) is performed by doing a symbolic simulation of the test protocol for a design.

If the data applied at the scan in ports is successfully and predictably loaded into the scan chain, the cells are scan controllable. If data can be captured into the scan cells during the parallel capture cycle, and successfully and predictably unloaded, the cells are scan observable. When sequential cells are neither fully scannable (both scan controllable and scan observable) nor valid nonscan cells (for partial scan designs), fault coverage suffers.

DFT Compiler provides a net tracing capability which allows you to view the results of the symbolic simulation to help in the identification and correction of test protocol problems. DFT Compiler displays the logic values of the nets as information messages. All output from the design rule checker, including information messages, is linked to the design schematic. You can debug your protocol by selecting nets with certain values, then viewing the corresponding section in the schematic through the Design Analyzer.

Net tracing is enabled in either of two fashions. If **trace\_nets** statements are added to vector or stream groups within a custom test protocol supplied by the designer, they enable tracing within a *local* scope limited to that vector or stream group. Alternatively, by specifying nets using the **trace\_nets** command, nets can be traced within the *global* scope of the entire current test protocol. The **untrace\_nets** command only acts on nets specified by the **trace\_nets** command.

#### MANIFESTATION

This error message is generated when a net specified by the **untrace\_nets** command does not currently have *global* tracing enabled as a result of a previous **trace\_nets** command.

If an asterisk (\*) is encountered within a net name passed to **untrace\_nets**, the set of all nets in the design containing the associated partial net name specified will be checked for tracing. If no net within the set was found to have tracing enabled, this error message is invoked for *all* the nets in the set.

## WHAT NEXT

This is a benign error message indicating that you have asked that tracing be disabled on a net for which *global* tracing is not enabled. If you are still seeing net tracing for this net, it must be the result of a *local* **trace\_nets** statements in your custom protocol. Remove that statement from the custom protocol.

If this error message is being produced multiple times it probably indicates that you have made imprecise use of a wildcard asterisk (\*) when specifying your net. Check your use of asterisks within your list of net names passed to the **untrace\_nets** command.

## UIT-31 (error) Cannot find vector file '%s' written by TestSim.

### DESCRIPTION

This error message will appear when you are trying to perform the **write\_test** command on a test program created by a fault simulation run. During a fault simulation run, two **.vdb** files are created : **<test\_program\_name>.vdb** and **<test\_program\_name>.testsim.vdb**. The **write\_test** command needs both of these files to write out the output vector file.

### WHAT NEXT

Confirm that you have not accidentally deleted this file. If you have deleted this file, you will have to re-run fault simulation.

## UIT-32 (error) Bad protocol format '%s'.

### DESCRIPTION

You receive this message if you specify a test protocol format other than stil or tpf; these are the only formats allowed by **write\_test\_protocol**. By default, **write\_test\_protocol** uses tpf format.

### WHAT NEXT

Re-execute **write\_test\_protocol** and specify either stil or tpf as the protocol format. Alternatively, if you want to use the default format (tpf), you can execute **write\_test\_protocol** with no format specification.

### SEE ALSO

**write\_test\_protocol(2)**.

## **UIT-33 (error) Bad test model format '%s'.**

### **DESCRIPTION**

You receive this message if you specify a test model format other than `ctl`; this is the only format allowed by `write_test_model`.

### **WHAT NEXT**

Re-execute `write_test_model` and specify `ctl` as the test model format, or do not specify any format.

### **SEE ALSO**

`write_test_model(2)`.

## **UIT-34 (warning) Redundant TCK period specification '%f' ignored.**

Existing TCK period '%f' (frequency '%e') retained.

### **DESCRIPTION**

This warning message is generated when `insert_jtag -tck_period` is invoked on a design with an existing boundary scan Test Access Port (TAP) TCK port where a clock has been previously specified at this port. The period and resulting frequency of this clock is reported in the message. In this case, DFT Compiler ignores the new specification and retains the old specification.

### **WHAT NEXT**

If the old specification (probably generated using the `create_clock` command) is unsatisfactory, either remove the `clock` attribute on the TAP TCK port and invoke `insert_jtag -tck_period <correct_period>`, or change the existing clock period specification and invoke `insert_jtag` without the `-tck_period` option.

## **UIT-35 (error) Physical dft preview doesn't support the shadow logic client.**

### **DESCRIPTION**

You receive this message if you've specified the shadow logic DFT client to be

executed during DFT logic preview with the command: `set_dft_configuration -order {wrapper}` To perform physical dft preview, you have used the following commands: `preview_dft -physcial` Currently, physical dft preview doesn't support that client. This will prevent the completion of DFT logic previewing .

## WHAT NEXT

Reset your DFT configuration: `remove_dft_configuration` Only set the Autofix client if you wish to use it as well as to perform physical dft preview.  
`set_dft_configuration -order {autofix}`. Proceed to DFT logic previewing.

## SEE ALSO

`preview_dft(2)`. `insert_dft(2)`. `set_dft_configuration(2)`.

# UIT-36 (Error) Test protocol already exists for design '%s'.

## DESCRIPTION

A valid test protocol already exists in memory. It was either created by using `create_test_protocol` command or read by using `read_test_protocol` command.

## WHAT NEXT

You have to use `remove_test_protocol` command to avoid this message.

## SEE ALSO

`create_test_protocol`, `read_test_protocol`, `remove_test_protocol`.

# UIT-37 (Warning) Test protocol that already exists for design '%s' is invalid.

## DESCRIPTION

An invalid test protocol exists in memory. It was either created by using `create_test_protocol` command or read by using `read_test_protocol` command. This invalid test protocol will be removed and a new one will be created.

## WHAT NEXT

You can use `remove_test_protocol` command to avoid this message and read in a new protocol or create it from scratch.

## SEE ALSO

`create_test_protocol, read_test_protocol, remove_test_protocol.`

## UIT-39 (error) The test\_require attribute cannot be set on the three-state driver '%s'.

### DESCRIPTION

DFT Compiler will not be able to account for the specified **test\_require** on the three-state driver. The specification is ignored.

### WHAT NEXT

There are multiple ways to specify required values around a three-state bus: upstream from the drivers, after the bus, or on the enables. In order to obtain the effect of a require on a single three-state driver, do the following. Identify the driver's input and enable pins. Manually insert buffers driving these pins. Set the desired test\_require value on the driver of the data pin. Set a test\_require value of 1 on the driver of the enable pin.

## UIT-41 (error) No implementation for component "%s" supplied.

### DESCRIPTION

You must specify an implementation for the passed component type.

The implementation must be available in the jtag.db library. It may be a default implementation supplied with DFT Compiler, or a user supplied implementation added to the jtag.db.

Refer to the DFT Compiler reference manual for details of how to add custom components to the jtag.db

### WHAT NEXT

Re-execute the command, specifying an implementation type from those available in the jtag.db.

## UIT-42 (error) '%s' is not a valid value for %s option of the

## **check\_test command.**

### **DESCRIPTION**

This message tells you that you have given the **check\_test** command invalid **-check\_contention** or **-check\_float** option arguments.

### **WHAT NEXT**

Repeat the **check\_test** command using valid option arguments.

## **UIT-43 (information) %s won't force conditioned bidirectionals.**

### **DESCRIPTION**

The default protocol inferred by DFT Compiler assumes that all bidirectional ports are turned in the same direction during scan shift. They can be turned inwards or outwards.

This message tells you that scan insertion does not insert logic to reconfigure ports that are turned in the opposite direction during scan shift.

### **WHAT NEXT**

Set "test\_force\_conditioned\_bidir\_pads" to "true" to change this behavior.

## **UIT-44 (information) Assuming %s for combinational methodology.**

### **DESCRIPTION**

This message tells you that DFT Compiler does not insert disabling logic when the test methodology is combinational.

### **WHAT NEXT**

If you want to insert disabling logic, change the test methodology. To make the warning go away, ask for no disabling logic.

## **UIT-45 (information) %s won't find the best scan-out pins.**

### **DESCRIPTION**

This message tells you that scan insertion does not look for the best scan-out pins when it routes scan chains.

### **WHAT NEXT**

Set "test\_disable\_find\_best\_scan\_out" to "false" to change this behavior.

## **UIT-46 (information) %s will create dedicated subdesign scan-out ports.**

### **DESCRIPTION**

You receive this message because DFT Compiler does not look for existing connections and creates dedicated subdesign scan-out ports if no port has a **test\_scan\_out signal\_type** attribute.

When connecting scan chains from subdesigns to parent designs, DFT Compiler first looks for subdesign ports that have **test\_scan\_out signal\_type** attributes. DFT Compiler then checks to see whether an existing connection can be used. If nothing is found, DFT Compiler creates a dedicated subdesign scan-out port.

### **WHAT NEXT**

Set the **test\_dedicated\_subdesign\_scan\_outs** environment variable to **false** to change this behavior.

### **SEE ALSO**

**test\_dedicated\_subdesign\_scan\_outs (3)**.

## **UIT-47 (warning) Dedicated subdesign scan-out ports will be created for sub-designs when hierarchical isolation is specified. Ignoring hierarchical isolation if there are existing dedicated**

# subdesign scan-out ports.

## DESCRIPTION

You receive this message because DFT Compiler does not create dedicated subdesign scan-out ports when you also requested hierarchical isolation logic. The request for hierarchical isolation logic takes precedence. If the sub-designs already have dedicated scan-out ports hierarchical isolation request will not be valid.

When connecting scan chains from subdesigns to parent designs, DFT Compiler first looks for subdesign ports that have **test\_scan\_out signal\_type** attributes. DFT Compiler then checks to see if an existing connection can be used. If it finds none, it creates a dedicated subdesign scan-out port.

You can set the **test\_dedicated\_subdesign\_scan\_outs** environment variable to **true** to direct DFT Compiler to ignore existing connections and create dedicated subdesign scan out ports.

## WHAT NEXT

To obtain dedicated subdesign scan-outs, do not ask for hierarchical isolation logic. Set the **test\_dedicated\_subdesign\_scan\_outs** environment variable to **false** to eliminate the warning message.

## SEE ALSO

[\*\*test\\_dedicated\\_subdesign\\_scan\\_outs\*\* \(3\)](#).

# UIT-48 (warning) Scan insertion will not add clock gating logic.

## DESCRIPTION

Sequential ATPG assumes that valid nonscan cells in designs using multiplexed flip-flop scan styles retain their states during scan shift. To insert clock gating logic into your design and validate this assumption, use the **-clock\_gating** option of **set\_scan\_configuration**.

This message tells you that you decided not to insert clock gating logic. **check\_test** violates nonscan cells that do not retain their states during scan shift, and **create\_test\_patterns** cannot use them to control or observe test vectors.

## WHAT NEXT

Confirm that you do not want scan insertion to add clock gating logic.

## **UIT-49** (warning) Scan style '%s' does not implement scan clock gating. Ignoring the set\_scan\_configuration -clock\_gating command.

### **DESCRIPTION**

Only the multiplexed\_flip\_flop scan style implements scan clock gating. This message tells you that you asked DFT Compiler to implement scan clock gating, but have specified a scan style that is not a multiplexed\_flip\_flop. DFT Compiler is telling you that it is ignoring your **-clock\_gating** option.

### **WHAT NEXT**

To get rid of the warning, remove the **-clock\_gating** from the **set\_scan\_configuration** option list, or set the scan style to multiplexed\_flip\_flop.

## **UIT-50** (warning) Test methodology '%s' does not implement scan clock gating. Ignoring the set\_scan\_configuration -clock\_gating command.

### **DESCRIPTION**

Only the partial scan test methodology implements scan clock gating. This message tells you that you asked DFT Compiler to implement scan clock gating, but specified a test methodology that is not partial\_scan. DFT Compiler is telling you that it is ignoring your **-clock\_gating** option.

### **WHAT NEXT**

To get rid of the warning, remove the **-clock\_gating** from the **set\_scan\_configuration** option list, or set the test methodology to partial\_scan.

## **UIT-51** (warning) Area-critical partial scan is not enabled. Ignoring the set\_scan\_configuration -area\_critical true command.

### **DESCRIPTION**

Ultimately, DFT Compiler covers the entire scan spectrum. By default, DFT Compiler selects scan cells to maximize fault coverage, subject to both area and timing

constraints. Tell DFT Compiler to ignore area constraints by setting a **set\_scan\_configuration -area\_critical** option **false**, and tell it to ignore timing constraints by setting a **set\_scan\_configuration -timing\_critical** option **false**. The user model sees timing-critical partial scan as the first step to scan spectrum coverage. Tell DFT Compiler to maximize fault coverage subject to timing constraints, and ignore area constraints. Give **set\_scan\_configuration** an **-area\_critical** option, and ask for timing-critical partial scan by giving it a mandatory **false** argument.

## WHAT NEXT

To get rid of the warning, remove the **-area\_critical true** from the **set\_scan\_configuration** option list.

**UIT-52 (warning)** Test methodology '%s' cannot not scan cells on timing critical paths. Ignoring the **set\_scan\_configuration -area\_critical** command.

## DESCRIPTION

Only the partial scan test methodology cannot scan cells on timing critical paths. This message tells you that you asked DFT Compiler to implement not scan cells on timing critical paths, but specified a test methodology that is not `partial_scan`. DFT Compiler is telling you that it is ignoring your **-area\_critical** option.

## WHAT NEXT

To get rid of the warning, remove the **-area\_critical** from the **set\_scan\_configuration** option list or set the test methodology to `partial_scan`.

**UIT-53 (information)** Enabling area critical partial scan.

## DESCRIPTION

DFT Compiler can make scan cells non-scan to meet area constraints. Use this capability when you need to back off scan in a small percentage of cells to meet critical area constraints.

This message tells you that the capability is enabled.

## WHAT NEXT

Confirm that you want to use the capability. To tell the DFT Compiler that you do not want to use the capability, use **set\_scan\_configuration -area\_critical false**.

## **UIT-54 (Error) The format tpf is no longer supported.**

### **DESCRIPTION**

You receive this error message because you invoked one of the following commands: `read_init_protocol` or `read_test_protocol` or `write_test_protocol` with the `-format` option set to `tpf`. The `tpf` format has been obsoleted and the only valid format is the `stil` format.

### **WHAT NEXT**

While writing the test protocol, replace the `tpf` format by the `stil` format and reissue the command. While reading an initialization protocol or a test protocol, ensure that the protocol has the `stil` format, replace the `tpf` format by the `stil` format and reissue the command.

### **SEE ALSO**

`read_init_protocol` (2), `read_test_protocol` (2), `write_test_protocol` (2).

## **UIT-55 (Error) All the scan signals have to be routed in the compression flow.**

### **DESCRIPTION**

You receive this error message because the `scan_signals` option of the `set_scan_configuration` command has to be set to `all` for the scan compression feature.

### **WHAT NEXT**

Set to all the scan signals for the `set_scan_configuration` command.

### **SEE ALSO**

`set_scan_configuration` (2),

## **UIT-56 (Error) Scan methodology must be multipexed\_flip\_flop**

and all the scan signals have to be routed in the logic BIST flow.

## DESCRIPTION

You receive this error message related to the set\_scan\_configuration command because the methodology must be set to multiplexed\_flip\_flop, the scan\_signals option must be set to all and the route option must be set to true for the logic BIST flow.

## WHAT NEXT

Set to multiplexed\_flip\_flop the methodology, set to all the scan signals and set to true the route for the set\_scan\_configuration command.

## SEE ALSO

`set_scan_configuration (2)`,

**UIT-87** (warning) Assignment of %s-only BSR cells to port '%s' is not compliant with the IEEE 1149.1 JTAG standard.

## DESCRIPTION

Unless the user requests a user-defined Boundary Scan Register (BSR) cell implementation using the `set_jtag_implementation` command, DFT Compiler selects default BSR cells from among the following 10 defined types:

### Type Default Name BSR Cell Function

BSRINBOTHJTAG\_BSRINBOTHset & observe data input cell  
BSRINSETJTAG\_BSRINSETset-only data input cell  
BSRINOBSJTAG\_BSRINOBSobserve-only data input cell  
BSRINCLKBOTHJTAG\_BSRINCLKBOTHset & observe clock input cell  
BSRINCLKSETJTAG\_BSRINCLKSETset-only clock input cell  
BSRINCLKOBSJTAG\_BSRINCLKOBSobserve-only clock input cell  
BSROUTBOTHJTAG\_BSROUTBOTHset & observe data output cell  
BSROUTSETJTAG\_BSROUTSETset-only data output cell  
BSROUTOBSJTAG\_BSROUTOBSobserve-only data output cell  
BSRCTLJTAG\_BSRCTLcontrol cell

IEEE 1149.1 Standard rule 10.1.1 specifies legal boundary scan register cell types. Several of the 10 types listed above are not compliant with the standard. Nonetheless, DFT Compiler supports them in order to allow designers the greatest possible flexibility when using Programmable JTAG.

**10.1.1(b)** "For a unidirectional system input pin (clock or nonclock), a

boundary-  
scan register cell shall be connected between the system pin and the  
on-  
chip system logic to allow the state of the system pin to be observed and,  
optionally, for the state of the system logic to be controlled."

Thus, legal data and clock input BSR cell types for unidirectional system input pins are observe-only and both control and observe. BSRINSET and BSRINCLKSET are non-compliant types.

**10.1.1(c)** "For 2-state and open-collector system output pins, a boundary-  
scan register cell shall be provided to allow the state of the system  
pin to be controlled and the state of the on-  
chip system logic output to be  
observed."

Thus, the legal output BSR cell type for system 2-state and open-collector output pins is both control and observe. BSROUTSET and BSROUTOBS are non-compliant types.

**10.1.1(d)** "For 3-state system output pins, boundary-scan register cells shall be provided to allow both the data value and the output drive state  
(active or inactive) to be controlled and for the corresponding system logic  
outputs to be observed."

Thus, the legal output BSR cell type for system 3-state output pins is both control and observe. BSROUTSET and BSROUTOBS are non-compliant types.

**10.1.1(e)** "For a bidirectional system pin, boundary-scan register cells shall be provided to allow the value and direction of data at the system pin to  
be controlled or observed and, where appropriate, for the corresponding system logic inputs to be controlled."

This is somewhat ambiguous. Test Compiler interprets this rule to indicate that as applied to bidirectional signals BSRINSET, BSROUTSET and BSROUTOBS are non-compliant types.

The types '**BSRxxxBOTH**' (control and observe) '**BSRxxxSET**' (control-only) and '**BSRxxxOBS**' (observe-only) differ. They correspond respectively to the three modes 'both', 'control' and 'observe' specified with the **set\_jtag\_port\_mode** command. When this command is invoked for one or more ports of the design, BSR cells for those ports will have BSR cells of the specified type associated with them.

If the specified type will result in a non-compliant BSR cell being synthesized for a port, this warning message is issued.

## WHAT NEXT

Determine whether non-compliant BSR cells can be tolerated in your design. If not, modify the port mode settings for the offending ports.

# UIT-88 (error) Data register ‘%s’ pin of type ‘%s’ not found.

## DESCRIPTION

You receive this message because the specified data register pin is not recognized as a port at the top level of the core design.

As a designer customizing the JTAG chip interface, you may want the JTAG Test Access Port (TAP) to access core test structures that DFT Compiler cannot automatically recognize. For example, suppose you want to activate a RAM test using an embedded test data register. You must do the following:

1. Initiate the test.
2. Capture the result of the test in the data register.
3. Shift the test result out through **TDO**.

To perform this test using the JTAG TAP, you require:

- An activation signal enabled by the associated JTAG instruction. This signal enters the data register through its *enable\_pin*.
- Connection of the data register’s serial input to **TDI**. This connection is optional, required only if data must be shifted into the data register to execute the test. This signal enters the data register through its *load\_pin*.
- An input to the JTAG MUX (which selects between data registers) dedicated to this data register. This input is selected when the associated JTAG instruction is active. This signal leaves the data register through its *capture\_pin*.

In order to retain the functional and structural identity of the core logic, the DFT Compiler’s JTAG logic synthesis interacts with the design’s core logic at the top level of the design’s hierarchy. This ensures that simulation of the core logic, before and after JTAG synthesis, remains identical. Thus, for DFT Compiler to automatically connect to the JTAG TAP the *capture\_pin*, *load\_pin*, and *enable\_pin* of a user-specified core data register, these pins must exist as pseudo-ports at the top level of the original circuit. That is, it is the responsibility of the designer to ensure that the signals controlling and observing a core test register traverse the circuit hierarchy until they are visible at the top level of the design.

## WHAT NEXT

Determine the reason that the pin has not been found. If it is appropriately named, check to ensure that the pin appears as a pseudo-port of the top level of the design core.

## **UIT-89** (error) An illegal implementation ‘%s’ has been specified for JTAG component type ‘%s’.

### **DESCRIPTION**

Any alternate implementation for one of the JTAG component types

- the Test Access Port (TAP) Controller: **TAP**,
- the Bypass Register: **BR**
- the device Identification Register: **ID**
- the JTAG instruction register: **IR**, or
- one of the Boundary Scan Register cells: **BSRINBOTH**, **BSRINSET**,  
**BSRINOBS**, **BSROUTBOTH**, **BSROUTSET**, **BSROUTOBS**,  
**BSRCTL**, **BSRINCLKBOTH**, **BSRINCLKSET** or **BSRINCLKOBS**

must have all the I/O ports that exist on the default implementation.

### **WHAT NEXT**

Compare the I/O of the user-specified implementation with that of the default component of the specified component type.

## **UIT-90** (error) set\_jtag\_implementation must be invoked with a legal component type. ‘%s’ is not a recognized component type.

### **DESCRIPTION**

**set\_jtag\_implementation** must be invoked with one of the JTAG component types

- the Test Access Port (TAP) Controller: **TAP**,
- the Bypass Register: **BR**
- the device Identification Register: **ID**
- the JTAG instruction register: **IR**, or
- one of the Boundary Scan Register cells: **BSRINBOTH**, **BSRINSET**,  
**BSRINOBS**, **BSROUTBOTH**, **BSROUTSET**, **BSROUTOBS**,  
**BSRCTL**, **BSRINCLKBOTH**, **BSRINCLKSET** or **BSRINCLKOBS**

These are the *only* legal JTAG component types.

### **WHAT NEXT**

Invoke the dc\_shell JTAG command with the **-help** option to review the correct command syntax and make sure a legal JTAG component type has been selected.

# **UIT-91 (warning) Illegal JTAG ground\_bounce value '%d' replaced by '%d'.**

## **DESCRIPTION**

The environmental variable **test\_jtag\_ground\_bounce\_limit** has been added to the .synopsys setup environment to provide the user with a mechanism to ensure that the 'ground bounce' problem does not occur for designs with JTAG synthesized by DFT Compiler.

This problem arises when the pins of a chip that does not normally support simultaneous switching or enabling of all outputs are controlled from the Boundary Scan Register (BSR), rather than from the on-chip system logic. For example, this situation arises when the EXTEST instruction is selected. It is possible that the tests supplied through the boundary-scan path will cause all outputs to change state and/or be active simultaneously. If precautions are not taken, the sum of the switching currents of all pins may produce VCC and VSS glitches that could exceed the tolerance level of the IC, and the core logic as well as the BSR cells and TAP would then be subject to interference. The power consumption could be increased beyond the capacity of the power pins for a prolonged period, perhaps resulting in incorrect operation of the chip.

Delays that only effect the signal path when the chip is in JTAG test mode can be added to prevent simultaneous switching of outputs when pins are driven from the BSR. The added delays should be small in comparison with the minimum period of TCK, but should be sufficient to ensure that the power-current demand arising from the change of state at one pin or group of pins does not overlap with that from another group producing the excessive power consumption.

However, if the process to optimize the number of BSR cells results in a single BSR cell (for example a bus three-state enable signal) driving too many enable signals, there is no way to introduce delays between the signals controlled by that BSR cell and ground bounce may not be prevented.

The environmental variable **test\_jtag\_ground\_bounce\_limit** puts a cap on the number of outputs that can be driven by a single BSR cell. A default value is established for this variable. The user can establish another positive non-zero limit, by changing the value of the variable in the .synopsys\_dc.setup file.

The value of the ground-bounce limit for a particular JTAG design can be determined by executing **report\_test -jtag**.

A detailed discussion of the Ground-Bounce problems is presented in Chapter 15, 'Providing Boundary-Scan on Chips with Power or Output-Switching limitations' of 'The Test Access Port and Boundary-Scan Architecture' by Colin M. Maunders and Rodham E. Tulloss, IEEE Computer Society Press Tutorial, 1990.

## **WHAT NEXT**

Reset the value of the **test\_jtag\_ground\_bounce\_limit** to a legal value.

## **UIT-92 (information) User defined instruction '%s' not associated with identifiable data register. Dangling signals will be synthesized.**

### **DESCRIPTION**

Each JTAG instruction activates a single target data register. By definition, the target register of any user defined instruction is not specified in the IEEE 1149.1 JTAG Standard; therefore, that target register cannot be inferred by DFT Compiler. The user must identify the target register by using either **-reg\_name core\_scan\_chain\_name** or **-reg\_coordinates capture\_pin [load\_pin]** and **-reg-enable enable\_pin**.

When invoking **set\_jtag\_instruction instruction\_name [-code code]** if you do not specify **-reg\_name core\_scan\_chain\_name**, **-reg\_coordinates capture\_pin [load\_pin]**, or **-reg-enable enable\_pin**, DFT Compiler will synthesize all the necessary instruction decode logic and create two new design ports: an input port called **<instruction\_name>CAPTURE** and an output port called **<instruction\_name>ENABLE**. The port **<instruction\_name>ENABLE** is active **HIGH** when the instruction **instruction\_name** is loaded into the IR. The designer can then manually edit the circuit to connect these two signals to the appropriate data register circuitry.

### **WHAT NEXT**

Manually connect the two signals **<instruction\_name>CAPTURE** and **<instruction\_name>ENABLE** to the appropriate data register circuitry.

## **UIT-93 (warning) One or more ports have been excluded from the JTAG Boundary Scan Register (BSR). JTAG logic synthesized based on this configuration will not be compliant with the IEEE 1149.1 JTAG standard.**

### **DESCRIPTION**

The IEEE 1149.1 JTAG Standard specifies that *all* non-TAP I/O ports must be included in the BSR. Exclusion of one or more ports results in this warning message.

### **WHAT NEXT**

If a non-compliant JTAG implementation is satisfactory, ignore this message.

Otherwise, compliance with this condition may be met by executing **set\_jtag\_port -default**.

## UIT-94 (error) Erroneous JTAG data register '%s' associated with JTAG instruction '%s'.

### DESCRIPTION

The IEEE 1149.1 JTAG Standard specifies and requires three mandatory JTAG instructions: BYPASS, SAMPLE/PRELOAD and EXTEST. If a JTAG device Identification Register (IDreg) exists, then a fourth JTAG instruction, IDCODE, is mandatory. The standard also defines three other instructions: INTEST, RUNBIST and USERCODE. The target register selected by each of these instructions is designated by the standard as follows:

| Instruction    | Target Data Register |
|----------------|----------------------|
| BYPASS         | JTAG_BYPASS_REG      |
| SAMPLE/PRELOAD | JTAG_BSR             |
| EXTEST         | JTAG_BSR             |
| INTEST         | JTAG_BSR             |
| IDCODE         | JTAG_ID_REG          |
| USERCODE       | JTAG_ID_REG          |
| RUNBIST        | JTAG_BIST_REG        |

Because only one data register is associated with each of these instructions, it need never be specified by the designer. If the target data register *is* specified, using **set\_jtag\_instruction instruction\_name -reg\_name name**, a check is made that the legal data register has been specified. This error message appears if an illegal register is specified.

Note, however, that if you specify a particular core BIST register with RUNBIST, you need to include register coordinate information.

### WHAT NEXT

Since specifying the data register with any of these seven JTAG instructions is redundant, avoid this error by simply removing the erroneous specification.

## UIT-95 (error) JTAG logic already inserted into this design.

## **insert\_jtag not invoked.**

### **DESCRIPTION**

Invoking JTAG synthesis on a design twice returns an error. The danger is that preexisting JTAG logic might be confused with core logic and result in duplicate JTAG logic synthesis.

When DFT Compiler successfully inserts JTAG into a design, it sets a design attribute flag. A call to **insert\_jtag** is not executed if a check for the presence of this design attribute indicates pre-existing JTAG logic.

### **WHAT NEXT**

If you want to reinvoke JTAG synthesis, make sure you begin with a clean design without JTAG.

## **UIT-96 (error) Port '%s' excluded from the JTAG Boundary Scan Register (BSR).**

No BSR cells can be associated with it.

### **DESCRIPTION**

BSR cells are only synthesized for ports that are included in the JTAG BSR. Thus it is an error to specify a routing order for BSR cells relative to ports that are excluded from the BSR.

### **WHAT NEXT**

Either remove reference to those BSR cells associated to the excluded port or specify inclusion of the port in the BSR by executing **set\_jtag\_port TRUE port\_name**.

## **UIT-97 (error) '%s' not an input or output port. (You must specify '/out', '/in' or '/ctl'.)**

### **DESCRIPTION**

For bidirectional ports, the *port\_name* is insufficient to differentiate between the Boundary Scan Register (BSR) input, output, and control cells.

## WHAT NEXT

A trailing specifier **/in**, **/out** or **/ctl** must be appended to *port\_name* to identify each bidirectional port BSR cell.

# UIT-98 (error) '%s' not a port of the current design.

## DESCRIPTION

JTAG Boundary Scan Register (BSR) cells can only be specified in **set\_jtag\_port\_routing\_order** relative to ports in the current design.

## WHAT NEXT

Check the ports of the current design to verify the set of legal *port\_name* candidates.

# UIT-99 (error) Unrecognized BSR cell specifier '%s'. (Must be '/out', '/in' or '/ctl').

## DESCRIPTION

The *ordered\_list\_of\_annotated\_BSR\_port\_names* contains members of four classes:

- <*input\_or\_output\_port\_name*> which, depending on the direction of the port, specifies a BSR input or output cell;
- <*bidirectional\_port\_name*>**/in** which specifies the BSR input cell associated with this bidirectional port;
- <*bidirectional\_port\_name*>**/out** which specifies the BSR output cell associated with this bidirectional port;
- <*tristate\_or\_bidirectional\_port\_name*>**/ctl** which specifies the BSR three-state control cell associated with this output or bidirectional port.

## WHAT NEXT

Only three legal specifiers (**/in**, **/out** or **/ctl**) may be appended to a *port\_name* to identify a BSR cell.

# UIT-100 (error) Instruction Register (IR) too small.

# This design requires an %d-bit register.

## DESCRIPTION

The IEEE 1149.1 JTAG Standard mandates that the JTAG Instruction Register (IR) be at least two bits wide. DFT Compiler supports IRs of between 2 and 32 bits inclusively. The size of the IR is set in three ways:

- specifying the size using `insert_jtag -ir_size bit_width;`
- forcing the IR size by specifying an instruction code  
`set_jtag_instruction -code "code";`
- DFT Compiler will automatically infer the IR size from the set of specified and mandatory instructions selected.

## WHAT NEXT

**UIT-101 (error)** JTAG Test Access Port (TAP) I/O port '%s' may not be included in the boundary scan register (BSR).

## DESCRIPTION

The IEEE 1149.1 JTAG Standard specifies that the Boundary Scan Register (BSR) is a data register connected between TDI and TDO. The BSR may not include any of the JTAG Test Access Port (TAP) ports. An error will result if you include ports carrying the following signals:

- TDI: JTAG Test Data In
- TDO: JTAG Test Data Out
- TMS: JTAG Test Mode Select
- TCK: JTAG Test Clock
- TRST: JTAG Test Reset

## WHAT NEXT

**UIT-102 (error)** Illegal JTAG boundary scan port mode '%s' specified.

## DESCRIPTION

The JTAG circuitry associated with each port allows that port to be **controlled** only, **observed** only, or **both** controlled and observed. This is the JTAG operational mode of

a port.

The default mode can be initially set in the .synopsys file using `jtag_bsr_port_mode = '<mode_string>'` where allowable port modes are `control`, `observe`, or `both`.

## WHAT NEXT

# UIT-103 (error) Illegal JTAG boundary scan port signal type '%s' specified.

## DESCRIPTION

The JTAG circuitry associated with a port can be optimized depending on the signal type, `clock`, `enable` or `data`, of that port.

The JTAG circuitry associated with an *input* port can be optimized based on the signal type (`clock` or `data`) of that port. Ports that drive clock trees can be associated with specialized JTAG circuitry. An input port can be explicitly identified as carrying one of the "clock" or "data" categories.

When the three-state elements driving three-state and bidirectional *outputs* are found in the core logic of the IC (i.e. not embedded in the pads themselves) DFT Compiler requires that these three-state elements be located at the top hierarchy of the core of the design so that Boundary Scan Register (BSR) cells can be placed on the `inside` of the three-state elements in order to control and observe the data and enable lines. In these cases, only a single three-state line exits the core logic.

However, in the cases where the three-state controller for output signals will be embedded in the three-state output or bidirectional input/output pad associated with these ports of a design two signals exit the core logic; a *data* line and a *enable* line. Unless, TC knows the distinction between these two types of exit lines, it will always assume that they are data lines and not insert the correct type of BSR cell on the enable lines. By specifying "enable" or "data" on a port the designer instructs TC on which type of BSR cell to place on these output ports.

Where possible, DFT Compiler will extract this information from the circuit design. A port may be explicitly identified as carrying one of these categories of data.

## WHAT NEXT

If you are defining the characteristics of input ports, choose between the "clock" and "data" options. If you are defining the characteristics of output ports, choose between the "enable" and "data" options.

# UIT-104 (error) Requested Instruction Register size '%d' is less than

previously specified Instruction code size '%d'.

## DESCRIPTION

The IEEE 1149.1 JTAG Standard mandates that the JTAG Instruction Register (IR) be at least two bits wide. DFT Compiler supports IRs of 2- to 32-bit widths inclusively. The size of the IR is set in three ways:

- specifying the size using **insert\_jtag -ir\_size bit\_width**;
- forcing the IR size by specifying an instruction code **set\_jtag\_instruction -code "code"**;
- DFT Compiler will automatically infer the IR size from the set of specified and mandatory instructions selected.

This error is generated if one or more JTAG instructions with specified codes of length  $n$  have been previously specified, but **insert\_jtag -ir\_size m** is invoked where  $n > m$ .

If  $m > n$  then DFT Compiler can pad the  $m-n$  high order bits of the previously specified instruction codes with 0s. But it cannot truncate previously specified codes when  $m > n$ .

## WHAT NEXT

Either invoke **insert\_jtag -ir\_size** with a size greater or equal to the length of all previously specified codes, or, if a smaller IR is required, specify codes for all instructions with previously specified codes, so that their code length is less than or equal to the desired IR size.

**UIT-105 (error) Instruction '%s' has code fixed by the 1149.1 JTAG standard.**

You cannot assign the code '%s' to this instruction.

## DESCRIPTION

You receive this message because DFT Compiler generates it when an attempt is made to reset **BYPASS** and **EXTEST** JTAG code.

Each JTAG instruction requires the following triplet of information:

- Instruction name
- Target data register
- Instruction code

DFT Compiler can automatically generate some of this information.

The mandatory **BYPASS** and **EXTEST** JTAG instructions have mandatory codes. The **BYPASS** code is all 1s (ones). The **EXTEST** code is all 0s (zeros). All other mandatory and nonmandatory JTAG instructions support arbitrary codes.

Since the **BYPASS** and **EXTEST** instructions have mandatory codes, the designer never has to specify them. DFT Compiler automatically extracts all information relative to these two instructions.

**UIT-106 (warning)** The 1149.1 JTAG standard instruction '%s' does not support register coordinate specification.  
(Specifications ignored.)

## DESCRIPTION

The IEEE 1149.1 JTAG Standard specifies and requires three mandatory JTAG instructions: BYPASS, SAMPLE/PRELOAD, and EXTEST. If a JTAG device Identification Register (IDreg) exists, then a fourth JTAG instruction, IDCODE, is mandatory. The standard also defines three other instructions: INTEST, RUNBIST, and USERCODE. The target register selected by each of these instructions is designated by the standard as follows:

| Instruction    | Target Data Register |
|----------------|----------------------|
| BYPASS         | JTAG_BYPASS_REG      |
| SAMPLE/PRELOAD | JTAG_BSR             |
| EXTEST         | JTAG_BSR             |
| INTEST         | JTAG_BSR             |
| IDCODE         | JTAG_ID_REG          |
| USERCODE       | JTAG_ID_REG          |
| RUNBIST        | JTAG_BIST_REG        |

For the first six JTAG instructions above only one data register is associated with each of these instructions; the register does not need to be specified. In these six cases, if the target data register is specified, using **set\_jtag\_instruction instruction\_name -reg\_coordinates capture\_pin [load\_pin] -reg\_enable enable\_pin**, the register coordinate information is ignored and this warning message is generated.

If you specify a particular core BIST register with RUNBIST, you need to include register coordinate information.

## WHAT NEXT

Since specifying the data register with any of these seven JTAG instructions is redundant, avoid this error by simply removing the redundant coordinate specification.

# **UIT-107 (error) Code length '%d' of instruction '%s' conflicts with a previously specified instruction code length '%d'.**

## **DESCRIPTION**

The IEEE 1149.1 JTAG Standard mandates that the JTAG Instruction Register (IR) be at least two bits wide. DFT Compiler supports IRs of 2- to 32- bit widths inclusively. The size of the IR is set in three ways:

- specifying the size using **insert\_jtag -ir\_size bit\_width**;
- forcing the IR size by specifying an instruction code **set\_jtag\_instruction -code "code"**;
- DFT Compiler will automatically infer the IR size from the set of specified and mandatory instructions selected.

If you specify codes to be assigned to specific instructions, the length of these codes must be consistent with any previously specified codes or the previously specified Instruction Register (IR) size.

## **WHAT NEXT**

Modify the length of the offending codes to be equal that of previously specified instruction codes and/or IR size.

# **UIT-108 (error) Code '%s' for instruction '%s' conflicts with the code for instruction '%s'.**

## **DESCRIPTION**

You receive this message because the code for an instruction conflicts with the code specified for another instruction.

Each instruction must have a unique code that does not conflict with the code specified for another instruction. In the absence of a user-specified code for an instruction, DFT Compiler generates a unique code for that instruction.

Each JTAG instruction requires a triplet of information:

- Instruction name
- Target data register
- Instruction code

DFT Compiler can automatically generate some of this information. The mandatory **BYPASS** and **EXTTEST** JTAG instructions have mandatory codes. The **BYPASS** code is all 1s (ones). The **EXTTEST** code is all 0s (zeros). All other mandatory and nonmandatory JTAG

instructions support arbitrary codes.

## WHAT NEXT

Eliminate the coding conflict by executing a legal change of code for one of the two conflicting instructions. (You cannot change the mandatory codes of the **BYPASS** and **EXTEST** instructions.)

Again execute the **set\_jtag\_instruction** command.

While changing the conflicting code, you must keep all other specifications relative to the instruction the same.

## SEE ALSO

**set\_jtag\_instruction** (2).

# UIT-109 (error) BSR cell '%s' has been assigned multiple routing positions.

## DESCRIPTION

Each JTAG Boundary Scan Register (BSR) cell only appears once in the BSR. Therefore, when specifying its location in the BSR using the **set\_jtag\_port\_routing\_order** instruction, it is an error to specify more than one location for each BSR cell.

## WHAT NEXT

Remove multiple specifications of the BSR cell reported in the error message, leaving at most one reference to it in the *ordered\_list\_of\_annotated\_BSR\_port\_names* when executing **set\_jtag\_port\_routing\_order**.

# UIT-110 (warning) Compliance with the IEEE's 1149.1 JTAG Standard requires a BYPASS Register. This implementation is non-compliant.

## DESCRIPTION

If you specify that a JTAG BYPASS register not be synthesized, the resulting JTAG architecture will *not* be IEEE 1149.1 compliant.

## WHAT NEXT

If you want a compliant JTAG architecture, do not invoke `insert_jtag` with the `-no_bypass` option.

**UIT-111 (warning) JTAG component implementation '%s' not found.**

The default implementation will be used instead.

## DESCRIPTION

The basic JTAG components (`BSRin`, `BSRout`, `BSRcontrol`, `TAP`, `BYPASS`, `ID`, and `IR`) must have functionality that conforms to the IEEE 1149.1 standard. Each can be implemented in a number of different architectures. There are several different functionality implementations (set-only, observe-only, or both set and observe) of the JTAG Boundary Scan Register (BSR) cells. DFT Compiler has a default implementation for each of the three types (input, output, and control) of BSR cells.

You can override the default implementation of all the JTAG components:

- one of the Boundary Scan Register (BSR) cells `BSRin`, `BSRout`, or `BSRcontrol`
- the Test Access Port (TAP) Controller `TAP`
- the Bypass Register `BYPASS`
- the device Identification Register `ID`
- the JTAG instruction register `IR`

by executing

```
set_jtag_implementation component_type implementation
```

where `component_type` is `BSRin`, `BSRout`, `BSRcontrol`, `TAP`, `BYPASS`, `ID`, or `IR`.

You can override the implementation of one or more of the BSR cells of the specified type in the BSR by executing the `set_jtag_implementation` instruction with the correct arguments:

- `set_jtag_implementation BSRin implementation [list_of_ports]`
- `set_jtag_implementation BSRout implementation [list_of_ports]`
- `set_jtag_implementation BSRcontrol implementation [list_of_ports]`

The `implementation` is the name of the desired JTAG component in the JTAG component library. If DFT Compiler cannot find this component in the library, it issues this message and uses the default implementation for this type of BSR cell.

## WHAT NEXT

If you want to override the default implementation, make sure that the JTAG

component named *implementation* is in the JTAG library.

## UIT-112 (error) Target core register '%s' not found.

### DESCRIPTION

If you want to specify an instruction and, optionally, the code for a specific internal scan chain, execute **set\_jtag\_instruction** *instruction\_name -reg\_name name [-code code]*.

The *name* of each internal scan chain is the name of its parallel scan-in port; that is, the port which has the **test\_scan\_in** attribute assigned to it. This guarantees the uniqueness of names for these scan chains and provides DFT Compiler with a mechanism to identify each target scan chain. If DFT Compiler cannot find this unique parallel scan-in port, this message is generated.

### WHAT NEXT

Verify the names of the parallel scan-in ports of the design using **report\_test -scan**.

## UIT-113 (information) Creating user defined instruction '%s'. (not a 1149.1 JTAG standard instruction)

### DESCRIPTION

DFT Compiler recognizes the seven standard instructions defined by the IEEE 1149.1 JTAG Standard:

#### Instruction Target Data Register

BYPASSJTAG\_BYPASS\_REG  
SAMPLE/PRELOADJTAG\_BSR  
EXTESTJTAG\_BSR  
INTESTJTAG\_BSR  
IDCODEJTAG\_ID\_REG  
USERCODEJTAG\_ID\_REG  
RUNBISTJTAG\_BIST\_REG

DFT Compiler also accepts user-defined JTAG instructions. These instructions may access core scan chains or invoke other test circuitry in the design. When a user-defined instruction has been successfully parsed, this information message is issued.

The existence of this message also provides a check for misspelled names of the seven

standard JTAG instructions. It verifies that you in fact want to create a user-defined instruction.

## WHAT NEXT

# UIT-114 (information) Creating 1149.1 JTAG standard instruction '%S'.

## DESCRIPTION

DFT Compiler recognizes the seven standard instructions defined by the IEEE 1149.1 JTAG Standard:

### Instruction Target Data Register

BYPASSJTAG\_BYPASS\_REG  
SAMPLE/PRELOADJTAG\_BSR  
EXTESTJTAG\_BSR  
INTESTJTAG\_BSR  
IDCODEJTAG\_ID\_REG  
USERCODEJTAG\_ID\_REG  
RUNBISTJTAG\_BIST\_REG

DFT Compiler also accepts user-defined JTAG instructions. This information message confirms that DFT Compiler has recognized and parsed one of the standard instructions.

The existence of this message also provides a check for user-defined instructions which have been mislabeled with standard instruction names.

## WHAT NEXT

# UIT-115 (error) Illegal joint specification of -no\_internal scan and -daisy\_chained internal scan. (Specify only one of these options.)

## DESCRIPTION

By default DFT Compiler will attach core test structures that it recognizes (for example, internal scan chains) to the JTAG Test Access Port (TAP). Internal scan chains will not be connected to the TAP if you execute **insert\_jtag -no\_internal\_scan**. If you want all of the recognized core scan chains accessible as a

single long register comprised of the individual scan chains serially daisy-chained together, execute **insert\_jtag -daisy\_chained** [*ordered\_set\_of\_scan\_chain\_indexes*].

These two options are mutually exclusive. This error message is invoked if both options are specified at once.

## WHAT NEXT

Determine which core scan chain option is desired and invoke **insert\_jtag** with the appropriate argument.

# UIT-116 (information) Instruction '%s' has been cancelled.

## DESCRIPTION

Any non-mandatory instruction may be removed from the set of instructions "understood" by the synthesized JTAG instruction decode logic. This message confirms removal of the specified instruction. As a result, decode logic will not be synthesized to recognize this instruction.

## WHAT NEXT

# UIT-117 (error) Mandatory instruction '%s' may not be cancelled.

## DESCRIPTION

The IEEE 1149.1 JTAG Standard requires the following mandatory instructions:

- BYPASS,
- SAMPLE/PRELOAD
- EXTEST.

If a Device Identification (ID) Register is part of the JTAG logic, then IDCODE is also mandatory.

The first three instructions will *always* be included in the set of instructions "understood" by the synthesized JTAG instruction decode logic. If you request an ID register, you must include the fourth instruction, IDCODE. An error message will appear if you attempt to cancel any one of these instructions.

## WHAT NEXT

# UIT-118 (error) JTAG insertion terminated abnormally.

## DESCRIPTION

Anytime DFT Compiler encounters a fatal designer JTAG specification error after **insert\_jtag** has been invoked, an error message identifying the problems appears and DFT Compiler executes a graceful abnormal termination of JTAG synthesis. Any changes to the design resulting from execution of **insert\_jtag** are eliminated.

Fatal designer JTAG specification errors include encountering a three-state cell controlling a port which is not at the top level of the design (see **UIT-119**) ; and JTAG component library not found (see **TEST-234**).

## WHAT NEXT

Identify and correct the cause of the abnormal termination and reinvoke **insert\_jtag**.

# UIT-119 (error) Three-state cell ‘%s’ controlling port(s) in the JTAG Boundary Scan Register not at the top level of the design.

## DESCRIPTION

Up to three Boundary Scan Register (BSR) cells can be associated with each port of the design. A simple input port has a single BSR input cell associated with it. If it is a two state output, an output port will have one BSR cell associated with it. If it is a three-state output, it will have two BSR cells associated with it. A bidirectional port can have three BSR cells associated with it (input, output and control BSR cells). When DFT Compiler inserts boundary scan cells for three-state ports into the design, it determines their location by locating the data and control inputs to generic three-state devices.

Whether or not you want to group all system logic into a level of (core) hierarchy, you must ensure that the three-state devices controlling the behavior of any ports are visible at the top level of the core hierarchy. This is necessary for pad optimization since three-states can be absorbed into a pad.

The following script fragment demonstrates this:

```
dc_shell> read -f lsi AMPM.NET
 /* get the top level design */
 dc_shell> current_design = DESIGN
```

```

/
* need to separate any top level port three_state control cells from the core.
 In this case they are buried in sub-modules U6 and U7 */
dc_shell> ungroup {U6 U7}

/* group the core logic with the exception of the 6 three-state cells */
dc_shell> group -design_name CORE -except
{U6/UU2 U6/UU3 U6/UU4 U7/UU4 U7/UU5 U7/UU6} -cell_name AMPM

/* need to set port_is_pad to do pad insertion */
dc_shell> set_port_is_pad find (port, "*")

dc_shell> insert_jtag

```

This error message results when DFT Compiler encounters a three-state cell controlling a port which is not at the top level of the design. The complete hierarchical name of the offending cell is reported in the error message. DFT Compiler then gracefully aborts JTAG insertion.

## WHAT NEXT

Bring the offending three-state cell to the top level as shown in the script fragment above to eliminate this error.

**UIT-120 (warning) -no\_asynchronous\_reset option invoked but port '%s' with jtag\_trst attribute found.**

**Port '%s' will NOT be included in the JTAG Boundary Scan Register (BSR).**

## DESCRIPTION

The JTAG Test Access Port (TAP) provides the test interface in JTAG mode between the chip and the outside world. It includes the three mandatory input ports (test data in **TDI**, test mode select **TMS**, and test clock **TCK**) and one optional input (test reset **TRST\***). It also includes a single output port (test data out **TDO**).

The active-LOW asynchronous reset signal, if present, provides asynchronous initialization of the TAP controller and other JTAG test logic in the circuit. In the absense of the **TRST\*** signal, the TAP controller will synchronously enter the *Test-Logic-Reset* controller state following five rising edges of **TCK**, provided **TMS** is held high.

If none of the TAP I/O ports exist, the mandatory ports will be automatically generated. By default, the JTAG logic will be synthesized with an asynchronous reset. The optional **TRST\*** port will not be generated if requested using **insert\_jtag**

**-no\_asynchronous\_reset**. If however, the **TRST\*** port already exists, and it has been identified using **set\_signal\_type "jtag\_trst"** with **insert\_jtag -no\_asynchronous\_reset** invoked, this warning message is generated to flag the apparent discrepancy in designer intent.

## WHAT NEXT

Determine whether an asynchronous reset of the TAP controller is desired and act accordingly. If you want the port with the **jtag\_trst** attribute included in the BSR, remove this attribute using **remove\_attribute jtag\_trst port\_name**.

# UIT-121 (error) Erroneous JTAG Manufacturer ID Number '%d'.

## DESCRIPTION

The JTAG Device Identification Register (IDreg) is permanently loaded with a 32-bit number comprised of the JEDEC chip ID number, the design version number, and the manufacturer ID number.

Since the JTAG Device Identification register has a fixed size with four fixed-size fields, legal values for these fields must fall within the specified ranges. If DFT Compiler encounters an illegal value for the manufacturer ID field, this error message is generated along with error message UIT-124 specifying the erroneous value and the range of legal values.

## WHAT NEXT

Enter a legal *integer* for *integer\_in\_range\_0\_to\_2047* where **0 <= integer <= 2407** when executing **set\_jtag\_manufacturer\_id** (see UIT-124).

# UIT-122 (error) Erroneous JTAG Part Number '%d'.

## DESCRIPTION

The JTAG Device Identification Register (IDreg) is permanently loaded with a 32-bit number comprised of the JEDEC chip ID number, the design version number, and the manufacturer ID number.

Since the JTAG Device Identification register has a fixed size with four fixed-size fields, legal values for these fields must fall within the specified ranges. If DFT Compiler encounters an illegal value for the part number field, this error message is generated along with error message UIT-124 specifying the erroneous value and the range of legal values.

## WHAT NEXT

Enter a legal *integer* for *integer\_in\_range\_0\_to\_65535* where **0 <= integer <= 65535** when executing **set\_jtag\_part\_number** (see UIT-124).

## UIT-123 (error) Erroneous JTAG Version Number '%d'.

### DESCRIPTION

The JTAG Device Identification Register (IDreg) is permanently loaded with a 32-bit number comprised of the JEDEC chip ID number, the design version number, and the manufacturer ID number.

Since the JTAG Device Identification register has a fixed size with four fixed-size fields, legal values for these fields must fall within the specified ranges. If DFT Compiler encounters an illegal value for the design version field, this error message is generated along with error message UIT-124 specifying the erroneous value and the range of legal values.

## WHAT NEXT

Enter a legal *integer* for *integer\_in\_range\_0\_to\_15* where **0 <= integer <= 15** when executing **set\_jtag\_version\_number** (see UIT-124).

## UIT-124 (information) Number out of legal range. (Must be between %d and %d inclusively.)

### DESCRIPTION

Since the JTAG Device Identification register has a fixed size with four fixed-size fields, legal values for these fields must fall within the specified ranges. Legal values for these ranges are specified as non-negative integers within the inclusive range specified in the error message.

## WHAT NEXT

Enter a legal *integer* for *integer\_in\_range\_X\_to\_Y* where **X <= integer <= Y** when executing **set\_jtag\_version\_number**, **set\_jtag\_part\_number** or **set\_jtag\_manufacturer\_id**. The erroneous field is identified by the previous error message (see UIT-121, UIT-122 or UIT-123).

## UIT-125 (warning) -cancel mode should be invoked with

**instruction name only.  
(Other arguments will be ignored.)**

## **DESCRIPTION**

Any non-mandatory instruction may be removed from the set of instructions "understood" by the synthesized JTAG instruction decode logic by executing **set\_jtag\_instruction instruction\_name [-cancel]**.

It is sufficient to supply *instruction\_name* to identify which instruction to cancel, so the existence of other arguments to **set\_jtag\_instruction** is ignored when **[-cancel]** is included.

## **WHAT NEXT**

To eliminate this warning, remove the superfluous arguments when executing **[-cancel]**.

**UIT-126 (error) '0000111111' (127) is an illegal Manufacturer ID when used in JTAG ID registers.**

## **DESCRIPTION**

The JTAG Device Identification Register (IDreg) is permanently loaded with a 32-bit number comprising the JEDEC chip ID number, the design version number, and the manufacturer ID number.

With respect to the manufacturer number, Rule 11.2.1(b) of the IEEE 1149.1 standard specifies that "0000111111 shall not be used in components that are otherwise compatible with this standard."

DFT Compiler generates this error message if this number is illegally defined using **set\_jtag\_manufacturer\_id integer\_in\_range\_0\_to2047 [list\_of\_designs]**.

## **WHAT NEXT**

Enter another manufacturer number using **set\_jtag\_manufacturer\_id integer\_in\_range\_0\_to2047 [list\_of\_designs]**. If you require (integer) 127 as the manufacturer ID number, enter (integer) 0 and manually rewire the code into the IDreg.

# UIT-127 (error) Direction of pin '%s' is erroneous.

## DESCRIPTION

You may want to control and access core test structures that DFT Compiler is unable to recognize automatically. For example, you may want to activate a RAM test, capture a response from that test structure, and shift it out through TDO.

To support such a scenario, two or three "hooks" are required:

*enable\_pin*(input)- the existence of an activation signal enabled by the associated JTAG instruction

*load\_pin*(input)- optional connection to TDI of the serial input of the core test structure data register

*capture\_pin*(output)- a dedicated MUX input for selecting this data register as the source of TDO output.

You need to select this latter MUX input when the associated JTAG instruction is active. Specify the existence of these "hooks" with the command **set\_jtag\_instruction instruction\_name [-code code] -reg\_coordinates capture\_pin [load\_pin] reg\_enable enable\_pin**. If you specify *capture\_pin*, *load\_pin* and *enable\_pin*, the inputs will be connected to the appropriate synthesized JTAG instruction control logic.

Note that if you specified **-reg\_coordinates**, the *capture\_pin* is mandatory and the *load\_pin* is optional. Test compiler checks that the specified pins are of the correct direction, and issues this error message if a pin has an erroneous direction.

If you do not specify the *enable\_pin* and *capture\_pin*, the result is a synthesis of all the necessary JTAG instruction decode and control logic as well as the creation of two new (bogus) ports connected to the design; an input port named "<instruction\_name>CAPTURE" and an output port named "<instruction\_name>ENABLE". The port <instruction\_name>ENABLE is active HIGH when *instruction\_name* is loaded into the JTAG Instruction Register (IR). You can then manually edit the circuit to connect these two (bogus) ports to the appropriate input and output pins of the target core test structure (thus "removing" them as ports).

## WHAT NEXT

If the specified pin direction is erroneous, then this is not the correct pin for this signal. Verify the design to identify to correct pin.

# UIT-128 (error) Port '%s' must have pad attribute set.

## DESCRIPTION

The JTAG Boundary Scan Register (BSR) associates a register with each pad of a device which can be used to either 'capture' (observe) the value at the pad and/or

'apply' (control) a value at the pad distinct from the value applied externally or internally. These registers are serially chained to form the BSR from which their values may be serially set and read.

Since the BSR only includes design ports which will eventually have pads associated with them (that is, *not* module ports internal to the final top level design), DFT Compiler only considers ports which have been designated as requiring pads as candidates for inclusion in the BSR. At least one port must be specified as requiring a pad, since the BSR must have at least one element.

DFT Compiler will generate this error if a port processed by **set\_jtag\_port** (or any other command processing ports to be included in the BSR) does not have its **port\_is\_pad** attribute set.

## WHAT NEXT

Set the **port\_is\_pad** attribute using the **set\_port\_is\_pad** command on each port to be considered for inclusion in the BSR. Note that this does not automatically mean that the port *will* be included in the BSR. For example, if a JTAG TAP port has the **port\_is\_pad** attribute set TRUE, it will nonetheless be excluded from the BSR.

One easy way to specify ports as pads is to execute **set\_port\_is\_pad find (port,"")** on the current\_design.

# UIT-129 (warning) -default should be invoked alone. (Other arguments will be ignored.)

## DESCRIPTION

Many of the dc\_shell JTAG commands include a **-default** argument which resets the specified JTAG settings to their default values. The **-default** argument overrides all other arguments so it should be invoked alone. This error message results from specification of **-default** with other arguments.

## WHAT NEXT

Remove the conflicting arguments and reexecute the command.

# UIT-130 (error) No options specified for the "%s" command. For available options, execute "%s -help".

## DESCRIPTION

You must specify at least one optional argument with this command. This error message is generated when no options are specified with the command, and when the

command is invoked with the **-help** option.

## WHAT NEXT

Invoke the command with the **-help** option to review the correct command syntax. Then, re-execute the command, using one of the optional arguments on the command line.

# UIT-131 (error) JTAG Port '%s' is not an input or bidirectional port.

## DESCRIPTION

Only input or bidirectional ports can take the */in* specifier. There are no input BSR cells associated with an output port. Thus, *<output\_port\_name>/in* is an illegal BSR cell identifier.

In *set\_jtag\_port\_routing\_order*, the *ordered\_list\_of\_annotated\_BSR\_port\_names* contains members of four classes:

- *<input\_or\_output\_port\_name>*, which specifies a BSR input or output cell (depending on the direction of the port),
- *<bidirectional\_port\_name>/in*, which specifies the BSR input cell associated with this bidirectional port,
- *<bidirectional\_port\_name>/out*, which specifies the BSR output cell associated with this bidirectional port, or
- *<tristate\_or\_bidirectional\_port\_name>/ctl*, which specifies the BSR three-state control cell associated with this output or bidirectional port.

Thus there are only three legal specifiers ('/in', '/out' or '/ctl') that can be appended to a *port\_name* to identify a boundary scan register (BSR) cell. Each of these specifiers can only be associated with a subset of the port types (input, two-state output, three-state output and bidirectional ports) that can be included in the BSR.

DFT Compiler generates this message if you associate a non-existent boundary scan register (BSR) cell type ('/in', '/out' or '/ctl') with a port. DFT Compiler also generates UIT-138, which identifies the nature of the problem.

## WHAT NEXT

An illegal specifier for *output\_port\_name* indicates that a port of that type does not have a BSR input cell associated with it. Therefore, either delete this reference to a non-existent BSR input cell or correct the reference to an existing BSR cell by correcting *output\_port\_name*.

(See UIT-138)

## UIT-132 (error) JTAG Port '%s' is not an output or bidirectional port.

### DESCRIPTION

Only output or bidirectional ports can take the `/out` specifier. There are no output BSR cells associated with an input port. Thus, `<input_port_name>/out` is an illegal BSR cell identifier.

In `set_jtag_port_routing_order`, the `ordered_list_of_annotated_BSR_port_names` contains members of four classes:

- `<input_or_output_port_name>`, which specifies a BSR input or output cell (depending on the direction of the port),
- `<bidirectional_port_name>/in`, which specifies the BSR input cell associated with this bidirectional port,
- `<bidirectional_port_name>/out`, which specifies the BSR output cell associated with this bidirectional port, or
- `<tristate_or_bidirectional_port_name>/ctl`, which specifies the BSR three-state control cell associated with this output or bidirectional port.

Thus there are only three legal specifiers ('`/in`', '`/out`' or '`/ctl`') that can be appended to a `port_name` to identify a boundary scan register (BSR) cell. Each of these specifiers can only be associated with a subset of the port types (input, two-state output, three-state output and bidirectional ports) that can be included in the BSR.

DFT Compiler generates this message if you associate a non-existent boundary scan register (BSR) cell type ('`/in`', '`/out`' or '`/ctl`') with a port. DFT Compiler also generates UIT-138, which identifies the nature of the problem.

### WHAT NEXT

An illegal specifier for `input_port_name` indicates that a port of that type does not have a BSR output cell associated with it. Therefore, either delete this reference to a non-existent BSR output cell or correct the reference to an existing BSR cell by correcting `input_port_name`.

(See UIT-138)

# UIT-133 (error) JTAG Port '%s' is not three-stated.

## DESCRIPTION

Only three-state ports can take the `/ctl` specifier. There are no control BSR cells associated with an input or a two-state output port. Thus, `<two_state_input_or_output_port_name>/ctl` is an illegal BSR cell identifier.

In `set_jtag_port_routing_order`, the `ordered_list_of_annotated_BSR_port_names` contains members of four classes:

- `<input_or_output_port_name>`, which specifies a BSR input or output cell (depending on the direction of the port),
- `<bidirectional_port_name>/in`, which specifies the BSR input cell associated with this bidirectional port,
- `<bidirectional_port_name>/out`, which specifies the BSR output cell associated with this bidirectional port, or
- `<tristate_or_bidirectional_port_name>/ctl`, which specifies the BSR three-state control cell associated with this output or bidirectional port.

Thus there are only three legal specifiers ('`/in`', '`/out`' or '`/ctl`') that can be appended to a `port_name` to identify a boundary scan register (BSR) cell. Each of these specifiers can only be associated with a subset of the port types (input, two-state output, three-state output and bidirectional ports) that can be included in the BSR.

NOTE that even when a port is in fact three-stated, if the three-state is not visible at the top level of the core hierarchy, this error message may be generated and must be resolved. DFT Compiler determines whether a port is three-stated by checking for three-states at the top level of hierarchy. If it does not find them there, it assumes that the port is not three-stated and issues this error message when an operation requiring a three-stated port is invoked.

## WHAT NEXT

An illegal specifier for `two_state_port_name` indicates that a port of that type does not have a BSR control cell associated with it. Therefore, either delete this reference to a non-existent BSR control cell or correct the reference to an existing BSR cell by attaching the `/ctl` specifier to the correct `three-state_or_bidirectional_port_name`.

If the offending port is in fact three-stated, you must regroup your core logic so that the three-state controlling this port is visible at the top level.

(See UIT-138)

**UIT-134 (error) Insufficient information included with user-specified instruction '%s'. You must include either a register name or both reg\_coordinate(s) and reg\_enable specifications.**

## DESCRIPTION

Each JTAG instruction activates a single target data register. The target register of a user-defined instruction is (by definition) not specified in the IEEE 1149.1 JTAG Standard. Therefore that target register cannot be inferred by DFT Compiler, and you must identify it by using either `-reg_name core_scan_chain_name` or `-reg_coordinates capture_pin [load_pin]` and `-reg-enable enable_pin`.

This message is also generated if you only partially identify the data register by using only one of the two options `-reg_coordinates capture_pin [load_pin]` or `-reg-enable enable_pin`. For complete identification of the target data register, you must specify both.

## WHAT NEXT

Determine what information is missing and supply it.

If you want to specify an instruction and (optionally) the code for a specific internal scan chain, execute `set_jtag_instruction instruction_name -reg_name name [-code code]`.

The `name` of each internal scan chain is the name of its parallel scan-in port; that is, the port which has the `test_scan_in` attribute assigned to it. This guarantees the uniqueness of names for these scan chains and provides DFT Compiler with a mechanism to identify each target scan chain.

If you want to specify some other core test structure, identify it by using `-reg_coordinates capture_pin [load_pin]` and `-reg-enable enable_pin`.

[See UIT-92]

**UIT-135 (error) Instruction '%s' has illegal JTAG instruction code string '%s'.**  
(The code string must contain only '0's and '1's.)

## DESCRIPTION

JTAG instruction codes are loaded 'as is' into the JTAG Instruction register. Therefore, they must be fully specified binary codes. Code cubes (which include 'dont care' X bits) are not allowed. The only characters permitted in these code

strings are '0's and '1's.

## WHAT NEXT

Re-write the instruction code string using only '0's and '1's.

**UIT-136 (error) Incompatible arguments. Specify either a register name or both register coordinate(s) and register enable.**

## DESCRIPTION

Each JTAG instruction activates a single target data register. The target register of a user-defined instruction is (by definition) not specified in the IEEE 1149.1 JTAG Standard. Therefore that target register cannot be inferred by DFT Compiler, and you must identify it by using either `-reg_name core_scan_chain_name` or `-reg_coordinates capture_pin [load_pin]` and `-reg-enable enable_pin`.

Specifying both `-reg_name core_scan_chain_name` and `-reg_coordinates capture_pin [load_pin]` or `-reg-enable enable_pin` is not supported and generates this error message.

## WHAT NEXT

If you want to specify an instruction and (optionally) the code for a specific internal scan chain, execute `set_jtag_instruction instruction_name -reg_name name [-code code]`.

The `name` of each internal scan chain is the name of its parallel scan-in port; that is, the port which has the `test_scan_in` attribute assigned to it. This guarantees the uniqueness of names for these scan chains and provides DFT Compiler with a mechanism to identify each target scan chain.

If you want to specify some other core test structure, identify it by using `-reg_coordinates capture_pin [load_pin]` and `-reg-enable enable_pin`.

**UIT-137 (error) Instruction Register (IR) must be between 2 and 32 bits wide.**

## DESCRIPTION

The IEEE 1149.1 JTAG Standard mandates that the JTAG Instruction Register (IR) be at least two bits wide. DFT Compiler supports IRs of between 2 and 32 bits inclusively. There are three ways to set the size of the IR:

- You specify the size using `insert_jtag_ir_size bit_width`,
- You force the IR size by specifying an instruction code `set_jtag_instruction_code "code"`, or
- DFT Compiler automatically infers the IR size from the set of specified and mandatory instructions selected.

## POSSIBLE CAUSES

This error occurs if you have *not* surrounded your specified code in quotes (" "). In the absence of quotes, the command line parser interprets the first character as an independent string and assumes that a 1-bit code has been specified, forcing a 1-bit IR.

## WHAT NEXT

Specify an IR width between 2 and 32 bits. If you forgot the quotes in your `set_jtag_instruction` command, re-issue the command with quotes around the code.

## UIT-138 (error) Non-existent BSR '%s' cell with routing position '%d' associated with port '%s'.

### DESCRIPTION

In `set_jtag_port_routing_order`, the `ordered_list_of_annotated_BSR_port_names` contains members of four classes:

- `<input_or_output_port_name>`, which specifies a BSR input or output cell (depending on the direction of the port),
- `<bidirectional_port_name>/in`, which specifies the BSR input cell associated with this bidirectional port,
- `<bidirectional_port_name>/out`, which specifies the BSR output cell associated with this bidirectional port, or
- `<tristate_or_bidirectional_port_name>/ctl`, which specifies the BSR three-state control cell associated with this output or bidirectional port.

Thus there are only three legal specifiers ('/in', '/out' or '/ctl') that can be appended to a `port_name` to identify a boundary scan register (BSR) cell. Each of these specifiers can only be associated with a subset of the port types (input, two-state output, three-state output and bidirectional ports) that can be included in the BSR.

DFT Compiler generates this message if you associate a non-existent boundary scan register (BSR) cell type ('/in', '/out' or '/ctl') with a port. DFT Compiler also generates a message (UIT-131, UIT-132 or UIT-133) that tells you why the specifier you used is illegal.

## WHAT NEXT

An illegal specifier for a port indicates that that type of port does not have that type of BSR cell associated with it. Therefore, either delete this reference to a non-existent BSR cell or correct the reference to an existing BSR cell by correcting the associated *port\_name*.

(See UIT-131, UIT-132 or UIT-133)

## UIT-139 (error) -no\_internal\_scan invoked but instruction '%s' specifies core scan chain '%s'.

### DESCRIPTION

If you want to specify an instruction and (optionally) the code for a specific internal scan chain, execute *set\_jtag\_instruction instruction\_name -reg\_name name [-code code]*.

The *name* of each internal scan chain is the name of its parallel scan-in port; that is, the port which has the *test\_scan\_in* attribute assigned to it. This guarantees the uniqueness of names for these scan chains and provides DFT Compiler with a mechanism for identifying each target scan chain.

By default DFT Compiler will attach core test structures that it recognizes (e.g. internal scan chains) to the JTAG Test Access Port (TAP). Internal scan chains will not be connected to the TAP if you execute *insert\_jtag -no\_internal\_scan*.

DFT Compiler generates this error message if *-no\_internal\_scan* has been invoked, but you have explicitly specified a JTAG instruction for one of the internal scan chains using *set\_jtag\_instruction instruction\_name -reg\_name name [-code code]*.

## WHAT NEXT

Resolve the conflict. If you want to cancel the scan chain instruction, execute *set\_jtag\_instruction instruction\_name -cancel*. Otherwise invoke *insert\_jtag* without *-no\_internal\_scan*.

## UIT-140 (warning) The DFT Compiler specific JTAG instruction '%s' does not support register name or coordinate specification.

# Specifications ignored.

## DESCRIPTION

It is meaningless to specify `-reg_name`, `-reg_coordinates`, or `-reg_enable` with the `DAISY_CORE_SCAN` instruction. Doing so results in this error message.

The `DAISY_CORE_SCAN` instruction selects a single scan chain made up of all internal scan chains daisy-chained together. To assign a specific code to this instruction, issue the command `set_jtag_instruction DAISY_CORE_SCAN -code code`. This is equivalent to executing `insert_jtag -daisy_chained`, so you do not need to invoke `-daisy_chained` explicitly, UNLESS you want to specify the routing order of the serially daisy-chained scan chains.

## WHAT NEXT

Re-invoke `set_jtag_instruction DAISY_CORE_SCAN -code code` without the `-reg_name`, `-reg_coordinates`, and/or `-reg_enable` specifications.

# UIT-141 (error) Bad model scale factor, must be positive.

## DESCRIPTION

For the command, `set_model_scale`, the scale value must be positive. You have entered a zero or negative number.

## WHAT NEXT

Reenter the command with a positive scale factor.

# UIT-142 (error) Bad model load value, should not be negative.

## DESCRIPTION

For the command, `set_model_load`, the load value cannot be negative. You have entered a negative number.

## WHAT NEXT

Reenter the command with a non-negative load value.

## **UIT-143 (error) Bad model drive value, should not be negative.**

### **DESCRIPTION**

For the command, `set_model_drive`, the drive value cannot be negative. You have entered a negative number.

### **WHAT NEXT**

Reenter the command with a non-negative drive value.

## **UIT-144 (warning) Port '%s/%s' is not an input or inout port; model\_drive not set.**

### **DESCRIPTION**

The `set_model_drive` command works only on input or inout ports.

### **WHAT NEXT**

Examine the design to determine the correct ports for the command.

## **UIT-145 (error) Erroneous specification of a list of ports since set\_jtag\_implementation has not been invoked with a Boundary Scan Register (BSR) component.**

### **DESCRIPTION**

`set_jtag_implementation` only supports a `list_of_ports` when invoked with Boundary Scan Register (BSR) components (`BSRin`, `BSRout` or `BSRcontrol`), associating a JTAG component implementation of a BSR cell with specific ports in the BSR. A port list is meaningless with respect to the JTAG TAP controller, Bypass Register, Instruction Register or device Identification Register.

### **WHAT NEXT**

Resolve the inconsistency either by removing the `list_of_ports`, or by specifying a BSR cell component.

## **UIT-146 (error) Three-state cell '%s' (technology library cell '%s') is dont\_touch.**

### **DESCRIPTION**

For successful JTAG synthesis, DFT Compiler requires that all three-state devices associated with circuit I/O be at the top level of the design. When DFT Compiler inserts boundary scan cells for three-state ports into the design, it determines their location by locating the data and control inputs to the associated generic three-state devices. In order to translate a three-state device into its generic equivalent, the original three-state device must *not* have its **dont\_touch** attribute set **TRUE**. If it is ' set **TRUE**, this error message is generated.

There are two ways that a device can have its **dont\_touch** attribute set **TRUE**; the user can explicitly set the attribute, or the technology library cell with which the device is implemented may specify that the device should not be touched.

### **WHAT NEXT**

Remove the **dont\_touch** attribute associated with the offending three-state device.

## **UIT-147 (error) Invalid sample percentage value '%d'.**

### **DESCRIPTION**

The **-sample** option of the command **create\_test\_patterns** specifies the percentage of faults to be considered for test generation.

### **WHAT NEXT**

The value of this option should be in the 0-100 range.

## **UIT-149 (Information) The set\_jtag\_part\_number command is overriding the environmental variable "jtag\_part\_number" value '%d' by '%d'.**

### **DESCRIPTION**

It is possible to specify the value of the 16-bit binary part number field of the JTAG ID register in two ways: using the **set\_jtag\_part\_number** command or using the

environmental variable `jtag_part_number`. This message indicates that the value set by `set_jtag_part_number` is overriding the default value set by `jtag_part_number`.

## WHAT NEXT

Using environmental variables for those JTAG synthesis constraints that rarely change in your synthesis environment reduces the number of explicit JTAG synthesis commands you must invoke.

**UIT-150 (Information)** The `set_jtag_manufacturer_id` command is overriding the environmental variable "jtag\_manufacturer\_id\_number" value '%d' by '%d'.

## DESCRIPTION

There are two ways to specify the value of the 11-bit binary manufacturer ID field of the JTAG ID register: by using the `set_jtag_manufacturer_id` command, or by using the environmental variable `jtag_manufacturer_id_number`. This message indicates that the default value set by the latter is being overridden by the value specified by the former.

## WHAT NEXT

To reduce the number of explicit JTAG synthesis commands you must invoke, use environmental variables for those JTAG synthesis constraints that rarely change in your synthesis environment.

**UIT-151 (Information)** The `set_jtag_version_number` command is overriding the environmental variable "jtag\_version\_number" value '%d' by '%d'.

## DESCRIPTION

There are two ways to define the value of the 4-bit binary version number field of the JTAG ID register: by using the `set_jtag_version_number` command, or by using the environmental variable `jtag_version_number`. This message indicates that the default value set by the latter is being overridden by the value defined by the former.

## WHAT NEXT

To reduce the number of explicit JTAG synthesis commands you must invoke, use environmental variables for those JTAG synthesis constraints that rarely change in your synthesis environment.

**UIT-152a (warning)** The '%s' command is ignored. Either a '%s' license or '%s' license is required for this command.

## DESCRIPTION

You receive this warning message as a result of the `write_test` command. To run this command, you must have either the Test-Compiler license or the Test-IEEE-Std-1149-1 license.

## WHAT NEXT

Verify that your installation is correct and that you are authorized for this license feature. If you are not authorized for this feature, contact Synopsys.

## SEE ALSO

`write_test` (2).

**UIT-152 (warning)** The '%s' command is ignored. A '%s' license is required for this command.

## DESCRIPTION

Some dc\_shell commands require specific licenses. This error may occur when the required feature is not authorized.

## WHAT NEXT

Make sure your installation is correct and that you are supposed to be authorized for this license feature.

**UIT-153 (error)** The sum of strobe time (%10.2f) and strobe width value (%10.2f) is required to be less than period value

(%10.2f).

## DESCRIPTION

You have specified a strobe time and strobe width value such that the end of the strobe period stretches beyond the period.

## WHAT NEXT

Check your strobe time specifications.

## UIT-154 (error) Unable to fault-simulate vectors because %s.

## DESCRIPTION

The current vectors could not be fault-simulated, either because the test protocol is not parallel-loadable, or because the **vdb** file was not created by a v3.1 or later version of ATPG.

During fault simulation of **vdb** files, scan operations are performed in a parallel-load fashion. Thus, fault simulation of **vdb** files is restricted to parallel-loadable protocols only. Currently, custom test protocols are NOT parallel-loadable. Initialization protocols read with the **read\_init\_protocol** command are acceptable.

Only **vdb** files written by v3.1 (or later) ATPG can be directly fault-simulated by TestSim; **vdb** files written by TestSim itself cannot be directly fault-simulated by TestSim.

## WHAT NEXT

If you have a **vdb** file with vectors that are not parallel-loadable, you can use the **write\_test** command to write these vectors out into a *tds* or a *wgl* vector format and then fault-simulate that *tds* or *wgl* file. The *wgl* format is preferable because its vector file is usually smaller in size. Note, however, that if you simulate a scan vector set in a serial format such as *tds* or *wgl*, then fault simulation of scan operations will be serial and therefore considerably slower.

If you got this message because your **vdb** file was created by a previous release version of ATPG, then you will need to create a new **vdb** file or write out the vectors to *tds* or *wgl* as suggested above.

## UIT-155 (error) write\_test could not find the intermediate (SIF)

file to be formatted.

## **DESCRIPTION**

Write\_test formatter executable could not find the required input file (SIF file) to be formatted. The file may be deleted accidentally from the directory where this program is being run or it may not have been created due to errors such as not enough disc space to write vector file, occurring during write\_test.

## **WHAT NEXT**

Re-run write\_test after ensuring that you have enough disk space

## **UIT-156 (error) write\_test failed to open temporary file to be used during vector formatting.**

## **DESCRIPTION**

Write\_test could not open temporary file(s) needed during the vector formatting process. This may be caused by lack of write permission to the directory, or failure due to insufficient disc space to write the file(s).

## **WHAT NEXT**

Make sure that there is sufficient disc space, and that all the right permissions are set.

## **UIT-157 (error) Insufficient memory, write\_test failed to format vectors.**

## **DESCRIPTION**

Write\_test ran out of run-time memory during vector formatting.

## **WHAT NEXT**

Ensure that sufficient memory is available.

## **UIT-158 (error) internal error, write\_test formatter executable**

## (stran) failed due to syntax error in input (SIF) file.

### DESCRIPTION

The `write_test` formatter failed due to syntax error in the intermediate (SIF) file used as its input. The file may have been corrupted, incompletely generated (e.g. due to insufficient disc space) or have been manually tampered with

### WHAT NEXT

Re-invoke `write_test` and notice any error and warning messages issued. Report any relevant messages to Synopsys.

## UIT-159 (error) internal error, unexpected end-of-file found in input file to the `write_test` formatter executable (stran).

### DESCRIPTION

The `write_test` formatter failed due to unexpected end-of-file found in the intermediate (SIF) file used as its input. The file may have been corrupted, incompletely generated (e.g. due to insufficient disc space) or have been manually tampered with

### WHAT NEXT

Ensure that sufficient disc space is available, and that the `write_test` command does not issue any error messages.

## UIT-160 (error) Unsupported vector format '%s' specified in the -format option.

### DESCRIPTION

The vector format specified in the `-format` option of the `fault_simulate` command is not supported. Use one of the supported formats. The formats currently supported for the `fault_simulate` command are "sif", "tds", "vdb", "wgl", and "wif".

For the `prepare_testsim_vectors` command, all except the "vdb" format are supported. If you are using the "vdb" format, input this directly to the `fault_simulate` command without going through the `prepare_testsim_vectors` command.

## WHAT NEXT

Use one of the supported vector formats.

# UIT-163 (error) JTAG Port '%s' is not an input port.

## DESCRIPTION

Only input ports can take the *clock* specifier. The JTAG circuitry associated with an *input* port can be optimized based on the signal type (**clock** or **data**) of that port. Ports that drive clock trees can be associated with specialized JTAG circuitry. An input port can be explicitly identified as carrying one of the "clock" or "data" categories.

DFT Compiler generates this message if you attempt to assign an output or bidirectional port the *clock* specifier.

The only legal output port specifiers are *enable* or *data*. (See error message UIT-164.)

## WHAT NEXT

Remove all output ports from the list of ports receiving the *clock* specifier. If you are trying to specify the type of an output port, select between *enable* or *data*.

# UIT-164 (error) JTAG Port '%s' is not a two-state output port.

## DESCRIPTION

Only two-state output ports can take the *enable* specifier.

When the three-state elements driving three-state and bidirectional *outputs* are found in the core logic of the IC (i.e. not embedded in the pads themselves) DFT Compiler requires that these three-state elements be located at the top hierarchy of the core of the design so that Boundary Scan Register (BSR) cells can be placed on the **inside** of the three-state elements in order to control and observe the data and enable lines. In these cases, only a single three-state line exits the core logic.

However, in the cases where the three-state controller for output signals will be embedded in the three-state output or bidirectional input/output pad associated with these ports of a design a pair of two state signals exit the core logic; a *data* line and a *enable* line. (It does not make sense for one of these ports to be a bidirectional port.) Unless, TC knows the distinction between these two types of exit lines, it will always assume that they are data lines and not insert the correct type of BSR cell on the enable lines. By specifying "enable" or "data" on a port the designer instructs TC on which type of BSR cell to place on these output ports.

DFT Compiler generates this message if you attempt to assign an input or bidirectional port the *enable* specifier, or if you have assigned the *enable* specifier to a three-state output.

The only legal input port specifiers are *clock* or *data*. (See error message UIT-163.)

## WHAT NEXT

Remove all input ports from the list of ports receiving the *enable* specifier. If you are trying to specify the type of an input port, select between *clock* or *data*.

# UIT-165 (error) %s time (%10.2f) must be less than strobe time (%10.2f).

## DESCRIPTION

Data application time/delay must happen before strobe time

## WHAT NEXT

Change strobe time, and/or delay or bidirectional delay time such that data application time happens before strobe time, and rerun `create_test_protocol`. To set the strobe time use the `test_default_strobe` variable, and to set the bidirectional delay time use the `test_default_bidir_delay` variable.

# UIT-167 (error) Test program '%s' does not match the design '%S'.

## DESCRIPTION

This message indicates that the test program does not match the design. The design has probably been changed since the test program was written.

## WHAT NEXT

If you need to use this test program, you must change the design back to what it was when the test program was written out. Otherwise, the test program cannot be used and a new one will have to be generated.

# UIT-168 (error) Test program '%s' does not match the design

'%s'. Could not get value for port '%s' in test program. This port is present in the design.

## DESCRIPTION

This message indicates that the test program does not match the design. The design has probably been changed since the test program was written.

## WHAT NEXT

If you need to use this test program, you must change the design back to what it was when the test program was written out. Otherwise, the test program cannot be used and a new one will have to be generated.

# UIT-169 (Error) No port has been specified.

## DESCRIPTION

The `set_dft_signal` command allows design objects to specify ports. The port specification is mandatory.

## WHAT NEXT

Specify a port with the `-port` option and re-issue the command

# UIT-170 (error) Value '%s' is not supported for the `clock_gating` option.

Use either '`entire_design`' or '`leaf_cell`' as values.

## DESCRIPTION

The `clock_gating` option currently supports the options `entire_design` and `leaf_cell`.

The default behavior if the `clock_gating` option is not specified is to do entire design clock gating.

## WHAT NEXT

Specify either `entire_design` and `leaf_cell` as values for the `clock_gating` option.

## **UIT-171 (error) The test program sequence contained in the test program '%s' does not match the expected test program sequence.**

### **DESCRIPTION**

The test program sequence information contained in the test program specified in this error message is incorrect. It does not match the test program sequence information that was expected. The expected test program sequence information was based on the information in the test program that was input to this 'write\_test' command.

This will happen when the original vdb file for the test program specified in this error message was overwritten by a later fault processor run.

When you lose or corrupt a vdb file for a test program, all test programs which depended on this test program (i.e. all test programs which were after it in the same sequence) are also invalidated.

### **WHAT NEXT**

Recreate the test program which is in error. You may have to also regenerate all test programs in the sequence following this test program.

## **UIT-172 (information) Formatting of test vectors was successful for test program '%s'.**

### **DESCRIPTION**

You receive this message when you use the **-cumulative** option in a multi-pass test (**multi\_pass\_test\_generation** set to **true**) after **write\_test** successfully formats each test program.

### **WHAT NEXT**

No action is required on your part.

## **UIT-173 (warning) Formatting of test vectors failed for test**

program '%s'.

## DESCRIPTION

This message indicates that a serious error occurred while **write\_test** was processing your patterns. **write\_test** has failed to save your patterns in the format you requested. Earlier messages will give you details of the specific problems encountered by **write\_test**.

## WHAT NEXT

Review previous error messages in the transcript and take the appropriate action based on those messages. See the man pages for the previous messages if you need more details on what action to take.

**UIT-174 (warning)** You cannot use the **-output** option with the **-cumulative** option.

The **-output** option will be ignored.

## DESCRIPTION

You receive this message when you attempt to use both the **-cummulative** and **-output** options in a multi-pass test (**multi\_pass\_test\_generation** set to *true*). You cannot set both options because when you use the **-cummulative** option, you are writing out more than one file. The **-output** option specifies only one filename.

The **write\_test** command ignores the **-output** option and will write out more than one file.

## WHAT NEXT

To avoid this violation, change your script so you do not use the **-cummulative** and **-output** options simultaneously.

If you wish to format your patterns into a single file, you must use single pass test generation.

## SEE ALSO

**create\_test\_patterns** (2), **write\_test** (2).

**UIT-177 (warning)** You cannot use the **-all** option as well as

specify the object list with the **set\_test\_unmask\_fault** command.

The **-all** option wins. All faults in the entire design will be unmasked.

## DESCRIPTION

You receive this message if specify both an object list and the **-all** option for the **set\_test\_unmask\_fault** command. For example:

```
dc_shell> set_test_unmask_fault U1 -all
```

Object list and the **-all** option are mutually exclusive. The message warns you that the **set\_test\_unmask\_fault** command has honored the **-all** option and ignored object list.

## WHAT NEXT

If you intend to unmask all faults, no action is required on your part. However, you can prevent future occurrences of this error message by removing the object list.

If you intended to unmask only those faults specified by the object list, you need to re-establish fault masking on the faults you wish to mask. Use the **set\_test\_mask\_fault** command to do this. Or, if you are using a script, you can correct and rerun the script.

**UIT-178 (error)** You must either use the **-all** option or specify the object list with the **set\_test\_unmask\_fault** command.

## DESCRIPTION

You receive this message if you do not specify either an object list or the **-all** option. The following command will result in this error message:

```
dc_shell> set_test_unmask_fault -sa1
```

You must specify either the **-all** option or an object list to identify which masked faults you wish to unmask.

## WHAT NEXT

Issue the **set\_test\_unmask\_fault** command with either an object list or the **-all** option specified.

## **UIT-184 (error) JTAG instruction '%s' not yet declared, so it cannot be cancelled.**

### **DESCRIPTION**

An instruction may not be deleted from the specification of the Boundary Scan Instruction Register instruction set, if it has not previously been added to that set.

In other words, `set_jtag_instruction <instruction_name> -cancel` may not be invoked if `set_jtag_instruction <instruction_name>` has not been previously invoked.

### **WHAT NEXT**

Remove this call to cancel the instruction from your script as it is effects no useful operation.

## **UIT-186 (error) Illegal IDDQ fault model '%s'. Choose between 'shorts' and 'toggle'.**

### **DESCRIPTION**

The IDDQ fault model specified in the `-fault_model_iddq` option of the `fault_simulate` command is not supported. The IDDQ fault models currently supported are `shorts`, which targets transistor shorts and models 6 shorts per transistor; and `toggle`, which targets node toggle coverage.

### **WHAT NEXT**

Reissue `fault_simulate` and specify either of the valid fault models `shorts` or `toggle` for the `-fault_model_iddq` option.

## **UIT-189 (error) Can't write output vdb file '%s'.**

### **DESCRIPTION**

This message indicates that the output `vdb` file cannot be written, because a file of the same name already exists and is protected from being overwritten.

### **WHAT NEXT**

Use a different name for the output test program, or remove the write protection

from the existing **vdb** file so that it can be overwritten. Then re-execute.

## **UIT-191 (error) '%s' is not a known clock domain restriction.**

### **DESCRIPTION**

The `set_scan_configuration` command accepts a `clock_domains` option. This tells DFT Compiler how to define clock domains. Option arguments must be known restrictions.

### **WHAT NEXT**

Replace the option argument with a known restriction, for example `"no_mix"`, `"mix_edges"`, or `"mix_clocks"`.

## **UIT-192 (error) '%s' is not a known clock gating technique.**

### **DESCRIPTION**

The `set_scan_configuration` command accepts a `clock_gating` option. When a partial scan methodology and a multiplexed flip flop scan style is chosen, this tells DFT Compiler what technique to use to gate the clocks connected to non-scan cells. Option arguments must be known techniques.

### **WHAT NEXT**

Replace the option argument with a known technique, for example `"entire_design"`, `"superbuffer"`, or `"leaf_cell"`.

## **UIT-193 (error) Can not insert '%s' scan chains.**

### **DESCRIPTION**

The `set_scan_configuration` command accepts a `chain_count` option. This tells DFT Compiler the number of scan chains to implement in the testable design. Option arguments must be positive integers or `"default"` strings.

### **WHAT NEXT**

Repeat the `set_scan_configuration` command using a positive integer or the string `"default"`.

## **UIT-194 (error) '%s' is not a known bidirectional mode.**

### **DESCRIPTION**

The `set_scan_configuration` command accepts a `dedicated_scan_ports` option. This tells DFT Compiler whether to turn bidirectional ports inwards or outwards during scan. Arguments specified must be known bidirectional modes.

### **WHAT NEXT**

Replace the option argument with a known bidirectional mode, for example "input" or "output".

## **UIT-195 (warning) Arguments override the default script file name, but do not ask for a script. None is generated.**

### **DESCRIPTION**

You receive this message because you are overriding a default script file name, but have not asked for a script file.

When you use `preview_scan` command with the `-script` option, DFT Compiler generates a script that completely specifies the scan design. If you do not specify the `-script` option, no script is generated.

The script file has a default name that you can override by specifying a script file name.

### **WHAT NEXT**

Specify the `preview_scan` command with the `-script` option, if you want a script file. Otherwise, ignore the warning, or do request the script file name.

### **SEE ALSO**

`preview_scan` (2).

## **UIT-196 (warning) '%s' is a %s and can not be used to specify a**

scan signal port.

## DESCRIPTION

The `set_scan_signal` command allows design objects to specify ports. These must be ports. Other kinds of design objects cannot be used to specify scan signal ports, and are rejected.

## WHAT NEXT

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

**UIT-197 (warning)** '%s' is a %s and can not be used to specify a scan signal pin.

## DESCRIPTION

The `set_scan_signal` command allows design objects to specify pins. These must be pins or pin instances. Other kinds of design objects cannot be used to specify scan signal ports, and are rejected.

## WHAT NEXT

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

**UIT-198 (error)** '%s' is not a scan signal type.

## DESCRIPTION

The `set_scan_signal` command lets you associate scan signal semantics with design ports. Specified signal types must be scan signal types in `test_scan_enable`, `test_scan_enable_inverted`, `test_scan_clock`, `test_scan_clock_a`, `test_scan_clock_b`, `test_clock`, `test_scan_in`, and `test_scan_out`. Other signal types do not have scan signal semantics and are rejected.

## WHAT NEXT

Repeat the `set_scan_signal` command using a scan signal type.

## **UIT-199 (error) '%s' is not a signal type for the '%s' scan style.**

### **DESCRIPTION**

The `set_scan_signal` command lets you associate scan signal semantics with design ports. Specified signal types must be consistent with the specified scan style. Other signal types do not have scan signal semantics in the specified scan style and are rejected.

### **WHAT NEXT**

Repeat the `set_scan_signal` command using a scan signal type that has meaning in the specified scan style.

## **UIT-200 (warning) %s port '%s' can not be a %s.**

### **DESCRIPTION**

You can use the `set_scan_signal` command to put associated scan semantics with design ports. This warning is generated when you try to set the signal type of a port to something that is inconsistent with its direction. For example, signal type `test_scan_out` is associated with scan chain outputs. It cannot be associated with an input port.

### **WHAT NEXT**

Repeat the command using the correct port.

## **UIT-201 (warning) did not complete set\_signal\_type. '%s' is a %s, not a design port.**

### **DESCRIPTION**

You can use the `set_signal_type` command to put test-specific signal types on design ports. This warning is generated when you try to set the signal type of an object that is not a design port.

### **WHAT NEXT**

Repeat the command using the correct port name.

## **UIT-202 (warning) did not complete set\_signal\_type. %s port '%s' can not be a %s.**

### **DESCRIPTION**

You can use the set\_signal\_type command to put test-specific signal types on design ports. This warning is generated when you try to set the signal type of a port to something that is inconsistent with its direction. For example, signal type test\_scan\_out is associated with scan chain outputs. It cannot be associated with an in port.

### **WHAT NEXT**

Repeat the command using the correct port.

## **UIT-203 (warning) %s pin '%s' can not be a %s.**

### **DESCRIPTION**

You can use the set\_scan\_signal command to specify hookup pins for design ports that have scan semantics. This warning is generated when you try to set the hookup pin for a port to something that is inconsistent with its direction. For example, ports with signal type test\_scan\_out should be associated with output pins. They cannot be associated with input pins.

### **WHAT NEXT**

Repeat the command using the correct hookup pin.

## **UIT-204 (error) There is no valid scan port.**

### **DESCRIPTION**

You use the set\_scan\_signal command to associate scan signal semantics with design ports. You see this error when nothing you specify is a valid design port.

### **WHAT NEXT**

Study accompanying messages for the reasons why specified ports were not acceptable, and repeat the command using valid ports.

## **UIT-205 (error) No specified hookup pin is valid.**

### **DESCRIPTION**

You can use the set\_scan\_signal command to associate hookup pins with scan signal ports. You see this error when nothing you specify is a valid design pin.

### **WHAT NEXT**

Study accompanying messages for the reasons why the specified access pins were not acceptable. Repeat the command using valid pin instances.

## **UIT-206 (warning) %d scan ports have been specified. Only the first will be processed.**

### **DESCRIPTION**

You use the set\_scan\_signal command to associate scan signal semantics with design ports. You see this error when you try to specify the signal type of multiple design ports using the same command. To simplify commands and eliminate ambiguity, separate commands must be used.

### **WHAT NEXT**

Split outstanding scan port specifications among multiple commands.

## **UIT-207 (warning) %d hookup pins have been specified. Only the first will be processed.**

### **DESCRIPTION**

You can use the set\_scan\_signal command to associate hookup pins with scan signal ports. You see this warning when you try to associate more than one hookup pin with a design port. Only one can be specified.

### **WHAT NEXT**

If you want another hookup pin to be used, repeat the command specifying only that pin.

## **UIT-208 (warning) There is no scan chain called '%s'. Specification is ignored.**

### **DESCRIPTION**

You can use the set\_scan\_signal command to associate scan chains with scan signals. You see this warning when you try to associate a non-existent chain with a scan signal. Chains must already have been specified using set\_scan\_path command.

### **WHAT NEXT**

Correct the chain name, if you've made a mistake, or specify the chain using the set\_scan\_path command before repeating the specification.

## **UIT-209 (warning) %d scan ports have been specified, but access pins or scan chains have been specified also. Only the first scan port will be processed.**

### **DESCRIPTION**

You use the set\_scan\_signal command to associate scan signal semantics with design ports. You see this error when you try to specify the signal type of multiple design ports, and associate access pins of scan chains with them, using the same command. To simplify commands and eliminate ambiguity, separate commands should be used.

### **WHAT NEXT**

Split outstanding scan port specifications among multiple commands.

## **UIT-210 (error) '%s' is not a known scan link type.**

### **DESCRIPTION**

Use the set\_scan\_link command to declare scan links for the current design. Known scan link types include "wire" and "scan\_out\_lockup". You see this error when you specify an unknown scan link type.

### **WHAT NEXT**

Repeat the specification using a known scan link type.

## **UIT-211 (warning) '%s' is not a scan signal type. Discarding specified access point.**

### **DESCRIPTION**

The set\_scan\_segment command lets you specify access points with scan signal semantics. Specified signal types must be scan signal types in testdb\_scan\_enable, testdb\_scan\_enable\_inverted, testdb\_scan\_clock, testdb\_scan\_clock\_a, testdb\_scan\_clock\_b, testdb\_clock, testdb\_scan\_in, and testdb\_scan\_out. Other signal types do not have scan signal semantics and are rejected.

### **WHAT NEXT**

Repeat the set\_scan\_segment command using a scan signal type.

## **UIT-212 (warning) '%s' does not identify a design pin. Discarding specified access point.**

### **DESCRIPTION**

The set\_scan\_segment command lets you specify access points with scan signal semantics. Specified access points must identify design pins. Other kinds of design objects cannot be used to specify access points, and are rejected.

### **WHAT NEXT**

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

## **UIT-213 (warning) Access point specification is not paired. Last specification is incomplete and is discarded.**

### **DESCRIPTION**

The set\_scan\_segment command lets you specify access points with scan signal semantics. Specified access points must be pairs, where each pair includes a signal type and a design port or pin. Incomplete pairs cannot be used to specify access points, and are rejected.

## WHAT NEXT

Remove the last object from the argument list to get rid of the warning.

# UIT-214 (error) Link name '%s' identifies a design cell. Link specification creates ambiguity and is discarded.

## DESCRIPTION

The set\_scan\_link command lets you define scan links. Specified link names cannot identify design cells. Otherwise future scan chain specifications would be ambiguous.

## WHAT NEXT

Rename the scan link.

# UIT-215 (error) Segment name '%s' identifies a design cell. Specification creates ambiguity and is discarded.

## DESCRIPTION

The set\_scan\_segment command lets you define scan segments. Specified segment names cannot identify design cells. Otherwise future scan chain specifications would be ambiguous.

## WHAT NEXT

Rename the scan segment.

# UIT-216 (warning) %s pin '%s' can not be a %s.

## DESCRIPTION

You can use the set\_scan\_segment command to specify access pins for scan segment using scan semantics. This warning is generated when you try to set the access point for a segment to something that is inconsistent with its direction. For example, ports with signal type test\_scan\_out should be associated with output pins. They cannot be associated with input pins.

## WHAT NEXT

Repeat the command using the correct access pin or signal type.

# UIT-217 (error) '%s' is not a signal type for the '%s' scan style.

## DESCRIPTION

The set\_scan\_segment command lets you associate scan signal semantics with design ports and pins. Specified signal types must be consistent with the specified scan style. Other signal types do not have scan signal semantics in the specified scan style and are rejected.

## WHAT NEXT

Repeat the set\_scan\_signal command using a scan signal type that has meaning in the specified scan style.

# UIT-218 (warning) Segment access list has multiple hookup points for signal type '%s'. All but the first is discarded.

## DESCRIPTION

The set\_scan\_segment command lets you associate scan signal semantics with design ports or pins. You can associate at most one hookup point with each signal type. This message tells you that you have tried to associate more than one hookup point with a signal type, and that DFT Compiler is discarding all but the first.

## WHAT NEXT

Repeat the set\_scan\_segment command if you want to specify a different hookup point.

# UIT-219 (warning) Segment access list has multiple signal types for hookup point '%s'. All but the first is discarded.

## DESCRIPTION

The set\_scan\_segment command lets you associate scan signal semantics with design ports or pins. You can associate at most one signal type with each access point. This message tells you that you have tried to associate more than one signal type with an access point, and that DFT Compiler is discarding all but the first.

## WHAT NEXT

Repeat the `set_scan_segment` command if you want to specify a different signal type.

## UIT-220 (warning) Scan chain '%s' has scan style '%s' that differs from design scan style '%s'. Specification is ignored.

### DESCRIPTION

You can use the `set_scan_signal` command to associate scan chains with scan signals. You see this warning when you try to associate a chain that you have specified under one scan style with a scan signal you specify under another. Chains must have been specified using the same scan style.

### WHAT NEXT

Change the scan style and reapply the `set_scan_signal` command, or reapply your earlier `set_scan_path` command using the new scan style.

## UIT-221 (warning) '%s' identifies multiple pins. Discarding specified access point.

### DESCRIPTION

The `set_scan_segment` command lets you specify access points with scan signal semantics. Specified access points must identify one design pin. Wildcards cannot be used to specify access points, and are rejected.

### WHAT NEXT

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

## UIT-222 (warning) Segment '%s' does not have scan style '%s' and is not being added to the scan chain.

### DESCRIPTION

The `set_scan_path` command accepts an ordered list of design objects. These must be cells, instances, links or segments. DFT Compiler does not support scan chains with

mixed scan styles. Segments must have the same scan style as the scan chain. You cannot add segments with other scan styles to a scan chain.

## WHAT NEXT

If you really do want to add the segment to the chain, simply re-specify it using the same scan style as the chain.

# **UIT-223 (warning) '%s' is not a cell, instance, scan segment, or scan link, and is not being added to the scan chain.**

## DESCRIPTION

The set\_scan\_path command accepts an ordered list of design objects. These must be cells, instances, links or segments. Other kinds of design objects cannot be added to scan chains, and are rejected.

## WHAT NEXT

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

# **UIT-224 (warning) write\_test\_max\_scan\_patterns value specified (%d) ignored.**

## DESCRIPTION

Illegal value specified for this variable: the value can not be a negative or a 1. The value specified is ignored.

## WHAT NEXT

Use a value of greater than 1 for this variable

# **UIT-225 (warning) write\_test\_max\_cycles value specified (%d)**

ignored.

## DESCRIPTION

Illegal value specified for this variable: the value can not be a negative. The value specified is ignored.

## WHAT NEXT

Use a positive value for this variable

**UIT-226 (warning)** Scan chain element '%s' is a scan link and is not being added to the scan chain.

## DESCRIPTION

The **set\_scan\_path** command accepts an ordered list of design objects. The first object in the list can not be a scan link because there is no preceding cell to associate it with.

## WHAT NEXT

Remove the object from the argument list to get rid of the warning.

**UIT-227 (warning)** Scan style '%s' does not add lockup latches to the scan chain.

Ignoring the **set\_scan\_configuration -add\_lockup** command.

## DESCRIPTION

Only the multiplexed\_flip\_flop scan style adds lockup latches to the scan chain. This message tells you that you have asked DFT Compiler to add lockup latches to the scan chain, but have specified a scan style that is not multiplexed\_flip\_flop. DFT Compiler is telling you that it is ignoring your **-add\_lockup** option.

## WHAT NEXT

To get rid of the warning, remove the **-add\_lockup true** from the **set\_scan\_configuration** option list, or set the scan style to multiplexed\_flip\_flop.

## **UIT-228 (warning) Ignoring preview\_scan -show option argument '%s'.**

### **DESCRIPTION**

The `preview_scan` command has a `-show` option, that gives users the flexibility they need to customize what they see. The option takes a list argument, containing case-insensitive keywords in "cells", "scan", "segments", "scan\_clocks", "scan\_signals", and "all". This message says that you have used a `-show` option argument that is not a keyword. DFT Compiler ignores the specification.

### **WHAT NEXT**

To get rid of the warning, remove the unknown keyword from the `preview_scan -show` option argument list.

## **UIT-229 (warning) Scan style '%s' does not need scan clock domain constraints. Ignoring the set\_scan\_configuration -clock\_mixing command.**

### **DESCRIPTION**

Only the multiplexed\_flip\_flop scan style needs scan clock domain constraints. This message tells you that you have asked DFT Compiler to implement scan clock domain constraints, but have specified a scan style that is not multiplexed\_flip\_flop. DFT Compiler is telling you that it is ignoring your `-clock_mixing` option.

### **WHAT NEXT**

To get rid of the warning, remove the `-clock_mixing` from the `set_scan_configuration` option list, or set the scan style to multiplexed\_flip\_flop.

## **UIT-230 (information) To support new scan insertion capabilities, this command is being replaced by the set\_scan\_path command, which is used with the insert\_scan command. Please see the DFT Compiler Scan Synthesis User Guide for more information about set\_scan\_path and**

## **insert\_scan.**

### **DESCRIPTION**

To support new scan insertion capabilities, the **insert\_test** command is being replaced by **insert\_scan**.

The **set\_scan\_chain** command is not recognized by **insert\_scan**. The **set\_scan\_path** command is used instead.

DFT Compiler continues to support **set\_scan\_chain** and **insert\_test** for a transition period, so legacy **dc\_shell** scripts continue to work.

We believe that **set\_scan\_path** and **insert\_scan** supports all **set\_scan\_chain** and **insert\_test** features, and ultimately intend obsoleting **set\_scan\_chain** and **insert\_test**.

### **WHAT NEXT**

See the DFT Compiler Scan Synthesis User Guide for more information about **set\_scan\_path**, **insert\_scan**, and the hierarchical scan user interface. Let Synopsys know about any **set\_scan\_chain** or **insert\_test** feature that you rely on, and is not supported by **set\_scan\_path** and **insert\_scan**.

## **UIT-231 (Error) The options -chain and -cell cannot be specified at the same time.**

### **DESCRIPTION**

This message indicates that a **report\_scan\_path** command has been issued, but the two options -chain and -cell cannot be specified at the same time. You choose either to report the scan signal information for the scan chains with the -chain option or to report the cells of the scan chains with the -cell option.

### **WHAT NEXT**

Remove one of the options (-chain or -cell) and reissue the command.

### **SEE ALSO**

[report\\_scan\\_path](#)

## **UIT-232 (warning) Coverage threshold option ignored.**

## Coverage threshold must be greater than 0%%.

### DESCRIPTION

The specified coverage threshold for fault\_simulate was ignored because it was less than or equal to 0%.

### WHAT NEXT

The coverage threshold must be greater than 0% and less than or equal to 100%.

## **UIT-233 (warning) Coverage threshold option ignored. Coverage threshold must be less than or equal to 100%%.**

### DESCRIPTION

The specified coverage threshold for fault\_simulate was ignored because it was greater than 100%.

### WHAT NEXT

The coverage threshold must be greater than 0% and less than or equal to 100%.

## **UIT-235 (error) cannot generate TSTL2 format, too many timing types.**

### DESCRIPTION

All the inputs with same delay are grouped into one input timing type. All the outputs with same delay (or strobe time) are grouped into one output timing type. TSTL2 format allows a maximum of seven (6 + 1 dedicated for DT waveform) types of input timing and two types of output timing. One TIMESET statement is generated for each timing type. Input to the write\_test requires it to generate more than allowed TIMESET statements.

### WHAT NEXT

To generate TSTL2 format, change the timing values on inputs and/or outputs to reduce the number of timing types. Read TIMESET statement section of TSTL2 specifications for detailed information.

**UIT-236** (warning) You have invoked `preview_dft` with `-script` and one or more of the following options: `-show`, `-test_points`, `-test_wrapper`, `-core_integration`, `-mbist`, `-bsd`, `-test_mode`, `-verbose`. These options are ignored.

## DESCRIPTION

The `preview_dft` command option `-script` is mutually exclusive to the following options `-show`, `-test_points`, `-test_wrapper`, `-core_integration`, `-mbist`, `-bsd`, `-test_mode`, and `-verbose`. This message says that you have asked for one or more of the options. DFT Compiler ignores the additional option(s) and generates a script.

## WHAT NEXT

To get rid of the warning, invoke `preview_dft` with either the `-show` option and/or the following options: `-test_points`, `-test_wrapper`, `-core_integration`, `-mbist`, `-bsd`, `-test_mode`, `-verbose` OR just the `-script` option, but not both.

**UIT-237** (information) You have invoked `remove_scan_configuration` with no options. The command is ignored.

## DESCRIPTION

The `remove_scan_specification` command does nothing when it is invoked without options.

This, in itself, is not a problem. No scan specifications are removed. You might, however, have meant to use the "`-all`" option or one of the other more limited options.

## WHAT NEXT

To get rid of the information message, invoke `remove_scan_configuration` with options.

**UIT-238** (information) To support new scan insertion capabilities, this command is being replaced by the `insert_scan` command. Please see the DFT Compiler Scan Synthesis User

# Guide for more information about `insert_scan`.

## DESCRIPTION

To support new scan insertion capabilities, the `insert_test` command is being replaced by `insert_scan`.

DFT Compiler continues to support both commands for a transition period, so legacy `dc_shell` scripts continue to work.

`insert_scan` supports all `insert_test` features and ultimately intend obsoleting `insert_test`.

## WHAT NEXT

See the DFT Compiler Scan Synthesis User Guide for more information about `insert_scan` and the hierarchical scan user interface. Let Synopsys know about any `insert_test` feature that you rely on, and is not supported by `insert_scan`.

**UIT-239 (information)** To support new scan insertion capabilities, this command is being replaced by the `set_scan_path` command, which is used with the `insert_scan` command. Please see the DFT Compiler Scan Synthesis User Guide for more information about `set_scan_path` and `insert_scan`.

## DESCRIPTION

To support new scan insertion capabilities, the `insert_test` command is being replaced by `insert_scan`.

The `set_test_routing_order` command is not recognized by `insert_scan`. The `set_scan_path` command is used instead.

DFT Compiler continues to support `set_test_routing_order` and `insert_test` for a transition period, so legacy `dc_shell` scripts continue to work.

`set_scan_path` and `insert_scan` support all `set_test_routing_order` and `insert_test` features, and ultimately intend obsoleting `set_test_routing_order` and `insert_test`.

## WHAT NEXT

See the DFT Compiler Scan Synthesis User Guide for more information about `set_scan_path`, `insert_scan`, and the hierarchical scan user interface. Let Synopsys

know about any `set_test_routing_order` or `insert_test` feature that you rely on, and is not supported by `set_scan_path` and `insert_scan`.

**UIT-240 (information)** Some design changes may have occurred after "create\_test\_patterns" or "create\_test\_patterns" was run in a different dc\_shell session.

## DESCRIPTION

`write_test` prints this message if it detects any design changes after "create\_test\_patterns" or if "create\_test\_patterns" was run in a different dc\_shell session. Make sure that any changes made to the design after the test vectors were generated do not invalidate the patterns. This can cause simulation mismatches.

## WHAT NEXT

If there are any design changes that invalidate the patterns, please rerun "create\_test\_patterns".

**UIT-241 (warning)** Ignoring the -complete true option because scan chain '%s' is empty.

## DESCRIPTION

Specify scan chains using the `set_scan_path` command. Tell DFT Compiler to not add elements to your scan chain by setting the `-complete` option to `true`.

This message tells you that DFT Compiler ignores a `-complete true` option because it is applied to an empty scan chain.

## WHAT NEXT

Remove the option from the command line or specify valid scan chain elements to get rid of the warning. If you did specify chain elements, study accompanying warning messages to see why they were discarded.

**UIT-242 (information)** The %s attribute on the library cell %s now has priority over this attribute on an instance, reference or

design.

## DESCRIPTION

You receive this message when you perform **set\_scan\_element** or **set\_scan\_transparent** on a library cell. The message indicates that the command has been executed (and the specified attribute is now present on the library cell), but warns you that this attribute now has precedence and so cannot be overwritten by performing **set\_scan\_element** or **set\_scan\_transparent** on an instance, reference or design.

## WHAT NEXT

If it is acceptable to you that the library cell attribute takes precedence over the attribute on an instance, reference or design, no action on your part is required. If this is not acceptable, remove the attribute from the library cell using **set\_scan\_element -false**, **set\_scan\_transparent -false**, or **remove\_attribute**.

**UIT-243 (warning)** The design %s corresponding to the object %s has the %s attribute set to true. This specification will not have any effect.

## DESCRIPTION

The value of the scan element or scan transparent attribute on a design has precedence over the the value of the scan element or scan transparent attribute on an instance or a reference. If the scan element or the scan transparent attribute is set on an instance or a reference, and the design corresponding to this instance or reference has the scan element or scan transparent attribute set, the specification does not have any effect because of the precedence rules.

## WHAT NEXT

Remove the attribute on the design if you want to see the effect of the scan element or scan transparent attribute on an instance or reference.

**UIT-244 (warning)** The design %s corresponding to the object %s has the %s attribute set to true. This specification will not have any effect for the level-

sensitive elements inside %s.

## DESCRIPTION

The value of the scan element or scan transparent attribute on a design has precedence over the the value of the scan element or scan transparent attribute on an instance or a reference. If the scan element or the scan transparent attribute is set on an instance or a reference, and the design corresponding to this instance or reference has the scan element or scan transparent attribute set, the specification does not have any effect because of the precedence rules.

## WHAT NEXT

Remove the attribute on the design if you want to see the effect of the scan element or scan transparent attribute on an instance or reference.

# UIT-245 (warning) Deleting the scan transparent attribute on object %s.

## DESCRIPTION

If the value of the **scan\_element** attribute on a design object is true, it implies that all flip-flops and all latches inside that design object, that do not have violations, must be made a part of the scan chain. Therefore, setting the **scan\_element** attribute value on a design object that already has the scan transparent value set to true causes the scan transparent attribute to be deleted.

## WHAT NEXT

If you do not want the scan transparent attribute deleted, use the **set\_scan\_element command to set the scan\_element attribute false**. To reapply the scan transparent attribute, use the **set\_scan\_transparent** command.

# UIT-246 (error) Compliance enable specification is not paired.

## DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port\_name value pairs. Incomplete pairs cannot be used to specify a compliance enable pattern and are rejected.

## WHAT NEXT

Make sure that the compliance enable pattern has port\_name value pairs.

# UIT-247 (error) '%s' is not a port of the design.

## DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port\_name value pairs. One of the port names specified in the compliance enable pattern does not correspond to a design port.

## WHAT NEXT

Change the compliance pattern specification such that all port names appearing in a compliance pattern are ports of the design.

# UIT-248 (error) Multiple design objects found with name '%s'.

## DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a Boundary Scan Design. Each compliance enable pattern consists of a set of port\_name-value pairs. One of the port names specified in the compliance enable pattern corresponds to multiple design objects.

## WHAT NEXT

Re-issue the **set\_bsd\_compliance** command making sure that each port name in a compliance enable pattern corresponds to a unique design object.

# UIT-249 (error) The value specified at a compliance enable port must be either a '0' or a '1'.

## DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port\_name value pairs. The value at a compliance enable port must be either a logic zero or a logic one.

## WHAT NEXT

Make sure that the value at each compliance enable port in a compliance enable pattern is either a logic zero or a logic one.

## UIT-250 (error) The following compliance enable port is not an input port: %s.

### DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port\_name value pairs. Each port name in a compliance enable specification must correspond to an input port of the design.

### WHAT NEXT

Make sure that each port in the compliance enable pattern corresponds to an input port of the design.

## UIT-251 (error) The following compliance enable port is a TAP port: %s.

### DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port\_name value pairs. No compliance enable pattern may include a TAP port.

### WHAT NEXT

Remove the TAP ports from the compliance pattern specification.

## UIT-252 (warning) No TAP ports were found for the design.

### DESCRIPTION

The **set\_bsd\_compliance** command issues an error if any compliance enable port is a TAP port. You get this warning if this check is not performed because no IEEE 1149.1 Test Access Ports were found for the design.

## WHAT NEXT

No further action is necessary.

**UIT-253 (error)** The following port appears more than once in a compliance enable pattern: '%s'.

## DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of port\_name value pairs. No port can appear more than once in a compliance enable specification.

## WHAT NEXT

Make sure that the compliance enable pattern has no duplicate ports.

**UIT-254 (information)** Writing '%s' package description.

## DESCRIPTION

The **read\_pin\_map** command lets you read port-to-pin map files for Boundary Scan Designs. The **read\_pin\_map** command produces this information message when the user reads in a port-to-pin map file.

## WHAT NEXT

No further action is necessary.

**UIT-255 (information)** Overwriting '%s' package description.

## DESCRIPTION

The **read\_pin\_map** command lets you read port-to-pin map files for Boundary Scan Designs. If a port-to-pin map file with some package name has been read in and the user tries to read in another port-to-pin map file with the same package name, the **read\_pin\_map** command produces this information message.

## WHAT NEXT

No further action is necessary.

## **UIT-256 (information) Deleting '%s' package description.**

### **DESCRIPTION**

The **remove\_pin\_map** command lets you delete a package description for a Boundary Scan Design. The **remove\_pin\_map** command produces this information message when the user tries to delete a package description.

### **WHAT NEXT**

No further action is necessary.

## **UIT-257 (error) Could not find package '%s'.**

### **DESCRIPTION**

The **remove\_pin\_map** command lets you delete a package description for a Boundary Scan Design. The **remove\_pin\_map** command produces this information message when the package name specified by the user has not been read in.

### **WHAT NEXT**

Check the packages read in for the design using the **report\_pin\_map** command and reissue the **remove\_pin\_map** command with a valid package name.

## **UIT-258 (error) Naming check must be one of 'VHDL', 'BSDL' or 'none'.**

### **DESCRIPTION**

The only valid values for the naming\_check argument to **write\_bsd1** are "VHDL", "BSDL" or "none". This error message indicates that the naming\_check argument has some value other than these.

### **WHAT NEXT**

Make sure that the value of the naming check argument is valid.

## **UIT-259 (error) Unable to open output file '%s' for writing.**

### **DESCRIPTION**

This error message indicates that the BSDL generation subsystem could not open the output file for writing.

### **WHAT NEXT**

Make sure that the output file has write permissions.

## **UIT-260 (information) Opened BSDL file '%s' for writing.**

### **DESCRIPTION**

This information message indicates that the BSDL generation subsystem has successfully opened the output file for writing.

### **WHAT NEXT**

No further action is necessary.

## **UIT-261 (error) Cannot read file '%s'.**

### **DESCRIPTION**

This error appears when you try to read a protected pin map file or the file does not exist.

### **WHAT NEXT**

Check and correct search\_path, then reinvoke the `read_pin_map` command.

## **UIT-262 (error) File '%s' is a directory name.**

### **DESCRIPTION**

You receive this message from the `read_pin_map` command if the argument you issued with that command is a directory name and not a filename. The argument of `read_pin_map` must be the full name of a file containing the port-to-pin mapping for

your design.

## WHAT NEXT

Verify the full pathname of your port-to-pin mapping file, then reissue `read_pin_map` using the complete, correct filename as the argument.

## SEE ALSO

`read_pin_map(2)`.

**UIT-263 (warning) %d ports have been specified. Only the first will be processed.**

## DESCRIPTION

You use the `set_dft_signal` command to associate test mode signal semantics with exactly one design port. You see this error when you try to specify the test mode of multiple design ports using the `set_dft_signal` command.

## WHAT NEXT

Ensure that you want to associate test mode semantics with the first design port. Remove additional specifications to silence the warning.

**UIT-264 (warning) %s port '%s' can not be a %s.**

## DESCRIPTION

You can use the `set_dft_signal` command to associate test mode signal semantics with exactly one design input port. This warning is generated when you apply the `set_dft_signal` command to a port that is not an input port.

## WHAT NEXT

Repeat the command using the correct port.

## **UIT-265 (error) There is no valid test mode port.**

### **DESCRIPTION**

You use the set\_dft\_signal command to associate test mode signal semantics with exactly one design input port. You see this error when nothing you specify identifies a design input port.

### **WHAT NEXT**

Study accompanying messages for the reasons why the port you specified was not acceptable, and repeat the command using a valid input port.

## **UIT-266 (error) '%s' is not a test mode signal type.**

### **DESCRIPTION**

The set\_dft\_signal command lets you associate test mode signal semantics with exactly one design input port. Specified signal types must be test mode signal types in test\_hold\_logic\_zero and test\_hold\_logic\_one. Other signal types do not have test mode signal semantics and are rejected.

### **WHAT NEXT**

Repeat the set\_dft\_signal command using a test mode signal type.

## **UIT-267 (warning) Port '%s' has a '%s' signal\_type attribute. This may conflict with '%s' signal semantics.**

### **DESCRIPTION**

The set\_scan\_signal and set\_dft\_signal commands let you associate signal semantics with design ports. This message tells you that a port has a signal\_type attribute that may conflict with these semantics.

### **WHAT NEXT**

Satisfy yourself that there is no conflict.

## **UIT-268 (warning) Port '%s' has a test\_hold '%s' attribute. This**

conflicts with '%s' signal semantics.

## DESCRIPTION

The `set_dft_signal` command lets you associate signal semantics with exactly one design input port. This message tells you that the port has a `test_hold` attribute that conflicts with these semantics.

## WHAT NEXT

Satisfy yourself that there is no conflict.

**UIT-269 (error)** The type of a Test Access Port must be one of %S, %S, %S, %S, or %S.

## DESCRIPTION

You can use the `set_bsd_port` command to put test-specific signal types on design ports. The only valid signal types for 1149.1 TAP ports are tdi, tdo, tms, trst, or tck. This error message appears when you try set the signal type of a TAP port to a value other than tdi, tdo, tms, trst, or tck.

## WHAT NEXT

Repeat the command using the correct TAP port type.

**UIT-270 (error)** More than one port specified with the `set_1149.1_port` command.

## DESCRIPTION

You can use the `set_bsd_port` command to put test-specific signal types on a design port. This error occurs when you try to perform `set_bsd_port` on a set of ports.

## WHAT NEXT

Specify exactly one port when using the `set_bsd_port` command.

**UIT-271 (error)** Did not complete `set_bsd_port`. '%s' is a %s, not

a design port.

## DESCRIPTION

You can use the **set\_bsd\_port** command to put test-specific signal types on design ports. This error is generated when you try to set the signal type of an object that is not a design port.

## WHAT NEXT

Repeat the command using the correct port name.

**UIT-272 (error)** Did not complete set\_bsd\_port. %s port '%s' can not be a %s.

## DESCRIPTION

You can use the **set\_bsd\_port** command to put test-specific signal types on design ports. This error is generated when you try to set the signal type of a port to something that is inconsistent with its direction. For example, signal type tdo is associated with boundary scan test data output. It cannot be associated with an input port.

## WHAT NEXT

Repeat the command using the correct port.

**UIT-273 (error)** A port, '%s', with a signal type of '%s' already exists in the design.

## DESCRIPTION

You can use the **set\_bsd\_port** command to put test-specific signal types on a design port. This error message is produced if a port with the given signal type already exists in the design.

## WHAT NEXT

Remove the signal\_type attribute from the existing port and reissue the command.

## **UIT-274 (error) The '%s' port is a system clock.**

### **DESCRIPTION**

You can use the **set\_bsd\_port** command to put test-specific signal types on a design port. This error message is produced if you try to declare a system clock port as the TDI, TDO, TMS or TRST pin of the TAP.

### **WHAT NEXT**

Reissue the **set\_bsd\_port** command specifying a non-clock port as the TDI, TDO, TMS or TRST pin of the TAP.

## **UIT-275 (error) The '%s' port is a test clock.**

### **DESCRIPTION**

You can use the **set\_bsd\_port** command to put test-specific signal types on a design port. This error message is produced if you try to declare a test clock port as the TDI, TDO, TMS or TRST pin of the TAP.

### **WHAT NEXT**

Reissue the **set\_bsd\_port** command specifying a port that is not a test clock as the TDI, TDO, TMS or TRST pin of the TAP.

## **UIT-276 (Warning) Overwriting the signal type attribute for the port '%s'.**

### **DESCRIPTION**

You can use the **set\_bsd\_port** command to put test-specific signal types on a design port. This warning message is produced if you try to perform **set\_bsd\_port** on a port that already has a signal type attribute.

### **WHAT NEXT**

No further action is necessary.

## **UIT-277 (error) The '<signal\_port\_bit\_value\_pairs>' list has no**

members.

## DESCRIPTION

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a Boundary Scan design. The signal\_port-bit\_value list in a **set\_bsd\_compliance** cannot be empty.

## WHAT NEXT

Reissue the command with a nonempty list of signal\_port-bit\_value pairs.

**UIT-278 (information)** You invoked **remove\_bsd\_specification** with no options. The command is ignored.

## DESCRIPTION

The **remove\_bsd\_specification** command does nothing when it is invoked without options.

This, in itself, is not a problem. No IEEE 1149.1 specifications are removed. However, you might have meant to use the **-all** option or one of the other more limited options.

## WHAT NEXT

To get rid of the information message, invoke **remove\_bsd\_specification** with options.

**UIT-279 (warning)** The sense value '%s' is ignored.

## DESCRIPTION

In command **set\_scan\_signal**, the option **-sense** is applicable only if a hookup pin has been specified. If there is no hookup pin, the sense value is then ignored.

## WHAT NEXT

If you want to specify a hookup pin, use the option **-hookup**.

## **UIT-280 (error) '%S' is not a correct hookup sense type.**

### **DESCRIPTION**

The **set\_scan\_signal** command lets you associate scan signal semantics with design ports. With respect to a specific design port, if a hookup pin also is specified, **insert\_scan** connects wires to the hookup pin. The sense between the port and the hookup pin is specified by the option of **-sense**. The valid values are **non\_inverted** and **inverted**, and the default value is **non\_inverted**.

### **WHAT NEXT**

Repeat the command using a correct hookup sense value.

## **UIT-281 (information) Setting the default package for the design '%S'.**

### **DESCRIPTION**

The **-default\_package** switch of the **set\_bsd\_configuration** command lets you set the default package for a Boundary Scan Design. You get this information message when you invoke the **set\_bsd\_configuration** command to set the default package for a Boundary Scan Design.

### **WHAT NEXT**

No further action is necessary.

## **UIT-282 (information) Overwriting the default package for the design '%S'.**

### **DESCRIPTION**

The **-default\_package** switch of the **set\_bsd\_configuration** command lets you set the default package for a Boundary Scan Design. If the default package for a Boundary Scan Design has already been set, and you invoke the **set\_bsd\_configuration** command to set the default package for the Boundary Scan Design, you get this information message.

### **WHAT NEXT**

No further action is needed.

## **UIT-283 (Warning) Signature is not supported for '%s' instruction. Ignored the signature spec.**

### **DESCRIPTION**

The **set\_bsd\_instruction** command allows you to set the signature for the RUNBIST instruction. This message indicates that you specified a signature for other instruction.

### **WHAT NEXT**

Signature spec is ignored for this instruction. Remove signature spec to avoid this warning.

## **UIT-284 (error) The signature for the RUNBIST instruction is invalid.**

### **DESCRIPTION**

The **set\_bsd\_instruction** command allows you to set the parameters for the RUNBIST instructions. This error message indicates that you either ignored signature specification for RUNBIST or specified a RUNBIST signature that contains values other than a logic zero or a logic one.

### **WHAT NEXT**

Make sure you specify signature if time or clock cycle is specified for RUNBIST instruction. Also make sure that the signature specified for the RUNBIST instruction is a stream of logic ones and zeros of a length equal to the length of the test data register selected by the RUNBIST instruction.

## **UIT-285 (error) The wait specification for the RUNBIST/INTEST instruction is missing.**

### **DESCRIPTION**

The **set\_bsd\_instruction** command allow you to set the timing parameters for the RUNBIST or INTEST instructions respectively. This error message indicates that you have not specified the duration required for the RUNBIST or INTEST instruction to complete.

## WHAT NEXT

Specify the wait duration required for the RUNBIST or INTEST instructions to complete using either the **-time** or the **-clock\_cycles** switches.

## UIT-286 (error) The time specified for RUNBIST/INTEST to complete must be a positive real number.

### DESCRIPTION

The **set\_bsd\_instruction** command allow you to set the parameters for the RUNBIST or INTEST instructions respectively. This error message indicates that you specified a nonpositive duration for the RUNBIST or INTEST instructions to complete.

### WHAT NEXT

Specify a positive wait duration for the RUNBIST or INTEST execution.

## UIT-287 (error) The clock\_port-num\_cycles list in the wait specification for the RUNBIST/INTEST instruction is empty.

### DESCRIPTION

The **set\_bsd\_instruction** command allow you to set the parameters for the RUNBIST and INTEST instructions respectively. One of the ways to specify the RUNBIST or INTEST duration is to provide a list of **clock\_port-integer** pairs using the **-clock\_cycles** switch for these instructions. This error message indicates that the argument passed by way of the **-clock\_cycles** switch has no members.

### WHAT NEXT

Make sure that the argument passed by way of the **-clock\_cycles** switch has an positive, even number of members.

## UIT-288 (error) The RUNBIST/INTEST execution time

specification is not paired.

## DESCRIPTION

The **set\_bsd\_instruction** command allow you to set the parameters for the RUNBIST and INTEST instructions respectively. One of the ways to specify the RUNBIST or INTEST duration is to provide a list of *clock\_port-integer* pairs using the **-clock\_cycles** switch for these instructions. This error message indicates that the argument passed using the **-clock\_cycles** switch has an odd number of members.

## WHAT NEXT

Make sure that the argument, using the **-clock\_cycles** switch, has an even number of members.

**UIT-289 (error) The number of clock cycles in the wait specification must be a positive integer.**

## DESCRIPTION

The **set\_bsd\_instruction** command allow you to set the parameters for the EXTEST\_PULSE, EXTEST\_TRAIN, RUNBIST and INTEST instructions. The number of clock cycles specified using the **-clock\_cycles** switch for either of these commands must be a positive integer. This error message indicates that you have specified a non-integer or a non-positive integer with the **-clock\_cycles** switch of the above commands.

## WHAT NEXT

Make sure that the number of clock cycles specified via the **-clock\_cycles** switch is a positive integer.

**UIT-290 (error) Could not find port '%s' in the design '%s'.**

## DESCRIPTION

The **set\_bsd\_instruction** command allow you to set the parameters for the EXTEST\_PULSE, EXTEST\_TRAIN, RUNBIST and INTEST instructions respectively. This error message indicates that a port name specified using the **-clock\_cycles** switch of the previous commands is not a port of the design.

## WHAT NEXT

Make sure that the port name specified, using the **-clock\_cycles** switch is a port of the design.

## UIT-291 (error) The '%s' port in the wait specification is not an input/inout port.

### DESCRIPTION

The **set\_bsd\_instruction** command allow you to set the parameters for the RUNBIST and INTEST instructions respectively. This error message indicates that a port specified using the **-clock\_cycles** switch of the prior commands is not an input or inout port.

## WHAT NEXT

Make sure that all ports in the wait specification are input or inout ports.

## UIT-292 (error) The '%s' port in the RUNBIST/INTEST duration specification is not a system or test clock.

### DESCRIPTION

The **set\_bsd\_runbist** and the **set\_bsd\_intest** commands allow you to set the parameters for the RUNBIST and INTEST instructions respectively. This error message indicates that a port specified using the **-clock\_cycles** switch of the above commands is not a system or test clock.

## WHAT NEXT

Make sure that all ports in the wait specification are either system clocks or test clocks.

## UIT-293 (error) The '%s' port appears more than once in the RUNBIST/INTEST wait specification.

### DESCRIPTION

The **set\_bsd\_runbist** and the **set\_bsd\_intest** commands allow you to set the parameters for the RUNBIST and INTEST instructions respectively. This error message indicates

that a clock port appears more than once in the wait specification for the above commands.

## WHAT NEXT

Make sure that no clock ports appear more than once in the RUNBIST/INTEST wait specification.

# UIT-294 (information) Writing the parameters for the INTEST instruction.

## DESCRIPTION

The **set\_bsd\_intest** command allows you to set the parameters for the INTEST instructions. This information message indicates that the parameters associated with the INTEST instruction are being written to the db design.

## WHAT NEXT

No further action is needed.

# UIT-295 (information) Overwriting the parameters for the INTEST instruction.

## DESCRIPTION

The **set\_bsd\_intest** command allows you to set the parameters for the INTEST instructions. This command is not cumulative. This information message indicates that the existing parameters associated with the INTEST instruction are being overwritten by the new user specification for the INTEST parameters.

## WHAT NEXT

No further action is needed.

# UIT-296 (information) Writing the parameters for the RUNBIST

instruction.

## DESCRIPTION

The **set\_bsd\_runbist** command allows you to set the parameters for the RUNBIST instructions. This information message indicates that the parameters associated with the RUNBIST instruction are being written to the db design.

## WHAT NEXT

No further action is needed.

# UIT-297 (information) Overwriting the parameters for the RUNBIST instruction.

## DESCRIPTION

The **set\_bsd\_runbist** command allows you to set the parameters for the RUNBIST instructions. This command is not cumulative. This information message indicates that the existing parameters associated with the RUNBIST instruction are being overwritten by the new user specification for the RUNBIST parameters.

## WHAT NEXT

No further action is needed.

# UIT-298 (error) The '%s' port is not an IEEE 1149.1 Test Access Port.

## DESCRIPTION

The **remove\_bsd\_port** command allows you to remove the IEEE 1149.1 attributes from the test access ports. This error message indicates that the port you specified does not have the attributes associated with IEEE 1149.1 Test Access Ports.

## WHAT NEXT

Run **report\_test -port** to identify the IEEE 1149.1 test access ports and reissue the command.

## **UIT-299** (error) Could not remove the '%s' IEEE 1149.1 test access port.

### **DESCRIPTION**

The **remove\_bsd\_port** command allows you to remove the IEEE 1149.1 attributes from the test access ports. This error message tells you that the **remove\_bsd\_port** cannot remove the IEEE 1149.1 test attributes from the port.

### **WHAT NEXT**

Make sure that the port is indeed an IEEE 1149.1 test access port.

## **UIT-300** (warning) The specified routing signals are ignored because the -route option is set to false.

### **DESCRIPTION**

In command **set\_scan\_configuration**, the option **-route\_signals** is not applicable when the option **-route** is set to false.

### **WHAT NEXT**

Set the option **-route** to true, or just take the default value.

### **SEE ALSO**

`set_scan_configuration`

## **UIT-301** (error) The specified routing signal type '%s' is incorrect.

### **DESCRIPTION**

In command `set_scan_configuration`, the correct routing scan signal types for the option **-route\_signals** are {`all`, `global`, `serial`, `scan_enables`, `clocks`}.

### **WHAT NEXT**

Repeat the command using the correct routing scan signal types.

## SEE ALSO

`set_scan_configuration`

**UIT-302 (warning)** The specified routing signal type '%s' is not valid for the scan style '%s'.

## DESCRIPTION

In command `set_scan_configuration`, the correct routing scan signal types for the option `-route_signals` are {`all`, `global`, `serial`, `scan_enables`, `clocks`}.

However, some route signal types do not belong to certain scan styles. For example, the routing signal type `clocks` is not valid for `multiplexed-flip-flop` scan style, and `scan_enables` is not valid for `lssd` scan style.

## WHAT NEXT

Check your `set_scan_configuration -style` and `-route_signals` specifications are consistent.

**UIT-303 (warning)** The `-internal_clocks` option will be ignored. It only applies to multiplexed-Flip-Flop scan style.

## DESCRIPTION

You receive this message if you are using a scan style other than `multiplexed_flip_flop` and specified the `-internal_clocks` option with either the `set_scan_configuration` or `create_test_clock` command. You can use the `-internal_clocks` option only with the `multiplexed_flip_flop` scan style; the option is ignored for all other scan styles.

## WHAT NEXT

If you want to use the `-internal_clocks` option, set the scan style to `multiplexed_flip_flop` using `set_scan_configuration`, and re-apply the `-internal_clocks` option. If you want to keep your current scan style, or if it is acceptable for the `-internal_clocks` option to be ignored, you do not need to take any action.

## SEE ALSO

`set_scan_configuration` (2). `create_test_clock` (2).

## **UIT-304 (warning) Restoring Constrained value for port '%s'.**

### **DESCRIPTION**

In the STIL procedures, you can force a constrained port to a state other than the requested constrained value, but usually this is allowed only for a few tester cycles, and then the port must be returned to the constrained value. For example, you might want to hold a global reset port to an off state for general ATPG patterns but allow it to be asserted to initialize the design.

### **WHAT NEXT**

This message is purely an informational message; no action is required.

## **UIT-305 (error) '%s' is not a DFT signal type.**

### **DESCRIPTION**

You receive this message if you execute the **set\_dft\_signal** command and use a signal type that is not a valid DFT signal type. Valid DFT signal types are `test_point_normal_data_source`, `test_point_normal_data_sink`, `test_point_clock` and `test_mode`. Other signal types do not have DFT signal semantics and are rejected.

### **WHAT NEXT**

Reexecute the **set\_dft\_signal** command using a valid DFT signal type.

### **SEE ALSO**

**set\_dft\_signal** (2).

## **UIT-306 (warning) %d DFT ports have been specified, but access pins have been specified also. Only the first port will be processed.**

### **DESCRIPTION**

You receive this message if you execute the **set\_dft\_signal** command and specify both the **-hookup pin** and **-port port\_list** options, where *port\_list* contains more than one port. If you use the **-hookup** option, you can use only one design port for *port\_list*.

## WHAT NEXT

Re-execute the **set\_dft\_signal** command, and specify only one port if you are also specifying access pins with the **-hookup** option. If you want to specify multiple DFT ports, use a single command for each port.

## SEE ALSO

**set\_dft\_signal** (2).

# UIT-307 (warning) '%s' is a %s and cannot be used to specify a DFT signal port.

## DESCRIPTION

The **set\_dft\_signal** command allows design objects to specify ports. These must be ports. Other kinds of design objects cannot be used to specify DFT signal ports, and are rejected.

## WHAT NEXT

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

# UIT-308 (warning) '%s' is a %s and cannot be used to specify a DFT signal pin.

## DESCRIPTION

The **set\_dft\_signal** command allows design objects to specify pins. These must be pins or pin instances. Other kinds of design objects cannot be used to specify DFT signal ports, and are rejected.

## WHAT NEXT

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

## **UIT-309 (warning) %s port '%s' cannot be a %s.**

### **DESCRIPTION**

You can use the **set\_dft\_signal** command to put associated DFT semantics with design ports. This warning is generated when you try to set the signal type of a port to something that is inconsistent with its direction. For example, signal type `test_point_normal_data_source` is associated with input ports. It cannot be associated with an output port.

### **WHAT NEXT**

Repeat the command using the correct port.

## **UIT-310 (error) There is no valid DFT port.**

### **DESCRIPTION**

You receive this error message if you execute the **set\_dft\_signal** command and do not specify a valid design port.

### **WHAT NEXT**

Study accompanying messages to determine why specified ports were not acceptable, and repeat the command using valid ports.

### **SEE ALSO**

**set\_dft\_signal** (2).

## **UIT-311 (error) No specified hookup pin is valid.**

### **DESCRIPTION**

You receive this message if you execute the **set\_dft\_signal** command with the **-hookup** option, and its argument is not a valid design pin.

### **WHAT NEXT**

Study accompanying messages to determine why the specified access pins were not acceptable. Repeat the command using valid pin instances.

## SEE ALSO

`set_dft_signal` (2).

## UIT-312 (warning) %s pin '%s' cannot be a %s.

### DESCRIPTION

You can use the `set_dft_signal` command to specify hookup pins for design ports that have DFT semantics. This warning is generated when you try to set the hookup pin for a port to something that is inconsistent with its direction. For example, ports with signal type `test_point_normal_data_source` should be associated with output pins. They cannot be associated with input pins.

### WHAT NEXT

Repeat the command using the correct hookup pin.

## UIT-313 (warning) %d DFT ports have been specified. Only the first will be processed.

### DESCRIPTION

You use the `set_dft_signal` command to associate DFT signal semantics with design ports. You receive this error message when both of the following are true:

1. The `set_dft_signal` specification has multiple ports specified using the `-port` switch.
2. The `set_dft_signal` specification has a hookup pin specified using the `-hookup` switch.

### WHAT NEXT

Execute the `set_dft_signal` command specifying a single port each time you wish to specify a hookup pin for the DFT signal.

## UIT-314 (warning) %d hookup pins have been specified. Only

the first will be processed.

## DESCRIPTION

You receive this message if you execute **set\_dft\_signal -hookup** with more than one pin name as the argument to **-hookup**. You can specify only one pin name for the **-hookup** option. This message informs you that all pin names after the first one are ignored.

## WHAT NEXT

Re-execute **set\_dft\_signal -hookup** with a single pin as the argument. If you want an additional hookup pin to be used, re-execute the command specifying that pin for the design port.

## SEE ALSO

**set\_dft\_signal** (2).

**UIT-315 (information)** The list of ports from which the DFT signals are to be removed is empty.

## DESCRIPTION

You receive this message if you issue the **remove\_dft\_signal** command and the *object\_list* argument is empty. The *object\_list* argument is required; the command does nothing when it is invoked with an empty set of boundary scan ports to be removed.

## WHAT NEXT

If you did not intend to remove DFT signals from any ports, no action is required on your part. Otherwise, re-issue the **remove\_dft\_signal** command with at least one port as argument.

## SEE ALSO

**remove\_dft\_signal** (2).

**UIT-316 (error)** At present, the '%s' command only supports the

full scan test methodology.

## DESCRIPTION

You receive this error message if you execute **insert\_dft** or **preview\_dft** and have previously specified a scan test methodology of *partial\_scan* or *none*. Currently the **insert\_dft** and **preview\_dft** commands support only the *full\_scan* test methodology.

## WHAT NEXT

Specify the *full\_scan* test methodology by executing **set\_scan\_configuration -methodology full\_scan**. Then reexecute **insert\_dft** or **preview\_dft**.

## SEE ALSO

**insert\_dft** (2), **preview\_dft** (2), **set\_scan\_configuration** (2).

**UIT-317 (error)** At present, the '%s' command does not support the '%s' scan style.

## DESCRIPTION

You receive this error message if you execute **insert\_dft** or **preview\_dft** and have previously specified a scan style other than *multiplexed\_flip\_flop* or *lssd*. Currently the **insert\_dft** and **preview\_dft** commands support only the *multiplexed\_flip\_flop* scan style and the *lssd* scan style.

## WHAT NEXT

Specify the *multiplexed\_flip\_flop* scan style or the *lssd* scan style by executing **set\_scan\_configuration -scan\_style multiplexed\_flip\_flop** or **set\_scan\_configuration -scan\_style lssd**. Then reexecute **insert\_dft** or **preview\_dft**.

## SEE ALSO

**insert\_dft** (2), **preview\_dft** (2), **set\_scan\_configuration** (2).

**UIT-318 (information)** The '%s' command will become obsolete

in the 2000.04 release. Please use '%s' instead.

## DESCRIPTION

This message informs you that the **set\_scan**, **set\_scan\_chain**, **set\_test\_routing\_order** and **insert\_test** commands will become obsolete in the 2000.04 release of DFT Compiler. You are advised to use the specified replacement commands instead.

## WHAT NEXT

Use the **set\_scan\_element**, **set\_scan\_path** or **insert\_scan** commands instead.

## SEE ALSO

**insert\_scan** (2), **set\_scan\_element** (2), **set\_scan\_path** (2).

# UIT-319 (error) Cannot change the scan style for a '%s' design.

## DESCRIPTION

You receive this error message if you attempt to use **set\_scan\_configuration -style** to change the scan style of a design whose scan state is test ready, scan replaced, scan routed or existing scan. In all these cases, the design has already been modified to have scan cells according to the current scan style. Therefore, you cannot change the scan style for such designs.

## WHAT NEXT

If you want to change the scan style for a design, you must start with a pre-scan design.

## SEE ALSO

**set\_scan\_configuration** (2).

# UIT-320 (warning) You have executed insert\_dft with both the -dont\_fix\_constraintViolations and -map\_effort options. Ignoring

**-map\_effort.**

## DESCRIPTION

You receive this message if you invoke **insert\_dft** with both the **-dont\_fix\_constraintViolations** and **-map\_effort** options. If you use the **-dont\_fix\_constraintViolations** option, **insert\_dft** does not fix constraint violations after scan synthesis. Therefore, the **-map\_effort** option has no meaning and is ignored.

## WHAT NEXT

If it is acceptable to you that the **-map\_effort** option is ignored, no action is required on your part. Otherwise, reissue **insert\_dft -map\_effort** without the **-dont\_fix\_constraintViolations** option.

## SEE ALSO

**insert\_dft** (2).

**UIT-321** (warning) The **model** command is obsolete as of release 2000.10. Use the PrimeTime STAMP functionality instead.

## DESCRIPTION

This message informs you that the **model** command is obsolete as of release 2000.10; it has been replaced by the PrimeTime STAMP functionality.

## WHAT NEXT

If you have questions or issues, contact your local Synopsys representative.

**UIT-322** (warning) Invalid argument for **-chain\_length**: '%s'. Argument must be a positive integer or the string "default". If an invalid argument is provided the "default" value will be used.

## DESCRIPTION

You receive this message if you execute the **set\_scan\_configuration** command and use

an invalid argument for the **-chain\_length** option. Valid arguments are positive integers or the string "default".

## WHAT NEXT

Reexecute the **set\_scan\_configuration** command and use a valid argument for the **-chain\_length** option.

## SEE ALSO

**set\_scan\_configuration** (2).

**UIT-323 (warning)** You cannot use both the **-longest\_chain\_length** and **-chain\_count** options in the same script. Ignoring **-chain\_count**.

## DESCRIPTION

You receive this message if your script contains the **set\_scan\_configuration** command and both the **-longest\_chain\_length** and **-chain\_count** options are used. These two options are mutually exclusive; **-longest\_chain\_length** takes precedence. This message warns you that **-chain\_count** is being ignored and that **-longest\_chain\_length** is in effect.

This message is generated whether the two options are used on the same or on different command lines. For example, both of the following would generate the message:

```
set_scan_configuration -longest_chain_length 3 -chain_count 4
or
set_scan_configuration -chain_count 4
set_scan_configuration -longest_chain_length 3
```

In both cases, **-chain\_count 4** is ignored and **-longest\_chain\_length 3** is used.

## WHAT NEXT

If it is acceptable to you that the **-chain\_count** option is ignored, no action is required on your part. However, if you want the **-chain\_count** option to be effective, edit your script so that you do not also use the **-longest\_chain\_length** option. Then reexecute the command.

## SEE ALSO

**set\_scan\_configuration** (2).

## **UIT-324 (error) Library cell %s not found in any of the libraries currently available in dc\_shell.**

### **DESCRIPTION**

You get this error message when the library cell specified by the **set\_bsd\_pad\_design** command, is not found in any of the libraries available in dc\_shell.

### **WHAT NEXT**

Insure that the library cell name is correct and the library it belongs to is available in the dc\_shell. Check the **link\_library** variable. Check the **search\_path** variable.

### **SEE ALSO**

**set\_bsd\_pad\_design (2)**.

## **UIT-325 (error) Pin named "%s" not found on the library cell "%S".**

### **DESCRIPTION**

You get this error message when the library cell specified by the **set\_bsd\_pad\_design** command does not have a pin as specified in the access list.

### **WHAT NEXT**

Insure that correct library cell name and pin names are specified.

### **SEE ALSO**

**set\_bsd\_pad\_design (2)**.

## **UIT-326 (information) The '%s' command will become obsolete in the '%s' release. Please use '%s' instead.**

### **DESCRIPTION**

This message informs you that the command specified in the error message will be

obsolete in the release specified in the error message. You are advised to use the specified replacement command instead.

## WHAT NEXT

Use the replacement command instead.

## SEE ALSO

**UIT-327** (Warning) Disable result '%s' is not valid for pad type '%s'. Ignoring the specified disable result and using the default value.

## DESCRIPTION

You get this warning message when the disable result specified by the **-disable\_res** option of the **set\_bsd\_pad\_design** command, is not valid for the pad type.

Following are valid disable results for different pad types:

```
tristate_output - Z bidirectional - Z open_drain_output - WEAK0, PULL0
open_source_output - WEAK1, PULL1 open_drain_bidirectional - WEAK0, PULL0
open_source_bidirectional - WEAK1, PULL1
```

## WHAT NEXT

Specify a valid disable result for the pad design and rerun.

## SEE ALSO

**set\_bsd\_pad\_design** (2).

**UIT-328** (error) Signal types port and/or port\_inverted not specified for differential pad design.

## DESCRIPTION

You get this error message when the option **-differential** of the command **set\_bsd\_pad\_design** is set to true and the **access\_list** does not specify both **port** and **port\_inverted** signal types. For differential pad designs both **port** and **port\_inverted** signal types must be specified in the access list.

## WHAT NEXT

Specify both **port** and **port\_inverted** signal types for the pad design and rerun.

## SEE ALSO

`set_bsd_pad_design (2)`.

**UIT-329 (Error) Instruction '%s' has illegal opcode "%s". (The opcode string must contain only binary values '0's and '1's.)**

## DESCRIPTION

BSD instruction opcodes must be binary codes. Code cubes (which include 'dont care' X bits) are not allowed. The only characters permitted in these code strings are '0's and '1's.

## WHAT NEXT

Re-write the binary opcode for the instruction using only '0's and '1's.

**UIT-330 (information) TPF protocol format will no longer be the default format from 2003.03 release. Please switch to STIL format in future releases.**

## DESCRIPTION

The tool shows this message to indicate that the default format of the test protocol will be changed in the future release. Please switch to the new test protocol format.

## WHAT NEXT

## SEE ALSO

`read_test_protocol(2), write_test_protocol(2), read_init_protocol>(2)`.

**UIT-331 (information) The '%s' command will become obsolete in the 2002.05 release. Please use TetraMAX ATPG tool**

instead.

## DESCRIPTION

This message informs you that the **create\_test\_patterns** command will become obsolete in the 2002.05 release of DFT Compiler. You are advised to refer to TetraMAX ATPG tool for test pattern generation.

## WHAT NEXT

Refer to the TetraMAX ATPG User Guide for more information about using TetraMAX ATPG tool.

**UIT-332 (warning)** Port '%s' has a driven\_by\_logic\_%s attribute. This conflicts with '%s' signal semantics.

## DESCRIPTION

The set\_dft\_signal command lets you associate signal semantics with exactly one design input port. This message tells you that the port has a driven\_by\_logic attribute that conflicts with these semantics.

## WHAT NEXT

Satisfy yourself that there is no conflict.

**UIT-333 (warning)** Port '%s' has a dft\_signal\_type '%s' attribute. The signal semantics conflicts with the test\_hold '%s' attribute.

## DESCRIPTION

The set\_test\_hold command sets the test\_hold attribute to a logic value to be assumed on specified input ports during testing. This message tells you that a port has a dft\_signal\_type attribute and the signal semantics conflicts with the value of the test\_hold attribute.

## WHAT NEXT

Satisfy yourself that there is no conflict.

## **UIT-334 (error) Incorrect value for the -async\_fix option argument. Allowed values are mux and MUX; or gate and GATE.**

### **DESCRIPTION**

This error message informs you that you used the `set_ autofix_configuration` command with an invalid argument for the `-async_fix` option. Allowed values for the `-async_fix` option argument are mux and MUX; or gate, GATE.

### **WHAT NEXT**

Use the `set_ autofix_configuration` command with the `-async_fix` option and specify one of the allowed values as the argument.

### **SEE ALSO**

`set_ autofix_configuration (2)`.

## **UIT-335 (warning) You have specified the command '%s' for the port '%s' with a sense inout. Make sure you apply the correct test constraints for test design rule checking.**

### **DESCRIPTION**

This warning message informs you that you used one of the following commands - `set_dft_signal`, `set_ autofix_clock`, `set_ autofix_async` - to specify a port with a direction inout.

### **WHAT NEXT**

Make sure you apply the correct test constraints for test design rule checking.

### **SEE ALSO**

`set_dft_signal (2)`, `set_ autofix_clock (2)`, `set_ autofix_async (2)`.

## **UIT-336 (error) Boundary scan data register length should be a**

**positive integer.**

## **DESCRIPTION**

You receive this message if you execute the **set\_bsd\_register** command and specify an invalid value for the *length*.

## **WHAT NEXT**

Specify a positive integer value for the boundary scan data register length.

## **SEE ALSO**

**insert\_bsd** (2), **set\_bsd\_register** (2).

**UIT-337 (error)** License feature '%s' required for the '%s' option of the '%s' command could not be found in the license file.

## **DESCRIPTION**

Some dc\_shell commands require specific licenses for some of their options. This error may occur when the required feature is not authorized.

## **WHAT NEXT**

Make sure your installation is correct and that you are supposed to be authorized for this license feature.

**UIT-338 (error)** '%s' is not a valid value for the '%s' option of the '%s' command.

## **DESCRIPTION**

You get this error when the value specified for the command option is invalid.

## **WHAT NEXT**

Specify a valid value for the command option and rerun. See the command man page for a list of valid values for the option.

## **UIT-339 (error) Specified pin '%s' is not found in the design '%s'.**

### **DESCRIPTION**

You receive this message if the named pin is not found in the current design.

### **WHAT NEXT**

Reexecute the command with the correct pin that exists in the current design.

### **SEE ALSO**

`set_power_up_reset (2)`.

## **UIT-349 (error) Register not specified for the instruction %. The -register argument is required for user-defined and RUNBIST instructions.**

### **DESCRIPTION**

A standard data register or a user-defined register previously declared with the `set_bsd_register` command in DB mode or with `set_scan_path` command in XG mode, must be specified for user-defined and RUNBIST instruction by `-register` argument. For user-defined and RUNBIST instructions there is no default register to be connected for serial access between TDI and TDO when the instruction is active.

### **WHAT NEXT**

Specify a standard data register or a user-defined register for the `-register` argument of the instruction.

### **SEE ALSO**

`set_bsd_instruction (2)`, `set_bsd_register (2)`, `set_scan_path (2)`.

## **UIT-350 (error) '%s' is not a standard instruction.**

### **DESCRIPTION**

The `set_bsd_instruction` command is used to specify a standard boundary scan instruction as defined by IEEE Std 1149.1. You have used this command to specify a

nonstandard boundary scan instruction.

## WHAT NEXT

Issue the command with a standard boundary scan instruction.

# UIT-351 (error) The '%s' instruction is not supported.

## DESCRIPTION

The **set\_bsd\_instruction** command is used to specify a standard boundary-scan instruction as defined by IEEE Std 1149.1. At present, the **set\_bsd\_instruction** command only supports the following instructions: BYPASS, EXTEST, SAMPLE, HIGHZ, CLAMP and IDCODE. You have used this command to specify one of the following instructions: RUNBIST, INTEST or USERCODE.

## WHAT NEXT

Reissue **set\_bsd\_instruction** command specifying a set of boundary scan instructions supported by BSD Compiler.

# UIT-352 (information) Writing boundary-scan instruction '%s'.

## DESCRIPTION

You receive this message from the **set\_bsd\_instruction** command to inform you that the specified instruction is being written to the database, to be implemented during the Boundary Scan logic insertion performed by **insert\_bsd**.

## WHAT NEXT

If you intend that the specified instruction be implemented, no action is required on your part. Otherwise, you can remove the instruction using **remove\_bsd\_instruction**.

## SEE ALSO

**insert\_bsd** (2), **remove\_bsd\_instruction** (2), **set\_bsd\_instruction** (2).

## **UIT-353 (warning) Overwriting boundary-scan instruction '%s'.**

### **DESCRIPTION**

You receive this message if you issue the **set\_bsd\_instruction** command and specify an instruction that is already on the list of instructions to be implemented by **insert\_bsd**. This message informs you that the specified instruction is being overwritten in the list by the **set\_bsd\_instruction** command you just issued.

### **WHAT NEXT**

This is an informational message only. No action is required on your part.

### **SEE ALSO**

**insert\_bsd** (2), **set\_bsd\_instruction** (2).

## **UIT-354 (warning) %d boundary scan TAP ports have been specified. Only the first boundary scan port will be processed.**

### **DESCRIPTION**

Use the **set\_bsd\_signal** command to associate boundary scan signal semantics with design ports. This error occurs when you try to specify the signal type of multiple design ports.

### **WHAT NEXT**

Split outstanding boundary scan TAP port specifications among multiple commands.

## **UIT-355 (error) There is no valid boundary scan TAP port.**

### **DESCRIPTION**

Use the **set\_bsd\_signal** command to associate boundary scan signal semantics with design ports. This error occurs when nothing you specified is a valid design port.

### **WHAT NEXT**

Study accompanying messages for the reasons why specified ports were not acceptable,

and repeat the command using valid ports.

**UIT-356 (warning)** %d boundary scan ports are specified. Only the first will be processed.

#### **DESCRIPTION**

Use the **set\_bsd\_signalf** command to associate boundary scan signal semantics with design ports. This error occurs when you try to specify the signal type of multiple design ports using the same command. To simplify commands and eliminate ambiguity, use separate commands.

#### **WHAT NEXT**

Split outstanding boundary scan port specifications among multiple commands.

**UIT-357 (error)** Instruction encoding must be one of 'default' or 'one\_hot'.

#### **DESCRIPTION**

You can use the **set\_bsd\_configuration** command to specify the instruction encoding for the boundary scan instructions synthesized by the **create\_bsd** command. The only valid values for instruction encoding are **one\_hot** or **default**. You have specified an instruction encoding other than **default** or **one\_hot**.

#### **WHAT NEXT**

Specify the instruction encoding to be either **default** or **one\_hot**.

**UIT-358 (error)** You must specify at least one option.  
For available options, input "set\_bsd\_configuration -help".

#### **DESCRIPTION**

The **set\_bsd\_configuration** command does nothing when it is invoked without options.

## WHAT NEXT

To get rid of the information message, invoke **set\_bsd\_configuration** with at least one option.

# UIT-359 (information) The set of boundary scan instructions to be removed is empty.

## DESCRIPTION

The **remove\_bsd\_instruction** command does nothing when it is invoked with an empty set of instructions to be removed.

## WHAT NEXT

To get rid of the information message, invoke **remove\_bsd\_instruction** with at least one instruction to be removed.

# UIT-360 (information) Removing boundary scan instruction '%s'.

## DESCRIPTION

The **remove\_bsd\_instruction** command is used to remove boundary scan instructions previously specified with the **set\_bsd\_instruction** command.

## WHAT NEXT

Empty.

# UIT-361 (warning) Could not remove boundary scan instruction '%s'.

## DESCRIPTION

The **remove\_bsd\_instruction** command is used to remove boundary scan instructions previously specified with the **set\_bsd\_instruction** command. This warning message indicates that the boundary scan instruction specified by the user could not be removed.

## WHAT NEXT

Check if the instruction was previously specified using the **set\_bsd\_instruction** command.

## UIT-362 (warning) Could not find boundary scan instruction '%S'.

### DESCRIPTION

The **remove\_bsd\_instruction** command is used to remove boundary scan instructions previously specified with the **set\_bsd\_instruction** command. This warning message indicates that the boundary scan instruction specified by the user could not be found.

### WHAT NEXT

Check if the instruction was previously specified using the **set\_bsd\_instruction** command.

## UIT-363 (information) The list of ports from which the boundary scan signals are to be removed is empty.

### DESCRIPTION

The **remove\_bsd\_signal** command does nothing when it is invoked with an empty set of boundary scan ports to be removed.

### WHAT NEXT

To get rid of the information message, invoke **remove\_bsd\_signal** with at least one boundary scan port to be removed.

## UIT-365 (warning) The direction switch may only be used with bidirectional ports.

### DESCRIPTION

The **-direction** switch of the **set\_bsr\_cell\_type** command should only be used for bidirectional ports. You have used the **-direction** switch with some input or output

ports. The **set\_bsr\_cell\_type** command issued will only operate on bidirectional ports in the list of ports specified.

## WHAT NEXT

None.

# UIT-366 (warning) Ignoring the command for the %s ports.

## DESCRIPTION

This warning message occurs when you invoke the **set\_bsr\_cell\_type** command with the **-direction** switch and there are some input or output ports in the port list. This warning message also occurs when you specify a boundary scan cell type of **observe\_only** for an output port or the output side of a bidirectional port.

## WHAT NEXT

Correct your **set\_bsr\_cell\_type** specification and re-issue the command.

# UIT-367 (warning) Observe-only is not a valid boundary scan cell type for %s port.

## DESCRIPTION

This warning message occurs when you specify a boundary scan cell type of **observe\_only** for an output port or the output side of a bidirectional port.

## WHAT NEXT

Correct your **set\_bsr\_cell\_type** specification and re-issue the command.

# UIT-368 (error) Invalid boundary scan cell type '%s'. Boundary scan cell type must be one of 'none', 'observe\_only' or 'control\_observe'.

## DESCRIPTION

You have specified an invalid boundary scan cell type. Boundary scan cell type must

be one of none, observe\_only or control\_observe.

## WHAT NEXT

Specify one of the valid boundary scan cell types and re-issue the **set\_bsr\_cell\_type** command.

# UIT-369 (error) Invalid direction argument '%s'. The direction must be one of 'in' or 'out'.

## DESCRIPTION

You have specified an invalid direction argument for a bidirectional port. The direction argument must be one of in or out, corresponding to the input and output sides of a bidirectional port.

## WHAT NEXT

Re-issue the **set\_bsr\_cell\_type** command with the correct direction.

# UIT-370 (error) Scan specification on cell '%s' would make multibit '%s' in design '%s' non-homogeneous.

## DESCRIPTION

Multibits have the property that each bit implements the same function. The scan specification is such that, if insert\_scan implements it, the bits of this multibit no longer have the same function.

In order to avoid breaking the homogeneity property of multibits, DFT Compiler ignores this scan specification.

## WHAT NEXT

If you still want the scan specification on this cell, you have two options:

- 1) Remove the multibit with the **remove\_multibit** command. For this operation, you will need to set the current design to the design containing the multibit.
- 2) Issue the scan specification for the whole multibit.

## **UIT-371 (Warning) Multibit '%s' in design '%s' is not a scan segment.**

### **DESCRIPTION**

You have used a multibit in a context where a scan segment is expected. This particular multibit is not a segment. Either the global default (set using the set\_scan\_configuration) calls for multibits not to be segments, or you have marked this multibit as not a segment.

The multibit and its constituent cells are ignored.

### **WHAT NEXT**

You can make a multibit into a scan segment using the set\_scan\_segment command. You can also list the individual bits of the multibit.

## **UIT-372 (Warning) The '%s' option of the set\_scan\_segment command does not apply to synthesizable segments; the option is ignored.**

### **DESCRIPTION**

The command you have issued refers to a synthesizable segment. You can not specify access points or the contained cells of a synthesizable segment. These options are used for user segments.

The extra option is ignored.

### **WHAT NEXT**

See the description of the set\_scan\_segment command for an explanation of the various options and their interrelations.

## **UIT-373 (Warning) The '%s' option of the set\_scan\_segment command does not apply to user segments; the option is**

ignored.

## **DESCRIPTION**

The command you have issued refers to a user segment. In a user segment, the order of the cells are determined by the connectivity of the design. You cannot alter this through scan specifications.

The `-reverse_order` option has no effect, it is ignored.

## **WHAT NEXT**

See the description of the `set_scan_segment` command for an explanation of the various options and their interrelations.

# **UIT-374 (warning) Multibit '%s' is already a synthesizable segment.**

## **DESCRIPTION**

The specification is redundant. It is ignored.

## **WHAT NEXT**

No action required if you don't mind the extra message.

# **UIT-375 (warning) '%s' is already a segment.**

## **DESCRIPTION**

The specification is redundant. It is ignored.

## **WHAT NEXT**

No action required if you don't mind the extra message.

# **UIT-376 (information) There is no explicit synthesizable segment specification for multibit '%s'; it remains %s a**

synthesizable segment, as specified in the scan configuration.

## DESCRIPTION

You have attempted to remove a segment specification which you have not given explicitly using the `set_scan_segment` command. The `remove_scan_configuration` command has effect only on explicit segments.

## WHAT NEXT

If you want to override the default provided by the scan configuration, use the `set_scan_segment` command. To view the current default, use the `report_test -configuration` command. To specify a new default for multibits, use the `set_scan_configuration` command.

**UIT-377 (information)** The explicit synthesizable segment specification for multibit '%s' is removed; now, it is %s a synthesizable segment, as specified in the scan configuration.

## DESCRIPTION

You have removed a segment specification which you previously set using the `set_scan_segment` command. This message informs you of the default specification this segment inherits from the scan configuration. Note that it is possible to have non-segments become segments as a result of applying the `remove_scan_configuration` command.

## WHAT NEXT

If you are happy with the current state of this segment, no action is required. Otherwise, you can issue an explicit scan configuration using the `set_scan_segment` command. To view the current default, use the `report_test -configuration` command. To specify a new default for multibits, use the `set_scan_configuration` command.

**UIT-378 (error)** Instance '%s' is not in the system.

## DESCRIPTION

This error indicates that the current command cannot find the instance in the system.

## WHAT NEXT

Use a different `-instance` option.

**UIT-379 (error)** Incorrect value of `-clock` option argument.  
Allowed values are true, TRUE, on, and ON; or false, FALSE, off, and OFF.

## DESCRIPTION

You receive this message if you execute `set_ autofix_configuration` or `set_ autofix_element` with an incorrect argument for the `-clock` option. Allowed values of the `-clock` option argument are *true*, *TRUE*, *on*, and *ON*; or *false*, *FALSE*, *off*, and *OFF*.

## WHAT NEXT

Re-issue the command with one of the allowed values for the `-clock` option argument.

## SEE ALSO

`set_ autofix_configuration` (2), `set_ autofix_element` (2).

**UIT-380 (error)** Incorrect value of `-async` option argument.  
Allowed values are true, TRUE, on, and ON; or false, FALSE, off, and OFF.

## DESCRIPTION

You receive this message if you execute `set_ autofix_configuration` or `set_ autofix_element` with an incorrect argument for the `-async` option. Allowed values of the `-async` option argument are *true*, *TRUE*, *on*, and *ON*; or *false*, *FALSE*, *off*, and *OFF*.

## WHAT NEXT

Re-issue the command with one of the allowed values for the `-async` option argument.

## SEE ALSO

`set_ autofix_configuration` (2), `set_ autofix_element` (2).

**UIT-381** (error) Incorrect value of `-fix_protocol` option argument. Allowed values are true, TRUE, on, and ON; or false, FALSE, off, and OFF.

## DESCRIPTION

You receive this message if you execute `set_ autofix_configuration` or `set_ autofix_element` with an incorrect argument for the `-fix_protocol` option. Allowed values of the `-fix_protocol` argument are *true*, *TRUE*, *on*, and *ON*; or *false*, *FALSE*, *off*, and *OFF*.

## WHAT NEXT

Re-issue the command with one of the allowed values for the `-fix_protocol` option argument.

## SEE ALSO

`set_ autofix_configuration` (2), `set_ autofix_element` (2).

**UIT-382** (error) Incorrect value of `-string` option argument. Allowed values are true, TRUE, false, or FALSE.

## DESCRIPTION

You receive this message if you execute `set_ autofix_element` with an incorrect argument for the `-string` option. Allowed values of the `-string` option argument are *true*, *TRUE*, *false*, or *FALSE*.

## WHAT NEXT

Re-issue the command with one of the allowed values for the `-string` option argument.

## SEE ALSO

`set_ autofix_element` (2).

## **UIT-383 (error) No port of name %s was found in design %s.**

### **DESCRIPTION**

This is an error message. The port %s was not found in design %s.  
Check the name and re-invoke the command.

### **WHAT NEXT**

You may want to use find command to list all ports.

## **UIT-384 (error) Port %s is not a test clock.**

### **DESCRIPTION**

The port %s is not a test clock. Use **create\_test\_clock** to create a test clock associated with port %s.

### **WHAT NEXT**

Use **report\_test -port** to report all test clocks available on the current design.

## **UIT-385 (error) Port %s is not of type input.**

### **DESCRIPTION**

You receive this error message if the specified port, given with the **set\_ autofix\_clock** command or the **set\_ autofix\_async** command, is not an input port. This argument must be an input port.

### **WHAT NEXT**

Re-issue the **set\_ autofix\_clock** command or the **set\_ autofix\_async** command and specify an input port.

### **SEE ALSO**

**set\_ autofix\_clock** (2), **set\_ autofix\_async** (2).

## UIT-386 (warning) Cannot find cell %s in design %s.

### DESCRIPTION

You receive this message if the specified cell, which you gave as part of the *object\_list* argument of the **set\_autofix\_clock** command or the **set\_autofix\_async** command, or the *cellNames* argument of the **set\_dft\_drc\_rules** command, cannot be found. Often, typos or spelling errors cause messages of this type.

### WHAT NEXT

Use the **find** command to list the cells in your design, and re-execute the command using the name of a valid cell.

### SEE ALSO

**set\_autofix\_clock** (2), **set\_autofix\_async** (2), **set\_dft\_drc\_rules** (2).

## UIT-387 (warning) Cell %s is combinational; you must use a sequential cell or a hierarchical cell with sequential elements.

### DESCRIPTION

This message warns you that the specified cell is combinational. **set\_autofix\_clock**, **set\_autofix\_async** and **set\_autofix\_element** require sequential cells or hierarchical cells with sequential elements. You cannot use combinational cells.

### WHAT NEXT

Re-issue the command and make sure that *object\_list* does not contain any combinational cells.

### SEE ALSO

**set\_autofix\_clock** (2), **set\_autofix\_async** (2), **set\_autofix\_element** (2).

## UIT-388 (error) You cannot specify more than one clock.

### DESCRIPTION

You receive this error message if you execute **set\_autofix\_clock** and specify more than one clock. You can specify only one clock.

## WHAT NEXT

Re-execute **set\_autofix\_clock** and specify only one clock.

## SEE ALSO

**set\_autofix\_clock** (2).

**UIT-389** (error) You cannot specify more than one asynchronous port.

## DESCRIPTION

This message informs you that you used the **set\_autofix\_async** command and specified more than one asynchronous port. You can specify only one asynchronous port with this command.

## WHAT NEXT

Rerun **set\_autofix\_async** and specify only one asynchronous port.

## SEE ALSO

**set\_autofix\_async** (2).

**UIT-390** (error) Clock port %s has a hold value of %s. You cannot specify a clock port that has a hold value set on it.

## DESCRIPTION

You receive this message from **set\_autofix\_clock** if the specified clock port has the specified hold value set on it. Clocks with hold values are not valid for **set\_autofix\_clock**. A hold value is set on a clock by using the **set\_test\_hold** command, which places the **test\_hold** attribute on the clock. You can remove the **test\_hold** attribute using the **remove\_attribute** command; **reset\_design** removes all attributes, including **test\_hold**.

## WHAT NEXT

Remove the **test\_hold** attribute from the clock port using the **remove\_attribute** command. Then reissue the **set\_autofix\_clock** command and respecify the clock port.

## SEE ALSO

`remove_attribute` (2), `reset_design` (2), `set_ autofix_clock` (2), `set_test_hold` (2).

## UIT-391 (information) Performing set\_ autofix\_clock of clock "%s" on cell/instance "%s".

### DESCRIPTION

This message informs you that `set_ autofix_clock` is being performed on the specified clock on the specified cell or instance.

### WHAT NEXT

This is an informational message only; no action is required on your part.

## SEE ALSO

`set_ autofix_clock` (2).

## UIT-392 (warning) The variable `disable_transition_degradation` is now obsolete. Use `disable_library_transition_degradation` instead.

### DESCRIPTION

This message informs you that the variable `disable_transition_degradation` is now obsolete, and has been replaced by `disable_library_transition_degradation`. However, `disable_transition_degradation` will continue to be supported for backward compatibility.

### WHAT NEXT

Use `disable_library_transition_degradation` instead of `disable_transition_degradation` in future designs.

## SEE ALSO

`disable_library_transition_degradation` (3).

## **UIT-393 (error) '%s' is not a valid compliance enable pattern name.**

### **DESCRIPTION**

The **remove\_bsd\_specification -compliance <all | pattern name>** command let you remove all compliance enable patterns, or one compliance enable pattern with given pattern name.

### **WHAT NEXT**

You mush specify a valid pattern name, or "all". To view all existing compliance patterns, use command **report\_test -bsd**.

### **SEE ALSO**

**set\_bsd\_compliance , report\_test .**

## **UIT-394 (error) Port %s is not a test asynch or a test asynch inverted.**

### **DESCRIPTION**

The port %s is neither a test asynch nor a test asynch inverted. Use **set\_signal\_type** to create a test asynch or test asynch inverted associated with the port %s.

### **WHAT NEXT**

Use **report\_test -port** to report all test asynchs available on the current design.

## **UIT-395 (error) Port %s is already a test asynch or a test asynch inverted and can not be a test clock.**

### **DESCRIPTION**

The port %s is a test asynch or test asynch inverted and can not be a test clock. Use **remove\_attribute** if you do not want the port %s to be a test asynch (or a test asynch inverted) and repeat **create\_test\_clock**.

## WHAT NEXT

Use `report_test -port` to report all test clocks and test asynchs available on the current design.

# UIT-396 (error) Port %s is already a test clock and can not be a test asynch or a test asynch inverted.

## DESCRIPTION

The port %s is a test clock and can not be a test asynch or a test asynch inverted. Use `remove_attribute` if you do not want the port %s to be a test clock and repeat `set_signal_type`.

## WHAT NEXT

Use `report_test -port` to report all test clocks and test asynchs available on the current design.

# UIT-397 (error) You cannot specify more than two async ports.

## DESCRIPTION

You receive this error message if you execute `set_ autofix_async` and specify more than two asyncs. You can specify one or two asyncs.

## WHAT NEXT

Re-execute `set_ autofix_async` and specify one or two asyncs.

## SEE ALSO

`set_ autofix_async (2)`.

# UIT-398 (error) Options '-function' and '-direction' cannot be specified together.

## DESCRIPTION

You receive this error message if you execute `set_bsd_data_cell` command and

specified both the '-function' and '-direction' options. Currently **set\_bsd\_data\_cell** command supports two alternate options to specify the BSR data cell function at a port. The '-function' option provides a direct way of specifying the BSR data cell function at a port. In the alternate way of specification the BSR data cell function is inferred from the '-direction' option and the port\_direction. You should use exactly one of the '-function' and '-direction' options in your specification.

## WHAT NEXT

Re-execute **set\_bsd\_data\_cell** and specify exactly one of the '-function' and '-direction' option.

## SEE ALSO

**set\_bsd\_data\_cell** (2).

## UIT-399 (error) Invalid value %s specified for the '-function' option.

## DESCRIPTION

You receive this error message if you execute **set\_bsd\_data\_cell** command and specified an incorrect value for the '-function' option. The '-function' option provides a direct way of specifying the BSR data cell function at a port. The valid values for this option are: INPUT INPUT\_INVERTED OUTPUT OUTPUT\_INVERTED BIDIR BIDIR\_INVERTED OBSERVE

## WHAT NEXT

Re-execute **set\_bsd\_data\_cell** and specify a valid value for the '-function' option.

## SEE ALSO

**set\_bsd\_data\_cell** (2).

## UIT-400 (error) internal error, write\_test vector formatter (stran) is unable to write out status.

## DESCRIPTION

The **write\_test** command invokes the vector formatter **stran** in order to translate .sif

files to different vector formats. Once **stran** is run, it communicates back its result status to **write\_test** through a file named '.stran.status'.

The error message above is issued by the **write\_test** command when the '.stran.status' file is not writable. Two reasons for that to happen: either '.stran.status' has WRITE permission or no disk space left.

## WHAT NEXT

Check for write permission on the .stran.status file or disk space.

# UIT-401 (error) Unknown -command option argument '%s' for preview\_scan, assuming 'insert\_scan' (default).

## DESCRIPTION

If you receive this message, you have probably used an invalid argument for the **-command** option of the **preview\_scan** command. The valid arguments are **insert\_scan** (the default) or **reoptimize\_design**; this message informs you that the default, **insert\_scan**, is being used.

When **-command** is set to **insert\_scan**, **preview\_scan** works only in logical domain. When **-command** is set to **reoptimize\_design**, **preview\_scan** takes the physical design information into account.

## WHAT NEXT

If you do not want **preview\_scan** to use the **insert\_scan** argument to the **-command** option, reapply the **preview\_scan** command with the **reoptimize\_design** option. For details, see the **preview\_scan** man page.

# UIT-402 (error) BSD configuration style must be either synchronous or asynchronous.

## DESCRIPTION

You receive this message if you issue **set\_bsd\_configuration -style** with an invalid argument for the **-style** option. Valid values are *synchronous* and *asynchronous*. The **set\_bsd\_configuration** command specifies the configuration style for the boundary scan design synthesized by the **insert\_bsd** command.

## WHAT NEXT

Reissue **set\_bsd\_configuration -style** with a valid argument for the **-style** option.

## SEE ALSO

`insert_bsd` (2), `set_bsd_configuration` (2).

# UIT-403 (error) BSD instruction width must be in the range of 2 to 31.

## DESCRIPTION

You receive this message if you issue the `set_bsd_configuration` command with an invalid value for the `-ir_width` option argument. Valid values are 2 through 31 only. The `insert_bsd` command uses the `-ir_width` option value to specify the number of bits in the instruction register when synthesizing the boundary scan design.

## WHAT NEXT

Reissue the `set_bsd_configuration` with a valid value for the `-ir_width` option argument.

## SEE ALSO

`insert_bsd` (2), `set_bsd_configuration` (2).

# UIT-404 (error) Invalid boundary scan register type for a bidirectional port.

## DESCRIPTION

You receive this message if you issue the `set_bsd_data_cell` command and specify an invalid value for the boundary scan register cell type to be used for a bidirectional port. Valid values of boundary scan register cell types for input, output, and bidirectional ports are listed in the manual page and the online help for the `set_bsd_data_cell` command. The `insert_bsd` command uses the specified boundary scan register cell types when synthesizing the boundary scan design.

## WHAT NEXT

Refer to the manual page or the online help for the `set_bsd_data_cell` command to determine the current valid boundary scan register cell types, and reissue the `set_bsd_data_cell` command with a valid type.

## SEE ALSO

`insert_bsd` (2), `set_bsd_data_cell` (2).

# UIT-405 (error) Invalid boundary scan register cell type for an input port.

## DESCRIPTION

You receive this message if you issue the `set_bsd_data_cell` command and specify an invalid value for the boundary scan register cell type to be used for an input port. Valid values of boundary scan register cell types for input, output, and bidirectional ports are listed in the manual page and the online help for the `set_bsd_data_cell` command. The `insert_bsd` command uses the specified boundary scan register cell types when synthesizing the boundary scan design.

## WHAT NEXT

Refer to the manual page or the online help for the `set_bsd_data_cell` command to determine the current valid boundary scan register cell types, and reissue the `set_bsd_data_cell` command with a valid type.

## SEE ALSO

`insert_bsd` (2), `set_bsd_data_cell` (2).

# UIT-406 (error) Invalid boundary scan register cell type for an output port.

## DESCRIPTION

You receive this message if you issue the `set_bsd_data_cell` command and specify an invalid value for the boundary scan register cell type to be used for an output port. Valid values of boundary scan register cell types for input, output, and bidirectional ports are listed in the manual page and the online help for the `set_bsd_data_cell` command. The `insert_bsd` command uses the specified boundary scan register cell types when synthesizing the boundary scan design.

## WHAT NEXT

Refer to the manual page or the online help for the `set_bsd_data_cell` command to determine the current valid boundary scan register cell types, and reissue the `set_bsd_data_cell` command with a valid type.

## SEE ALSO

`insert_bsd` (2), `set_bsd_data_cell` (2).

# UIT-407 (error) Invalid port type '%s' specified for user-defined BSR, TAP, or BSD Register.

## DESCRIPTION

You receive this message if you issue the `set_bsd_bsr_element`, `set_bsd_tap_element`, or `set_bsd_register` command and specify an invalid port type. Valid port types are found in the manual page or online help for each of the three commands. The `insert_bsd` command uses the user-defined registers when synthesizing the boundary-scan design.

## WHAT NEXT

Refer to the manual pages or the online help for the `set_bsd_bsr_element`, `set_bsd_tap_element`, or `set_bsd_register` command to determine the current valid BSR, TAP, and BSD register port types, respectively. Then reissue the appropriate command with a valid port type.

## SEE ALSO

`insert_bsd` (2), `set_bsd_bsr_element` (2), `set_bsd_register` (2), `set_bsd_tap_element` (2).

# UIT-408 (error) Invalid port or control BSR name '%s'.

## DESCRIPTION

You receive this message if you issue the `set_bsd_path` command and the `identifier_list` contains a name that is neither a valid design port nor a valid control BSR cell identifier; this could be caused by a typo or spelling error. The `identifier_list` must contain a list of names of valid ports and valid control BSR identifiers. The order of the names in the list determines the order that the `insert_bsd` command uses when it implements the boundary scan design.

## WHAT NEXT

Verify the correct names of the ports and control BSR cell identifiers, then reissue the `set_bsd_path` command using the correct names and identifiers.

## SEE ALSO

`insert_bsd` (2), `set_bsd_control_cell` (2), `set_bsd_path` (2).

# UIT-409 (error) Port direction must be either "in" or "out".

## DESCRIPTION

You receive this message if you execute `set_bsd_data_cell` or `set_bsd_path` and specify an invalid port direction. Valid port directions are "in" and "out". For `set_bsd_data_cell`, you specify the port direction using the `-direction` option. For `set_bsd_path`, you can specify the direction of a bidirectional port by attaching /in or /out to the port name in the `identifier_list`.

The `insert_bsd` command uses the port direction information when synthesizing the boundary scan design.

## WHAT NEXT

Choose a valid port direction for the port, and reissue the appropriate command using the valid port direction.

## SEE ALSO

`insert_bsd` (2), `set_bsd_data_cell` (2), `set_bsd_path` (2).

# UIT-410 (error) You cannot specify the direction of a nonbidirectional port.

## DESCRIPTION

You receive this message if you execute the `set_bsd_path` command and specify the direction of a port that is not a bidirectional port. You can specify the direction of a bidirectional port in the `identifier_list` as `port_name/in` or `port_name/out`; however, it is an error to attach /in or /out to the name of a nonbidirectional port. `insert_bsd` uses the `identifier_list` to determine the order in which the BSR cells are to be connected in the synthesized boundary scan design.

## WHAT NEXT

Verify the port types in the `identifier_list`, and reexecute the `set_bsd_path` command specifying the direction for only the bidirectional ports.

## SEE ALSO

`insert_bsd` (2), `set_bsd_path` (2).

# UIT-411 (error) Cannot find the specified pin '%s'.

## DESCRIPTION

You receive this message if you issue the `set_bsd_register` command and a pin specified in the `access_list` cannot be found on the user-specified boundary scan data register cell. This could be caused by a typo or spelling error. The `insert_bsd` command uses the user-specified boundary scan data register cell in synthesizing the boundary scan design. You may also get this message if you intend to specify a scan-through tap register, and issue the `set_bsd_register` command with the reserved words `SR_SI` or `SR_SO` in the access list, however the register name is not the reserved word `STT_REG`.

## WHAT NEXT

Verify the correct name for the specified pin, and reissue the `set_bsd_register` command using the correct pin name. If you want to specify a scan-through-tap register use the reserved name `STT_REG` for the register and reissue the command.

## SEE ALSO

`insert_scan` (2), `set_bsd_register` (2).

# UIT-412 (error) You cannot specify a control BSR cell for a non-tristate port '%s'.

## DESCRIPTION

You receive this message if you execute the `set_bsd_control_cell` command and the `port_list` contains a port that is not connected to a tristate pad. You specify a control BSR cell to control tristate port pads only. The `insert_bsd` command uses the control BSR cell when synthesizing the boundary scan design.

## WHAT NEXT

Reexecute the `set_bsd_control_cell` command with a `port_list` that contains only names of ports that are connected to tristate pads.

## SEE ALSO

`insert_bsd` (2), `set_bsd_control_cell` (2).

# UIT-413 (error) Cannot find the specified port '%s' in the design or instance.

## DESCRIPTION

You receive this message if you execute the `set_bsd_bsr_element`, `set_bsd_tap_element`, or `set_bsd_register` command and a port you specify cannot be found in the design or instance. This could be caused by a typo or spelling error.

## WHAT NEXT

Verify the name of the port. Then reissue the appropriate command using the correct port name for the design or instance.

## SEE ALSO

`insert_bsd` (2), `set_bsd_bsr_element` (2), `set_bsd_register` (2), `set_bsd_tap_element` (2).

# UIT-414 (error) Cannot find cell name '%s' in the current design.

## DESCRIPTION

You receive this message if you issue the `set_bsd_register` command and the name you specify for the `hierarchical_cell` argument cannot be found in the current design. This could be caused by a typo, a spelling error, or an incorrect path.

The `insert_bsd` command uses the user-specified boundary scan data register cell in synthesizing the boundary scan design.

## WHAT NEXT

Verify the correct name and hierarchical path of the cell you want to specify as a boundary scan data register, and reissue the `set_bsd_register` command using the correct name.

## SEE ALSO

`insert_bsd` (2), `set_bsd_register` (2).

## **UIT-415 (error) Invalid cell type for boundary scan register element.**

### **DESCRIPTION**

You receive this message if you issue the **set\_bsd\_bsr\_element** command and specify an invalid value for the boundary scan register cell type. Valid values of boundary scan register cell types are listed in the manual page and the online help for the **set\_bsd\_bsr\_element** command. The **insert\_bsd** command uses the specified boundary scan register cell type when synthesizing the boundary scan design.

### **WHAT NEXT**

Refer to the manual page or the online help for the **set\_bsd\_bsr\_element** command to determine the current valid boundary scan register cell types, and reissue the **set\_bsd\_bsr\_element** command with a valid cell type.

### **SEE ALSO**

**insert\_bsd** (2), **set\_bsd\_bsr\_element** (2).

## **UIT-416 (error) Invalid cell type for boundary scan tristate control register.**

### **DESCRIPTION**

You receive this message if you issue the **set\_bsd\_control\_cell** command and specify an invalid cell type for the boundary scan tristate control register. Valid values of cell types for a boundary scan tristate control register are listed in the manual page and the online help for the **set\_bsd\_control\_cell** command. The **insert\_bsd** command uses the specified boundary scan control register cell type when synthesizing the boundary scan design.

### **WHAT NEXT**

Refer to the manual page or the online help for the **set\_bsd\_control\_cell** command to determine the current valid cell types for the boundary scan tristate control register, and reissue the **set\_bsd\_control\_cell** command with a valid cell type.

### **SEE ALSO**

**insert\_bsd** (2), **set\_bsd\_control\_cell** (2).

# **UIT-417 (error) Invalid boundary scan register cell type for ports.**

## **DESCRIPTION**

You receive this message if you issue the **set\_bsd\_data\_cell** command and specify an invalid value for the boundary scan register cell type to be used for specified ports. Valid values of boundary scan register cell types for input, output, and bidirectional ports are listed in the manual page and the online help for the **set\_bsd\_data\_cell** command. The **insert\_bsd** command uses the specified boundary scan register cell types when synthesizing the boundary scan design.

## **WHAT NEXT**

Refer to the manual page or the online help for the **set\_bsd\_data\_cell** command to determine the current valid boundary scan register cell types, and reissue the **set\_bsd\_data\_cell** command with a valid cell type.

## **SEE ALSO**

**insert\_bsd** (2), **set\_bsd\_data\_cell** (2).

# **UIT-418 (error) Cannot find the specified design in memory.**

## **DESCRIPTION**

You receive this message if you execute the **set\_bsd\_bsr\_element** or **set\_bsd\_tap\_element** command and the name you specify for the *design\_name* argument cannot be found in memory. This could be caused by a typo or spelling error. The **insert\_bsd** command uses the specified design as a boundary scan register or tap controller when synthesizing the boundary scan design.

## **WHAT NEXT**

Verify that the design you want to use does exist in memory, and verify its spelling. Then re-execute the appropriate command using the correct design name.

## **SEE ALSO**

**insert\_bsd** (2), **set\_bsd\_bsr\_element** (2), **set\_bsd\_tap\_element** (2).

# **UIT-419 (error) You cannot use a reserved word as a user-**

defined boundary scan data register name.

## DESCRIPTION

You receive this message if you execute the **set\_bsd\_register** command in DB mode or **set\_scan\_path** command in XG mode and specify a reserved word (for example, BOUNDARY, BYPASS, or DEVICE\_ID) as the *register\_identifier*. Reserved words are predefined names, reserved for boundary scan test data; you cannot use a reserved word to name a user-defined data register. Reserved words are listed in the manual page for the **set\_bsd\_register** command. The **insert\_bsd** command in DB mode or **insert\_dft** command in XG mode uses the user-defined data register when synthesizing the boundary scan design.

## WHAT NEXT

Refer to the manual page of the **set\_bsd\_register** command for the list of reserved words, and specify a *register\_identifier* that is not a reserved word.

## SEE ALSO

**insert\_bsd** (2), **set\_bsd\_register** (2), **insert\_dft** (2), **set\_scan\_path** (2).

# UIT-420 (error) Invalid bidirectional port is specified

## DESCRIPTION

You can use the **set\_bsd\_path** command to specify the order in which the BSR cells need to be hooked up in the boundary scan design synthesized by the **create\_bsd** command. This command takes a list of design ports or control BSR names as input. For a bidirectional port the direction can be specified as <port\_name>/in or <port\_name>/out if the input BSR cell and output BSR cell for the port need to be routed in a particular order. Direction can't be specified for a non bidirectional port. You have specified direction for a non bidirectional port.

## WHAT NEXT

Don't specify direction for a non bidirectional port.

# UIT-421 (error) Invalid bidirectional port is specified

## DESCRIPTION

You can use the **set\_bsd\_path** command to specify the order in which the BSR cells need to be hooked up in the boundary scan design synthesized by the **create\_bsd** command.

This command takes a list of design ports or control BSR names as input. For a bidirectional port the direction can be specified as <port\_name>/in or <port\_name>/out if the input BSR cell and output BSR cell for the port need to be routed in a particular order. Direction can't be specified for a non bidirectional port. You have specified direction for a non bidirectional port.

## WHAT NEXT

Don't specify direction for a non bidirectional port.

# UIT-422 (error) Invalid bidirectional port is specified

## DESCRIPTION

You can use the **set\_bsd\_path** command to specify the order in which the BSR cells need to hooked up in the boundary scan design synthesized by the **create\_bsd** command. This command takes a list of design ports or control BSR names as input. For a bidirectional port the direction can be specified as <port\_name>/in or <port\_name>/out if the input BSR cell and output BSR cell for the port need to be routed in a particular order. Direction can't be specified for a non bidirectional port. You have specified direction for a non bidirectional port.

## WHAT NEXT

Don't specify direction for a non bidirectional port.

# UIT-423 (error) Invalid bidirectional port is specified

## DESCRIPTION

You can use the **set\_bsd\_path** command to specify the order in which the BSR cells need to hooked up in the boundary scan design synthesized by the **create\_bsd** command. This command takes a list of design ports or control BSR names as input. For a bidirectional port the direction can be specified as <port\_name>/in or <port\_name>/out if the input BSR cell and output BSR cell for the port need to be routed in a particular order. Direction can't be specified for a non bidirectional port. You have specified direction for a non bidirectional port.

## WHAT NEXT

Don't specify direction for a non bidirectional port.

## **UIT-424 (error) Specified BSD pad design "%s" does not exist.**

### **DESCRIPTION**

You receive this error message because you have executed the **set\_bsd\_pad\_design** command and specified a design that does not exist in memory. You can use **set\_bsd\_pad\_design** to specify and characterize a design as a pad design. Such a design is treated like a pad cell by the boundary-scan insertion.

### **WHAT NEXT**

Use the **list\_designs** command to see what designs are in memory, then use the **read** command to read in the design. Next, execute the **set\_bsd\_pad\_design** command to set the desired design as a pad design.

### **SEE ALSO**

**list\_designs** (2), **read** (2), **set\_bsd\_pad\_design** (2).

## **UIT-425 (error) Signal type "%s" specified in the access list of the pad design is invalid.**

### **DESCRIPTION**

You receive this error message because you have executed the **set\_bsd\_pad\_design** command and have specified an invalid signal type as part of the access list for the pad design. You use the **set\_bsd\_pad\_design** command to specify and characterize a design as a pad design. The access list for the pad design is specified as a list of pairs of signal types and pin names. Valid signal types are `data_in`, `data_in_inverted`, `data_out`, `data_out_inverted`, `enable`, and `enable_inverted`.

### **WHAT NEXT**

Reexecute the **set\_bsd\_pad\_design** command and specify a valid signal type in the access list for the **-access** option.

### **SEE ALSO**

**set\_bsd\_pad\_design** (2).

## **UIT-426 (error) Specified pad design "%s" does not have a pin**

named "%s".

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_pad\_design** command and specify a pin name in the access list that does not exist in the pad design. The **set\_bsd\_pad\_design** command is used to specify and characterize a design as a pad design. The access list for the pad design specifies a list of pairs of signal types and pin names.

## WHAT NEXT

Reexecute the **set\_bsd\_pad\_design** command and specify a valid pin name in the access list for the **-access** argument.

## SEE ALSO

**find** (2), **set\_bsd\_pad\_design** (2).

**UIT-427** (error) "%s" is not a valid value for the "%s" option of the **set\_bsd\_pad\_design** command.

## DESCRIPTION

You receive this error message because you have specified an invalid argument for the **-type** option, the **-disable\_res** option, or the **-differential** option of the **set\_bsd\_pad\_design** command. Use the **set\_bsd\_pad\_design** command to specify and characterize a design as a pad design. Valid arguments for the **-type** option are input, output, tristate\_output, and bidirectional. Valid arguments for the **- disable\_res** option are WEAK0, WEAK1, PULL0, and PULL1. Valid arguments for the **- differential** option are true and false.

## WHAT NEXT

Reexecute the **set\_bsd\_pad\_design** command and specify a valid option argument.

## SEE ALSO

**find** (2), **set\_bsd\_pad\_design** (2).

**UIT-428** (error) Insufficient BSD instruction width '%d' specified.

## Requires at least '%d'.

### DESCRIPTION

This error message tells you that you used the **set\_bsd\_configuration** command and specified an invalid value for the **-ir\_width** option. The specified width is not sufficient to hold all the instruction opcodes specified with the **set\_bsd\_instruction** command. The **insert\_bsd** command uses the **-ir\_width** option value to specify the number of bits in the instruction register when synthesizing the boundary scan design.

### WHAT NEXT

Use the **set\_bsd\_configuration** command with the **-ir\_width** option and specify a value sufficient to hold all the instruction opcodes.

### SEE ALSO

**insert\_bsd** (2), **set\_bsd\_configuration** (2), **set\_bsd\_instruction** (2).

## UIT-429 (error) BSD instruction opcode width must be in the range of 2 to 31.

### DESCRIPTION

This error message indicates that you ran the **set\_bsd\_instruction** command with the **-code** option and specified an invalid opcode width. Valid opcode widths are 2 through 31. The **insert\_bsd** command uses the opcode width to specify the number of bits in the instruction register when synthesizing the boundary scan design.

### WHAT NEXT

Rerun the **set\_bsd\_instruction** command and specify a valid opcode width for the **-code** option argument.

### SEE ALSO

**insert\_bsd** (2), **set\_bsd\_instruction** (2).

## UIT-430 (error) Signal type '%s' specified twice or specified with

its inversion.

## DESCRIPTION

This message informs you that you ran the **set\_bsd\_pad\_design** command with an access list that specifies a signal type twice, or that specifies a signal type and its inversion. For example, an access list specifying both enable and enable\_inverted signal types, or specifying two data\_in signal types results in this error message.

## WHAT NEXT

Rerun the **set\_bsd\_pad\_design** command with a valid access list.

## SEE ALSO

**insert\_bsd** (2), **set\_bsd\_pad\_design** (2).

# UIT-431 (error) Signal type '%s' specified twice.

## DESCRIPTION

You receive this message if you issue the **set\_bsd\_pad\_design** command with an access list specifying a signal type or it's inverted type twice. For instance an access list specifying both enable and enable\_inverted signal types, or an access list specifying two data\_in signal types.

## WHAT NEXT

Reissue the **set\_bsd\_pad\_design** with a valid access list.

## SEE ALSO

**insert\_bsd** (2), **set\_bsd\_pad\_design** (2).

# UIT-432 (error) Incorrect %s field is specified for input/output ports.

## DESCRIPTION

You receive this message if you execute **set\_bsd\_data\_cell** command and specify an incorrect direction/function for an input or output port. The direction field in **set\_bsd\_data\_cell** command for input/output ports should be unspecified(in which case

it is assumed to be the same as the port direction) or should be consistent with the port direction. The function field in **set\_bsd\_data\_cell** command for input ports should be unspecified(in which case it is assumed to be INPUT) or should be either INPUT or INPUT\_INVERTED or OBSERVE. The function field in **set\_bsd\_data\_cell** command for output ports should be unspecified (in which case it is assumed to be OUTPUT) or should be either OUTPUT or OUTPUT\_INVERTED. Please note that options direction and function are mutually exclusive.

## WHAT NEXT

For input/output ports, leave the direction/function field blank or specify a direction/function consistent with the port direction. For bidirectional port, you should specify the direction/function, or leave it blank in case you specify the cell\_type as "BC\_7", or "none".

# UIT-433 (error) The output format '%s' was not supported by new translation engine.

## DESCRIPTION

You receive this message if you execute **write\_test** command with **write\_test\_new\_translation\_engine** = true(default), but specify a test program format which is not currently supported by new translation engine.

## WHAT NEXT

For valid test program formats currently supported by new translation engine, execute "write\_test -help" for more information.

# UIT-434 (error) The design does not have a BSD clock port.

## DESCRIPTION

You receive this message if you execute **write\_test** command to write out the BSD test program in or through STIL format, but the design does not have a BSD clock port.

## WHAT NEXT

Please check if the jtag clock of the design was defined correctly.

## SEE ALSO

**set\_bsd\_signal** (2), **set\_bsd\_port** (2), **set\_signal\_type** (2).

## **UIT-435 (error) The unix environment variable LTRAN\_ROOT is not defined.**

### **DESCRIPTION**

You receive this message if you execute **write\_test** command to write out test program with format tdl91, tstl2, or ftdl, with environment variable **write\_test\_new\_translation\_engine" set to true(default). In this case, the environment variable LTRAN\_ROOT must be correctly set to invoke Ltran executable.**

### **WHAT NEXT**

You should set it as,

```
setenv LTRAN_ROOT $SYNOPSYS/$TARGET_ARCH/syn/tran
```

## **UIT-436 (warning) Assigning name "%s" to the bsr element.**

### **DESCRIPTION**

You get this warning when the (optional) name parameter for the bsr element is not specified. When unspecified, a name identical to the bsr element type("BC\_1", "BC\_2", "BC\_4" or "BC\_7") is assigned to the bsr element. As BSD compiler recognizes the bsr elements named as "BC\_1", "BC\_2", "BC\_4" and "BC\_7" as the default bsr elements of types BC\_1, BC\_2, BC\_4 and BC\_7 respectively, this bsr element will become the default bsr element for the type. If a bsr element named so(explicitly or implicitly) is not defined, then Design Ware bsr element remains the default bsr element for the type. A default bsr element is the one chosen from different implementations for bsr cells not having a "set\_bsd\_data\_cell" or "set\_bsd\_control\_cell" specification.

### **WHAT NEXT**

Specify a valid name other than "BC\_1", "BC\_2", "BC\_4" and "BC\_7" for the bsr element if you do not intend to use this bsr element as the default for the type, and rerun the command.

### **SEE ALSO**

```
set_bsd_bsr_element (2), set_bsd_data_cell (2), set_bsd_control_cell (2).
```

## **UIT-437 (error) Reserved name %s cannot be used as bsr**

element name for type %s.

## DESCRIPTION

You get this warning when the name specified for the bsr element is one of the reserved names "BC\_1", "BC\_2", "BC\_4" or "BC\_7" and it does not match with the specified type of the bsr element. Reserved bsr elements names "BC\_1", "BC\_2", "BC\_4" and "BC\_7" are used to explicitly define the default bsr elements of types BC\_1, BC\_2, BC\_4 and BC\_7 respectively (else Design Ware bsr elements are used as default), and must match with the type. A default bsr element is the one chosen from different implementations for bsr cells not having a "set\_bsd\_data\_cell" or "set\_bsd\_control\_cell" specification.

## WHAT NEXT

Correct the name or the type of the bsr element. Specify a unique name other than "BC\_1", "BC\_2", "BC\_4" and "BC\_7" for the bsr element if you do not intend to use this bsr element as the default for the type.

## SEE ALSO

`set_bsd_bsr_element (2)`, `set_bsd_data_cell (2)`, `set_bsd_control_cell (2)`.

**UIT-438 (error) Reserved name "%s" cannot be used as bsr element name.**

## DESCRIPTION

You get this warning when the name specified for the bsr element is one of the reserved names "DW\_BC\_1", "DW\_BC\_2", "DW\_BC\_4", "DW\_BC\_7" or "NONE". These reserved bsr elements names are used to convey the following meaning when used as the bsr element identifier in the "set\_bsd\_data\_cell" and "set\_bsd\_control\_cell" commands:

DW\_BC\_1 - Insert a Design Ware BSR cell of type BC\_1  
DW\_BC\_2 - Insert a Design Ware BSR cell of type BC\_2  
DW\_BC\_4 - Insert a Design Ware BSR cell of type BC\_4  
DW\_BC\_7 - Insert a Design Ware BSR cell of type BC\_7  
NONE - Do not insert a BSR cell

## WHAT NEXT

Specify a valid name for the bsr element other than "DW\_BC\_1", "DW\_BC\_2", "DW\_BC\_4", "DW\_BC\_7" or "NONE".

## SEE ALSO

`set_bsd_bsr_element (2)`, `set_bsd_data_cell (2)`, `set_bsd_control_cell (2)`.

## **UIT-439 (error) BSR element named %s has already been defined.**

### **DESCRIPTION**

You get this warning when the name specified for the bsr element has already been used to define a bsr element by an earlier "set\_bsd\_bsr\_element" command.

### **WHAT NEXT**

Specify a unique and valid name for the bsr element, and rerun the command.

### **SEE ALSO**

`set_bsd_bsr_element (2)`, `set_bsd_data_cell (2)`, `set_bsd_control_cell (2)`.

## **UIT-440 (warning) This bsr cell becomes the default bsr element for type %s.**

### **DESCRIPTION**

BSD compiler recognizes the bsr elements named as "BC\_1", "BC\_2", "BC\_4" and "BC\_7" as the default bsr elements of types BC\_1, BC\_2, BC\_4 and BC\_7 respectively. If a bsr element named so is not defined, then Design Ware bsr element remains the default bsr element for the type. Note that if the name is not specified for a bsr element then BSD compiler assigns a name identical to the bsr element type("BC\_1", "BC\_2", "BC\_4" or "BC\_7") for the bsr element. A default bsr element is the one chosen from different implementations for bsr cells not having a "set\_bsd\_data\_cell" or "set\_bsd\_control\_cell" specification.

### **WHAT NEXT**

Specify a valid name other than "BC\_1", "BC\_2", "BC\_4" and "BC\_7" for the bsr element if you do not intend to use this bsr element as the default for the type, and rerun the command.

### **SEE ALSO**

`set_bsd_bsr_element (2)`, `set_bsd_data_cell (2)`, `set_bsd_control_cell (2)`.

## **UIT-441 (error) Illegal width %d for port '%s'. Port width for signal**

# **type '%s' must be %d.**

## **DESCRIPTION**

You get this error when you specify a custom tap design port signal type and the actual width of the port is not found valid. The bus port widths must be as follows for different access types:

```
instructions = 32-bit tap_state = 16-bit user_code_val = 32-bit ver = 4-bit part_num
= 16-bit mnfr_id = 11-bit
```

Rest of the access types are scalar with expected port width of 1.

## **WHAT NEXT**

Provide a correct interface for the tap design.

## **SEE ALSO**

[\*\*set\\_bsd\\_tap\\_element \(2\)\*\*](#)

# **UIT-442 (error) Usercode value is not specified for the %s instruction.**

## **DESCRIPTION**

You get this error when you specify the USERCODE instruction, but don't provide a usercode value. USERCODE instruction must have the usercode value specified using the "-user\_code\_val" option of the "set\_bsd\_instruction" command.

## **WHAT NEXT**

Correct the specification by specifying the usercode value. The 32-bit usercode value can be specified as design pin(s) and/or sized binary constant and/or sized hex constant. Design pins must be specified as full hierarchical full pin names. Binary and hex constants must be specified using the verilog syntax.

Example: -----

Following is an incomplete and hence invalid USERCODE specification:  
`set_bsd_instruction USERCODE -code {0110}`

The above USERCODE specification should be corrected by specifying the usercode value. For instance following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
```

```
version_reg/v2, version_reg/v1, version_reg/v0, 16'b111111110000000, 12'h2ab}
```

## SEE ALSO

**set\_bsd\_instruction** (2)

**UIT-443 (error)** Usercode value cannot be specified for %s instruction. Usercode value can only be specified for the USERCDOE instruction.

## DESCRIPTION

You get this error when you specify the usercode value for a non USERCODE instruction. An instruction is treated as the USERCODE instruction when the instruction name is spelt as u-s-e-r-c-o-d-e (case insensitive).

## WHAT NEXT

Correct the specification. If you have USERCODE specification mixed with other instructions, you will get this error for other instructions in the list. If this is the case, separate the USERCODE specification.

If you intend to implement the USERCODE instruction and get this message make sure that the instruction name is spelt correctly(it must be spelt as case insensitive u-s-e-r-c-o-d-e).

## SEE ALSO

**set\_bsd\_instruction** (2)

**UIT-444 (error)** '%s' is a PrimeTime command that is not supported by Design Compiler.

## DESCRIPTION

Although this command is supported by PrimeTime, it is not currently supported by Design Compiler. You can check which commands are supported by Design Compiler by executing **list -commands** or **help** in dc\_shell.

## WHAT NEXT

Remove the command that is not supported.

## **UIT-445 (warning) Invalid value '%s' for spdm\_mode. The valid values are either false or true. Setting default value as false.**

### **DESCRIPTION**

### **WHAT NEXT**

Set it to one of the valid values.

### **EXAMPLES**

#### **EXAMPLE MESSAGE**

Error: Invalid value 'false' for spdm\_mode. The valid values are either false or true. Setting default value as false. (UIT-445)

## **UIT-446 (error) Invalid argument in the usercode value list. '%s' is not a valid design pin, sized binary or a sized hex constant.**

### **DESCRIPTION**

You get this error when you specify an invalid value in the usercode value argument list for the USERCODE instruction. The 32-bit usercode value can be specified as any combination of design pin(s) and/or sized binary constant and/or sized hex constant.

### **WHAT NEXT**

Check and correct the usercode value argument syntax. Design pins must be specified as full hierarchical full pin names. Binary and hex constants must be specified using the following verilog syntax:

<size>'[b|B|h|H]<binary or hexadecimal value>

Example: ----- Following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
version_reg/v2, version_reg/v1, version_reg/v0, 16'b1111111100000000, 12'h2ab}
```

### **SEE ALSO**

**set\_bsd\_instruction (2)**

## **UIT-447 (error) Invalid size %d of the usercode value argument '%s'. Usercode value argument's size should be in the range of 1 to 32-bits.**

### **DESCRIPTION**

You get this error when you specify a binary or hexadecimal constant value in the usercode value argument list and the size of the argument is not in the valid range of 1 to 32-bits.

Binary and hex constants are specified using the following verilog syntax:

```
<size>'[b|B|h|H]<binary or hexadecimal value>
```

Example: ----- Following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
version_reg/v2, version_reg/v1, version_reg/v0, 16'b1111111100000000, 12'h2ab}
```

### **WHAT NEXT**

Check and correct the usercode value argument's size.

### **SEE ALSO**

**set\_bsd\_instruction (2)**

## **UIT-448 (error) %s usercode value '%s' cannot be represented in the specified %d bits.**

### **DESCRIPTION**

You get this error when you specify a binary or hexadecimal constant value in the usercode value argument list and the specified size of the argument is not sufficient enough to represent the value you have specified.

Binary and hex constants are specified using the following verilog syntax:

```
<size>'[b|B|h|H]<binary or hexadecimal value>
```

### **WHAT NEXT**

Check and correct the usercode value argument's size.

Example: ----- Following is a wrong USERCODE specification, leading to the above

error as the hex value 5'h2ab cannot be represented in 5 bits:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
version_reg/v2, version_reg/v1, version_reg/v0, 16'b111111110000000, 5'h2ab}
```

Following would be a corrected specification:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
version_reg/v2, version_reg/v1, version_reg/v0, 16'b111111110000000, 12'h2ab}
```

## SEE ALSO

**set\_bsd\_instruction** (2)

**UIT-449 (error) A %s value is specified as the usercode value. Usercode value must be a 32-bits value.**

## DESCRIPTION

You get this error when the cumulative bit width of the arguments specified in the '-user\_code\_val' option of the set\_bsd\_instruction command is not 32-bits. The 32-bit usercode value can be specified as any combination of design pin(s) and/or sized binary constant and/or sized hex constant.

Binary and hex constants are specified using the following verilog syntax:  
<size>'[b|B|h|H]<binary or hexadecimal value>

## WHAT NEXT

Check and correct the usercode value argument's size.

Example: ----- Following is a wrong USERCODE specification, leading to the above error as the cumulative bit width of the usercode value here is 31:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
version_reg/v2, version_reg/v1, version_reg/v0, 16'b111111110000000, 11'h2ab}
```

Following would be a corrected specification:

```
set_bsd_instruction USERCODE -code {0110} -user_code_val {version_reg/v3,
version_reg/v2, version_reg/v1, version_reg/v0, 16'b111111110000000, 12'h2ab}
```

## SEE ALSO

## **UIT-450 (error) Cannot read test model file '%s'.**

### **DESCRIPTION**

This error occurs when you try to read a test model file that is protected or does not exist.

### **WHAT NEXT**

Check that the file exists, check the search\_path, and check what protections are set on the file. Then, rerun the **read\_test\_model** command.

### **SEE ALSO**

**read\_test\_model** (2).

## **UIT-451 (error) Cannot write test model file '%s'.**

### **DESCRIPTION**

This error is generated when you run the **write\_test\_model** command and attempt to write the test model file to a nonexistent or protected directory, or over a file that is protected.

### **WHAT NEXT**

Check the existence and the write protection of the directory.

Check the protection of the existing file with the same name. Make the necessary change to the file or directory, and rerun the **write\_test\_model** command.

### **SEE ALSO**

**write\_test\_model** (2).

## **UIT-452 (error) Cannot attach test model to design '%s'.**

### **DESCRIPTION**

This error is generated because a test model in CTL format is successfully read in but cannot be associated with the named design because it does not have a CTL interface.

## WHAT NEXT

Make sure the named design exists and has a CTL interface. Then, rerun the `read_test_model` command.

## SEE ALSO

`read_test_model` (2).

# UIT-453 (error) Design '%s' has no test model.

## DESCRIPTION

This error is generated when you request a test model operation on a design that has no test model.

## WHAT NEXT

Make sure you specified the design you intended. To see a list of designs that have test models, use the `list_test_models` command. You may try to read a test model with the `read_test_modelP` command or infer one with the `check_dftP` command.

## SEE ALSO

`check_dft` (2), `create_test_schedule` (2), `list_test_models` (2), `read_test_model` (2),  
`remove_test_models` (2), `report_test_models` (2), `write_test_model` (2).

# UIT-454 (error) Format '%s' is not a valid test model format.

## DESCRIPTION

This error message indicates that you specified an invalid format with the `read_test_model` command. Valid formats are db (the default) and ctl.

## WHAT NEXT

Rerun the `read_test_model` command and specify a valid format.

## SEE ALSO

`read_test_model` (2).

## **UIT-455 (error) The CTL model in '%s' is not accepted.**

### **DESCRIPTION**

This error occurs when you run the **read\_test\_model** command and specify a CTL file that has errors that prevent the correct interpretation of the file. The exact errors are reported as CTL-\* messages immediately preceding this message.

### **WHAT NEXT**

Fix the reported errors and reissue the command.

### **SEE ALSO**

**list\_test\_models** (2), **remove\_test\_model** (2), **report\_test\_model** (2), **write\_test\_model** (2).

## **UIT-456 (error) The CTL model on design '%s' is not accepted.**

### **DESCRIPTION**

This error occurs when the test model stored on the specified design contains errors that prevent its correct interpretation. The errors are reported as CTL-\* messages immediately preceding this message.

### **WHAT NEXT**

This error is most likely due to a corrupted db file. Verify that the file is not corrupted by reading it using the **read** command and using the design in a context other than test models. If the file is not corrupted, report the problem to Synopsys immediately.

### **SEE ALSO**

**list\_test\_models** (2), **read** (2), **remove\_test\_model** (2), **report\_test\_model** (2).

## **UIT-457 (information) The name of the design is included in the model file; the -design option is ignored.**

### **DESCRIPTION**

This message informs you that the **-design** option does not need to be specified with

the **read\_test\_model** command. For test models in db format, the model file contains the design name.

## WHAT NEXT

To avoid receiving this message, use the **read\_test\_model** command without the **-design** option.

## SEE ALSO

**read\_test\_model** (2).

**UIT-458** (error) Asynchronous port %s has a hold value of %s.  
You cannot  
specify an asynchronous port that has a hold value set on it.

## DESCRIPTION

This error message tells you that the asynchronous port given to the **set\_ autofix\_async** command has the specified hold value set on it. Asynchronous ports with hold values are not valid for **set\_ autofix\_async**. A hold value is set on an asynchronous port using the **set\_test\_hold** command, which places the **test\_hold** attribute on the asynchronous port. You can remove the **test\_hold** attribute by using the **remove\_attribute** command; **reset\_design** removes all attributes, including **test\_hold**.

## WHAT NEXT

Remove the **test\_hold** attribute from the asynchronous port using the **remove\_attribute** command. Then, run the **set\_ autofix\_async** command and specify the asynchronous port.

## SEE ALSO

**remove\_attribute** (2), **reset\_design** (2), **set\_ autofix\_async** (2), **set\_test\_hold** (2).

**UIT-459** (information) Running **set\_ autofix\_async** on  
asynchronous port(s) "%s" to autofix the asynchronous

signal(s) on the cell or instance "%s".

## DESCRIPTION

This message informs you that **set\_autofix\_async** is being run on the specified asynchronous port to autofix the asynchronous signal(s) of the specified cell or instance.

## WHAT NEXT

This is an informational message only. No action is required on your part.

## SEE ALSO

**set\_autofix\_async** (2).

**UIT-460** (error) Mode decoding style must be one of 'default' or 'one\_hot'.

## DESCRIPTION

This error message tells you that you have specified a decoding style other than default or one\_hot for the **-mode\_decoding\_style** option to the **set\_core\_integration\_configuration** command. You use **set\_core\_integration\_configuration** to specify the decoding style for the test mode ports used during core integration by the **insert\_dft** command.

## WHAT NEXT

Specify default or one\_hot as the mode decoding style.

## SEE ALSO

**insert\_dft** (2), **set\_core\_integration\_configuration** (2).

**UIT-461** (information) You must specify the **-mode\_decoding\_style** option and the default or one\_hot switch.

## DESCRIPTION

This informational message tells you that you did not specify any options with the

`set_core_integration_configuration` command.

## WHAT NEXT

Use the `set_core_integration_configuration` command and specify an option.

## SEE ALSO

`set_core_integration_configuration` (2).

**UIT-462** (information) You must specify at least one of the following switches: -all.

## DESCRIPTION

This message informs you that you did not specify an option when you used the `remove_core_integration_configuration` command. The `remove_core_integration_configuration` command does nothing when it is used without options.

## WHAT NEXT

Use the `remove_core_integration_configuration` command with at least one option.

## SEE ALSO

`remove_core_integration_configuration` (2).

**UIT-463** (error) Design '%s' already has a wrapper.

## DESCRIPTION

This error message indicates that you attempted to insert a wrapper around a design using the `insert_wrapper -core_wrapper` command, but the design is already wrapped.

## WHAT NEXT

Run the `insert_dft` command, but do not specify the `-core_wrapper` option.

## SEE ALSO

`insert_dft` (2), `set_dft_configuration` (2).

## **UIT-464 (warning) Resolution of tristate port '%s' failed.**

### **DESCRIPTION**

This warning message tells you that the core wrapper architect only supports simple tristate drivers; for example, single-cell drivers at the top-level. Complex drivers are not supported.

### **WHAT NEXT**

Use simple tristate drivers in the design. Alternatively, the port can be excluded from wrapping.

### **SEE ALSO**

`set_dft_configuration (2)`. `set_core_wrapper_cell (2)`. `set_core_wrapper_configuration (2)`.

## **UIT-465 (warning) Resolution of bidirectional port '%s' failed.**

### **DESCRIPTION**

This warning message tells you that the core wrapper architect only supports simple bidirectional drivers, which are single cell drivers at the top level. Complex drivers are not supported.

### **WHAT NEXT**

Use simple bidirectional drivers in the design. Alternately, exclude the port from wrapping.

### **SEE ALSO**

`set_dft_configuration (2)`, `set_core_wrapper_cell(2)`, `set_core_wrapper_configuration (2)`.

## **UIT-466 (warning) Degenerate bidirectional port : %s.**

## **DESCRIPTION**

This warning message means that the core wrapper architect excludes the specified port from wrapping because it is a degenerate bidirectional port.

## **WHAT NEXT**

Rerun the command and specify a port that is not a degenerate bidirectional port.

## **SEE ALSO**

`set_dft_configuration (2)`, `set_core_wrapper_cell (2)`.

# **UIT-467 (warning) Degenerate tristate port : %s.**

## **DESCRIPTION**

This warning message informs you that the core wrapper architect excludes the specified port from wrapping because it is a degenerate tristate port.

## **WHAT NEXT**

Rerun the command and specify a port that is not a degenerate tristate port.

## **SEE ALSO**

`set_dft_configuration (2)`, `set_core_wrapper_cell (2)`.

# **UIT-468 (error) You must specify at least one of the following switches: -default\_wrapper\_cell, -default\_safe\_state.**

## **DESCRIPTION**

This error occurs because you used the `set_core_wrapper_configuration` command but did not specify any options.

## WHAT NEXT

Run the `set_core_wrapper_configuration` with at least one option.

## SEE ALSO

`remove_core_wrapper_configuration` (2).

# UIT-469 (warning) Bad type for wrapper cell.

## DESCRIPTION

This warning message informs you that the specified wrapper cell type is invalid. The default specification is used.

## WHAT NEXT

Rerun the command and specify a valid wrapper cell type.

## SEE ALSO

`set_core_wrapper_configuration` (2). `set_core_wrapper_cell` (2).

# UIT-470 (error) You must specify at least one of the following switches: -cell\_type, -safe\_value, or -port\_list.

## DESCRIPTION

This error occurs because you used the `set_core_wrapper_cell` command and did not specify and option.

## WHAT NEXT

Run the `set_core_wrapper_cell` command with at least one option.

## SEE ALSO

`set_core_wrapper_configuration` (2).

## **UIT-471 (warning) Bad port: '%s'.**

### **DESCRIPTION**

This warning message informs you that you specified a port that is not in the design.

### **WHAT NEXT**

Run the command and specify a port that is in the design.

### **SEE ALSO**

`set_core_wrapper_cell (2)`, `set_core_wrapper_configuration (2)`.

## **UIT-472 (error) Error when running Core Wrapper.**

### **DESCRIPTION**

This message informs you that the Core Wrapper client could not be run successfully. This indicates an error in the design or in the specifications for core wrapping. Causes might be one of the following:

1. Trying to directly wrap a CTL model
2. Trying to wrap a design without any connected ports
3. An error while instantiating wrapper cells due to incorrect libraries
4. Unsupported scan methodology

### **WHAT NEXT**

Check the design. Make sure you are not directly trying to wrap a test model. Check the specifications.

### **SEE ALSO**

`insert_dft (2)`, `preview_dft (2)`, `remove_core_wrapper_configuration (2)`,  
`set_core_wrapper_cell (2)`, `set_core_wrapper_configuration (2)`, `set_dft_configuration (2)`, `set_dft_signal (2)`.

# **UIT-473 (error) '%s' identifies multiple pins.**

## **DESCRIPTION**

This error occurs if you use the **set\_bsd\_register** command and specify a pin in the access list that contains a wildcard that identifies multiple pins on the register cell. Each signal type and pin name pair must identify only one pin. If you want to identify multiple pins of the same type, you must specify multiple signal types and pin name pairs.

## **WHAT NEXT**

Reissue the **set\_bsd\_register** command and specify multiple pin name pairs, or use a more specific wildcard.

## **SEE ALSO**

**set\_bsd\_register** (2).

# **UIT-474 (error) The test model for design '%s' is stored in version %s of CTL. It cannot be retrieved.**

## **DESCRIPTION**

The version of CTL in which the test model is expressed is incompatible with the tool's capabilities.

CTL is an evolving standard (P1450.6) which is not under the control of the Synopsys developers. Since the Beta version, some incompatible changes were introduced into the language.

Note that the CTL version is not an official denomination of P1450.6. It is an arbitrary number assigned to Synopsys' implementation of a snapshot of the evolving standard. The first production release supports version 1.00.

## **WHAT NEXT**

There are two options. If the model is on a design for which full implementation is available, then you can run **check\_scan** to regenerate the model in the current version of CTL. If the design implementation is not readily available, then the process by which the model was created, most likely **insert\_scan**, needs to be repeated using the current version of the tool.

## SEE ALSO

`read_test_model()`, `write_test_model()`, `check_scan()`

**UIT-475 (information)** The test model on design '%s' is updated to the current CTL version. Writing out the design to disk will make this update permanent.

## DESCRIPTION

The version of CTL in which the stored test model is expressed is not compliant with the current state of the proposed standard. The model was retrieved and automatically translated to the newer version of the CTL syntax.

CTL is an evolving standard (P1450.6) which is not under the control of the Synopsys developers. Since the previous version of DFT Compiler, some incompatible changes were introduced into the language.

Note that the CTL version is not an official denomination of P1450.6. It is an arbitrary number assigned to Synopsys' implementation of a snapshot of the evolving standard. DFT Compiler currently supports version 1.70.

## WHAT NEXT

There are two options. 1- Do nothing, in which case the same message will be reissued each time this test model is used in this version of DFT Compiler. 2- Save the db file containing this test model back to disk.

## SEE ALSO

`read_test_model()`, `write_test_model()`

**UIT-476 (error)** The test model for design '%s' cannot be retrieved.

## DESCRIPTION

The version of CTL in which the test model is expressed is compatible with the tool's capabilities, but the information cannot be retrieved. This may be due to data corruption on the db file, or incomplete compatibility between tool versions.

CTL is an evolving standard (P1450.6) which is not under the control of the Synopsys developers. Since the previous release of DFT Compiler, some incompatible changes were introduced into the language.

Note that the CTL version is not an official denomination of P1450.6. It is an arbitrary number assigned to Synopsys' implementation of a snapshot of the evolving standard. This release supports version 1.70.

## WHAT NEXT

There are multiple options. If the db file containing the model is very old, reading it into a previous version of DFT Compiler and writing it back to disk will automatically update the text of the model to the DFT Compiler version. The current version of DFT Compiler will most likely be able to read the newly updated model. Otherwise, the model can be regenerated from the current text, from the current netlist, or from the pre-dft netlist. To update the model from the current text, edit the ascii version of the model contained in file <design\_name>\_obsolete\_model.ctl, in the current directory. It can then be read back in and re-attached to the design using the read\_test\_model command. If the model is on a design for which full implementation is available, then the model may be regenerated from the netlist: you can run DRC to regenerate the model in the current version of CTL. If the design implementation is not readily available, then the process by which the model was created, most likely insert\_scan, needs to be repeated using the current version of the tool.

## SEE ALSO

`read_test_model()`, `write_test_model()`, `check_scan()`

**UIT-477 (information)** The '%s' command is obsoleted in the 2003.03 release. Please use '%s' instead.

## DESCRIPTION

This message informs you that the `set_test_signal` command is obsoleted in the 2003.03 release of DFT Compiler. You are advised to use the specified replacement commands instead.

## WHAT NEXT

Use the `set_dft_signal` command instead.

## SEE ALSO

`insert_dft (2)`, `set_dft_signal (2)`.

**UIT-478 (Error)** Valid index required for scan-in and scan-out

# ports

## DESCRIPTION

This message indicates that you are attempting to describe the scan-in and scan-out ports in the design without associated indices. In order to correctly extract scan chains using descriptive specifications, the test design rule checker needs information associating scan access pins to their respective scan chains.

## WHAT NEXT

Specify the appropriate indices.

## SEE ALSO

`test_drc` (2),

**UIT-479** (information) The option `-order '{%s}'` is obsolete in the 2003.12 release. Please use the options `-autofix` and/or `-shadow_wrapper`.

## DESCRIPTION

This message informs you that the `-order` option of the `set_dft_configuration` command is obsolete in the 2003.12 release of DFT Compiler. You are advised to use the specified replacement options instead.

## WHAT NEXT

Use the the `-autofix` and/or `-shadow_wrapper` options instead.

## SEE ALSO

`insert_dft` (2), `set_dft_configuration` (2).

**UIT-480** (error) The `-order` option cannot not be used with the -

autofix and/or -shadow\_wrapper options.

## DESCRIPTION

The **-order** option will become obsolete in the 2003.12 release. You are advised to use the **-autofix** and/or the **-shadow\_wrapper** options instead.

## WHAT NEXT

Modify the options accordingly to the recommendations and repeat the command.

## SEE ALSO

`insert_dft` (2) `set_dft_configuration` (2)

**UIT-481** (warning) Resolution of tristate port '%s' connected to pin '%s' of cell '%s' failed. The port will be excluded from wrapping.

## DESCRIPTION

This warning message tells you that the core wrapper architect didn't find any tristate driver for the specified port connected to a tristate pin of a cell with test model.

## WHAT NEXT

Use simple tristate drivers in the design for the specified port. Alternatively, the port can be excluded from wrapping.

## SEE ALSO

`set_dft_configuration` (2). `set_core_wrapper_cell` (2). `set_core_wrapper_configuration` (2).

**UIT-482** (warning) Resolution of bidirectional port '%s' connected to pin '%s' of cell '%s' failed. The port will be excluded from wrapping.

## **DESCRIPTION**

This warning message tells you that the core wrapper architect didn't find any bidirectional driver for the specified port connected to a bidir pin of a cell with test model.

## **WHAT NEXT**

Use simple bidirectional drivers in the design. Alternately, exclude the port from wrapping.

## **SEE ALSO**

`set_dft_configuration (2)`, `set_core_wrapper_cell(2)`, `set_core_wrapper_configuration (2)`.

# **UIT-483 (warning) Mapping Wrapper Cell Designs is not successfull, turning off wrapper insertion.**

## **DESCRIPTION**

This warning message tells you that the core wrapper insertion couldn't map wrapper cell designs successfully. Wrapper insertion can't proceed without mapped wrapper cells. Wrapper insertion will be turned off.

## **WHAT NEXT**

Check if link library is setup properly to include the libraries used in mapping wrapper cells. Check if there is a license available to map wrapper cells.

## **SEE ALSO**

`set_dft_configuration (2)`, `set_core_wrapper_cell(2)`, `set_core_wrapper_configuration (2)`.

## **UIT-484 (error) Instance '%s' of design '%s' has no test model.**

### **DESCRIPTION**

This error is generated when there is no test model for the design corresponding to the cell instance you specified in a **set\_test\_target** command.

### **WHAT NEXT**

Make sure you specified the instance you intended. To see a list of designs that have test models, use the **list\_test\_models** command. You may need to use the **read\_test\_model** command to attach a test model to the design specified in the error message.

### **SEE ALSO**

**set\_test\_target** (2), **list\_test\_models** (2), **read\_test\_model** (2), **report\_test\_models** (2).

## **UIT-485 (error) Test mode '%s' does not exist.**

### **DESCRIPTION**

This error is generated when the **-test\_mode** argument to the current command is invalid.

### **WHAT NEXT**

Use the **list\_test\_modes** command to see the valid **-test\_mode** arguments. If the desired test mode is not listed, you can create a new test mode with the **define\_test\_mode** command.

### **SEE ALSO**

**define\_test\_mode** (2), **list\_test\_modes** (2), **set\_test\_target** (2).

## **UIT-486 (error) Cell '%s' is repeated.**

### **DESCRIPTION**

This error is generated when a cell in the **-cores** argument of the **set\_test\_target** command is repeated. Each cell may only have one mode.

## WHAT NEXT

Choose only one mode for each cell and repeat the command. You can use the `report_test_model` command to see the available test modes for a given design.

## SEE ALSO

`report_test_model` (2), `set_test_target` (2).

# UIT-487 (error) Cell '%s' can not be in wrapped mode '%s' when -purpose is top\_internal\_test.

## DESCRIPTION

This error is generated when you try to put a core into a wrapped internal test mode (i.e. wrp\_if mode) when you have specified the purpose of the mode as a top-level scan test. These are incompatible, because the top-level scan test implies that you will apply a set of patterns to the top level and the wrapped internal test mode implies that you will apply the patterns that were generated for the core. There is no way to apply both patterns at once.

## WHAT NEXT

You should use the `define_test_mode` command to create two test modes. Use `set_test_target -purpose top_internal_test` without cores for one mode, and `set_test_target -purpose core_internal_test` with the desired cores for the other mode.

## SEE ALSO

`set_test_target` (2).

# UIT-488 (error) Test mode '%s' does not exist for instance '%s' of design '%s'.

## DESCRIPTION

This error is generated when the `-cores` argument to the `set_test_target` command specifies an invalid mode.

## WHAT NEXT

Use the `report_test_model` command to see the valid test modes for the design

indicated in the error message. Retry the **set\_test\_target** command using a valid mode.

## SEE ALSO

**report\_test\_model** (2), **set\_test\_target** (2).

# UIT-489 (error) No mode specified for instance %s.

## DESCRIPTION

This error is generated when the **-cores** argument to the **set\_test\_target** command specifies an instance without a mode.

## WHAT NEXT

Make sure that the **-cores** argument contains complete instance/mode pairs when you retry the **set\_test\_target** command.

## SEE ALSO

**set\_test\_target** (2).

# UIT-490 (error) Bad -purpose '%s'.

## DESCRIPTION

This error is generated when you specify an unrecognized **-purpose** for the **set\_test\_target** command.

## WHAT NEXT

Retry the command with a valid **-purpose**.

## SEE ALSO

**set\_test\_target** (2).

# UIT-491 (error) You must specify -cores when -purpose is

## core\_internal\_test.

### DESCRIPTION

This error is generated when you specify **-purpose core\_internal\_test** without the **-cores** argument for the **set\_test\_target** command.

### WHAT NEXT

Retry the command with a the **-cores** argument, or change **-purpose** to **top\_internal\_test**.

### SEE ALSO

**set\_test\_target** (2).

## UIT-492 (error) Current test mode is not defined.

### DESCRIPTION

This error is generated when the **-test\_mode** argument is omitted from the current command, and the current test mode has not been set.

### WHAT NEXT

Use the **current\_test\_mode** command to define the current test mode, or specify a test mode directly with the **-test\_mode** argument when you retry the command.

### SEE ALSO

**current\_test\_mode** (2), **list\_test\_modes** (2), **set\_test\_target** (2).

## UIT-493 (error) Test mode '%s' must be type InternalTest.

### DESCRIPTION

This error is generated when the test mode for the **set\_test\_target** command does not have type InternalTest. Since the **set\_test\_target** command only specifies internal tests (either at the top level or core level) it doesn't make sense for the test mode to be anything other than InternalTest.

## WHAT NEXT

Use the `define_test_mode` command to create a test mode with `-type InternalTest`, and specify that test mode with either the `current_test_mode` command, or the `-test_mode` argument when you retry the `set_test_target` command.

## SEE ALSO

`current_test_mode` (2), `define_test_mode` (2), `set_test_target` (2).

# UIT-494 (error) Cannot write CTL model with exec name '%s' to file '%s'.

## DESCRIPTION

This error is generated when you run the `write_test` command and failed to write out the CTL model with the specified pattern exec name to the given file.

## WHAT NEXT

Check the existence and the write protection of the directory.

Check the protection of the existing file with the same name.

Check the CTL model if the specified PatternExec exists. Be sure not to have quoted pattern exec name in the command line.

## SEE ALSO

`write_test_model` (2).

# UIT-495 (error) There is no valid pattern info in file '%s'.

## DESCRIPTION

This error occurs when you run the `read_pattern_info` command and there is no valid pattern information block in the input file although it is a valid CTL file.

## WHAT NEXT

Check the input file to add pattern info block.

## **UIT-496 (error) The patinfo for Pattern '%s' already existed.**

### **DESCRIPTION**

This error occurs when you run the **read\_pattern\_info** command and the patinfo blocks in the input file already exist in the CTL model. Unless '-overwrite' switch is added, it is an error to re- define the existing patinfo.

### **WHAT NEXT**

Add switch '-overwrite' if you want to redefine the existing patinfo.

## **UIT-497 (error) Cannot find pattern matching name '%s' in existing CTL model.**

### **DESCRIPTION**

This error occurs when you run the **read\_pattern\_info** command and the pattern name in the patinfo file does not have a match in the existing CTL model.

### **WHAT NEXT**

The user should change the pattern block name in the test program and patinfo file to match the pattern name in the CTL model.

## **UIT-498 (Warning) The following ports of design '%s' have no corresponding Signals in its test model:%s.**

### **DESCRIPTION**

The error occurs when you run the **read\_test\_model** command, if some ports of the design don't have corresponding Signals in the read test model. This means that there is no test information for these ports. This will make the test model unusable.

### **WHAT NEXT**

The user should check the validity of the test model and whether it realy is the test model of the design it is being attached to.

## **UIT-499** (Warning) The following test model Signals have no corresponding ports in design '%s':%s.

### **DESCRIPTION**

The error occurs when you run the `read_test_model` command, if some Signals of the model don't have corresponding ports in the design it is being associated with. This means that the model provides information about non-existing port. This will make the test model unusable.

### **WHAT NEXT**

The user should check the validity of the test model and whether it really is the test model of the design it is being attached to.

## **UIT-500** (Warning) The following ports of sub-design '%s' have no corresponding Signals in its test core:%s.

### **DESCRIPTION**

The error occurs when some ports of a sub-design don't have corresponding Signals in its test core referenced by the test model of current design. This will make the CoreType unusable.

### **WHAT NEXT**

The user should check the validity of the test core defined in the test model of current design.

## **UIT-501** (Warning) The following test core Signals have no corresponding ports in sub-design '%s':%s.

### **DESCRIPTION**

The error occurs when some Signals of a core referenced by the model of current design don't have corresponding ports in the sub-design it is being associated with. This means that the CoreType provides information about non-existing port. This will make the CoreType unusable.

## WHAT NEXT

The user should check the validity of the CoreType in the test model of current design.

## UIT-502 (error) Mode decoding style must be one of 'binary' or 'one\_hot'.

### DESCRIPTION

This error message tells you that you have specified a decoding style other than binary or one\_hot for the **-mode\_decoding\_style** option to the **set\_dft\_configuration** command. You use **set\_dft\_configuration** to specify the decoding style for the test mode ports used during multi-mode DFT insertion by the **insert\_dft** command.

### WHAT NEXT

Specify binary or one\_hot as the mode decoding style.

### SEE ALSO

**insert\_dft** (2), **set\_dft\_configuration** (2).

## UIT-503 (Error) The signal '%s' must be predefined as an Oscillator signal.

### DESCRIPTION

This error tells you that one of the specified PLL clocks has not been predefined as an Oscillator signal and hence the clock controller specification cannot be accepted. The **set\_dft\_clock\_controller** command specification is ignored due to the error.

### WHAT NEXT

To correct this error, specify the PLL clocks signals as having the Oscillator signal type.

In DB mode, a PLL clock pll/out is defined using either  
dc\_shell-t> **set\_dft\_signal Oscillator -hookup\_pin pll/out**  
or  
dc\_shell-t> **set\_dft\_signal Oscillator\_inverted -hookup\_pin pll/out**  
depending on the PLL clock active state.

In XG mode, a PLL clock pll/out is defined using  
dc\_shell-xg-t> **set\_dft\_signal -view existing\_dft -type Oscillator -hookup\_pin**  
**pll\_out -active\_state < 0 | 1 >**

## SEE ALSO

**set\_dft\_signal** (2)

## UIT-504 (Warning) The port '%s' has not predefined as an Oscillator signal.

### DESCRIPTION

This warning tells you that one of the specified ATE clocks has not been predefined as an Oscillator signal. If the ATE clock is a reference clock, it has to be predefined as an Oscillator signal; otherwise, this warning can be ignored. The **set\_dft\_clock\_controller** command specification is not ignored due to this warning.

### WHAT NEXT

You can ignore this warning if the ATE clock is not a reference clock. If the ATE clock is a reference clock, specify the ATE clock signal as having the Oscillator signal type and reissue the **set\_dft\_clock\_controller** command.

In DB mode, a reference and ATE clock ate\_clk is defined using either  
dc\_shell-t> **set\_dft\_signal Oscillator -port ate\_clk**  
or  
dc\_shell-t> **set\_dft\_signal Oscillator\_inverted -port ate\_clk**  
depending on the ATE clock active state.

In XG mode, an ATE clock ate\_clk is defined using  
dc\_shell-xg-t> **set\_dft\_signal -view existing\_dft -type Oscillator -port ate\_clk -**  
**active\_state < 0 | 1 >**

## SEE ALSO

**set\_dft\_signal** (2)

## UIT-505 (Error) An ATE clock must be a port of the design; '%s'

is not a valid port name.

## DESCRIPTION

This error tells you that one of the specified ATE clock names is not a valid port name. The **set\_dft\_clock\_controller** command specification is discarded due to this error.

## WHAT NEXT

If you want to specify a hookup pin for an ATE clock, you should specify the hookup pin with the **set\_dft\_signal** command and reissue the **set\_dft\_clock\_controller** command.

## SEE ALSO

**set\_dft\_signal** (2)

**UIT-506** (Warning) The port '%s' has not predefined as a clock signal.

## DESCRIPTION

This error tells you that the specified port has not been predefined as a clock signal and that the Oscillator signal specification cannot be accepted. If the port is a reference clock it has to be first defined as a clock and then defined as a reference clock. The **set\_dft\_signal** command specification is ignored due to this error.

## WHAT NEXT

If the port is a reference clock, specify the ATE clock signal as having the a clock signal type and reissue the **set\_dft\_signal** command.

In DB mode, a reference clock ref\_clk is defined using  
dc\_shell-t> **create\_test\_clock ref\_clk -waveform [list 45 55]** dc\_shell-t>  
**set\_dft\_signal Oscillator -port ref\_clk**

In XG mode, an ATE clock ate\_clk is defined using  
dc\_shell-xg-t> **set\_dft\_signal -view existing\_dft -type MasterClock -port ref\_clk -timing [list 45 55]** dc\_shell-xg-t> **set\_dft\_signal -view existing\_dft -type Oscillator -port ref\_clk**

## SEE ALSO

`set_dft_signal (2)`

# UIT-510 (Error) Test Model of core instance '%s' is not valid for integration.

## DESCRIPTION

SoC BIST does not allow integration of unencapsulated cores during core integration. This error tells you that the specified core instance is not encapsulated and hence a test mode of the core instance can't be used with `set_test_target` command. The `set_test_target` command specification is ignored due to the error.

## WHAT NEXT

To avoid the error, specify only encapsulated core test modes with `set_test_target` command.

## SEE ALSO

`set_test_target (2)`

# UIT-511 (Error) More than one bist test modes are specified, bist test modes can't be tested in parallel.

## DESCRIPTION

SoC BIST does not allow bisted cores to be tested in parallel currently. This error tells you that the `set_test_target` specification includes more than one bist test modes. The `set_test_target` command specification is ignored due to the error.

## WHAT NEXT

To avoid the error, specify only one encapsulated bist test mode with `set_test_target` command.

## SEE ALSO

`set_test_target (2)`

## **UIT-512 (Error)** Bist test modes are specified along with scan test modes, bist test modes can't be tested in parallel.

### **DESCRIPTION**

SoC BIST does not allow bisted cores to be tested in parallel currently. This error tells you that the **set\_test\_target** specification includes one or more bist test modes and one or more scan test modes. The **set\_test\_target** command specification is ignored due to the error.

### **WHAT NEXT**

To avoid the error, don't mix bist test modes with scan test modes with **set\_test\_target** command.

### **SEE ALSO**

**set\_test\_target** (2)

## **UIT-520 (error)** Specified dft design "%s" does not exist.

### **DESCRIPTION**

You receive this error message because you have executed the **define\_dft\_design** command and specified a design that does not exist in memory. You can use **define\_dft\_design** to specify and characterize a design as a dft design. Such a design is treated like a user dft design of the specified type for dft insertion.

### **WHAT NEXT**

Use the **list\_designs** command to see what designs are in memory, then use the **read** command to read in the design. Next, execute the **define\_dft\_design** command to set the desired design as a pad design.

### **SEE ALSO**

**list\_designs** (2), **read** (2), **define\_dft\_design** (2).

## **UIT-521 (error)** Specified dft design "%s" does not have a pin

named "%s".

## DESCRIPTION

You receive this error message when you execute the **define\_dft\_design** command and specify a pin name in the interface list that does not exist in the specified dft design. The **define\_dft\_design** command is used to specify and characterize a design as a dft design of a type. The interface list for the dft design specifies a list of triplets of signal type, pin name and pin polarity.

## WHAT NEXT

Reexecute the **define\_dft\_design** command and specify a valid pin name in the interface list for the **-interface** argument.

## SEE ALSO

**find** (2), **define\_dft\_design** (2).

**UIT-522** (error) Syntax error with the list specified with **-interface** option, expects a list of triplets <signal\_type> <pin\_name> <pin\_polarity> .

## DESCRIPTION

You receive this error message when you execute the **define\_dft\_design** command and specify an incorrect interface list. The **define\_dft\_design** command is used to specify and characterize a design as a dft design of a type. The interface list for the dft design specifies a list of triplets : signal type, design pin name and design pin polarity.

## WHAT NEXT

Reexecute the **define\_dft\_design** command and specify a valid list for the **-interface** argument.

## SEE ALSO

**find** (2), **define\_dft\_design** (2).

**UIT-523** (error) Invalid design name '%s' - this design name is

**reserved.**

## **DESCRIPTION**

You receive this error message when you execute the **define\_dft\_design** command and specify a design name that is reserved. The **define\_dft\_design** command is used to specify and characterize a design as a dft design of a type. The design name specified with this command can not be one of the following names as the name conflicts with our designware implementation of the dft component.

```
DW01_decode DW_control_force DW_Z_control_force DW_observ_dgen DW03_shftreg DW_bc_1
DW_bc_2 DW_bc_3 DW_bc_4 DW_bc_5 DW_bc_7 DW_bc_8 DW_bc_9 DW_bc_10 DW_wc_d1_s
DW_wc_s1_s DW_INSTRREG DW_tap DW_tap_uc DFT_bistc DFT_codec DFT_xbistc DFT_xcodec
DFT_clk_mux DFT_clk_chain DW_mbist_ctrl DW_mbist_wrapper
```

## **WHAT NEXT**

Reexecute the **define\_dft\_design** command and specify a valid design name for the **-design\_name** argument.

## **SEE ALSO**

**find** (2), **define\_dft\_design** (2).

**UIT-524 (error) Illegal width %d for pin '%s' of signal type '%s', legal width must be %d.**

## **DESCRIPTION**

You receive this error message when you execute the **define\_dft\_design** command and specify a design pin of invalid width. The **define\_dft\_design** command is used to specify and characterize a design as a dft design of a type. The dft design pins are checked for legal width according to the specified dft design type.

The legal widths of bus pins for different interface pin types are as follows.

DFT Design Type : TAP

```
instructions = 32-bit tap_state = 16-bit
```

DFT Design Type : TAP\_UC

```
instructions = 32-bit tap_state = 16-bit user_code_val = 32-bit ver = 4-bit part_num
= 16-bit mnfr_id = 11-bit
```

## WHAT NEXT

Reexecute the **define\_dft\_design** command and specify a valid design with bus pins of legal width.

## SEE ALSO

**find** (2), **define\_dft\_design** (2).

# UIT-525 (error) Incorrect syntax specified for list param, list param should be terminated with \$end\_list\$

## DESCRIPTION

You receive this error message when you execute the **define\_dft\_design** command and specify a list parameter with no list terminator. The syntax of a list parameter is as follows.

```
<parameter name> <parameter type> <param value1> <param value2> ... end_list
```

where <parameter type> is string .

## WHAT NEXT

Reexecute the **define\_dft\_design** command and specify the correct syntax for list parameters.

## SEE ALSO

**define\_dft\_design** (2).

# UIT-530 (error) Specified pin '%s' is not found in the current design.

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_instruction** command and specify a pin name that does not exist in the current design.

## WHAT NEXT

Reexecute the **set\_bsd\_instruction** command and specify a valid pin name.

## SEE ALSO

## WHAT NEXT

Reexecute the `set_bsd_instruction` command with out output conditioning.

## SEE ALSO

`find (2)`, `set_bsd_instruction (2)`.

# UIT-536 (error) Invalid Excluded BSR Conditioning '%s' specified.

## DESCRIPTION

You receive this error message when you execute the `set_bsd_instruction` command and specify an incorrect excluded bsr cell onditioning value.

Here are the allowed conditioning values for BSR cells excluded from the current instruction.

CLAMP

NONE

## WHAT NEXT

Reexecute the `set_bsd_instruction` command and specify thye correct excluded bsr conditioning value with option `-excluded_bsr_condition`.

## SEE ALSO

`find (2)`, `set_bsd_instruction (2)`.

# **UIT-537 (error) Excluded BSR Conditioning can't be specified for a non short BSR chain instruction.**

## **DESCRIPTION**

You receive this error message when you execute the **set\_bsd\_instruction** command and specify excluded bsr conditioning for an instruction that doesn't select a short BSR chain.

## **WHAT NEXT**

Reexecute the **set\_bsd\_instruction** command with out excluded bsr conditioning.

## **SEE ALSO**

**find** (2), **set\_bsd\_instruction** (2).

# **UIT-538 (error) Invalid BSR chain name '%s'.**

## **DESCRIPTION**

You receive this error message when you execute the **set\_bsd\_path** command in DB mode or **set\_scan\_path** command in XG mode and specify a reserved name as the BSR chain(path) name.

Here are the reseved names that are not allowed for BSR chains.

BYPASS DEVICE\_ID BOUNDARY (allowed in XG mode) STT\_REG

## **WHAT NEXT**

Reexecute the command and specifiy a different name for BSR chain name.

## **SEE ALSO**

**find** (2), **set\_bsd\_path** (2), **set\_scan\_path** (2).

# **UIT-539 (error) Conflicting BSD register name '%s'.**

## **DESCRIPTION**

You receive this error message when you execute the **set\_bsd\_register** command in DB

mode or **set\_scan\_path** command in XG mode and specify a conflicting name as the BSD register name. The name is also used to describe a short BSR chain.

## WHAT NEXT

Reexecute the command and specify a different name for BSD register name.

## SEE ALSO

**find** (2), **set\_bsd\_register** (2), **set\_scan\_path** (2).

# UIT-540 (error) Conflicting BSR chain name '%s'.

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_path** command in DB mode or **set\_scan\_path** command in XG mode and specify a conflicting name as the BSR chain name. The name is also used to describe a short BSD register.

## WHAT NEXT

Reexecute the command and specify a different name for BSR chain name.

## SEE ALSO

**find** (2), **set\_bsd\_path** (2), **set\_scan\_path** (2).

# UIT-541 (warning) Unable to find the bsr cell for '%s', ignoring the member.

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_path** command in DB mode or **set\_scan\_path** command in XG mode and specify a short BSR chain and a member of the short chain doesn't point to a valid BSR cell.

Please note that input/output/control BSR cells of a tristate/bidir ports can included separately in a short BSR chain only if they are defined.

EX:-

```
set_bsd_data_cell -function input -port out set_bsd_data_cell -function output -port
out set_bsd_control_cell CTRL1 -type BC_1 -port out
```

```
set_bsd_path -name SHORT_BSR1 { out/in out1 out/out out3 CTRL1 }
```

Individual BSR cells of BSR embedded pads can't be included in a short BSR chain, either alll of embedded BSR cells can be included in a short BSR chain or none.

## WHAT NEXT

Reexecute the command and specifiy a valid BSR cell name.

## SEE ALSO

**find** (2), **set\_bsd\_path** (2), **set\_scan\_path** (2).

# UIT-542 (error) Invalid or missing %s Condition specified for standard instructions : %s .

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_instruction** command and specify **-input\_clock\_condition** or f-output\_condition options. These options are not allowed for the following standard instructions.

```
EXTEST EXTEST_PULSE EXTEST_TRAIN SAMPLE PRELOAD BYPASS HIGHZ CLAMP IDCODE USERCODE
```

The standard predefines condition if any required for these instuctions and user is not allowed to change that.

You also see this error message for INTEST or RUNBIST instructions if - **input\_clock\_condition** or f-output\_condition options are not specified or incorrect value specified for the option f-output\_condition.

The standard allows only BSR or HIGHZ output condition for these instructions.

There are no restrictions on output condition for user defined instructions.

## WHAT NEXT

Reexecute the command with the correct options.

## SEE ALSO

**set\_bsd\_instruction** (2).

# **UIT-543 (error) Invalid bit '%c' specified in capture value.**

## **DESCRIPTION**

You receive this error message when you execute the **set\_bsd\_instruction** command and specify **-capture\_value** option and specify an invalid capture value string.

The format of capture value string is as follows.

nn'bXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

where nn is between 1 and 32 and X can be 0 or 1, -

nn'hXXXXXXXXX

where nn is between 1 and 32 and X can be 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, A, b, B, c, C, d, D, e, E, f, F, -

## **WHAT NEXT**

Reexecute the command with correct capture value.

## **SEE ALSO**

**set\_bsd\_instruction** (2).

# **UIT-544 (error) Invalid capture value length '%d'.**

## **DESCRIPTION**

You receive this error message when you execute the **set\_bsd\_instruction** command and specify **-capture\_value** option and specify an invalid capture value string.

The format of capture value string is as follows.

nn'bXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

where nn is between 1 and 32 and X can be 0 or 1, -

nn'hXXXXXXXXX

where nn is between 1 and 32 and X can be 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, a, A, b, B, c, C, d, D, e, E, f, F, -

The bit stream length in binary form can't exceed 32.

## WHAT NEXT

Reexecute the command with correct capture value.

## SEE ALSO

`set_bsd_instruction` (2).

# UIT-545 (error) Invalid LSB for IDCODE capture value.

## DESCRIPTION

You receive this error message when you execute the `set_bsd_instruction` command and specify `-capture_value` option and specify an invalid capture value string. The LSB bit of the capture value string for IDCODE instruction should be '1'.

## WHAT NEXT

Reexecute the command with correct capture value.

## SEE ALSO

`set_bsd_instruction` (2).

# UIT-546 (error) BSD Test Data Register length is mandatory, specify the length with -exact\_length option.

## DESCRIPTION

You receive this error message when you execute the `set_scan_path` command in XG mode to specify a Test Data Register(TDR) and don't specify the length of the Test Data Register.

## WHAT NEXT

Reexecute the command and specify the length of the TDR using `-exact_length` option.

## SEE ALSO

`set_scan_path` (2).

## **UIT-547 (error) One of the options -ordered\_elements or -hookup\_elements is mandatory for BSD.**

### **DESCRIPTION**

You receive this error message when you execute the **set\_scan\_path** command in XG mode to specify a BSR chain or Test Data Register(TDR) and don't specify either of the required options.

In view spec, option -ordered\_elements is used to specify a BSR chain.

In view spec/existing\_dft, option -hookup\_elements is used to specify a TDR.

### **WHAT NEXT**

Reexecute the command and specify either of the options as required.

### **SEE ALSO**

**set\_scan\_path** (2).

## **UIT-548 (error) Options -ordered\_elements, -hookup\_elements are mutually exclusive for BSD.**

### **DESCRIPTION**

You receive this error message when you execute the **set\_scan\_path** command in XG mode to specify a BSR chain or Test Data Register(TDR) and specify both of the above options. These options are mutually exclusive, specify only one of the options.

In view spec, option -ordered\_elements is used to specify a BSR chain.

In view spec/existing\_dft, option -hookup\_elements is used to specify a TDR.

### **WHAT NEXT**

Reexecute the command and specify only one of the above options as required.

### **SEE ALSO**

**set\_scan\_path** (2).

## **UIT-549 (error) BSR chains can not be specified in view existing\_dft.**

### **DESCRIPTION**

You receive this error message when you execute the **set\_scan\_path** command in XG mode in view existing\_dft to specify a BSR chain. BSR chains can not be specified in view existing\_dft.

BSR chains can be specified in view spec using the option -ordered\_elements in conjunction with the option -class bsd.

### **WHAT NEXT**

Fix the error and reexecute the command.

### **SEE ALSO**

**set\_scan\_path** (2).

## **UIT-550 (error) Invalid argument in the capture value list. '%s' is not a valid design pin, sized binary or a sized hexadecimal constant.**

### **DESCRIPTION**

This error message occurs when an invalid value is specified in the capture value argument list for the USERCODE instruction. The 32-bit capture value can be specified as any combination of design pin(s), sized binary constant(s), and/or sized hexadecimal constant(s).

Specify binary and hexadecimal constants using the following Verilog syntax:

```
<size>'[b|B|h|H]<binary or hexadecimal value>
```

For example, the following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110}
-capture_value {version_reg/v3, version_reg/v2, version_reg/v1, \
version_reg/v0, 16'b1111111110000000, 12'h2ab}
```

### **WHAT NEXT**

Check and correct the capture value argument syntax. Specify design pins as full hierarchical pin names.

## SEE ALSO

`set_bsd_instruction(2)`

**UIT-551 (error) Invalid size %d of the capture value argument '%s'.** Capture value argument's size should be in the range of 1 to 32 bits.

## DESCRIPTION

This error message occurs when you specify a binary or hexadecimal constant value in the capture value argument list, and the size of the argument is not in the valid range of 1 to 32 bits.

Specify binary and hexadecimal constants using the following Verilog syntax:

```
<size>'[b|B|h|H]<binary or hexadecimal value>
```

For example, the following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110}
 -capture_value {version_reg/v3, version_reg/v2, version_reg/v1, \
version_reg/v0, 16'b1111111110000000, 12'h2ab}
```

## WHAT NEXT

Check and correct the size of the capture value argument, and run the command again.

## SEE ALSO

`set_bsd_instruction(2)`

**UIT-552 (error) %s capture value '%s' cannot be represented in the specified %d bits.**

## DESCRIPTION

This error message occurs when you specify a binary or hexadecimal constant value in the capture value argument list and the specified size of the argument is not sufficient to represent the specified value.

Specify binary and hexadecimal constants using the following Verilog syntax:

```
<size>'[b|B|h|H]<binary or hexadecimal value>
```

For example, the following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110}
 -capture_value {version_reg/v3, version_reg/v2, version_reg/v1, \
version_reg/v0, 16'b1111111100000000, 12'h2ab}
```

## WHAT NEXT

Check and correct the size of the capture value argument, and run the command again.

## SEE ALSO

[set\\_bsd\\_instruction\(2\)](#)

**UIT-553 (error) A %s value is specified as the capture value. Capture value must be a 32-bit value.**

## DESCRIPTION

This error message occurs when the cumulative bit width of the arguments specified in the **-capture\_value** option of the **set\_bsd\_instruction** command is not 32 bits. The 32-bit capture value can be specified as any combination of design pin(s), sized binary constant(s), and/or sized hexadecimal constant(s).

Specify binary and hexadecimal constants using the following Verilog syntax:

```
<size>'[b|B|h|H]<binary or hexadecimal value>
```

For example, the following is a valid USERCODE specification:

```
set_bsd_instruction USERCODE -code {0110}
 -capture_value {version_reg/v3, version_reg/v2, version_reg/v1, \
version_reg/v0, 16'b1111111100000000, 12'h2ab}
```

## WHAT NEXT

Check and correct the size of the capture value argument, and run the command again.

## SEE ALSO

## **UIT-554 (error) '%s' cell does not exist in the design.**

### **DESCRIPTION**

This error message occurs when the cell that was specified as part of the `state_cells` argument of the **set\_tap\_elements** command, cannot be found.

Typographical or spelling errors often cause this type of error message.

### **WHAT NEXT**

Use the **find** command to list the cells in your design, and rerun the **set\_tap\_elements** command using the name of a valid cell.

### **SEE ALSO**

`set_tap_elements(2)`

## **UIT-580 (error) The test\_modes value, %s, specified is not a valid value.**

### **DESCRIPTION**

The `-test_modes` option requires a valid integer number of modes required in the design.

### **WHAT NEXT**

## **UIT-581 (error) The client %s specified is not a valid dft client.**

### **DESCRIPTION**

You receive this message if you issue **set\_dft\_configuration -order** and specify an invalid value for the `-order` option argument. Valid values are `autofix`, to specify the Autofix utility as dft client; or `wrapper`, to specify the Shadow LogicDFT utility as dft client. For more information, see the manual page for the **set\_dft\_configuration** command.

### **WHAT NEXT**

Reissue **set\_dft\_configuration -order** with a valid value for the `-order` option argument.

## SEE ALSO

`set_dft_configuration` (2).

**UIT-582** (error) Core Integration of cores is mutually exclusive with options : `-shadow_wrapper` | `-core_wrapper` | `-testability` | `-mbist` | `-scan_compression` .

## DESCRIPTION

You receive this message if you issue `set_dft_configuration -core_integration` and also specify one of the following options. `-shadow_wrapper` `-core_wrapper` `-testability` `-mbist` `-scan_compression` UI option `-core_integration` is mutually exclusive with the above options. For more information, see the manual page for the `set_dft_configuration` command.

## WHAT NEXT

Reissue `set_dft_configuration` command with valid options.

## SEE ALSO

`set_dft_configuration` (2).

**UIT-583** (error) Core Integration of MBIST cores doesn't support the options : `-clock_controller` | `-bist` .

## DESCRIPTION

You receive this message if you issue `set_dft_configuration -core_integration` and also specify one of the following options. `-bist` `-clock_controller` UI option `-core_integration` is mutually exclusive with the above options when the design contains MBIST(Tech2) cores. UI option `-core_integration` is mutually exclusive with the option `-clock_controller` when the design contains MBIST(Tech1) cores. For more information, see the manual page for the `set_dft_configuration` command.

## WHAT NEXT

Reissue `set_dft_configuration` command with valid options.

## SEE ALSO

`set_dft_configuration (2)`.

## UIT-584 (error) Object '%s' is not valid, it's either not found or not a cell of current design, '%s'.

### DESCRIPTION

Object specified in the command has to be present as a cell under the current design.

### WHAT NEXT

Check whether the name of the object is correct and current design is specified correctly.

## UIT-587 (error) Cell '%s' doesn't have a test model.

### DESCRIPTION

Cell specified in the command should have a test model. The specification can't be executed if there is no test model for the specified cell.

### WHAT NEXT

Check whether the name of the cell is correct and it has a test model. Correct the specification and reexecute the command. Note that test model can be attached to a cell using `read_test_model` command.

## SEE ALSO

`set_core_integration_configuration (2)`, `read_test_model (2)`.

## UIT-588 (error) MBIST(Tech2) encapsulated core modes can't be used with `set_test_target` command.

### DESCRIPTION

You receive this message if you issue `set_test_target` command and also specify an

encapsulated MBIST(Tech2) core mode with `-cores` option. DFT architect creates a single top level mode to target all MBIST(Tech2) encapsulated core modes of the same type and user can't change this behavior with `set_test_target` command. The name of such a test mode can be controlled with `define_test_mode` and `set_dft_logic_usage` commands.

## WHAT NEXT

Don't specify `set_test_target` command with MBIST(Tech2) core modes.

## SEE ALSO

`set_test_target` (2), `define_test_mode` (2), `set_dft_logic_usage` (2).

# UIT-590 (error) A configuration for port %s already exists.

## DESCRIPTION

The `set_port_configuration` command has previously been specified for this port.

## WHAT NEXT

Check to see if the `set_port_configuration` command has previously been specified for this port.

# UIT-591 (error) Duplicate control specification for %s data port of %s.

## DESCRIPTION

The `set_port_configuration` command has previously been specified for this port.

## WHAT NEXT

Verify that the `set_port_configuration` command has previously been specified for this port.

# UIT-592 (error) %s has a clock port specified for it that is

different from the port specified in the command.

## DESCRIPTION

A previous **set\_port\_configuration** command has specified a different clock port for this port.

## WHAT NEXT

Check if the **set\_port\_configuration** command has previously been used to specify a clock for this port.

# UIT-593 (error) %s specified as clock port in the command does not exist on the cell

## DESCRIPTION

You receive this message if you issue the **set\_port\_configuration** command and the clock port you specified was not found on the specified cell. This could be caused by a spelling error or typo.

## WHAT NEXT

Verify that the port exists on the cell, and verify the correct spelling. Then reexecute **set\_port\_configuration**.

## SEE ALSO

**set\_port\_configuration** (2).

# UIT-594 (error) Multiple ports named %s on Object %s

## DESCRIPTION

You receive this message if you execute **set\_port\_configuration** and specify a port name that occurs more than once on the specified object. There can be only one port associated with a given port name.

## WHAT NEXT

Examine the library description of the cell to determine why there are two ports with the same name. Ensure that there is only one port associated with each port

name. Then reexecute **set\_port\_configuration**.

## SEE ALSO

**set\_port\_configuration** (2).

# UIT-595 (error) The read control pattern is not paired (port value)

## DESCRIPTION

You receive this message if you issue the **set\_port\_configuration** command with the **-read** option, and a *signal\_value\_pin\_pairs* argument to **-read** does not contain two values. Each **-read** argument must be a pair that includes both a signal value and the name of the input pin associated with that value. One of those values is missing.

## WHAT NEXT

Examine your execution of **set\_port\_configuration** for an unpaired pin name or signal value. Reexecute **set\_port\_configuration -read** and ensure that all arguments to **-read** are *signal\_value/pin\_name* pairs.

## SEE ALSO

**set\_port\_configuration** (2).

# UIT-596 (error) port %s not found on %s

## DESCRIPTION

You receive this message if you issue **set\_port\_configuration** and the *port\_name* cannot be found on the specified object. This could be caused by a spelling error or typo.

## WHAT NEXT

Verify that the port exists on the object, and verify the correct spelling. Then reexecute **set\_port\_configuration**.

## SEE ALSO

**set\_port\_configuration** (2).

## **UIT-597 (error) Illegal value %s specified in the read control for port %s**

### **DESCRIPTION**

You receive this message if you issue the **set\_port\_configuration** command with the **-read** option and specify an illegal value for the *signal\_value* part of the *signal\_value\_pin\_pairs* argument pair. *signal\_value* can have values of only 0 or 1.

### **WHAT NEXT**

Reexecute **set\_port\_configuration -read** with a valid value for *signal\_value*.

### **SEE ALSO**

**set\_port\_configuration** (2).

## **UIT-598 (error) Illegal direction for port %s**

### **DESCRIPTION**

You receive this message if you issue the **set\_port\_configuration** command with the **-read** option and specify a non-input port as the control port of the *signal\_value\_pin\_pairs* argument. You can specify only input ports.

### **WHAT NEXT**

Reexecute **set\_port\_configuration -read** using the name of an input port as the control port for the *signal\_value\_pin\_pairs* argument.

### **SEE ALSO**

**set\_port\_configuration** (2).

## **UIT-599 (error) port %s has already been specified in the read control pattern**

### **DESCRIPTION**

You receive this message if you issue the **set\_port\_configuration** command with the **-read** option and the specified port name appears more than once in the list of

*signal\_value\_pin\_pairs*. Each port name can be used only once.

## WHAT NEXT

Reexecute **set\_port\_configuration -read** without duplicating any port names in the *signal\_value\_pin\_pairs* arguments.

## SEE ALSO

**set\_port\_configuration** (2).

# UIT-600 (error) %s, %s specification conflicts with previous value specified on %s

## DESCRIPTION

You receive this message if you issue the **set\_port\_configuration** command with the **-read** option and a signal value assigned to a pin as one of the *signal\_value\_pin\_pairs* conflicts with the value already assigned to that pin through a previous execution of **set\_port\_configuration**. Each pin can have only one value assigned to it.

## WHAT NEXT

Remove the earlier specification using **remove\_port\_configuration** command if the previous specification was incorrect and then issue both correct **set\_port\_configuration** commands. If the current specification is wrong then reissue only the current command with correct specification.

# UIT-601 (error) could not find object named %s

## DESCRIPTION

You receive this message if you issue **set\_port\_configuration** or **remove\_port\_configuration** and the specified object cannot be found in the design. This could be caused by the wrong current design setting, or by a spelling error or typo.

## WHAT NEXT

Verify that the current design is set as intended. Verify that the object exists in the design, and verify the correct spelling. Then reexecute the command.

## SEE ALSO

`remove_port_configuration` (2), `set_port_configuration` (2).

**UIT-602 (error)** %s is an output port. It can't have an write control.

## DESCRIPTION

You receive this message if you issue the `set_port_configuration` command with the `-write` option and specify an output port as a control port for the `signal_value_pin_pairs` argument. You can specify only input ports as control ports.

## WHAT NEXT

Reexecute `set_port_configuration -write` using the name of an input port as part of the `signal_value_pin_pairs` argument.

## SEE ALSO

`set_port_configuration` (2).

**UIT-603 (error)** The read control pattern is missing or empty

## DESCRIPTION

You receive this message if you issue the `set_port_configuration` command with the `-tristate` option and do not specify a read control using the `-read` option. A tristate port must have a read control.

## WHAT NEXT

Reexecute `set_port_configuration` and use the `-read` option to specify a read control for the tristate port.

## SEE ALSO

`set_port_configuration` (2).

## **UIT-604 (error) The current design does not exist**

### **DESCRIPTION**

You receive this message if you issue the **set\_port\_configuration** command and the specified current design cannot be found in memory. This could be caused by a spelling error or typo.

### **WHAT NEXT**

Verify that the current design exists in memory, and verify the correct spelling. If necessary, load the design into memory or respecify using **current\_design**. Then reexecute **set\_port\_configuration**.

### **SEE ALSO**

**current\_design** (2), **set\_port\_configuration**(2).

## **UIT-605 (error) The direction of port %s is missing**

### **DESCRIPTION**

You receive this message if you issue the **set\_wrapper\_element** command and do not supply a direction for the specified port. Each port must have a specified direction.

### **WHAT NEXT**

Check the model for the cell, and find out the port direction. Then reexecute **set\_wrapper\_element** and specify the direction of the port.

### **SEE ALSO**

**set\_wrapper\_element** (2).

## **UIT-606 (error) The port configuration information is missing for %s**

### **DESCRIPTION**

You receive this message if you issue **set\_wrapper\_element** and the specified port does not have port configuration information. Each port must either be modeled using

Library Compiler's memory syntax, or the port interface must be described using **set\_port\_configuration** for each output or bidirectional port.

## WHAT NEXT

Either modify the module description in the library or provide the interface information using the **set\_port\_configuration** command. Then reexecute **set\_wrapper\_element**.

## SEE ALSO

**set\_wrapper\_element** (2), **set\_port\_configuration** (2).

# UIT-607 (error) No objects specified in the command

## DESCRIPTION

You receive this message if you issue **set\_wrapper\_element** and do not specify an object. You must specify at least one object.

## WHAT NEXT

Reexecute **set\_wrapper\_element** and specify at least one object.

## SEE ALSO

**set\_wrapper\_element** (2).

# UIT-608 Wrapper attribute not found on %s

## DESCRIPTION

You receive this message if you issue the **remove\_wrapper\_element** command and the **wrapper\_element** attribute was not found on the specified object. You can remove the **wrapper\_element** attribute from an object only if the attribute has been set on that object using the **set\_wrapper\_element** command.

You might not have been aware that the specified object did not have the attribute; or you might have inadvertently specified the wrong object when you executed the **remove\_wrapper\_element** command.

## WHAT NEXT

Determine whether the object specified in this warning message is the object from

which you intended to remove the **wrapper\_element** attribute. If necessary, reexecute the **remove\_wrapper\_element** command and specify only objects on which the **wrapper\_element** attribute has been set.

## SEE ALSO

**remove\_wrapper\_element** (2), **set\_wrapper\_element** (2).

# UIT-609 (error) %s is an output port; can't have a write control

## DESCRIPTION

You receive this message if you issue the **set\_port\_configuration** command with the **-write** option and specify an output port as part of the *signal\_value\_pin\_list* argument. Only input ports can have write control.

## WHAT NEXT

Verify the correct spelling of the input ports you want to use as control ports. Then reexecute **set\_port\_configuration** and specify only input ports as part of the **-write signal\_value\_pin\_list** argument.

## SEE ALSO

**set\_port\_configuration** (2).

# UIT-610 (error) Illegal object type. Need reference or design

## DESCRIPTION

Only reference of design can be specified in the command. You receive this message if you issue **set\_port\_configuration** or **remove\_port\_configuration** with an illegal object type as part of the *cell\_design\_ref\_list* argument. Objects can be only cells, designs, or references.

## WHAT NEXT

Reexecute the command and specify only cells, designs, or references for the *cell\_design\_ref\_list* argument.

## SEE ALSO

**remove\_port\_configuration** (2), **set\_port\_configuration** (2).

## **UIT-611 (error) Black\_boxes are not supported.**

### **DESCRIPTION**

Only modules with descriptions or empty boxes are supported by the command.

### **WHAT NEXT**

Create an empty box i.e. an interface description for the module in the design.

## **UIT-612 (error) Port %s not found on %s**

### **DESCRIPTION**

Port specified in the command should be there on the cell specified for command to be successful.

### **WHAT NEXT**

Check whether cell name and port name are correct.

## **UIT-613 (error) Object %s not found in %s**

### **DESCRIPTION**

Object specified in the command has to be present under the current design.

### **WHAT NEXT**

Check whether the name of the object is correct and current design is specified correctly.

## **UIT-614 (error) Wrapping a constant is not supported**

### **DESCRIPTION**

The module to be wrapped has to be a non-constant.

## WHAT NEXT

Check whether name of the object is correct.

# UIT-615 (warning) %s has already been specified for wrapping

## DESCRIPTION

An Object can be specified for wrapping only once. You receive this message if you issue the **set\_wrapper\_element** command and the **wrapper\_element** attribute is already set on the specified object. You can set the **wrapper\_element** attribute only once on a given object.

You might not have been aware that the specified object already had the attribute, or you might have inadvertently specified the wrong object, when you executed the **set\_wrapper\_element** command.

## WHAT NEXT

Determine whether the object specified in this warning message is the object on which you intended to set the **wrapper\_element** attribute. If necessary, reexecute the **set\_wrapper\_element** command and specify only objects on which the **wrapper\_element** attribute has not already been set.

## SEE ALSO

**set\_wrapper\_element** (2).

# UIT-616 (warning) %s has already been wrapped

## DESCRIPTION

An object can be wrapped only once.

## WHAT NEXT

Check whether the object name is correct.

# UIT-617 (warning) %s has already been specified as clock port

for %s port

## DESCRIPTION

Duplicate specification is detected.

## WHAT NEXT

Check the names of clock port and data port.

**UIT-618 (error)** '%d' is not a valid value for %s option of the **rtldrc** command.

## DESCRIPTION

You receive this message when you have assigned an invalid value to the **-max\_detail\_lines** option for the **rtldrc** command. The value must be greater than or equal to 0.

## WHAT NEXT

Reexecute the **rtldrc** command using a valid value.

**UIT-619 (error)** '%s' is not a valid disabling option for a tristate net.

## DESCRIPTION

You receive this message if you issue **set\_scan\_configuration** or **set\_scan\_tristate** with an invalid value for the scan shift tristate disabling option for internal or external tristate nets. Valid values for the tristate disabling option in scan shift are *enable\_one*, *disable\_all*, or *no\_disabling*.

## WHAT NEXT

Reissue the **set\_scan\_tristate** or **set\_scan\_configuration** command and specify a valid scan shift disabling option for tristate nets in the design.

## SEE ALSO

**insert\_scan** (2), **set\_scan\_configuration** (2), **set\_scan\_tristate** (2).

## **UIT-620 (information) Writing the disable option for the tristate net '%S'.**

### **DESCRIPTION**

You receive this message to inform you that the **set\_scan\_tristate** command is writing to the persistent database the scan shift disabling option you specified for this tristate net.

### **WHAT NEXT**

This is an informational message only. No action is required on your part.

### **SEE ALSO**

**insert\_scan** (2), **set\_scan\_configuration** (2), **set\_scan\_tristate**.

## **UIT-621 (warning) Overwriting the disable option for the tristate net '%S'.**

### **DESCRIPTION**

You receive this message to inform you that there was already a scan shift disabling option set for this tristate net, and that setting is being overwritten by the scan shift disabling option you just specified using the **set\_scan\_tristate** command.

### **WHAT NEXT**

No action is required on your part.

### **SEE ALSO**

**insert\_scan** (2), **remove\_scan\_specification** (2), **set\_scan\_configuration** (2),  
**set\_scan\_tristate** (2).

## **UIT-622 (error) The '%s' object is a '%s'.**

### **DESCRIPTION**

You receive this message if you issue the **set\_scan\_tristate** command and the *net\_list* argument includes the name of an object that is not a net. You can specify only net

names with the **set\_scan\_tristate** command.

## WHAT NEXT

Reissue the **set\_scan\_tristate** command and specify a *net\_list* argument that lists only net names.

## SEE ALSO

**set\_scan\_tristate** (2).

# UIT-623 (error) '%s' is not a bidirectional port.

## DESCRIPTION

You receive this message if you issue the **set\_scan\_bidi** command and the *port\_list* argument includes the name of an object that is not a bidirectional port. You can specify only bidirectional ports with the **set\_scan\_bidi** command.

## WHAT NEXT

Reissue the **set\_scan\_bidi** command and specify a *port\_list* argument that lists only bidirectional port names.

## SEE ALSO

**set\_scan\_bidi** (2).

# UIT-624 (information) Writing the mode in scan shift for the bidirectional port '%s'.

## DESCRIPTION

You receive this message to inform you that the **set\_scan\_bidi** command is writing to the persistent database the scan shift mode you specified for this bidirectional port.

## WHAT NEXT

This is an informational message only. No action is required on your part.

## SEE ALSO

`insert_scan (2)`, `set_scan_configuration (2)`, `set_scan_bidi (2)`.

# UIT-625 (warning) Overwriting the mode in scan shift for the bidirectional port '%s'.

## DESCRIPTION

You receive this message to inform you that there was already a scan shift mode set for this bidirectional port, and that setting is being overwritten by the scan shift mode you just specified using the `set_scan_bidi` command.

## WHAT NEXT

No action is required on your part.

## SEE ALSO

`insert_scan (2)`, `remove_scan_specification (2)`, `set_scan_bidi (2)`,  
`set_scan_configuration (2)`.

# UIT-626 (error) '%s' is not a valid disabling option for internal tristate nets.

## DESCRIPTION

You receive this message if you issue `set_scan_configuration` with an invalid value of the scan shift tristate disabling option for internal tristate nets. Valid values are `disable_all`, `enable_one` (the default) or `no_disabling`.

## WHAT NEXT

Reissue the `set_scan_configuration` command and specify a valid scan shift tristate disabling option for internal tristate nets in the design.

## SEE ALSO

`insert_scan (2)`, `set_scan_configuration (2)`.

## **UIT-627 (error) '%s' is not a valid value for the `-prtool` option argument.**

### **DESCRIPTION**

You receive this message if you execute `set_scan_configuration` with an incorrect argument for the `-prtool` option. Currently allowed values are *cadence* and *avant*.

### **WHAT NEXT**

Reissue the `set_scan_configuration` command with one of the allowed values for the `-prtool` option argument.

### **SEE ALSO**

`set_scan_configuration` (2).

## **UIT-628 (warning) The design '%s' is not scan completed and cannot be represented with a test model.**

### **DESCRIPTION**

Only a scan completed design may be represented using a test model. You have specified a design that is not scan completed as a scan core.

### **WHAT NEXT**

Make sure that your design is scan completed and re-issue the `set_scan_core` command.

## **UIT-630 (error) Pin '%s' is not sticky.**

### **DESCRIPTION**

You receive this message if you issue the `set_rtl_load` command and specify a pin that is not sticky. A sticky pin is a pin or port that is guaranteed to be persistent throughout the early stages of optimization, so that annotated capacitance and resistance can "stick" to those pins and not be lost. You can perform `set_rtl_load` only on sticky pins, or on nets connected to sticky pins.

For a complete explanation of sticky pins, see the manual page for the `set_rtl_load` command.

## WHAT NEXT

If you want to set an RTL load value on the specified pin, you must make it sticky; you can do so by using **set\_dont\_touch** or **set\_size\_only** on the pin. Then reissue the **set\_rtl\_load** command.

If you do not need to set an RTL load on the specified pin, remove it from the *pin\_net\_list* and reissue the **set\_rtl\_load** command.

## SEE ALSO

**set\_dont\_touch** (2), **set\_rtl\_load** (2), **set\_size\_only** (2).

# UIT-631 (error) Net '%s' has no sticky pins.

## DESCRIPTION

You receive this message if you issue the **set\_rtl\_load** command and specify a net that has no sticky pins. A sticky pin is a pin or port that is guaranteed to be persistent throughout the early stages of optimization, so that annotated capacitance and resistance can "stick" to those pins and not be lost. You can perform **set\_rtl\_load** only on sticky pins, or on nets connected to sticky pins.

For a complete explanation of sticky pins, see the manual page for the **set\_rtl\_load** command.

## WHAT NEXT

If you want to set an RTL load value on the specified net, you must make one or more pins of the net sticky. You can make pins sticky by using **set\_dont\_touch** or **set\_size\_only**; alternatively, you can make the net sticky by using **set\_dont\_touch** on the net. Then reissue the **set\_rtl\_load** command.

If you do not need to set an RTL load on the specified net, remove it from the *pin\_net\_list* and reissue the **set\_rtl\_load** command.

## SEE ALSO

**set\_dont\_touch** (2), **set\_rtl\_load** (2), **set\_size\_only** (2).

# UIT-632 (error) You must specify at least a capacitance or

resistance value.

## DESCRIPTION

You receive this message if you issue the **set\_rtl\_load** command and do not specify a capacitance or a resistance value on the pin or net. You must specify at least one; otherwise, the command has no effect. For more information, see the manual page for the **set\_rtl\_load** command.

## WHAT NEXT

Reissue the **set\_rtl\_load** command and specify a capacitance or resistance value, or both, using the **-cap** *cvalue* or **-res** *rvalue* arguments.

## SEE ALSO

**set\_rtl\_load** (2).

# UIT-633 (error) You must specify a net or pin object or -all.

## DESCRIPTION

You receive this message if you issue the **remove\_rtl\_load** command and do not specify either **-all** or *pin\_net\_list*. You must specify one or more target objects on which the **remove\_rtl\_load** command is to operate.

## WHAT NEXT

Reissue the **remove\_rtl\_load** command and specify either **-all** or *pin\_net\_list*.

## SEE ALSO

**remove\_rtl\_load** (2), **set\_rtl\_load** (2).

# UIT-634 (error) You must specify either or both of the -capacitance and -delay options.

## DESCRIPTION

You receive this message if you issue the **calculate\_rtl\_load** command without either the **-capacitance** or **-delay** option. At least one of these options is required, and you can specify both.

## WHAT NEXT

Reissue the **calculate\_rtl\_load** command and specify at least one of the **-capacitance** and **-delay** options.

## SEE ALSO

`calculate_rtl_load.2`

# UIT-635 (error) Net '%s' must have a set\_load value.

## DESCRIPTION

You receive this message if you issue **calculate\_rtl\_load -capacitance** and the specified net does not have a **set\_load** value on it. In order for the **-capacitance** option to be processed, you must have previously placed a **set\_load** value on the specified net, or on the net that is connected to the specified pin.

## WHAT NEXT

Set a load on the specified net using **set\_load**. Then reissue the **calculate\_rtl\_load** command.

## SEE ALSO

`calculate_rtl_load (2)`, `set_load (2)`.

# UIT-650 (warning) A set\_test\_point\_element command has already been specified for the pin %s and for the type %s.

The previous **set\_test\_point** specification will be deleted and replaced with the current one.

## DESCRIPTION

You have used **set\_test\_point\_element** to set a new test point on pin %s

A user-defined test point specification already exists on that pin. This is a warning message

The previous user-defined test point specification will be deleted.

## WHAT NEXT

If you do not want to remove a test point which already exists on the specified pin,

do not specify this pin with the set\_test\_point\_element command.

## **UIT-651 (Information) The previous user-defined test point specification in location %s of type %s is being deleted.**

### **DESCRIPTION**

This is an information message. The previous user-defined test point specification in location %s of type %s is being deleted.

### **WHAT NEXT**

You can specify another test point location with the set\_test\_point\_element command.

## **UIT-652 (warning) Cell %s has a dont\_touch attribute. The asynchronous violation associated with it will not be autofixed.**

### **DESCRIPTION**

You receive this warning message because the asynchronous violation associated with cell %s will not be autofixed because of a **dont\_touch** attribute on this cell.

### **WHAT NEXT**

If you are satisfied with this result, no action is required on your part. If you want the asynchronous violation associated with the specified cell to be autofixed, remove the **dont\_touch** attribute from the specified cell and rerun autofix.

### **SEE ALSO**

**insert\_dft** (2).

## **UIT-653 (warning) Cell %s has a dont\_touch attribute.**

The clock violation associated with it will not be autofixed.

## DESCRIPTION

You receive this warning message because the clock violation associated with cell %s will not be autofixed because of a **dont\_touch** attribute on this cell.

## WHAT NEXT

If you are satisfied with this result, no action is required on your part. If you want the clock violation associated with the specified cell to be autofixed, remove the **dont\_touch** attribute from the specified cell.

## SEE ALSO

**insert\_dft** (2).

**UIT-654** (information) There are %d other cells with the same violation.

## DESCRIPTION

This message summarizes the total number of violations identified in UIT-652 and UIT-653.

## WHAT NEXT

This is an informational message. No action is required on your part. For more information, see the manual page for UIT-652 and UIT-653.

## SEE ALSO

**insert\_dft** (2).

**UIT-655** (warning) Scan style '%s' does not add lockup latches to the scan chain.

Ignoring the set\_scan\_configuration -

## **insert\_end\_of\_chain\_lockup\_latch command.**

### **DESCRIPTION**

This warning message tells you that you have asked DFT Compiler to add lockup latches to the scan chain but have specified a scan style that is not multiplexed\_flip\_flop. The compiler is ignoring the **-insert\_end\_of\_chain\_lockup\_latch** option. Only the multiplexed\_flip\_flop scan style adds lockup latches to the scan chain.

### **WHAT NEXT**

To avoid receiving this warning message, remove **-insert\_end\_of\_chain\_lockup\_latch true** from the **set\_scan\_configuration** option list, or set the scan style to multiplexed\_flip\_flop.

### **SEE ALSO**

**set\_scan\_configuration (2)**.

## **UIT-656 (warning) port '%s' is the wrong direction to be a %s.**

### **DESCRIPTION**

This warning message informs you that you tried to set the access point for a register port to something that is inconsistent with its direction. The **set\_bsd\_register** command lets you specify access points for a user-defined register using boundary scan signal semantics. Ports with signal type "tdo" must be associated with output ports. Ports with all other signal types should not be associated with output ports or tristate ports.

### **WHAT NEXT**

Issue the **set\_bsd\_register** command and specify a valid access port or signal type.

### **SEE ALSO**

**set\_bsd\_register (2)**.

## **UIT-657 (error) Register port list has multiple signal types for**

hookup point '%s'.

## DESCRIPTION

This error message informs that you tried to associate more than one signal type with a port. The **set\_bsd\_register** command lets you specify ports for user-defined registers using boundary-scan signal semantics. However, you can associate only one signal type with each port.

## WHAT NEXT

Use the **set\_bsd\_register** command and specify only one signal type per port.

## SEE ALSO

**set\_bsd\_register** (2).

**UIT-658 (warning)** Port specification is not paired. Last specification is incomplete and is discarded.

## DESCRIPTION

This warning message informs you that you specified an incomplete port with the **set\_bsd\_register** command. The **set\_bsd\_register** command lets you specify ports for user-defined registers using boundary-scan signal semantics. Specified ports must be pairs, and each pair must include a signal type and a design port or pin. Incomplete pairs cannot be used to specify ports and are discarded.

## WHAT NEXT

To avoid receiving this warning message, remove the last object from the argument list.

## SEE ALSO

**set\_bsd\_register** (2).

**UIT-659 (error)** Port type '%s' is repeated.

## DESCRIPTION

This error message informs you that multiple ports have been specified for the same

signal type in the access list. The **set\_bsd\_register** command lets you specify ports for user-defined registers using boundary-scan signal semantics. Port signal types "tdi" and "tdo" can be specified multiple times only for register named as **STT\_REG**. For all other registers signal types "tdi" and "tdo" can be specified only once. All other signal types can always be repeated.

## WHAT NEXT

Run the **set\_bsd\_register** command and specify only one "tdi" and one "tdo" port if the register is not **STT\_REG**. If you want to specify a scan-through-tap register use the reserved name **STT\_REG** for the register and reissue the command.

## SEE ALSO

**set\_bsd\_register** (2).

# UIT-660 (error) Access point specification is missing signal type '%S'.

## DESCRIPTION

The **set\_bsd\_register** command lets you specify access points for a user-defined register with boundary-scan signal semantics. This error is generated because the register cannot be wired correctly without a signal of the designated type.

## WHAT NEXT

Rerun the **set\_bsd\_register** command and include ports for the required signal type using the **-access** option.

## SEE ALSO

**set\_bsd\_register** (2).

# UIT-661 (Error) Missing ports for user-defined BSR or TAP elements.

## DESCRIPTION

This error is generated because some of the required access ports for the BSR and TAP elements are missing from the specification. The **set\_bsd\_bsr\_element** or **set\_bsd\_tap\_element** command lets you specify user-defined BSR or TAP elements.

## WHAT NEXT

Rerun one of the commands and specify all required access ports using the **-access** option. For a list of required access ports, see the man page for the **set\_bsd\_bsr\_element** or **set\_bsd\_tap\_element** commands.

If you are getting this error on **set\_bsd\_tap\_element**, it might be due to the reason that you are using an old custom tap implementation and signal type 'instructions' is missing in the access list. In this case you might want to set the variable 'bsd\_use\_old\_tap' to true and rerun the command.

## SEE ALSO

**set\_bsd\_bsr\_element** (2), **set\_bsd\_tap\_element** (2).

# UIT-662 (error) Mismatched signal types 'tdi' and 'tdo'.

## DESCRIPTION

The **set\_bsd\_register** command lets you specify access points 'tdi' and 'tdo' multiple times for the scan-through-tap register **STT\_REG**. This error is generated either because access points 'tdi' and 'tdo' do not match in number or because they are not specified in alternate order.

## WHAT NEXT

Correct the access points 'tdi' and 'tdo' specified in the **-access** option and rerun the **set\_bsd\_register** command.

## SEE ALSO

**set\_bsd\_register** (2).

# UIT-663 (error) Multiple signal types cannot be specified for hookup port '%s'.

## DESCRIPTION

This error message informs that you tried to associate more than one signal type with a hookup port. The **set\_dft\_signal** command lets you specify hookup ports for different types. However, you can associate only one signal type with each port.

## WHAT NEXT

Use the **set\_dft\_signal** command and specify only one signal type per hookup port.

## SEE ALSO

**set\_dft\_signal** (2).

# UIT-664 (error) -bsd\_style can only be specified with -view spec.

## DESCRIPTION

You receive this error message when you execute the **set\_scan\_path** command in XG mode with view existing\_dft and -bsd\_style options . -bsd\_style can not be specified with view existing\_dft.

## WHAT NEXT

Fix the error and re-execute the command.

## SEE ALSO

**set\_scan\_path** (2).

# UIT-665 (error) -bsd\_style can only be specified for user defined test data registers.

## DESCRIPTION

You receive this error message when you execute the **set\_scan\_path** command with -bsd\_style option for Boundary or Short BSR Chains. -bsd\_style can be specified for User Defined Test Data Registers only.

## WHAT NEXT

Use -bsd\_style for User Defined Test Data Registers only.

## SEE ALSO

**set\_scan\_path** (2).

# **UIT-666 (warning) Scan-in and scan-out ports for compression mode %s should be specified only in the base mode.**

## **DESCRIPTION**

This warning message occurs when scan-in and scan-out ports are specified in the compression mode.

The compression mode specifications are specifically used to guide the tool to build scan chains outside compressor/decompressor in the compression mode. These chains can be specified in the compression mode by using the **set\_scan\_path command** and assigning the flops to be routed between the external scan-in and scan-out ports.

If you do not intend to build any chains outside compressor/decompressor, specify scan-in and scan-out specifications only in the all\_dft mode or the base scan mode.

For example, the following commands instruct the tool to build scan chains outside compressor/decompressor in compression mode:

```
set_dft_signal -type ScanDataIn -port my_si \
 -view spec -test_mode ScanCompression_mode

set_dft_signal -type ScanDataOut -port my_so \
 -view spec -test_mode ScanCompression_mode

set_scan_path my_ext_chain -view spec -scan_data_in my_si \
 -scan_data_out my_so -include_elements {Flop1 Flop2 Flop3} \
 -complete true -test_mode ScanCompression_mode
```

## **WHAT NEXT**

This is only a warning message. No action is required.

However, if the result is not what you intended, use the commands shown above for correct specifications, or remove the scan-in and scan-out specifications from the compression mode and specify them in the all\_dft or the base scan mode.

## **SEE ALSO**

```
set_dft_signal(2)
set_scan_compression_configuration(2)
set_scan_path(2)
```

# **UIT-667 (error) Pin name '%s' specified more than once.**

## **DESCRIPTION**

This message informs you that you ran the **define\_dft\_design** command with an access

list that specifies a pin name more than once.

## WHAT NEXT

Rerun the **define\_dft\_design** command with a valid access list.

## SEE ALSO

**insert\_bsd** (2), **set\_bsd\_pad\_design** (2).

# UIT-668 (error) Signal type '%s' specified more than once.

## DESCRIPTION

This message informs you that you ran the **define\_dft\_design** command with an access list that specifies any of the following signal types more than once: data\_in, data\_out or enable.

## WHAT NEXT

Rerun the **define\_dft\_design** command after making sure that the signal types viz. data\_in, data\_out and enable are specified only once.

## SEE ALSO

**insert\_bsd** (2), **set\_bsd\_pad\_design** (2).

# UIT-669 (error) Polarity high(H) specified more than once for signal type '%s'.

## DESCRIPTION

This message informs you that you ran the **define\_dft\_design** command with an access list that specifies polarity "high" more than once for any of the following signal types: data\_in, data\_out and port.

## WHAT NEXT

Rerun the **define\_dft\_design** command after making sure that the polarity "high" is specified exactly once if the signal type is data\_in, data\_out or port.

## SEE ALSO

`insert_bsd` (2), `set_bsd_pad_design` (2).

## UIT-670 (error) Polarity low(L) specified more than once for signal type '%s'.

### DESCRIPTION

This message informs you that you ran the `define_dft_design` command with an access list that specifies polarity "low" more than once for any of the following signal types: data\_in, data\_out and port.

### WHAT NEXT

Rerun the `define_dft_design` command after making sure that the polarity "low" is specified exactly once if the signal type is data\_in, data\_out or port.

## SEE ALSO

`insert_bsd` (2), `set_bsd_pad_design` (2).

## UIT-671 (warning) Signal type '%s' should not be specified for 'hybrid' PAD. Ignored the specification.

### DESCRIPTION

This message informs you that you ran the `define_dft_design` command for a hybrid PAD with an interface list that specifies any of the following signal types: port, data\_in, data\_out, or enable. These signal types are not used for a hybrid PAD. For a hybrid PAD this information is collected from the `$bsr_segment$` specification of the `-params` option of the `define_dft_design` command.

### WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended you can make sure that the port, data\_in, data\_out, and enable signal types are not specified for the hybrid PAD, and then run the `define_dft_design` command again.

## SEE ALSO

```
define_dft_design(2)
insert_dft(2)
```

## UIT-700 (warning) Invalid scan state.

### DESCRIPTION

This warning message informs you that you have specified an invalid scan state with the **set\_scan\_state** command.

### WHAT NEXT

Rerun the **set\_scan\_state** command and specify a valid scan state.

## SEE ALSO

```
set_scan_state (2).
```

## UIT-701 (error) Incorrect value of -power\_saving\_on option argument. Allowed values are true, TRUE; or false, FALSE.

### DESCRIPTION

You receive this message if you execute **set\_testability\_configuration** with an incorrect argument for the **-power\_saving\_on** option. Allowed values of the **-power\_saving\_on** option are *true*, *TRUE*; or *false*, *FALSE*.

### WHAT NEXT

Re-issue the command with one of the allowed values for the **-power\_saving\_on** option argument.

## SEE ALSO

```
set_testability_configuration (2).
```

## UIT-702 (warning) '%s' is not an external port and cannot be

used to specify a port.

## DESCRIPTION

This warning informs you that you used an object other than an external port to specify a port. The **set\_test\_hold** command allows only external ports to specify ports. Other kinds of objects cannot be used to specify ports and are rejected.

## WHAT NEXT

Remove the offending object from the argument list. Use hierarchical instance names, with respect to the top-level design, to locate external ports. Then, rerun the command with a valid external port.

## SEE ALSO

**set\_test\_hold** (2).

**UIT-703 (warning)** The test point '%s' is not inserted, because the instance location '%s' does not exist due to insert\_dft optimization.

## DESCRIPTION

You receive this warning message if you execute **insert\_dft** after the **set\_test\_point\_element** command. The **set\_test\_point\_element** command allows design objects to specify pin instances on which test points need to be inserted. Some test points might be rejected if their corresponding pin instances do not exist after the optimization.

## WHAT NEXT

If the test point is required then use the **set\_dont\_touch** command to prevent the cell from being modified or replaced during optimization. Another way consists in using **insert\_dft** with optimization switched off. Use **-dont\_fix\_constraints** and **-ignore\_compile\_design\_rules** options to switch off optimization.

**UIT-703 (warning)** The test point '%s' is not inserted because the instance location '%s' does not exist due to insert\_dft

# optimization.

## DESCRIPTION

This message informs you that the specified test point is rejected because corresponding pin instances do not exist after optimization. You receive this warning message if you use the **insert\_dft** command after the **set\_test\_point\_element** command. The **set\_test\_point\_element** command allows design objects to specify pin instances on which test points must be inserted.

## WHAT NEXT

Use the **set\_dont\_touch** command to prevent the cell from being modified or replaced during optimization; or, use **insert\_dft** with optimization switched off. Use the **-dont\_fix\_constraints** and **-ignore\_compile\_design\_rules** options with the **insert\_dft** command to switch off optimization.

## SEE ALSO

**insert\_dft** (2), **set\_dont\_touch** (2), **set\_test\_point\_element** (2).

# UIT-704 (warning) Cell '%s' has a dont\_touch attribute. The violation(s) associated with it will not be autofixed.

## DESCRIPTION

This message informs you that the **dont\_touch** attribute exists on the specified cell and prevents violations associated with this cell from being autofixed. You receive this warning message when you use the **preview\_dft** command. The full list of instances with the **dont\_touch** attribute is reported using the **preview\_dft -verbose** command. Without the **-verbose** switch, the **preview\_dft** command reports the first violation and the total number occurrences of the **dont\_touch** attribute.

## WHAT NEXT

If you are satisfied with this result, no action is required on your part. If you want the violation(s) associated with the specified cell to be autofixed, remove the **dont\_touch** attribute from the specified cell and rerun AutoFix.

## SEE ALSO

**preview\_dft** (2).

## **UIT-705 (information)** There are %d other cells with the same violation.

### **DESCRIPTION**

This message summarizes the total number of violations identified in UIT-704. Specifically, this message reports the first violation and the total number of occurrences of the **dont\_touch** attribute in the design.

### **WHAT NEXT**

This is an informational message. No action is required on your part. For more information, see the manual page for UIT-704.

### **SEE ALSO**

`preview_dft (2); UIT-704 (n).`

## **UIT-706 (information)** The port %s is used as a test mode signal to AutoFix asynchronous sets and resets and as a test scan enable signal.

### **DESCRIPTION**

This message informs you that the port %s is shared between the test mode signal and the test scan enable signal to Autofix asynchronous sets and resets. You have used the **set\_ autofix\_configuration** command with the **-fix\_async\_with\_se true** option to use the test scan enable signal to Autofix asynchronous sets and resets.

### **WHAT NEXT**

This is an informational message only. No action is required on your part.

### **SEE ALSO**

`set_ autofix_configuration (2).`

## **UIT-707 (error)** Incorrect value for -fix\_async\_with\_scan\_en option argument. Allowed values are true, TRUE, on, and ON; or

false, FALSE, off, and OFF.

## DESCRIPTION

This error message informs you that you used the `set_ autofix_ configuration` command with an invalid argument for the `-fix_async_with_scan_en` option. Allowed values for the `-fix_async_with_scan_en` option argument are true, TRUE, on, and ON; or false, FALSE, off, and OFF.

## WHAT NEXT

Use the `set_ autofix_ configuration` command with the `-fix_async_with_scan_en` option and specify one of the allowed values as the argument.

## SEE ALSO

`set_ autofix_ configuration` (2).

**UIT-708** (Warning) Overwriting the async port specification '%s' to autofix the cell/instance '%s'.

## DESCRIPTION

You can use the `set_ autofix_ async` command to put a specific async port to autofix a cell/instance. This warning message is produced if you try to perform `set_ autofix_ async` on a cell/instance that already has a specified async port.

## WHAT NEXT

No further action is necessary.

**UIT-709** (information) One asynchronous pin of the cell %s has already been autofixed. As a consequence, another handler %s will be used to autofix the second asynchronous pin %s.

## DESCRIPTION

You receive this information message because one of the asynchronous signals of the cell has been autofixed. The same handler cannot be used to autofix the asynchronous pins of the same register. Therefore, two different handlers will be used to autofix the two asynchronous pins of the same register.

## WHAT NEXT

Use the `set_ autofix_async` command to specify existing ports to be used to fix asynchronous signals of cells.

## SEE ALSO

`insert_dft (2)`, `set_ autofix_async(2)`, `set_dft_signal (2)`.

# UIT-710 (error) Invalid cell type for core wrapper insertion.

## DESCRIPTION

You receive this message if you issue the `set_core_wrapper_design` command and specify an invalid value for the wrapper cell type. Valid values of wrapper cell types are listed in the manual page and the online help for the `set_core_wrapper_design` command. The `insert_dft` command uses the specified wrapper cell type when synthesizing wrapper into the design.

## WHAT NEXT

Refer to the manual page or the online help for the `set_core_wrapper_design` command to determine the current valid wrapper cell types, and reissue the `set_core_wrapper_design` command with a valid wrapper cell type.

## SEE ALSO

`insert_dft (2)`, `set_core_wrapper_design (2)`.

# UIT-711 (error) Cannot find the specified design in memory.

## DESCRIPTION

You receive this message if you execute the `set_core_wrapper_design` command and the name you specify for the `design_name` argument cannot be found in memory. This could be caused by a typo or spelling error. The `insert_dft` command uses the specified design as a wrapper cell design when synthesizing wrapper into the design.

## WHAT NEXT

Verify that the design you want to use does exist in memory, and verify its spelling. Then re-execute the appropriate command using the correct design name.

## SEE ALSO

`insert_dft` (2), `set_core_wrapper_design` (2).

# UIT-712 (error) Invalid port type '%s' specified for user-defined wrapper cell design.

## DESCRIPTION

You receive this message if you issue the `set_core_wrapper_design` command and specify an invalid port type. Valid port types are found in the manual page or online help for the above command. The `insert_dft` command uses the user-defined wrapper cell design when synthesizing wrapper into the design.

## WHAT NEXT

Refer to the manual pages or the online help for the `set_core_wrapper_design`, command to determine the current valid wrapper cell design port types, respectively. Then reissue the appropriate command with a valid port type.

## SEE ALSO

`insert_dft` (2), `set_core_wrapper_design` (2).

# UIT-713 (Error) Missing ports for user-defined wrapper cell design : %s.

## DESCRIPTION

This error is generated because some of the required access ports for the wrapper cell design are missing from the specification. The `set_core_wrapper_design` command lets you specify user-defined wrapper cell design.

## WHAT NEXT

Rerun one of the commands and specify all required access ports using the `-access` option. For a list of required access ports, see the man page for the `set_core_wrapper_design` command.

## SEE ALSO

`set_core_wrapper_design` (2).

# **UIT-714 (error) Cannot find the specified port '%s' in the design.**

## **DESCRIPTION**

You receive this message if you execute the **set\_core\_wrapper\_design** command and a port you specify cannot be found in the design. This could be caused by a typo or spelling error. The **insert\_dft** command uses the specified wrapper cell type when synthesizing wrapper into the design.

## **WHAT NEXT**

Verify the name of the port. Then reissue the appropriate command using the correct port name for the design or instance.

## **SEE ALSO**

**insert\_dft** (2), **set\_core\_wrapper\_design** (2).

# **UIT-715 (error) Scan chain '%s' exists in another mode.**

## **DESCRIPTION**

DFT Compiler does not allow same scan chains to be specified using multiple **set\_scan\_path** commands. This warning tells you that an earlier specification for the same scan chain exists for another mode. Scan chain names should be unique for the whole design.

## **WHAT NEXT**

Establish whether you want the specification to be overwritten. If not, combine the two specifications into one **set\_scan\_path** command for the same mode.

# **UIT-717 (error) The option **test\_use\_test\_models** is not supported by **write\_layout\_scan**.**

## **DESCRIPTION**

You receive this message if you set the env variable **test\_use\_test\_models** to TRUE before the command **write\_layout\_scan**. This flow is not supported for **write\_layout\_scan**.

## WHAT NEXT

Reset the env variable `test_use_tes_models` before the command `write_layout_scan`

## SEE ALSO

`test_use_test_models` (3). `write_layout_scan` (2).

**UIT-718 (error)** The `-power_saving_on` option is only available when the `-method` option has the `tdvr` argument.

## DESCRIPTION

You receive this message if you execute `set_testability_configuration` with the `-power_saving_on` option and without `tdvr` as an argument for the `-method` option.

## WHAT NEXT

Re-issue the command with `tdvr` for the `-method` option argument or re-issue the command without the `fB-power_saving_on` option.

## SEE ALSO

`set_testability_configuration` (2).

**UIT-719 (Error)** The type `%s` is not a valid type for the `set_test_point_element` command.

## DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued, but the type is not a valid type for the command.

## WHAT NEXT

Check the valid types in the manpage of the `set_test_point_element`, modify the type and re-issue the command.

## SEE ALSO

`set_test_point_element`

## **UIT-720 (Error) The parameter for the %s option has to be enable or disable.**

### **DESCRIPTION**

This message indicates that a `set_test_point_element` command has been issued, but the parameter for the option is not a valid one. The valid parameters are enable or disable.

### **WHAT NEXT**

Change the parameter for the option and re-issue the command.

### **SEE ALSO**

`set_test_point_element`

## **UIT-721 (Error) Port %s is not a test mode.**

### **DESCRIPTION**

The port %s is not a test mode. Use `set_dft_signal` to create a test mode associated with port %s.

### **WHAT NEXT**

After the dft signal specification, re-issue the command.

## **UIT-722 (Warning) The -scan\_test\_point\_enable option is ignored for the type %s.**

### **DESCRIPTION**

This message indicates that a `set_test_point_element` command has been issued, but the `-scan_test_point_enable` option is not an option that can be specified for the type and the option is ignored. The `-scan_test_point_enable` option is a valid option for the control types.

### **WHAT NEXT**

Remove the `-scan_test_point_enable` option.

## **SEE ALSO**

`set_test_point_element`

# **UIT-723 (Warning) The -test\_points\_per\_test\_point\_enable option is ignored for the type %s.**

## **DESCRIPTION**

This message indicates that a `set_test_point_element` command has been issued, but the `-test_points_per_test_point_enable` option is not an option that can be specified for the type and the option is ignored. The `-test_points_per_test_point_enable` option is a valid option for the control types.

## **WHAT NEXT**

Remove the `-test_points_per_test_point_enable` option.

## **SEE ALSO**

`set_test_point_element`

# **UIT-724 (Warning) The -test\_point\_enable option is ignored for the type %s.**

## **DESCRIPTION**

This message indicates that a `set_test_point_element` command has been issued, but the `-test_point_enable` option is not an option that can be specified for the type and the option is ignored. The `-test_point_enable` option is a valid option for the control types.

## **WHAT NEXT**

Remove the `-test_point_enable` option.

## **SEE ALSO**

`set_test_point_element`

## **UIT-725 (Error) The port or the pin %s does not have the correct direction.**

### **DESCRIPTION**

This message indicates that a set\_test\_point\_element command has been issued, but the port or the pin does not have the correct direction according to the option in which the port or the pin has been specified.

### **WHAT NEXT**

Specify another port or another pin with the correct direction and re-issue the command.

### **SEE ALSO**

[set\\_test\\_point\\_element](#)

## **UIT-726 (Error) The pin %s does not have the correct direction for a test point location.**

### **DESCRIPTION**

This message indicates that a set\_test\_point\_element command has been issued, but a pin from the list does not have the correct direction. A test point location has to be an output pin.

### **WHAT NEXT**

Specify another pin with the correct direction for the test point location and re-issue the command.

### **SEE ALSO**

[set\\_test\\_point\\_element](#)

## **UIT-727 (Error) The port %s cannot be specified for a test point**

location.

## DESCRIPTION

This message indicates that a `set_test_point_element` command has been issued, but a port cannot be the location of a test point. A test point location has to be an output internal pin.

## WHAT NEXT

Specify an internal output pin and re-issue the command.

## SEE ALSO

`set_test_point_element`

## UIT-728 (warning) Cell '%s' has no function specification.

The asynchronous pin violation(s) associated with it will not be autofixed.

## DESCRIPTION

This message informs you that the specified cell has no function specification and this prevents the asynchronous pin violations associated with this cell from being autofixed. You receive this warning message when you use the `preview_dft` and `insert_dft` commands.

## WHAT NEXT

If you are satisfied with this result, no action is required on your part. If you want the violation(s) associated with the specified cell to be autofixed, provide the library for the cell; the `test_simulation_library` does not provide enough information to autofix the asynchronous pins of the specified cell.

## SEE ALSO

`preview_dft` (2), `insert_dft` (2).

# **UIT-730 (Error) Unsupported client '%s' for RTL Insertion.**

## **DESCRIPTION**

This message informs you that RTL insertion is incompatible with any other DFT clients.

## **WHAT NEXT**

Remove DFT clients from set\_dft\_configuration and insert\_dft UI commands.

## **SEE ALSO**

`set_dft_configuration (2)`, `insert_dft (2)`.

# **UIT-731 (Error) Unrecognized HDL format '%s'.**

## **DESCRIPTION**

This message informs you that the specified HDL format for RTL insertion is not valid. Only 'verilog' and 'VHDL' are valid values.

## **WHAT NEXT**

Change the HDL format to 'verilog' or 'VHDL'.

## **SEE ALSO**

`set_dft_rtl_configuration (2)`,

# **UIT-732 (error) '%s' is not a directory.**

## **DESCRIPTION**

You have specified an invalid directory; or, the directory or one or more of its parents are read or search protected.

## **WHAT NEXT**

Check your project file to ensure that variables specifying directories are correctly set.

Change your permissions to enable reading and searching of the appropriate directory and all of its parents. For example,

```
chmod a+rx <dir_name>
```

## **UIT-733 (error) Cannot perform RTL insertion because the variable hdlin\_enable\_rtldrc\_info is set to FALSE**

### **DESCRIPTION**

The variable `hdlin_enable_rtldrc_info` must be set to TRUE to perform RTL insertion. FALSE is the `hdlin_enable_rtldrc_info` variable default value.

### **WHAT NEXT**

Set the variable `hdlin_enable_rtldrc_info` to TRUE For example,

```
set hdlin_enable_rtldrc_info TRUE
```

## **UIT-770 (Warning) The option -identify\_shift\_register will be ignored in 2007.03 SP4. Shift register identification will be moved fully to DC Ultra in Z2007.03 SP4.**

### **DESCRIPTION**

This options is ignored in 2007.03 release. Added back in 2007.03 SP1. This option will again be ignored from 2007.03 SP4. The functionality is incorporated into `compile_ultra -scan`. The variable `compile_seqmap_identify_shift_registers` can be used to enable/disable the identification in `compile_ultra -scan`

### **WHAT NEXT**

Execute `compile_ultra -scan`

## **UIT-800 (warning) Bad value for the number of test points per observe flop option. Eight test points per observe flop will be**

considered during test point insertion.

## DESCRIPTION

In order to provide balanced xor tree, the only accepted values for -**test\_points\_per\_observe\_flop** option are 1, 2, 4 and 8. If a different value is set, then the default value (8) will be considered.

## WHAT NEXT

Set number of test points per observe clock with a correct value.

# UIT-801 (warning) No observe test point will be inserted.

## DESCRIPTION

This warning message appears when **-max\_observe\_points** and/or **-max\_observe\_logic\_area** are set to zero. In this case, no observe test point will be inserted in the design.

## WHAT NEXT

Set **-observe\_points\_per\_scan\_cell** and/or **-max\_observe\_logic\_area** options with the correct value.

# UIT-802 (Error) Unable to read the TRC file %s given.

## DESCRIPTION

This is issued from the command **read\_trc\_file**. The command is not able to read the file specified due to errors given before.

## WHAT NEXT

Check the file syntax as well is as per the standard supported.

# UIT-803 (information) reverting value of environment variable

**'%s' to its default value '%s'.**

## **DESCRIPTION**

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable value is invalid. DFT Compiler supplies a default.

## **WHAT NEXT**

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

**UIT-804 (Warning) '%s' is not a valid scan style.**

## **DESCRIPTION**

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable that needs to specify a scan style specifies an invalid one. DFT Compiler will use a default scan style.

## **WHAT NEXT**

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

**UIT-805 (Warning) '%s' is not 'true' or 'false'.**

## **DESCRIPTION**

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable that needs to specify either 'true' or 'false' specifies something else. DFT Compiler will use a default value.

## **WHAT NEXT**

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

**UIT-806 (warning) Cannot associate a '%s' signal with chain**

'%S'.

## DESCRIPTION

DFT Compiler uses one scan enable signal to enable scan mode. This message warns that you used the **set\_scan\_signal** command to associate a scan enable with a specific scan chain. Because the scan enable is associated with all scan chains, the specific association is ignored.

## WHAT NEXT

Remove the association to suppress the warning.

## UIT-807 (information) reverting value of environment variable '%d' to its default value '%d'.

## DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable value is invalid. DFT Compiler supplies a default.

## WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

## UIT-808 (Warning) '%s' does not include the substring '%%s'.

## DESCRIPTION

DFT Compiler validates the values of environment variables it uses. You see this message when an environment variable that needs include the substring "%s" does not. DFT Compiler will use a default value.

## WHAT NEXT

Confirm that the environment variable is invalid. Modify the environment variable value to remove the warning.

## **UIT-809 (warning) Hookup sense value '%s' conflicts with the old value '%s'.**

### **DESCRIPTION**

DFT Compiler only associates exactly one hookup sense between a design port and an internal hookup pin. This message warns that you have used the **set\_scan\_signal** command to associate a second hookup sense, and that the second specification has overwritten the first.

### **WHAT NEXT**

Check that you do want to overwrite the specification. Repeat the correct specification if the overwrite was mistaken.

## **UIT-810 (error) Argument -memory\_cells should be specified for a single controller.**

### **DESCRIPTION**

This error occurs because you used the **set\_mbist\_controller** command to assign a list of memory cells to two or more controllers.

### **WHAT NEXT**

Run the **set\_mbist\_controller** command specifying one controller with -controller\_names and a list of memory cells using -memory\_cells.

### **SEE ALSO**

**set\_mbist\_element** (2).

## **UIT-811 (error) Memory '%s' has already been assigned to a controller. Cannot change notouch value to TRUE.**

### **DESCRIPTION**

This error occurs because you either used the **set\_mbist\_controller** command to assign a memory cell, which has already been assigned to a controller, to a new controller or you used **set\_mbist\_element** command to set notouch value to TRUE for that memory cell.

## WHAT NEXT

Run the `remove_mbist_configuration` command to remove the current MBIST configuration. Assign the memory cell to the new controller using `set_mbist_controller` command specifying one controller with `-controller_names` and the memory cell using `-memory_cells`.

## SEE ALSO

`remove_mbist_configuration` (2).

## UIT-812 (error) -notouch and -ip\_parameters are mutually exclusive.

### DESCRIPTION

This error occurs because you used the `set_mbist_element` command to simultaneously set the `-notouch` value and assign the `-ip_parameters` for the memory cells.

## WHAT NEXT

Run the `set_mbist_element` command with either `-notouch` or the `-ip_parameter` switch.

## SEE ALSO

`remove_mbist_configuration` (2).

## UIT-813 (error) Odd number of items in the -ip\_parameters list.

### DESCRIPTION

This error occurs because you used the `set_mbist_element` or `set_mbist_controller` command to pass odd number of items in the `-ip_parameters` list.

## WHAT NEXT

Run the `set_mbist_element` or `set_mbist_controller` command with even number of items in the `-ip_parameter` list.

## SEE ALSO

`remove_mbist_configuration` (2).

## **UIT-814 (error) -notouch value can be either TRUE or FALSE.**

### **DESCRIPTION**

This error occurs because you used the **set\_mbist\_element** command to set -notouch to a value other than TRUE or FALSE.

### **WHAT NEXT**

Run the **set\_mbist\_element** command with -notouch value as TRUE or FALSE

### **SEE ALSO**

[\*\*remove\\_mbist\\_configuration\*\* \(2\)](#).

## **UIT-815 (error) Memory '%s' has notouch value set to TRUE and cannot be assigned ip parameters or to a controller .**

### **DESCRIPTION**

This error occurs because you either used the **set\_mbist\_controller** command to assign a memory cell, which has already been excluded from MBIST consideration, to controller or tried to assign ip parameters using /fBset\_mbist\_element/fP.

### **WHAT NEXT**

Run the **remove\_mbist\_configuration** command to remove the current MBIST configuration. Assign the memory cell to the new controller using **set\_mbist\_controller** command specifying one controller with -controller\_names and the memory cell using -memory\_cells.

### **SEE ALSO**

[\*\*remove\\_mbist\\_configuration\*\* \(2\)](#).

## **UIT-816 (error) Invalid value for the -mbist parameter**

### **DESCRIPTION**

This error occurs because you specified an invalid value for the -mbist parameter.

## WHAT NEXT

See the list of available values

## SEE ALSO

`preview_dft` (2).

**UIT-817 (error)** "%s" is not a valid command line option for set\_mbist\_run command.

## DESCRIPTION

You receive this message because the parameter(s) name or value specified in the set\_mbist\_run command are not valid.

## WHAT NEXT

Please enter valid parameter name and values in the command line.

## SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

**UIT-818 (error)** Parameter "fail\_limit" can be defined only for debug mode.

## DESCRIPTION

You receive this message because the parameter "fail\_limit" was specified for a test\_mode other than debug mode.

## WHAT NEXT

Please change the test\_mode to debug mode or remove the "fail\_limit" parameter from the command line.

## SEE ALSO

`insert_dft` (2), `preview_dft` (2), `read_test_model` (2), `set_dft_configuration` (2).

## **UIT-819** (error) Memory instance %s does not exist in the top level model.

### **DESCRIPTION**

You receive this message because either the memory instance is missing from the top model or the corresponding reference object is missing.

### **WHAT NEXT**

Please add the memory instance to the netlist. If the instance does not exist in the design, remove the instance name from the list of memories in the command line. If the memory instance is in the design, read the library cell or the design object corresponding to the reported memory instance in the dc\_shell.

### **SEE ALSO**

```
insert_dft (2), preview_dft (2), read_test_model (2), set_dft_configuration (2).
```

## **UIT-820** (error) Odd number of items in the -parameters list.

### **DESCRIPTION**

This error occurs because you used the **set\_mbist\_wrapper**, **set\_mbist\_controller** or **set\_mbist\_configuration** command to pass an odd number of items in the **-parameters** list.

### **WHAT NEXT**

Run the respective command with an even number of items in the -parameter list.

### **SEE ALSO**

```
set_mbist_configuration (2) set_mbist_wrapper (2) (XG mode) set_mbist_controller (2)
reset_mbist_configuration (2) (XG mode) remove_mbist_configuration (2)
```

## **UIT-821** (error) Controller '%s' has no memories assigned to it,

and can not have -complete TRUE.

## DESCRIPTION

This error occurs because you used the **set\_mbist\_controller** command to set a controller as complete (no more memories can be assigned), but you never assigned any memories. This means you tried to specify a controller that controls nothing.

## WHAT NEXT

Try the same **set\_mbist\_controller** command again, while including some -memory\_cells.

## SEE ALSO

**set\_mbist\_controller** (2) .

**UIT-822** (error) 'memory\_cells' (alias 'target' in XG mode) parameter is required when view is set to SPEC

## DESCRIPTION

This is issued from the command **set\_mbist\_element** (or **set\_mbist\_wrapper** in XG mode) because the 'memory\_cells' (alias 'target' in XG mode) parameter is missing. This is required when view is set to SPEC.

## WHAT NEXT

Look at **set\_mbist\_element** (or **set\_mbist\_wrapper** in XG mode) man page

## SEE ALSO

**preview\_dft** (2) . **set\_mbist\_element** (2) . **set\_mbist\_wrapper** (2) .

**UIT-823** (warning) '-mem\_id' is ignored when 'view' option is set to EXISTING

## DESCRIPTION

This is issued from the command **set\_mbist\_element** (or **set\_mbist\_wrapper** in XG mode) because the 'mem\_id' option is specified in the case of 'view' option set to SPEC. The 'mem\_id' option is required only when 'view' is set to EXISTING.

## WHAT NEXT

Look at `set_mbist_element` (or `set_mbist_wrapper` in XG mode) man page

## SEE ALSO

`preview_dft (2)`. `set_mbist_element (2)`. `set_mbist_wrapper (2)`.

**UIT-824 (warning)** '-no\_touch', '-memory\_cells' (alias '-target' in XG mode) and '-ip\_parameters' (alias '-parameters' in XG mode) options are ignored when 'view' option is set to EXISTING

## DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because the '-no\_touch', '-memory\_cells' (alias '-target' in XG mode) and '-ip\_parameters' (alias '-parameters' in XG mode) options are used when 'view' option is set to SPEC and are ignored when 'view' option is set to EXISTING.

## WHAT NEXT

Look at `set_mbist_element` (or `set_mbist_wrapper` in XG mode) man page

## SEE ALSO

`preview_dft (2)`. `set_mbist_element (2)`. `set_mbist_wrapper (2)`.

**UIT-825 (error)** the test model has not been generated by MBISTC Tech 2

## DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because the test model of the current design has not been generated by MBISTC Tech 2 and so it can not be modified.

## WHAT NEXT

Read the correct test model and set the correct current design

## SEE ALSO

`preview_dft (2)`. `set_mbist_element (2)`. `set_mbist_wrapper (2)`.

# UIT-826 (error) 'content\_file' option supports only one file name in the case of 'view' option set to EXISTING

## DESCRIPTION

This is issued from the command `set_mbist_element` (or `set_mbist_wrapper` in XG mode) because the 'content\_file' option value is a list of file names. The 'content\_file' value can be a file name list in the case of 'view' option set to SPEC; only one file name is supported for 'content\_file' option in the case of 'view' option set to EXISTING.

## WHAT NEXT

Look at the `set_mbist_element` (or `set_mbist_wrapper` in XG mode) man page

## SEE ALSO

`preview_dft (2)`. `set_mbist_element (2)`. `set_mbist_wrapper (2)`.

# UIT-827 (error) At least one of the trace\_file parameters must be specified

## DESCRIPTION

This is issued from the command `report_mbist_trace` as no trace file was specified. You must specify at least one of the following parameters: `-trace_file`, `-repair_trace_file`

## WHAT NEXT

Specify a trace file parameter

## SEE ALSO

`report_mbist_trace (2)`.

## **UIT-900 (warning) '%s' is not a cell, instance, scan segment, or scan link, and is not being added to the scan group.**

### **DESCRIPTION**

The `set_scan_group` command accepts an unordered list of design objects. These must be cells, instances, links or segments. Other kinds of design objects cannot be added to scan groups, and are rejected.

### **WHAT NEXT**

Remove the object from the argument list to get rid of the warning. Use hierarchical instance names, with respect to the top-level design, to locate design objects.

## **UIT-901 (warning) Scan group element '%s' is a scan link and is not being added to the scan group.**

### **DESCRIPTION**

The `set_scan_group` command accepts an unordered list of design objects. The first object in the list can not be a scan link because there is no preceding cell to associate it with.

### **WHAT NEXT**

Remove the object from the argument list to get rid of the warning.

## **UIT-902 (Error) Ignoring the scan group specification as the scan group '%s' is empty.**

### **DESCRIPTION**

Specify scan groups using the `set_scan_group` command.

This message tells you that DFT Compiler ignores a `set_scan_group` command because the scan group is empty .

### **WHAT NEXT**

Specify valid scan group elements to get rid of the error. If you did specify group elements, study accompanying warning messages to see why they were discarded.

## **UIT-903 (error) Scan %s '%s' element '%s' has internal and wrapper segments.**

### **DESCRIPTION**

This error message is generated when you try to include a core cell into a scan group or scan segment. A core cell is a cell with a test model and has both internal scan and wrapper segments. As internal scan segments and wrapper segments can't be mixed during core integration, you can't include such a cell with other elements of a scan group or a scan segment.

### **WHAT NEXT**

Check if you have specified core\_integration flag of dft configuration. If you are not integrating cores, remove such a specification and reinvoke the current command.

### **SEE ALSO**

`set_scan_group (2)`. `set_scan_segment (2)`. `set_dft_configuration (2)`.  
`remove_dft_configuration (2)`.

## **UIT-904 (error) Scan Group '%s' has %s segments.**

### **DESCRIPTION**

This error message is generated when you try to include a wrapper or an internal scan segment with other segments in a scan group during core integration. Wrapper or internal scan segments can not be mixed with other segments during core integration.

### **WHAT NEXT**

Check if you have specified core\_integration flag of dft configuration. If you are not integrating cores, remove such a specification and reinvoke the current command.

### **SEE ALSO**

`set_scan_group (2)`. `set_dft_configuration (2)`. `remove_dft_configuration (2)`.

## **UIT-905 (warning) Scan group '%s' overwrites an earlier**

**specification.**

## **DESCRIPTION**

DFT Compiler does not allow scan groups to be specified using multiple **set\_scan\_group** commands. This warning tells you that an earlier specification of scan group is being overwritten.

## **WHAT NEXT**

Establish whether you want the specification to be overwritten. If not, combine the two specifications into one **set\_scan\_group** command.

# **UIT-906 (error) Scan group '%s' exists in another mode.**

## **DESCRIPTION**

DFT Compiler does not allow same scan group to be specified using multiple **set\_scan\_group** commands. This warning tells you that an earlier specification for the same scan group exists for another mode. Scan group names should be unique for the whole design.

## **WHAT NEXT**

Establish whether you want the specification to be overwritten. If not, combine the two specifications into one **set\_scan\_group** command for the same mode.

# **UIT-907 (error) Scan groups '%s' and '%s' have common elements.**

## **DESCRIPTION**

DFT Compiler does not let scan groups share scan elements (cells or design instances). This error tells you that some elements belong to more than one group.

## **WHAT NEXT**

If the common elements can be removed from the scan group you're specifying, remove them and reapply the **set\_scan\_group** command. Otherwise, apply the **remove\_scan\_group** command and start again specifying without common elements between groups.

## **UIT-908 (error) Signal of data type '%s' is not valid for internal pins flow.**

### **DESCRIPTION**

The signal data types that are valid for internal pins flow are MasterClock, ScanMasterClock, Reset, Constant, ScanDataIn, ScanDataOut, ScanEnable, and TestMode.

### **WHAT NEXT**

Please specify a valid data type using the **set\_dft\_signal** command and turn on the internal pins flow using the **set\_dft\_drc\_configuration**.

## **UIT-909 (error) Internal pin '%s' of type '%s' direction is not valid for internal pins flow.**

### **DESCRIPTION**

If the internal pin specified is not a hierarchical pin and is of data type MasterClock, ScanMasterClock, Reset, Constant, ScanDataIn, ScanEnable, and TestMode, the pin should be of direction Out and if the data type is ScanDataOut, the pin should be of direction In. For the hierarchical pins, pins with both In and Out directions are valid.

### **WHAT NEXT**

Please specify a pin with valid direction using the **set\_dft\_signal** command and turn on the internal pins flow using the **set\_dft\_drc\_configuration**.

## **UIT-910 (error) The hookup pin '%s' of type '%s' direction is not a valid hookup pin.**

### **DESCRIPTION**

The valid hookup pins specified for **set\_dft\_signal** are either driven by a proper combinational/sequential logic or they are outputs of a black box. The hookup pins specified by the user that have no driver or pins that are connected to a logic zero or one internally are not valid.

## WHAT NEXT

Please change the netlist to either add driver for the hookup pin or specify another pin with valid driver using the **set\_dft\_signal** command.

## UIT-911 (error) Numbers of pipeline head and tail registers do not match the respective numbers in previously specified scan paths

### DESCRIPTION

You have specified several scan paths with their corresponding head and tail registers. But the number of head pipeline registers specified for the current chain is different from the one specified in previous chains or the number of tail pipeline stages specified for the current chain is different from the one specified in previous chains. The number of head pipeline registers should be the same across all chains. The number of tail pipeline registers should be the same across all chains.

### WHAT NEXT

Correct the list of register name for **set\_scan\_path -pipeline\_head** or **-pipeline\_tail** command

## UIT-912 (error) The pin '%s' is not a valid hookup pin.

### DESCRIPTION

The valid hookup pins specified for **set\_scan\_path** are either driven by a proper combinational/sequential logic or they are outputs of a black box. For a hierarchical box that has some pins with proper drivers, or pins that are connected to a logic zero or one internally, the hookup pins specified by the user that have no driver are not valid. The hookup pin must be associated with a pin using **set\_dft\_signal**, prior to be used in **set\_scan\_path** for scan path specification.

### WHAT NEXT

Please change the netlist to either add driver for the hookup pin or specify another pin with valid driver using the **set\_dft\_signal** and **set\_scan\_path** commands.

## UIT-913 (warning) Same hookup pin specified more than once.

# Duplicate hookup pins will be removed.

## DESCRIPTION

The hookup pins specified for `set_scan_path` are expected to be unique. Multiple use of a hookup pin gives this warning. The duplicate hookup pin specification is ignored.

## WHAT NEXT

Use unique hookup pins with `-hookup` option of `set_scan_path` command. Use `report_scan_path` command to observe the scan path set.

# UIT-914 (warning) Specification of a signal of type Oscillator in spec view is ignored.

## DESCRIPTION

You receive this message because you have specified a signal of type Oscillator with `-view` spec or without the `-view` option. In this case, the command will be ignored because a signal of type Oscillator must be specified in view `existing_dft`.

## WHAT NEXT

Please specify the signal in existing view using the `set_dft_signal` command.

# UIT-915 (error) Hookup pin is not allowed for the '%s' boundary scan port.

## DESCRIPTION

This error message occurs when a hookup pin is specified while using the `set_dft_signal` command with the `-type TAP` ports option. A hookup pin cannot be specified for the TCK, TDI, TDO, TMS and TRST boundary scan TAP ports.

## WHAT NEXT

Remove the `-hookup_pin` option for BSD TAP ports. See the `set_dft_signal` man page for more information.

## SEE ALSO

`set_dft_signal(2)`

**UIT-916 (error)** Only one port is allowed for the '%s' boundary scan signal type.

## DESCRIPTION

This error message occurs when multiple ports for a BSD signal type are specified with the `-port` option of the `set_dft_signal` command. Only one port should be used as a boundary scan TAP port.

## WHAT NEXT

Use only one port with the `-port` option of the `set_dft_signal` command for boundary scan TAP ports.

## SEE ALSO

`set_dft_signal(2)`

**UIT-917 (warning)** BSD Test Data Register hookup pins are going to be obsoleted in existing\_dft view for synthesis, specify them in spec view.

## DESCRIPTION

Considering that BSD Test Data Registers can be useful only at spec view, it is decided to remove the `-existing_dft` option of `set_scan_path` and `set_dft_signal` commands for BSD Test Data Registers.

## WHAT NEXT

Use `-hookup_pins` option with option `-view spec` for Test Data Registers in BSD, while using `set_dft_signal` or `set_scan_path` commands.

**UIT-918 (warning)** BSD Test Data Register hookup pin of type reset is obsoleted, specify the pin type as `bsd_reset`, changing

the pin type to `bsd_reset`.

## DESCRIPTION

The hookup pin type `reset` is obsoleted in BSDC, instead it is suggested to use the new option `bsd_reset` for the same functionality. You get this message if -type reset is used while specifying hookup pin for Test Data Register using `set_dft_signal` command.

## WHAT NEXT

You can ignore this warning as hookup pin type `reset` is read as `bsd_reset` by BSDC. Instead hookup pin type `bsd_reset` can be used to not get this warning.

**UIT-919 (warning)** Incorrect active state '%d' specified for TRST port, resetting the active state of the port to 0.

## DESCRIPTION

This warning message occurs when the `set_dft_signal -active_state` option is not set to 0 (zero) for the TRST port type. If the TRST port `-active_state` is not set to 0, BSDC forces the active state to 0.

## WHAT NEXT

This is only a warning message. No action is required.

You can ignore this warning as BSDC sets the active state to 0 internally. To avoid this message, use 0 with the `-active_state` option for a TRST port while using `set_dft_signal` command.

## SEE ALSO

`set_dft_signal`

**UIT-920 (error)** The option `-include_elements` of `set_scan_path` command does not accept a collection as an input.

## DESCRIPTION

You have specified a collection as an input parameter for the `-include_elements` option of the `set_scan_path` command. This option accepts only a list of elements.

## WHAT NEXT

Use a list of elements as an input parameter

**UIT-921** (warning) Incorrect active state '%d' specified for TAP port, resetting the active state of the port to 1.

## DESCRIPTION

This warning message occurs when the **set\_dft\_signal -active\_state** option is not set to 1 (one) for the TAP port type (TCK/ TMS/ TDI / TDO). If the TAP port **-active\_state** is not set to 1, BSDC forces the active state to 1.

## WHAT NEXT

This is only a warning message. No action is required.

You can ignore this warning as BSDC sets the active state to 1 internally. To avoid this message, use 1 with the **-active\_state** option for a TAP port while using **set\_dft\_signal** command.

## SEE ALSO

`set_dft_signal`

**UIT-930** (error) Signal of data type '%s' is not valid for **-connect\_to** option.

## DESCRIPTION

The signal data types that are valid with **-connect\_to** option are MasterClock, ScanMasterClock, ScanClock and Oscillator.

## WHAT NEXT

Please specify a valid data type using the **set\_dft\_signal** command.

**UIT-931** (error) Pin '%s' direction is not valid for **-connect\_to**

option.

## DESCRIPTION

You receive this message because you specified a wrong pin direction for **-connect\_to** option. In this case, the pin should be of direction In.

## WHAT NEXT

Please specify a pin with a valid direction using the **set\_dft\_signal** command.

# UIT-935 (error) Invalid clock controller specification due to inconsistent pll clock sources.

## DESCRIPTION

You received this message because you specified a single clock controller for pllclocks sources that come from different hierachical blocks.

## WHAT NEXT

Please specify a clock controller for each group of pllclocks that belong to the same hierarchy using **set\_dft\_clock\_controller** command.

# UIT-999 (Error) The scan state is invalid for running this command. The scan state should be scan existing.

## DESCRIPTION

You receive this error message because the scan state should be either **scan\_existing** (scan routed) for the **disconnect\_scan\_chains** command to run. If the current state of the design is not scan existing, this error message prevents **disconnect\_scan\_chains** command from proceeding.

## WHAT NEXT

Set the scan state using the **set\_scan\_state** command before using the **disconnect\_scan\_chains** command.

## SEE ALSO

`set_dft_optimization_configuration` (2), `disconnect_scan_chains` (2), `insert_dft` (2),

**UIT-1000** (error) Invalid argument for `-use_register_io`: '%s'. Argument must be either true or false.

## DESCRIPTION

You receive this message if you execute either `set_core_wrapper_configuration` or `set_core_wrapper_cell` command and use an invalid argument for the `-use_register_io` option. Valid arguments are true or false.

## WHAT NEXT

Reexecute the command and use a valid argument for the `-use_register_io` option.

## SEE ALSO

`set_core_wrapper_configuration` (2). `set_core_wrapper_cell` (2).

**UIT-1001** (error) Invalid argument for `-longest_chain_length`: '%s'. Argument must be a positive integer or the string "default".

## DESCRIPTION

You receive this message if you execute the `set_core_wrapper_configuration` command and use an invalid argument for the `-longest_chain_length` option. Valid arguments are positive integers or the string "default".

## WHAT NEXT

Reexecute the `set_core_wrapper_configuration` command and use a valid argument for the `-longest_chain_length` option.

## SEE ALSO

`set_core_wrapper_configuration` (2).

## **UIT-1002 (error) Can not insert '%s' scan chains.**

### **DESCRIPTION**

The `set_core_wrapper_configuration` command accepts a `chain_count` option. This tells DFT Compiler the number of scan chains to implement in the testable design. Option arguments must be positive integers or "default" strings.

### **WHAT NEXT**

Repeat the `set_core_wrapper_configuration` command using a positive integer or the string "default".

### **SEE ALSO**

`set_core_wrapper_configuration` (2).

## **UIT-1003 (error) Cannot find the specified port '%s' in the current design.**

### **DESCRIPTION**

You receive this message if you execute the `set_core_wrapper_path` command and a port you specify cannot be found in the current design. This could be caused by a typo or spelling error or an invalid name being used as a port name.

### **WHAT NEXT**

Verify the name of the port. Then reissue the command `set_core_wrapper_path` using the correct port name of the current design.

### **SEE ALSO**

`set_core_wrapper_path` (2)

## **UIT-1004 (error) Wrapper Cell type must be either "in" , "out" or "en".**

### **DESCRIPTION**

You receive this message if you execute `set_core_wrapper_path` and specify an invalid

wrapper cell type. Valid cell types are "in", "out" or "en". For **set\_core\_wrapper\_path**, you can specify the type of a wrapper cell by attaching /in , /out or /en to the port name in the *identifier\_list*. The cell types /in, /out, /en can be used to identify wrapper cells attached to a bidirectional port. The cell types /out, /en can be used to identify wrapper cells attached to a tr-state port. No cell type can be used to identify wrapper cells attached to input ports.

## WHAT NEXT

Choose a valid cell type for the Wrapper cell, and reissue the command **set\_core\_wrapper\_path** using the valid wrapper cell type.

## SEE ALSO

**set\_core\_wrapper\_path** (2).

**UIT-1005** (warning) Ignoring the -complete true option because wrapper chain '%s' is empty.

## DESCRIPTION

The **set\_core\_wrapper\_path** command accepts a list of ports and **-complete** option. This tells DFT Compiler the order of wrapper cells in a wrapper chain to implement in the testable design. This error occurred as user didn't specify any valid ports and **-complete** option is set to TRUE for the command.

## WHAT NEXT

Repeat the **set\_core\_wrapper\_path** command using either a set of valid ports or setting the **-complete** option to false.

## SEE ALSO

**set\_core\_wrapper\_path** (2).

**UIT-1006** (information) You have invoked **remove\_core\_wrapper\_specification** with no options. The command is ignored.

## DESCRIPTION

The **remove\_core\_wrapper\_specification** command does nothing when it is invoked

without options.

This, in itself, is not a problem. No core wrapper specifications are removed. You might, however, have meant to use the "-all" option or one of the other more limited options.

## WHAT NEXT

To get rid of the information message, invoke **remove\_core\_wrapper\_specification** with options.

## SEE ALSO

`remove_core_wrapper_specification(2)` `set_core_wrapper_path(2)`  
`set_core_wrapper_design(2)`

**UIT-1007 (error)** Pipelining is only supported with the "no\_mix" scan clock domain constraints.

## DESCRIPTION

You get this message when you have selected something else than **no\_mix** after the option **-clock\_mixing** and you have enabled scan enable pipelining. Pipelining scan enable supports only the no\_mix scan clock domain constraints.

## WHAT NEXT

Modify the scan clock domain constraint to **no\_mix**, using the `set_scan_configuration` command

## SEE ALSO

`set_scan_configuration(2)`

**UIT-1008 (error)** Invalid argument for -  
register\_ioImplementation: '%s'. Argument must be either  
swap or in\_place.

## DESCRIPTION

You receive this message if you execute either **set\_core\_wrapper\_configuration** or **set\_core\_wrapper\_cell** command and use an invalid argument for the -

`register_io_implementation` option. Valid arguments are `swap` or `in_place`.

## WHAT NEXT

Reexecute the command and use a valid argument for the `-register_io_implementation` option.

## SEE ALSO

`set_core_wrapper_configuration` (2). `set_core_wrapper_cell` (2).

**UIT-1009 (error)** Invalid argument for `-one_wrapper_clock`: '%s'. Argument must be either true or false.

## DESCRIPTION

You receive this message if you execute either `set_core_wrapper_configuration` or `set_core_wrapper_cell` command and use an invalid argument for the `-one_wrapper_clock` option. Valid arguments are `swap` or `in_place`.

## WHAT NEXT

Reexecute the command and use a valid argument for the `-one_wrapper_clock` option.

## SEE ALSO

`set_core_wrapper_configuration` (2). `set_core_wrapper_cell` (2).

**UIT-1010 (error)** Scan %s '%s' element '%s' has internal and wrapper segments.

## DESCRIPTION

This error message is generated when you try to include a core cell into a scan path or scan segment. A core cell is a cell with a test model and has both internal scan and wrapper segments. As internal scan segments and wrapper segments can't be mixed during core integration, you can't include such a cell with other elements of a scan path or a scan segment.

## WHAT NEXT

Check if you have specified `core_integration` flag of dft configuration. If you are

not integrating cores, remove such a specification and reinvoke the current command.

## SEE ALSO

`set_scan_path (2)`. `set_scan_segment (2)`. `set_dft_configuration (2)`.  
`remove_dft_configuration (2)`.

# UIT-1011 (error) Scan Chain '%s' has %s segments.

## DESCRIPTION

This error message is generated when you try to include a wrapper or an internal scan segment with other segments in a scan path during core integration. Wrapper or internal scan segments can not be mixed with other segments during core integration.

## WHAT NEXT

Check if you have specified core\_integration flag of dft configuration. If you are not integrating cores, remove such a specification and reinvoke the current command.

## SEE ALSO

`set_scan_path (2)`. `set_dft_configuration (2)`. `remove_dft_configuration (2)`.

# UIT-1012 (Error) Incorrect lockup element type specified.

## DESCRIPTION

This is issued from the command `set_scan_configuration` or `set_scan_path`, when the user intends to specify the type of lockup element to be used (-lockup\_type). Values for the lockup type are restricted to either "latch" or "flip\_flop". By default, the lockup type is set to "latch"

## WHAT NEXT

Check the value entered after the option -lockup\_type.

# UIT-1013 (Error) The period %f must evenly divide the default

period %f.

## DESCRIPTION

This error occurs when you use the `-mbist_clock` argument and the specified period does not evenly divide the default period. This relation is required to create the MBIST protocols.

## WHAT NEXT

Specify a different clock period with the `create_test_clock` command, or change the default period with the `test_default_period` command.

## SEE ALSO

`create_test_clock` (2) `test_default_period` (3)

**UIT-1014 (Error)** The parameter for the `-write_ip_rtl` option has to be enable, generate\_only or disable.

## DESCRIPTION

This message indicates that a `set_dft_insertionj_configuration` command has been issued, but the parameter for the option is not a valid one. The valid parameters are enable, generate\_only or disable.

## WHAT NEXT

Change the parameter for the option and re-issue the command.

## SEE ALSO

`set_dft_insertion_configuration`, `reset_dft_insertion_configuration`,  
`report_dft_insertion_configuration`.

**UIT-1015 (Error)** The parameter for the `-ip_rtl_format` option has to be verilog or vhdl.

## DESCRIPTION

This message indicates that a `set_dft_insertionj_configuration` command has been

issued, but the parameter for the option is not a valid one. The valid parameters are verilog or vhdl.

## WHAT NEXT

Change the parameter for the option and re-issue the command.

## SEE ALSO

`set_dft_insertion_configuration`, `reset_dft_insertion_configuration`,  
`report_dft_insertion_configuration`.

# UIT-1016 (error) %s.

## DESCRIPTION

This error is generated when the `-design` or `-memory_ref` arguments of the `create_mbist_standalone` command specify a wrong design name.

## WHAT NEXT

Make sure that the `-design` or `-memory_ref` arguments specify a valid design name then retry the `create_mbist_standalone` command.

## SEE ALSO

`create_mbist_standalone` (2).

# UIT-1020 (error) : Component signal type '%s' is not specified in user design interface signals.

## DESCRIPTION

This error message is generated when you try to define a dft design with command `define_dft_design`. The error message is issued when a pin of the specified signal type is not included in the interface of the dft design.

## WHAT NEXT

Reexecute the `define_dft_design` command and specify a dft design pin of the signal type with the `-interface` argument.

## SEE ALSO

```
define_dft_design (2). insert_dft (2).
```

# UIT-1021 (error) Unknown signal type '%s' is specified in user design interface signals.

## DESCRIPTION

This error message occurs when attempting to define a DFT design with the **define\_dft\_design** command. The error message indicates that an unknown signal type is specified with the interface of the DFT design.

## WHAT NEXT

If the port of the specified signal type is used in DFT insertion, add the correct signal type for the port and rerun the **define\_dft\_design** command.

## SEE ALSO

```
define_dft_design(2)
insert_dft(2)
```

# UIT-1022 (error) : Unable to find the specified design type '%s', make sure that proper dw libs are included in link\_library.

## DESCRIPTION

This error message is generated when you try to define a dft design with command **define\_dft\_design**. The error message is issued when the specified design type is not a known design type. This can happen if all dw libraries are not specified with the **link\_library** variable.

## WHAT NEXT

Specify all dw libraries with **link\_library** variable and rerun the **define\_dft\_design** command.

## SEE ALSO

```
define_dft_design (2). insert_dft (2).
```

## **UIT-1023 (error) : One of the options '-design\_name' or '-type' or '-all' is mandatory.**

### **DESCRIPTION**

This error message is generated when you try to remove a dft design with command remove\_dft\_design. The error message is issued when the command is run with insufficient options.

### **WHAT NEXT**

Specify one of the options '-design\_name' or '-type' or -all' with the remove\_dft\_design command.

### **SEE ALSO**

`define_dft_design (2). insert_dft (2).`

## **UIT-1024 (error) : Options '-design\_name', '-type', '-all' are mutually exclusive, specify only one of them.**

### **DESCRIPTION**

This error message is generated when you try to remove/report a dft design with command remove\_dft\_design/report\_dft\_design. The error message is issued when the command is run with invalid combination of options. Please note that options '-design\_name', '-type', '-all' of the command remove\_dft\_design/report\_dft\_design are mutually exclusive.

### **WHAT NEXT**

Specify only one of the options '-design\_name' or '-type' or -all' with the remove\_dft\_design/ report\_dft-design commands.

### **SEE ALSO**

`define_dft_design (2). insert_dft (2).`

## **UIT-1025 (error) : Design '%s' is not specified with**

**define\_dft\_design** command.

## DESCRIPTION

This error message is generated when you try to remove/report a dft design with command `remove_dft_design`/`report_dft_design`. The error message is issued when the command is run with the '`-design_name`' option and the specified design is not defined using `define_dft_design` command.

## WHAT NEXT

Check if the specified design is defined using `define_dft_design` command. You can use `report_dft_design` command to see all the user dft designs.

## SEE ALSO

`define_dft_design` (2). `insert_dft` (2).

**UIT-1026 (information)** Memory-driven specification mode is enabled. You can not specify any Tests with the `set_mbist_controller` command.

## DESCRIPTION

You just enabled the MBIST configuration, and memory-driven specification mode is enabled, because you set the `test_mbc_memory_driven_spec` environment variable to true.

## WHAT NEXT

All memory models should contain complete Test specifications. You can not specify any Tests with the `set_mbist_controller` command. This means all Test parameters (ie `Test0`, `Test1`, ...) are invalid.

## SEE ALSO

`set_mbist_configuration` (2), `set_mbist_controller` (2), `test_mbc_memory_driven_spec` (3), `test_variables` (3).

**UIT-1027 (warning)** Memory-driven specification mode is

enabled. The test you just defined will not be synthesized.

## DESCRIPTION

The memory-driven specification mode is enabled, because you set the `test_mbc_memory_driven_spec` environment variable to true. This means that all synthesized tests are specified in the memory models. Any tests you define with the `define_mbist_program` command can only be used at run-time by the `set_mbist_run` command.

## WHAT NEXT

Do not attempt to specify any Tests with the `set_mbist_controller` command. This means all Test parameters (ie Test0, Test1, ...) are invalid.

## SEE ALSO

`set_mbist_configuration` (2), `set_mbist_controller` (2), `define_mbist_program` (2),  
`test_mbc_memory_driven_spec` (3), `test_varbiaries` (3).

**UIT-1028** (warning) Invalid option(s) specified to the `set_optimize_registers` command.

## DESCRIPTION

You receive this message if you execute the `set_optimize_registers` command with options that are not supported in non-XG mode.

## WHAT NEXT

Please see the man page of the `set_optimize_registers` command for a list of options that are supported in XG/non-XG modes.

## SEE ALSO

`set_optimize_registers` (2). `optimize_registers` (2).

**UIT-1030** (error) Option -time, -clock\_cycles and -signature can

not be specified for instruction '%s'.

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_instruction** command and specify time constant or signature for an invalid instruction. Time constants are supported only for the following instructions.

INTEST RUNBIST EXTEST\_PULSE EXTEST\_TRAIN

Signature is supported only for RUNBIST instruction.

For EXTEST\_PULSE instruction, options -time specifies minimum wait duration in real time and option -clock\_cycles specifies minimum wait duration in TCK pulses. These two option are mutually exclusive for this instruction.

For EXTEST\_TRAIN instruction minimum number of TCK pulses should be specified with -clock\_cycles option in addition to maximum time with -time option.

## WHAT NEXT

Reexecute the **set\_bsd\_instruction** command with out time constant and signature specifications.

SH SEE ALSO **find** (2), **set\_bsd\_instruction** (2).

**UIT-1031 (error) Invalid IEEE1149 Std. version '%s', valid values are : ieee1149.1\_2001 | ieee1149.1\_1993, ieee1149.6\_2003 .**

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_configuration** command and specify an incorrect std. version. The following std. versions are legal.

"ieee1149.1\_1993" "ieee1149.1\_2001" "ieee1149.1\_2001 ieee1149.6\_2003"  
"ieee1149.1\_1993 ieee1149.6\_2003" "ieee1149.6\_2003"

Std. version "ieee1149.6\_2003" is same as "ieee1149.1\_2001 ieee1149.6\_2003" .

The default value for the Std. option is "ieee1149.1\_2001" .

## WHAT NEXT

Reexecute the **set\_bsd\_configuration** command with the correct std. version name(s).

SH SEE ALSO **find** (2), **set\_bsd\_configuration** (2).

**UIT-1032** (Warning) IEEE1149 Std. versions ieee1149.1\_2001, ieee1149.1\_1993 are mutually exclusive, ignoring std. version ieee1149.1\_1993 .

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_configuration** command and specify an incorrect std. version. The following std. versions are legal.

```
"ieee1149.1_1993" "ieee1149.1_2001" "ieee1149.1_2001 ieee1149.6_2003"
"ieee1149.1_1993 ieee1149.6_2003" "ieee1149.6_2003"
```

Std. version "ieee1149.6\_2003" is same as "ieee1149.1\_2001 ieee1149.6\_2003" .

The default value for the Std. option is "ieee1149.1\_2001" .

## WHAT NEXT

Reexecute the **set\_bsd\_configuration** command with the correct std. version name(s).

SH SEE ALSO **find** (2), **set\_bsd\_configuration** (2).

**UIT-1033** (error) Incorrect port '%s' with direction '%s' specified, only ports with direction 'out' or 'inout' are allowed.

## DESCRIPTION

You receive this error message when you execute the **set\_bsd\_ac\_port** command and specify an incorrect port. Only ports of type 'out' or 'inout' are allowed as ac ports.

## WHAT NEXT

Reexecute the **set\_bsd\_ac\_port** command with the correct ports.

SH SEE ALSO **find** (2), **set\_bsd\_ac\_port** (2).

**UIT-1034** (error) Insufficient number of options, specify either of

**options : -port\_list | -all**

## **DESCRIPTION**

You receive this error message when you execute the **remove\_bsd\_ac\_port** command and doesn't specify the required options. Either of the options **-all** or **-port\_list** are required for this command.

## **WHAT NEXT**

Reexecute the **remove\_bsd\_ac\_port** command with the required options.

SH SEE ALSO **find** (2), **remove\_bsd\_ac\_port** (2).

**UIT-1035 (error)** Options **-port\_list** and **-all** are mutually exclusive, specify only one of them.

## **DESCRIPTION**

You receive this error message when you execute the **remove\_bsd\_ac\_port** command and specified conflicting options. Options **-all** and **-port\_list** are mutually exclusive.

## **WHAT NEXT**

Reexecute the **remove\_bsd\_ac\_port** command with the either of **-all** or **-port\_list** options.

SH SEE ALSO **find** (2), **remove\_bsd\_ac\_port** (2).

**UIT-1036 (Warning)** Port '**%s**' is not an ac port, not removing the port.

## **DESCRIPTION**

You receive this error message when you execute the **remove\_bsd\_ac\_port** command and specified a port which is not an AC port. You can only remove AC ports with this command.

## **WHAT NEXT**

Reexecute the **remove\_bsd\_ac\_port** command with the AC ports.

SH SEE ALSO **find** (2), **remove\_bsd\_ac\_port** (2).

## UIT-1037 (error) No Ac Ports found on the current design.

### DESCRIPTION

You receive this error message when you execute the **remove\_bsd\_ac\_port** command and there are no AC ports to be removed. Check if the current design is correct.

### WHAT NEXT

If the current design is correct, the **remove\_bsd\_ac\_port** command is not required as there are no AC ports to be removed.

SH SEE ALSO **find** (2), **remove\_bsd\_ac\_port** (2).

## UIT-1038 (error) Capture value not specified for the IDCODE or USERCODE instructions.

### DESCRIPTION

You receive this error message when you execute the **set\_bsd\_instruction** command and doesn't specify capture value. Capture value is mandatory for these instructions.

### WHAT NEXT

If the current design is correct, the **set\_bsd\_instruction** command with capture value.

SH SEE ALSO **find** (2), **set\_bsd\_instruction** (2).

## UIT-1039 (Warning) Instruction '%s' does not exist, could not remove the instruction.

### DESCRIPTION

You receive this error message when you execute the **remove\_bsd\_instruction** command and specify an unexisting instruction.

## WHAT NEXT

Check for instruction name and reexecute the **remove\_bsd\_instruction** command with the correct instruction names.

SH SEE ALSO **find** (2), **remove\_bsd\_instruction** (2).

## UIT-1040 (error) No instructions exist, cannot remove instructions.

### DESCRIPTION

You receive this error message when you execute the **remove\_bsd\_instruction** command and there are no instructions specified for the current design.

### WHAT NEXT

If the current design is correct, the **remove\_bsd\_instruction** command is unnecessary as there are instructions to be removed.

SH SEE ALSO **find** (2), **remove\_bsd\_instruction** (2).

## UIT-1041 (error) Boundary Cell Types AC\_1, AC\_2, AC\_7, AC\_SELU, AC\_SELX can't be used for ports which are not AC ports.

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command on specify AC BSR cells on a set of ports that are not AC ports. AC BSR cells can be used only on AC ports.

### WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

## UIT-1042 (error) Invalid cell type '%s' specified with function '%s'

for boundary scan.

## DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command on specify a BSR cell type that is not supported with the specified function.

Here is the list of cell types allowed for different functions.

```
FUNCTION BSR Cell Types ===== input BC_1 |
BC_2 | BC_4 | none input_inverted BC_1 | BC_2 | BC_4 | none output BC_1 | BC_2 |
AC_1 | AC_2 | none output_inverted BC_1 | BC_2 | AC_1 | AC_2 | none bidir BC_7 |
AC_7 | none bidir_inverted BC_7 | AC_7 | none control BC_1 | BC_2 | none observe
BC_4 | none receiver_p BC_4 | BC_1 | BC_2 | none receiver_n BC_4 | BC_1 | BC_2 |
none ac_select AC_SELU | AC_SELX | none
=====
```

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

# UIT-1043 (error) Specified design '%s' is not a user dft design, allowed design types : %s

## DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command on specify a design name which is not of a standard dft design type.

Here is the list of allowed dft design types.

WC\_D1 WC\_D1\_S WC\_S1 WC\_S1\_S BC1 BC2 BC4 BC7 AC1 AC2 AC7 AC\_SELU AC\_SELX

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

# UIT-1044 (Warning) Option '-share' is applicable only for

# Control/Ac Select Boundary Cells, ignoring the option.

## DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specify option -share with an unsupported function. This option can be specified only with option -function values : control | ac\_select .

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

# UIT-1045 (error) Boundary Cell Name is mandatory for Control/Ac Select boundary cells.

## DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specify option -function with value control or ac\_select and doesn't specify a name for the boundary cell. Option -name is mandatory for these function values.

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

# UIT-1046 (error) Option '-ports' is mandatory with options '-class core\_wrapper', '-class bsd'.

## DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and doesn't specify a list of ports with option -class values core\_wrapper or bsd. Port list is mandatory for these class values.

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

## UIT-1047 (error) Option '-cells' is not allowed with options '-class core\_wrapper', '-class bsd'.

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specified a list of cells with option -class values core\_wrapper or bsd. Cell list is not allowed for these class values.

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

## UIT-1048 (error) Options '-type' and 'design' are mutually exclusive.

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specified options -type and -design. These options are mutually exclusive.

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

## UIT-1049 (error) Invalid boundary cell type with '-class core\_wrapper', allowed values : WC\_D1 | WC\_D1\_S | WC\_S1 |

## WC\_S1\_S .

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specified a cell type not suitable for option -class value core\_wrapper. Only the following cell types are allowed for this class value.

WC\_D1 WC\_D1\_S WC\_S1 WC\_S1\_S

### WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2) .

## UIT-1050 (error) Invalid function value with '-class core\_wrapper', allowed values : input | output | control | bidir .

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specified a function type not suitable for option -class value core\_wrapper. Only the following function types are allowed for this class value.

input output control bidir

### WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2) .

## UIT-1051 (error) Ports '%s' can't be specified with function '%s' .

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and specified a function type not suitable for the specified ports.

Here is a list of functions and allowed port types.

```
Function Name Port Direction ===== input input
| bidir input_inverted input | bidir output output | bidir output_inverted output |
bidir bidir bidir bidir_inverted bidir control output | bidir observe input | output
| bidir receiver_p input | bidir receiver_n input | bidir ac_select output | bidir
=====
```

## WHAT NEXT

Fix the problem and Reexecute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

## UIT-1052 (Warning) Boundary Cell '%s' overwrites an earlier specification.

### DESCRIPTION

You receive this error message when you execute the **set\_boundary\_cell** command and the specification overwrites an earlier specification.

Here are situations where earlier specification is overwritten.

1. Option -name value is already specified for a previous Boundary Cell. Previous Boundary Cell is overwritten.
2. Option -function value is already specified for a previous Boundary Cell with common ports. Common ports are removed from the previous Boundary Cell.
3. A Boundary Cell with common ports and unspecified -function value is found. Common ports are removed from the previous Boundary Cell.
4. Option -function value is not specified and a Boundary Cell with common ports is found. Common ports are removed from the previous Boundary Cell.

## WHAT NEXT

No action is required if overwriting earlier specification is ok with you.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

## UIT-1053 (error) %s delay time (%10.2f) is required to be less

than rise time value (%10.2f) for port '%s'.

## DESCRIPTION

Input/Bidirectional delay time is greater than specified rise time of the port.

## WHAT NEXT

Check your test\_default\_delay/test\_default\_bidir\_delay and timing specification for the specified port.

**UIT-1054 (error)** Rise time (%10.2f) of port '%s' is required to be less than strobe time value (%10.2f).

## DESCRIPTION

You have specified rise time of the specified port greater than the strobe time.

## WHAT NEXT

Check your test\_default\_strobe and timing specification for the specified port.

**UIT-1055 (warning)** Bidir delay (%10.2f) must be less than strobe time (%10.2f), setting bidir delay to input delay (%10.2f) .

## DESCRIPTION

You have specified bidirectional delay time greater than the strobe time. Bidirectional delay time is reset to input delay time.

## WHAT NEXT

Check your test\_default\_strobe and test\_default\_bidir\_delay variables.

SH SEE ALSO `create_bsd_patterns` (2), `test_default_bidir_delay` (3).

**UIT-1056 (warning)** Bidir delay (%10.2f) must be less than

**period (%10.2f), setting bidir delay to input delay (%10.2f) .**

## **DESCRIPTION**

You have specified bidirectional delay time greater than the period. Bidirectional delay time is reset to input delay time.

## **WHAT NEXT**

Check your `test_default_period` and `test_default_bidir_delay` variables.

SH SEE ALSO `create_bsd_patterns` (2), `test_default_bidir_delay` (3).

**UIT-1057 (warning) Bidir delay (%10.2f) must be less than TCK rise time (%10.2f), setting bidir delay to input delay (%10.2f) .**

## **DESCRIPTION**

You have specified bidirectional delay time greater than the TCK rise time. Bidirectional delay time is reset to input delay time.

## **WHAT NEXT**

Check your `test_default_bidir_delay` variable and rise time of TCK.

SH SEE ALSO `create_bsd_patterns` (2), `test_default_bidir_delay` (3).

**UIT-1058 (error) Invalid Paramter Type '%s' specified for parameter '%s' .**

## **DESCRIPTION**

You have specified an unsupported paramater type with `define_dft_design` command. Only the following parameter types are supported.

`string`

`boolean`

`float`

`list string`

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

**UIT-1059** (error) Invalid Paramter value '%s' specified for parameter '%s', expected value of type '%s' .

## DESCRIPTION

You have specified an unsupported paramater value with **define\_dft\_design** command. Only the following parameter values are supported.

|                |                        |       |        |        |
|----------------|------------------------|-------|--------|--------|
| Parameter Type | Parameter Value        | ===== | string | string |
| boolean        | true   false           |       |        |        |
| float          | floating point number  |       |        |        |
| list           | string list of strings | ===== |        |        |

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

**UIT-1060** (error) Invalid List Paramter member type '%s' specified for parameter '%s' .

## DESCRIPTION

You have specified an unsupported list paramater member type with **define\_dft\_design** command. Only the following parameter types are supported.

list string

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

## **UIT-1061 (error) Incorrect Pin Polarity '%s' specified for pin '%s', expected polarity : high | low .**

### **DESCRIPTION**

You have specified an unsupported pin polarity value with **define\_dft\_design** command. Only the following polarity values are supported.

high | h

low | l

### **WHAT NEXT**

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

## **UIT-1062 (error) Option '-params' is only allowed for dft designs of type 'PAD'.**

### **DESCRIPTION**

You have specified option '-params' for a dft design that is not of type 'PAD' with **define\_dft\_design** command. This option is supported only for dft designs of type 'PAD'.

### **WHAT NEXT**

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

## **UIT-1063 (error) Invalid Pad Access Pin Type '%s' specified for the PAD design '%s'.**

### **DESCRIPTION**

You have specified an unsupported pad access pin type for a pad design with **define\_dft\_design** command. Only the following pad access pin types are supported.

Pad Type

Allowed Access Pin Types

```
=====
any pad capture_clk capture_en update_clk update_en

```

=====

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

**UIT-1064a (error) No pad type found for the PAD design '%s'.**

## DESCRIPTION

This error message occurs because the pad type was not specified with the **-param** **{\$pad\_type\$}** option of the **define\_dft\_design** command.

## WHAT NEXT

Rerun the **define\_dft\_design** command with the **-param {\$pad\_type\$}** option specifying a valid pad type.

## SEE ALSO

`define_dft_design(2)`

## UIT-1064 (error) Invalid Pad type '%s' specified for the PAD design '%s'.

## DESCRIPTION

You have specified an unsupported pad type for a pad design with **\$pad\_type\$** parameter of **define\_dft\_design** command. Only the following pad types are supported.

input

output

tristate\_output

bidirectional

open\_drain\_output

open\_drain\_bidirectional

open\_source\_output

open\_source\_bidirectional

Note that the pad types need to be specified in the following format.

`define_dft_design ... -params { $pad_type$ string <pad_type> ... }`

where **<pad\_type>** is one of the pad types mentioned above.

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design (2)**.

## UIT-1065 (error) Invalid Parameter '%s' of type '%s' specified,

expected type '%s' .

## DESCRIPTION

You have specified an unsupported parameter or unsupported parameter type for a pad design with **define\_dft\_design** command. Only the following parameters are supported.

```
Parameter Name Parameter Type ===== pad_type string
$disable_res$ string | boolean $differential$ string | boolean $bsr_segment$ list
string lib_cell string | boolean lp_time string hp_time string on_chip
string | boolean =====
```

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

# UIT-1066 (error) Invalid active\_state value %s specified.

## DESCRIPTION

You have specified an unsupported active\_state value with **set\_bsd\_power\_up\_reset** command. Only the following active\_state values are supported.

high low

## WHAT NEXT

Correct the specification and reissue the **set\_bsd\_power\_up\_reset** command.

SH SEE ALSO **set\_bsd\_power\_up\_reset** (2).

# UIT-1067 (error) Incorrect number of ports/values specified with option '-pattern'.

## DESCRIPTION

You have specified an insufficient number of port/value pairs with option **-pattern** of **set\_bsd\_compliance** command. The syntax of the compliance pattern is as follows.

```
{ [<port_name> <port_value>]+ }
```

where <port\_name> is the name of the port of the current design and <port\_value> can

be 0 or 1.

## WHAT NEXT

Correct the specification and reissue the **set\_bsd\_compliance** command.

SH SEE ALSO **set\_bsd\_compliance** (2).

**UIT-1068 (error)** Specified IR width %d is not within 2-32 inclusive, ir\_width specification discarded.

## DESCRIPTION

You have specified an unsupported Instruction Register(IR) Width with **set\_bsd\_configuration** command. The IR width should be a positive number between 2 and 32.

## WHAT NEXT

Correct the specification and reissue the **set\_bsd\_configuration** command.

SH SEE ALSO **set\_bsd\_configuration** (2).

**UIT-1069 (error)** Invalid value %s specified for option -asynchronous\_reset.

## DESCRIPTION

You have specified an invalid value for option **-asynchronous\_reset** of **set\_bsd\_configuration** command. The allowed values for this option are : true | false

## WHAT NEXT

Correct the specification and reissue the **set\_bsd\_configuration** command.

SH SEE ALSO **set\_bsd\_configuration** (2).

**UIT-1070 (error)** Invalid value %s specified for option -

## **instruction\_encoding.**

### **DESCRIPTION**

You have specified an invalid value for option **-instruction\_encoding** of **set\_bsd\_configuration** command. The allowed values for this option are : binary | one\_hot

### **WHAT NEXT**

Correct the specification and reissue the **set\_bsd\_configuration** command.

SH SEE ALSO **set\_bsd\_configuration** (2).

## **UIT-1071 (error) Invalid value %s specified for option -style.**

### **DESCRIPTION**

You have specified an invalid value for option **-style** of **set\_bsd\_configuration** command. The allowed values for this option are : synchronous | asynchronous

### **WHAT NEXT**

Correct the specification and reissue the **set\_bsd\_configuration** command.

SH SEE ALSO **set\_bsd\_configuration** (2).

## **UIT-1072 (warning) UI option -ieee1149.1\_1993 will be obsolete, please use option -std to specify the std. version.**

### **DESCRIPTION**

You have specified option **-ieee1149.1\_1993** with **set\_bsd\_configuration** command. This option is obsolete, use the new option **-std ieee1149.1\_1993** to enable IEEE1149.1\_1993 standard.

### **WHAT NEXT**

Correct the specification and reissue the **set\_bsd\_configuration** command.

SH SEE ALSO **set\_bsd\_configuration** (2).

## **UIT-1073 (warning) Ignoring %s constant of pad design '%s'.**

### **DESCRIPTION**

You have specified LP\_time or HP\_time constants for a pad design and the value of this time constant is not valid.

The time is not valid if the time constant is less than 0.0

LP\_time constant is also invalid if HP\_time contant is not specified.

The time constant should be a positive real number in units of nano seconds.

### **WHAT NEXT**

Correct the specification and reissue the **define\_dft\_design** and **preview\_dft**, **insert\_dft** commands.

SH SEE ALSO **define\_dft\_design** (2), **preview\_dft** (2), **insert\_dft** (2).

## **UIT-1074 (error) Std. Instruction '%s' is not allowed if support for ieee1149.6\_2003 is not enabled.**

### **DESCRIPTION**

You have specified EXTEST\_PULSE or EXTEST\_TRAIN instruction with **set\_bsd\_instruction** command, but didn't enable IEEE1149.6\_2003 standard. These two instructions are supported only if IEEE1149.6\_2003 standard support is enabled with option **-std ieee1149.6\_2003** of **set\_bsd\_configuration** command.

### **WHAT NEXT**

Correct the specification and reissue the **set\_bsd\_configuration** and **preview\_dft**, **insert\_dft** commands.

SH SEE ALSO **set\_bsd\_configuration** (2), **preview\_dft** (2), **insert\_dft** (2).

## **UIT-1075 (warning) Port '%s' doesn't need an AC/DC Selector cell, not adding the selector cell for the port.**

### **DESCRIPTION**

You have specified that AC/DC selector cell should be added for the specified port

and the tool determined that the port doesn't need such a BSR cell. AC/DC selector cells are added to control the AC mode pin of AC BSR cells. If an AC BSR cell(AC\_1, AC\_2, AC\_7) doesn't drive a port, no AC/DC selection BSR cell is needed for the port.

## WHAT NEXT

Correct the specification and reissue the **set\_boundary\_cell** and **preview\_dft**, **insert\_dft** commands.

SH SEE ALSO **set\_boundary\_cell** (2), **preview\_dft** (2), **insert\_dft** (2).

**UIT-1076 (error)** Invalid cell type '%s' for boundary scan tristate control register of port '%s', adding default control BSR cell to the port.

## DESCRIPTION

You have specified an invalid BSR cell as a control BSR cell for a port with **set\_boundary\_cell** command. Valid control BSR cells are : BC\_1 | BC\_2 | none. A default BSR cell will be added as a control cell for the port. The default control BSR cell is BC\_1 cell if INTEST instruction is specified, otherwise the default control cell is BC\_2 BSR cell.

## WHAT NEXT

Correct the specification and reissue the **set\_boundary\_cell** and **preview\_dft**, **insert\_dft** commands.

SH SEE ALSO **set\_boundary\_cell** (2), **preview\_dft** (2), **insert\_dft** (2).

**UIT-1077 (error)** Invalid cell type '%s' for boundary scan ac/dc select register of port '%s', not adding any ac/dc selector BSR cell to the port.

## DESCRIPTION

You have specified an invalid BSR cell as a ac/dc selector BSR cell for a port with **set\_boundary\_cell** command. Valid ac/dc selector BSR cells are : AC\_SELU | AC\_SELX | none. No AC/DC selector BSR cell is added to the specified port.

## WHAT NEXT

Correct the specification and reissue the **set\_boundary\_cell** and **preview\_dft**, **insert\_dft** commands.

SH SEE ALSO **set\_boundary\_cell** (2), **preview\_dft** (2), **insert\_dft** (2).

**UIT-1078** (warning) BC\_1 cell should be used for output control pins when INTEST is specified, using BC\_1 cell for control pin of port '%s'.

## DESCRIPTION

You have specified BC\_2 BSR cell as the control cell for a port and also specified INTEST instruction. When INTEST instruction is specified, BC\_2 BSR cell can't be used as a control BSR cell, adding BC\_1 BSR cell as the control cell for the specified port.

## WHAT NEXT

Correct the specification and reissue the **set\_boundary\_cell** and **preview\_dft**, **insert\_dft** commands.

SH SEE ALSO **set\_boundary\_cell** (2), **preview\_dft** (2), **insert\_dft** (2).

**UIT-1079** (error) Polarity '%s' is not allowed of pad access pins of type '%s'.

## DESCRIPTION

You have specified an incorrect polarity for a pad access pin. Here is a list of pad access pins and the allowed polaritities for each of them.

Padd Acces Pin Type Allowed Polarites ====== port  
high low ac\_mode high low shift\_dr high low capture\_clk high low capture\_en high low  
update\_clk high low update\_en high low data\_out high low ac\_init\_data\_p high low  
ac\_init\_data\_n high low ac\_init\_clk high low mode\_in high low data\_in high low  
mode\_out high low ac\_test high low mode1 inout high low mode2 inout high low enable  
high low highz high low

observe high low high high si high so high receiver\_p high receiver\_n high  
=====

## WHAT NEXT

Correct the specification and reissue the **define\_dft\_design** command.

SH SEE ALSO **define\_dft\_design** (2).

# UIT-1080 (Warning) Port '%s' is not a linkage port, not removing the port.

## DESCRIPTION

You receive this warning message when you execute the **remove\_bsd\_linkage\_port** command and specified a port which is not a Linkage port. You can only remove Linkage ports with this command.

## WHAT NEXT

Reexecute the **remove\_bsd\_linkage\_port** command with Linkage ports.

SH SEE ALSO **remove\_bsd\_linkage\_port** (2). **set\_bsd\_linkage\_port** (2).

# UIT-1081 (Error) No Linkage Ports found on the current design.

## DESCRIPTION

You receive this error message when you execute the **remove\_bsd\_linkage\_port** command and no linkage ports found on the current design. You can only remove Linkage ports with this command.

## WHAT NEXT

Reexecute the **remove\_bsd\_linkage\_port** command with Linkage ports.

SH SEE ALSO **remove\_bsd\_linkage\_port** (2). **set\_bsd\_linkage\_port** (2).

# UIT-1082 (Error) No Power Up Reset Ports found on the current design.

## DESCRIPTION

You receive this error message when you execute the **remove\_bsd\_power\_up\_reset**

command and no power up reset ports found on the current design. You can only remove Power Up Reset ports with this command.

## WHAT NEXT

Reexecute the `remove_bsd_power_up_reset` command with Power Up Reset ports.

SH SEE ALSO `find` (2), `remove_bsd_power_up_reset` (2). `set_bsd_power_up_reset`(2).

# UIT-1083 (Warning) Pattern-name '%s' is not in bsd compliance, not removing pattern-name.

## DESCRIPTION

You receive this warning message when you execute the `remove_bsd_compliance` command and specified a pattern-name which is not set using `set_bsd_compliance`. You can only remove compliance pins with this command.

## WHAT NEXT

Reexecute the `remove_bsd_compliance` command with compliance pins.

SH SEE ALSO `find` (2), `remove_bsd_compliance`(2). `set_bsd_compliance`(2).

# UIT-1084 (Error) No Compliance Ports found on the current design.

## DESCRIPTION

You receive this error message when you execute the `remove_bsd_compliance` command and no compliance pins found on the current design. You can only remove Compliance pins with this command.

## WHAT NEXT

Reexecute the `remove_bsd_compliance` command with Compliance pins.

SH SEE ALSO `find` (2), `remove_bsd_compliance` (2). `set_bsd_compliance` (2).

# UIT-1085 (Warning) Cell '%s' is not a boundary cell IO, not

removing the cell.

## DESCRIPTION

You receive this warning message when you execute the **remove\_boundary\_cell\_io** command and specified a cell which is not a Boundary Cell IO. You can only remove Boundary Cell IOs with this command.

## WHAT NEXT

Reexecute the **remove\_boundary\_cell\_io** command with Boundary cell IOs.

SH SEE ALSO **remove\_boundary\_cell\_io** (2). **set\_boundary\_cell\_io** (2).

# UIT-1086 (Error) No Boundary Cell IOs found on the current design.

## DESCRIPTION

You receive this error message when you execute the **remove\_boundary\_cell\_io** command and no boundary cell IOs found on the current design. You can only remove Boundary IO cells with this command.

## WHAT NEXT

Reexecute the **remove\_boundary\_cell\_io** command with Boundary cell IOs.

SH SEE ALSO **remove\_boundary\_cell\_io** (2). **set\_boundary\_cell\_io** (2).

# UIT-1087 (Error) Insufficient number of options, specify either of options : -cell | -all.

## DESCRIPTION

You receive this error message when you execute the **remove\_boundary\_cell\_io** command and doesn't specify the required options. Either of the options -all or -cell are required for this command.

## WHAT NEXT

Reexecute the **remove\_boundary\_cell\_io** command with the required options.

SH SEE ALSO **find** (2), **remove\_boundary\_cell\_io** (2). **set\_boundary\_cell\_io** (2).

## **UIT-1088 (Error)** Options -cell and -all are mutually exclusive, specify only one of them.

### **DESCRIPTION**

You receive this error message when you execute the **remove\_boundary\_cell\_io** command and specified conflicting options. Options -all and -port\_list are mutually exclusive.

### **WHAT NEXT**

Reexecute the **remove\_boundary\_cell\_io** command with the either of -all or -port\_list options.

SH SEE ALSO **find** (2), **remove\_boundary\_cell\_io** (2). **set\_boundary\_cell\_io** (2).

## **UIT-1089 (error)** Insufficient number of options, specify either of options : -name | -all

### **DESCRIPTION**

You receive this error message when you execute the **remove\_bsd\_compliance** command and doesn't specify the required options. Either of the options -name or -all are required for this command.

### **WHAT NEXT**

Reexecute the **remove\_bsd\_compliance** command with the required options.

SH SEE ALSO **remove\_bsd\_compliance**(2). **set\_bsd\_compliance**(2).

## **UIT-1090 (Warning)** Option '-name' is applicable only for Control/Ac Select Boundary Cells, ignoring the option.

### **DESCRIPTION**

You receive this warning message when you execute the **set\_boundary\_cell** command and specify option -name with an unsupported function. This option can be specified

```
only with option values : control | ac_select .
```

## WHAT NEXT

Fix the problem and Re-execute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **find** (2), **set\_boundary\_cell** (2).

# UIT-1091 (Warning) Option '-share' is applicable only for multiple Control/Ac Select Boundary Cells, ignoring the option.

## DESCRIPTION

You receive this warning message when you execute the **set\_boundary\_cell** command and specify option -share with a single port in -ports option. The option -share is applicable only when used with multiple Control/Ac Select Boundary Cells.

## WHAT NEXT

Fix the problem and Re-execute the **set\_boundary\_cell** command with the correct specification.

SH SEE ALSO **set\_boundary\_cell** (2). **set\_scan\_path** (2).

# UIT-1100 (Error) Invalid option value '%s'

## DESCRIPTION

The value specified for the option is invalid

## WHAT NEXT

Check the value

## **SEE ALSO**

# **UIT-1101 (Error) Could not find valid link/reference for %s.**

## **DESCRIPTION**

You receive this error message in set\_bsd\_register command when the cell specified in the '-cell' option of the command does not have a valid reference. This might happen when the specified cell does not have a reference or when it has failed to link.

## **WHAT NEXT**

Run the link command and fix the LINK-3 or LINK-5 errors reported on the cell.

## **SEE ALSO**

`link (2)`, `set_bsd_register (2)`,

# **UIT-1102 (Error) Could not find valid link/reference for %s.**

## **DESCRIPTION**

You receive this error message in set\_dft\_signal command when the cell specified in the '-hookup\_pin' option of the command does not have a valid reference. This might happen when the specified cell does not have a reference or when it has failed to link.

## **WHAT NEXT**

Run the link command and fix the LINK-3 or LINK-5 errors reported on the cell.

## **SEE ALSO**

`link (2)`, `set_dft_signal (2)`,

# **UIT-1110 (warning) DFT Hierarchy Location specification is not**

honored when %s is enabled.

## DESCRIPTION

You receive this warning message when you execute the **set\_dft\_location** command and also enable the following DFT clients for DFT insertion.

Wrapper Boundary Scan Logic Bist

When these clients are specified, user specified DFT Hierarchy location is not used in DFT insertion.

## WHAT NEXT

Dft logic not added to user specified DFT Hierarchy during DFT insertion.

SH SEE ALSO **set\_dft\_location** (2), **set\_dft\_configuration** (2)

**UIT-1111 (warning) DFT Hierarchy Location specification is ignored for Test Point, PLL or pipeline scan insertion.**

## DESCRIPTION

You receive this warning message when you execute the **set\_dft\_location** command and also enable the Test Point, PLL or pipeline scan insertion during DFT insertion.

When Test Point insertion, PLL or pipeline scan is enabled, Test Point, PLL or pipeline scan dft logic is not added to the user specified DFT Hierarchy location.

## WHAT NEXT

Test Point, PLL or pipeline scan Dft logic not added to the user specified DFT Hierarchy during DFT insertion.

SH SEE ALSO **set\_dft\_location** (2), **set\_dft\_configuration** (2)

**UIT-1112 (warning) Specified hierarchy name '%s' doesn't exists in the current design %s'.**

## DESCRIPTION

You receive this warning message when you execute the **set\_dft\_location** command and specify an instance name with the command that doesn't exists in the current design.

## WHAT NEXT

DFT insertion creates the specified instance.

SH SEE ALSO **set\_dft\_location** (2), **insert\_dft** (2)

# UIT-1113 (error) Specified hierarchy name '%s' is not valid.

## DESCRIPTION

You receive this warning message when you execute the **set\_dft\_location** command and specify an invalid instance name with the command.

## WHAT NEXT

Check if the specified instance name is valid and reissue the command with the correct instance name.

SH SEE ALSO **set\_dft\_location** (2)

# UIT-1114 (error) Specified name '%s' is not an instance of hierarchical design.

## DESCRIPTION

You receive this warning message when you execute the **set\_dft\_location** command and specify a leaf level instance with the command.

The specified name should be an instance of a hierarchical design. Instances of black box modules, unresolved modules or library cells are not allowed as valid instance names for this command.

## WHAT NEXT

Reissue the command with a valid hierarchical instance name.

SH SEE ALSO **set\_dft\_location** (2)

## **UIT-1115 (error) Specified instance '%s' %s.**

### **DESCRIPTION**

You receive this warning message when you execute the **set\_dft\_location** command and specify an invalid instance with the command.

Instances with dont\_touch or test model or ilms are not valid instances for the command.

Instances inside a test model or ilm are not valid instances for the command.

### **WHAT NEXT**

Reissue the command with a valid instance name.

SH SEE ALSO **set\_dft\_location** (2)

## **UIT-1200 (error) The -none option cannot not be used with the -all option.**

### **DESCRIPTION**

You are advised to use the **-none** option to turn off optimizations during scan insertion and use **-all** option for performing all the optimizations during scan insertion.

### **WHAT NEXT**

Modify the options accordingly to the recommendations and repeat the command.

### **SEE ALSO**

**insert\_dft** (2) **set\_dft\_optimization\_configuration** (2)

## **UIT-1300 (Warning) Resetting wire load mode to '%s'.**

### **DESCRIPTION**

The wire load mode is set to a default value.

## WHAT NEXT

Use the **set\_wire\_load\_mode** command to adjust.

## UIT-1310 (error) Core Integration of cores requires the option : -scan .

### DESCRIPTION

You receive this message if you issue **set\_dft\_configuration -integration enable** and also specify the following option. *-scan* disable UI option *-integration* of command **set\_dft\_configuration** requires the option *-scan enable*. For more information, see the manual page for the **set\_dft\_configuration** command.

### WHAT NEXT

Reissue **set\_dft\_configuration** command with valid options.

### SEE ALSO

**set\_dft\_configuration** (2).

## UIT-1311 (error) Core Integration of cores is mutually exclusive with options :

**-fix\_set | -fix\_reset | -fix\_bus | -fix\_bidirectional | -fix\_clock | -fix\_xpropagation | -control\_points | -observe\_points | -logicbist | -mbist | -wrapper | -scan\_compression .**

### DESCRIPTION

You receive this message if you issue **set\_dft\_configuration -integration enable** and also specify one of the following options. *-fix\_set enable -fix\_reset enable -fix\_bus enable -fix\_bidirectional enable -fix\_clock enable -fix\_xpropagation enable -control\_points enable -observe\_points enable -logicbist enable -mbist enable -wrapper enable -scan\_compression enable*

UI option *-integration* of command **set\_dft\_configuration** is mutually exclusive with the above options. For more information, see the manual page for the **set\_dft\_configuration** command.

## WHAT NEXT

Reissue **set\_dft\_configuration** command with valid options.

## SEE ALSO

**set\_dft\_configuration** (2).

**UIT-1312** (error) Core Integration of cores doesn't support the options : *-clock\_controller* .

## DESCRIPTION

You receive this message if you issue **set\_dft\_configuration -integration enable** and also specify one of the following options. *-clock\_controller enable* UI option *-integration* of command **set\_dft\_configuration** is mutually exclusive with the option *-clock\_controller enable* when the design doesn't contain MBIST(Tech2) cores. For more information, see the manual page for the **set\_dft\_configuration** command.

## WHAT NEXT

Reissue **set\_dft\_configuration** command with valid options.

## SEE ALSO

**set\_dft\_configuration** (2).

**UIT-1313** (error) Boundary Scan Synthesis is mutually exclusive with options :

*-scan | -fix\_set | -fix\_reset | -fix\_bus | -fix\_bidirectional | -fix\_clock | -fix\_xpropagation | -control\_points | -observe\_points | -wrapper | -scan\_compression* .

## DESCRIPTION

You receive this message if you issue **set\_dft\_configuration -bsd enable** and also specify one of the following options. *-scan enable | -fix\_set enable | -fix\_reset enable | -fix\_clock enable | -fix\_xpropagation enable | -control\_points enable | -observe\_points enable | -wrapper enable | -scan\_compression enable*

UI option *-bsd* of command `set_dft_configuration` is mutually exclusive with the above options. For more information, see the manual page for the `set_dft_configuration` command.

## WHAT NEXT

Reissue `set_dft_configuration` command with valid options.

## SEE ALSO

`set_dft_configuration` (2).

**UIT-1314 (error)** Boundary Scan Synthesis doesn't support the options : *-mbist* | *-logicbist* | *-clock\_controller* .

## DESCRIPTION

You receive this message if you issue `set_dft_configuration -bsd enable` and also specify one of the following options. *-logicbist enable* *-mbist enable* *-clock\_controller enable* UI option *-bsd* of command `set_dft_configuration` is mutually exclusive with the option *-logicbist enable*. UI option *-bsd* of command `set_dft_configuration` is mutually exclusive with the option *-mbist enable* when not synthesizing MBIST(Tech1) logic. UI option *-bsd* of command `set_dft_configuration` is mutually exclusive with the option *-clock\_controller enable* when not synthesizing MBIST(Tech2) logic. For more information, see the manual page for the `set_dft_configuration` command.

## WHAT NEXT

Reissue `set_dft_configuration` command with valid options.

## SEE ALSO

`set_dft_configuration` (2).

**UIT-1315 (error)** Boundary Scan Integration of MBIST/LBIST logic requires the option : *-scan* .

## DESCRIPTION

You receive this message if you issue `set_dft_configuration -bsd enable` and also specify the following option. *-scan disable* *-mbist enable* OR *-logicbist enable* UI option *-integration* of command `set_dft_configuration` requires the option *-scan*

*enable* when `-mbist enable` OR `-logicbist enable` is also set. For more information, see the manual page for the **set\_dft\_configuration** command.

## WHAT NEXT

Reissue **set\_dft\_configuration** command with valid options.

## SEE ALSO

**set\_dft\_configuration** (2).

**UIT-1316** (warning) The option `-integration` is not recommended and will be obsoleted in the 2007.03 release.

## DESCRIPTION

You receive this message if you issue **set\_dft\_configuration -integration enable** command in XG mode or **set\_dft\_configuration -core\_integration** command in DB mode.

It is not recommended to use Core Integration functionality, the functionality is going to be obsoleted in 2007.03 release.

In DB mode, core integration functionality is still supported only with **-bist** option.

## WHAT NEXT

Reissue **set\_dft\_configuration** command with valid options.

## SEE ALSO

**set\_dft\_configuration** (2).

**UIT-1800** (error) '%s' is not defined as a TestMode port.

## DESCRIPTION

The port defined in the `-encoding` option of the **define\_test\_mode** command is not defined as a **TestMode port**. The type of the port is defined by using the **set\_dft\_signal** command.

## **UIT-1801 (error) The value '%s' for the TestMode port is not correct.**

### **DESCRIPTION**

The value defined for the port in the **-encoding** option must be either equal to 0 or 1.

## **UIT-1802 (warning) The current mode already contains encoding.**

### **DESCRIPTION**

The current mode already contains encoding. The previous encoding specification will be overwritten.

## **UIT-1803 (error) The following compliance enable port is not an input or inout port: %s.**

### **DESCRIPTION**

The **set\_bsd\_compliance** command lets you specify a compliance enable pattern for a boundary scan design. Each compliance enable pattern consists of a set of `port_name` value pairs. Each port name in a compliance enable specification must correspond to an input or inout port of the design.

### **WHAT NEXT**

Make sure that each port in the compliance enable pattern corresponds to an input or inout port of the design.

## **UIT-1804 (error) No patterns found to write native Verilog test bench file.**

### **DESCRIPTION**

This error is generated when the `create_bsd_patterns` does not generate any patterns that could be written to the native Verilog test bench.

## WHAT NEXT

Check what caused no test bench patterns to be generated.

## SEE ALSO

`create_bsd_patterns` (1). `write_test` (1).

# UIT-1805 (Error) Specification of hookup sense without port specification is invalid.

## DESCRIPTION

You receive this message because you have specified a hookup sense for a hookup pin without specifying the port name corresponding to this hookup pin. In the particular case of an internal pin specification, you should drop both the hookup sense and the port name.

## WHAT NEXT

If you are in an internal pin flow, please drop the hookup sense specification. If you are not in an internal pin flow please specify the port name corresponding to your hookup pin. `set_dft_signal` command.

# UIT-1806 (error) '%s' is defined several times in the encoding definition .

## DESCRIPTION

The port defined in the `-encoding` option must be defined once.

## **UITCL**

**UITCL-100** (error) Can't get object name of multiple objects;  
Only a single object collection accepted.

### **DESCRIPTION**

This command only accepts a collection that contains only one object.

### **WHAT NEXT**

Try the command again with one object collection.

**UITCL-101** (error) Cannot split list elements of value '%s' for variable '%s'.

### **DESCRIPTION**

The variable value is not a valid list. Therefore, its value cannot be processed correctly.

### **WHAT NEXT**

Check the value of the given variable that is printed out by the error message.

**UITCL-102** (warning) The update\_script command is not supported in Tcl mode;  
Update\_script is available in dcsh only.  
To translate dcsh to tcl format, use the dc-transcript program.

### **DESCRIPTION**

This command is not supported in dc\_shell Tcl mode.

### **WHAT NEXT**

## **UIТЕ**

### **UIТЕ-100 (error) Design mode configuration '%s' is not defined.**

#### **DESCRIPTION**

The given design mode configuration is not defined.

#### **WHAT NEXT**

Design mode might be misspelled. Try `report_design_modes` to find out. To make a new `design_mode_configuration`, use `create_design_mode`.

### **UIТЕ-101 (error) Design mode '%s' is not defined in mode configuration '%s'.**

#### **DESCRIPTION**

The given design mode configuration does not contain the given mode. If no design modes configuration is specified, the first one is assumed.

#### **WHAT NEXT**

The design mode might be misspelled. Try `report_design_mode` to find out. The wrong design mode configuration might be assumed.

### **UIТЕ-102 (error) No design modes have been defined.**

#### **DESCRIPTION**

No design modes have been defined for the current design.

#### **WHAT NEXT**

To make a `design_mode_configuration`, use `create_design_modes`.

## **UITE-103 (error) Design mode group '%s' is already defined.**

### **DESCRIPTION**

There is already a design mode group of the specified name.

### **WHAT NEXT**

To define a different design mode group, choose another name and enter the command again. Once a design mode group is defined, you cannot change it. You must reset all of the design modes and start again.

## **UITE-104 (error) Input port '%s' not found.**

### **DESCRIPTION**

Synchronize\_inputs only works on top-level input or inout ports of the current design.

### **WHAT NEXT**

To find the names of the existing input ports, use report\_port.

## **UITE-105 (error) Port '%s' must be an input or inout port.**

### **DESCRIPTION**

Synchronize\_inputs only works on the top-level input or inout ports of the current design.

### **WHAT NEXT**

To find the names of the existing input and inout ports, use report\_port.

## **UITE-106 (warning) The %s command will be discontinued in**

future releases. This command has been replaced by %s

## DESCRIPTION

A command has been renamed. The old command name is being supported temporarily but will cause syntax errors in future releases

## WHAT NEXT

Use the new command instead of the discontinued command.

## SEE ALSO

**UITE-107** (error) Cannot set timing derates on a design that is not the current design.

## DESCRIPTION

This message is issued if the user has called the `set_timing_derate` command with a design, which is not the current design, as an argument.

## WHAT NEXT

If the user has intended to operate on the specified design, then set the current design using the `current_design` command.

## SEE ALSO

`set_timing_derate` (2). `current_design` (2).

**UITE-115** (error) Reference '%s' '%s' must be a leaf pin or port.

## DESCRIPTION

`-reference_pin` should specify a leaf pin or port on some clock network, i.e. direct or transistive fanout of some clock source given by `-clock`.

## WHAT NEXT

**UITE-116 (Error)** Edge value of clock '%s' is greater than its subsequent edge values.

## DESCRIPTION

The value of each edge must be less or equal than its subsequent edge values. There must be an even number of edges and they are assumed to be alternating rise and fall.

## WHAT NEXT

Use `report_clock` to check for clock information.

**UITE-119 (Warning)** Clock does not have waveform values monotonically increasing, so waveform has been adjusted.

## DESCRIPTION

There must be an even number of edges, which are interpreted as alternating rising and falling edges. The edges must be monotonically increasing, except for a special case with two edges specified. When only two edge values are specified and the first value is greater than the second value, it is interpreted as a return-to-one waveform instead of the normal return-to-zero waveform if the falling edge adding one period is still larger than rising edge.

## WHAT NEXT

**UITE-120 (error)** Invalid waveform. Edges must be an even number of

monotonically increasing values less than one period in duration.

## DESCRIPTION

The specified clock waveform is not valid.

## WHAT NEXT

**UITE-121** (warning) Creating virtual clock named '%s' with no sources.

## DESCRIPTION

This warning occurs when a virtual clock is created. A virtual clock has a name but no sources. This means it is not applied to any ports or pins in the design. A virtual clock can be used to specify input or output delay.

## WHAT NEXT

The command `create_clock -period 10 -name CLK` does not apply the clock to any sources. If you want to apply the clock to a pin or port, you must specify the pin or port as in `create_clock -period 10 CLK` or `create_clock -period 10 -name CLK ff1/CP`.

**UITE-122** (error) The 'create\_clock' command cannot be used on output port '%s'.

## DESCRIPTION

Clock sources must be input ports or internal pins. Inout ports can be used, but they are not recommended because of bus contention issues.

## WHAT NEXT

Identify a valid set of sources and reapply the `create_clock` command.

**UITE-123** (warning) Creating a clock source on inout port '%s'.

## DESCRIPTION

A circuit, where a clock signal drives an inout port, can be unpredictable. If the port is functioning as an output while the clock is driving, bus contention occurs. If the clock is three-stated, any registers in the fanout of the clock can lose state.

## **WHAT NEXT**

Verify that the circuit is safe according to your design rules. The PrimeTime product assumes that the clock is valid.

## **UITE-124 (error) Cannot remove internal path group '%s'.**

### **DESCRIPTION**

You cannot use **remove\_path\_group** to remove internal path groups (such as the default group).

### **WHAT NEXT**

Reenter the command without the internal path group name.

## **UITE-125 (warning) Invalid delay direction for port '%s'.**

### **DESCRIPTION**

The entered port direction does not match the specifier used. For example, an input port is used with a -to specifier.

### **WHAT NEXT**

Re-enter the command with valid port directions.

## **UITE-126 (error) Unable to %s on path from '%s' to '%s'.**

### **DESCRIPTION**

A timing exception command failed to apply or remove information on the specified path.

### **WHAT NEXT**

## **UITE-127 (information) Found a design with sdf backannotation: (design '%s', file '%s').**

Performance will be better by reading the db with -netlist\_only and then reading the sdf file with read\_sdf.

## DESCRIPTION

A design with sdf backannotation was read in from a db file. The performance of PrimeTime will be improved if the design db is read in order to obtain only the netlist (read\_db -netlist\_only), and the sdf data is read from an sdf file using read\_sdf.

## WHAT NEXT

### **UITE-128 (error) Unable to set %s on '%s'.**

## DESCRIPTION

Failed to execute the given set operation on the specified clock.

## WHAT NEXT

### **UITE-129 (error) Unable to remove %s on '%s'.**

## DESCRIPTION

Failed to execute the given remove operation on the specified clock.

## WHAT NEXT

### **UITE-130 (warning) Creating a clock on internal pin '%s'.**

## DESCRIPTION

Clock sources must be input ports. Internal pins can be used, but they are not recommended because they segment your path and prevent slew propagation. PrimeTime restarts slew propagation from the internal clock source pins and reset its value to zero as if the user issued a set\_annotated\_transition command with a value of zero on the internal clock source pin. You can use the set\_annotated\_transition command on the clock source pin to set a slew value different than zero.

## WHAT NEXT

Identify a valid set of sources and reapply the `create_clock` command.

## SEE ALSO

`create_clock` (2), `set_annotation_transition` (2).

# UITE-131 (error) Design mode '%s' is already defined.

## DESCRIPTION

There is already a design mode of the specified name.

## WHAT NEXT

Choose a different design mode name and enter the command again, or remove the old design mode with the `remove_design_mode` command.

# UITE-132 (warning) Mode '%s' does not exist on cell '%s'.

## DESCRIPTION

There is no mode of the specified name on the cell.

## WHAT NEXT

Use `report_mode` to determine the valid modes for the cell.

# UITE-133 (error) Pin '%s' is not a valid %s.

## DESCRIPTION

The specified pin is not a valid timing startpoint or endpoint. Some commands such as `set_mode` require that the from objects be valid timing startpoints, and the to objects be valid endpoints.

## WHAT NEXT

Use input ports or register clock pins for the from objects, and output ports or register data pins for the to objects.

## **UITE-134** (warning) Creating a %s on multi-driven net '%s', only driver pin '%s' is used as the source.

### **DESCRIPTION**

It is recommended that you use only ports/pins as clock or generated clock sources. Net can be used as clock source, but the effective source used by PrimeTime is the driver pin of the net. If the net is multi-driven, only one of the driver pins is used as the source of the clock.

### **WHAT NEXT**

Identify a valid set of sources and reapply the `create_clock` or `create_generated_clock` command.

### **SEE ALSO**

`create_clock` (2), `create_generated_clock` (2).

## **UITE-135** (error) Creating a %s on net '%s' which does not have a driver pin as real source.

### **DESCRIPTION**

It is recommended that you use only ports/pins as clock or generated clock sources. Net can be used as clock source, but the effective source used by PrimeTime is the driver pin of the net. If the net is multi-driven, only one of the driver pins is used as the source of the clock. If the net does not have a driver pin, the clock will not be correctly created.

### **WHAT NEXT**

Identify a valid set of sources and reapply the `create_clock` or `create_generated_clock` command.

### **SEE ALSO**

`create_clock` (2), `create_generated_clock` (2).

## **UITE-136** (warning) Creating a generated clock on hierarchical

pin '%s'.

## DESCRIPTION

It is recommended that you do not specify a generated clock on a hierarchical design pin. PrimeTime may support generated clocks on hierarchical pins in the future.

## WHAT NEXT

Move the generated clock to a leaf driver or load pin on the same net.

## SEE ALSO

`create_clock` (2), `create_generated_clock` (2).

# UITE-137 (warning) Creating '%s' on a hierarchical pin '%s'.

## DESCRIPTION

Defining a constraint at a hierarchical pin causes the timing arcs (net arcs) from leaf pins driving this pin to leaf pins driven by this pin to be broken. This gives rise to two distinct limitations. First, the hierarchical boundary is a virtual designation and, generally, does not map to a specific physical location. Hence, PrimeTime cannot make any assumptions as to distributing the interconnect delay to the left and right of the bidirectional boundary. Second, breaking the original timing arcs may introduce a loss of timing information. For example, if the hierarchical pin were driven by three leaf pins and drives three other leaf pins, then breaking at the hierarchical boundary would reduce nine timing arcs to six, or worse, three considering the first limitation.

## WHAT NEXT

Move the constraint to a leaf driver or load pin on the same net.

## SEE ALSO

`create_clock` (2), `set_clock_sense` (2), `set_input_delay` (2), `set_output_delay` (2).

# UITE-150 (warning) Negative clock latency specified: %g

## DESCRIPTION

You specified a negative value to `set_clock_latency`. Although this is legal, it is

not typical.

## WHAT NEXT

Ensure that you really wanted a negative value.

# **UITE-200 (error) Must specify %s option along with %s option.**

## DESCRIPTION

The two options must be together; if one of them is not specified, it is an error.

## WHAT NEXT

Specify both the options together.

# **UITE-201 (warning) Option '%s' is valid only with option '%s'.**

## DESCRIPTION

The option specified is valid only if specified along with the other option.

## WHAT NEXT

This option will be ignored, so you can remove this option from the command.

# **UITE-202 (error) The factor for -MULTIPLY\_BY/-DIVIDE\_BY '%d' is not a power of two.**

## DESCRIPTION

The -MULTIPLY\_BY or -DIVIDE\_BY factor should be a power of two, if not, it is an error.

## WHAT NEXT

If the multiplication factor or division factor is not a power of two, model the clock derivation with -EDGES option.

## **UITE-203 (error) The number of edges specified '%d' is not an odd number larger than or equal to 3.**

### **DESCRIPTION**

The number of edges to make one period of the generated clock waveform has to be an odd number larger than or equal to 3.

### **WHAT NEXT**

Carefully specify edges and ensure that you specify one full clock cycle using the edges.

## **UITE-204 (error) The number of edge\_shifts specified '%d' using '-EDGE\_SHIFT' option is not equal to the number of edges specified '%d' using '-EDGES' option.**

### **DESCRIPTION**

The number of edge\_shifts specified using the '-EDGE\_SHIFTS' option must be equal to the number of edges specified using the '-EDGES' option.

### **WHAT NEXT**

Make the number of edge\_shifts equal to the number of edges.

## **UITE-205 (error) Expected to find, at most, two numbers along with the option '%s', but found %d.**

### **DESCRIPTION**

The options '-MAX\_EDGE\_DELAY/-MIN\_EDGE\_DELAY' can have, at the most, two numbers along with each, one for rise and one for fall edge.

### **WHAT NEXT**

Specify only the rise and fall edge delays.

## **UITE-206 (error) The clock %s is a generated clock.**

### **DESCRIPTION**

A generated clock cannot be removed using 'remove\_clock' command.

### **WHAT NEXT**

To remove the generated clocks, use the **remove\_generated\_clock** command.

## **UITE-207 (error) A generated clock has already been defined with the name %s.**

### **DESCRIPTION**

A generated clock has already been defined with the name you specified.

### **WHAT NEXT**

Either delete the generated clock and change the name, or change the name of the clock you are defining.

## **UITE-208 (error) You can specify only a single object for master clock source.**

### **DESCRIPTION**

The -source option takes only a single object as an argument.

### **WHAT NEXT**

You can have a generated clock derived from a single clock. You cannot generate a clock from more than one master clock.

## **UITE-209 (error) You cannot specify an output port '%s' to be a**

generated clock master source.

## DESCRIPTION

Generated clock master can be an input or inout port or a pin.

## WHAT NEXT

An output port cannot be a generated clock master.

# **UITE-210 (warning) Creating a generated clock on input or inout port '%s'.**

## DESCRIPTION

When creating a generated clock on an input or inout port, please note that the generated clock would only derive its waveform characteristics from the master clock. Delay, on the other hand, is derived from delay information at the port itself. Additionally, creating a generated clock to drive an inout port can cause unpredictable circuit behavior. If the port is functioning as an output while the clock is driving, bus contention occurs. If the clock is three-stated, any registers in the fanout of the clock can lose state.

## WHAT NEXT

Verify that the circuit is safe according to your design rules. The PrimeTime product assumes the generated clock is valid.

# **UITE-211 (Error) The -edges spec of generated clock '%s' has edge number less than 1, the edge number should be from 1 up.**

## DESCRIPTION

The -edge specification in creat\_generated\_clock command should use edge number of the master clock which should be from 1 up. Zero or negative number are not allowed.

## WHAT NEXT

Change your -edge spec in create\_generated\_clock coommand.

## **UITE-212 (Error) In the -edge specification of create\_generated\_clock '%s', the edge numbers must be in increasing order.**

### **DESCRIPTION**

In the -edge specification of a create\_generated\_clock command, the edge numbers specified must be in increasing order.

### **WHAT NEXT**

Check the -edge spec in create\_generated\_clock command and edge numbers increasing.

## **UITE-213 (Warning) clock port '%s' cannot be assigned input delay relative to clock '%s'. Ignoring the value.**

### **DESCRIPTION**

When setting an input delay on clock port, it must be specified relative to the same clock. If a different clock is specified, this setting is ignored.

### **WHAT NEXT**

Remove the unneeded input delay value using the **remove\_input\_delay** command.

## **UITE-214 (Information) Updating %-35s**

### **DESCRIPTION**

Shows the progress of update timing. The update timing can happen explicitly by calling update\_timing or implicitly by calling one of the commands that need update timing.

## **UITE-215 (warning) Ignoring -significant\_digits option with -**

connections.

## DESCRIPTION

Since the output of report\_net with the -connections option formats the output according to the number of significant digits necessary, the -significant\_digits option is ignored.

# UITE-216 (warning) Object '%s' is not a valid %s.

## DESCRIPTION

The specified object is neither a valid timing startpoint nor endpoint. Commands such as **set\_false\_path**, **set\_multicycle\_path**, and **group\_path** require the **-from** option *from\_list* objects to be valid timing startpoints and the **-to** option *to\_list* objects to be valid timing endpoints.

One important limitation to note is that the call to **update\_timing** command may cause the creation of path endpoints at combinational pins. One major example is clock gating checks if the pin connects to the signal gating the clock signal. In that case, entering an exception before an **update\_timing** would emit this message, whereas doing so after an **update\_timing** would not.

## WHAT NEXT

Use input ports or register clock pins for the *from\_list* objects. Use output ports or register data pins for the *to\_list* objects.

## SEE ALSO

**group\_path** (2), **set\_false\_path** (2), **set\_multicycle\_path** (2), **update\_timing** (2).

# UITE-217 (warning) Forcing pin '%s' to be a timing %s.

## DESCRIPTION

The specified pin is neither a valid timing startpoint nor endpoint. The **set\_max\_delay** and **set\_min\_delay** commands are point-to-point timing exception commands. In this case, these commands override the default single-cycle timing relationship for affected timing paths, so the matched component of each path has a new startpoint (if you specify the **-from** option) and a new endpoint (if you specify the **-to** option). The remaining portions of the path are left unconstrained at the specified pin.

## WHAT NEXT

PrimeTime assumes the behavior described above is intended. If not, use input ports or register clock pins for the **from** *from\_list* objects, and output ports or register data pins for the **-to** *to\_list* objects.

## SEE ALSO

`set_max_delay (2)`, `set_min_delay (2)`.

# UITE-218 (Warning) `set_clock_groups` overwrote existing false paths.

## DESCRIPTION

The **set\_clock\_groups** command won't analyze the paths between exclusive and asynchronous clocks. Previous manually defined false paths between these exclusive and asynchronous clocks will be removed by **set\_clock\_groups** command.

## WHAT NEXT

Use the **report\_exceptions** command to see the existing false paths. To undo the **set\_clock\_groups**, use the **remove\_clock\_groups** command.

## SEE ALSO

`set_false_path(2)`, `set_clock_groups(2)`, `remove_clock_groups (2)`,  
`report_exceptions(2)`.

# UITE-219 (warning) Exception overwrites a previous exception of the same type.

## DESCRIPTION

The entered exception overwrites a previously entered exception that is of the same type: false path, multicycle path, min or max delay. The overwritten exception uses the same design objects in the specification. Part or all of the former exception will be discarded.

## WHAT NEXT

Make sure that the appropriate exceptions are set to the desired design paths. Note that discarded exceptions will not appear as ignored in `report_exceptions`.

## SEE ALSO

`set_false_path (2)`, `set_multicycle_path (2)`, `set_max_delay (2)`, `set_min_delay (2)`,  
`report_exceptions (2)`.

## UITE-220 (information) Design exceptions have been modified.

### DESCRIPTION

Some user-entered false paths, multi-cycle paths, min or max delays, were cleaned up by the `transform_exceptions` command. While this clean up removed ignored path specifiers from the original specifications, the design paths utilization of the exceptions is unchanged.

### WHAT NEXT

Refer to the man page for `transform_exceptions(2)` for more details.

## UITE-221 (error) Transformation options %s are mutually exclusive.

### DESCRIPTION

The `transform_exceptions` command options `-remove_ignored`, `-flatten`, `-use_to_for_endpoints` cannot be specified for the same command invocation. Since these are different transformations with different requirements that can be order dependent, the user cannot intermix these transformations.

### WHAT NEXT

Separate the indicated transformation options into separate calls to the `transform_exceptions` command.

## SEE ALSO

`transform_exceptions (2)`.

## UITE-222 (error) The feedback pin '%s' , and the output pin '%s'

do not belong to the same PLL.

## DESCRIPTION

The feedback pin specified using the **-pll\_feedback** and the output pin specified using the **-pll\_output** option of **create\_generated\_clock** command do not belong to the same PLL. Since these pins belong to different cells, there is no valid feedback path for the PLL.

## WHAT NEXT

Define a valid configuration for the PLL, where the feedback pin is connected to an output clock pin on the PLL.

**UITE-223 (error) The source pin '%s' does not belong to the PLL cell '%s'.**

## DESCRIPTION

The master pin specified using the **-source** does not belong to the same PLL to which the feedback pin specified by the **-pll\_feedback** belongs. During the defining of a PLL and its feedback path, the master pin specified using the **-source** option should be the reference clock pin of the PLL.

## WHAT NEXT

Define a valid configuration for the PLL, where the master pin is the reference clock pin of the PLL.

**UITE-300 (Error) %s '%s' in when expression: '%s' for libcell '%s'.**

## DESCRIPTION

There was an error while parsing the when expression for the specified library cell. Therefore, the when expression will be ignored.

## WHAT NEXT

The library DB file has not been properly generated.

## **UITE-301** (Warning) Conflict in specifying '%s' with '%s'. Option '%s' will be used.

### **DESCRIPTION**

The listed command options cause a conflict. The more specific option will be chosen.

### **WHAT NEXT**

Look at the manpage for this command for more information on command options.

## **UITE-302** (Warning) Negative clock uncertainty specified: %g

### **DESCRIPTION**

You specified a negative value to `set_clock_uncertainty`.

Typically, clock uncertainty should be positive. Negative uncertainty values are supported for constraining designs with complex clock relationships. Setting the uncertainty value to a negative number may lead to optimistic timing analysis and should be used with extreme care.

### **WHAT NEXT**

Ensure that you really wanted a negative value.

## **UITE-303** (warning) Setting input delay on clock port '%s'. This will not be supported in future releases.

### **DESCRIPTION**

The setting of an input delay on a clock port that does not fanout to a latch D pin is interpreted as clock source latency. However, this feature will not be supported in future releases.

### **WHAT NEXT**

Use the `set_clock_latency` command with the `-source` option to specifically set clock source latency.

## SEE ALSO

`remove_clock_latency` (2), `set_clock_latency` (2).

**UITE-304** (warning) Setting input delay on clock port '%s', which also has a source latency. Input delay will be ignored.

## DESCRIPTION

The setting of an input delay on a clock port that does not fanout to a latch D pin is interpreted as clock source latency. However, the clock also has a defined source latency, so the input delay is ignored.

## SEE ALSO

`remove_clock_latency` (2), `set_clock_latency` (2).

**UITE-305** (warning) Converting a propagated clock '%s' to an ideal clock.

## DESCRIPTION

The direct setting of a clock network latency on a propagated clock converts it to a ideal clock.

## WHAT NEXT

Verify that this is the intended behavior.

## SEE ALSO

`remove_clock_latency` (2), `set_clock_latency` (2).

**UITE-306** (Error) The %s command requires all clocks are active.

## DESCRIPTION

You receive this error message because there is inactive clocks in the design. The

**characterize\_context** require all clocks in the design are active.

## WHAT NEXT

To active all clocks in the design, use the **set\_active\_clocks [all\_clocks]** command.  
To report clock status, use the **report\_clock** command.

## SEE ALSO

**set\_active\_clocks** (2), **report\_clock** (2).

# UITE-307 (error) Clock %s exists in more than one group.

## DESCRIPTION

The **set\_clock\_groups** command allows each clock can be defined in only one clock group.

## WHAT NEXT

To define multiple groups related to the same clock, use multiple **set\_clock\_groups** commands.

## SEE ALSO

**set\_clock\_groups** (2).

# UITE-308 (Error) Clock group %s does not exist.

## DESCRIPTION

All names must be predefined by the **set\_clock\_groups**.

## WHAT NEXT

Use the **set\_clock\_groups** command to define clock groups. Use the **report\_clock** command with -groups option to see existing clock groups.

## SEE ALSO

**remove\_clock\_groups**(2), **set\_clock\_groups**(2), **report\_clock**(2).

## **UITE-309** (warning) Exclusive or asynchronous clock groups specification supercedes set\_false\_path between clocks.

### **DESCRIPTION**

A preceding **set\_clock\_groups** command already dictates that paths between some or all of the clocks specified in the current **set\_false\_path** exception will not be analyzed. Therefore, the exception will not be entered into PrimeTime and would not show in the output of the **report\_exceptions** command. Note that if the exception specifies more clocks than present in the asynchronous or exclusive groups, then a reduced exception is entered such that this reduced exception is a subset of the original that only specifies clock to clock pairs not in the asynchronous or exclusive groups.

### **WHAT NEXT**

Use **report\_clock -groups** to view the current asynchronous or exclusive clock groups. Use the **remove\_clock\_groups** command to remove existing clock groups, if desired.

### **SEE ALSO**

**report\_clock(2)**, **set\_clock\_groups(2)**, **remove\_clock\_groups(2)**, **set\_false\_path(2)**.

## **UITE-310** (warning) CRPR command options will be discontinued in future releases.

### **DESCRIPTION**

The user interface to clock reconvergence pessimism removal (CRPR) has changed. The following discontinued options:

**-remove\_clock\_reconvergent\_pessimism**  
**-report\_clock\_reconvergent\_pessimism**

of the **report\_timing**, **report\_constraint**, and **get\_timing\_paths** commands are replaced with the following Boolean variable:

**timing\_remove\_clock\_reconvergence\_pessimism**

In future releases, use of the discontinued options will cause a syntax error.

### **WHAT NEXT**

Use the new **timing\_remove\_clock\_reconvergence\_pessimism** variable instead of the

discontinued options. For details on backward compatibility, see the **timing\_remove\_clock\_reconvergence\_pessimism** man page.

## SEE ALSO

**get\_timing\_paths** (2), **report\_constraint** (2), **report\_timing** (2),  
**timing\_remove\_clock\_reconvergence\_pessimism**. (3).

# UITE-311 (error) CRPR command options cannot be used if the design is up to date.

## DESCRIPTION

Until the following discontinued options:

**-remove\_clock\_reconvergent\_pessimism** and  
**-report\_clock\_reconvergent\_pessimism**

of the **report\_timing**, **report\_constraint**, and **get\_timing\_paths** commands are completely removed, limited backward-compatibility support is provided: If the design is not up to date, then the following Boolean variable:

`timing_remove_clock_reconvergence_pessimism`

is automatically set to **TRUE**. If the design is up to date, then the command fails.

## WHAT NEXT

Use the new **timing\_remove\_clock\_reconvergence\_pessimism** variable instead of the discontinued options. For more detail on backward compatibility, see the **timing\_remove\_clock\_reconvergence\_pessimism** variable man page.

## SEE ALSO

**get\_timing\_paths** (2), **report\_constraint** (2), **report\_timing** (2), **update\_timing** (2),  
**timing\_remove\_clock\_reconvergence\_pessimism**. (3).

# UITE-312 (information) Variable

`timing_remove_clock_reconvergence_pessimism` was set to

# TRUE.

## DESCRIPTION

Until the following discontinued options:

```
-remove_clock_reconvergent_pessimism
-report_clock_reconvergent_pessimism
```

of the **report\_timing**, **report\_constraint**, and **get\_timing\_paths** commands are completely removed, limited backward-compatibility support is provided. If the design is not up to date, then the following Boolean variable:

`timing_remove_clock_reconvergence_pessimism`

is automatically set to **TRUE**. If the design is up to date, then the command fails.

## WHAT NEXT

Update your scripts to use the new **timing\_remove\_clock\_reconvergence\_pessimism** variable instead of the discontinued command options.

## SEE ALSO

```
get_timing_paths (2), report_constraint (2), report_timing (2),
timing_remove_clock_reconvergence_pessimism. (3).
```

# UITE-313 (Information) '%s' has been renamed to '%s'.

## DESCRIPTION

You receive this message because the **-exclusive** option has been renamed to **-logically\_exclusive** since **-physically\_exclusive** is added.

## WHAT NEXT

Use the **report\_clock** with **-groups** option to check what clock groups have been set. To remove the existing clock groups, use the **remove\_clock\_groups** command.

## SEE ALSO

```
set_clock_groups (2), remove_clock_groups (2), report_clock (2).
```

## **UITE-314 (warning) Converting pin '%s' from propagated to ideal.**

### **DESCRIPTION**

Setting a clock network latency on a pin or port directly will convert all the latches in the transitive fanout to ideal if they were marked propagated before.

### **WHAT NEXT**

Please verify that this is the intended behaviour.

## **UITE-315 (warning) Converting %s object '%s' from ideal to propagated.**

### **DESCRIPTION**

The direct setting of a `propagated_clock` attribute on a `clock`, `pin`, or `port` can convert all latches in the transitive fanout to propagated. This occurs if they were already marked ideal and had some network latencies set. The user-specified network latencies are removed and can not be recovered. This message is generated if you use the `set_propagated_clock` command on the objects (`pin`, `port` or `clock`) after setting network latencies by using the `set_clock_latency` command on the same objects.

### **WHAT NEXT**

Verify that this is the intended behavior.

### **SEE ALSO**

`remove_clock_latency` (2), `set_clock_latency` (2), `set_propagated_clock` (2).

## **UITE-316 (warning) Virtual clock '%s' cannot be made propagated.**

### **DESCRIPTION**

A virtual clock cannot be made propagated as it has no source and does not affect any register in the design.

## WHAT NEXT

Remove the virtual clock from the clock list.

## SEE ALSO

`remove_clock (2)`.

**UITE-317 (error)** Exception is not set because no through objects could be found.

## DESCRIPTION

The object list of the exception path is empty at the from, to, or through position. This might happen if the specified object in the command line is a net that does not have any global driver or is a cell with no output pins.

## WHAT NEXT

Verify that this is the intended behavior.

**UITE-318 (Warning)** Clock groups with same clocks are already set.

## DESCRIPTION

You receive this warning message because the clock groups you specified are already set by previous command.

## WHAT NEXT

Use the `report_clock` with -groups option to check what clock groups have been set. To remove the existing clock groups, use the `remove_clock_groups` command.

## SEE ALSO

`set_clock_groups (2)`, `remove_clock_groups (2)`, `report_clock (2)`.

**UITE-319 (warning)** Setting clock latency on a non-clock pin or

port.

## DESCRIPTION

The direct setting of a clock network latency on a non-clock pin or a port converts all latches in the transitive fanout to an ideal clock.

## WHAT NEXT

Verify that this is the intended behavior.

## SEE ALSO

`remove_clock_latency` (2), `set_clock_latency` (2).

## **UITE-400 (Error) No sequential clock pins in '%s' or its transitive fanout.**

## DESCRIPTION

You receive this message if you execute `report_clock_timing` with an input pin list (either *from\_list* or *to\_list*) that does not contain any sequential clock pins, nor any in the pins' transitive fanout. All pins in the *from\_list* and *to\_list* lists must be sequential clock pins, or must contain them in their transitive fanout.

## WHAT NEXT

Reexecute the `report_clock_timing` command and ensure that all pins in the *from\_list* or *to\_list* are sequential clock pins, or that they have sequential clock pins in their transitive fanout.

## SEE ALSO

`report_clock_timing` (2).

## **UITE-401 (Warning) Pins that are not sequential clock pins and contain no sequential clock pins in their transitive fanout have**

been dropped from '%s'.

## DESCRIPTION

You receive this message if the list of input pins submitted to **report\_clock\_timing** in the *to\_list* or *from\_list* contains pins that are not sequential clock pins, and do not have sequential clock pins in their transitive fanout. Such pins are not valid inputs to **report\_clock\_timing**. This message warns you that the offending pins are being omitted from the report.

## WHAT NEXT

If it is acceptable to you for these pins to be excluded from the report, no action on your part is required. Otherwise, investigate why these were included in the lists of input pins, and make corrections accordingly. Then reexecute the **report\_clock\_timing** command, and ensure that all pins on the *from\_list* and *to\_list* are sequential clock pins, or that they have sequential clock pins in their transitive fanout.

## SEE ALSO

**report\_clock\_timing** (2).

**UITE-402 (Error)** No pins specified by the given '%s' belong to the specified clock domains.

## DESCRIPTION

You receive this message if you execute **report\_clock\_timing** and none of the pins on the input pin list (either *from\_list* or *to\_list*) belong to any of the clock domains specified by *clock\_list*. All pins in the *from\_list* and *to\_list* must be clocked by one of the specified clocks.

## WHAT NEXT

Reexecute the **report\_clock\_timing** command and ensure that all pins on the *from\_list* and *to\_list* are clocked by one of the clocks on the *clock\_list*.

## SEE ALSO

**report\_clock\_timing** (2).

**UITE-403** (Warning) Pins specified by the given '%s' that do not belong to the specified clock domains have been dropped from the current %s report.

## DESCRIPTION

You receive this message if you execute **report\_clock\_timing** with an input pin list (either *from\_list* or *to\_list*), and some of the pins do not belong to any of the clock domains specified by *clock\_list*. All pins in the *from\_list* and *to\_list* must be clocked by one of the specified clocks. This message warns you that the offending pins are being omitted from the report.

## WHAT NEXT

If it is acceptable to you for these pins to be excluded from the report, no action on your part is required. Otherwise, investigate why these were included in the lists of input pins, and make corrections accordingly. Then reexecute the **report\_clock\_timing** command, and ensure that all pins on the *from\_list* and *to\_list* are clocked by at least one of the clocks in *clock\_list*.

## SEE ALSO

**report\_clock\_timing** (2).

**UITE-404** (Error) 'from\_list' and 'to\_list' contain no pins that are clocked by the same clock; therefore, the skew cannot be reported.

## DESCRIPTION

You receive this message if you execute **report\_clock\_timing** and specify a skew report, but the *from\_list* and *to\_list* do not contain any pins clocked by the same clock. Skew reports are produced by **report\_clock\_timing** only on a per-clock-domain basis. If both *from\_list* and *to\_list* are specified and *clock\_list* is not, the set of clock domains clocking any pin in the *from\_list* is intersected with the set of clock domains clocking any pin in the *to\_list*. If this intersection is null, the skew report cannot continue.

## WHAT NEXT

Reexecute the **report\_clock\_timing** command, and ensure that the *from\_list* and *to\_list* contain pins clocked by the same clock. If you do not specify the *clock\_list*, ensure

that pins on the *from\_list* and *to\_list* belong to the same clock domain or set of domains.

## SEE ALSO

`report_clock_timing` (2).

**UITE-405** (Warning) Pins have been dropped from '%s', because they are not contained in the clock intersection with '%s'.

## DESCRIPTION

You receive this message if you execute `report_clock_timing` and specify a skew report, but the *from\_list* and *to\_list* contain some pins that are not clocked by the same clock. Skew reports are produced by `report_clock_timing` only on a per-clock-domain basis. If both *from\_list* and *to\_list* are specified and *clock\_list* is not, the set of clock domains clocking any pin in *from\_list* is intersected with the set of clock domains clocking any pin in *to\_list*. This message warns you that pins in either input list that are not part of any of these derived domains are being removed from the list of pins to report.

## WHAT NEXT

This is a warning message only; no action is required on your part. In general, you can ignore this warning, because the `report_clock_network` command makes it easy to specify a superset of the clock pins of interest; the pruning referred to in this message is helpful to narrow down the superset of clock pins. However, if you have specified pins that you believe are part of a shared clock domain or set of domains, you should investigate why a sink pin in *to\_list* is not included in ANY domain implied by *from\_list*, or vice versa.

## SEE ALSO

`report_clock_timing` (2).

**UITE-406** (Error) No clock pins of '%s' sequential devices found.

## DESCRIPTION

A skew report requires a set of clock pins capable of launching data and a set of clock pins capable of capturing data. The combination of *from\_list*, *to\_list*, and *clock\_list* values specified in the `report_clock_timing` command failed to produce these two sets of pins.

## WHAT NEXT

If you specify the *from\_list* value, ensure that it contains clock pins of launching sequential devices, either explicitly or in its transitive fanout. If you specify the *to\_list* value, ensure that it contains clock pins of capturing sequential devices, either explicitly or in its transitive fanout. If you specify the *clock\_list* value, ensure that the clocks have associated networks (that they are not virtual clocks).

## SEE ALSO

`report_clock` (2), `report_clock_timing` (2).

# UITE-407 (Error) No clock pins of launching or capturing sequential devices are found.

## DESCRIPTION

A latency or transition time report requires a set of clock pins capable of either launching or capturing data. The combination of *from\_list*, *to\_list*, and *clock\_list* values specified in the `report_clock_timing` command failed to produce these pins.

## WHAT NEXT

If you specify the *from\_list* or *to\_list* value, ensure that they contain clock pins of launching or capturing sequential devices, either explicitly or in their transitive fanout. If you specify the *clock\_list* value, ensure that the clocks have associated networks (that they are not virtual clocks).

## SEE ALSO

`report_clock` (2), `report_clock_timing` (2).

# UITE-408 (Error) No sequential clock pins in '%s' or its transitive fanout are clocked.

## DESCRIPTION

The specified list contains sequential device clock pins, but none of them are clocked.

## WHAT NEXT

The specified input pin list (either the *from\_list* or *to\_list* value) must be part of the clock network of a defined clock. Check the clock definitions and the scope of their networks and determine if this is true.

## SEE ALSO

`all_clocks` (2), `create_clock` (2), `report_clock` (2), `report_clock_network` (2),  
`report_clock_timing` (2).

**UITE-409 (Error)** No pins specified by the given '%s' belong to the specified '%s'.

## DESCRIPTION

You receive this message if you execute an inter-clock skew report using `report_clock_timing` and none of the pins on the input pin list, either *from\_list* or *to\_list*, belong to the clock domains specified by *from\_clock\_list* or *to\_clock\_list* respectively. At least one pin in both *from\_list* and *to\_list* must be clocked by one of the specified clocks.

## WHAT NEXT

Reexecute the `report_clock_timing` command and ensure that all pins on the *from\_list* and *to\_list* are clocked by one of the clocks on the *from\_clock\_list* and *to\_clock\_list* respectively.

## SEE ALSO

`report_clock_timing` (2).

**UITE-410 (Warning)** Pins specified by the given '%s' that do not belong to the specified '%s' have been dropped from the current inter-clock skew report.

## DESCRIPTION

You receive this message if you execute an inter-clock skew report using `report_clock_timing` and some of the pins on the input pin list, either *from\_list* or *to\_list*, do not belong to any of the clock domains specified by *from\_clock\_list* or

*to\_clock\_list* respectively. All pins in the *from\_list* and *to\_list* should be clocked by one of the specified clocks. This message warns you that the offending pins are being omitted from the report.

## WHAT NEXT

If it is acceptable to you for these pins to be excluded from the report, no action on your part is required. Otherwise, investigate why these were included in the lists of input pins, and make corrections accordingly. Then reexecute the **report\_clock\_timing** command, and ensure that all pins on the *from\_list* and *to\_list* are clocked by one of the clocks on the *from\_clock\_list* and *to\_clock\_list* respectively.

## SEE ALSO

**report\_clock\_timing** (2).

# UITE-411 (Error) No clock pins of '%s' sequential devices found.

## DESCRIPTION

An inter-clock skew report requires a set of clock pins capable of launching data and a set of clock pins capable of capturing data. The combination of *from\_list*, *to\_list*, *from\_clock\_list* and *to\_clock\_list* values specified in the **report\_clock\_timing** command failed to produce these two sets of pins.

## WHAT NEXT

If you specify the *from\_list* value, ensure that it contains clock pins of launching sequential devices, either explicitly or in its transitive fanout. If you specify the *to\_list* value, ensure that it contains clock pins of capturing sequential devices, either explicitly or in its transitive fanout. If you specify *from\_clock\_list* or *to\_clock\_list*, ensure that the clocks have associated networks (that they are not virtual clocks).

## SEE ALSO

**report\_clock** (2), **report\_clock\_timing** (2).

# UITE-412 (Error) Pin '%s' is not the clock pin of a sequential

device.

## DESCRIPTION

You receive this message if you execute **report\_crpr** with an input pin (either *from\_pin* or *to\_pin*) that is not a sequential clock pin. Both the *from\_pin* and *to\_pin* must be sequential clock pins.

## WHAT NEXT

Reexecute the **report\_crpr** command and ensure that the *from\_pin* and *to\_pin* are sequential clock pins.

## SEE ALSO

**report\_crpr** (2), **timing\_remove\_clock\_reconvergence\_pessimism**. (3).

# UITE-413 (Warning) Searching unconstrained paths will take longer run-time than expected.

## DESCRIPTION

The tool will search for unconstrained paths when constrained paths can not be found, which will involve partial update timing, and takes longer time than searching constrained paths.

## WHAT NEXT

It is suggested that all paths in the design get constrained. The potential unconstrained paths may be caused by black boxes, no launching or capturing clocks, empty hierarchy, cells from IP instead of from library, etc. To check constraints in the design, please use the **check\_timing** command. Specifying the *to\_pin\_list* can also reduce the number of endpoints to search and speed up the report timing process.

## SEE ALSO

**check\_timing** (2), **timing\_report\_status\_level** (3), **report\_timing** (2),  
**report\_constraint** (2).

# **UITE-414 (Error) CRPR is currently switched off.**

## **DESCRIPTION**

This error message is being issued because the user has attempted to use some functionality related to Clock Reconvergence Pessimism Removal (CRPR) when it is not turned on (see the **report\_crpr** man page).

## **WHAT NEXT**

Set the variable, **timing\_remove\_clock\_reconvergence\_pessimism** to TRUE and carry out a full update\_timing in order to have CRPR included in the timing analysis.

## **SEE ALSO**

**report\_crpr** (2), **timing\_remove\_clock\_reconvergence\_pessimism** (3).

# **UITE-416 (Warning) There %s %d invalid %s.**

## **DESCRIPTION**

When report\_timing is specified with "\*" or a cell name, there is possibility that many invalid startpoints or endpoints are gotten, such as **-from [get\_pins FF/\*]** includes input, output and asynchronous pins. The current behavior for PrimeTime will consider these invalid startpoints or endpoints as through points and continues the path searching. Even though it is convenient to use, it is not suggested since it usually takes longer run time.

## **WHAT NEXT**

You can use filter to filter redundant or invalid objects, such as **-from [get\_pins "FF/\* -filter "is\_clock\_pin == true"]**. You also can use variable **timing\_report\_always\_use\_valid\_start\_end\_points** to report using valid startpoints and endpoints only.

## **SEE ALSO**

**report\_timing** (2), **timing\_report\_always\_use\_valid\_start\_end\_points** (3).

## **UITE-418 (Error) Could not find latch for pin '%s'.**

### **DESCRIPTION**

You receive this error message because the input clock pin (either *from\_pin* or *to\_pin*) you specified with the **report\_crpr** command does not correspond to a sequential device or constrained port. Both the *from\_pin* and *to\_pin* must be sequential clock pins or constrained ports.

### **WHAT NEXT**

Reexecute **report\_crpr** and ensure that the *from\_pin* and *to\_pin* are sequential clock pins or constrained ports.

### **SEE ALSO**

**report\_crpr** (2); **timing\_remove\_clock\_reconvergence\_pessimism** (3).

## **UITE-421 (warning) Using the %s option to specify both launching and capturing clocks has been discontinued and will not be supported in future releases.**

### **DESCRIPTION**

The command **report\_crpr** has been enhanced to account for cases where multiple clocks fan out to the clock pins of sequential devices. In order to account for this new behavior optional command arguments have been added to allow the user to specify the clocks incident on both the launching and capturing devices. See the man page for **report\_crpr** for more details.

### **WHAT NEXT**

After examining the man page repeat the command with the relevant arguments.

### **SEE ALSO**

## **UITE-422 (warning) -leaf cannot be specified for pins/ports.**

# Ignoring -leaf.

## DESCRIPTION

The all\_connected command allows -leaf option to be specified for net objects. You are seeing this message because you specified -leaf for pins/ports.

## WHAT NEXT

The command will proceed by ignoring the -leaf. So, you need not do anything.

# UITE-423 (error) path\_collection cannot be used with any other path search option.

## DESCRIPTION

The path\_collection is intended to be directly printed according to formatting options specified. No option that need path search, like -nworst, -from, -to etc. can be used with this option.

## WHAT NEXT

Try use only print formatting options with path\_collection.

# UITE-424 (error) Regular path-based analysis works only when design is in on\_chip\_variation mode.

## DESCRIPTION

Regular path-based analysis only recomputes paths when the analysis type of the design is set to *on\_chip\_variation*. When the analysis type is set to *single*, no recomputed paths are returned.

## WHAT NEXT

Use **set\_operating\_conditions** to set the design to the *on\_chip\_variation* analysis mode.

# UITE-425 (error) Cannot activate modes %s and %s on cell %s

as they are in the same mode group %s, no mode has been activated.

## DESCRIPTION

It is not possible to activate more than one cell mode in a cell mode group at any one time.

## WHAT NEXT

Select only one cell mode per cell mode group

**UITE-426 (error)** Cannot perform regular PBA on unconstrained paths.

## DESCRIPTION

Regular PBA only recomputes constrained paths and ignores unconstrained paths, regardless of the value of the variable timing\_report\_unconstrained\_paths. Also, the unconstrained paths will not be returned in the resulting collection.

## WHAT NEXT

Only perform path-based analysis on constrained paths.

**UITE-427 (warning)** Setting a %s derate on hierarchical net '%s', all other portions of this net will also use this derate factor.

## DESCRIPTION

This message is issued if the user has set a net-specific derate factor on a hierarchical portion of a global net. A global net is a net that spans a number of hierarchies.

Since PrimeTime will calculate only one delay for the entire global net the derate factor will be set for every net segment (hierarchical portion) in this global net.

## WHAT NEXT

No user action required.

## SEE ALSO

`set_timing_derate (2), report_timing_derate (2).`

## UITE-428 (warning) Maximum of %d paths can be recalculated together.

### DESCRIPTION

Regular path-based analysis is intended to remove pessimism from critical paths. Recalculating a huge number of paths can lead to significant runtime. If path-based analysis is performed on more paths than the limit, then only the worst paths up to the path limit will be recomputed and returned. This path limit does not include unconstrained paths that are skipped by regular path-based analysis.

### WHAT NEXT

Please perform path-based analysis on small paths sets below the path limit. Alternatively, the `pba_disable_path_recalculation_limit` variable can be used to disable the path limit; however, please note that the runtime can be significant when recalculating large numbers of paths.

## UITE-429 (warning) Timing path due to data-check constraint at pin '%s' is not recalculated.

### DESCRIPTION

The command `get_recalculated_timing_paths` does not support recalculation of paths due to data-check constraints. These paths are returned directly without recalculation.

## UITE-430 (warning) Variable

`timing_report_maxpaths_nworst_reached` is suggested to use with `timing_report_always_use_valid_start_end_points`.

### DESCRIPTION

Variable `timing_report_maxpaths_nworst_reached` message may count more endpoints and less max paths if invalid start/through/end points are specified.

## **UITE-432 (warning) The %s variable is obsolete as of the %s release.**

**Do not use this variable as it is no longer supported.**

### **DESCRIPTION**

You received this message because you have set the indicated variable to a value other than the default value of the variable.

As of the indicated release of PrimeTime, this variable is obsolete and will no longer be supported in this or subsequent releases. In the indicated release, PrimeTime will honor the setting of this variable and issue this warning message. In subsequent releases, the behavior with default value of this variable will be supported only, and the variable will be removed from PrimeTime.

### **WHAT NEXT**

Please remove the settings of this variable.

## **UITE-433 (warning) The %s option is obsolete as of the %s release.**

**Do not use this option as it is no longer supported.**

### **DESCRIPTION**

You received this message because you have used the indicated option of the command you are running.

As of the indicated release of PrimeTime, this option is obsolete and will no longer be supported in this or subsequent releases. In the indicated release, PrimeTime will honor the usage of this option and issue this warning message. In subsequent releases, the option will be removed from the command that you are running and you will receive an error message when you use the option.

### **WHAT NEXT**

Please do not use this obsolete option of the command that you are running.

## **UITE-434 (warning) The %s option is obsolete as of the %s release.**

# Do not use this option as it is no longer supported.

## DESCRIPTION

You received this message because you have used the indicated option of the report\_timing or get\_timing\_paths command.

As of the indicated release of PrimeTime, this option is obsolete and will no longer be supported in this or subsequent releases. In the indicated release, PrimeTime will honor the usage of this option and issue this warning message. In subsequent releases, the option will be removed from the command that you are running and you will receive an error message when you use the option.

This variable is obsolete and replaced with the usage of the variable timing\_enable\_preset\_clear\_arcs. By setting the value of this variable to the non-default value, you can obtain the same effect as with this obsoleted option. You will, however, incur the CPU cost of a full update when the value of the variable is changed. In order to minimize the CPU cost, please do not change the value of the variable frequently.

## WHAT NEXT

Please set timing\_enable\_preset\_clear\_arcs variable to true instead.

# UITE-435 (Information) %s

## DESCRIPTION

Display messages when variable **timing\_report\_maxpaths\_nworst\_reached** sets to TRUE.

## WHAT NEXT

## SEE ALSO

**UITE-436 (warning)** Resetting a %s derate on hierarchical net '%s', all other portions of this net will also use this derate factor.

## DESCRIPTION

This message is issued if the user has reset a net-specific derate factor on a hierarchical portion of a global net. A global net is a net that spans a number of hierarchies.

Since PrimeTime will calculate only one delay for the entire global net the derate factor will be reset for every net segment (hierarchical portion) in this global net.

## WHAT NEXT

No user action required.

## SEE ALSO

`reset_timing_derate` (2).

# **UITE-437** (warning) Implicitly setting the '%s' option for the `set_timing_derate` command.

## DESCRIPTION

This message is issued if the user has called the `set_timing_derate` command with an `object_list` and has not explicitly set one of the `net_delay`, `cell_delay` or `cell_check` options.

## WHAT NEXT

Explicitly specify one of the `net_delay`, `cell_delay` or `cell_check` options. The `net_delay` and `cell_delay` options may be specified together.

## SEE ALSO

`set_timing_derate` (2).

# **UITE-438** (error) Ambiguous command. One of the `net_delay`, `cell_delay` or `cell_check` options must be specified.

## DESCRIPTION

This message is issued if the user has called the `set_timing_derate` command with an `object_list` and has not explicitly set one of the `net_delay`, `cell_delay` or `cell_check` options and the `object_list` contains hierarchical cells.

## WHAT NEXT

Explicitly specify one of the `net_delay`, `cell_delay` or `cell_check` options. The

`net_delay` and `cell_delay` options may be specified together.

## SEE ALSO

`set_timing_derate` (2).

# UITE-445 (Information) %s

## DESCRIPTION

Display messages when variable `timing_report_maxpaths_nworst_reached` sets to TRUE.

## WHAT NEXT

## SEE ALSO

# UITE-446 (Warning) Enabling Clock Reconvergence Pessimism Removal (CRPR).

## DESCRIPTION

This message is being issued because the user has enabled the adaptive CRPR engine (turned on by setting `timing_crpr_enable_adaptive_engine` to TRUE) when CRPR is turned off. The adaptive engine will only function when CRPR is turned on, hence CRPR has been enabled automatically.

See the man page for `timing_crpr_enable_adaptive_engine` for more details.

## WHAT NEXT

Update scripts to set the variable `timing_remove_clock_reconvergence_pessimism` to TRUE.

## SEE ALSO

`timing_crpr_enable_adaptive_engine` (2), `timing_remove_clock_reconvergence_pessimism` (3).

# UITE-447 (Warning) Derate summary report may not match the

# output of report\_timing without timing derates applied.

## DESCRIPTION

This warning message is issued when the **report\_timing** command has been called with the '-derate' option when the design has derate and signal integrity data and signal integrity analysis is enabled.

The derate summary report may not match the output of report\_timing when there are no timing derates applied. Application of derates to aggressor nets will widen arrival windows thus making crosstalk interaction more likely. These additional crosstalk effects appear in the output of report\_timing with derates applied. A full analysis with no derating applied would be required to remove these additional crosstalk effects.

If CRPR is on, then the clock reconvergence pessimism (due to derating) in the derate summary report shows the amount of CRP removed due to the static effect of derating. It is not possible to remove the additional crosstalk effects arising from derating.

## WHAT NEXT

Reset the timing derates using the **reset\_timing\_derate** command and use report\_timing to determine the effect of removing timing derates.

## SEE ALSO

**report\_timing** (2), **reset\_timing\_derate** (2), **si\_enable\_analysis** (2),  
**timing\_remove\_clock\_reconvergence\_pessimism** (3).

# UITE-448 (Warning) Unrealistically large derate value specified: %g

## DESCRIPTION

This warning message is issued when the **set\_timing\_derate** command has been called with a derate value greater than 2.

A derate factor greater than 2.0 is unrealistically large. As a consequence, the values shown in the Derate Summary Report in the **report\_timing** output may not be accurate.

## WHAT NEXT

It is likely that the specified derate value is incorrect, because of a user input error. Please specify a more realistic derate factor within the range [0 to 2].

## SEE ALSO

`report_timing` (2), `set_timing_derate` (2).

# UITE-450 (Warning) Transferring ideal net attribute onto driver pin '%s' of net '%s'.

## DESCRIPTION

This warning message occurs when the `set_ideal_network` command is called with nets specified in the `object_list`.

If a net is ideal then all it's driver pins must be ideal. The ideal network attribute is transferred from the specified net to the global driver pins of that net.

## WHAT NEXT

No action is required.

## SEE ALSO

`set_ideal_network` (2).

# UITE-451 (Warning) Ignoring hierarchical pin '%s'. Object must be a port, net or pin of a leaf cell.

## DESCRIPTION

This warning message occurs when the `set_ideal_network` command is called with a hierarchical pin in the `object_list`. You cannot specify a hierarchical pin as an ideal network start point.

PrimeTime ignores the hierarchical pin specified in the warning message, but continues to set ideal networks on any remaining valid objects in the `object_list`.

## WHAT NEXT

Specify only ports, nets or pins of leaf cells in the `object_list`. A leaf cell is a cell that does not contain other cells.

## SEE ALSO

`set_ideal_network (2)`.

## **UITE-452** (Warning) Ignoring net '%s' because the 'no\_propagate' option is not specified.

### DESCRIPTION

This warning message occurs when the `set_ideal_network` command is called with nets specified in the `object_list` and the 'no\_propagate' option has not been specified.

### WHAT NEXT

To set a net ideal use the 'no\_propagate' option.

## SEE ALSO

`set_ideal_network (2)`.

## **UITE-453** (Warning) Overwritting previous ideal network that was set on pin '%s'.

### DESCRIPTION

This warning message occurs when the user sets an ideal network on a pin, which already has an ideal network set on it. The previous ideal network that was set on the pin is overwritten with this ideal network set on the pin.

### WHAT NEXT

No action is required.

## SEE ALSO

`set_ideal_network (2)`.

## **UITE-454** (Warning) Ignoring hierarchical pin '%s'. Object must

be a port or pin of a leaf cell.

## DESCRIPTION

This warning message occurs when the `set_ideal_latency` command or `set_ideal_transition` command is called with a hierarchical pin in the `object_list`. You cannot annotate ideal timing values on a hierarchical pin.

PrimeTime ignores the hierarchical pin specified in the warning message, but continues to set ideal values on any remaining valid objects in the `object_list`.

## WHAT NEXT

Specify only ports or pins of leaf cells in the `object_list`. A leaf cell is a cell that does not contain other cells.

## SEE ALSO

`set_ideal_network` (2), `set_ideal_latency` (2), `set_ideal_transition` (2).

# UITE-455 (Warning) Removing ideal attribute from driver pin '%s' of net '%s'.

## DESCRIPTION

This warning message occurs when the `remove_ideal_network` command is called with nets specified in the `object_list`.

If a net is ideal then all it's driver pins must be ideal. The ideal network attribute is transferred from the specified net to the global driver pins of that net.

## WHAT NEXT

No action is required.

## SEE ALSO

`remove_ideal_network` (2).

# UITE-456 (Warning) Ideal timing is specified on the non-ideal

**%S.**

## DESCRIPTION

This warning message occurs if the user has annotated ideal latency and/or ideal transition values on a pin or port that is not part of an ideal network. The annotated ideal timing values will only take effect if the object is part of an ideal network.

## WHAT NEXT

If you intend to apply the annotated ideal timing values, then set an ideal network on the pin or port using the `set_ideal_network` command.

If you do not intend to apply annotated ideal timing values on the object, then remove the annotated ideal timing values using the `remove_ideal_latency` command and/or the `remove_ideal_transition` command.

## SEE ALSO

`set_ideal_network` (2), `set_ideal_latency` (2), `set_ideal_transition` (2),  
`remove_ideal_latency` (2), `remove_ideal_transition` (2).

**UITE-457 (Error)** '%s' and '%s' are already defined as '%s' not allowing paths.

## DESCRIPTION

You receive this error message because the `-allow_paths` defined by asynchronous clock groups is conflict with false path set by either the asynchronous, physically exclusive or logically exclusive clock groups for the same clock pair.

## WHAT NEXT

Use the `report_clock` with `-groups` option to check what clock groups have been set. To remove the existing clock groups, use the `remove_clock_groups` command.

## SEE ALSO

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

## **UITE-458 (Error) '%s' and '%s' are already defined as -allow\_paths in asynchronous clock groups.**

### **DESCRIPTION**

You receive this error message because the clock pair is already defined as asynchronous clock relationships which allow paths between these two clocks.

### **WHAT NEXT**

Use the `report_clock` with `-groups` option to check what clock groups have been set. To remove the existing clock groups, use the `remove_clock_groups` command.

### **SEE ALSO**

`set_clock_groups` (2), `remove_clock_groups` (2), `report_clock` (2).

## **UITE-459 (Error) Reference pin '%s' is not reached by any clock.**

### **DESCRIPTION**

You receive this error message because the input or output delay you defined on a pin or port with respect to a reference pin, which is not a fanout of any clock network. In case of no clock propagates to reference pin, the defined input/output delay will be ignored.

### **WHAT NEXT**

It is suggested that reference pin for input/output delay constraints should be in the fanout of clock network. Please verify the connection of reference pin and modified the reference pin if needed.

### **SEE ALSO**

`set_input_delay` (2), `remove_input_delay` (2), `set_output_delay` (2),  
`remove_output_delay` (2).

## **UITE-460 (Warning) Overwriting previously defined AOCVM**

**value: %s.**

## **DESCRIPTION**

You received this warning message because the AOCVM value you have specified has overwritten a previously defined AOCVM value of the same type.

## **WHAT NEXT**

No action is required. Use the **report\_aocvm** command to show the AOCVM components and coefficients that been defined.

## **SEE ALSO**

**set\_aocvm\_derate\_component** (2), **set\_aocvm\_derate\_coefficient** (2), **report\_aocvm** (2).

# **UITE-461 (Error) Generated clock '%s' '%s' is not satisfiable%**

## **DESCRIPTION**

This is an error message whenever the clock network traverse can not find a path which satisfies the sense relationship defined by `create_generated_clock` command.

## **WHAT NEXT**

Check for the generated clock definition to see if the generated clock is correctly defined. One example is that a divided\_by 2 generated clock is driven by a inverter only. In this case, generated clock should be redefined with -invert with -divided\_by 1. Another example is a divided\_by 2 generated clock with preinverting. If master clock source pin is used as generated clock source pin, PrimeTime will issue the warning message. In this case, generated clock source pin should be redefined to clock pin of divider.

# **UITE-462 (Error) No constant bounding derates have been defined.**

## **DESCRIPTION**

You have received this message because you have attempted to perform a path-based AOCVM analysis using either the **report\_timing** command or the **get\_timing\_paths** command, but no constant timing derates have been defined.

Constant derates are required to pessimistically bound derates calculated during a

path-based AOCVM analysis. PrimeTime aborted the AOCVM analysis, because there are no constant derates and so there is no OCV pessimism for AOCVM to remove.

## WHAT NEXT

Define constant bounding derates using the **set\_timing\_derate** command. Alternatively, consider using the graph-based AOCVM analysis, which automatically determines tight non-optimistic bounding derates for the path-based AOCVM analysis.

timing_aocvm_enable_analysis (3).
```

**UITE-463 (Error)** No AOCVM derate factors or AOCVM derate components have been defined. PrimeTime cannot continue with AOCVM analysis.

## DESCRIPTION

You have received this message because you have attempted to perform an AOCVM analysis, but no AOCVM derate factors or AOCVM derate components have been defined. An AOCVM analysis requires either AOCVM derate factors or AOCVM derate components.

AOCVM derate factors are specified using the **read\_aocvm** command.

AOCVM derate components are specified using the **set\_aocvm\_derate\_component** command. AOCVM derate components are used to calculate AOCVM derate factors.

## WHAT NEXT

Either define AOCVM derate factors using the **read\_aocvm** command; or define AOCVM derate components using the **set\_aocvm\_derate\_component** command.

## SEE ALSO

```
set_aocvm_derate_component (2), read_aocvm (2), report_aocvm (2).
```

**UITE-464 (Warning)** No coordinates have been defined;

# AOCVM analysis may be inaccurate.

## DESCRIPTION

You have received this message because you have attempted to perform an AOCVM analysis using either the **report\_timing** command or the **get\_timing\_paths** command, but no coordinates have been defined.

Coordinates are used to calculate systematic AOCVM derate components. The coordinates of various nodes of nets, pins, and ports are imported into PrimeTime from a parasitic file using the **read\_parasitics** command.

PrimeTime will continue with the AOCVM analysis and will set the systematic AOCVM derate components to zero.

## WHAT NEXT

Set the **read\_parasitics\_load\_locations** variable to **true** and read parasitics using the **read\_parasitics** command.

## SEE ALSO

**report\_timing** (2), **get\_timing\_paths** (2), **read\_parasitics** (2),  
**read\_parasitics\_load\_locations** (3).

# UITE-465 (Warning) No clock paths found. AOCVM requires a 'full\_clock\_expanded' path for an accurate analysis.

## DESCRIPTION

You have received this message because you have attempted to perform an AOCVM analysis on a path, but the clock path has not been included.

PrimeTime will continue with the AOCVM analysis, however the analysis may be inaccurate due to the lack of information.

## WHAT NEXT

Use the **get\_timing\_paths** command with the **-path\_type** option to obtain a path with it's associated clock path.

## SEE ALSO

**get\_timing\_paths** (2), **report\_timing** (2).

## **UITE-466** (Warning) Ignoring hierarchical cell '%s'. Object must be a leaf cell or a library cell.

### **DESCRIPTION**

This warning message occurs when the `set_aocvm_derate_coefficient` command is called with a hierarchical cell in the `object_list`. You cannot annotate AOCVM derate coefficients on a hierarchical cell.

PrimeTime ignores the hierarchical cell specified in the warning message, but continues to set AOCVM derate coefficient values on any remaining valid objects in the `object_list`.

### **WHAT NEXT**

Specify only leaf cells or library cells in the `object_list`. A leaf cell is a cell that does not contain other cells.

### **SEE ALSO**

`set_aocvm_derate_coefficient` (2), `report_aocvm` (2).

## **UITE-467** (Error) AOCVM and Variation-Aware analyses are mutually exclusive; PrimeTime will disable the AOCVM analysis.

### **DESCRIPTION**

You have received this message because you have attempted to perform an AOCVM analysis and a Variation-Aware analysis together. The analyses cannot be performed together.

### **WHAT NEXT**

If you intend to perform a Variation-Aware analysis only, then no action is required.

If you intend to perform an AOCVM analysis, then you must disable Variation-Aware analysis, which is controlled using the PrimeTime variable `variation_enable_analysis`.

### **SEE ALSO**

`get_timing_paths` (2), `report_timing` (2), `variation_enable_analysis` (3).

## **UITE-468 (Information) The CRP value reported by report\_timing and report\_clock\_timing will be %s.**

### **DESCRIPTION**

You are receiving this message because the report\_crpr command has detected that its corresponding report\_timing (or report\_clock\_timing) command is using a smaller CRP value. The report\_crpr command reports the exact CRP value whereas report\_timing (and report\_clock\_timing) use values calculated considering the CRPR threshold. This difference is a product of performance optimizations that are outlined in the next paragraph.

In order to prevent performance degradation during update\_timing, CRPR groups sequential devices with similar CRP values (i.e. the difference between the CRP values is within the value of the crpr threshold). This can lead to some paths using a CRP value that will be smaller than the exact CRP. The difference between the two will be bounded by the value of the CRPR threshold.

### **WHAT NEXT**

In order to align the CRP values used by report\_timing, report\_clock\_timing and report\_crpr the crpr threshold may be set to a smaller value. It should be noted that this can cause significant performance degradation during subsequent timing updates.

### **SEE ALSO**

`timing_crpr_threshold_ps (3)`,

## **UITE-469 (error) Unable to set %s on '%s'.**

### **DESCRIPTION**

Failed to execute the given set operation on the specified object.

### **WHAT NEXT**

## **UITE-470 (Warning) Ignoring systematic AOCVM coefficients in**

the derate table based flow.

## DESCRIPTION

You have received this message because systematic AOCVM coefficients have been defined in a derate table based AOCVM flow.

Systematic AOCVM coefficients, specified using the **set\_aocvm\_ceoefficient -systematic** command, are used only in the component based AOCVM flow; they will be ignored by PrimeTime in the derate table based flow.

## WHAT NEXT

No action is required.

## SEE ALSO

`read_aocvm (2)`, `set_aocvm_coefficient (2)`.

**UITE-471** (Warning) Ignoring AOCVM components in the derate table based flow.

## DESCRIPTION

You have received this message because AOCVM components have been defined in a derate table based AOCVM flow.

AOCVM components, specified using the **set\_aocvm\_component** command, are used only in the component based AOCVM flow; they will be ignored by PrimeTime in the derate table based flow.

## WHAT NEXT

No action is required.

## SEE ALSO

`read_aocvm (2)`, `set_aocvm_component (2)`.

**UITE-472** (Error) You cannot specify the `-aocvm_guardband` option of `set_timing_derate` in the `derate_list` of the

`timing_aocvm_derate_list` variable.

## DESCRIPTION

You have received this message because you have attempted set guardband derate factors using the `-aocvm_guardband` option of the `set_timing_derate` command in the `derate_list` of the `timing_aocvm_derate_list` variable.

## WHAT NEXT

Remove the `-aocvm_guardband` option.

## SEE ALSO

`set_timing_derate` (2), `timing_aocvm_derate_list` (3).

**UITE-473** (Error) You cannot specify the `-aocvm_guardband` option of `set_timing_derate` in the `derate_list` of the `get_recalculated_timing_paths` command.

## DESCRIPTION

You have received this message because you have attempted set guardband derate factors using the `-aocvm_guardband` option of the `set_timing_derate` command in the `derate_list` of the `get_recalculated_timing_paths` command.

## WHAT NEXT

Remove the `-aocvm_guardband` option.

## SEE ALSO

`set_timing_derate` (2), `get_recalculated_timing_paths` (2).

**UITE-474** (Warning) The option '`%s`' is now the default and will be removed from the UI in a later release. You can use '`%s`' to

get the old default behavior.

## DESCRIPTION

You have received this message because you have issued an option that is now the default option on the command and will be removed from the UI in a later release.

## WHAT NEXT

Remove the option for future.

## SEE ALSO

**UITE-475** (Warning) Usage of the `timing_aocvm_derate_list` variable is deprecated and will be obsoleted in the 2008.12 release of PrimeTime. Use '`set_timing_derate -aocvm_guardband`' instead.

## DESCRIPTION

You have received this message because you have attempted set AOCVM guard-band derate components using the `timing_aocvm_derate_list` variable. This variable has been deprecated, and it will be obsoleted entirely in the 2008.12 release of PrimeTime.

## WHAT NEXT

Use the `-aocvm_guardband` option on the `set_timing_derate` command to specify AOCVM guard-band derates instead. This option is only applicable in an AOCVM context. In a AOCVM context the derate factor that is applied to an arc is a product of the guard-band derate factor and the AOCVM derate factor.

## SEE ALSO

`set_timing_derate` (2).

**UITE-476** (Error) Graph-based AOCVM analysis must be

performed in 'on\_chip\_variation' mode.

## DESCRIPTION

You have received this message because you have attempted to perform graph-based AOCVM analysis in the 'single' or 'bc\_wc' analysis mode, which is not supported.

## WHAT NEXT

Use the `set_operating_conditions` command to set the design into 'on\_chip\_variation' mode.

## SEE ALSO

`report_design` (2), `set_operating_conditions` (2), `timing_aocvm_enable_analysis` (3).

**UITE-477 (Error)** Graph-based delay-weighted AOCVM analysis cannot be performed in worst\_arrival mode.

## DESCRIPTION

You have received this message because you have attempted to perform graph-based AOCVM analysis in the delay-weighted analysis mode, but the design is in worst\_arrival mode.

## WHAT NEXT

Set the `timing_slew_propagation_mode` variable to "worst\_slew" and set the `si_xtalk_delay_analysis_mode` variable to "all\_paths" if you want to perform graph-based AOCVM analysis in the delay-weighted analysis mode.

## SEE ALSO

`si_xtalk_delay_analysis_mode` (3), `timing_slew_propagation_mode` (3), `timing_aocvm_analysis_mode` (3), `timing_aocvm_enable_analysis` (3).

**UITE-478 (Error)** Graph-based delay-weighted AOCVM analysis cannot be used when the `si_use_driving_cell_derate_for_delta_delay` variable is set to

true.

## DESCRIPTION

You have received this message because you have attempted to perform graph-based AOCVM analysis in the delay-weighted analysis mode, but the **si\_use\_driving\_cell\_derate\_for\_delta\_delay** variable is set to true.

## WHAT NEXT

Set the **si\_use\_driving\_cell\_derate\_for\_delta\_delay** variable to *false* if you want to perform graph-based AOCVM analysis in the delay-weighted analysis mode. Otherwise, if you need to use the **si\_use\_driving\_cell\_derate\_for\_delta\_delay** variable, turn off graph-based AOCVM using the **timing\_aocvm\_enable\_analysis** variable.

## SEE ALSO

**si\_use\_driving\_cell\_derate\_for\_delta\_delay** (3), **timing\_aocvm\_analysis\_mode** (3),  
**timing\_aocvm\_enable\_analysis** (3).

**UITE-479** (Warning) Exhaustive path-based analysis may take a long time using the current PrimeTime settings. Try using the following settings, which may reduce the runtime of the analysis: %s

## DESCRIPTION

You have received this message because you have attempted to perform an exhaustive path-based analysis using settings that may considerably degrade the runtime of the analysis.

## WHAT NEXT

The warning message suggests settings that should be changed to improve the runtime of the analysis.

## SEE ALSO

**report\_timing** (2),  
**get\_timing\_paths** (2),  
**pba\_aocvm\_only\_mode** (3),  
**timing\_aocvm\_analysis\_mode** (3),  
**timing\_aocvm\_enable\_analysis** (3),  
**timing\_remove\_clock\_reconvergence\_pessimism** (3),

```
timing_report_use_worst_parallel_cell_arc (3).
```

**UITE-480** (Warning) The exhaustive path-based recalculation limit of %d has been exceeded at endpoint '%s' and group '%s'. The worst PBA slack found at this endpoint was %g. It is known that no PBA paths with slack worse than %g exist at this endpoint for this group.

## DESCRIPTION

You have received this message because the user specified path-based endpoint recalculation limit has been met during an exhaustive search for worst paths at this endpoint. This message gives details on the endpoint that has not been exhaustively searched.

## WHAT NEXT

Exhaustive path recalculation is a last mile analysis technique and as a result it should only be used when the design is close to signoff. Try to recalculate the endpoint using conservative values for slack\_lesser\_than, nworst and max\_paths.

Increasing the user specified path-based endpoint recalculation limit may allow the endpoint to be exhaustively searched, however this will increase the runtime of the analysis.

## SEE ALSO

```
report_timing (2),
get_timing_paths (2),
pba_exhaustive_endpoint_path_limit (3),
timing_aocvm_analysis_mode (3).
```

**UITE-481** (Warning) Usage of the 'set\_aocvm\_component' command is deprecated and will be obsoleted in the 2008.12 release of PrimeTime. Use the 'read\_aocvm' command instead.

## DESCRIPTION

You have received this message because you have attempted to set random or systematic AOCVM components using the **set\_aocvm\_component** command. The component-based AOCVM flow has been deprecated, and it will be obsoleted entirely in the 2008.12 release of PrimeTime.

## WHAT NEXT

Use the `read_aocvm` command to specify AOCVM derates instead.

## SEE ALSO

`set_aocvm_component` (2), `read_aocvm` (2).

**UITE-482 (Error)** Cannot specify a value for nworst (%d) greater than the exhaustive path-based recalculation limit (%d). Setting nworst to %d.

## DESCRIPTION

You have received this message during a exhaustive path-based recalculation. An exhaustive path-based limit applies during this analysis and the user specified nworst value cannot exceed this limit.

## WHAT NEXT

Set a conservative value for nworst. If necessary increase the path-based endpoint recalculation limit, however this will increase the runtime of the analysis.

## SEE ALSO

`report_timing` (2),  
`get_timing_paths` (2),  
`pba_exhaustive_endpoint_path_limit` (3),  
`timing_aocvm_analysis_mode` (3).

**UITE-483 (Error)** Usage of the 'delay\_based\_random\_variation\_model' analysis mode has been obsoleted.

## DESCRIPTION

You have received this message because you have attempted to perform the 'delay\_based\_random\_variation\_model' AOCVM analysis mode. This AOCVM analysis mode was obsoleted 2008.06 release of PrimeTime.

## WHAT NEXT

There is no action that can be taken to perform this type of analysis.

## SEE ALSO

`timing_aocvm_analysis_mode` (3).

## UITE-484 (warning) Timing path with -true is not recalculated.

### DESCRIPTION

The command `get_recalculated_timing_paths` does not support recalculation of paths from -true option. Also these paths are not returned as part of the resulting collection.

## UITE-485 (Error) Setting input delay on a clock port (%s) that does not fanout to any data sink.

### DESCRIPTION

A `set_input_delay` was set on this clock input port. However, this input port has no data sinks, so the input delay has no effect. To specify clock latency instead of data input delays, the `set_clock_latency` command should be used.

Note that simultaneous clock/data timing is not supported. A data input delay set on a clock port is ignored.

## WHAT NEXT

Be sure to use `set_clock_latency` with the -source option to specifically set clock latency. If a data sink is expected in the fanout of this input port, check the design.

## SEE ALSO

`remove_clock_latency` (2), `set_clock_latency` (2).

## UITE-486 (Error) Cannot specify a value for the pba\_derate\_list

variable in an AOCVM context.

## DESCRIPTION

You have received this message because you attempted to perform a path-based AOCVM analysis and you specified a value for the **pba\_derate\_list** variable.

## WHAT NEXT

To perform a path-based AOCVM analysis, set the **pba\_derate\_list** variable to "". Otherwise, to use the derates specified in the **pba\_derate\_list** variable, you must remove all AOCVM information using the **remove\_aocvm** command.

## SEE ALSO

**get\_timing\_paths** (2), **report\_timing** (2), **remove\_aocvm** (2), **pba\_derate\_list** (3).

**UI-TE-487** (Warning) AOCVM path-based analysis can take a long time if path-specific slew propagation is also performed.

## DESCRIPTION

The **-pba\_mode** option on **report\_timing** (and **get\_timing\_paths**) instructs PrimeTime to perform both AOCVM PBA and regular PBA (path-specific slew propagation). The analysis runtime is significantly improved if only AOCVM path-based analysis is performed.

This message is only displayed once per session.

## WHAT NEXT

If you intended to perform AOCVM and regular path-based analyses, then no action is required.

If you intended to perform only AOCVM path-based analysis, then set the **pba\_aocvm\_only\_mode** variable to true.

## SEE ALSO

**report\_timing** (2),  
**get\_timing\_paths** (2),  
**pba\_aocvm\_only\_mode** (3),

# **UITE-488** (warning) Setting input delay on clock port ('%s') that has data sink(s). The behavior will change in future releases.

## **DESCRIPTION**

The setting of an input delay on a clock port that has data sink(s) is also interpreted as clock source latency. However, this feature will not be supported in future releases.

## **WHAT NEXT**

Use the `set_clock_latency` command with the `-source` option to specifically set clock source latency.

## **SEE ALSO**

`remove_clock_latency` (2), `set_clock_latency` (2).

## **UIV**

**UIV-1** (error) Specify one of the following: -list, -resize, -scroll, -enter,  
-motion, -button, -key.

### **DESCRIPTION**

### **WHAT NEXT**

**UIV-2** (error) If -scroll is specified, -value must also be specified.

### **DESCRIPTION**

### **WHAT NEXT**

**UIV-3** (error) If -list, -resize and -scroll are not specified, -type

must be specified.

**DESCRIPTION**

**WHAT NEXT**

**UIV-4** (error) '%s' is not a valid selection for '%s'.

**DESCRIPTION**

**WHAT NEXT**

**UIV-5** (error) View object '%s' does not exist.

**DESCRIPTION**

**WHAT NEXT**

**UIV-6** (error) If -resize is not specified, widget\_name must be specified.

**DESCRIPTION**

**WHAT NEXT**

**UIV-7** (error) If resize is specified, the width and height must be

specified.

**DESCRIPTION**

**WHAT NEXT**

**UIV-8** (error) If -list is specified, -value must also be specified.

**DESCRIPTION**

**WHAT NEXT**

**UIV-9** (error) Window number '%d' does not exist.

**DESCRIPTION**

**WHAT NEXT**

**UIV-10** (error) One of the -settings, -value arguments must be used.

**DESCRIPTION**

**WHAT NEXT**

**UIV-11** (error) Parameters to the -settings argument must be strings.

**DESCRIPTION**

**WHAT NEXT**

## **UPF**

**UPF-001 (error)** The %s command is not supported in non-UPF mode.

### **DESCRIPTION**

This error message occurs when the specified command is supported only in UPF mode.

### **WHAT NEXT**

Either start the tool in UPF mode or remove the unsupported command.

**UPF-002 (error)** The %s command is not supported in UPF mode.

### **DESCRIPTION**

This error message occurs when the specified command is supported only in non-UPF mode.

### **WHAT NEXT**

Either start the tool in non-UPF mode or remove the unsupported command.

**UPF-003 (error)** The %s option is not supported in non-UPF mode.

### **DESCRIPTION**

This error message occurs when the specified option is supported only in UPF mode.

### **WHAT NEXT**

Either start the tool in UPF mode or remove the unsupported option.

## **UPF-004 (error) The %s option is not supported in UPF mode.**

### **DESCRIPTION**

This error message occurs when the specified option is supported only in non-UPF mode.

### **WHAT NEXT**

Either start the tool in non-UPF mode or remove the unsupported option.

## **UPF-005 (error) %s %s already exists.**

### **DESCRIPTION**

This error message occurs when the specified power domain already exists. Either the power domain name is already being used or you are trying to create a design-level power domain that covers the design top and one already exists.

### **WHAT NEXT**

Specify a unique name for the power domain you are creating.

## **UPF-006 (error) Supply net %s already exists.**

### **DESCRIPTION**

This error message occurs when the specified supply net already exists. Supply net names must be unique.

### **WHAT NEXT**

Specify a unique name for the supply net. Use the `get_supply_nets` command with the `-hierarchical` option to see all supply nets that have been defined.

### **SEE ALSO**

`get_supply_nets(2)`

## **UPF-007 (error) Supply port %s already exists.**

### **DESCRIPTION**

This error message occurs when the specified supply port already exists. Supply port names must be unique.

### **WHAT NEXT**

Specify a unique name for the supply port. Use the **get\_supply\_ports** command with the **-hierarchical** option to see all supply ports that have been defined.

### **SEE ALSO**

`get_supply_ports(2)`

## **UPF-008 (error) Design element %s does not reside beneath the scope instance %s.**

### **DESCRIPTION**

This error message occurs when a design element specified in the element list of the power domain does not reside beneath the scope of the power domain.

### **WHAT NEXT**

Make sure that all design elements specified in the **-elements** list are within the current scope or within the scope of the **-scope** instance, if specified.

### **SEE ALSO**

`create_power_domain(2)`

## **UPF-009 (error) Power domain %s does not exist.**

### **DESCRIPTION**

This error message occurs when the specified power domain does not exist.

### **WHAT NEXT**

Make sure that the power domain has been specified in the current scope and rerun

the command.

## **UPF-010 (error) Supply net %s does not exist.**

### **DESCRIPTION**

This error message occurs when the specified supply net does not exist.

### **WHAT NEXT**

Specify the supply net in the current scope.

## **UPF-011 (error) Supply port %s does not exist.**

### **DESCRIPTION**

This error message occurs when the specified supply port does not exist.

### **WHAT NEXT**

Specify the supply port with respect to the current scope.

## **UPF-012 (error) A leaf cell instance %s has been specified as the scope.**

### **DESCRIPTION**

This error message occurs when the specified leaf cell instance is named as the scope.

A leaf cell instance cannot be specified as the scope of any objects or as the current scope. Only a hierarchical instance can be specified as the scope.

### **WHAT NEXT**

Make sure that the specified scope is not a leaf instance and rerun the command.

## **UPF-013 (error) Supply net %s is already connected to supply**

port %s.

## DESCRIPTION

This error message occurs when a connection from the specified supply net to the specified supply port already exists. The supply net cannot be connected to the supply port more than once.

## WHAT NEXT

Review your script for the **connect\_supply\_net** command and make sure that the specified supply net and ports are named correctly in the current scope.

Use the **save\_upf** command to check existing connections.

## SEE ALSO

`connect_supply_net(2)`  
`save_upf(2)`

**UPF-014 (error) Inside/outside connection of supply port %s is already established to supply net %s.**

## DESCRIPTION

This error message occurs when the specified supply port already has inside/outside connections to the specified supply net.

A supply port can be connected by only one supply net on each side (inside/outside).

## WHAT NEXT

Use the **save\_upf** command to check existing connections.

## SEE ALSO

`save_upf(2)`

**UPF-015 (error) Invalid connection from supply net %s to supply**

port %s.

## DESCRIPTION

This error message occurs when attempting to make a connection from a supply net that is below the scope of the supply port. A supply port can be connected only by a supply net that is at or above the scope of the supply port.

## WHAT NEXT

Specify a supply net that is at or above the scope of the supply port. Use the **save\_upf** command to check existing connections.

## SEE ALSO

`save_upf(2)`

**UPF-016 (warning) Supply net %s is being replaced by %s as a %s connection for power domain %s.**

## DESCRIPTION

This warning message occurs when the primary power and ground nets of the power domain are already defined. This command supersedes the previous connections.

## WHAT NEXT

This is only a warning message. No action is required.

## SEE ALSO

`set_domain_supply_net(2)`

**UPF-017 (warning) Attempting to read a UPF mode specific constraint '%s' in non-UPF mode. The constraint will be lost.**

## DESCRIPTION

This warning message occurs when attempting to read a .ddc file containing UPF mode specific constraints from a Design Compiler or IC Compiler shell running in non-UPF mode. The UPF mode specific constraints are not preserved in non-UPF mode and will be lost.

## WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, you can either reapply the lost constraints using the equivalent non-UPF commands or start the shell in UPF mode and run the UPF commands again.

## **UPF-018 (warning) Attempting to read a non-UPF mode specific constraint '%s' in UPF mode. The constraint will be lost.**

### DESCRIPTION

This warning message occurs when you are attempting to read a .ddc file containing non-UPF mode specific constraints from a Design Compiler or IC Compiler shell running in UPF mode. The non-UPF mode specific constraints cannot be preserved in UPF mode and will be lost.

### WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, you can either reapply the lost constraints using the equivalent UPF commands or start the shell in non-UPF mode and run the non-UPF commands again.

## **UPF-019 (error) At least one of the options %s or %s must be specified.**

### DESCRIPTION

This error message occurs when no options are specified. The tool requires that at least one of the two options shown in the message be specified.

### WHAT NEXT

Use one or both of the options and rerun the command.

## **UPF-020 (error) Supply net %s is already created for power**

domain %s.

## DESCRIPTION

This error message occurs when the specified supply net already exists and is associated with the given power domain.

## WHAT NEXT

Specify a different power domain and rerun the command.

**UPF-021 (error)** Supply port %s cannot be created at the logical instance %s.

## DESCRIPTION

This error message occurs when a hierarchical name is specified as a supply port, but the logical instance path is invalid for the scope instance.

A scope instance must already exist and cannot be a leaf cell.

## WHAT NEXT

Use the `get_cells` command to verify that the scope instance exists. Make sure that the scope instance is not a leaf cell.

## SEE ALSO

`get_cells(2)`

**UPF-022 (error)** Hierarchical name %s cannot be specified for `create_supply_port` command when `-domain` is specified.

## DESCRIPTION

This error message occurs when running the `create_supply_port` command with the `-domain` option specified. Because `create_supply_port` creates the supply port in the scope of the power domain, a hierarchical name cannot be specified for the supply port.

## WHAT NEXT

Specify a simple name for the supply port if you run **create\_supply\_port** with the **-domain** option. Specify a hierarchical name for the supply port if you run **create\_supply\_port** without the **-domain** option.

See the **create\_supply\_port** man page for complete syntax information.

## SEE ALSO

**create\_supply\_port(2)**

# UPF-023 (error) Strategy %s already exists on power domain %S.

## DESCRIPTION

This error message occurs when attempting to define a specified strategy that already exists.

## WHAT NEXT

Use a unique strategy name and rerun the command.

# UPF-024 (error) The UPF value conversion table '%s' already exists.

## DESCRIPTION

This error message occurs when the specified value conversion table you are trying to define already exists.

## WHAT NEXT

Specify a unique name for the value conversion table you are defining and rerun the command.

# UPF-025 (error) The UPF value conversion table '%s' cannot be

found.

## DESCRIPTION

This error message occurs when the specified value conversion table does not exist.

## WHAT NEXT

Create the required value conversion table using the `create_hdl2upf_vct` or `create_upf2hdl_vct` command.

## SEE ALSO

`create_hdl2upf_vct(2)`  
`create_upf2hdl_vct(2)`

# UPF-026 (error) Strategy %s does not exist on power domain %S.

## DESCRIPTION

This error message occurs when using the `set_retention_control` command to specify a retention strategy that has not been defined for the given power domain.

## WHAT NEXT

Check that the retention strategy name is correct and that `set_retention` has been defined for the specified retention strategy and the specified power domain.

## SEE ALSO

`set_retention(2)`  
`set_retention_control(2)`

# UPF-027 (error) Options %s and %s are mutually exclusive.

## DESCRIPTION

This error message occurs when attempting to use two command options that cannot be used together.

## WHAT NEXT

The specified options are mutually exclusive and cannot be used together. Use only one of the options and rerun the command.

# UPF-028 (error) Bind checker has already been defined on %s.

## DESCRIPTION

This error message occurs when attempting to bind a checker to a cell that already has the checker defined.

## WHAT NEXT

Remove the existing checker on the cell and then bind a new checker on the cell.

# UPF-029 (error) The top-level design instance has been defined.

## DESCRIPTION

This error message occurs when setting the top-level design instance on a design that already has a top-level design instance defined.

## WHAT NEXT

Make sure that the `set_design_top` command is run only once for the design.

## SEE ALSO

`set_design_top(2)`

# UPF-030 (error) The connection is abandoned because it invalidates the power state table.

## DESCRIPTION

This error message occurs when attempting to connect a supply net or port to another supply net or port when the power state table does not allow the connection. The connection operation is abandoned because it would invalidate the power state table.

## WHAT NEXT

Remove the power state table and rerun the command.

# UPF-031 (error) Port state format is not acceptable: %s.

## DESCRIPTION

This error message occurs when the supply port state specified in the `add_port_state` command does not follow the UPF standard:

```
add_port_state port_name
-state {name <nom | <min nom max> | off> }
```

## WHAT NEXT

Use the syntax shown above and rerun the command.

## SEE ALSO

`add_port_state(2)`

# UPF-032 (error) Port state '%s' has been defined.

## DESCRIPTION

This error message occurs when the specified input port state name was previously defined. The input port state name has already been used on the port.

## WHAT NEXT

Specify a unique name for the port state and rerun the command.

# UPF-033 (error) Same or connected supply net or port of '%s' is already in the supply list.

## DESCRIPTION

This error message occurs when the specified supply net or port either already exists in the power state table supply list, or is connected to another port or net in the supply list.

A supply net or port can appear only once in the supply list of the power state table. If a port or net is connected to another port or net, they cannot be in the supply list simultaneously.

## WHAT NEXT

The supply list keeps only one supply net or port for each supply net or port group. Remove the redundant supply net or port from the supply list.

# UPF-034 (error) Can not find power state table '%s'.

## DESCRIPTION

This error message occurs when the specified power state table name in the command does not match the previously defined name of the power state table.

## WHAT NEXT

Use the previously defined name of the power state table and rerun the command.

# UPF-035 (error) Cannot find port state '%s'.

## DESCRIPTION

This error message occurs when the tool cannot find the specified port state.

In each power state table, each supply net or port can accept only a state that has been defined on a connected port or itself.

## WHAT NEXT

Use the **write\_script** or **save\_upf** command to view the states that have been defined for a supply port. Specify a defined port state name and rerun the command.

## SEE ALSO

`save_upf(2)`  
`write_script(2)`

# UPF-036 (error) The connection is abandoned because it

causes conflicting port states.

## DESCRIPTION

This error message occurs when attempting to connect two ports that have the same state name but have different contents.

## WHAT NEXT

Remove the conflicting port states and rerun the command.

# UPF-037 (error) Level shifter strategy '%s' has been defined.

## DESCRIPTION

This error message occurs when attempting to define a level shifter strategy that is already defined. A level shifter strategy can be defined only once.

## WHAT NEXT

Make sure that level shifter strategies are defined only once on a domain. Use the `save_upf` command to view the defined level shifter strategies.

## SEE ALSO

`save_upf(2)`

# UPF-038 (error) A level shifter strategy has been defined on '%S'.

## DESCRIPTION

This error message occurs when a level shifter strategy is already defined on the specified design element. A design element can have only one level shifter strategy.

## WHAT NEXT

Make sure that level shifter strategies are defined only once on an element.

## **UPF-039** (error) Power switch %s already exists.

### **DESCRIPTION**

This error message occurs when a power switch with the specified name already exists and cannot be created again.

### **WHAT NEXT**

Use a unique name for the new power switch and rerun the command.

## **UPF-040** (information) Setting upf\_version outside of a UPF file has no effect.

### **DESCRIPTION**

This information message occurs when the **upf\_version** variable is set outside of the context of a UPF file. In this situation, changing the **upf\_version** variable has no effect.

### **WHAT NEXT**

This is only an information message. No action is required.

### **SEE ALSO**

`upf_version(3)`

## **UPF-041** (warning) The UPF version in file %s does not match the version you requested from load\_upf (%s). Some constraints and options may not function.

### **DESCRIPTION**

This warning message occurs when you specify with the **load\_upf -version** command a UPF version that is different from that specified with the **upf\_version** command in the UPF file.

### **WHAT NEXT**

Ensure that the commands in your UPF file conform to the UPF version you specified

with the **load\_upf** command.

However, if the result is not what you intended, specify the correct UPF version and rerun the **load\_upf** command.

## SEE ALSO

`load_upf(2)`

# UPF-042 (warning) The UPF command '%s' is not supported by %S.

## DESCRIPTION

This warning message occurs when the current application does not support the specified UPF command, so the command is ignored. Some applications do not support all of the UPF commands.

Each instance of an ignored UPF command generates one UPF-042 warning message. Then, after the **load\_upf** command completes, a UPF-043 summary message informs you of how many of each type of UPF command was ignored.

## WHAT NEXT

If the result is not what you intended, check the UPF file for unsupported commands.

For a complete list of supported commands, see the **load\_upf** command man page.

## SEE ALSO

`load_upf(2)`

# UPF-043 (information) Ignored %d unsupported '%s' command %S.

## DESCRIPTION

This is a summary message indicating how many instances of a particular UPF command were ignored by the **load\_upf** command because the command is not supported.

## WHAT NEXT

This is only an information message. No action is required.

## **SEE ALSO**

`load_upf(2)`

**UPF-044 (error) Errors reading UPF file: %s. Use error\_info for more information.**

## **DESCRIPTION**

This error message is generated by the **load\_upf** command when a syntax error occurs during the reading of a UPF file. The text of the message shows the specific error.

## **WHAT NEXT**

Use the **error\_info** command to show the file and line number of the syntax error.

## **SEE ALSO**

`error_info(2)`

**UPF-045 (error) Detected circular references to file %s while loading UPF file %s.**

## **DESCRIPTION**

This error message occurs when you attempt to load a UPF file that references itself; this results in a circular reference, which is illegal. The following is an example of a circular reference:

```
File 1.upf:
load_upf 2.upf

File 2.upf:
load_upf 1.upf
```

## **WHAT NEXT**

Remove the **load\_upf** command that causes the circular reference.

## **UPF-047 (error) Could not set the scope to %s. load\_upf failed.**

### **DESCRIPTION**

This error message occurs when the scope specified with the **load\_upf -scope** command does not exist.

### **WHAT NEXT**

Ensure that the design contains a cell instance name that matches the string supplied to the **-scope** option. After making any changes, rerun the command.

### **SEE ALSO**

[load\\_upf\(2\)](#)

## **UPF-048 (error) RTL port %s cannot be made a supply port because it is already connected by a signal net.**

### **DESCRIPTION**

This error message occurs when the specified RTL port is already being used as a signal port.

An RTL port can only be set as a supply port (using the **add\_port\_state** or **connect\_supply\_net** command) if the port is not connected to a signal net.

### **WHAT NEXT**

Make sure that the **add\_port\_state** or **connect\_supply\_net** syntax is correct, or disconnect the RTL port from the signal net. After making your changes, rerun the command.

### **SEE ALSO**

[add\\_port\\_state\(2\)](#)  
[connect\\_supply\\_net\(2\)](#)

## **UPF-049 (error) Name space conflict while trying to create**

**object %s.**

## **DESCRIPTION**

This error message occurs when a UPF command attempts to create

- An object with the same name as an existing design object
- A power domain with the same name as an instance or a port in the same scope

## **WHAT NEXT**

Ensure that objects specified in your UPF file are not the same as existing objects in the same name space.

**UPF-050 (error) Supply net %s cannot be connected as ground and also have a nonzero operating voltage or a nonzero on state%s.**

## **DESCRIPTION**

This error message occurs when a supply net that has been connected as ground has a nonzero operating voltage or a nonzero "on" state in the power state table.

A supply net that has already been specified as a ground net cannot have an operating voltage or a nonzero "on" state. Conversely, a supply net that has an operating voltage or a nonzero "on" state cannot be used as a ground net.

## **WHAT NEXT**

Check that all supply nets connected as ground are specified to operate at zero volts and do not have nonzero "on" supply states.

**UPF-051 (error) The power network and ground network cannot be connected together.**

## **DESCRIPTION**

This error message occurs when attempting to connect the power supply network and the ground supply network. The power and ground supply networks cannot be connected to each other.

## WHAT NEXT

Use the `write_script` or `save_upf` command to review all of the UPF commands, and disconnect the power network from the ground network.

## SEE ALSO

`save_upf(2)`  
`write_script(2)`

**UPF-052 (error)** Supply net %s cannot have different operating voltages from other supply nets (e.g. %s) connected to it as a single metal through supply ports.

## DESCRIPTION

This error message occurs when attempting to specify an operating voltage different from other supply nets connected to it as a single metal through supply ports.

All supply nets connected together as a single metal through supply ports must share common operating voltages. Supply nets having different operating voltages cannot be connected together through supply ports.

## WHAT NEXT

If you have previously applied the `set_voltage` command on several supply nets connected together, apply `set_voltage` on these supply nets simultaneously to change their operating voltages. To do this, specify multiple supply nets in the `-object_list`. Connecting supply nets that have different operating voltages is illegal.

## SEE ALSO

`set_voltage(2)`

**UPF-053 (error)** Option %s in the given UPF command is not supported.

## DESCRIPTION

This error message occurs when attempting to run a UPF command with an option that is not supported by UPF.

## WHAT NEXT

Omit the unsupported option and rerun the command.

# UPF-054 (warning) The power state table can only be created in the top-level scope.

## DESCRIPTION

This warning message occurs when attempting to create a power state table that is not in the top-level scope.

Creating a power state table is not allowed if the current scope is not on the top level of the design.

## WHAT NEXT

Change the scope to the top level of the design using the `set_scope` command, and rerun the `create_pst` command.

## SEE ALSO

`create_pst`(2)  
`set_scope`(2)

# UPF-055 (error) Top-level power domain is not yet defined.

## DESCRIPTION

This error message occurs when attempting to run the `compile` or `check_mv_design` command without defining the top-level power domain. The top-level power domain must be defined in order for synthesis to proceed.

## WHAT NEXT

Create the top-level power domain using the `create_power_domain` command.

## SEE ALSO

`create_power_domain`(2)

# UPF-056 (error) No primary supply nets (power and ground)

have been defined for power domain %s.

## DESCRIPTION

This error message occurs because the primary power and ground nets are not defined for the specified power domain. Primary supply nets must be defined for all power domains in the design.

## WHAT NEXT

Define the primary power and ground nets for the specified power domain using the **set\_domain\_supply\_net** command.

## SEE ALSO

`set_domain_supply_net(2)`

**UPF-057 (error) Supply net %s does not have a defined operating voltage%s.**

## DESCRIPTION

This error message occurs because the specified supply net is defined in the design but does not have an defined operating voltage.

All supply nets defined in the design must have a defined operating voltage in order for synthesis to proceed.

## WHAT NEXT

Apply the operating voltages using the **set\_voltage** command.

## SEE ALSO

`set_voltage(2)`

**UPF-058 (error) Supply net %s cannot be used in domain %s.**

## DESCRIPTION

This error message occurs because the specified supply net is not defined for the given domain. A supply net can only be used in the domains for which it has been defined.

## WHAT NEXT

Define an existing supply net for a new domain using the `create_supply_net -reuse` command.

SH "SEE ALSO"

`create_supply_net(2)`

## UPF-059 (error) Isolation name %s already used.

### DESCRIPTION

This error message occurs when the specified isolation name is already in use. The `set_isolation` command cannot define an isolation strategy with a name that has already been used to define another isolation strategy in the same power domain.

### WHAT NEXT

Use a unique name to define the isolation strategy and rerun the command.

### SEE ALSO

`set_isolation(2)`

## UPF-060 (error) %s default isolation already exists for this domain.

### DESCRIPTION

This error message occurs when attempting to define default isolation strategies that are already defined.

The `set_isolation` command allows you to define default isolation strategies for input, output, or both kinds of ports of the power domain. Once defined, these default strategies cannot be redefined.

For example, if you first define an isolation strategy that applies to input ports, then you can later define another default isolation strategy that applies to both kinds of ports or just input ports.

### WHAT NEXT

Define only one default isolation strategy for a given port type.

## SEE ALSO

`set_isolation(2)`

# UPF-061 (error) Isolation strategy %s does not exist or it does not belong to power domain %s.

## DESCRIPTION

This error message occurs when using the `set_isolation_control` or `map_isolation_cell` command when specifying an isolation strategy that does not exist or that not belong to the power domain in -domain option.

The `set_isolation_control` command and `map_isolation_cell` command are effective only when you specify an isolation strategy that already exists in the given power domain.

## WHAT NEXT

Look for typos in isolation strategy name. Make sure the isolation strategy was created using `set_isolation` command for the power domain specified in -domain option

## SEE ALSO

`set_isolation(2)`  
`set_isolation_control(2)`  
`map_isolation_cell`

# UPF-062 (information) Converting isolation signal %s to its driver pin %s.

## DESCRIPTION

This information message occurs after specifying a net or hierarchical pin as the isolation signal with the `set_isolation_control` command. The tool then uses the driver pin of the net as the isolation signal.

## WHAT NEXT

This is only an information message. No action is required.

## SEE ALSO

`set_isolation_control(2)`

## **UPF-063 (warning) set\_isolation\_control for isolation strategy %s is not defined. Skipping this strategy.**

### **DESCRIPTION**

This warning message occurs when the specified isolation strategy has not been defined with the **set\_isolation\_control** command. The strategy is skipped.

The **set\_isolation\_control** command specifies crucial parts of the isolation strategy. The tool cannot add isolation cells if **set\_isolation\_control** is not defined for an isolation strategy.

### **WHAT NEXT**

Define **set\_isolation\_control** for the isolation strategy and rerun the command.

### **SEE ALSO**

`set_isolation_control(2)`

## **UPF-064 (error) Error encountered while processing option %s of create\_power\_switch command. No switch is created.**

### **DESCRIPTION**

This error message occurs when the tool detects an error during the processing of the specified option used in the **create\_power\_switch** command.

This error might be caused by incorrectly specified supply nets, signal nets, or Boolean functions.

### **WHAT NEXT**

Check the syntax and make sure that all names are referenced with respect to the current scope.

### **SEE ALSO**

`create_power_switch(2)`

## **UPF-065 (error) Hierarchical name %s cannot be directly**

specified for the object created by this command.

## DESCRIPTION

This error message occurs when a hierarchical name is specified for the object created by this command.

Only simple names, without a slash (/), are permitted for the object created by this command. The created object automatically has its hierarchical name based on the scope instance in which it is created. For example, an object with the simple name of 'A' created in scope U1/U2/U3 (relative to the top) will have a hierarchical name of U1/U2/U3/A.

## WHAT NEXT

Use a simple name for the object and rerun the command.

**UPF-066 (error)** In UPF mode (default for dc\_shell), the -object\_list option for set\_operating\_conditions is not allowed on cells that are not macro nor pad.

## DESCRIPTION

This error message occurs when attempting to use the **-object\_list** option with the **set\_operating\_conditions** command in UPF mode. The **-object\_list** option is deprecated for **set\_operating\_conditions** in UPF mode, except when the objects are macro or pad cells.

## WHAT NEXT

Use the **set\_voltage** command to constrain the design for multivoltage on power nets.

## SEE ALSO

`set_operating_conditions(2)`  
`set_voltage(2)`

**UPF-067 (error)** Supply net connection cannot be determined

for power\_pin %s on cell %s.

## DESCRIPTION

This error message occurs when preexisting technology cells in the design have backup power or ground pins. These cells, including macro cells, retention cells, isolation cells, and dual-rail always-on cells, require proper UPF constraining so that their backup connections can be determined by the tool.

For macro cells, exception connections may be needed. For others, relevant **set\_retention** and **set\_isolation** commands are needed.

## WHAT NEXT

Set up the design using the **connect\_supply\_net**, **set\_retention**, and **set\_isolation** commands.

## "SEE ALSO

```
connect_supply_net(2)
set_isolation(2)
set_retention(2)
```

## UPF-068 (error) Incorrect -hdl\_type or -table specification in create\_hdl2upf\_vct or create\_upf2hdl\_vct commands.

## DESCRIPTION

This error message occurs when the tool encounters an illegal specification for the **-hdl\_type** or **-table** option.

The **-hdl\_type** option uses the following format:

```
-hdl_type { <vhdl | vlog | SV> [typename] }
```

The **-hdl\_type** option supports the following case-sensitive values:

- vhdl
- verilog
- SV

The value conversion table included in the **-table** option cannot be empty.

## WHAT NEXT

If the **-hdl\_type** option was used, verify that you specified the correct format and value. If the **-table** option was used, verify that you specified a value conversion table that is not empty.

## SEE ALSO

`create_hdl2upf_vct(2)`  
`create_up2hdl_vct(2)`

# UPF-069 (error) Incorrect syntax on retention %s control signal or its sense value.

## DESCRIPTION

This error message occurs when attempting to run the UPF **set\_retention\_control** command using an incorrect syntax.

The **set\_retention\_control** command requires that you specify the control signal together with the control signal sense in the format of `{signal_net signal_sense}`.

The error message indicates that either `signal_net` or `signal_sense` was not specified, or an incorrect syntax was used for specifying the retention control signal and its sense value.

## WHAT NEXT

Check the command syntax and ensure that it follows the syntax shown in the **set\_retention\_control** man page.

## SEE ALSO

`set_retention_control(2)`

# UPF-070 (error) %s isolation cell has a mismatch between the UPF pragma and UPF.

## DESCRIPTION

This error message occurs when the UPF isolation strategy name stored on the cell does not match the UPF isolation name strategy for the power domain port that is being isolated by this cell.

During compile, the tool checks each isolation cell to ensure it is consistent with the **set\_isolation** UPF command specified for the power domain port that connects to the isolation cell. A mismatch might occur if the UPF file is modified after compile or if changes are made to the UPF isolation pragmas or attributes on the isolation cells.

The pragmas are placed in the Verilog/VHDL output of the tool for internal tracking purposes.

## WHAT NEXT

Change the pragma in the Verilog/VHDL file back to its original value if it has been modified since being written out by the tool.

## SEE ALSO

`set_isolation(2)`

# UPF-071 (error) %s isolation cell's location is inconsistent with its UPF strategy %s.

## DESCRIPTION

This error message occurs when the UPF isolation location stored on the cell does not match the actual location of the cell, either in the same design as where **set\_isolation** is specified, or in the parent design.

During compile, the tool checks each isolation cell to ensure it is consistent with the **set\_isolation** UPF command specified for the power domain port that connects to the isolation cell. A mismatch might occur if the UPF file is modified after compile or if changes are made to the UPF isolation pragmas or attributes on the isolation cells.

The pragmas are placed in the Verilog/VHDL output of the tool for internal tracking purposes.

## WHAT NEXT

Change the pragma in the Verilog/VHDL file back to its original value, if it has been modified since being written out by the tool.

## SEE ALSO

`set_isolation(2)`

# UPF-072 (error) The %s isolation cell's clamp value is

## inconsistent with its UPF strategy %s.

### DESCRIPTION

This error message occurs when the UPF isolation clamp value stored on the cell does not match the actual clamp value of this isolation cell.

During compile, the tool checks each isolation cell to ensure it is consistent with the **set\_isolation** UPF command specified for the power domain port that connects to the isolation cell. A mismatch may occur if the UPF file is modified after compile or if changes are made to the UPF isolation pragmas or attributes on the isolation cells.

The pragmas are placed in the Verilog/VHDL output of the tool for internal tracking purposes.

### WHAT NEXT

Change the pragma in the Verilog/VHDL file back to its original value if it has been modified since being written out by the tool.

### SEE ALSO

`set_isolation(2)`

## UPF-073 (information) Isolation strategy %s applied on isolation cell %s.

### DESCRIPTION

This information message advises you that the specified isolation strategy has been applied to an existing isolation cell and no new cell needs to be created.

If an isolation strategy is specified for a port that already has an isolation cell, the tool verifies that the existing isolation cell satisfies all of the parameters of the isolation strategy, except for power and ground nets. If these parameters are satisfied, the tool uses the existing cell and does not create another isolation cell for the port. The cell gets its isolation power and ground nets as specified in the isolation strategy.

### WHAT NEXT

This is only an information message. No action is required.

## **UPF-074 (error) Cannot apply UPF retention strategy %s on existing retention cell %s because the lib\_cell\_type %s in this UPF retention strategy is different than the existing retention cell's lib\_cell\_type %s.**

### **DESCRIPTION**

This error message occurs when the specified retention strategy cannot be applied because the given *lib\_cell\_type* does not match the existing *lib\_cell\_type*.

If you run the **map\_retention\_cell** UPF command with the **-lib\_cell\_type** option on an existing retention cell in the netlist and specify a library type that does not match the retention type on the existing library cell, the command is ignored. The existing retention cell type takes priority.

### **WHAT NEXT**

Check the **map\_retention\_cell** command man page for information about the **-lib\_cell\_type** option.

### **SEE ALSO**

`map_retention_cell(2)`

## **UPF-075 (error) Cannot apply UPF retention strategy %s on existing retention cell %s because there is a conflict between library cells that are specified in this UPF retention strategy and the library cell %s of the existing retention cell.**

### **DESCRIPTION**

This error message occurs when the UPF retention strategy cannot be applied because there is a conflict between the library cells specified in this retention strategy and the library cell of the existing retention cell.

If the UPF **map\_retention\_cell** command specifies an existing retention cell in the netlist and the **-lib\_cells** option specifies a set of library cells that does not contain the library cell of the existing preinstantiated retention cell, the **map\_retention\_cell** command on the existing retention cell is ignored. The existing retention cell takes priority over this command.

## WHAT NEXT

Check the `map_retention_cell` man page for the correct input.

## SEE ALSO

`map_retention_cell(2)`

# UPF-076 (error) Cannot find the real driver of isolation\_signal %S.

## DESCRIPTION

This error message occurs when the specified isolation signal is either driven by an unlinked cell or not driven by a real driver.

The `-isolation_signal` option of the `set_isolation_control` command requires that the signal the option specifies be driven by a real driver. Real drivers include output pins of leaf level cells and the top-level design ports. If a cell is unlinked, the tool cannot determine if the port of the cell driving an isolation signal is an output port.

## "WHAT NEXT

Modify the `set_isolation_control` command so that it specifies an isolation signal that is being driven by a real driver, and fix any linking issues.

## SEE ALSO

`set_isolation_control(2)`

# UPF-077 (warning) Design has %d retention cells that cannot be hooked up based on the UPF retention constraints due to retention library issues.

## DESCRIPTION

This warning message occurs when attempting to use a retention cell syntax that is no longer valid. Use the retention cell syntax provided in release 2007.03 or later.

In UPF mode, UPF retention control signals are save signals or restore signals that correspond to the retention save or retention restore pin in the retention library cell. This can only be modeled using the retention cell syntax introduced in the 2007.03 release. If you attempt to use a retention cell syntax from a release prior

to 2007.03, the retention pins do not have any save or restore meaning. The tool cannot determine which retention pin is the save pin, which pin is the restore pin, and so cannot do the hookup using UPF retention constraints.

## WHAT NEXT

If the result is not what you intended, you can do either of the following (although the first method is considered best practice):

- Update your .lib file to use the retention cell syntax from release 2007.03 or later and recompile your .lib file to get the library. This is the cleanest method.
- Use the `set_retention_control_pins` command to convert your library to a library that has the retention cell syntax from release 2007.03 or later.

## SEE ALSO

`set_retention_control_pins(2)`

**UPF-078 (error) Isolation cell voltage mismatch for For pin %s.**  
Nominal voltage of Isolation power net (%s) is different from the nominal volatge of the primary power net (%s) of the power domain where the isolation cell will be created.

## DESCRIPTION

In UPF user specifies isolation intent using `set_isolation` and `set_isolation_control` command. DC requires that the nominal volatge of the power net specified in the `set_isolation` command matches the nominal volatge of the primary power of the location specified in the `set_isolation` command. This error will occur whenever these two volatges do not match. Note that both min and max values of tthe nominal volatges should match.

## WHAT NEXT

Change the nominal volatges of the isolation power net or the primary power net of the location specified in `set_isolation` so that they match. Nominal voltages are specified using `set_voltage` command.

**UPF-079 (error) Nominal voltage of retention power net (%s) is different from the nominal volatge of the primary power net (%s) of the power domain (%s) where the retention cell will be**

created.

## DESCRIPTION

If UPF user specifies retention intent using `set_retention` command, DC currently requires that the nominal volatge of the retention power net specified in the `set_retention` command matches the nominal volatge of the primary power of the power domain where the retention cells will be created under this retention strategy. This error will occur whenever these two volatges do not match. Note that both min and max values of the nominal volatges should match.

## WHAT NEXT

Change the nominal volatges of the retention power net or the primary power net of the power domain where the retention cells will be created under this retention strategy. Nominal voltages are specified using `set_voltage` command.

**UPF-080 (error) Nominal voltage of retention ground net (%s) is different from the nominal voltage of the primary ground net (%s) of the power domain (%s) where the retention cell will be created.**

## DESCRIPTION

This error message occurs when the nominal voltage of the specified ground net does not match the nominal voltage of the specified primary ground net.

The tool requires that the nominal voltage of the retention ground net specified in the `set_retention` command matches the nominal voltage of the primary ground net of the power domain where the retention cells will be created under this retention strategy.

## WHAT NEXT

Change the nominal voltages of the retention ground net or the primary ground net of the power domain where the retention cells will be created based on this retention strategy. Specify nominal voltages using the `set_voltage` command.

## SEE ALSO

`set_retention(2)`  
`set_voltage(2)`

## **UPF-081 (warning) Retention strategy %s does not have an associated map\_retention\_cell constraint.**

### **DESCRIPTION**

This warning message occurs because the tool cannot map sequential cells under the specified retention strategy when the strategy does not have an associated **map\_retention\_cell** command.

In each UPF retention strategy, the associated **map\_retention\_cell** command specifies how the retention cell mapping will be done. If a retention strategy does not have an associated **map\_retention\_cell** command, the tool cannot map any sequential cells that are under this retention strategy to the retention cell.

### **WHAT NEXT**

To map specific sequential cells under a retention strategy to a retention cell during compile, make sure that there is a corresponding **map\_retention\_cell** command associated with the retention strategy.

### **SEE ALSO**

[map\\_retention\\_cell\(2\)](#)

## **UPF-082 (Error) The specified power switch %s has not been created for power domain %s.**

### **DESCRIPTION**

This error message occurs because you are referring to a power switch that either (1) has yet been created, or, (2) has been created, but not for the power domain.

### **WHAT NEXT**

Use [get\_power\_switches <domain\_scope>/<switch\_name>] command to look for the power switch, to see if it exists at all.

Also make sure that the power switch was indeed defined for the power domain.

## **UPF-083 (error) The argument %s cannot be used with the**

argument %s.

## DESCRIPTION

This error occurs if you have entered a combination of arguments that is invalid.

## WHAT NEXT

Please refer to the man page of the command used to see the valid option of arguments.

**UPF-084 (error)** The power domain "%s" does not have any isolation strategies defined.

## DESCRIPTION

This error occurs when the single power domain specified with the isolation strategies has no isolation strategies defined.

## WHAT NEXT

Please make sure that there are isolation strategies defined for the given power domain and try again.

**UPF-085 (error)** The argument %s cannot be used without the argument %s.

## DESCRIPTION

This error occurs if you have entered a combination of arguments that is invalid.

## WHAT NEXT

Please refer to the man page of the command used to see the valid option of arguments.

**UPF-086 (warning)** Argument -applies\_to to set\_isolation is

ignored because -elements arguments is also specified

## DESCRIPTION

The -elements option to set\_isolation command has priority over -applies\_to option. This means that set\_isolation will applies to all members of -elements argument regardless of the direction specified in -applies\_to option. This is to keep set\_isolation command in compliance with UPF specification.

## WHAT NEXT

Please remove -applies\_to option from this set\_isolation command.

## UPF-087 (error) Cannot set\_voltage on an empty list of supply net(s).

## DESCRIPTION

This error message occurs attempting to set voltage an empty list of supply nets, or the specified supply nets are invalid.

The cause could be the invalid supply net name specified by user, or the design contains invalid supply net data.

## WHAT NEXT

Check and make sure the specified supply nets exist.

## UPF-088 (warning) set\_isolation\_control -location self is specified for non-hierarchical pin %s. No isolation will be inserted for this pin.

## DESCRIPTION

set\_isolation\_control -location self is specified for a non-hierarchical pin, such as a pin on a macro cell. The tool will not be able to honor this strategy, since nothing can be inserted within a macro.

## WHAT NEXT

Use -location parent for such a pin.

## **UPF-089 (error) set\_retention\_control has already been defined for strategy %s.**

### **DESCRIPTION**

The error occurs when applying **set\_retention\_control** to a retention strategy that already has control defined.

### **WHAT NEXT**

Please make sure that there is only one **set\_retention\_control** for a retention strategy.

## **UPF-090 (error) Pin %s is not on boundary of domain %s.**

### **DESCRIPTION**

This error message occurs when attempting to specify a pin in -elements option of **set\_isolation** command that is not on the power domain boundary for which the isolation strategy is being defined.

### **WHAT NEXT**

Look at the pin in the error message, verify that it is not a pin on the power domain boundary and change it to the one on the power domain boundary to which the isolation strategy applies.

### **SEE ALSO**

[set\\_isolation\(2\)](#)

## **UPF-091 (warning) Unable to find a match for some of the library cells specified.**

### **DESCRIPTION**

This error message occurs when the tool is not able to find a match for some of the library cells specified in -lib\_cells option of **map\_isolation\_cell**/**map\_level\_shifter\_cell** command in any of the technology libraries.

## WHAT NEXT

Please verify there are no typos in the library cell names of -lib\_cells option. Make sure you have specified just the cell\_name of library cell and not in library\_name/cell\_name format. For map\_isolation\_cell, please make sure the library cell's clamp value does not contradict with isolation strategy clamp value.

## SEE ALSO

map\_isolation\_cell  
map\_level\_shifter\_cell

# UPF-092 (error) Isolation strategy %s is defined with -no\_isolation option

## DESCRIPTION

This error message occurs when map\_isolation\_cell command is specified on an isolation strategy defined with -no\_isolation option.

## WHAT NEXT

Please verify that the isolation strategy on which map\_isolation is being defined for is not defined with -no\_isolation option.

## SEE ALSO

map\_isolation\_cell

# UPF-093 (error) UPF commands are supported only with the compile\_ultra command.

## DESCRIPTION

This error message occurs when the **compile** command is issued on a design with UPF constraints. UPF is only supported by DC Ultra. Use the **compile\_ultra** command instead.

## WHAT NEXT

Verify if there are any UPF constraints on the design. You can check for UPF commands using either the **save\_upf file\_name** command or the **write\_script** command. If the UPF constraints are intentional use **compile\_ultra** to compile the design.

## **SEE ALSO**

`save_upf(2)`  
`write_script(2)`

# **UPF-094 (error) Level shifter strategy %s is not found**

## **DESCRIPTION**

This error message occurs when `map_level_shifter_cell` command is issued for a not existent level shifter strategy or the strategy does not belong to the power domain specified with `-domain` option

## **WHAT NEXT**

Please verify that the level shifter strategy on which `map_level_shifter_cell` is being defined is present and it exists on the power domain specified with `-domain` option

## **SEE ALSO**

`set_level_shifter`

# **UPF-095 (Warning) Supply net %s has an out of domain connection to cell %s in domain %s that is not consistent with UPF semantics.**

## **DESCRIPTION**

A supply net can only be connected to power pins that lie within the extent of the power domain(s) in which the supply net is defined.

## **WHAT NEXT**

Ensure that the supply net is defined in the power domain to which the cell belongs. This can be done using `create_supply_net -reuse`. Fix the connection before reading this UPF into any tools.

## **SEE ALSO**

`create_supply_net(2)`  
`connect_supply_net(2)`

## **UPF-096 (error) UPF resolution type %s not supported on net %s.**

### **DESCRIPTION**

This error message occurs when the resolution type is valid according to the UPF definition but is not supported by the shell.

### **WHAT NEXT**

This message applies to the **create\_supply\_net** command **-resolve** option, for which the shell currently only supports the **unresolved** and **parallel** values. The value of **one\_hot** is not supported.

### **SEE ALSO**

`create_supply_net(2)`

## **UPF-097 (error) Invalid UPF resolution type %s on net %s.**

### **DESCRIPTION**

This error message occurs when the resolution type does not comply with the IEEE 1801 (UPF) standard.

### **WHAT NEXT**

This message applies to the **create\_supply\_net -resolve** option. The shell currently supports only the values of **unresolved** and **parallel** for this option.

### **SEE ALSO**

`create_supply_net(2)`

## **UPF-098 (warning) Default resolution forced to %s for net %s.**

### **DESCRIPTION**

This warning message occurs when the **create\_supply\_net** command is specified with the **-reuse** option, but **-resolve parallel** is omitted on a supply net that supports multiple drivers.

## WHAT NEXT

According to the IEEE 1801 (UPF) standard, the default resolution for a supply net is **unresolved** when the **-resolve** option is omitted. However, when a supply net is connected to multiple domains, the definition must be consistent across instantiations. If the first instantiation was of type **parallel** and **-resolve** is omitted for subsequent connections, the shell will enforce the consistency.

## SEE ALSO

`create_supply_net(2)`

# UPF-099 (error) Inconsistent resolution type on net %s.

## DESCRIPTION

This error message occurs when the **create\_supply\_net** command with the **-reuse** option is specified and the **-resolve** option is inconsistent with the previous definition.

## WHAT NEXT

According to the IEEE 1801 (UPF) standard, the definitions of resolution types may not be mixed on a single supply net.

## SEE ALSO

`create_supply_net(2)`

# UPF-100 (error) Multiple drivers on unresolved supply net %s.

## DESCRIPTION

This error message occurs when multiple power sources are connected to a net specified as **unresolved** with the **create\_supply\_net** command **-resolvelfp** option.

## WHAT NEXT

Supply nets specified as **unresolved** may receive only 1 driver. Either disconnect other sources or specify the supply net as **parallel**.

## SEE ALSO

`create_supply_net(2)`

## **UPF-101 (Error) Supply net %s cannot be connected to the cell %s in domain %s. This connection is not consistent with UPF semantics.**

### **DESCRIPTION**

A supply net can only be connected to power pins that lie within the extent of the power domain(s) in which the supply net is defined.

### **WHAT NEXT**

Define the supply net in the power domain which contains the cell before its connection. This can be done using the `create_supply_net -reuse` command.

### **SEE ALSO**

`create_supply_net(2)`  
`connect_supply_net(2)`

## **UPF-102 (error) Supply net %s cannot be specified for retention strategy %s since it is not defined in the power domain %s.**

### **DESCRIPTION**

Using supply net(s) for a retention strategy, which are not defined in the domain of the strategy, is not consistent with UPF semantics.

### **WHAT NEXT**

Ensure that the supply nets being used are defined in the power domain in which strategy is defined. This can be done using `create_supply_net -reuse`.

### **SEE ALSO**

`set_retention(2)`  
`create_supply_net(2)`

## **UPF-103 (error) Supply net %s cannot be specified for isolation strategy %s since it is not defined in the power domain %s in**

which the isolation cells will be inserted.

## DESCRIPTION

Supply net(s) specified for an isolation strategy, must be available in the domain in which the isolation cells inserted by the strategy would lie, for the UPF design to be consistent with UPF semantics.

## WHAT NEXT

Ensure that the supply nets being used are defined in the power domain(s) in which the isolation cells inserted by the strategy would lie. This can be done using `create_supply_net -reuse`.

## SEE ALSO

```
set_isolation(2)
set_isolation_control(2)
create_supply_net(2)
```

**UPF-104 (error)** Supply net %s cannot be used as the %s net for power switch %s as it is not defined in the power domain %s.

## DESCRIPTION

Supply net(s) being used as input supply nets and output supply nets for a power switch, must be defined in the power domain in which the power switch is being created, for the UPF design to be consistent with UPF semantics.

## WHAT NEXT

Ensure that the supply nets being specified as the input and output supply nets are defined in the power domain(s) in which the power switch is being created. This can be done using `create_supply_net -reuse`.

## SEE ALSO

```
create_power_switch(2)
create_supply_net(2)
```

**UPF-105 (error)** Cannot apply UPF retention strategy %s on existing retention cell %s because there is a conflict between

retention cell type '%s' that are specified in this UPF retention strategy and the library cell %s of the existing retention cell.

## DESCRIPTION

This error message occurs when the UPF retention strategy cannot be applied because there is a conflict between the retention cell type specified in this retention strategy and the library cell of the existing retention cell.

If the UPF **map\_retention\_cell** command specifies an existing retention cell in the netlist and the **-lib\_cell\_type** option specifies a set of library cells that does not contain the library cell of the existing preinstantiated retention cell, the **map\_retention\_cell** command on the existing retention cell is ignored. The existing retention cell takes priority over this command.

## WHAT NEXT

Check the **map\_retention\_cell** man page for the correct input.

## SEE ALSO

`map_retention_cell(2)`

**UPF-106 (warning)** Supply net %s cannot be used for the isolation strategy %s since it is not defined in the power domain %s in which the isolation cells will be inserted.

## DESCRIPTION

Supply net(s) specified for an isolation strategy, must be available in the domain in which the isolation cells inserted by the strategy would lie, for the UPF design to be consistent with UPF semantics.

## WHAT NEXT

Ensure that the supply nets being used are defined in the power domain(s) in which the isolation cells inserted by the strategy would lie. This can be done using **create\_supply\_net -reuse**. Fix the issue before reading the UPF into any tool.

## SEE ALSO

`set_isolation(2)`  
`set_isolation_control(2)`  
`create_supply_net(2)`

## **UPF-107 (error) Duplicate port name '%s' in instance '%s'**

### **DESCRIPTION**

Port names must be unique within and instance.

### **WHAT NEXT**

Ensure that all ports of the instance have a unique name.

## **UPF-108 (error) Invalid boolean expression '%s' in argument '%s'.**

### **DESCRIPTION**

The expected boolean expression must comply with the SystemVerilog requirements.

### **WHAT NEXT**

The boolean expression must be a combination of instance control port names and logical or bitwise operators (!, |, ||, &, &&, ^ and ==). SystemVerilog keywords are not acceptable port names.

## **UPF-109 (error) Invalid portname '%s' in -ack\_delay option.**

### **DESCRIPTION**

The argument of -ack\_delay must match a -ack\_port option.

### **WHAT NEXT**

Ensure the option -ack\_delay has a -ack\_port counterpart.

## **UPF-110 (error) Non-existent input port '%s' in -on\_state option.**

### **DESCRIPTION**

The argument of the -on\_state option must match an -input\_supply\_port argument.

## WHAT NEXT

Ensure the argument of the option `-on_state` matches a `-input_supply_port` counterpart.

# UPF-111 (error) Invalid state name specification for instance %s.

## DESCRIPTION

All arguments and options that rely on a state specifications must refer to the same state, the actual operation being defined by the Boolean expression.

## WHAT NEXT

Ensure all the arguments and options refer to the same state within an instance.

# UPF-112 (error) Pin or port %s was already assigned the isolation strategy %s before %s.

## DESCRIPTION

This error message occurs when a pin or port is listed in the elements list of one isolation strategy. You may not explicitly include the same pin or port in more than one isolation strategy.

## WHAT NEXT

Ensure that all pins are assigned in only one isolation strategy.

## SEE ALSO

`set_isolation(2)`

# UPF-113 (warning) Inout %s, %s is ignored.

## DESCRIPTION

This warning message appears if an inout Pin/Port is specified in the `-elements` option of the `set_isolation` or `set_level_shifter` command. You cannot specify an isolation or level shifter strategy on an inout Pin/Port.

## WHAT NEXT

This is only a warning message. No action is required.

However, to avoid receiving this message, verify if the Pin/Port for which the warning appears is an inout pin. Since isolation and level shifter strategies cannot be specified on an inout Pin/Port, remove this from the list in the **-elements** option and run the command again.

## SEE ALSO

`set_isolation(2)`  
`set_level_shifter(2)`

# UPF-114 (warning) Power switch %s does not have a match in the target libraries.

## DESCRIPTION

This warning message occurs when the model names specified for the power switch do not match any entry in the target libraries.

## WHAT NEXT

Check the available models in the target libraries and specify a valid name. At least one valid name must exist.

## SEE ALSO

`map_power_switch(2)`

# UPF-115 (warning) Library cell for instance %s is not a power switch.

## DESCRIPTION

This warning message occurs when the library cell specified for the **map\_power\_switch** command does not appear to be a valid power switch. While the library cell specified is found in the target libraries, the function of the library cell does not match that of a power switch.

## WHAT NEXT

Check the available library cells in the target libraries and specify a valid name.

At least one valid name must exist in the list provided with the `map_power_switch` command.

## SEE ALSO

`map_power_switch(2)`

**UPF-116 (error)** The `set_retention` command was invoked with an empty list of elements for strategy %s.

## DESCRIPTION

This error message occurs because the `set_retention` command takes an optional `-elements` argument that defines the pins and ports affected by the strategy. If this argument is specified, the list of elements must contain at least 1 valid port or pin.

## WHAT NEXT

Check that the list of ports is not empty and contains existing ports or pins in the design, and run the command again.

## SEE ALSO

`set_retention(2)`

**UPF-119 (error)** Cannot find supply pin %s in cell %s.

## DESCRIPTION

This error message occurs when the `connect_supply_net` attempts to connect a specific supply pin of a given library cell to a supply net. In this case, the pin must exist in the interface.

## WHAT NEXT

Check the interface of the library cell and correct the pin name.

## SEE ALSO

`connect_supply_net(2)`

## **UPF-120** (error) The specified net control or ack net '%s' cannot be found.

### **DESCRIPTION**

This error message occurs when the specified control or ack net for a UPF power switch does not exist.

### **WHAT NEXT**

Check that the name is correct and run the command again.

### **SEE ALSO**

`create_power_switch(2)`

## **UPF-121** (information) A total of %d power switches found that are not mapped to a valid library cell; %d of them have been reported.

### **DESCRIPTION**

This information message provides a summary of the total number of power switches that are not mapped to an existing library cell, or are mapped to a library cell other than a power switch.

### **WHAT NEXT**

All of these violations can be viewed using the `check_mv_design -max_messages` command. Use a larger value with `-max_messages` if you are already seeing this message with the `check_mv_design` command.

### **SEE ALSO**

`check_mv_design(2)`  
`map_power_switch(2)`

## **UPF-122** (information) Selecting supply net %s for isolation

strategy %s:%s in scope %s for characterization.

## DESCRIPTION

This information message indicates that the supply net specified for the isolation strategy is not available in the hierarchy that is being characterized. A supply net connected to the specified supply net in the instance being characterized is used.

## WHAT NEXT

This is only an information message. No action is required.

## SEE ALSO

characterize(2)

**UPF-123 (error) Unable to find a supply net connected to the supply net %s, in the scope %s.**

## DESCRIPTION

This error message occurs when the **propagate\_constraints** command cannot find a supply net in the scope that is connected to the supply net specified for the isolation strategy with the location defined as the parent in the scope of the characterized instance.

## WHAT NEXT

Connect the supply nets at the scope in which the isolation cells will be inserted to supply nets associated with the isolation strategy through supply ports.

Compiling the design without correcting the connections will generate a **UPF-103** error message.

## SEE ALSO

connect\_supply\_net(2)  
create\_supply\_net(2)  
create\_supply\_port(2)  
UPF-103(n)

**UPF-124 (error) Control specified for strategy %s not supported**

**because %s.**

## **DESCRIPTION**

This error message occurs when the control specified for isolation or retention strategy is invalid.

## **WHAT NEXT**

Please look for the reason why the control signal is rejected and correct it.

## **SEE ALSO**

`set_isolation_control(2)`  
`set_retention_control(2)`

**UPF-125 (warning) Cell %s, previously an isolation cell is now being treated as a normal cell.**

## **DESCRIPTION**

This error message occurs when a cell is linked to a normal cell and it has attributes of an isolation cell. Tool is removing these attributes and will treat these cells as normal cells.

## **WHAT NEXT**

Make sure the libraries haven't changed. If standard cells are used as isolation cells, remember to set the attributes '`'ok_for_isolation'`' and '`'isolation_cell_enable_pin'`' again, if the libraries are reloaded. These attributes are not written to the libraries.

**UPF-126 (error) Acknowledge net %s is not valid.**

## **DESCRIPTION**

Acknowledge net of the power switch already has a driver.

## **SEE ALSO**

`create_power_switch`

## **UPF-200 (error) Symbol '%s' violates the UPF naming conventions.**

### **DESCRIPTION**

This error message occurs when an argument violates the identifier naming conventions of UPF.

### **WHAT NEXT**

Identifiers used with UPF constructs must start with a letter. All other characters of the identifier must be either an alphanumeric character, "A-Z a-z 0-9", or the underscore character, "\_". UPF names are case sensitive.

## **UPF-300 (error) Cannot apply UPF map\_retention\_cell -elements on retention strategy %s because map\_retention\_cell is already defined on this strategy.**

### **DESCRIPTION**

This error message occurs when map\_retention\_cell -elements is issued, while another map\_retention\_cell is already defined for this retention strategy.

### **WHAT NEXT**

Check the `map_retention_cell` constraint. If -elements has to be used for map\_retention\_cell, then you better split the retention strategy to two retention strategies.

### **SEE ALSO**

`map_retention_cell(2)`

## **UPF-500 (warning) Power or ground net creation is skipped for supply net %s because it is not connected to any power domain or domain element.**

### **DESCRIPTION**

This warning message occurs when the tool cannot create a power or ground net

because the specified supply net is not connected to a power domain or domain element. The tool cannot determine if the net being created will be used as a power net or a ground net.

A supply net and its connected supply nets should be used for one of the following connections:

- Primary power or ground net of power domain(s)
- Explicit connections on power or ground pins of cell(s)
- Isolation power or ground supply
- Retention power or ground supply

## WHAT NEXT

Check the UPF constraints and make sure the supply net or its connected supply nets are connected to a domain or domain element.

## SEE ALSO

`check_mv_design(2)`  
`derive_pg_connection(2)`

# UPF-501 (error) Failed to get matching power or ground net for supply net %s.

## DESCRIPTION

This error message occurs when the specified supply net does not have a matching power or ground net.

The specified supply net belongs to a supply net group, which includes all connected supply nets. All nets in a supply net group must have the same power or ground net. The matching power or ground net has the same name as the supply net within the highest logic hierarchy among all nets in the supply net group.

## WHAT NEXT

Use the `derive_pg_connection -create_net` command to create power or ground nets if they are missing. Ensure that all supply nets and ports are properly defined and connected.

## SEE ALSO

`check_mv_design(2)`

```
derive_pg_connection(2)
```

## UPF-502 (warning) Supply net %s is not connected to any domain element.

### DESCRIPTION

This warning message occurs when the specified supply net is not connected to a power domain or domain element. The tool cannot determine if the supply net will be used as a power net or a ground net.

A supply net and its connected supply nets should be used for one of the following connections:

- Primary power or ground net of power domain(s)
- Explicit connections on power or ground pins of cell(s)
- Isolation power or ground supply
- Retention power or ground supply

### WHAT NEXT

Check the UPF constraints and make sure the supply net or its connected supply nets are connected to a domain or domain elements.

### SEE ALSO

```
check_mv_design(2)
derive_pg_connection(2)
```

## UPF-503 (error) Supply net %s is connected to power or ground pin %s outside the net's domain scope.

### DESCRIPTION

This error message occurs when an explicit connection is made between the power or ground pin in one domain scope and the supply net in another domain scope.

### WHAT NEXT

Make the supply net available to the domain of the power or ground pin. If the pin's

domain and the supply net's domain share the same hierarchical scope, introduce the supply net to the pin's domain using the `create_supply_net -reuse` command. Otherwise, create additional supply ports and supply nets and connect them to the supply net to make it available to the pin's domain.

## SEE ALSO

`create_supply_net(2)`  
`create_supply_port(2)`

# **UPF-504 (error) Top-level power states %s is not fully included in the power state table of scope %s.**

## DESCRIPTION

This error message occurs when a power state defined at the top-level is not included in the power state table of a lower-level scope.

## WHAT NEXT

Add the top-level power state to the power state table of the lower-level scope.

## SEE ALSO

`check_mv_design(2)`

# **UPF-505 (warning) Power state '%s' in scope '%s' is ignored or partially ignored by implementation.**

## DESCRIPTION

This error message occurs when a power state defined in a lower-level scope is not included by the top-level power state table and therefore is ignored by implementation.

## WHAT NEXT

Please investigate if the power state tables are defined as intended.

## **SEE ALSO**

`check_mv_design(2)`

# **UPF-506 (warning) No port state has been defined on any supply port connected to supply net %s.**

## **DESCRIPTION**

This error message occurs when there is no port state defined on any supply port that is connected to the supply net.

Level shifter violations appear between two signal pins if one of them is powered by a supply power with port states and the other one without.

## **WHAT NEXT**

Please check the connectivity of supply net with port, or add appropriate port states to supply port connected to the supply net.

## **SEE ALSO**

`check_mv_design(2)`

# **UPF-507 (Error) Supply %s must belong to the scope of PST.**

## **DESCRIPTION**

This error message occurs when the supply list contains certain objects with scopes not belonging to the scope of the PST to be created.

## **WHAT NEXT**

Use supply objects within the scope of the PST in the supply list.

## **SEE ALSO**

`create_pst(2)`

# **UPF-508 (warning) Skipping the following %d netgroups since**

**they do not have valid states:%s.**

## **DESCRIPTION**

This error message occurs when there is no port state defined on any supply port that is connected to the supply net. Nets of the netgroups that do not have any state can not have any PST entries. Without a PST entry, features such as LS inserter are unable to process the nets.

## **WHAT NEXT**

Please check the connectivity of supply net with port, or add appropriate port states to supply port connected to the supply net.

## **SEE ALSO**

UPF-506  
add\_pst\_state  
connect\_supply\_net

**UPF-509 (warning) The netgroups in the following scenarios do not have a corresponding PST entry:%s.**

## **DESCRIPTION**

This error message occurs when voltages have been assigned to a netgroup without creating a corresponding PST entry. Without a PST entry, features such as LS inserter are unable to insert all the required level-shifters.

## **WHAT NEXT**

Create a PST, if one is not there already and add a state to it corresponding to the missing values.

## **SEE ALSO**

create\_pst  
add\_pst\_state

**UPF-510 (warning) Non-existing supply '%s' is ignored in PST**

'%S'.

## DESCRIPTION

This warning message occurs when a supply in PST is found non-existing in the design. The corresponding column of the supply in the PST is ignored. This could be caused by removing a sub-design that contains a supply used in a higher-level PST.

## WHAT NEXT

Reload the sub-design with UPF and the corresponding column of the supply in the PST will be used again.

## SEE ALSO

[create\\_pst](#)  
[add\\_pst\\_state](#)

## **VAL**

### **VAL-1 (error) Parsing error in the association list '%s'.**

#### **DESCRIPTION**

The association list is a sequence of comma separated clauses where each clause has the form: parameter => value For example: a=>123, b => "this is a string", c=>enum\_literal is a valid association list. Only named associations are supported; positional associations are not supported.

#### **WHAT NEXT**

Check that your association list is in the right format including all associations having a parameter name and a parameter value.

### **VAL-2 (warning) The value '%s' from parameter '%s' is being omitted.**

#### **DESCRIPTION**

Legal parameter values for design names are integers, strings, and enumeration literals. Integers are <digits> or verilog format 'd<digits> or <width>'h<hex number>. Strings are "<string>" or verilog format 's<string>. Enumerations are <enumeration\_literal>; character literals for enumerations are not included in the design name.

#### **WHAT NEXT**

Re-enter your parameter/generic value. Avoid this warning by putting the parameter/generic in the `generics_not_in_name` attribute in the VHDL source.

### **VAL-3 (warning) The parameter/generic value '%s' in design '%s' exceeds the threshold length %d. Excluding the parameter from the design name.**

#### **DESCRIPTION**

This message indicates that the specified parameter value is longer than the maximum length specified in the `dc_shell` environment variable `hdl_naming_threshold`. The

parameter value is excluded from the design name.

## WHAT NEXT

To prevent this warning from appearing, change the value of the `hdl_naming_threshold` variable to increase the threshold; or, specify that this parameter is not to be used in the design name by adding the parameter to the VHDL attribute `generics_not_in_name`.

# VAL-4 (error) Internal parameter parser error, unrecognized token "%s".

## DESCRIPTION

This is an internal error caused by something in your parameter specification that the parser doesn't recognize.

## WHAT NEXT

Examine your parameter specification closely for correct syntax. Please file a Star and include this testcase.

# VAL-5 (error) Array members must be of the same type. %S

## DESCRIPTION

The elements of a VHDL array must be of the same type. In your parameter specification string, you have included an aggregate with members that are of different types.

## WHAT NEXT

Examine your parameter specification string closely to see if there is an aggregate with incompatible member types and correct the problem. Examples include: -p # p1 => ('1', 2, '3') # -p # p2 => ("a", 'b', "c") #

## **VAL-6 (error) Illegal value for aggregate member "%s".**

### **DESCRIPTION**

Your parameter specification includes a VHDL aggregate. One of the elements of this aggregate is not recognized as a legal value. The only supported types are: integer character string array

### **WHAT NEXT**

Examine your parameter specification string closely to see if one of the elements of an aggregate has a typo.

## **VAL-7 (error) Aggregate elements must be separated by commas:**

`%s`

### **DESCRIPTION**

You have included a VHDL aggregate in your parameter specification string. Elements of an aggregate must be delimited by commas, some other character was found.

### **WHAT NEXT**

## **VAL-8 (error) Arrays can only be concatenated with arrays: %s**

### **DESCRIPTION**

Your parameter specification includes a VHDL aggregate, followed by a '`&`' followed by something that is not an aggregate. This is not a supported syntax for parameter specifications.

### **WHAT NEXT**

Examine your parameter specification to see if there is a typo. in one of your parameter values.

## **VAL-9 (error) Strings can only be concatenated with strings:**

**%s**

## **DESCRIPTION**

Your parameter specification includes a VHDL concatenation operator, '&'. The values being concatenated must both be strings.

## **WHAT NEXT**

**VAL-10 (error)** Parameter name must be followed by a legal value:

**%s**

## **DESCRIPTION**

Your parameter specification included a value that could not be recognized. Only integer, string, character, and array type values are supported.

## **WHAT NEXT**

**VAL-11 (error)** Illegal parameter name "%s".

## **DESCRIPTION**

Your parameter specification contains a parameter name that contains illegal characters. Parameter names can only contain [a-z0-9\_].

## **WHAT NEXT**

**VAL-12 (error)** Unexpected end of parameter specification:

**%s**

## **DESCRIPTION**

Your parameter specification includes a parameter name with no corresponding value.

## WHAT NEXT

**VAL-13 (error)** "%s" is not a valid parameter value.

## DESCRIPTION

Your parameter specification includes a parameter value that is not recognized. The only supported types of parameter values are integer, character, string and array.

## WHAT NEXT

**VAL-14 (error)** Parameter specifications must be separated by commas:

%s

## DESCRIPTION

Commas are required to separate individual parameter specifications.

## WHAT NEXT

**VAL-15 (error)** Negative integers with radix not supported: "%s".

## DESCRIPTION

Verilog supports specifying the width and radix of integer constants. These values can also be negative. This syntax is not supported for parameter specification strings.

## WHAT NEXT

Specify the value as a negative integer like "-24" or invert the value manually and specify it as an unsigned value.

**VAL-16 (error)** This form of Verilog integer syntax not supported:

"%S".

## DESCRIPTION

Only a limited subset of the Verilog integer syntax is supported. An integer width must be specified and the only radix allowed is hexadecimal.

## EXAMPLES

```
'h23 // not supported
8'hAF // supported
-8'h3 // not supported
3'o3 // not supported
-3 // supported
```

## WHAT NEXT

If you need to specify the width of a value, use radix hexadecimal.

**VAL-17 (error)** Parameter value, '%s', must have 32 bits or fewer.

## DESCRIPTION

## EXAMPLES

## WHAT NEXT

Either the width or the value must be changed to be less than or equal to a 32 bit number.

## **VE**

### **VE-0 (error) %s**

#### **DESCRIPTION**

A syntax or internal error has surfaced during verilog parsing. The message specifies where the error appeared and why it was issued.

#### **WHAT NEXT**

Internal errors indicate a problem which should be reported to your Synopsys representative.

### **VE-1 (error) Unable to open file '%s'**

#### **DESCRIPTION**

The specified file cannot be opened, which is most likely caused by the file being outside the search\_path. This error is also triggered if the file permissions prohibit read access.

#### **WHAT NEXT**

If the file exists in the current directory, ensure "." is present in the search\_path.

For files in other directories, add the directory to your search\_path.

Permissions problems can be ruled out by trying to view the file in an editor. Errors of this variety are not specific to Verilog.

### **VE-2 (warning) Unsized number %s is too big. It will be**

truncated to 32 bits %s

**DESCRIPTION**

**WHAT NEXT**

**VE-3** (error) Undefined variable '%s' used %s

**DESCRIPTION**

**WHAT NEXT**

**VE-4** (error) Variable '%s' defined more than once %s

**DESCRIPTION**

**WHAT NEXT**

**VE-5** (error) Cannot assign to constant '%s' %s

**DESCRIPTION**

**WHAT NEXT**

**VE-6** (error) Illegal assignment to reg '%s' %s

**DESCRIPTION**

**WHAT NEXT**

**VE-7** (error) Illegal assignment to wire '%s' %s.

## DESCRIPTION

Only continuous assignment is allowed for wire types. Most likely, a wire type was assigned inside an always block.

## WHAT NEXT

The assignment to a wire type should be moved outside the always block, or the assignment's target should be changed to a register type.

## EXAMPLE

The following example will trigger error VE-7:

```
wire tmp;

always @ (inp)
begin
 tmp = inp;

 ...
end
```

If continuous assignment is desired, move the assignment outside the always block.

```
wire tmp;

assign tmp = inp;

always @ (inp)
begin

 ...
end
```

If the assignment inside an always block is appropriate, the target of the assignment should be changed into a register type.

```
reg tmp;

always @ (inp)
begin
 tmp = inp;

 ...
end
```

## VE-8 (error) Module/Function name '%s' defined more than

once  
%S

## DESCRIPTION

### WHAT NEXT

**VE-9 (error)** Component '%s' instantiated more than once %s

## DESCRIPTION

### WHAT NEXT

**VE-10 (error)** Ambiguous direction declaration for port '%s'  
%S

## DESCRIPTION

The same port has been declared with differing directions.

### WHAT NEXT

If the port needs to be used as both input and output, declare the port to be of type "inout".

## EXAMPLE

The declarations below seek to declare 'result' as both input and output:

```
input [3:0] result; output [3:0] result;
```

To resolve the conflict, declare the port as inout:

```
inout [3:0] result;
```

The port will allow input and output operations, and the VE-10 error message will no longer be triggered.

**VE-11** (error) Port '%s' defined more than once %s

**DESCRIPTION**

**WHAT NEXT**

**VE-12** (error) Port '%s' used before being assigned a direction %s

**DESCRIPTION**

**WHAT NEXT**

**VE-13** (error) Port '%s' not defined in module terminal list but defined  
in an input/output/inout statement %s

**DESCRIPTION**

**WHAT NEXT**

**VE-14** (error) Port '%s' has no defined direction (input/output/  
inout)  
%s

**DESCRIPTION**

**WHAT NEXT**

**VE-15** (error) Attempt to disable block/function '%s' which is not active

%S

**DESCRIPTION**

**WHAT NEXT**

**VE-17** (error) Continuous Assignment made to reg '%S' %s.

**DESCRIPTION**

**WHAT NEXT**

**VE-18** (warning) Wand and Wor declarations treated as Wire declaration

**%S**

**DESCRIPTION**

**WHAT NEXT**

**VE-19** (error) Initial statement not supported %s

**DESCRIPTION**

**WHAT NEXT**

**VE-20** (error) Task statement not supported %s

**DESCRIPTION**

**WHAT NEXT**

**VE-21** (error) Depending on edge and non-edge expression not supported %s.

**DESCRIPTION**

The sensitivity list contains both level-sensitive and edge-sensitive registers. Edge-sensitive registers are indicated by the use of either posedge or negedge in the sensitivity list.

All registers in an always block must either be edge-sensitive or level-sensitive.

**WHAT NEXT**

A mix of level- and edge-sensitive registers requires separate always blocks. Move the level-sensitive registers into their own always block.

**VE-22** (error) Depending on 2 edges of same variable '%s' not

supported  
%S

#### DESCRIPTION

#### WHAT NEXT

**VE-23** (error) All asynchronous conditions must be tested in an "if" statement

%S

#### DESCRIPTION

#### WHAT NEXT

**VE-24** (error) You must specify an "else" clause for the clocked logic

%S

#### DESCRIPTION

#### WHAT NEXT

**VE-25** (error) Can't test variable '%s' because it wasn't in the event expression

%S

#### DESCRIPTION

This error occurs if a reg or wire that is not specified in the timing control of an 'always' block is tested inside an 'if' statement in the always block. In the example below, reset2 is tested in the 'if' statement but does not occur in the timing block (reset1 appear instead).

## EXAMPLES

```
module err (d, reset1, reset2, clk, q);
 input d, clk;
 input reset1, reset2;
 output q;

 always @ (posedge clk or negedge reset1)
 if (!reset2)
 q = d;
 end

endmodule
```

## WHAT NEXT

Introduce the offending reg or wire in the timing control of the 'always' block.

## VE-26 (error) Testing wrong polarity of variable '%s' %s

### DESCRIPTION

## WHAT NEXT

## VE-27 (error) Delay/Event control not allowed in continuous assignment statement

%s

**DESCRIPTION**

**WHAT NEXT**

**VE-28** (error) Resource '%s' defined more than once %s

**DESCRIPTION**

**WHAT NEXT**

**VE-29** (error) Resource '%s' not defined %s

**DESCRIPTION**

**WHAT NEXT**

**VE-30** (error) Expected semicolon (;) at end of statement %s

**DESCRIPTION**

**WHAT NEXT**

**VE-31** (warning) Resource declaration legal only in functions  
and blocks

%s

**DESCRIPTION**

**WHAT NEXT**

**VE-32** (warning) Attributes for resources can be assigned only  
in functions  
and blocks %s

**DESCRIPTION**

**WHAT NEXT**

**VE-33** (warning) Directive '%s' must be scoped inside a function  
%s

**DESCRIPTION**

**WHAT NEXT**

**VE-34** (warning) Illegal directive '%s' ignored %s

**DESCRIPTION**

**WHAT NEXT**

**VE-35** (warning) Directive '%s' must be scoped inside a module

%S

**DESCRIPTION**

**WHAT NEXT**

**VE-36** (warning) Directive '%s' declared more than once %S

**DESCRIPTION**

**WHAT NEXT**

**VE-37** (error) Unknown enumerated type '%s' %S

**DESCRIPTION**

**WHAT NEXT**

**VE-38** (error) Declaration of enumeration type requires range specification  
%S

**DESCRIPTION**

**WHAT NEXT**

**VE-39** (error) Enumerated type '%s' declared more than once

**%S**

**DESCRIPTION**

**WHAT NEXT**

**VE-40** (warning) Value assignment to parameters of instantiated modules is not supported. It is ignored %S

**DESCRIPTION**

**WHAT NEXT**

**VE-41** (warning) Port number %d of module '%S' was renamed to '%S'.

**DESCRIPTION**

Typically this warning occurs when unusual characters are used to form a port name. The use of brackets in a port name is an example of when this warning can be triggered. HDL Compiler renames the original port so that it can process the design.

**WHAT NEXT**

For port names containing brackets, change the name so it no longer uses brackets.

**VE-42** (warning) TIME declarations are not supported %s

**DESCRIPTION**

**WHAT NEXT**

**VE-43** (warning) EVENT declarations are not supported %s

**DESCRIPTION**

**WHAT NEXT**

**VE-44** (warning) DEFPARAM is not supported %s

**DESCRIPTION**

**WHAT NEXT**

**VE-45** (error) Resource declarations are not allowed in unnamed blocks

%s

**DESCRIPTION**

**WHAT NEXT**

**VE-46** (error) Attribute declarations are not allowed in unnamed blocks

%s

**DESCRIPTION**

**WHAT NEXT**

**VE-47** (warning) Width specified for number %s is too small.  
Higher order bits will be truncated %s

**DESCRIPTION**

**WHAT NEXT**

**VE-48** (error) Incorrect number of terminals for bufif/notif %s

**DESCRIPTION**

**WHAT NEXT**

**VE-49** (error) Expected identifier to label resource %s

**DESCRIPTION**

**WHAT NEXT**

**VE-50** (error) End of file seen before %s block begun at line %d  
was ended

**DESCRIPTION**

A comment, directive or dc\_script crossed the end of file boundary, indicating it wasn't terminated appropriately. This problem likely involves an unbalanced "/\*", which will need a terminating "\*/".

## WHAT NEXT

For run-on comments or dc\_script\_begin, examine the lines immediately after the one specified in the error. Mark the boundary between code and comment with a terminating "\*/".

For (preprocessor) directives, its very likely an 'ifdef or 'else was not completed with an 'endif. Determine what code should fit within the 'ifdef, and end it with an 'endif.

## VE-51 (error) Illegal use of array of register '%s' %s

### DESCRIPTION

#### WHAT NEXT

## VE-52 (error) 'include' directive requires a filename enclosed in double quotes

%s

### DESCRIPTION

A missing or misformed include filename can trigger this error. Here is an example usage of 'include':

```
'include "myfile.v"
```

#### WHAT NEXT

Provide the filename, if missing.

Preface the filename with a double-quote ("), and place another double-quote after the last character in the filename.

## VE-53 (error) Recursive file inclusion detected for file "%s"

### DESCRIPTION

A circular dependency was found in the use of an 'include directive. This error is issued to prevent a file from including itself in an endless loop. Breaking the need for an 'include loop will avoid triggering this error.

A file that directly includes itself most likely meant to include another file with a similar name.

## WHAT NEXT

Examine the need for the nested 'include. Most likely, several files all depend on each other. The dependencies should be split up so that one file does not depend on any of the others. This can be achieved by moving needed code or 'defines to one central file. When one file no longer depends on the others, the corresponding 'include(s) can be removed from that file. This should break the 'include loop and avoid the VE-53 error.

## VE-54 (error) RTL assignments are allowed only when no blocking delays are used

%S

### DESCRIPTION

This error occurs when RTL assignments and blocking delays are specified in the same module. RTL assignments are assignments made using the "<=" operator. Blocking delays are delays specified using the "#" construct (as in foo = #5 bar; or as in #7 foo = bar;).

## WHAT NEXT

If you need to use RTL assignments, remove the blocking delays from your description. (Delays are ignored by the synthesis tool.)

## VE-55 (error) Blocking delays are allowed only when no RTL assignments are used

%S

### DESCRIPTION

## WHAT NEXT

## VE-56 (error) RTL assignments are not allowed for wires

**%S**

## **DESCRIPTION**

### **WHAT NEXT**

**VE-57 (error)** A reg can only be assigned with all RTL assignments or all procedural assignments %s.

## **DESCRIPTION**

The two different methods of assignment are incompatible. Procedural assignments provide access to assigned values in the current clock cycle. A value passed along from variable A to variable B to variable C through a procedural assignment winds up with all three having the same value in every clock cycle. In the netlist, procedural assignments are indicated when the input net of one flip-flop is also connected to the input net of another. Both flip-flops will input the same value in the same clock cycle.

Values generated by RTL assignment are passed on in the next clock cycle. An assignment from variable A to variable B takes place after one clock cycle, provided that variable A has previously been the target of an RTL assignment. An assignment from variable B to variable C will always take place after one clock cycle, since B was the target of an RTL assignment of variable A's value. Variable A will transmit its current value to variable C in two clock cycles. In the netlist, this method of assignment shows up as flip-flop B getting its input from the output net of flip-flop A. The value held by flip-flop A will take one clock cycle to propagate to flip-flop B.

A given register can only follow one of the assignment methods. The VE-57 error message indicates a single register is assigned with both procedural and RTL assignment methods. This usage does not clearly specify if the register's value should be available in the current cycle or the next cycle.

### **WHAT NEXT**

Decide if a register's value, when passed on, should be that of the current clock cycle or the next clock cycle. If only one method of assignment was intended, fix the unintended use of the other method of assignment.

If both styles of assignment are needed, two variables are required in place of the original. One variable will be the target of procedural assignments and uses, while the other is used in RTL assignments.

## EXAMPLE

The following example illegally mixes RTL and procedural assignment.

```
always @(posedge clk) begin
 tmp1 = input1 + input2;
 output1 = tmp1;

 tmp1 <= input1 + input2;
 output2 <= tmp1;
end
```

The intent appears to be providing the value of `(input1 + input2)` on `output1`, and the same value should be delayed one clock cycle before appearing on `output2`. Since `tmp1` is the target of both methods of assignment, a VE-57 error is triggered by the aforementioned HDL. To retain the same intent, a second variable is introduced which interacts with the RTL assignments:

```
always @(posedge clk) begin
 tmp1 = input1 + input2;
 output1 = tmp1;

 tmp2 <= tmp1;
 output2 <= tmp2;
end
```

The previous example avoids targeting the same variable with RTL and procedural assignments. Register `tmp1` is targeted by the procedural assignment, while new variable `tmp2` is targeted by the RTL assignment.

## VE-58 (error) Identifier '%s' previously declared %s

### DESCRIPTION

### WHAT NEXT

## VE-60 (error) Unable to open file '%s' included by the 'include' directive %s

### DESCRIPTION

The specified file cannot be opened, which is most likely caused by the file being

outside the search\_path. This error is also triggered if the file permissions prohibit read access.

## WHAT NEXT

If the file exists in the current directory, ensure "." is present in the search\_path.

For files in other directories, add the directory to your search\_path.

Permissions problems can be ruled out by trying to view the file in an editor. Errors of this variety are not specific to Verilog.

## **VE-61** (warning) Assignments to supply nets are ignored %s

### DESCRIPTION

### WHAT NEXT

## **VE-62** (warning) 'use\_mux' directive is not supported %s

### DESCRIPTION

### WHAT NEXT

## **VE-70** (error) Access to variables external to a module is not allowed from inside functions and tasks %s

### DESCRIPTION

### WHAT NEXT

## **VE-71** (error) Assignment to external variables is not supported

'%S'

**DESCRIPTION**

**WHAT NEXT**

**VE-72** (error) %s is not a construct in up or down path of module  
'%S'

**DESCRIPTION**

**WHAT NEXT**

**VE-73** (error) Component %s has not been instantiated in  
module  
'%S'

**DESCRIPTION**

**WHAT NEXT**

**VE-74** (error) Module %s not defined

**DESCRIPTION**

**WHAT NEXT**

**VE-75** (error) Intra module hierarchical name (%s) not

supported in module '%s'

**DESCRIPTION**

**WHAT NEXT**

**VE-76** (error) Cannot find symbol '%s' in module '%s'

**DESCRIPTION**

**WHAT NEXT**

**VE-77** (error) Nested module names and intra-module  
hierarchical names not supported

in module '%s'

**DESCRIPTION**

**WHAT NEXT**

**VE-78** (error) Cannot find variable %s in module '%s'

**DESCRIPTION**

**WHAT NEXT**

**VE-79** (error) Module %s defined more than once

**DESCRIPTION**

**WHAT NEXT**

**VE-80** (error) (Internal error) Unable to add extra port to contained design

**DESCRIPTION**

**WHAT NEXT**

**VE-81** (error) (Internal error) Unable to create connection for

new port

**DESCRIPTION**

**WHAT NEXT**

**VE-91** (error) In an event expression with 'posedge' and 'negedge' qualifiers, only simple identifiers are allowed %s

**DESCRIPTION**

**WHAT NEXT**

**VE-92** (error) The expression in the reset condition of the 'if' statement in this 'always' block can only be a simple identifier or its negation (%s)

**DESCRIPTION**

**WHAT NEXT**

**VE-93** (error) The statements in this 'always' block are outside the scope of the synthesis policy (%s). Only an 'if' statement is allowed at the top level in this 'always' block. Please refer to the HDL Compiler reference manual for ways

to infer flip-flops and latches from 'always' blocks.

#### **DESCRIPTION**

#### **WHAT NEXT**

**VE-94** (error) Asynchronous conditions for an 'always' block can only be compared to 0 or 1 %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VE-95** (error) Unsupported global reference %s

#### **DESCRIPTION**

In a previous release, the HDL Compiler provided limited support for global references. This is no longer true.

#### **WHAT NEXT**

Please rewrite your description without using globals. Normally, this can be done by passing signals through module inputs and/or outputs.

**VE-96** (error) Redefinition of Object %s %s

#### **DESCRIPTION**

Object redefined when it is not allowed

#### **WHAT NEXT**

Change the name in the second definition

## **VE-97 (error) Mismatched directive %s**

### **DESCRIPTION**

Compiler directive used with wrong coupling. For example, an ``endif'' is used without a corresponding ``ifdef'' before it.

### **WHAT NEXT**

Delete the mismatched directive or add the missed one.

## **VE-98 (warning) Macro %s is redefined %s**

### **DESCRIPTION**

The same macro name is provided two different definitions, leading to a single macro name having different meanings in separate parts of the HDL. Although not an error, this is a potentially hard to find and confusing problem.

### **WHAT NEXT**

If the duplicate macro definition was accidental, provide a different name for one of the usages.

If the duplicate usage is intentional, this warning can be avoided by performing an 'undef' of the macro name before each duplicate definition.

## **VE-100 (warning) No arguments specified for pragma '%s' %s**

### **DESCRIPTION**

### **WHAT NEXT**

## **VE-101 (warning) Pragma '%s' requires two arguments. The**

second argument must be a string enclosed in double quotes %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VE-102 (warning)** Pragma '%s' accepts only one argument %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VE-103 (warning)** More than one %s pragma specified for %s  
%s

#### **DESCRIPTION**

A set/reset or multibit pragma was specified on the same signal more than once. For set/reset pragmas, a pragma may have been specified on the same block more than once. This warning is issued at the point where the duplicate pragma usage was detected.

#### **WHAT NEXT**

Find the first usage of the pragma, then determine which use of the set/reset or multibit pragma can be removed.

**VE-104 (warning)** The pragma '%s' for object %s will be ignored because the object could not be accessed.

#### **DESCRIPTION**

When a pragma is defined for an object, an attribute is placed on the object. If the object cannot be found, this pragma has no effect.

#### **WHAT NEXT**

Check HDL source to make sure that the object—usually a port, wire, or variable—is

specified before the pragma is defined.

## **VE-105** (error) %s has already been specified as a master process for a slave process %s

### **DESCRIPTION**

### **WHAT NEXT**

## **VE-106** (error) %s has already been specified as a slave process for a master process %s

### **DESCRIPTION**

### **WHAT NEXT**

## **VE-107** (warning) The "master\_process\_is/slave\_process\_is" pragma has been ignored because the %s process'%'s' could not be found.

### **DESCRIPTION**

### **WHAT NEXT**

## **VE-108** (error) For loop termination condition does not match index direction %s

### **DESCRIPTION**

This error occurs when you use a "<" or "<=" with a decrementing loop, or a ">" or ">=" with an incrementing loop.

## WHAT NEXT

Change the loop termination comparison to match the direction of the loop index.

## EXAMPLE

The follow example demonstrates all eight possible combinations of loop bounds, termination conditions, and index directions. The loops labeled "Zero Iterations" are legal, but they have no effect since the loop initialization already violates the termination condition.

```
module test(a);
output [0:1] a;
reg [0:1] a;

integer i;

always @(* a) begin
 for(i=0; i<=1; i=i+1) a[i] = 1'b1; /* OK */
 for(i=0; i<=1; i=i-1) a[i] = 1'b1; /* Error */
 for(i=0; i>=1; i=i+1) a[i] = 1'b1; /* Error */
 for(i=0; i>=1; i=i-1) a[i] = 1'b1; /* Zero Iterations */

 for(i=1; i<=0; i=i+1) a[i] = 1'b1; /* Zero Iterations */
 for(i=1; i<=0; i=i-1) a[i] = 1'b1; /* Error */
 for(i=1; i>=0; i=i+1) a[i] = 1'b1; /* Error */
 for(i=1; i>=0; i=i-1) a[i] = 1'b1; /* OK */
end

endmodule
```

**VE-109 (information)** Make sure there is an assertion block in the design for directive '%s' %s.

## DESCRIPTION

Directive 'one\_hot' indicates at most one object in its group can have a *Logic1* value at any instance of time, all other objects must have a *Logic0* value. Directive 'one\_cold' indicates at most one object in its group can have a *Logic0* value at any instance of time, all other objects must have a *Logic1* value. This information is used when inferring sequential logic.

## WHAT NEXT

For a directive //synopsis *one\_hot* "set, reset", add a block in the design like the following example.

```
// synopsys translate_off
always @(set or reset)
begin
 if (set + reset > 1)
 $write("ONE-HOT violation for set, reset");
end
// synopsys translate_on
```

For a directive `//synopsys one_cold "set, reset"`, add a block in the design like the following example.

```
// synopsys translate_off
always @(set or reset)
begin
 if ({~set} + {~reset} > 1)
 $write("ONE-COLD violation for set, reset");
end
// synopsys translate_on
```

**VE-110** (warning) The directive '`%s`' for the group containing object '`%s`'  
is ignored because the object is not defined `%s`.

#### DESCRIPTION

#### WHAT NEXT

**VE-111** (warning) The directive '`%s`' requires an argument containing  
more than one object `%s`.

#### DESCRIPTION

#### WHAT NEXT

**VE-112** (error) The directive '`%s`' must be scoped inside a

named block %s.

## DESCRIPTION

## WHAT NEXT

Create a *label* for the 'always' block in which you want to apply this directive. Use the directive after 'begin:*label*'.

**VE-120 (warning)** This design contains multiple nets of type 'wired\_and' or 'wired\_or'. Please see the extended message for this warning for more information.

## DESCRIPTION

The circuit synthesized by the (V)HDL Compiler can have a potential mismatch with simulation if a wire (signal in VHDL) or reg (variable) drives (through the use of the 'assign' construct in Verilog, '<=' construct in VHDL) more than one wire(signal) whose resolution is of type 'wired\_and' or 'wired\_or'.

In the following example, 'a' drives two wires(signals) 'e' and 'f' which are of resolution 'wired\_or'.

## EXAMPLES

### Verilog

```
wor e,f;

assign f = a;
assign f = b & d;

assign e = a;
assign e = c & d;
```

## WHAT NEXT

Instantiate explicit buffers to do the assignment to the wor or wand net. Do not use the Verilog 'buf' construct. Use a GTECH BUF gate or a buffer from your target

```
library
```

## EXAMPLES

### Verilog

```
wor e,f;

GTECH_BUF U1 (.A(a), .Z(f));
// assign f = a;
assign f = b & d;

GTECH_BUF U2 (.A(a), .Z(e));
//assign e = a;
assign e = c & d;
```

**VE-121 (warning)** This design contains event in verilog assignment. Please see the extended message for this warning for more information.

## DESCRIPTION

The circuit synthesized by the (V)HDL Compiler can have a potential mismatch with simulation if an assignment in verilog contains event.

## EXAMPLES

### Verilog

```
q = @ (posedge ck) d;
```

Only one reg will be inferred if above assignment is used.

## WHAT NEXT

Use the following assignments to replace above assignment if you want to have two regs inferred.

```
reg temp;

temp = d; @ (posedge ck); q = temp;
```

**VE-122 (warning)** Parameter range specification is only meaningful to synthesis. Different result may exist from simulations %s.

## DESCRIPTION

Some simulators may ignore the range specification and expand the parameter to 32 bits. The circuit synthesized by the (V)HDL Compiler can have a potential mismatch with simulation if range specification is used in parameter declaration. For the following example, the value of "out" from simulator may be 0, while (V)HDL Compiler gives the value 16.

## EXAMPLE1

### Verilog

```
output [4:0] out;
parameter [3:0] a = 0;

assign out = {1'b1, a};
```

For the following example, the value of "a" from simulator may be 10, while (V)HDL Compiler gives the value 2. The leftmost bit is chopped out.

## EXAMPLE2

### Verilog

```
parameter [2:0] a = 4'b1010;
```

## WHAT NEXT

Accordance between synthesis and simulation must be checked by the user where the bit width of the parameter is referred.

**VE-123 (warning)** This design contains assignment from wire to reg. Please see the extended message for this warning for more information.

## DESCRIPTION

The circuit synthesized by the (V)HDL Compiler can have a potential mismatch with simulation if an expression containing wire is assigned to a reg.

## EXAMPLES

### Verilog

```
input a;
reg p;
reg q;

wire x = p;

always @ (posedge CLK)
 p = a;
 q = x;
end
```

Two regs will be inferred for synthesis. While for certain simulation tools, it may simulate only as one reg. (e.g. VCS will simulate the above code as one reg)

**VE-124 (error)** Constant at RHS can not fit into LHS %s.

## DESCRIPTION

The value of the right-hand side is outside the range of the left-hand side.

## EXAMPLE

### Verilog

```
parameter [2:0] a = 14;
```

```
parameter [2:0] b = 4'b1110;
```

## WHAT NEXT

Declare a proper range for the left-hand side. Or check the value on the right-hand side to ensure that the range of the left-hand side covers that of the right-hand side.

**VE-125 (warning)** The '%s' '%s' is not a legal Verilog identifier.  
It has been renamed to '%s'.

## DESCRIPTION

This warning is generated when the identifier contains illegal Verilog character.

## WHAT NEXT

Please refer to Verilog reference manual and change it to legal Verilog character if you do not want it to be renamed.

**VE-126 (warning)** Port %s has been declared previously with a different type %s

## DESCRIPTION

The port warned has been declared previously with a different type.

### Verilog

```
module test (..., dataout);
output dataout;
reg [2:0] dataout;
```

Here dataout has been previously declared as one-bit, and later on declared as [2:0]. This may cause simulation, synthesis and formal verification mismatch due to the different interpretation in different tools as what's type of dataout.

## WHAT NEXT

Change your Verilog source code to remove the inconsistent declaration for the port.

## VE-127 (error) Ascending range in enum declaration is not supported with hdlin\_enable\_presto = false

### DESCRIPTION

Ascending range in enum declaration is not supported with `hdlin_enable_presto = false`.

### WHAT NEXT

Please either change the ascending range into descending range or restore `hdlin_enable_presto` to its default value TRUE.

## VE-128 (error) Bussed clock is not longer supported in HDLC. Use Presto Verilog instead.

### DESCRIPTION

Bussed clock is no longer supported in HDLC.

### WHAT NEXT

Please either recode the Verilog source code, or use Presto Verilog instead.

## **VER**

**VER-1** (warning) %s Redundant digits given in number %s.

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

**VER-2** (warning) %s Unknown debug option %s

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

**VER-4** (warning) %s Incompatible port connection, port %d of instance %s in module %s.

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

**VER-5** (warning) %s Mismatch in number of ports for instance

## %S

### DESCRIPTION

This is a syntax error.

### WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

## VER-8 (warning) %s Hierarchical component name %s is a macromodule and not expandable.

### DESCRIPTION

This is a syntax error.

### WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

## VER-9 (warning) %s Illegal synopsys label pragma, it will be ignored.

### DESCRIPTION

When synopsys label pragma is put wrong place, this warning message will be dumped. Presto ignores this label pragma.

### WHAT NEXT

Put the label pragma into right place.

## VER-12 (error) %s Hierarchical component name %s is not a

# module, task, function, or block

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-15 (error) %s The call to '\$display' does not have enough arguments to satisfy all format specifiers.

## DESCRIPTION

This error message occurs if you supply a format string when using the '\$display' system function, and there are not enough subsequent parameters to supply each token in the specifier.

In the following example, the format specifier "%s%s%d" contains three tokens and requires at least three values, which are a, b, and c.

```
$display ("%s%s%d", a, b, c);
```

## WHAT NEXT

Correct any occurrences of insufficient parameters for the specified format string in the Verilog code.

## SEE ALSO

[analyze\(2\)](#)

# VER-16 (error) %s First parameter of \$dumpvars must be an integer

## DESCRIPTION

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-17 (error) %s Incompatible number of arguments, usage versus declaration.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-18 (error) %s Bounds %s for vector %s must be integer.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-19 (error) %s +liborder and +librescan conflict; only one can be specified.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-20 (error) %s Package %s does not export the name '%s'.**

## **DESCRIPTION**

This message issues when the System Verilog scope operator (:) tries to extract content from the specified package, but the name was either not found in the global scope of that package, or its package-level definition is marked as not exportable.

## **WHAT NEXT**

Check that the package name is correct and that the source code with the desired definition has been analyzed without errors more recently than any other package with the same name. If the supplying package is at fault, re-analyze it and also the present file. If the consuming reference is not correct, adjust the RTL and re-analyze. The setting of `hdlin_sv_packages` can also affect whether names imported into a package can be re-exported.

## **SEE ALSO**

`analyze` (2), `read` (2), `hdlin_sv_packages` (3), **VER-26** (n), **VER-934** (n).

# **VER-21 (error) %s Multiple conflicting definitions of '%s' are available via wildcard imports.**

## **DESCRIPTION**

This message issues when you use a name which you have not previously declared that has more than one distinct definition supplied through several wildcard import routes (`import pkg_A::*, pkg_B::*;`) into the same surrounding scope.

When all imported packages are analyzed with `hdlin_sv_packages` set to `dont_chain`, this error corresponds to the prohibition in section 19.2.1 of IEEE-1800-2005: a name may come from at most one wildcarded package. Packages analyzed with `hdlin_sv_packages` set to `chain` or `enable`, may also export names that they imported from elsewhere. Thus a single common definition for name might arrive via several paths, VER-21 issues only when multiple source definitions are import candidates, and no import is more local than the others at the point of use.

## **WHAT NEXT**

There are many RTL source code adjustments of the import statements and/or the name reference that could clear this condition: You could place the wildcard imports at different levels in the scope stack so that the preferred supplier shadows the unwanted supplier. You could add an explicit "import desired\_supplier::name;" you could prefix the package scope extraction operator "desired\_supplier::" to the name reference to indicate the desired package. You might delete the import of an unused

package that causes the conflict. You could correct a spelling to avoid the collision. You could supply a missing local declaration of the name in the overloaded scope to override the wildcard imports. You could explicitly declare the name with a local meaning.

If you believe the RTL as written is correct, check that the current search\_path reaches .pvk files that were produced by successfully analyzing the current versions of these packages' source files. The setting of `hdlin_sv_packages` *at the time those packages were analyzed can also affect whether names imported into them will be re-exported, which might be either producing or exposing the observed name conflict.*

## SEE ALSO

`analyze` (2), `read` (2), `hdlin_sv_packages` (3), `ELAB-106` (n).

# VER-22 (error) %s Too many parameters found on task %s.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-23 (error) %s The %s parameter is not completely writable and it is being passed to an OUTPUT or INOUT formal parameter.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# **VER-25 (error) %s Module '%s' is redefined.**

## **DESCRIPTION**

You receive this message to inform you that during execution of the **analyze** or **read** command the compiler has encountered in your design a module declaration that has the same name as a previously defined module. Each module name must be unique.

## **WHAT NEXT**

Rename one of the modules so that all modules have unique names.

## **SEE ALSO**

**analyze** (2), **read** (2).

# **VER-26 (warning) %s The package %s has already been analyzed. It is being replaced.**

## **DESCRIPTION**

You receive this warning message if a package with the same name was analyzed by a previous read or analyze command, possibly during a different DC shell session. This can occur in three possible ways:

- The file currently being analyzed has already been analyzed.
- A package with the same name is declared in another file analyzed in the current work directory.
- You have modified the package's source file and are reanalyzing it.

The previous package contents are removed, and possibly overwritten by the declaration currently being analyzed.

## **WHAT NEXT**

This is only a warning message.

However, you can check the overwritten file. If the result is not what you intended, change the package name and run the command again.

All references to a revised package should be re-analyzed to insure that they are coherent. Failure to do this is one source of ELAB-106 warnings, VER-20, and various

type-mismatch errors.

## SEE ALSO

`analyze` (2), `read` (2), `ELAB-106` (n), `VER-20` (n), `VER-930` (n).

**VER-27 (error) %s Package %s has already been used or declared during this command.**

## DESCRIPTION

This error issues if a package is used before being (re)declared within the same analyze or read command. There are many ways this condition can arise. In addition to use-before-declaration within a single file: the file currently being analyzed, a copy of that file, or another file declaring or using a package with the same name may have appeared earlier in the file list of this command, been 'include'd there, or been indirectly imported by earlier package reference(s).

## WHAT NEXT

Arrange your command line(s) so that every package is analyzed or read exactly once before its first use.

Use a separate analyze command to update or change a package's definition. All references to a re-analyzed package should also be re-analyzed to insure that they are coherent. Failure to do this is one source of ELAB-106 ("homograph") warnings and type-mismatch errors.

## SEE ALSO

`VER-26` `VER-227` `ELAB-106` `analyze` (2), `read` (2).

**VER-28 (error) %s %s is a function and not a task**

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-30 (error) %s Stack overflow. %s

## DESCRIPTION

All applications and tools need an internal stack to execute. This stack can grow up to a limit set by command limit, on csh interpreters, or command ulimit, on sh interpreters. This message is issued when RTL compilation cannot complete because the internal stack did overflow.

This may happen when:

- Your design has an infinite or very long iterative loop and you set a high value for hdlin\_while\_loop\_iterations.
- Your design has a deeply nested construct, like a deeply parenthesized expression. This rather happens with code generated by other tools, not with hand coded sources.

Note that this message may be shown for loops that finish in simulation, but are infinite in synthesis. One example of infinite loop, and thus unsupported, is this design:

```
module sum (input [3:0] in, output reg [7:0] out);
reg [3:0] i;
always @* begin
 i = in;
 out = 0 ;
 while (i>0) begin
 out = out + i;
 i = i - 1;
 end
end
endmodule
```

This example will not finish in synthesis because the terminating condition depends on a port and therefore is never a proper constant.

## WHAT NEXT

Please review your code and ensure that the terminating condition of an iterative loop will be eventually constant true. It is always difficult to determine if an iterative loop will eventually finish, but VER-30 message is usually shown when it is infinite.

In very unusual cases, the VER-30 message is shown because the stack size limit is not big enough. Please check the current stack size limit (with command "limit stacksize" on csh interpreters or command "ulimit -s" on sh interpreters), increase it significatively (for example with command "limit stacksize 100m" on csh interpreters or command "ulimit -S -s 104857600" on sh interpreters) and restart design compiler. Try to analyze and elaborate your design again. If the message persists or the current stack size is unlimited, please reevaluate about a probable infinite loop.

Note that if your design has an infinite loop and the stack size limit is increased, Design Compiler will also take quite more time to show the stack overflow message.

If your design has been generated by another tool, this error message may be due to a deeply nested construct. In such a case increase the stack size limit as explained above, restart Design Compiler and analyze and elaborate your design again.

## SEE ALSO

**analyze** (2), **elaborate** (2), **ELAB-901** (n), **ELAB-900(n)**.

# VER-35 (warning) %s Register (%s) is the target of both blocking and nonblocking assignments in the same process.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-36 (error) %s Internal error: %s, in %s at line %d

## DESCRIPTION

This message issues when RTL compilation cannot complete because the compiler reached some detectably invalid internal state. Internal cross-checks are used extensively in the Presto RTL compilers to prevent software bugs from producing erroneous results - often called "bad logic". RTL code which conforms closely to the IEEE standards ( 1364, 1800, or 1076 ) and lies within the synthesizable subsets of those languages should, of course, not encounter internal compiler errors.

## WHAT NEXT

Contact Synopsys support who can help you further diagnose this problem and can often help you find a coding workaround, or a compiler release where the bug has been fixed.

If you encounter an internal error when using the most recent release from Synopsys, submit a testcase that reproduces the problem to the Synopsys Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at <http://solvnet.synopsys.com/ReleaseLibrary>.

For information about creating, packaging, and sending a testcase, go to <http://www.synopsys.com/testcase>.

## SEE ALSO

**read** (2), **analyze** (2), **elaborate** (2), **ELAB-255** (n), **VER-37** (n).

# VER-37 (error) %s Internal error.

## DESCRIPTION

This error message occurs if the HDL Compiler encounters an internal error and cannot proceed. The command shell is not affected by this failure, so your work session can continue without loss of data. Internal errors in the HDL Compiler are usually related to one or two constructs that can be recoded to work around the problem until Synopsys releases a new compiler free of this defect.

The Presto HDL Compiler contains thousands of internal checks on its operation designed to catch miscompilation problems as close as possible to their source. Internal errors prevent the production of incorrect results.

## WHAT NEXT

If you encounter an internal error when using the most recent release from Synopsys, submit a testcase that reproduces the problem to the Synopsys Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at <http://solvnet.synopsys.com/ReleaseLibrary>.

For information about creating, packaging, and sending a testcase, go to <http://www.synopsys.com/testcase>.

# VER-38 (error) %s Internal error: %s

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

## **VER-40 (error) %s** Too many errors; can't continue.

### **DESCRIPTION**

The Presto HDL Compiler issues this error from the `read`, `analyze`, or `elaborate` commands when it has encountered too many errors to continue the compilation.

### **WHAT NEXT**

Correct all of the errors reported before this one, and repeat the command.

## **VER-41 (error) %s** Unable to open file '%s': %s.

### **DESCRIPTION**

This error message occurs when you issue a `read` or `analyze` command on a file that cannot be opened for reading or writing.

### **WHAT NEXT**

To write to a file, make sure that the directory named by the `hdlin_output_dir` variable is writable, or change `hdlin_output_dir` to point to a writable directory. To read a file, make sure the file exists.

### **SEE ALSO**

`analyze(2)`  
`read(2)`

## **VER-43 (error) %s** Out of memory.

### **DESCRIPTION**

This may indicate syntax errors.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-44 (warning) %s** Little argument or return value checking

implemented for system task or function %s.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-51 (error) %s internal error: %s

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-55 (error) %s Illegal character in module, interface, or package name.

## DESCRIPTION

You receive this error message when the name you specified for a module, interface, or package cannot be directly used to name a file in the host file system. This is usually due to some reserved characters, such as '/' or ':'. Names in the standard *definitions name space* exist as file system objects and must conform to host or network naming conventions in addition to Verilog lexical rules.

For example, a/b/c is an invalid module name.

## WHAT NEXT

Change the module name in the relevant code to conform to the rules for file names in the host file system and run the command again.

## **VER-59 (error) %s Array index out of bounds %s.**

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-60 (error) %s Array index out of bounds %s.**

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-61 (warning) %s Statement unreachable %s.**

### **DESCRIPTION**

This warning is issued when statements inside of conditional branches can't be reached, because the condition is always false or a previous condition is always true.

### **WHAT NEXT**

Check the conditions of conditional statements like: if, case, when, ?, ...

## **VER-65 (error) %s Option**

'hdlin\_decoder\_min\_use\_percentage' must be in the range 0..100 (currently %d).

### **DESCRIPTION**

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-66 (warning) %s Won't infer decoders with input width > %d; option '%s' set too large.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-86 (warning) %s Comparison against 'x' values not inside a casex is always false.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-97 (error) %s No input files specified.

## DESCRIPTION

You receive this error message because no input files were specified with the **analyze** or **read** command for the Presto HDL Compiler. These commands require that one or more input files be specified.

## WHAT NEXT

Execute the **analyze** or **read** command and specify one or more input files.

## **SEE ALSO**

`analyze (2)`, `read (2)`.

# **VER-98 (error) %s RP group '%s' is defined multiple times.**

## **DESCRIPTION**

You receive this error message when a RP group is defined multiple times.

## **WHAT NEXT**

Remove the duplication of RP group.

## **SEE ALSO**

`elaborate (2)`, `read (2)`.

# **VER-102 (warning) %s Variable '%s' does not accept the value '%d'. The value has been reset to a compatible value.**

## **DESCRIPTION**

This warning message occurs when a variable uses a value that is not supported by the current flow. The variable is reset to a compatible value as documented in the man page of the variable.

## **WHAT NEXT**

Verify that the value for the variable is within the allowed range, and that the value matches your design requirement.

## **SEE ALSO**

`analyze(2)`  
`elaborate(2)`  
`read (2)`

# **VER-103 (warning) %s Pragma is obsolete or not implemented.**

# It will be ignored.

## DESCRIPTION

A pragma is a compiler directive in the source code. The Presto HDL compiler does not implement certain pragmas that the Synopsys HDL Compiler does. This warning, which has occurred during **analyze** or **read** command activity, notifies you that the pragma in the design will not have the same effect it would have if you were to compile the design using the Synopsys HDL Compiler.

The Presto HDL compiler implements most of the commonly used compiler directives, but not some of the less frequently used ones.

## WHAT NEXT

If your design requires the use of the pragma the message refers to, use the Synopsys HDL Compiler to analyze and elaborate your design.

## SEE ALSO

**analyze** (2), **elaborate** (2), **read** (2).

# VER-104 (warning) %s The '%s' construct is not supported. It will be ignored.

## DESCRIPTION

This warning message occurs during an **analyze** or **read** command activity, and notifies you that the given construct in your design is not supported for synthesis.

## WHAT NEXT

Check your design to verify that it still functions correctly, even though the construct the message refers to is ignored.

To avoid this warning, surround the construct with the following compiler directives:

```
'ifndef SYNTHESIS
<construct>
'endif
```

When the Presto HDL Compiler sees these compiler directives, it does not interpret

the construct.

## SEE ALSO

`analyze(2)`  
`read (2)`

# VER-105 (warning) %s Call to function '%s' with no parameters is not standard Verilog.

## DESCRIPTION

You receive this message because, during a `read` or `analyze` command activity, the compiler encountered a call to a function or functions that used parentheses to indicate an empty parameter list.

IEEE standard Verilog requires that a function have at least one input argument. The Presto HDL compiler accepts functions with no arguments; however, many Verilog tools do not.

```
...
x = f(); // non-standard call to zero-argument function
...
```

## WHAT NEXT

Consider adding at least one input argument to the function in question to conform to IEEE standards.

## SEE ALSO

`analyze (2)`, `read (2)`, `VER-175 (n)`.

# VER-106 (error) %s Function declaration redeclares symbol '%s'.

## DESCRIPTION

You see this message because you have assigned a function declaration to a symbol that has already been defined.

In the following example, which demonstrates such a situation, the symbol `f` is declared twice: first as a register and then as a function:

```
reg f; // initial declaration of 'f'

function f; // illegal redeclaration of 'f'
...
endfunction
```

The example elicits the VER-106 message.

## WHAT NEXT

Rename either the function declaration or the other declaration and all corresponding uses of the symbol.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-107 (error) %s Functions cannot contain blocking delays.

## DESCRIPTION

You are seeing this message because, during the execution of the **read** or **analyze** command, the compiler has encountered blocking delays in your design. The Verilog standard states that functions execute in one (simulation) time unit and cannot contain time-controlling statements, such as blocking delays.

The following example demonstrates the incorrect use of blocking delays in a function body:

```
...
function f;
 input a;
begin
 #10; // illegal use of blocking delay inside a function
 f = a;
end
endfunction
...
```

## WHAT NEXT

For synthesis, remove the the blocking delays because the compiler does not accept them and terminates with this error.

## SEE ALSO

**analyze** (2), **read** (2).

# **VER-108 (error) %s Functions cannot contain event control statements.**

## **DESCRIPTION**

You receive this error message because you have attempted to use an event control statement inside of a function. According to the Verilog standard, functions shall execute in one simulation time unit, and are not allowed to contain time-controlling statements. Therefore, event control statements are not allowed inside functions.

The following example demonstrates the illegal use of an event control statement in a function body:

```
...
function f;
 input a;
 begin
 @(posedge clk); // illegal use of an event control statement in a function.
 f = a;
 end
endfunction
...
```

## **WHAT NEXT**

Rewrite the source code so that the functions do not contain any time-controlling statements.

## **SEE ALSO**

`analyze (2), read (2).`

# **VER-109 (error) %s Function arguments cannot be declared as 'inout'.**

## **DESCRIPTION**

You receive this error message because you have declared a function argument as 'inout'. According to the Verilog standard, functions can have arguments declared as 'input' only. Declaring a function argument as 'inout', as illustrated in the following example, results in this error message.

```
...
function f;
 inout a; // illegal declaration of a function argument as 'inout'.
...
...
```

```
endfunction
...
```

## WHAT NEXT

Rewrite the code so that the function has 'input' arguments only. If you cannot avoid using 'inout' arguments, consider using a task instead of a function.

## SEE ALSO

`analyze (2), read (2).`

# VER-110 (error) %s Function '%s' not defined.

## DESCRIPTION

You receive this error message because no function with the given name has been defined.

## WHAT NEXT

Check to see if the specified function name was misspelled. If not, add a function declaration to define the missing function.

## SEE ALSO

`analyze (2), read (2).`

# VER-111 (error) %s Function arguments cannot be declared as 'output'.

## DESCRIPTION

You receive this error message because, according to IEEE Std 1364, functions can only have arguments declared as 'input'. Declaring a function argument as 'output', as illustrated in the following example, results in this error message.

```
...
function f;
 output a; // illegal declaration of a function argument as 'output'.
...
endfunction
...
```

## WHAT NEXT

Rewrite the code so that the function only has 'input' arguments. If you cannot avoid using 'output' arguments, consider using a task instead of a function.

## SEE ALSO

`analyze (2), read (2).`

# VER-112 (error) %s Illegal function declaration using empty parameter list.

## DESCRIPTION

You receive this error message because the function declaration was written with an empty parameter list.

The following example shows a function declaration that would generate this error.

```
function foo();
...
endfunction
```

The correct function declaration:

```
function foo;
...
endfunction
```

## WHAT NEXT

Rewrite the function declaration as shown in the example.

## SEE ALSO

`analyze (2), read (2).`

# VER-113 (error) %s Functions cannot enable tasks.

## DESCRIPTION

You receive this error message because you attempted to enable a task from a function. According to the IEEE Std 1364, tasks cannot be enabled from functions. The following is an example of this situation.

```
task t;
 ...
endtask

function f;
 ...
 t; // error: tasks cannot be enabled from functions.
endfunction
```

## WHAT NEXT

Rewrite the source code so that tasks are enabled only from processes or other tasks.

## SEE ALSO

[analyze \(2\)](#), [read \(2\)](#).

# VER-114 (error) %s Functions cannot contain 'wait' statements.

## DESCRIPTION

You receive this error message when you attempt to use a 'wait' statement inside of a function. According to the IEEE Verilog Standard 1364, functions shall execute in one simulation time unit and are not allowed to contain time-controlling statements. Therefore, 'wait' statements are not allowed inside functions.

The following example demonstrates the illegal use of a 'wait' statement in a function body.

```
...
function f;
 input a;
 begin
 wait (!a) f = a; // 'wait' not allowed inside a function.
 end
endfunction
...
```

## WHAT NEXT

Rewrite the Verilog source code so that functions do not contain any time-controlling statements.

## SEE ALSO

`analyze (2), read (2).`

# VER-115 (error) %s Redefinition of compiler directive '%s' not supported.

## DESCRIPTION

Redefining compiler directives using 'define' is not allowed. The following example is the illegal attempt to redefine the compiler directive 'define' itself:

```
'define define 2 // error: illegal redefinition of a
 // compiler directive
```

## WHAT NEXT

If a redefinition of the original directive was not intended, just rename the symbol such that it does not collide with a compiler directive.

# VER-116 (error) %s Redeclaration of symbol '%s' as parameter.

## DESCRIPTION

You receive this message if a symbol in a parameter declaration has already been declared, either as a parameter or as something else. In the following example, "in" is first declared as an input, then erroneously redeclared as a parameter.

```
input in;
...
parameter in = 1'b0; // erroneous redeclaration of input 'in'
 // as a parameter.
```

## WHAT NEXT

Decide which of the declarations is the intended one and remove or change the name in the other declaration. If you change the name in a declaration, ensure that you change all occurrences of that name.

## SEE ALSO

`analyze (2), read (2).`

# **VER-117 (error) %s Read-only expression '%s' passed to 'output' or 'inout' argument of a task or function.**

## **DESCRIPTION**

Task (or SV function) arguments declared with direction 'output' or 'inout' must receive an actual register, selection within a register, or other legal target of an assignment statement.

For example, the following two task calls are incorrect because neither an input nor a wire are registers, so they are not valid arguments to task output or inout parameters.

```
input a;
wire b;

task t;
 output x;
 begin
 x = 1'b0;
 end
endtask

always @(posedge clk)
begin
 t(a); // error: input is not a register
 t(b); // error: wire is not a register
end
```

## **WHAT NEXT**

Check the argument name or its positional order. If the task or function definition does not assign to the formal argument, restrict its direction to 'input'. Otherwise change the calling RTL to receive the task's (or function's) assignment into a register variable.

## **SEE ALSO**

```
analyze(2)
read(2)
VER-118(n)
```

# **VER-118 (error) %s Constant passed to an 'output' or 'inout'**

argument of a task or function.

## DESCRIPTION

Task (or SV function) arguments declared with direction 'output' or 'inout' must receive an actual register, selection within a register, or other legal target of an assignment statement.

The following task call is illegal because 1b0 is a constant value and not a valid argument to a task output or inout parameter.

```
task t;
 output x;
 ...
endtask

...
t(1'b0); // error: passing a constant value to an
 // 'output' parameter
```

## WHAT NEXT

Check the argument name or its positional order. If the task or function definition does not assign to the formal argument, restrict its direction to 'input'. Otherwise change the calling RTL to receive the task's (or function's) assignment into a register variable.

## SEE ALSO

```
analyze(2)
read(2)
VER-117(n)
```

**VER-119 (error) %s Wrong number of arguments in call to function or task '%s'.**

## DESCRIPTION

You receive this error message because the actual number of arguments in the function or task call does not match the number of formal arguments expected by the corresponding function or task.

## WHAT NEXT

Specify the correct number of arguments. Refer to the function or task declaration

to determine the number and order of the expected arguments.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-120 (error) %s Port '%s' not declared as 'input', 'output' or 'inout'.

## DESCRIPTION

The IEEE Verilog Standard 1364 requires that each port listed in a module port list be declared as input, output, or inout.

You receive this error because a port listed in the module port list is not declared subsequently as input, output, or inout.

The following example shows a correct port declaration:

```
module m (i, o);
 input i; // omitting this input declaration is an error.
 output o;
 reg o;

 always ...

endmodule
```

If the input declaration of port *i* is not present, an error is issued.

## WHAT NEXT

Add the missing port declaration, as either input, output, or inout.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-121 (error) %s Redeclaration of port '%s' is not allowed.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected that the same port is declared twice inside the same function, task, or module. Following is an example that illustrates this type

of error:

```
function f;
 input a;
 input a; // redeclaration of already declared port
 ...
endfunction;
```

## WHAT NEXT

Remove or rename as appropriate one of these ports.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-122 (error) %s Redeclaration of symbol '%s' as a real number is not allowed.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected a symbol declared twice, which is not valid.

In the following example, "r" is declared both as an integer and as a real number.

```
integer r;
real r; // error: invalid redeclaration of "r" as a real number
```

## WHAT NEXT

Remove or rename as appropriate one of the declarations.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-123 (error) %s Redeclaration of symbol '%s' not allowed.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-124 (error) %s Task or function argument must be specified.

## DESCRIPTION

This message issues when the Presto HDL Compiler parses an incomplete parameter list, or one with empty comma-delimited positions. It is an error to omit a parameter (argument) in the list used to enable (invoke) a task or function (unless, in SystemVerilog, the corresponding formal argument was declared with a default value initializer). Default initializers are not yet supported by Presto HDL.

The following example demonstrates a correct and an incorrect task call:

```
task not;
 input a;
 output y;
 ...
endtask

...
not(,o); // error: incomplete parameter list: first argument missing
not(a,b); // correct task call
...
```

## WHAT NEXT

Check the location of commas in this argument list. Specify any missing arguments.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-125 (error) %s called function (or task) '%s' not defined as a function (or task).

## DESCRIPTION

This error message occurs during `analyze` or `read` command activity when the Presto HDL Compiler detects a function (or task) that is not properly defined.

The specified function or task is either not defined at all, defined as something

other than a function (or task), or using a task as a function, or using a function as a task.

In Verilog-2005 and SystemVerilog standards, functions (or tasks) defined within anonymously scoped generate blocks are not accessible outside that block. For example:

```
module m #(parameter P=32) (output o);
 generate
 if (P>16)
 function f (input i);
 f = 1'b0 ;
 endfunction
 else
 function f (input i);
 f = 1'b1 ;
 endfunction
 endgenerate

 assign o = f(1'b0); /* Function 'f' is not visible */
 /* outside the generate block */
endmodule
```

## WHAT NEXT

Check that the name of the function (or task) is spelled correctly, and that the name is a valid definition of the function (or task).

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-126 (error) %s Called task '%s' not defined as a task.

## DESCRIPTION

You receive this message because, during `analyze` or `read` command activity, the Presto HDL Compiler has detected a task that is not properly defined.

The task, which a task call refers to, is not defined at all or it is defined as something other than a task.

## WHAT NEXT

Check to verify that the name of the task is spelled correctly. If it is, then you

need to supply a different (correct) definition of the task.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-127 (error) %s Called task '%s' not defined as a task.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected a task that is not properly defined.

The task, which a task call refers to, is not defined at all or it is defined as something other than a task.

## WHAT NEXT

Check to verify that the name of the task is spelled correctly. If it is, then you need to supply a different (correct) definition of the task.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-128 (error) %s Parameterless task call to task '%s' should not have parentheses.

## DESCRIPTION

Task calls that do not pass any parameters should not use parentheses to indicate an empty parameter list.

The following example demonstrates the right and the wrong way to call a task without parameters:

```
task t;
 ...
endtask

...
t(); // error: incorrect syntax for empty parameter list
t; // correct syntax without parentheses
...
```

## WHAT NEXT

Rewrite the task call as shown in the example above.

# VER-129 (warning) %s Intraassignment delays for blocking assignments are ignored.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected an intraassignment delay specified for a blocking assignment. Such delays have no meaning in synthesis, and the compiler ignores them.

Following is an example of an intraassignment delay.

```
y = #10 a;
```

## WHAT NEXT

Synthesis ignores intraassignment delays for blocking assignments, so it is acceptable to remove them in instances such as this.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-130 (warning) %s Intraassignment delays for nonblocking assignments are ignored.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected an intraassignment delay specified for a nonblocking assignment. Such delays have no meaning in synthesis, and the compiler ignores them.

Following is an example of an intraassignment delay.

```
y = #10 a;
```

## WHAT NEXT

Synthesis ignores intraassignment delays for nonblocking assignments, so it is acceptable to remove them in instances such as this.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-131 (error) %s Intra-assignment events for blocking assignments are unsupported in synthesis.

## DESCRIPTION

This error message occurs because intra-assignment events in blocking assignments are not supported for synthesis. For example:

```
y = @(posedge clk) a;
```

## WHAT NEXT

Rewrite the block so it does not use an intra-assignment event.

# VER-132 (error) %s Intra-assignment events for non-blocking assignments are not supported.

## DESCRIPTION

Intraassignment events for non-blocking assignments are not supported during synthesis. For example:

```
y <= @(posedge clk) a;
```

The correct synthesizable version is:

```
y <= a;
```

## WHAT NEXT

Remove the intraassignment event as shown above.

# VER-133 (warning) %s Intra-assignment repeat-event controls

for blocking assignments are ignored.

## DESCRIPTION

Intra-assignment repeat-event for blocking assignments do not have a meaning for synthesis and are ignored. For example:

```
y = repeat(3) @(posedge clk) a;
```

The correct synthesizable version is:

```
y = a;
```

## WHAT NEXT

Take out the repeat event specification as shown above.

**VER-134 (error) %s Variable '%s' is the target of both blocking and nonblocking assignments in the same always block.**

## DESCRIPTION

Mixing of blocking and nonblocking assignments to the same variable in the same always block is not supported in synthesis. For example:

```
always @(...) begin
 y <= a;
 y = a;
end
```

Verilog simulator performance is not improved by the mixing of blocking and nonblocking assignments in the same always block.

## WHAT NEXT

If the always block represents combinational logic, rewrite the always block to use only blocking assignments. If the always block represents sequential logic, rewrite the always block to use only nonblocking assignments.

**VER-135 (warning) %s Intra-assignment repeat-event controls**

for non-blocking assignment are ignored.

## DESCRIPTION

Intra-assignment repeat-event for non-blocking assignments do not have a meaning for synthesis and are ignored. For example:

```
y <= repeat(3) @ (posedge clk) a;
```

The correct synthesizable version is:

```
y <= a;
```

## WHAT NEXT

Take out the repeat event specification as shown above.

# VER-136 (warning) %s Function '%s' with non-empty body is mapped to '%s'; body will be ignored.

## DESCRIPTION

By mapping a function to a module, the module (instead of the function body) determines the implementation of the function. This warning is given to remind you the body of the function will be ignored.

The following example contains a function for which this warning message will be issued:

```
function f; // synopsys map_to_module add
 input a;
 input b;
begin
 f = a+b; // function body will be ignored.
end
endfunction
```

## WHAT NEXT

Make sure that the body of the function is indeed intended to be ignored in favor of the module the function is mapped to.

# VER-137 (error) %s Return port name '%s' conflicts with names

# of function input parameters.

## DESCRIPTION

The return port name specified by the 'return\_port\_name' pragma must be different from all formal parameters of the function the pragma is attached to. This error indicates that there is a conflict with one of the formal parameter names.

In the following example such a conflict is demonstrated: The return port name is specified to be "a", but a function parameter with the same name exists.

```
function f;
// synopsys map_to_module down
// synopsys return_port_name a
 input a;
 ...
endfunction
```

To resolve this error, the name of the function parameter is changed to "b" in the following example:

```
function f;
// synopsys map_to_module down
// synopsys return_port_name a
 input b;
 ...
endfunction
```

## WHAT NEXT

Change the name of the conflicting function parameter or the port name of the module the function is mapped to so that they don't conflict.

# VER-138 (warning) %s Extraneous argument for system function or task '%s' ignored.

## DESCRIPTION

The system function has been passed an unexpected additional argument. This argument will be ignored.

## WHAT NEXT

Remove the extra argument from the call. Refer to the function/task declaration to find out which arguments are actually required.

## **VER-139** (warning) %s Parameterless call to function '%s' should not have parentheses.

### **DESCRIPTION**

In Verilog, calls to functions without parameters should not use parentheses to indicate an empty parameter list; only the function identifier is used to call the function.

The following example indicates the correct and incorrect way to write a parameterless Verilog function call:

```
...
x = f(); // incorrect syntax: using parentheses
x = f; // correct syntax: using the function identifier only
...
```

### **WHAT NEXT**

Remove the parentheses as shown in the example above.

### **SEE ALSO**

**analyze** (2), **read** (2).

## **VER-140** (warning) %s Nonblocking assignments and blocking delays in the same process; potential simulation or synthesis mismatch.

### **DESCRIPTION**

This warning message occurs during **analyze** or **read** command activity, when the Presto HDL Compiler detects a nonblocking assignment and a blocking delay in the same process. This can cause simulation or synthesis mismatches.

The following is an example that causes the warning message:

```
always @(posedge clk) begin
 #10; // blocking delay is ignored
 out <= in; // nonblocking assignment
end
```

## WHAT NEXT

Review the code carefully to explore the potential for a simulation or synthesis mismatch.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-141 (error) %s Blocking delays and nonblocking assignments are not allowed in the same process.

## DESCRIPTION

You receive this message because, during `analyze` or `read` command activity, the Presto HDL Compiler has detected a nonblocking assignment and a blocking delay in the same process, which is invalid for synthesis.

Even though synthesis ignores blocking delays, it is important to recognize them in the two forms in which they occur. Blocking delays can stand alone or as part of an intra-assignment delay. The following example shows an instance of each form:

```
always @(posedge clk) begin
 a <= x; // nonblocking assignment
 #10; // blocking delay, not allowed with nonblocking assignment
 b = #10 y; // intraassignment delay, not allowed with nonblocking assignment
end
```

## WHAT NEXT

Synthesis ignores blocking delays, so it is acceptable to remove them in instances such as this.

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-142 (error) %s Nonblocking assignments and blocking delays are not allowed in the same process.

## DESCRIPTION

You receive this message because, during `analyze` or `read` command activity, the

Presto HDL Compiler has detected a nonblocking assignment and a blocking delay in the same process.

The following example demonstrates this invalid description:

```
always @(posedge clk) begin
 #10; // blocking delay
 out <= in; // nonblocking assignment, not allowed with blocking delay
end
```

## WHAT NEXT

Synthesis ignores blocking delays, so it is acceptable to remove them in instances such as this.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-143 (error) %s Blocking delays and nonblocking assignments are not allowed in the same process.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected a nonblocking assignment and a blocking delay in the same process, which is invalid for synthesis.

Even though synthesis ignores blocking delays, it is important to recognize them in the two forms in which they occur. Blocking delays can stand alone or as part of an intra-assignment delay. The following example shows an instance of each form:

```
always @(posedge clk) begin
 a <= x; // nonblocking assignment
 #10; // blocking delay, not allowed with nonblocking assignment
 b = #10 y; // intraassignment delay, not allowed with nonblocking assignment
end
```

## WHAT NEXT

Synthesis ignores blocking delays, so it is acceptable to remove them in instances such as this.

## SEE ALSO

**analyze** (2), **read** (2).

## **VER-144 (error) %s Incorrect naming of port found.**

### **DESCRIPTION**

You receive this message because the **read** or **analyze** command has detected an incorrect port name. A missing port name after '.' can cause the problem, as shown in the following example:

```
module test(a, . (b), c);
 input a, b;
 output c;

endmodule
```

### **WHAT NEXT**

Make sure the port name is complete.

### **SEE ALSO**

**analyze** (2), **read** (2).

## **VER-145 (error) %s Declarations are supported in named blocks only**

### **DESCRIPTION**

This error message occurs because declarations are allowed only in named blocks.

### **WHAT NEXT**

Correct the code by either removing the declarations inside the block, or giving the block a name.

### **SEE ALSO**

**analyze**(2)  
**read**(2)

## **VER-146 (warning) %s Time precision is less precise than the**

time unit.

## DESCRIPTION

This warning message advises you that time precision is usually more precise than the time unit.

## WHAT NEXT

This is a warning message only. No action is required on your part.

However, it is best practice to check the code and change the time precision to be more precise than the time unit where necessary.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-147 (error) %s Instantiation %s has mixed ordered and named port connections

## DESCRIPTION

This error message occurs because instantiation is using both ordered port connections and named port connections. Mixed ordered and port connections are not supported.

## WHAT NEXT

Change the code to use only ordered or only port connections.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-148 (error) %s Gate output %s must be a net

## DESCRIPTION

This error message occurs when the variable type for gate output is not set to net.

## WHAT NEXT

Change the variable type to net in the code.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-149 (error) %s Symbol %s not included in portlist

## DESCRIPTION

This error message occurs when the symbol declared in input and output lists is not included in the port list.

## WHAT NEXT

Add the missing input and output lists in the port list to the code.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-150 (error) %s Net assignment %s found in net declaration list.

## DESCRIPTION

You receive this message because the `read` or `analyze` command has detected a net assignment in a net declaration, a construct that the Presto HDL Compiler does not support.

The following is one example that can cause the problem:

```
module test(a, b, c);
 input a, b;
 output c;
 wire d, e=a;

endmodule
```

## WHAT NEXT

Check your design for invalid constructs like this and correct them.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-151 (warning) %s port %s have inconsistent declarations.

## DESCRIPTION

You receive this message because the `read` or `analyze` command has detected inconsistency of the port type.

The following is one example that can cause the problem:

```
'define N 4

module m1 (a,b) ;
 input ['N-1:0] a, b ;
 parameter P = 'N ;
 wire ['N-1:0] a ;
 wire [P-1:0] b ;
endmodule
```

This a mismatch for `b`, because the parameter `P` could be overridden, so it cannot be assumed to have its default value.

Another example that can cause the problem is:

```
module m2 (a,b);

 parameter A=2;
 parameter B=A;

 input [A:0] a;
 input [B:0] b;

 wire [B:0] a;
 wire [A:0] b;

endmodule
```

Even though `B` has the same default value as `A`, that value can be overridden.

## WHAT NEXT

Use identical expressions in corresponding pairs of port and signal declarations.

```
analyze (2), read (2).
```

## VER-152 (error) %s Vector or memory size mismatch on port %s using last declaration.

### DESCRIPTION

You receive this message because the **read** or **analyze** command has detected vector or memory size mismatches.

The following is one example that can cause the problem:

```
'define N 4

module m1 (a,b) ;
 input ['N-1:0] a, b ;
 parameter P = 'N+1 ;
 wire ['N-1:0] a ;
 wire [P-1:0] b ;
endmodule
```

This a mismatch for b, because the parameter P's default value is not the same as 'N. As a result, the width of array can not be determined.

Another example that can cause the problem is:

```
module m2 (a,b);

 parameter A=2;
 parameter B=A;

 input [A:0] a;
 input [B:0] b;

 wire [B:0] a;
 wire [A:0] b;

endmodule

module top(a, b);
 input [2:0] a;
 output [3:0] b;

 m2 #(B(3)) inst2(a, b);
endmodule
```

Even though B has the same default value as A, that value is overridden in the module instantiation when design top is evaluated.

As a result, the port a and b in module m2 has mismatched sizes in their declarations.

## WHAT NEXT

Use identical expressions in corresponding pairs of port and signal declarations.

**analyze** (2), **read** (2).

## VER-153 (error) %s Port %s occurs more than once in instance %s of module %s.

### DESCRIPTION

You see this message because during **read** or **analyze** command activity, the compiler has detected that you have used the same port name more than once in an instantiation, which is not valid.

The following is one example that can cause the problem:

```
module test(a, b, c);
 input a, b;
 output c;

 my_test c1(.p1(a), .p1(b), .p2(c));
endmodule
```

## WHAT NEXT

Check your design for duplicate port names and correct them.

### SEE ALSO

**analyze** (2), **read** (2).

## VER-154 (error) %s Gate instance with too few ports

### DESCRIPTION

This error message occurs when there are not enough ports in the gate instance.

## WHAT NEXT

Change the code to use the correct number of ports for the gate instance.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-155 (warning) %s non constant assignment to specparam %S.**

## **DESCRIPTION**

This warning message occurs when a non constant is assigned to the **specparam** variable and may not be accepted by other simulators.

## **WHAT NEXT**

This is a warning message only. No action is required on your part.

However, it is best practice to assign a constant expression to the **specparam** variable.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-156 (error) %s UDP initialization value %s is not 0, 1, or X.**

## **DESCRIPTION**

This error message occurs when the user-defined primitive (UDP) initialization value is not assigned as 0, 1, or X.

## **WHAT NEXT**

Assign 0, 1, or X to the UDP initialization value and run the command again.

## **SEE ALSO**

`analyze(2)`  
`read (2)`

# **VER-157 (error) %s UDP initialization variable %s must be**

**output.**

## **DESCRIPTION**

This error message occurs when the user-defined primitive (UDP) initialization variable is not output.

## **WHAT NEXT**

The UDP initialization statement specifies the value of the output port when simulation begins. Use output port as the UDP initialization variable and run the command again.

## **SEE ALSO**

**VER-173 (warning) %s delays for continuous assignment are ignored.**

## DESCRIPTION

This warning message advises that delays for continuous assignment are ignored in synthesis.

## WHAT NEXT

This is a warning message only. No action is required on your part.

However, it is best practice to ensure that the ignored delay is not integral to the functionality of the design.

## SEE ALSO

`analyze(2)`

```
read(2)
```

## VER-174 (error) %s '%s' is listed more than once in port list.

### DESCRIPTION

This error message occurs when the specified port name is used more than once in a port list.

### WHAT NEXT

Correct the code to use a port name only once in each port list and then rerun the command.

### SEE ALSO

```
analyze(2)
read(2)
```

## VER-175 (warning) %s Function '%s' should have at least one input argument.

### DESCRIPTION

You receive this message because, during **read** or **analyze** command activity, the compiler encountered a function that has no input arguments. The IEEE standard for Verilog (1364-1995) requires that a function have at least one input argument.

For example, the following function would trigger this warning:

```
function [0:2] f;
 begin
 f = 3'b101;
 end
endfunction
```

The Presto HDL compiler accepts functions with no arguments; however, many tools do not.

### WHAT NEXT

Consider adding at least one input argument to the function in question to conform to IEEE standards.

## SEE ALSO

`analyze (2), read (2), VER-105 (n).`

# VER-176 (warning) %s delay controls are ignored for synthesis.

## DESCRIPTION

This warning message occurs because your RTL description contains a delay control. Delay controls are ignored for synthesis.

The following is an example of a delay control.

```
module foo;
 ...
 always
 #(5) // delay control, will be ignored.
 b = a;
endmodule
```

## WHAT NEXT

This is a warning message only. No action is required on your part. You can leave the delay controls in your description, but be aware that the delay controls have no meaning for synthesis.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-177 (error) %s real declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because the real data type is not supported by synthesis.

The following example shows a real declaration.

```
module foo;
 real r; // data type real not supported by synthesis
endmodule
```

## WHAT NEXT

Rewrite your RTL code so that it does not contain real data types. Depending on your specific design, you may need to use integer types instead of real types. Rerun the command after making the changes.

## SEE ALSO

`analyze(2)`  
`read (2)`

# VER-178 (error) %s realtime declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because the realtime data type is not supported by synthesis.

The following example shows a realtime declaration.

```
module foo;
 realtime r; // data type realtime not supported by synthesis
endmodule
```

## WHAT NEXT

Realtime variables do not have a meaning in synthesis. Rewrite your RTL code so that it does not use realtime data types. Rerun the command after making the changes.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-179 (error) %s triand declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains triand declarations, which are not supported by synthesis.

The following example shows a triand declaration.

```
module foo;
 triand d;
endmodule
```

## WHAT NEXT

Rewrite your design so that it does not use triand declarations. Since triand nets imply an and logic function, one solution is to explicitly describe the logic in your RTL code. Rerun the command after making your changes.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-180 (error) %s trior declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains trior declarations, which are not supported by synthesis.

The following example shows a trior declaration.

```
module foo;
 trior d;
endmodule
```

## WHAT NEXT

Rewrite your design so that it does not use trior declarations. Since trior nets imply an or logic function, one solution is to explicitly describe the logic in the RTL code. Rerun the command after making the changes.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-181 (error) %s tri0 declarations are not supported by

# synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains tri0 declarations, which are not supported by synthesis.

The following example shows a tri0 declaration:

```
module foo;
 tri0 d;
endmodule
```

## WHAT NEXT

Rewrite your design such that it does not use tri0 declarations and then rerun the command.

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

# VER-182 (error) %s tri1 declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains tri1 declarations, which are not supported by synthesis.

The following example shows a tri1 declaration:

```
module foo;
 tri1 d;
endmodule
```

## WHAT NEXT

Rewrite your design so that it does not use tri1 declarations and run the command again.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-183 (error) %s trireg declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains trireg declarations, which are not supported by synthesis.

The following example shows a trireg declaration.

```
module foo;
 trireg d;
endmodule
```

## WHAT NEXT

Rewrite your design so that it does not use trireg declarations and run the command again.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-184 (error) %s pulldown declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains pulldown declarations, which are not supported by synthesis.

The following example shows a pulldown declaration.

```
module foo (c);
 output c;
 ..
 pulldown c1(c);
```

```
endmodule
```

## WHAT NEXT

Rewrite your design so that it does not use pulldown declarations and then run the command again.

## SEE ALSO

```
analyze(2)
read(2)
```

# VER-185 (error) %s pullup declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because your RTL description contains pullup declarations, which are not supported by synthesis.

The following example shows a pullup declaration.

```
module foo (c);
 output c;
 ..
 pullup c1(c);
endmodule
```

## WHAT NEXT

Rewrite your design so that it does not use pullup declarations and then run the command again.

## SEE ALSO

```
analyze(2)
read(2)
```

# VER-186 (error) %s user-defined primitives (UDPs) are not

# **supported by synthesis.**

## **DESCRIPTION**

This error message occurs because user-defined primitives (UDPs) are not supported by synthesis.

## **WHAT NEXT**

Enclose the UDPs in the following statement and run the command again.

```
'ifndef SYNTHESIS
...
'endif
```

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-187 (error) %s fork and join constructs are not supported by synthesis.**

## **DESCRIPTION**

This error message occurs because fork and join constructs are not supported by synthesis.

## **WHAT NEXT**

Enclose the fork-join construct as follows and rerun the command.

```
'ifndef SYNTHESIS
...
'endif
```

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-188 (error) %s wait statements are not supported by synthesis.**

## **DESCRIPTION**

This error message occurs because wait statements are not supported by synthesis.

## **WHAT NEXT**

Enclose the wait statements as follows and run the command again.

```
'ifndef SYNTHESIS
...
'endif
```

## **SEE ALSO**

analyze(2)  
read(2)

# **VER-189 (error) %s case equality (==) is not supported by synthesis.**

## **DESCRIPTION**

This error message occurs because case equality (==) is not supported by synthesis.

## **WHAT NEXT**

If the statement containing == is for synthesis, try replacing == with ==, if it does not change the semantics.

If the statement containing == is not for synthesis, enclose the statement as follows.

```
'ifndef SYNTHESIS
...
'endif
```

After making your changes, run the command again.

## SEE ALSO

analyze(2)  
read(2)

# VER-190 (error) %s case inequality (!==) is not supported by synthesis.

## DESCRIPTION

This error message occurs because case inequality (!==) is not supported by synthesis.

## WHAT NEXT

If the statement containing != is for synthesis, try replacing != with !=, if it does not change the semantics.

If the statement containing != is not for synthesis, enclose the statement with the following.

```
'ifndef SYNTHESIS
...
'endif
```

After making the changes, run the command again.

## SEE ALSO

analyze(2)  
read(2)

# VER-191 (error) %s time declarations are not supported by synthesis.

## DESCRIPTION

This error message occurs because time declarations are not supported by synthesis.

## WHAT NEXT

Enclose the time declarations with the following and then run the command again.

```
'ifndef SYNTHESIS
...
'endif
```

## SEE ALSO

analyze(2)  
read(2)

**VER-192 (warning) %s** In initial block, only \$power and \$retain are supported, other statements are ignored.

## DESCRIPTION

This warning message advises you that in initial block, only \$power and \$retain calls are supported in synthesis. All other statements are not supported in synthesis.

## WHAT NEXT

This is a warning message only. No action is required on your part.

However, to avoid receiving this warning message, you can suppress the message, or enclose the initial block with the following.

```
'ifndef SYNTHESIS
...
'endif
```

## SEE ALSO

analyze(2)  
read(2)

**VER-193 (error) %s** event triggers are not supported.

## DESCRIPTION

This error message occurs because event triggers are not supported.

## WHAT NEXT

Enclose the event trigger with the following and then rerun the command.

```
'ifndef SYNTHESIS
...
`endif
```

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

# VER-194 (error) %s Base of subscript operator %s must be a vector.

## DESCRIPTION

You receive this message because during **read** or **analyze** command activity, the compiler has detected a subscript operator whose base is not a vector, which is invalid.

The following is one example that can cause the problem:

```
module test(a, b);
 input a;
 output b;
 reg b;

 always
 b = a[0];

endmodule
```

## WHAT NEXT

Check your design for invalid constructs like this and correct them.

## SEE ALSO

[analyze \(2\)](#), [read \(2\)](#).

# VER-195 (error) %s Illegal digit %c in based number.

## DESCRIPTION

You see this message because during **read** or **analyze** activity, the compiler has

detected an invalid digit in a based number.

## WHAT NEXT

Check your design for invalid digits in based numbers and correct them.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-196 (error) %s Unable to open modfile %s for writing: %s

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-197 (information) %s writing module %s to file %s.

## DESCRIPTION

This information message advises you that the tool is writing the specified module to an analyzed file format (.pvl) file.

## WHAT NEXT

This is an informational message only. No action is required on your part.

## SEE ALSO

`analyze`(2)  
`read`(2)

# VER-198 (error) %s mixed direction ports %s must be nets.

## DESCRIPTION

This error message occurs because the code contains mixed direction ports that

should be net-types.

## WHAT NEXT

Rewrite code so that the ports with mixed direction are net-types and then rerun the command.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-199 (error) %s UDP table has invalid edge specification.

## DESCRIPTION

This error message occurs when the UDP table has an invalid edge specification, such as (0 0), (1 1) or (X X). The two level symbols in the edge indicator should be different. So (0 0), (1 1) and (X X) are invalid, while (1 0) is valid.

## WHAT NEXT

Change the invalid edge indicator to a valid one and run the command again.

# VER-200 (error) %s port %s must be declared as input.

## DESCRIPTION

This error message occurs because the port must be declared as an input port.

## WHAT NEXT

Correct the RTL code to declare the port as input port and then run the command again.

# VER-201 (error) %s port %s must be declared as output.

## DESCRIPTION

This error message occurs when the port must be declared as an output port.

## WHAT NEXT

Correct the RTL code to declare the port as an output port and then run the command again.

# VER-202 (error) %s path element %s should be reg or wire.

## DESCRIPTION

This error message occurs because the path element should be either reg or wire.

## WHAT NEXT

Correct the code to declare the path element as either reg or wire and run the command again.

# VER-203 (error) %s pulse limit for path not defined.

## DESCRIPTION

This error message occurs because the pulse limit for path is not defined. The valid **specparam** assignment format is one of the following.

```
specparam_identifier = constant_mintypmax_expression
```

```
specparam_identifier = pulse_control_specparam
```

The **pulse\_control\_specparam** format is as follows.

```
$PATHPULSE$... = (reject_limit_value, [, error_limit_value]).
```

You receive this error message when the required **reject\_limit\_value** is missing.

## WHAT NEXT

Add the **reject\_limit\_value** to the code and then run the command again.

## **VER-204 (error) %s timing reference event %s not port.**

### **DESCRIPTION**

This error message occurs because the timing reference event specified is not port.

### **WHAT NEXT**

Change the timing reference event to port and run the command again.

## **VER-205 (error) %s timing reference event %s should have edge identifier.**

### **DESCRIPTION**

This error message occurs because the timing reference event requires an edge identifier.

### **WHAT NEXT**

Add an edge identifier to the timing reference event and run the command again.

## **VER-206 (error) %s Too many parameters passed to system task '%s'.**

### **DESCRIPTION**

The given system task is passed more arguments than expected.

### **WHAT NEXT**

Find out how which arguments the system task expects. Remove the extraneous arguments from the task call.

## **VER-207 (error) %s The %s systask parameter must be**

writable.

## DESCRIPTION

Actual parameters passed to 'output' or 'inout' formal task parameters must be writable (because they are conceptually used as left-hand-side values of assignments). In the following example a constant is passed as an argument to the system function '\$random', which indeed expects the argument to be writable:

```
...
r = $random(3); // error: constant "3" is not writable.
...
```

## WHAT NEXT

Make sure the actual argument in question is writable, eg. a 'register'.

# VER-208 (warning) %s Register '%s' is the target of both blocking and non-blocking assignments in the same process.

## DESCRIPTION

Presto does allow mixing blocking and non-blocking assignments in the same process. However, this coding style can lead to unexpected results and the code may be hard to comprehend.

This warning is informational only. It tells you that targets assigned by both kinds of assignments actually exist.

## WHAT NEXT

Make sure the mixture of blocking and non-blocking assignments is really what you intended.

# VER-209 (warning) %s Little argument or return value checking implemented for system task or function '%s'.

## DESCRIPTION

Argument and return value checking for system tasks and functions is limited. This is a warning message indicating that some errors potentially remain uncaught because of incomplete checking.

## **WHAT NEXT**

The user should check system task or function all carefully to make sure the argument and return value are correct.

# **VER-210 (error) %s timing reference event %s has wrong edge.**

## **DESCRIPTION**

This error message occurs when the wrong edge is specified in the timing reference event.

## **WHAT NEXT**

Specify the edge as either posedge or negedge and then run the command again.

# **VER-211 (error) %s timing limit malformed.**

## **DESCRIPTION**

This error message occurs when the timing limit is malformed because both the event and the normal condition exist in the timing limit. Only one of these conditions is allowed.

## **WHAT NEXT**

Remove either the event or the normal condition and then run the command again.

# **VER-212 (error) %s timing limit should be positive.**

## **DESCRIPTION**

This error message occurs when the timing check limit should be positive.

## **WHAT NEXT**

Specify blocks are not supported in synthesis. Prevent the block from being read by enclosing it in the following compiler directives.

```
'ifndef SYNTHESIS
...
'
```

```
'endif
```

After making the changes, run the command again.

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

# VER-213 (error) %s timing event malformed.

## DESCRIPTION

This error message occurs when the timing check event is malformed.

## WHAT NEXT

Specify blocks are not supported in synthesis. Prevent the specify block from being read by enclosing it in the following compiler directives.

```
'ifndef SYNTHESIS
...
'endif
```

After making the changes, run the command again.

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

# VER-214 (error) %s timing notifier %s malformed.

## DESCRIPTION

This error message occurs when the optional notifier on the timing check is malformed.

## WHAT NEXT

Specify blocks are not supported in synthesis. Prevent the specify block from being read by enclosing it in the following compiler directives.

```
'ifndef SYNTHESIS
...
'endif
```

After making the changes, run the command again.

## SEE ALSO

analyze(2)  
read(2)

# VER-215 (error) %s timing reference event %s is not input or inout port.

## DESCRIPTION

This error message occurs because the reference event for a timing check must be an input or inout port.

## WHAT NEXT

Specify blocks are not supported in synthesis. Prevent the specify block from being read by enclosing the block in the following compiler directives.

```
'ifndef SYNTHESIS
...
'endif
```

After making the changes, run the command again.

## SEE ALSO

analyze(2)  
read(2)

# VER-216 (error) %s %s is not a parameter in module %s

## DESCRIPTION

You receive this error message because the name used in module instantiation (component instantiation in VHDL) or DEFPARAM is not a parameter in the specified module.

## WHAT NEXT

Change the name in the instantiation to a supported parameter.

## SEE ALSO

`elaborate` (2), `read` (2).

**VER-217 (error) %s wrong number of ports in UDP instantiation, not the same as declaration.**

## DESCRIPTION

This error message occurs when the number of ports in the UDP instantiation is different than the number of ports in the UDP declaration.

## WHAT NEXT

UDPs are not supported in synthesis. Modify the code so it does not use UDPs and then rerun the command.

## SEE ALSO

`analyze`(2)  
`read`(2)

**VER-219 (error) %s Non-standard replication constant is not supported.**

## DESCRIPTION

This message is a follow-up to the ELAB-364 warning message, but is issued with "Error" severity, so that violations of the prevailing language standard halt compilation.

## WHAT NEXT

Change the relevant code to conform to the level of IEEE Std 1364 selected by `hdlin_vrlg_std`, or choose a different value for `hdlin_repeat_count_0`.

**VER-220 (error) %s Unresolved hierarchical name %s in**

**module %s.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

**VER-221 (error) %s Module %s to be elaborated is not defined in analyzed source files.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

**VER-222 (warning) %s Assignment output %s should be a register.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

**VER-223 (warning) %s Task %s is not implemented; statement skipped.**

## **DESCRIPTION**

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

## VER-224 (error) %s Package '%s' has not been analyzed for import or content extraction.

### DESCRIPTION

This syntax error issues when a reference to the given package is analyzed before its declaration has been analyzed. Successfully analyzed packages leave a <identifier>.pvk file in DC shell's working directory. This file must be found and read when the package is later referenced for import or to extract its contents. Note that packages may never refer to each other in a cycle of dependence.

### WHAT NEXT

Compare the spelling of the package identifier in the reference to its intended declaration. Remove cycles of package reference for which no analyze ordering is possible. Insure that the source file containing the package declaration is analyzed before the the source files that refer to it, or that the package declaration precedes all uses within the same source file. Check DC shell's search paths to insure that packages analyzed by other DC shell sessions can be found by this session. Inspect file and directory search permissions to be certain you can access the package. Check whether an intervening read or analyze command reported a syntax error within a package of the same name, thereby removing the good package's .pvk file.

### SEE ALSO

VER-227  
analyze(2)  
read(2)

## VER-225 (warning) %s Recommend parentheses when a reduction-or follows bitwise-or.

### DESCRIPTION

A reduction-or operator follows a bitwise-or operator in the Verilog source. This is often a typographical error, when a space is inserted between the two characters in '||' (logical-or), resulting in '| |' (bitwise-or followed by reduction-or). Furthermore, some Verilog tools do not accept this syntax.

## WHAT NEXT

If you intended to use a reduction-or, surround it with parentheses to inhibit this warning.

# VER-226 (warning) %s Single element concatenation has unsized number.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-227 (error) %s Package '%s' directly or indirectly refers to the current package '%s'.

## DESCRIPTION

This syntax error issues within a package if a cyclic reference is made (by scope-extraction operator) to a package whose definition appears to depend upon the package currently being analyzed. This error is reported aggressively, based upon any mention of the current package in the source of the target package or recursively in the packages to which it may refer, regardless of whether an actual cycle of definitional dependence is being formed. Aggressive enforcement prevents VER-224 errors when all the packages are re-analyzed in an empty work directory; i.e. it prevents incremental closure of package reference cycles which would make it impossible to analyze them in an acyclic order.

## WHAT NEXT

You might not be extracting from the right package. See the VER-224 help page for suggestions related to this contingency.

Perhaps you chose a name for your package that matches another package name deeper in the supply-chain of the package libraries you are using. Choose a unique package name.

If you are analyzing a older library package that used to work, perhaps the tree of packages upon which it depends has grown to include a package name which collides with this one. Since VER-227 is reported for any name collision in the transitive closure of scope extractions, it could take a while to track down by trial and error. Use 'strings \*.pvk | fgrep my-package' or similar search tools to locate uses

of the current package name in the \*.pvk (or the package source files) of your project. Once located, the remedy may involve renaming one or the other package, or splitting either one so that the supply trees are disjoint (have no name collisions).

## SEE ALSO

VER-224  
analyze(2)  
read(2)

# VER-228 (error) %s Import symbol %s has already been defined.

## DESCRIPTION

This error message issues when you attempt to import a name that is already declared in the immediately surrounding scope.

## WHAT NEXT

Edit the RTL source to remove or rename whatever has been declared or imported with the same name, or to enclose the import statement and all references to the name in a more local sequential block. Rerun the command.

## SEE ALSO

analyze(2)  
read(2)

# VER-229 (error) %s Value '%s' for enumerated type '%s' should be an integer or sized constant.

## DESCRIPTION

You receive this error message when a parameter declaration with an attached 'synopsys enum' pragma declares a parameter whose value is not an integer or sized constant. For example:

```
parameter [2:0] /* synopsys enum colors */ red = 3'b001,
green = 3'b010,
yellow = "YELLOW";
```

The third value in this example would result in this error message.

## WHAT NEXT

Modify the design so that all parameters declared as members of an enumerated type are given an integer value or sized constant value.

## SEE ALSO

`analyze (2), read (2).`

# VER-230 (warning) %s Recommend parentheses when a reduction-and follows bitwise-and.

## DESCRIPTION

A reduction-and operator follows a bitwise-and operator in the Verilog source. This is often a typographical error, when a space is inserted between the two ampersands in '&&' (logical-and), resulting in '& &' (bitwise-and followed by reduction-and). Furthermore, some Verilog tools do not accept this syntax.

## WHAT NEXT

If you intended to use a reduction-and, surround it with parentheses to inhibit this warning.

# VER-231 (warning) %s Range ignored for integer variables.

## DESCRIPTION

This is a syntax error. The range will be ignored. In future releases this usage may be disallowed.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-232 (warning) %s Specifying strengths with the 'strength'

# keyword is archaic.

## DESCRIPTION

This message notifies you that during **read** or **analyze** command activity, the compiler has detected use of 'strength' as a keyword. This word is archaic and may not be supported by some Verilog tools. Synthesis ignores all drive strengths, including one specified in this way.

## WHAT NEXT

Avoid the use of the 'strength' keyword.

## SEE ALSO

**analyze** (2), **read** (2).

**VER-233 (error) %s** Symbol '%s' cannot be used as an argument to the 'disable' statement because it is not a task or named block identifier.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the compiler has detected an invalid argument to a disable statement. The invalid argument is a symbol that does not refer to a task or named block. In the following example, the symbol *x* does not refer to a named block and will trigger this error.

```
module test(in1);
 input in1;
 reg x;

 always begin : block
if(in1)
 disable x;
 end
endmodule
```

## WHAT NEXT

Correct the **disable** statement to refer to a named block or task.

## SEE ALSO

**analyze** (2), **read** (2).

## **VER-234 (error) %s Strengths highz0 and highz1 cannot be paired together in a strength specification.**

### **DESCRIPTION**

You receive this error message because, during **read** or **analyze** command activity, the compiler has detected a strength specification that uses both highz0 and highz1 strengths, which is invalid. Furthermore, all strength specifications are ignored for synthesis.

### **WHAT NEXT**

Correct the strength specification so that it does not use both highz1 and highz0.

### **SEE ALSO**

**analyze** (2), **read** (2).

## **VER-235 (error) %s Strength %s for pullup/pulldown must be a strength0.**

### **DESCRIPTION**

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected an invalid strength value in a position that requires a *strength0* value.

Synthesis ignores all strength specifications and does not support pullup and pulldown gates.

### **WHAT NEXT**

Replace the invalid value with a *strength0* value. Acceptable are *supply0*, *strong0*, *pull0*, *weak0*, and *highz0*.

### **SEE ALSO**

**analyze** (2), **read** (2).

## **VER-236 (error) %s Strength %s for pullup/pulldown must be a**

# strength1.

## DESCRIPTION

You receive this message because the **read** or **analyze** command has detected an invalid strength value in a position that requires a strength1 value. Synthesis ignores all strength specifications, and does not support pullup and pulldown gates.

## WHAT NEXT

Replace the strength value with a strength1 value. Acceptable values are *supply1*, *strong1*, *pull1*, *weak1*, and *highz1*.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-237 (error) %s Strength specifications must have strength0 and strength1 components.

## DESCRIPTION

You receive this error message because you have specified a strength that does not have one strength0 and one strength1 component. With the exception of 'pullup' and 'pulldown' gates, a strength must have one strength0 and one strength1 component.

Note that all strength specifications are ignored for synthesis.

In the example below, both strengths are from the strength1 category, resulting in this error message.

```
wire x, y, z;
and (weak1,strong1) a1 (x, y, z);
```

## WHAT NEXT

Specify a strength from the strength0 category and a strength from the strength1 category.

## SEE ALSO

**analyze** (2), **read** (2).

## **VER-238 (error) %s Strength declaration in incorrect place.**

### **DESCRIPTION**

There is a syntax error in the Verilog source because a strength declaration appears at an incorrect place. Often, this indicates a second strength specification in a gate instantiation.

For example, in the following code segment, the second strength specification will trigger this error because it is not valid Verilog.

```
wire a, b, c, x, y, z;
and (weak1,weak0) a1(a, b, c), (weak1,weak0) a2(x, y, z);
```

### **WHAT NEXT**

Examine the given file and line to determine which strength specification needs to be moved or deleted.

## **VER-239 (error) %s A wire declaration cannot have a drive strength, at symbol '%s'.**

### **DESCRIPTION**

A wire declaration contained a drive strength. A drive strength can only be specified in a net assignment.

### **WHAT NEXT**

Remove the drive strength from the declaration.

## **VER-240 (warning) %s Strength %s for pullup is redundant.**

### **DESCRIPTION**

A 'pullup' gate has only a strength0 specified, and no strength1. This is likely an error, because strength0 specifications are ignored for 'pullup' gates.

Note, however, that 'pullup' gates are not supported for synthesis, and drive strengths are ignored for synthesis.

## WHAT NEXT

Check if you intended to specify a strength1 for the pullup gate instead of a strength0. If not, ignore the warning.

# VER-241 (warning) %s Strength %s for pulldown is redundant. 0-strength defaulting to strong0.

## DESCRIPTION

A 'pulldown' gate has only a strength1 specified, and no strength0. This is likely an error, because strength1 specifications are ignored for 'pulldown' gates.

Note, however, that 'pulldown' gates are not supported for synthesis, and drive strengths are ignored for synthesis.

## WHAT NEXT

Check if you intended to specify a strength0 for the pulldown gate instead of a strength1. If not, ignore the warning.

# VER-242 (error) %s Enumerated type '%s' needs a size specification.

## DESCRIPTION

You receive this error message because a parameter declaration that is being used to declare an enumerated type using the 'synopsys enum' pragma is missing a size specification. The following declaration results in this error message.

```
parameter /* synopsys enum colors */ red = 3'b001,
green = 3'b010,
yellow = 3'b100;
```

## WHAT NEXT

Add a size specification to the declaration. The above example can be corrected as follows:

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
green = 3'b010,
yellow = 3'b100;
```

## SEE ALSO

`analyze (2), read (2).`

# VER-244 (error) %s Enumerated type '%s' has not been declared.

## DESCRIPTION

You receive this error message because the design has declared a symbol as a member of an enumerated type using the 'synopsys enum' pragma, but the enumerated type has not been declared.

## WHAT NEXT

Declare each enumerated type before using it. If you have declared the enumerated type, verify that no errors occurred while processing it.

## SEE ALSO

`analyze (2), read (2).`

# VER-245 (warning) %s Enumerated type '%s' is not compatible with this declaration.

## DESCRIPTION

The design declares a symbol as a member of an enumerated type using the 'synopsys enum' pragma, but the enumerated type has a different underlying type than the symbol. In the following example, the declaration of 'current\_state' would trigger this error because its type is not '[0:2]'.

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
 green = 3'b010,
 yellow = 3'b100;

reg [0:3] /* synopsys enum colors */ y;
```

## WHAT NEXT

If it is typo, correct the type of either the enumerated type declaration or the symbol declaration so that they match. A corrected declaration for 'y' in the above example would change its bounds to '[0:2]':

```
reg [0:2] /* synopsys enum colors */ y;
```

If user intends to let the symbol and the enumerated type have different type, the user have to make sure that the synthesis behavior is what the user wants.

## VER-246 (error) %s Port %s declared as being two different enums.

### DESCRIPTION

This error occurs when port has both a port declaration determining its direction, and a register declaration, and has a different enumerated type attached to the two declarations, using the 'synopsys enum' pragma. In the following example, the two declarations of 'y' would cause this error to be issued:

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
 green = 3'b010,
 yellow = 3'b100;
parameter [0:2] /* synopsys enum numbers */ one = 3'b001,
two = 3'b010;

output [0:2] /* synopsys enum colors */ y;
reg [0:2] /* synopsys enum numbers */ y;
```

### WHAT NEXT

Choose one enumerated type for the port in question, and correct the declaration.

## VER-247 (error) %s Enumerated type '%s' has multiple declarations.

### DESCRIPTION

You receive this error message because the same enumerated type is declared twice. The following example illustrates this situation.

```
parameter [0:2] /* synopsys enum colors */ red = 3'b001,
 green = 3'b010,
 yellow = 3'b100;

parameter [0:4] /* synopsys enum colors */ brown = 5'b001,
 black = 5'b010,
 gray = 5'b100;
```

## WHAT NEXT

Specify a new name for one of the enumerated types.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-248 (error) %s Encoding '%s' for '%s' is the wrong size for this enumerated type.

## DESCRIPTION

You receive this error message because a value given for an enumerated type has a different size than the enumerated type itself.

In the following example, the state values given are 8 bits, while the enumerated type is declared as 12 bits. This difference will result in this error message.

```
parameter [11:0] /* synopsys enum states */ state1 = 8'b00000001,
 state2 = 8'b00000010;
```

## WHAT NEXT

Modify the values or the type declaration so that they are the same size.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-249 (error) %s force output %s must be a register or a net.

## DESCRIPTION

This error message occurs because a force statement can only be used to assign to a variable or a net.

## WHAT NEXT

Force statements are not supported in synthesis. Enclose the force statement in the following compiler directives to prevent the statement from being read.

```
'ifndef SYNTHESIS
...
`endif
```

## SEE ALSO

analyze(2)  
read(2)

# VER-251 (error) %s Expecting a pair of bounds [msb:lsb].

## DESCRIPTION

This error message occurs when an array dimension has not specified exactly two bounds. Verilog bit vectors, Verilog memories, and all packed dimensions of SystemVerilog array types must be declared using the subscript values for both the most and the least significant bits as shown in the following example:

```
reg [most_significant_bit_index : least_significant_bit_index] packed_vector;
```

## WHAT NEXT

Adjust the bounds syntax. Or, in SystemVerilog, move the dimension brackets to the right of the array or type identifier to specify that this dimension should be treated as unpacked.

## SEE ALSO

analyze(2)  
read(2)

# VER-252 (error) %s illegal use of identifier %s.

## DESCRIPTION

This error message occurs when an identifier that is defined as a function is being used as a task.

## WHAT NEXT

Modify the source code to change the call to a function call and then run the command again.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-253 (error) %s Illegal reference to memory %s.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-254 (error) %s invalid symbol %s found in activation expression.**

## **DESCRIPTION**

This error message occurs when there is an invalid symbol in an activation expression. The symbol in an activation expression should be a net, variable or event.

## **WHAT NEXT**

Change the symbol in the activation expression to a net, variable or event, and then rerun the command.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-255 (error) %s invalid symbol %s found in expression.**

## **DESCRIPTION**

This error message occurs when there is an invalid symbol in an expression. The symbol in an expression should be a net or variable.

## WHAT NEXT

Change the symbol in the activation expression to a net or variable and then rerun the command.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-256 (error) %s illegal part selection has been found.

## DESCRIPTION

This error message occurs when an illegal part selection is found. The index of a vector in part selection should be constant valued, and its sign bit cannot be Z or X value.

## WHAT NEXT

Check the indexes of vectors in the part selection and correct the offending index. Run the command again.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-257 (error) %s invalid symbol %s found as system task argument.

## DESCRIPTION

This error message occurs when there is an invalid symbol in a system task argument list. The symbol used as a system task argument should be a net, variable, instance, module, event, or function.

## WHAT NEXT

Change the symbol in the system task argument list to a net, variable, instance, module, event, or function.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-258 (error) %s no semicolon at end of module name.**

## **DESCRIPTION**

This error message occurs when the semicolon is missing from the end of a module name.

## **WHAT NEXT**

Add a semicolon to the end of the module name and run the command again.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-259 (error) %s multiple delays found.**

## **DESCRIPTION**

This error message occurs when the tool finds multiple delays. Only one delay is allowed.

## **WHAT NEXT**

Correct the code to ensure that there is only one delay, and then run the command again.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-260 (error) %s symbol %s must be a constant or**

**parameter.**

## **DESCRIPTION**

This error message occurs because the symbol indicated in the error message must be a constant or a parameter, as required by the language.

In the example below, the expression in the generate case statement is required to evaluate to a constant value at elaboration time. The use of an input port in that expression violates this requirement.

```
module m (a);
 input a;

 generate
 case (a) // error: not constant
 ...
 endgenerate
endmodule
```

## **WHAT NEXT**

Change the specified symbol to a constant or a parameter and then run the command again.

## **SEE ALSO**

[analyze\(2\)](#)  
[read\(2\)](#)

**VER-261 (error) %s continuous assignment output %s must be a net.**

## **DESCRIPTION**

This error message occurs because the output of a continuous assignment must be a net.

## **WHAT NEXT**

Change the output of the continuous assignment to net and then run the command again.

## **SEE ALSO**

[analyze\(2\)](#)

```
read(2)
```

## VER-262 (error) %s net symbol %s has already been defined.

### DESCRIPTION

This error message occurs when the redeclaration of a net symbol is detected. A net can only be declared once.

### WHAT NEXT

Remove or rename the nets declared with the same name and then run the command again.

### SEE ALSO

```
analyze(2)
read(2)
```

## VER-263 (error) %s bit- or part-selected destination of a force %s must be a net.

### DESCRIPTION

This error message occurs because the bit-selected or part-selected destination of a force statement must be a net and not a variable.

### WHAT NEXT

Change the destination of the force statement from a variable to a net and run the command again.

### SEE ALSO

```
analyze(2)
read(2)
```

## **VER-264 (error) %s bad hierarchical name (%s).**

### **DESCRIPTION**

For Verilog, hierarchical references are not supported for synthesis.

For SystemVerilog, the preceding expression does not evaluate to a struct or union.

### **WHAT NEXT**

For Verilog, exclude the code from synthesis by enclosing the hierarchical reference in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

For SystemVerilog, if the name is a struct or union member, make sure the preceding expression evaluates to a struct or union. If the name is not a struct or union, follow the instructions in the previous paragraph, and enclose the code in the conditional compilation directives.

## **VER-265 (error) %s RCMOS switches are not supported.**

### **DESCRIPTION**

This error message occurs because RCMOS switches are not supported for synthesis.

### **WHAT NEXT**

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

## **VER-266 (error) %s RNMOS switches are not supported.**

### **DESCRIPTION**

This error message occurs because RNMOS switches are not supported for synthesis.

## WHAT NEXT

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

# VER-267 (error) %s RPMOS switches are not supported.

## DESCRIPTION

This error message occurs because RPMOS switches are not supported for synthesis.

## WHAT NEXT

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

# VER-268 (error) %s RTRAN switches are not supported.

## DESCRIPTION

This error message occurs because RTRAN switches are not supported for synthesis.

## WHAT NEXT

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

## **VER-269 (error) %s RTRANIF0 switches are not supported.**

### **DESCRIPTION**

This error message occurs because RTRANIF0 switches are not supported for synthesis.

### **WHAT NEXT**

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

## **VER-270 (error) %s RTRANIF1 switches are not supported.**

### **DESCRIPTION**

This error message occurs because RTRANIF1 switches are not supported for synthesis.

### **WHAT NEXT**

Exclude the code from synthesis by enclosing the code in the conditional compilation directives shown below.

```
'ifndef SYNTHESIS
...
'endif
```

## **VER-271 (error) %s TRAN switches are not supported.**

### **DESCRIPTION**

This error message occurs because TRAN switches are not supported for synthesis.

### **WHAT NEXT**

Exclude the code from synthesis by enclosing the code in the following conditional compilation directives.

```
'ifndef SYNTHESIS
...
'endif
```

## SEE ALSO

analyze(2)

# VER-272 (error) %s TRANIF0 switches are not supported.

## DESCRIPTION

This error message occurs because TRANIF0 switches are not supported for synthesis.

## WHAT NEXT

Exclude the code from synthesis by enclosing the code in the following conditional compilation directives

```
'ifndef SYNTHESIS
...
'endif
```

## SEE ALSO

analyze(2)

# VER-273 (error) %s TRANIF1 switches are not supported.

## DESCRIPTION

This error message occurs because TRANIF1 switches are not supported for synthesis.

## WHAT NEXT

Exclude the code from synthesis by enclosing the code in the following conditional compilation directives

```
'ifndef SYNTHESIS
...
'endif
```

## **SEE ALSO**

`analyze(2)`

**VER-274 (warning) %s** Unsupported system task '%s' will be ignored for synthesis.

## **DESCRIPTION**

Many system tasks are used only for simulation or testbench purposes; they are not supported for synthesis, and are ignored. This warning alerts you that your design contains an unsupported system task (or unsupported system function whose result is discarded).

## **WHAT NEXT**

If your design functions correctly without the system task, then no action is needed.

## **SEE ALSO**

`analyze(2), read(2)`.

**VER-275 (error) %s** User-defined primitives (UDP's) are not supported.

## **DESCRIPTION**

User-defined primitives (UDP's) are not supported.

## **WHAT NEXT**

Change your source file to remove UDPs or enclose them with translate on and translate off, or enclose them with 'ifndef SYNTHESIS ... 'endif'.

## **SEE ALSO**

`analyze(2), read(2)`.

## **VER-276 (error) %s Specify blocks are not supported.**

### **DESCRIPTION**

This error message occurs because specify blocks are not supported for synthesis.

### **WHAT NEXT**

Exclude the specify blocks from the synthesis source code by enclosing the blocks in conditional compilation directives as shown below.

```
'ifndef SYNTHESIS
 specify
 ...
 /* specparams that interfere with synthesis */
 endspecify
'endif
```

## **VER-277 (warning) %s Charge strengths are ignored.**

### **DESCRIPTION**

Charge strengths are ignored for synthesis.

### **WHAT NEXT**

No further action required.

## **VER-278 (error) %s Array bounds must be of integer type.**

### **DESCRIPTION**

You receive this error message because you have not provided the correct value for array bounds. For synthesis, array bounds must be of integer type.

### **EXAMPLE**

The following erroneous example tries to declare an array with a float value as an array bound:

```
...
reg [3.0:0] r; /* ERROR: '3.0' is not an integer bound */
...
```

## WHAT NEXT

Correct the values of the array bounds in your design so that they are expressed as integers.

# VER-279 (error) %s Syntax error in parameter value list at or near token '%s' (string position %d).

## DESCRIPTION

You received this error message because there is a syntax error in a parameter value list given by elaborate command argument **-parameters**.

## WHAT NEXT

Correct the syntax error in the parameter value list and then run the elaborate command again.

Refer to the man page for the **elaborate** command for information on the accepted parameter list syntax.

## SEE ALSO

**elaborate** (2).

# VER-280 (warning) %s In UPF shell mode, the RTL power construct \$isolate, \$power and \$retain are ignored.

## DESCRIPTION

This warning message advises you that in UPF mode, the \$isolate, \$power and \$retain statements are ignored.

## WHAT NEXT

This is a only a warning message. No action is required.

However, to prevent this warning message, remove the \$isolate, \$power and \$retain power constructs from the RTL code.

# VER-281 (warning) %s The statements in initial blocks are

ignored.

## DESCRIPTION

This warning message advises you that initial blocks are not supported in synthesis.

## WHAT NEXT

This is a warning message only. No action is required on your part.

However, to avoid receiving this warning message, you can enclose the initial block with the following:

```
'ifndef SYNTHESIS
...
'endif
```

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-282 (warning) All isolation\_upf and retention\_upf pragmas are ignored.

## DESCRIPTION

This warning message advises you that all isolation\_upf and retention\_upf pragmas are ignored.

## WHAT NEXT

This is only a warning message. No action is required.

However, to prevent this warning message, remove the isolation\_upf and retention\_upf pragmas from input Verilog.

## SEE ALSO

`read(2)`

# VER-286 (warning) %s 'event' declarations are not supported by

synthesis.

## DESCRIPTION

The Verilog 'event' declaration is not supported for synthesis.

## WHAT NEXT

Rewrite your design so that it does not use the 'event' declaration.

**VER-287 (error) %s** In UPF shell mode, the RTL power construct \$isolate, \$power and \$retain are not supported.

## DESCRIPTION

This error message advises you that in UPF shell mode, the \$isolate, \$power and \$retain statements are not supported.

## WHAT NEXT

Remove the specified line of code which contains the \$isolate, \$power or \$retain constructs, and correct the design correspondingly. Or, you may set hdlin\_upf\_allow\_legacy\_construct to true to let the tool strip off the logic for you.

**VER-288 (error) %s** Block name symbol %s already defined.

## DESCRIPTION

You get this error because the name used for block label has been previously used as an object name or a block label.

Example

```
module test (input in, output reg out1, out2);
 always @(in) begin:BLK
 out1 = in;
 end
 always @(in) begin:BLK
 out2 = in;
 end
endmodule
```

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-289 (error) %s Instance name symbol %s already defined.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-290 (error) %s Error in edge control specifier.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-291 (error) %s Event symbol %s already defined.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE std 1364.

## **VER-292 (error) %s Unable to open file '%s': %s.**

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-293 (error) %s '%s' is not a regular file.**

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-294 (error) %s Syntax error at or near token '%s'%s.**

### **DESCRIPTION**

You receive this error message because your code contains a syntax error or there's a syntax error in a /\* Synopsys \*/ comment.

### **WHAT NEXT**

Review your code and make appropriate corrections.

## **VER-295 (error) %s CMOS switches are not supported.**

### **DESCRIPTION**

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-296 (error) %s NMOS switches are not supported.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-297 (error) %s PMOS switches are not supported.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-298 (warning) %s Keyword vectored is ignored.

## DESCRIPTION

This warning message advises you that **vectored** is an optional advisory keyword. Presto warns about IEEE-1364 conforming uses of this net accessibility specification, but it is otherwise ignored for synthesis.

The following example shows the declaration of a vectored net. Since Presto ignores the keyword **vectored**, the effect is the same as if the keyword had been omitted.

```
...
wire vectored [1:0] x;
...
```

## WHAT NEXT

This is a warning message only. No action is required on your part.

## VER-299 (error) %s Illegal use of event '%s' as module connection.

### DESCRIPTION

You receive this message because the **read** or **elaborate** command detects an event in a module connection list. Events cannot be module connections in a module instantiation statement.

The IEEE 1364 Standard defines the term "module connection" as an element connected to a port of the instantiated module. Expressions in a parenthesized list in a module instantiation statement are valid module connections.

The following example shows an invalid attempt to use an event as a module connection:

```
event e;
...
SUBMODULE my_submodule(e); /* error: event used as module connection */
```

## WHAT NEXT

Determine the original intent of the module connection and replace the event with an element that correctly connects to a module.

```
analyze (2), read (2).
```

## VER-300 (error) %s Illegal attempt to declare hierarchical reference '%s'.

### DESCRIPTION

Hierarchical names are illegal in contexts where they would introduce or declare a new name in the current scope.

For example it is illegal to do a cross module declaration, as shown in the following code fragment:

```
reg a.b; /* illegal to declare a register in another scope */
```

## WHAT NEXT

Check if this is a typo, where a period should be a comma. Check that the names in the hierarchical reference are properly declared and accessible in the current scope. Reduce cross-module references by adding explicit ports to carry signals between modules.

# VER-301 (error) %s Specparam symbol '%s' already defined.

## DESCRIPTION

You receive this error message if you attempt to redefine an already defined symbol as a specification parameter.

## EXAMPLE

The following example demonstrates a case that results in this error message.

```
reg x; /* declaration of 'x' as a register */
...
specify
 specparam x = 1; /* illegal attempt to redeclare 'x' */
 ...
endspecify
```

## WHAT NEXT

Rename the original symbol or the specification parameter and all corresponding uses so that there is no conflict.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-302 (warning) %s Pragma '%s' for object '%s' will be ignored because the object could not be found.

## DESCRIPTION

A pragma is a compiler directive in the source code. This warning appears because, during **read** or **analyze** command activity, the symbol used in an *infer\_multibit* pragma is not declared in the source code.

## WHAT NEXT

Possibly you misspelled the name of the symbol or the symbol you used exists only in an old version of the source code and is no longer valid. Correct the symbol name or consider removing the pragma.

## SEE ALSO

`analyze (2), read (2).`

# VER-305 (warning) %s Drive strength specifications for gate instantiations are ignored.

## DESCRIPTION

You receive this warning message because a drive strength specification has been found in a gate instantiation statement. Drive strength specifications have no meaning for synthesis and are ignored.

## EXAMPLE

The following example shows a gate instantiation statement containing a drive strength specification, which results in this warning message.

```
not (highz1, strong0) n1 (a,y); /* highz1 and strong0 are drive strengths */
```

## WHAT NEXT

The drive strength specification is ignored during synthesis. If the code is intended for synthesis purposes only, consider removing the drive strength specification.

## SEE ALSO

`analyze (2), read (2).`

# VER-306 (warning) %s Drive strength specification for tri-state gate instantiation is ignored.

## DESCRIPTION

You receive this warning message because a drive strength specification has been found in a tristate gate instantiation statement. Drive strength specifications have

no meaning for synthesis and are ignored.

## EXAMPLE

The following example shows a gate instantiation statement containing a drive strength specification that results in this warning message.

```
bufif (highz1, strong0) b1 (y,a,c); /* highz1 and strong0 are drive strengths */
```

## WHAT NEXT

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-307 (warning) %s Drive strength specification for pull gate instantiation is ignored.

## DESCRIPTION

You receive this warning message because a drive strength specification has been found in a pull gate instantiation statement. Be aware that drive strength specifications have no meaning for synthesis and are ignored.

## EXAMPLE

The following example shows a gate instantiation statement containing a drive strength specification that results in this warning message.

```
pullup (strong1) p1 (y); /* highz1 and strong0 are drive strengths */
```

## WHAT NEXT

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

## SEE ALSO

**analyze** (2), **read** (2).

# **VER-308 (warning) %s Drive strength specification for module instantiation is ignored.**

## **DESCRIPTION**

You receive this warning message because a drive strength specification has been found in a module instantiation statement. Drive strength specifications have no meaning for synthesis and are ignored.

## **EXAMPLE**

The following example shows a module instantiation statement containing a drive strength specification that results in this warning message.

```
...
down (strong1, strong0) d (a,y); /* module instantiation with drive strengths */
...
```

## **WHAT NEXT**

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

## **SEE ALSO**

**analyze** (2), **read** (2).

# **VER-309 (warning) %s Drive strength specification for continuous assignment is ignored.**

## **DESCRIPTION**

You receive this warning message because a drive strength specification has been found in a continuous assignment statement. Be aware that the drive strength specifications have no meaning for synthesis and are ignored.

## **EXAMPLE**

The following example shows a continuous assignment statement containing a drive strength specification that results in this warning message.

```
...
assign (strong1, strong0) y = a; /* containing assignment with drive strengths */
...
```

## WHAT NEXT

If the code is intended for synthesis purposes only, consider removing the drive strength specification.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-310 (warning) %s Keyword scalared is ignored.

## DESCRIPTION

This warning message advises you that **scalared** is an optional advisory keyword. Presto warns about IEEE-1364 conforming uses of this net accessibility specification, but it is otherwise ignored for synthesis.

The following example shows the declaration of a scalared net. Since Presto ignores the keyword **scalared**, the effect is the same as if the keyword had been omitted.

```
...
wire scalared [1:0] x;
...
```

## WHAT NEXT

This is a warning message only. No action is required on your part.

# VER-311 (warning) %s Parameter range specification is new feature of Verilog 2001. Synthesis and non-Verilog 2001 compatible simulation may have different results.

## DESCRIPTION

This warning appears during `read` or `analyze` command activity to let you know that some simulators might ignore the range specification in the parameter declaration of your design and expand the parameter to 32 bits. It is thus possible that the circuit synthesized by the Presto HDL Compiler and the non-Verilog 2001 compatible simulation results will not match.

In the following example, the value of `out` from the simulator might be 0, but Presto HDL Compiler gives the value 16.

**Verilog**

```
output [4:0] out;
parameter [3:0] a = 0;

assign out = {1'b1, a};
```

In the following example, the value of `a` from the simulator might be 10, but the Presto HDL Compiler gives the value 2. The bit on the left is ignored.

Verilog

```
parameter [2:0] a = 4'b1010;
```

## WHAT NEXT

Check accordance between synthesis and simulation at the location in the source code that refers to the bit width of the parameter.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-312 (error) %s Cannot write architecture file %s: %s.

## DESCRIPTION

You receive this error when, during a `read` or `analyze` command, the Presto HDL compiler cannot open or write a file describing the source language (and for VHDL, the architecture) of the module or entity being analyzed.

## WHAT NEXT

Make sure that the output directory is writable.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-313 (warning) %s Verilog 'signed' data types are present; Verilog 'integer' data types become signed as well.

## DESCRIPTION

You receive this warning when you use the Verilog 2000 'signed' keyword to declare signed data types, using the Presto HDL Compiler in release 2000.11-1 and subsequent

releases. Using signed types causes signed logic for 'integer' types to be generated, as well (that is, any arithmetic using the variable of type integer will generate signed GTECH components in your netlist.)

Ordinarily the interpretation of integers as signed or unsigned data types in generated logic is controlled by the variable `hdlin_unsigned_integers`. However, when any variables in your design are declared using the 'signed' keyword, the variable is ignored, and integers are always interpreted as signed quantities.

This is a departure from releases of Presto prior to 2000.11-1, and from the default HDL Compiler in all previous releases. In earlier releases, the integer data type was not considered a hardware data type, but instead was intended only for compile-time calculations, such as counting loop iterations. As such, the integer data type generated unsigned logic.

This change reflects a reclassification of the integer data type under the Synopsys synthesis subset and conforms more closely to the IEEE Standard 1364-1995.

If you use integer data types to produce logic in your design, you might see a difference between designs compiled with earlier Presto HDL Compiler or HDL Compiler versions, as compared to Presto HDL Compiler version 2000.11-1 and subsequent versions. Make sure that expressions involving integer data types that produce logic are correctly computed when using signed arithmetic.

## WHAT NEXT

Ensure that your use of the integer data type is consistent with signed arithmetic.

## SEE ALSO

`hdlin_unsigned_integers` (3), `analyze` (2), `read` (2).

**VER-314 (warning) %s** Starting with the 2000.11-1 release, the Presto Verilog reader treats Verilog 'integer' types as signed; synthesized result may not match earlier versions of HDL Compiler.

## DESCRIPTION

You receive this warning when you use the Verilog 'integer' data type, when compiling your design with the Presto HDL Compiler, in release 2000.11-1 and subsequent releases.

By default, when expressions involving integer variables produce logic in the netlist, signed logic for will be generated (that is, any arithmetic using the variable of type integer will generate signed GTECH components in your netlist.)

This is a departure from Presto HDL Compiler in releases before 2000.11-1 and from the default HDL Compiler in all releases before 2001.08. In those earlier releases, the integer data type was not considered a hardware data type, but instead was intended only for compile-time calculations, such as counting loop iterations. As such, the integer data type generated unsigned logic.

This change reflects a reclassification of the integer data type under the Synopsys synthesis subset and conforms more closely to the IEEE Standard 1364-2001.

If you use integer data types to produce logic in your design, make sure that expressions involving integer data types that produce logic are correctly computed when using signed arithmetic.

The interpretation of integers as signed or unsigned data types in generated logic is controlled by the variable `hdlin_unsigned_integers`. However, when any variables in your design are declared using the 'signed' keyword, the variable is ignored, and integers are always interpreted as signed quantities.

## WHAT NEXT

Ensure that your use of the integer data type is consistent with signed arithmetic. If your design requires unsigned arithmetic generated by integer datatypes, and your design does not use Verilog 2000 'signed' types, consider setting `hdlin_unsigned_integers` to true.

## SEE ALSO

`hdlin_unsigned_integers` (3), `analyze` (2), `read` (2).

# VER-315 (warning) %s Module '%s' was renamed to '%s' with architecture '%s'.

## DESCRIPTION

You receive this warning because the named module contains the special separator string "\_\_" and was thus renamed to include the module and architecture. This warning informs you of the situation and this man page instructs you what to do if you did not intend the renaming.

When a Verilog module name contains the special separator string "\_\_" (two underscores), and the `hdlin_module_arch_name_splitting` variable is set to `true`, Presto HDL Compiler interprets the module name as specifying both a module and a specific architecture or implementation for that module. The portion of the original module name before the separator string becomes the new module name, and the portion after becomes the architecture.

For example, a module named "mod\_\_impl" would be renamed to "mod" and marked as having architecture "impl".

If the variable **hdlin\_module\_arch\_name\_splitting** is set to *false*, this renaming never occurs and modules always retain their original names. If it is set to *true*, the "\_" is used to divide the module name into module and architecture, as described above.

This capability exists primarily to allow the creation of synthetic libraries using Verilog, with multiple architectures per module.

## WHAT NEXT

If you did not intend to specify a module and architecture pair separated by "\_", either set **hdlin\_module\_arch\_name\_splitting** to *false* or rename your module so that it doesn't contain the separator string.

If you intended to imply a specific architecture, no further action on your part is required.

## SEE ALSO

**analyze** (2), **read** (2); **hdlin\_module\_arch\_name\_splitting** (3).

# VER-316 (error) %s The aggregated port expression in the declaration for port '%s' has a mixed direction.

## DESCRIPTION

This error indicates that the compiler has found a port declaration with an aggregated port expression that has a mixed direction.

Modules with mixed-direction port declarations are not supported in synthesis.

In Verilog, port directions are not declared directly, but are instead implied by the directions declared for port identifiers within port expressions.

When the port expression is a concatenation and the port identifiers within it are declared with different directions, the port has a mixed direction.

```
module mixed_direction (.p({a,e})) ;
 input a;
 output e;
 not(e,a);
endmodule
```

## WHAT NEXT

If you did not intend to specify a port with a mixed direction, change the expression in the port declaration or change the directions of some the identifiers it uses. If you intended to specify a port expression with mixed direction, split

the port into smaller ports that do not have mixed directions.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-318 (warning) %s %s to %s %s occurs.

## DESCRIPTION

You receive this warning message when the Presto HDL Compiler performs one of the following conversions or assignments:

- Implicitly converts an unsigned expression to a signed expression
- Implicitly converts a signed expression to an unsigned expression
- Assigns an unsigned right side to a signed left side
- Assigns a signed right side to an unsigned left side.

The following is an example of implicit signed/unsigned conversion:

```
reg signed [3:0] a;
reg [7:0] c;

a = 4'sb1010;
c = a+7'b0101011;
```

According to Verilog standard 2001, the tool converts the signed operand *a* to an unsigned value in the second assignment. The *a* operand is not sign-extended and the Presto HDL Compiler issues the following warning message:

signed to unsigned conversion occurs

However, if the operand being converted is a constant with leading zeros (in this case, converting between signed and unsigned does not change logic), the Presto HDL Compiler does not issue a warning. For example:

```
c = 5'sb01101+7'b0101011;
```

The first operand on the right side is implicitly converted to an unsigned value, but no warning is issued since the msb of the operand is 0.

Explicit type casting might also disable warnings about conversions. In the example

above, Presto HDL Compiler does not issue any warnings if *a* is coerced to be unsigned; for example, by assigning *c* as follows:

```
c = $unsigned(a)+7'b0101011;
```

The following is an example of a signed/unsigned assignment:

```
reg [7:0] a;
a = 4'sb1010;
```

The Presto HDL Compiler issues the following warning message:

```
signed to unsigned assignment occurs
```

Although the left side is unsigned, the right side is still sign-extended, so after the assignment, *a* equals 8'b11111010.

## WHAT NEXT

This is a warning message only. No action is required on your part if you want to have signed/unsigned conversions or assignments. However, you can avoid implicit conversion or signed/unsigned assignments by changing your Verilog code.

## SEE ALSO

[elaborate\(2\)](#)  
[read\(2\)](#)

## VER-319 (error) %s defparam to local parameter '%s' inside generate block not supported.

## DESCRIPTION

You receive this error message because parameter overwrites inside generate blocks to local parameters are not supported by synthesis.

```
module m ();
 parameter p = 1;
 generate
 defparam p = 2; // not allowed
 endgenerate
endmodule
```

## WHAT NEXT

Rewrite your source file, removing the parameter overwrites inside the generate blocks to local parameters, and then run the command again.

## SEE ALSO

**elaborate** (2), **read** (2).

# VER-320 (warning) %s right hand side of defparam statement should only contain constants or references to parameters.

## DESCRIPTION

You receive this warning message because according to the Verilog standard, the right side of a defparam statement should be a constant expression involving only numbers and references to parameters.

```
module m ();
 genvar i;

 generate
 for (i=0; i<10; i=i+1) begin : B1
 defparam p = i; // warning: genvar is not allowed on the RHS
 end;
 endgenerate
endmodule
```

## WHAT NEXT

No action is required on your part.

However, to strictly comply with the language standard, you should rewrite your code to use only constants or references to parameters on the right side of defparam statements.

You can avoid the warning message by changing the source file so that the defparam statements conform to the Verilog standard.

## SEE ALSO

**elaborate** (2), **read** (2).

# VER-321 (error) %s genvar '%s' used outside generate loop.

## DESCRIPTION

You receive this error message because a genvar can only be used inside the generate loop that uses the genvar as a loop index variable. Using the genvar outside of this loop is not permitted.

```
module m ();
 genvar i;

 generate
 for (i=0; i<10; i=i+1) begin : B1
 ...
 end;
 assign y = i; // use pf genvar outside generate loop.
 endgenerate
endmodule
```

## WHAT NEXT

Change your source file so that all genvars are only used inside the generate loop that uses the genvar as a loop index variable, and then run the command again.

## SEE ALSO

**elaborate** (2), **read** (2).

# VER-322 (error) %s A packed object cannot contain unpacked data: %s.

## DESCRIPTION

This error message occurs because a structure or union declared as packed cannot contain an unpacked member; an array with packed dimensions cannot have elements whose type is unpacked; or a Verilog-style concatenation cannot include unpacked ingredients.

```
struct packed {
 struct {
 } a; // error: unpacked structure inside packed structure
 } b;
 struct { byte car, cdr } cons; // This unpacked type cannot be:
 cons [12] register_file; // on a packed dimension, or
 register_file = {12{ cons'{0,0} }}; // in a packed concatenation.
```

## WHAT NEXT

Change your source file so that either the element (and all of its subelements) are declared as packed, or else declare all outer structs and/or unions as unpacked, and write outer array dimensions to the right of their variable name (which connotes an unpacked data arrangement).

In concatenations, you can rewrite the code to treat unpacked data in a separate structure. If this is not possible, then cast the concatenation to the appropriate unpacked type. As a final option, you can cast the offending element to a packed type of the correct width.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-323 (error) %s Trying to redeclare typename '%s'.

## DESCRIPTION

You receive this error message because an identifier declared as a typename can't be redeclared later.

```
typedef logic SPOCK;
...
reg SPOCK // error: 'SPOCK' already declared as a typename
```

## WHAT NEXT

Change your source file by renaming either the typename or the identifier causing the name clash to a new name.

## SEE ALSO

`elaborate (2)`, `read (2)`.

# VER-324 (error) %s Illegal slice name.

## DESCRIPTION

You receive this error message because you are applying more than one slice to an array or the slice is not the last element in the select chain.

The example below demonstrates legal and illegal situations.

```
reg [0:3] [4:7] [8:11] a;

... = a[1:2]; // legal: only one slice at the end of the select chain
... = a[2][5:6]; // legal: only one slice at the end of the select chain

... = a[1:2][4]; // illegal: slice not last element of select chain
... = a[1:2]5:6]; // illegal: more than one slice in select chain
```

## WHAT NEXT

Change your source file to use select chains with only one slice per select chain and make sure the slice is always the last element in the select chain.

## SEE ALSO

**elaborate** (2), **read** (2).

# VER-325 (error) %s This structure constructor is missing a value for member '%s'.

## DESCRIPTION

This error message occurs because structure construction expressions must specify a value for every member of the structure. The cited member was not mentioned in the list of member:value specifications, and none of the type:value or default:value specifications could be applied successfully.

## WHAT NEXT

Check the nesting of curly braces around this source line. Check the declaration of the structure type(s) and typedef names involved. After making the necessary changes, run the command again.

# VER-326 (error) %s conditionally generated declaration of port '%s'.

## DESCRIPTION

You receive this error message because the declaration of a port is conditionally generated. All 3 port declarations in the following example are illegal because they are either fully or partly contained in a conditional generate region.

```
module m (a, b, c);
 reg c;
```

```
output b;

generate
 if (...) output a;
 reg a;
 reg b;
 output c;
endgenerate
endmodule
```

## WHAT NEXT

Check the nesting of curly braces around this source line. Check the declaration of the structure type(s) and typedef names involved.

# VER-327 (error) %s Non-constant index expression on left hand side of continuous assignment '%s'.

## DESCRIPTION

You receive this error message because the left hand side of a continuous assignment contains a non-constant index expression. This is not legal Verilog.

```
module m (a, b);
 reg [0:7] a;
 integer b;

 assign a[b] = 1'b0; // error, 'b' is non-constant

endmodule
```

## WHAT NEXT

Rewrite the design such that all left hand sides of continuous assignments contain only constant index expressions. Depending on the context one way of achieving this is to turn the continuous assignment into a nonblocking assignment inside a combinational always block.

# VER-328 (error) %s Syntax error on apparent Verilog 2001 construct.

## DESCRIPTION

You receive this error message because hdlin\_vrlg\_std has been set to 1995, but the

Verilog code apparently contains a Verilog 2001 construct.

## WHAT NEXT

Either rewrite the code so that it does not use Verilog 2001 constructs or do not override the default value of hdlin\_vrlg\_std.

# VER-329 (warning) %s Parameter keyword used in local parameter declaration.

## DESCRIPTION

You receive this warning message because the 'parameter' keyword has been used in a local parameter declaration.

According to the 2nd paragraph of 3.11.1 in the Verilog-2001 LRM, "If any param\_assignments appear in a module\_parameter\_port\_list, then any param\_assignments that appear in the module become local parameters and shall not be overridden by any method." For example, because p2 in the following is a local parameter:

```
module bottom #(parameter p1 = 13) (output [31:0] o) ;
 parameter p2 = 17 ;
 assign o = p1 + p2 ;
endmodule
```

an instantiation that attempted to override it would be disallowed:

```
module top (output [31:0] o) ;
 bottom #(.p2(29)) bot (o) ;
endmodule
```

In SystemVerilog there are several additional scope contexts in which the parameter keyword is a synonym for the localparam keyword. According to 6.3.2 in the IEEE SystemVerilog LRM, "Unlike nonlocal parameters, local parameters can be declared in a generate block, in a package, or in a compilation-unit scope. In these contexts, the parameter keyword can be used as a synonym for the localparam keyword."

## WHAT NEXT

If there is no need to override the parameters in a module or interface declaration either do nothing or use the 'localparam' keyword instead. If there is a need to override the parameter in this declaration, declare them in the list\_of\_parameter\_declarations instead.

The parameters in a package, compilation-unit scope or generate block are always local parameters and cannot be overridden.

# VER-330 (warning) %s No operator for pragma label %s

## DESCRIPTION

In the statement, there is no operator to which the label could be applied.

### Verilog

```
a = b ; // synopsys label my_oper
```

A label can be associated only with an infix operator, such as +, or with a task or function call.

## WHAT NEXT

Modify the Verilog source code to remove the pragma or to introduce an operator for the label.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-331 (warning) %s Redeclaration of port '%s'.

## DESCRIPTION

You receive this message because, during **analyze** or **read** command activity, the Presto HDL Compiler has detected that a port previously declared using an ANSI-style port declaration (12.3.4 in the Verilog 2001 LRM) has been redeclared in the body of the module.

Following is an example that illustrates this type of problem:

```
module m (input a, output b);
 wire a; // redeclaration of input port
 reg b; // redeclaration of ouput port
endmodule
```

## WHAT NEXT

Remove the redeclaration and move any additional information it contains into the ANSI-style port declaration.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-332 (warning) %s The '%s' pragma is ignored when applied to 'if' statements.

## DESCRIPTION

This warning message occurs during `analyze` or `read` command activity when the compiler finds a `full_case` or `parallel_case` pragma applied to an "if" statement.

The `full_case` or `parallel_case` pragmas are only effective when applied to case statements.

The `infer_mux` pragma is meaningful when applied to "if" statements.

## WHAT NEXT

Remove any `full_case` or `parallel_case` pragmas from "if" statements in your design.

## SEE ALSO

`analyze`(2)  
`read`(2)

# VER-333 (error) %s Widths of ports on 'tran' instantiation are inconsistent.

## DESCRIPTION

This error message occurs when a Verilog "tran" instance has an input and output port that have different widths.

The following module produces this error message because the widths of "a" and "b" are not equal.

```
module E (a, b);

 input [2:0] a;
 output [3:0] b;

 tran (a, b);
```

```
endmodule
```

## WHAT NEXT

Correct the widths of the ports so that they are consistent and then invoke the compiler again.

## SEE ALSO

`elaborate(2)`

# VER-334 (error) %s Width of interface port is not consistent with width of expression.

## DESCRIPTION

This error message occurs when the design being compiled contains an interface instantiation in which the declared width of the interface's modport does not match the width of the connection in the interface instantiation.

## WHAT NEXT

Correct the width of the ports so that they are consistent and then invoke the compiler again.

## SEE ALSO

`elaborate(2)`

# VER-335 (error) %s 'defparam' is not supported inside generate blocks

## DESCRIPTION

You receive this error message when running the `read` or the `elaborate` command if your design contains a `defparam` statement within a `generate` block.

Presto HDL Compiler does not support `defparam` parameter value override assignments within `generate` blocks.

The following example demonstrates a supported coding style for parameter value override assignments.

```
module sub (...);
```

```

PARAMETER P1 = 10;
...
endmodule

module top (...);

...
generate if(1) begin: blk
 sub u1 (...) ; //error: defparams not supported
 defparam u1.P1 = 20; // inside generate blocks.
end

...
generate if(1) begin: blk2
 sub #(20) u1 (...) ; //supported method to assign parameter
end //value overrides

...
endmodule

```

## WHAT NEXT

Rewrite the parameter value assignment as shown in the example above.

## SEE ALSO

`elaborate(2)`  
`read(2)`

**VER-336 (warning) %s 'defparam' that accesses a hierarchical name may be ignored.**

## DESCRIPTION

The `read` or the `analyze` command issues this message when your design contains a `defparam` statement that modifies a parameter through hierarchical reference.

Presto HDL Compiler ignores `defparam` overrides of parameters inside functions, tasks or named blocks. Since the actual target is not known at the point where the `defparam` statement is analyzed, this message is just a warning and may be a false negative indication.

## WHAT NEXT

You may ignore this message if the `defparam` overrides a parameter which will later be declared in the top level of a module instantiated from within the current design. Otherwise, recode the design and try again.

## **SEE ALSO**

### **WHAT NEXT**

## **VER-409 (error) %s Attributes with non-locally static values on integer/constants are not supported.**

### **DESCRIPTION**

Attributes with non-locally static values on integer/constants are not supported.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std.

## **VER-410 (warning) %s Expecting explicit event control immediately after always\_ff.**

### **DESCRIPTION**

Expecting explicit event control immediately after always\_ff.

### **WHAT NEXT**

## **VER-411 (error) %s Interface instance is expected here : %s**

### **DESCRIPTION**

Failed to get the expected interface instance.

The most likely cause of this error message is that an interface has been instantiated before declaration. In synthesis, interfaces, unlike modules, must be declared before they are instantiated.

## WHAT NEXT

Please check your RTL for typographical errors, or that you have declared the interface before instantiating it and try again.

# VER-412 (error) %s Illegal digit %c in unbased number.

## DESCRIPTION

The digit should be one of the four basic values (0, 1, x, z).

## WHAT NEXT

Check your design for invalid digits in unbased numbers and correct them.

# VER-413 (error) %s Invalid argument for system task or function : %s

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std.

# VER-414 (warning) %s Unsupported hdlin\_field\_naming\_style : %s.

## DESCRIPTION

Unsupported hdlin\_field\_naming\_style encountered when analyzing/reading SystemVerilog RTL with Presto HDL Compiler.

The hdlin\_field\_naming\_stle variable defines the parts of the net names that Presto HDL Compiler generates corresponding to the fields in VHDL records and SystemVerilog structs.

By default, the hdlin\_field\_naming\_style is derived from the bus\_naming\_style and bus\_dimension\_separator\_style. But when these are "%s[%d]" and "][]" or are "%s<%d>" and "><", then it is possible to specify an independent hdlin\_field\_naming\_style,

such as "%s<%s>", "%s[%s]", or "%s.%s", in which the first %s stands for the name up to the field and the second %s stands for the field. The hdlin\_field\_naming\_style must be of the form "%sX%s" or "%sX%sY", where X and Y are (possibly identical) non-whitespace characters.

## WHAT NEXT

Modify the bus\_naming\_style, bus\_dimension\_separator\_style, and/or hdlin\_field\_naming\_style.

## SEE ALSO

**hdl\_variables** (3), **bus\_naming\_style** (3), **bus\_dimension\_separator\_style** (3),

An empty bus\_dimension\_separator\_style string ("") was encountered when elaborating a multidimensional bus.

## WHAT NEXT

Do not override the bus\_dimension\_separator\_style to the empty string ("").

## SEE ALSO

`hdl_variables (3)`, `bus_naming_style (3)`. `bus_dimension_separator_style (3)`.

# VER-419 (warning) %s Empty string used as bus\_dimension\_separator\_style.

## DESCRIPTION

An empty bus\_dimension\_separator\_style string ("") was encountered when elaborating a multidimensional bus.

## WHAT NEXT

Do not override the bus\_dimension\_separator\_style to the empty string ("").

## SEE ALSO

`hdl_variables (3)`, `bus_naming_style (3)`. `bus_dimension_separator_style (3)`.

## **VER-441 (warning) %s Port number %d of '%s' was named '%s'.**

### **DESCRIPTION**

You receive this warning when a complex port such as the third port in

```
module m(clk, out, .P({a,b}));
```

is declared without an explicit port name, as in

```
module m(clk, out, {a,b});
```

### **WHAT NEXT**

If you want to control the naming of the port, add an explicit name to the port declaration.

## **VER-500 (error) %s %s**

### **DESCRIPTION**

A syntax or internal error has surfaced during verilog traversering. The message specifies where the error appeared and why it was issued.

### **WHAT NEXT**

Internal errors indicate a problem which should be reported to your Synopsys representative.

## **VER-501 (error) %s Redundant %s directives on a chain of if-else-if statements.**

### **DESCRIPTION**

You receive this error message when running the **read** or the **elaborate** command if your SystemVerilog design contains a chain of if-else-if statements with redundant **unique** or **priority** keywords. For example:

```
unique if (x == 0)
 y = 1;
else unique if (x == 1)
 y = 2;
```

The second **unique** keyword is not permitted. Only the top if statement should be labeled.

## WHAT NEXT

Verify that you intend to use a unique or priority chain of if statements, and remove the redundant directive.

## SEE ALSO

[elaborate\(2\)](#)  
[read\(2\)](#)

# VER-502 (error) %s Conflicting directives on a chain of if-else-if statements; outer statements are labeled '%s', inner statement '%S'.

## DESCRIPTION

You receive this error message when running the **read** or the **elaborate** command when your SystemVerilog design contains a chain of if-else-if statements with conflicting **unique** or **priority** keywords. For example:

```
unique if (x == 0)
 y = 1;
else if (x == 1)
 y = 2;
else priority if (z == 0)
 y = 2;
else if (z == 0)
 y = 3;
```

The inner if statement is labeled with a conflicting directive, which is not permitted. Use a directive only on the top if statement.

## WHAT NEXT

If you want to start a new, separate chain of if-else-if statements inside the final else branch of the outer chain, use a block around the inner chain as shown below.

```
unique if (x == 0)
 y = 1;
else if (x == 1)
 y = 2;
else
 begin
```

```
priority if (z == 1)
 y = 2;
else if (z == 0)
y = 3;
end
```

Otherwise, decide whether you intend to use a **unique** or **priority** chain of if statements, and label only the top level if statement, removing all other directives in the chain of if-else-if statements.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-503 (warning) %s Case statement marked unique has overlapping conditions.

## DESCRIPTION

You receive this warning message when running the `read` or the `elaborate` command if your SystemVerilog design contains a **unique** case statement with overlapping branches. This means that more than one condition can be true at the same time, which contradicts the definition of unique case.

For example, the following case is not unique because the third branch matches any value of `c`, including the values matched by the first two branches. Therefore, the case requires priority encoding for correct execution.

```
unique casex (c)
 2'bx1: y = 2;
 2'b1x: y = 1;
 2'bxx: y = 3;
endcase
```

The synthesis tool may make optimizations based on the **unique** keyword so that the priority encoding logic is simplified. However, this may bring simulation/synthesis mismatch.

If you are unsure whether or not a case is **unique**, do not mark it **unique**.

## WHAT NEXT

Check the case statement conditions. Make sure that the case labels are intended to overlap. Otherwise, either correct the conditions so that they do not overlap, or remove the **unique** keyword.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-504 (warning) %s Case statement marked %s does not cover all possible conditions.

## DESCRIPTION

You receive this warning message when running the `read` or the `elaborate` command if your SystemVerilog design contains a **unique** or **priority** case statement, where it is possible that no branch condition will evaluate to true. This means the case statement may execute, but no branch is taken, which contradicts the definition of **unique** and **priority** case statements.

For example, the following case is not a **unique** or **priority** case, because when `c` is `3'b011`, `3'b010`, or `3'b001`, no branch is executed.

```
unique casex (c)
 3'b111: y = 5;
 3'b11x: y = 4;
 3'b1xx: y = 3;
 3'b000: y = 2;
endcase
```

However, based on your knowledge of the design, you may know that only the listed values will occur. In this case, you can ignore this warning.

The synthesis tool cannot check all **unique** and **priority** case statements for this condition. If a case is marked **unique** or **priority**, but the case statement may execute without having any branch taken, your design may produce unexpected results.

If you are unsure whether or not a case statement is a **unique** or **priority** case statement, do not mark it unique.

## WHAT NEXT

Check the case statement conditions. Based on your knowledge of the design, if you know that any values that are omitted from the case conditions cannot occur, you may ignore the warning. Otherwise, either add branches to cover the missing values, add a default branch, or remove the **unique** or **priority** keyword.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-505 (warning) %s If statement marked unique has overlapping conditions.

## DESCRIPTION

You receive this warning message when running the `read` or the `elaborate` command if your SystemVerilog design contains a `unique` if statement whose branches overlap. This means that more than one condition can be true at the same time, which contradicts the definition of a `unique` statement.

For example, the following if statement is not `unique` because the third branch overlaps with the first. Therefore, the if statement requires `priority` encoding for correct execution.

```
unique if (c == 2'b01)
 y = 2;
else if (c == 2'b10)
 y = 1;
else if (c == 2'b11 || c == 2'b01)
 y = 3;
```

The synthesis tool may make optimizations based on the `unique` keyword so that the priority encoding logic is simplified. However, this may bring simulation/synthesis mismatch.

If you are unsure whether or not an if statement is `unique`, do not mark it `unique`.

## WHAT NEXT

Check the if statement conditions. Make sure that the case labels are intended to overlap. Otherwise, either correct the conditions so that they do not overlap, or remove the `unique` keyword.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-506 (warning) %s If statement marked %s does not cover all possible conditions.

## DESCRIPTION

You receive this warning message when running the `read` or the `elaborate` command if your SystemVerilog design contains a `unique` or `priority` if statement where it is possible that no branch condition will evaluate to true. This means that the if

statement may execute, but no branch is taken, which contradicts the definition of **unique** and **priority** if statements.

For example, the following if chain is not a **unique** or **priority** if statement because only two of the eight possible values of c are checked.

```
priority if (c == 3'b111)
 y = 5;
else if (c == 3'b110)
 y = 4;
```

However, based on your knowledge, you may know that only those two values will occur. In this case, you may ignore this warning.

The synthesis tool cannot check all **unique** and **priority** if statements for this error. If an if statement is marked **unique** or **priority**, but the statement may execute without having any branch taken, your design may produce unexpected results.

If you are unsure whether or not an if statement is a **unique** or **priority** if statement, do not mark it as **unique** or **priority**.

## WHAT NEXT

Check the if statement conditions. Based on your knowledge of the design, if you know that any values that are omitted from the if conditions cannot occur, you may ignore the warning. Otherwise, either add branches to cover the missing values, add a final else branch, or remove the **unique** or **priority** keyword.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-507 (error) %s Enumerated type member %s does not match size of type; (size %d, expecting %d).

## DESCRIPTION

You receive this error message when running the **read** or **elaborate** command if your SystemVerilog design contains an enumerated type declaration, and a member of the enumerated type is the wrong size.

A value can be the wrong size because it will not fit into an explicitly declared data type, or because it does not match the size of a previous enum member that has a sized value.

```
enum short { red = 600000, blue = 2, green = 1} e; // red is too large to fit
```

```
enum { red = 5'd4, blue = 4'd3, green } e; // blue's size does not match red's
```

Consult the SystemVerilog language reference manual for more information on how values are assigned to members of enumerated types.

## WHAT NEXT

Examine the members of the enumerated type, and make the changes needed to ensure that each member has the same size.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-508 (error) %s Enumerated type member %s duplicates a previously seen value %s.

## DESCRIPTION

You receive this error message when running the `read` or `elaborate` command if your SystemVerilog design contains an enumerated type declaration, and two members of the enumerated type are assigned to the same value.

The error is issued either for members that have an explicit value assigned to them, or for members whose value is determined automatically from the values of the preceding members.

Values of SystemVerilog enumerated type members are determined as follows.

- If an explicit value is given, then that value is used.
- If no explicit value is given, and the member is the first in the enumerated type, it is assigned to 0.
- If no explicit value is given, and the member is not the first in the enumerated type, then it is given a value 1 greater than that of the previous member.

In the following example red and green are explicitly assigned the same value.

```
enum { red = 1, blue = 2, green = 1} e;
```

In the next example, red is assigned explicitly to 2, while green is given the value 2 because the previous member is given the value 1.

```
enum { red = 2, blue = 1, green } e;
```

Consult the SystemVerilog language reference manual for more information on how values are assigned to members of enumerated types.

## WHAT NEXT

Examine the members of the enumerated type, and make the changes needed to ensure that each member has a unique value.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-509 (error) %s Enumerated type member %s cannot be assigned a four-state value (%s).

## DESCRIPTION

You receive this error message when running the `read` or `elaborate` command if your SystemVerilog design contains an enumerated type declaration, the data type of the enumerated type is a two-state type, and a member of the enumerated type is assigned to a four-state value.

In the first example below, the `int` type is a two-state type and cannot represent `x` or `z` values, so `red` cannot be assigned to `3'bxxx`. If no data type is specified for the enumerated type, then it defaults to `int`, which is a two-state type.

```
enum int { red = 3'bxxx, blue = 2, green = 1} e; // error
enum { red1 = 3'bxxx, blue1 = 2, green1 = 1} e; // error since default is int
```

To use four-state values in enumerated types, choose a data type as shown below.

```
enum integer { red = 3'bxxx, blue = 2, green = 1} e; // OK with integer
```

Consult the SystemVerilog language reference manual for more information on how values are assigned to members of enumerated types.

## WHAT NEXT

Either use a four-state data type, or remove any four-state values from the list of enumerated type members.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-510 (error) %s Value of enumerated type member %s cannot be determined since previous value was four-state.

## DESCRIPTION

You receive this error message when running the `read` or `elaborate` command if your SystemVerilog design contains an enumerated type declaration, the specified member of the type is not explicitly assigned a value, and the previous member of the enumerated type is assigned to a four-state value.

Values of SystemVerilog enumerated type members are determined as follows.

- If an explicit value is given, then that value is used.
- If no explicit value is given, and the member is the first in the enumerated type, it is assigned to 0.
- If no explicit value is given, and the member is not the first in the enumerated type, then it is given a value 1 greater than that of the previous member.

When the value of a member of the enumerated type contains x or z, then it is an error not to specify an explicit value for the following member.

In the following example, red contains x, so blue must be explicitly assigned a value.

```
enum int { red = 3'bxxx, blue, green = 1} e; // error
```

## WHAT NEXT

Supply an explicit value for any enumerated type member that follows a member with a four-state value.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-511 (error) %s Subscript or range expression of the enum

# member %s is not a literal constant.

## DESCRIPTION

You receive this error message when running the **read** or **elaborate** command if your SystemVerilog design contains an enumerated type declaration that uses a subscript or range expression to produce a series of values in the type, and the subscript or range expression does not consist solely of constants.

The Presto HDL Compiler supports only a literal constant in such subscript or range expressions. For example, the following design fragment generates an error, because a parameter is used in a subscript expression for an enumerated type member.

```
parameter n = 8;
typedef enum { state[n] } states;
```

The following example shows an acceptable declaration.

```
typedef enum { state[8] } states;
```

## WHAT NEXT

Supply a constant value for all subscript or range expressions in enumerated type declarations.

## SEE ALSO

[elaborate\(2\)](#)  
[read\(2\)](#)

# VER-512 (error) %s Only integer types or one dimensional packed arrays are permitted as the underlying type of an enumeration.

## DESCRIPTION

You receive this error message when running the **read** or **elaborate** command if your SystemVerilog design contains an enumerated type declaration that specifies an underlying data type, and the underlying data type is not permitted.

Only integer types or one dimensional packed arrays are permitted as the underlying type of an enumeration. The following is an example of an unacceptable declaration.

```
/* Not acceptable */
```

```
typedef enum logic signed [0:0][0:0] { state1, state2, state3, state4 } states;
```

This example shows an acceptable declaration.

```
typedef enum logic signed [1:0] { state1, state2, state3, state4 } states;
```

## WHAT NEXT

Correct the design to use an integer type or one dimensional packed array as the underlying type of the enumeration.

## SEE ALSO

elaborate(2)  
read(2)

# VER-513 (error) %s redeclaration of symbol %s as constant.

## DESCRIPTION

You receive this error message if a symbol in a constant declaration has already been declared, either as a constant or as something else. In the following example, `in` is first declared as an input, then erroneously redeclared as a constant.

```
input in;
...
const in = 1'b0; // erroneous redeclaration of input 'in'
 // as a constant
```

## WHAT NEXT

Decide which of the declarations is the intended one and remove or change the name in the other declaration, and then run the command again.

## SEE ALSO

analyze(2)  
read(2)

# VER-514 (error) %s Return statement in non-void function %s

# requires an expression as return value.

## DESCRIPTION

You receive this error message when running the **read** or **elaborate** command if your SystemVerilog contains a function with a non-void return type, and a return statement occurs without an expression to use as the return type.

When a function is declared with a return type, all return statements must be accompanied by an expression.

## WHAT NEXT

Supply a return value in the return statement and run the command again.

## SEE ALSO

[elaborate\(2\)](#)  
[read\(2\)](#)

# VER-515 (warning) %s Discarding return value of function %s.

## DESCRIPTION

You receive this warning message when running the **read** or **elaborate** command if your SystemVerilog design contains a call to a function, and the function's return value is not used.

The warning is not issued if the return type of the function is void.

## WHAT NEXT

This is a warning message only. No action is required on your part if you intended to ignore the return value of the function.

However, if you do not want the return value of the function ignored, change the return type to void and run the command again.

## SEE ALSO

[elaborate\(2\)](#)  
[read\(2\)](#)

# VER-516 (error) %s the name %s after the end construct does

not match the name %s of the construct.

## DESCRIPTION

You receive this error message when the name after the end construct (module, interface, block, function, or task) does not match the construct name.

The following is an example of mismatched names after endmodule.

```
module name1(input i, output o);
 assign o = i;
endmodule :name2 //name2 is not the same as name1
```

The following shows another example of mismatched names for sequential block.

```
module name1(input i, output reg o);
 always begin
 o = i;
 end : name2 //the name of the sequential block is not specified.
endmodule : name1
```

## WHAT NEXT

Correct the names so that they match and run the command again.

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

**VER-517 (error) %s A case statement is marked with both a unique or priority keyword, and a full\_case or parallel\_case directive.**

## DESCRIPTION

You receive this error message from the **read** or **elaborate** commands when your SystemVerilog design contains a case, casex, or casez statement marked with the 'priority' or 'unique' keyword that is also marked with the '//synopsys parallel\_case' or '///synopsys full\_case' pragma.

In Verilog, pragmas were the only means of communicating information about a case statement's properties to the compiler. In SystemVerilog, the 'unique' and 'priority' keywords convey that information. The Presto HDL Compiler accepts either

style, but does not accept a mixture of the two styles on the same case statement.

## WHAT NEXT

If knowledge of the design guarantees that :

1. At least one case condition will evaluate to true

BUT NOT:

2. No more than one case condition will evaluate to true

then use the 'priority' keyword on the case.

If knowledge of the design guarantees that :

1. At least one case condition will evaluate to true

AND:

2. No more than one case condition will evaluate to true

then use the 'unique' keyword on the case.

If knowledge of the design guarantees that :

1. No more than one case condition will evaluate to true

BUT NOT:

2. At least one case condition will evaluate to true

AND:

then use the '//synopsys parallel\_case' pragma for the case statement.

If neither of these conditions is known to be true, then use no keyword or pragma.

## VER-518 (error) %s Cannot recover from previous errors.

### DESCRIPTION

This error message occurs when the errors reported so far have left the compiler in a state where further error reports would be inaccurate, misleading, or omitted. The **analyze** or **read** command stops even if some of the source text has not yet been processed. For example, if the \$unit scope of a SystemVerilog compilation issues any errors, compilation of modules or interfaces with visibility into that \$unit may not proceed.

### WHAT NEXT

Resolve the previously reported error message(s), and rerun the **analyze** or **read** command.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-519 (warning) %s Return value of function '%s' is not set.

## DESCRIPTION

This warning message occurs during a `read` or `elaborate` command, when your SystemVerilog design contains an automatic function with a non-void return value that does not set the return value inside the function body. The return value of the function is not specified by the language standard. Change the your code to clearly specify the result.

The warning is not issued if the return type of the function is `void`.

```
function automatic f;
 input a;
 reg r;
 r = 2 * a;
endfunction

always begin
 y = f (a);
end
```

## WHAT NEXT

If you intended to ignore the return value of the function you can disregard the warning message.

If the result is not what you intended, change the code to clearly specify the result.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-520 (warning) %s Task enable in always\_comb block.

## DESCRIPTION

This warning message occurs during a `read` or `analyze` command when your SystemVerilog design contains a task enable within an `always_comb` block. This is a possible

simulation-synthesis mismatch, because the language standard does not require simulators to be sensitive to the contents of a task.

## WHAT NEXT

Modify your code to use calls to void functions instead of task enables within always\_comb blocks and then run the command again.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-521 (error) %s Using nonexistent return value of void function '%s'.

## DESCRIPTION

You receive this error message from the `read` or `analyze` commands when your SystemVerilog design uses a call to a void function as an expression instead of like a task enable.

```
function automatic void f (a , output [1:0] b) ;
 reg r;
 b = 2 * a;
endfunction

always begin
 y = f (a , b);
end
```

## WHAT NEXT

Modify the void function to one that returns a value or to pass back the result through an output port.

# VER-522 (error) %s The 'inout' port '%s' is not of net type.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters an inout port declared with a non-net type, such as 'struct', 'bit', 'reg' or 'logic'. According to IEEE Std 1800-2005, section 19.12.1, a variable data type is not permitted on either side of an inout port.

## WHAT NEXT

Rewrite the SystemVerilog code to use a net type on this port or to use two ports instead of just one. (In simulation, a 'ref' port could also be used, but 'ref' ports are not synthesizable.)

## SEE ALSO

`analyze` (2), `read` (2).

# VER-523 (error) %s Static %s '%s' is not synthesizable in %s, expecting 'automatic' keyword.

## DESCRIPTION

This error message occurs when a function or task that is not automatic is encountered in \$unit (formerly known as \$root), in a package declaration, or in an interface declaration. The synthesizable SystemVerilog subset requires that each task and function in \$unit, in a package declaration, or in an interface declaration be declared **automatic**.

## WHAT NEXT

Add the **automatic** keyword after the **task** or **function** keyword.

# VER-524 (error) %s Multiple implicit port connection tokens in instantiation.

## DESCRIPTION

This syntax error message occurs when the .\* implicit port connection token is used more than once in a single module or interface instantiation:

```
xtend xtend(.*, .dout(dataout[7:0]), .*, din(alu_out[7]));
```

## WHAT NEXT

Remove all but one of the .\* tokens from the instantiation. Run the **analyze** or **read** command again.

## SEE ALSO

`analyze`(2)  
`read`(2)

# **VER-525 (error) %s Invalid interface access %s.**

## **DESCRIPTION**

This error message occurs when the Presto HDL Compiler finds an error when accessing the interface instance or the interface port.

For example:

```
I inst(); // I is an interface definition, with modport mp
// assign a = inst.mp.b;
```

## **WHAT NEXT**

Correct the access to the interface and then run the compiler again.

## **SEE ALSO**

```
analyze(2)
elaborate(2)
read(2)
```

# **VER-526 (error) %s Invalid name %s in the modport %s of the interface %s.**

## **DESCRIPTION**

This error message occurs when the Presto HDL Compiler finds an invalid name in the modport definition. This error may be caused by one of the following:

- There is no valid symbol declared in the interface.
- The symbols declared are inconsistent with the usage in the modport declaration.  
In the following example, the function *foo* is used as a port and signal *s* is used as a function or task:

```
interface I();
 function foo ... endfunction
 logic s;
 modport MP (input foo, import function s());
endinterface
```

- The name has been used in the modport declaration. In the following example, there are two ports named *s*:

```
interface I();
 function foo ... endfunction
 logic s;
 modport MP (input s, input s, import foo());
endinterface
```

## WHAT NEXT

Correct the name in the modport definition and then run the compiler again.

## SEE ALSO

[analyze\(2\)](#)  
[elaborate\(2\)](#)  
[read\(2\)](#)

# VER-527 (error) %s The input port %s is not writable.

## DESCRIPTION

This error message occurs when the input port expanded from modport is not writable.

In the following example, *a* is an input port expanded from modport port *i* in module *M*. The assignment to *i.a* causes the error message.

```
interface I();
```

```
 logic a;
```

```
 modport MP(input a);
```

```
endinterface
```

```
module M(I.MP i);
```

```
 assign i.a = 1'b1;
```

```
endmodule
```

## WHAT NEXT

Correct any errors in the code and run the command again.

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

# **VER-528** (warning) %s Invalid symbol name '%s' in the pragma signal name list. It is being ignored.

## **DESCRIPTION**

This warning message occurs because the Presto HDL Compiler found an invalid symbol name in the pragma signal name list. This problem may be caused by one of the following:

- There is no valid symbol declared in the module.
- The usage of the symbol in the pragma signal name list is not consistent with the symbol declaration in the module.
- The type of the symbol (such as constant or function name) is not allowed to appear in the pragma signal name list.

## **WHAT NEXT**

This is only a warning message. You can eliminate this warning by following the instructions below.

If you do not want the symbol to be ignored from the pragma signal name list, correct the symbol name in the pragma signal name list and then run the compiler again.

## **SEE ALSO**

`analyze(2)`  
`elaborate(2)`  
`read(2)`

# **VER-530** (warning) %s Treating %s '%s' as automatic in %s; possible simulation-synthesis mismatch.

## **DESCRIPTION**

This warning message occurs when a function or task that is not declared **automatic** is encountered in \$unit (formerly known as \$root), in a package declaration, or in an interface declaration. The synthesizable SystemVerilog subset requires that each task and function in \$unit, in a package declaration, or in an interface declaration be declared **automatic**.

## **WHAT NEXT**

Add the **automatic** keyword after the **task** or **function** keyword and run the command

again.

## **VER-531 (information) %s Variable '%s' is being read, but is not initialized. The subprogram default value will be used.**

### **DESCRIPTION**

You receive this message from the Presto HDL Compiler when your design contains a variable which is read, but has not been initialized yet. The subprogram default value will be used.

The subprogram default value can be 0's (as default) or tick-LEFT, which is controlled by the switch:

`hdlin_subprogram_default_values`

### **WHAT NEXT**

Verify that you intended to use the subprogram default value as the initial value of the uninitialized variable.

### **SEE ALSO**

`hdlin_subprogram_default_values`.

## **VER-532 (warning) %s If statement with %s directive but no else clause.**

### **DESCRIPTION**

You receive this warning message when running the `read` or the `elaborate` command if your SystemVerilog design contains a unique or priority if that has no has no else clause. For example:

```
unique if (x == 0)
 y = x;
```

According to the language standard, the unique or priority keyword on an if with no else clause, is an assertion that the condition is always true. Hence, the example is equivalent to an assertion that x is always 0, followed by the assignment. It could be optimized to

```
y = 0;
```

## WHAT NEXT

Verify that you intend to assert that the condition is always true. If so, consider using a formal assertion. If not, remove the unique or priority keyword.

## SEE ALSO

`elaborate(2)`  
`read(2)`

# VER-533 (warning) %s Using default enum base size of 32.

## DESCRIPTION

You receive this warning from the `read` or `analyze` commands when your SystemVerilog design contains an enum declaration without an explicit size declaration after the `enum` keyword. According to the language standard, the default size of an enum is 32. For example, in

```
typedef enum { RED, BLUE, GREEN, YELLOW } Color ;
Color current, next ;
```

current and next will be 32 bits wide, not 2 bits wide, as in

```
typedef enum [1:0] { RED, BLUE, GREEN, YELLOW } Color ;
Color current, next ;
```

## WHAT NEXT

Modify your code to use an explicit size declaration for the enum.

# **VER-537 (error) %s Inout direction for variable %s in modport.**

## **DESCRIPTION**

This error message occurs when the Presto HDL Compiler finds a variable listed in a modport definition with direction **inout**. A variable port cannot have direction **inout**.

## **WHAT NEXT**

Correct the direction for the variable in the modport definition from **inout** to **input** or **output**, or correct the declaration of the data object from a variable kind to a net kind.

## **SEE ALSO**

`analyze(2)`  
`elaborate(2)`  
`read(2)`

# **VER-538 (warning) %s Inout direction for variable %s in modport.**

## **DESCRIPTION**

This warning message occurs when the Presto HDL Compiler finds a variable listed in a modport definition with direction **inout**. A variable port cannot have direction **inout**.

## **WHAT NEXT**

Correct the direction for the variable in the modport definition from **inout** to **input** or **output**, or correct the declaration of the data object from a variable kind to a net kind.

## **SEE ALSO**

`analyze(2)`  
`elaborate(2)`  
`read(2)`

# **VER-540 (warning) %s Redefining macro '%s' with value '%s' to**

'%S'.

## DESCRIPTION

A macro is being defined at least twice with different values in the RTL code. If this is not really intended by customer, it may produce unexpected synthesis results.

The macro redefinition may happen if it is defined several times in different files or when macros are defined in files included by other include files.

## WHAT NEXT

If a redefinition of the macro was not intended, just rename the macro such that it does not collide with the other macro definition, or keep files using one set of macro definitions separate when reading in the designs, to avoid macro names clashes.

# VER-541 (warning) %s Parameters of macro '%s' have been redefined.

## DESCRIPTION

A macro is being defined at least twice with a different list of parameters in the RTL code. If this is not really intended by customer, it may produce unexpected synthesis results.

The macro redefinition may happen if it is defined several times in different files or when macros are defined in files included by other include files.

The redefinition checks for literal parameter definition. If in one file exists this definition:

```
'define SUM(x,y) x+y
```

and in another verilog file exists another definition of SUM:

```
'define SUM(a,b) a+b
```

and if both files are used while compiling the same unit scope, VER-541 warning message will be issued, even if the macros are semantically equal.

When a macro is being redefined, usually the definition of macro will change too, so an additional VER-540 warning message may be issued.

## WHAT NEXT

If a redefinition of the macro was not intended, just rename the macro so that it

does not collide with the other macro definition, or keep files using one set of macro definitions separate when reading in the designs, to avoid macro names clashes.

## **VER-553 (error) %s Pack operation using streaming operator requires that width of destination be greater than or equal to target.**

### **DESCRIPTION**

The Presto HDL Compiler issues this error message when the right-hand side of an assignment is a streaming operation that streams more bits than the left-hand side can use.

### **WHAT NEXT**

Correct any errors like this in your code.

### **SEE ALSO**

`analyze (2), read (2).`

## **VER-554 (error) %s Unpack operation using streaming operator requires that width of source bit stream be greater than or equal to target.**

### **DESCRIPTION**

The Presto HDL Compiler issues this error message when the left-hand side of an assignment is a streaming operation that consumes more bits than the right-hand side can provide.

### **WHAT NEXT**

Correct any errors like this in your code.

### **SEE ALSO**

`analyze (2), read (2).`

# **VER-555** (warning) %s Truncation discards bits.

## **DESCRIPTION**

The Presto HDL Compiler issues this warning message when the left-hand side of an assignment discards some of the bits provided by the right-hand side.

## **WHAT NEXT**

Correct any errors like this in your code.

## **SEE ALSO**

`analyze` (2), `read` (2).

# **VER-561** (error) %s Subscript expression of the enum member %s is not a positive literal constant.

## **DESCRIPTION**

You receive this error message when running the `read` or `elaborate` command if your SystemVerilog design contains an enumerated type declaration that uses [N] to produce a series of members in the type, but the N is not positive.

Only a positive literal constant is legal in that context.

For example, the following design fragment generates an error, because [0] is used to produces a series of members.

```
typedef enum { state[0] } states;
```

## **WHAT NEXT**

Supply a positive literal value for expressions in enumerated type declarations.

## **SEE ALSO**

`elaborate`(2)  
`read`(2)

# **VER-700** (error) %s The construct '%s' is not supported in

# synthesis.

## DESCRIPTION

This error message occurs when the syntactic construct cited is not supported for synthesis.

## WHAT NEXT

Exclude non-synthesizable constructs by enclosing the code with the conditional compilation directives shown below.

```
module mt(a);
`ifndef SYNTHESIS
 localparam realtime bus_stop=42;
`endif
```

# VER-701 (error) %s Variable '%s' index not supported.

## DESCRIPTION

You receive this error from the **read -f verilog -netlist** command, which invokes the Verilog netlist reader, because your code contains constructs the Verilog netlist reader does not support. To read a limited set of constructs more efficiently, the Verilog netlist reader supports only those Verilog constructs that commonly occur in netlists.

The Verilog netlist reader does not support the use of variables within subscripts or array declarations.

## WHAT NEXT

If your code contains any of these constructs, use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the "-netlist" option from the **read** command, or by using the **analyze** and **elaborate** commands.

## SEE ALSO

**analyze** (2), **elaborate** (2), **read** (2).

## VER-702 (error) %s Unknown wire type '%s'.

### DESCRIPTION

You receive this error from the **read -f verilog -netlist** command, which invokes the Verilog netlist reader, because your code contains constructs the Verilog netlist reader does not support. To read a limited set of constructs more efficiently, the Verilog netlist reader supports only those Verilog constructs that commonly occur in netlists, in order to read a limited set of constructs more efficiently.

The Verilog netlist reader does not support the use of some Verilog variable declarations, such as the "reg" datatype.

### WHAT NEXT

If your code contains these constructs, use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the "-netlist" option of the **read** command, or by using the **analyze** and **elaborate** commands.

### SEE ALSO

**analyze** (2), **elaborate** (2), **read** (2).

## VER-703 (error) %s Unknown constant value '%d'

### DESCRIPTION

You receive this message because The Verilog netlist reader was unable to read the design; the reader could not determine a constant value for the variable named in the message.

### WHAT NEXT

Use HDL Compiler to read your Verilog design. Invoke HDL Compiler by omitting the "-netlist" option from the **read command**, or by using the **analyze** and **elaborate** commands.

### SEE ALSO

**analyze** (2), **elaborate** (2), **read** (2).

## **VER-704 (error) %s Constant width not matched '%d' vs '%d'.**

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-705 (error) %s Constant signal '%s' cannot be at the left side.**

### **DESCRIPTION**

This is a syntax error.

### **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

## **VER-706 (error) %s Verilog netlist reader encountered trouble to build the named port in this design.**

### **DESCRIPTION**

Verilog netlist reader has limited support for named port handling. The following examples demonstrate the typical cases netlister reader now has trouble handling.

```
module inouta (.a(i),.b(i));
inout i;
endmodule

module bit_select (.a(i), .b1(j[1]), .b2(j[0]));
input i;
output [1:0] j;
endmodule
```

## WHAT NEXT

Please use read command without the -netlist option.

# VER-710 (error) %s The construct '%s' is not supported when %S = %S.

## DESCRIPTION

This error message occurs because the syntactic construct cited is not supported by the current configuration of the HDL Compiler or optimizer cited in the message.

## WHAT NEXT

Adjust the global option named in the message. Note that not all option combinations are possible. After making your changes, run the command again.

# VER-720 (error) %s The construct '%s' is not supported in this language.

## DESCRIPTION

This error message occurs when the syntactic construct cited is not supported for the language specified by the **-format**, **-rtl**, or **-netlist** option of your **read** or **analyze** command.

Verilog (**-format verilog**) reports this error for some syntax where SystemVerilog (**-format sverilog**) has extended the language beyond IEEE Std 1364.

This error may also be reported in rare situations where SystemVerilog does not implement syntax that is only available in older editions of Verilog.

The **-netlist** reader reports this error message about features that are not supported in gate-level netlists.

## WHAT NEXT

Adjust your use of the **-format** option or Tcl commands with the **read\_** prefix to parse the intended source language.

Switching from **-netlist** to **-rtl** may not be a practical solution for a large design. Use the **-rtl** reader on a small sample of the cited syntax, write the equivalent gate-level output, and then recode your **-netlist** input in the pattern suggested by the **-rtl** compiler.

## **SEE ALSO**

`analyze(2)`  
`read(2)`

# **VER-721 (error) %s The construct '%s' is not supported.**

## **DESCRIPTION**

This error message occurs when the syntactic construct cited is not supported in this compiler release.

## **WHAT NEXT**

Check whether or not you are running a current version of the synthesis tool.

If you are interested in more information about this feature, contact the Synopsys Support Center by using Enter A Call at <http://solvnet.synopsys.com/EnterACall>.

For information about the latest software releases, go to the Synopsys SolvNet Release Library at <http://solvnet.synopsys.com/ReleaseLibrary>.

For information about creating, packaging, and sending a test case, go to <http://www.synopsys.com/testcase>.

# **VER-722 (error) %s The relative placement directive '%s' has a syntax error.**

## **DESCRIPTION**

This error message occurs when the relative placement directive has a syntax error.

For example, the orientation in may be `rp_orient` incorrect. The orientation should be N|W|S|E|FN|FW|FS|FE.

Another example is that the alignment default is not `sw` in `rp_align`.

## **WHAT NEXT**

Correct the relative placement syntax error.

# **VER-730 (warning) %s The '%s' syntax is non-standard. %s**

## **DESCRIPTION**

This is a generic warning message which issues at every use of certain non-standard language features. The report includes a sentence to clarify what semantics are provided in lieu of the standard-prescribed error.

The setting of `hdlin_vrlg_std` at the time the (System)Verilog source is analyzed can influence which syntax gets this citation and what semantics are supplied.

## **WHAT NEXT**

Make sure you agree that the non-standard meaning is the intended behavior for this RTL. Check the setting of `hdlin_vrlg_std` if you believe that this construct is meant to invoke a standard definition. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

## **SEE ALSO**

`analyze` (2), `read` (2).

# **VER-731 (warning) %s The '%s' syntax is non-standard. %s Only the first use of this construct will be cited.**

## **DESCRIPTION**

This is a generic warning message which issues on the first use of oft-repeated, but non-standard, language features. The report includes a sentence to clarify what semantics are provided in lieu of the standard-prescribed error. Other uses of the construct will be handled similarly, but silently.

The setting of `hdlin_vrlg_std` at the time the (System)Verilog source is analyzed can influence which syntax gets this citation and what semantics are supplied.

## **WHAT NEXT**

Make sure you agree that the non-standard meaning is the intended behavior for this RTL. Check all uses of the non-standard construct. Check the setting of `hdlin_vrlg_std` if you believe that this construct is meant to invoke a standard definition. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

## SEE ALSO

`analyze (2), read (2).`

# VER-733 (warning) %s Forward references to '%s' are non-standard. %s

## DESCRIPTION

This message warns about violations of the SystemVerilog standard requirement that data variables be declared before use. Only the first reference to each name is cited. The references have been tolerated without this warning because the selection syntax you used could also be a legal form of hierarchical reference, but your explicit local declaration for this name became available before a hierarchical reference was located.

This is an unsound language extension, since forward references to variables are not and cannot be resolved in all possible contexts. To aid the migration of legacy codes that may have relied upon forward reference, this message has warning level severity; it will rise to an error level severity in a future release of Presto SystemVerilog.

The setting of the `hdlin_vrlg_std` variable at the time the SystemVerilog source is analyzed can influence which syntax gets this citation and what semantics are supplied.

## WHAT NEXT

Make sure you agree that the non-standard meaning is the intended behavior for this RTL. Check the setting of the `hdlin_vrlg_std` variable if you believe that this construct is meant to invoke a standard definition. If you need more choices of behavior when migrating legacy codes to current standards, contact Synopsys.

## SEE ALSO

`read(2)`  
`hdlin_vrlg_std(3)`

# VER-736 (warning) %s Task '%s' with non-empty body is mapped to '%s'; body will be ignored.

## DESCRIPTION

This warning message occurs when you map a task to a module because the module

(instead of the task body) determines the implementation of the task. The body of the task is ignored.

The following example contains a task for which this warning message is issued:

```
task so_msff_t(output so, input si); // synopsys map_to_module r00foobar
begin
 if(si === 1'b1) // task body will be ignored
 so <= si;
end
endtask
```

## WHAT NEXT

This only a warning message.

Make sure that you intended the body of the task to be ignored in favor of the module that the task is mapped to.

# VER-737 (warning) %s No module instance name.

## DESCRIPTION

The Presto HDL Compiler issues this warning message when a module instantiation without an instance name is detected during the **analyze** or **read** command.

According to the Verilog language standard, module instantiations must include an explicit name. For backward compatibility reasons, the Presto HDL Compiler issues a warning instead of an error on such usage and invents an instance name.

## WHAT NEXT

Add an explicit instance name so that the instantiation conforms with the language standard.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-738 (error) %s No structure of instances name.

## DESCRIPTION

The Presto HDL Compiler issues this error message when a structure of instances

without a name is detected during the **analyze** or **read** command. This syntactic restriction is consistent with the syntactic restrictions the Verilog language standard imposes on arrays of instances.

## WHAT NEXT

Add an explicit name for the structure of instances.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-739 (error) %s No array of instances name.

## DESCRIPTION

The Presto HDL Compiler issues this error message when an array of instances without a name is detected during the **analyze** or **read** command. According to the Verilog language standard, every array of instances, even of gate instances, must have an explicit name specified.

## WHAT NEXT

Add an explicit name for the array of instances.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-791 (warning) %s An end\_keywords directive without a matching begin\_keywords directive.

## DESCRIPTION

The Presto HDL Compiler issues this warning when excess end\_keywords directives are encountered. For example,

```
'begin_keywords "1364-1995"
 module test (in, generate);
 input in;
 output generate;
 assign generate = in;
 endmodule
`end_keywords
```

```
'end_keywords
```

## WHAT NEXT

Determine whether there is a missing begin\_keywords directive or too many end\_keywords directives.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-792 (warning) %s A begin\_keywords directive without a matching end\_keywords directive.

## DESCRIPTION

The Presto HDL Compiler issues this warning when insufficient end\_keywords directives are encountered. For example,

```
'begin_keywords "1364-1995"
'begin_keywords "1364-1995"
 module test (in, generate);
 input in;
 output generate;
 assign generate = in;
 endmodule
`end_keywords
```

## WHAT NEXT

Determine whether there are too many begin\_keywords directives or not enough end\_keywords directives to match them.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-793 (error) %s Unknown begin\_keywords directive version specifier '%s'.

## DESCRIPTION

The Presto HDL Compiler issues this error when the begin\_keywords directives is used

with an unknown version specifier. For example,

```
'begin_keywords "1364-1999"
 module test (in, generate);
 input in;
 output generate;
 assign generate = in;
 endmodule
`end_keywords
```

## WHAT NEXT

Determine if there is typo in the version specifier, which must be one of "1364-1995", "1364-2001", "1364-2001-noconfig", "1364-2005", or "1800-2005".

## SEE ALSO

`analyze` (2), `read` (2).

# VER-794 (error) %s Missing or unknown version specifier in begin\_keywords directive.

## DESCRIPTION

The Presto HDL Compiler issues this error when the `begin_keywords` directives is used alone, instead of with a version specifier, or when the double quotes in the version specifier are omitted. For example,

```
'begin_keywords
 module test (in, generate);
 input in;
 output generate;
 assign generate = in;
 endmodule
`end_keywords
```

or

```
'begin_keywords 1364-1995
 module test (in, generate);
 input in;
 output generate;
 assign generate = in;
 endmodule
`end_keywords
```

## WHAT NEXT

Determine if there is a version specifier, which must be one of "1364-1995", "1364-2001", "1364-2001-noconfig", "1364-2005", or "1800-2005". If so, then check if the double quotes have been forgot.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-795 (error) %s The begin\_keywords directive is only supported in SystemVerilog format.

## DESCRIPTION

The Presto HDL Compiler issues this error when the begin\_keywords directives is used with the Verilog format instead of with the SystemVerilog format.

## WHAT NEXT

Read the design as SystemVerilog.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-796 (error) %s A begin\_keywords directive within a design element.

## DESCRIPTION

The Presto HDL Compiler issues this error when

## WHAT NEXT

Do something wonderful.

## SEE ALSO

`analyze` (2), `read` (2).

# **VER-797 (error) %s** An end\_keywords directive within a design element.

## **DESCRIPTION**

The Presto HDL Compiler issues this error when

## **WHAT NEXT**

Do something wonderful.

## **SEE ALSO**

**analyze** (2), **read** (2).

# **VER-900 (error) %s** The 'defparam' construct is not supported.

## **DESCRIPTION**

Presto HDL Compiler does not support the use of defparam statements. The following is an example of a defparam statement.

```
module top;
 defparam b.parm = 0;
 bottom b ();
endmodule

module bottom;
 parameter parm = 1;
 .
endmodule
```

## **WHAT NEXT**

Replace defparam statements with module instance parameter overrides as shown in the following example.

```
module top;
 bottom #(.parm(0)) b ();
endmodule
```

# **VER-901 (error) %s** The "define" directive requires that commas

**separate formal arguments.**

## **DESCRIPTION**

The ‘‘define’ directive allows you to parameterize macros. An example is:

```
'define ADD(A,B) ((A)+(B))
```

This error message is generated whenever two formal arguments to the macro are not separated by a comma.

```
'define ADD(A B) ((A)+(B))
^ The missing comma will result in an error message.
```

## **WHAT NEXT**

Delete whitespace or add a comma to form the identifier(s) needed by the macro’s definition.

**VER-902 (error) %s** The “define” directive requires a non-empty argument list if parentheses are present.

## **DESCRIPTION**

The following macro definition is rejected because no identifiers were found inside the parentheses.

```
'define MACRO() 10
```

## **WHAT NEXT**

When a macro does not need arguments, omit the parentheses.

```
'define MACRO 10
```

**VER-903 (error) %s** the ‘default\_nettpe directive cannot occur inside a module, interface, or package.

## **DESCRIPTION**

This error message occurs because when using the ‘default\_nettpe directive, it must be placed outside the scope of a module declaration as shown in the following example.

```
'default_nettype wand

module top;
endmodule
```

The following example shows an invalid use of the 'default\_nettype directive.

```
module top;
'default_nettype wand
endmodule
```

## WHAT NEXT

Remove any 'default\_nettype directives from within module bodies. Ensure that the desired default net type is in effect from a directive outside the module body.

# VER-904 (error) %s The 'ifdef directive must have an identifier name after it.

## DESCRIPTION

This error message occurs when the token following an 'ifdef directive is not an identifier name. A common mistake is to use a literal constant after the 'ifdef.

The following is a example of the valid use of an 'ifdef directive.

```
'ifdef SYNTHESIS
'endif
```

This is an example of an invalid use of the 'ifdef directive, which generates this error message.

```
'ifdef 5
'endif
```

## WHAT NEXT

Correct your design so that the 'ifdef directive is used with a valid identifier, and then run the command again.

# VER-905 (error) %s The 'else directive was found without a

corresponding ‘ifdef directive.

## DESCRIPTION

This error message occurs when an ‘else directive is found without a corresponding ‘ifdef directive. Two common causes of this error message are that the corresponding ‘ifdef either does not exist, or that the ‘ifdef is not followed by an identifier name.

The following is an example of an ‘else directive without a corresponding ‘ifdef directive.

```
'else
'endif

// the 'ifdef is missing
```

This is an example of an ‘ifdef directive without the following identifier name.

```
'ifdef
'else
'endif

// the 'ifdef exists, but no identifier name follows it
```

This is an example of the correct use of an ‘else directive.

```
'ifdef SYNTHESIS
// ...

'else
// ...

'endif
```

## WHAT NEXT

Correct the design so that the ‘ifdef, ‘else, and ‘endif directives are matched, and then run the command again.

**VER-906 (error) %s The ‘endif directive was found without a**

corresponding ‘ifdef directive.

## DESCRIPTION

This error message occurs when the ‘endif directive is found without a corresponding ‘ifdef directive. Two common causes of this error message are that the corresponding ‘ifdef either does not exist, or that the ‘ifdef is not followed by an identifier name.

The following is an example of an ‘endif directive without a corresponding ‘ifdef directive.

```
'endif
// the 'ifdef is missing
```

This is an example of an ‘ifdef directive without the following identifier name.

```
'ifdef
'endif

// the 'ifdef exists, but no identifier name follows it
```

This is an example of the correct use of an ‘endif directive.

```
'ifdef SYNTHESIS
// ...

'endif
```

## WHAT NEXT

Correct the design so that the ‘ifdef and ‘endif directives match, and then run the command again.

**VER-907 (error) %s The ‘timescale directive was used incorrectly.**

## DESCRIPTION

This error message occurs when the syntax of the ‘timescale directive is incorrect.

The correct syntax of the ‘timescale directive is shown below.

```
'timescale time_unit / time_precision
```

The following is example of the correct use of the 'timescale directive.

```
'timescale 1 ns / 1 ps
```

The 'timescale directive has no effect on synthesis.

## WHAT NEXT

Correct the directive to use a valid timescale. Consult the IEEE 1364 standard for valid values. After making your changes, run the command again.

# VER-908 (error) %s The 'unconnected\_drive directive requires pull1 or pull0 to be used.

## DESCRIPTION

This error message occurs when either the 'unconnected\_drive directive is used without either pull1 or pull0.

The following example shows the correct use of the 'unconnected\_drive directive.

```
'unconnected_drive pull1
```

This directive has no effect for synthesis.

## WHAT NEXT

Correct the 'unconnected\_drive directive to use either use pull0 or pull1 and then run the command again.

# VER-909 (error) %s The 'default\_nettype directive requires a valid wire type.

## DESCRIPTION

This error message occur when using the 'default\_nettype directive, without specifying a valid wire type. The following list shows the valid wire types.

|      |        |      |
|------|--------|------|
| wire | tri    | tri0 |
| wand | triand | tri1 |

```
wor trior tireg
```

This example shows a valid use of the 'default\_nettype directive with the wand wire type.

```
'default_nettype wand
```

## WHAT NEXT

Correct the 'default\_nettype directive to use a valid wire type and then run the command again.

# VER-910 (error) %s macro calls are nested too deeply.

## DESCRIPTION

This error message occurs when there are too many nested macro calls. There is a limit to the amount of nesting that can occur in macro calls. The following is an example of a nested macro call.

```
'a('b('c(...)))
```

The Verilog standard sets the nesting limit to 50 levels, although the compiler may support more levels.

## WHAT NEXT

Recode your design to reduce the nesting of macro calls and then run the command again.

# VER-911 (error) %s The "define" directive must have an identifier name after it.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it finds that the token following an 'define directive is not an identifier name. A common mistake is to use a literal constant, which the following example shows:

```
'define 0 5
'endif
```

The following example shows a valid use of 'define.

```
'define ZERO 0
'endif
```

## WHAT NEXT

Correct any errors like this in your code.

## SEE ALSO

**analyze** (2), **read** (2).

**VER-912 (error) %s** The macro specified with the “define” directive has a bad parameter list.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it encounters a ‘define directive that specifies a macro that in turn takes parameters, and the parameters are not a list of identifier names.

The following example generates this error message.

```
'define NOT(0) ~X
```

## WHAT NEXT

Be sure that any macro you specify with a ‘define directive has a valid parameter list of identifier names.

## SEE ALSO

**analyze** (2), **read** (2).

**VER-913 (error) %s** The macro ‘%s’ has not been defined.

## DESCRIPTION

This message occurs when an attempt is made to use a macro that has not been previously defined. An example of this error is:

```
module top (out);
 output out;
```

```
assign out = `UNDEFINED_MACRO;
endmodule
```

## WHAT NEXT

Either define the macro, correct the macro reference to refer to a defined macro, or remove the macro invocation. After making your changes, rerun the command.

## SEE ALSO

[analyze\(2\)](#)  
[read\(2\)](#)

# VER-914 (error) %s End-of-file found before 'endif' found.

## DESCRIPTION

This message occurs when an 'ifdef or 'ifndef compiler directive is not closed with a corresponding 'endif compiler directive.

## WHAT NEXT

Insert an 'endif to close the 'ifdef or 'ifndef.

## SEE ALSO

[analyze \(2\)](#), [read \(2\)](#).

# VER-915 (error) %s Syntax error in system timing check at token '%S'.

## DESCRIPTION

Standard Verilog system timing checks can be grouped into those (\$setup, \$hold, \$setuphold, \$recovery, \$removal, \$recrrem) that use a stability window and those (\$skew, \$timeskew, \$fullskew, \$period, \$width, \$nochange) that are for clock and control signals.

Although the syntax looks like system task enables, the Verilog standard makes clear that these timing checks are not actual system task enables.

This error is issued when an actual system task enable is encountered where a system timing check is expected.

## WHAT NEXT

Modify the code to use standard system timing check syntax.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-916 (error) %s '%s' is a system function and not a system task.

## DESCRIPTION

You receive this error when a system function call is used as a statement instead of as an expression. Often this is an indication that the value of the system function call is being inadvertently thrown away.

```
module m ;
 always
 $random() ;
endmodule
```

## WHAT NEXT

If you really do not wish to use the return value, you could assign it to a dummy variable that will not be used or wrap the system function call in a dummy if statement.

```
module m ;
 always
 if ($random()) ;
endmodule
```

## SEE ALSO

`analyze` (2), `read` (2).

# VER-917 (error) %s The 'inout' port '%s' is incompatibly declared as 'real'.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters an inout port declared a real type, which is

invalid.

## WHAT NEXT

Correct any errors like this in your code.

## SEE ALSO

`analyze (2)`, `read (2)`.

**VER-918 (error) %s** The 'inout' port '%s' is incompatibly declared as 'reg'.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters an inout port declared a register type (reg), which is invalid.

## WHAT NEXT

Correct any errors like this in your code.

## SEE ALSO

`analyze (2)`, `read (2)`.

**VER-919 (error) %s** The 'input' port '%s' is incompatibly declared as 'real'.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters an input port declared a real type, which is invalid.

## WHAT NEXT

Correct any errors like this in your code.

## SEE ALSO

`analyze` (2), `read` (2).

**VER-920** (error) %s The 'input' port '%s' is incompatibly declared as 'reg'.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters an input port declared a register type (reg), which is invalid.

## WHAT NEXT

Correct any errors like this in your code.

## SEE ALSO

`analyze` (2), `read` (2).

**VER-921** (warning) %s The macro '%s' you are attempting to undefine with the "undef" directive is not defined.

## DESCRIPTION

When using the ''undef'' directive to undefine a macro, it must be defined. For example, the following examples would result in error messages:

```
'define CAT
`undef KAT

`define MY_MACRO
`undef MY_MACRO
`undef MY_MACRO
```

## WHAT NEXT

Examine the code to see if perhaps the name of the macro has been misspelled, the 'undef occurs twice, or the macro never got defined.

## SEE ALSO

`analyze (2), read (2).`

# VER-923 (error) %s A valid identifier must follow the “undef” directive.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it finds that the ‘`undef` directive lacks the required identifier.

The following example shows an instance of an invalid statement (`0` is not a valid identifier):

```
'undef 0
```

## WHAT NEXT

Correct any instances of this type by replacing an invalid identifier with a valid one.

## SEE ALSO

`analyze (2), read (2).`

# VER-924 (error) %s Newline in argument list of ‘define %s

## DESCRIPTION

You receive this message because this ‘`define` directive’s argument list has a new line in it. All parameters of a macro, and its definition must occur on the same line.

## WHAT NEXT

To correct this problem, remove the newline that has appeared, or if the newline is part of a formal argument’s default text, use a ‘‘ character immediately before the newline as an escape.

# **VER-925 (error) %s Input files nested too deep '%s'.**

## **DESCRIPTION**

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it finds that input source files are nested too deeply, using the 'include directive in Verilog.

When this happens, the message is generated.

## **WHAT NEXT**

Reduce the number of nested input files to a workable amount.

## **SEE ALSO**

**analyze** (2), **read** (2).

# **VER-926 (error) %s The "include" directive requires a filename enclosed in double quotes.**

## **DESCRIPTION**

When using the 'include directive to input another file, you must provide the filename enclosed in double quotation marks, as shown in the following example:

```
'include "my_include.h"
```

## **WHAT NEXT**

Be sure to use double quotation marks when using the 'include directive in this way.

## **SEE ALSO**

**analyze** (2), **read** (2).

# **VER-927 (error) %s The number of parameters for the '%s'**

# macro doesn't match its definition.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it finds that the number of parameters you pass to a macro does not match the number of parameters specified by the macro definition.

The following example shows such an error:

```
'define ADD(A,B) A+B

module top (IN, OUT);
input IN;
output OUT;

assign OUT = `ADD(IN);
endmodule
```

## WHAT NEXT

Correct any errors like this in your code.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-929 (error) %s The input file %s specified by the "include" directive cannot be recursive.

## DESCRIPTION

This message occurs when the file specified by an ‘‘include’ directive contains an ‘‘include’ directive to the current file or to another file that has one or so on. The Verilog language standard expresses it as: “A file included in the source using the ‘include compiler directive may contain other ‘include compiler directives. The number of nesting levels for include files shall be finite.”

## WHAT NEXT

Remove one or more of the ‘include directives from the files, or wrap the contents of the included file in an ‘ifndef’. For example,

```
'ifndef SEEN_HEADER_VH
#define SEEN_HEADER_VH
< the original contents of file >
```

```
'endif
```

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-930 (error) %s System function %s has been defined.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-931 (error) %s System task %s has been defined.

## DESCRIPTION

This may be a syntax error.

## WHAT NEXT

This message is no longer issued.

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-932 (error) %s '%s' is a system task and not a system function.

## DESCRIPTION

This message is issued when a system task enable is used as an expression, that is, when it is used as if were a system function call and had a return value. For example,

```
module m (output reg o) ;
 always o = $display("Hello, world") ;
```

```
endmodule
```

## WHAT NEXT

Modify code as appropriate.

## SEE ALSO

**analyze** (2), **read** (2).

**VER-933 (error) %s** The '%s' system call should not have parentheses unless it has at least one parameter.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it encounters invalid parentheses. In Verilog, when calling a system task or system function, if the task or function does not take parameters, you cannot have empty parentheses in the code.

The following example illustrates an invalid use of parentheses:

```
assign Q = $time();
```

Because \$time takes 0 parameters, you must omit the parentheses, as shown here:

```
assign Q = $time;
```

## WHAT NEXT

Correct any invalid instances like this in your code.

## SEE ALSO

**analyze** (2), **read** (2).

**VER-934 (information) %s** The imported name '%s' is %svisible to clients of this package.

## DESCRIPTION

This information message issues for every name imported into the most global scope of a package declaration. It indicates whether or not the prevailing SystemVerilog

dialect makes this name visible to the package's clients.

## WHAT NEXT

Because early SV implementations differ on this aspect of the *import* statement, you may need to adjust the setting of *hdlin\_sv\_packages* to bring the set of exported names into agreement with other tools in the flow which use your package. The reported visibility is final; settings of *hdlin\_sv\_packages* at the time that clients refer to this package will have no effect on which of its names will be (in)visible.

## SEE ALSO

**analyze** (2), **read** (2), **hdlin\_sv\_packages** (3), **VER-20** (n).

# VER-935 (error) %s Identifier name '%s' has not been declared.

## DESCRIPTION

This error is issued when the name of a variable is used before it has been declared.

## WHAT NEXT

This error is no longer issued.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-936 (warning) %s the undeclared symbol '%s' assumed to have the default net type, which is '%s'.

## DESCRIPTION

The Verilog standard says that if no explicit declaration is given for an identifier and the identifier is not in the scope of a ''default\_nettype none'' compiler directive, then it shall be assumed to be implicitly declared as a net of the default net type, which is 'wire' unless overridden with the 'default\_nettype' compiler directive. Specifically, this is assumed for undeclared identifiers used in a port expression declaration, for undeclared identifiers used in the terminal list of a primitive instance or a module instance, and, in Verilog 2001, for undeclared identifiers that appear on the left-hand side of a continuous assignment statement.

## WHAT NEXT

Check your design to make sure that you intended an implicit declaration for this symbol. If not, add an explicit declaration.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-937 (warning) %s Invalid argument for system function or task %s ignored.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-938 (warning) %s Missing expected argument for system function or task %s.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

# VER-939 (warning) %s The '%s' directive is not supported and will be ignored.

## DESCRIPTION

This message is issued when a compiler directive is encountered that is not currently supported. The result is that the directive is just ignored. For example,

```
'delay_mode_unit
```

## WHAT NEXT

No action is necessary.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-941 (warning) %s Invalid escape sequence '\%c' in call to '\$display'.

## DESCRIPTION

When using '\$display' this message is issued when the format specifier contains an invalid escape sequence for printing special characters.

```
$display("Hello, \zWorld.");
```

## WHAT NEXT

Rewrite the format specifier to use a valid escape sequence.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-942 (warning) %s Unescaped Verilog-2001 keyword '%s' used as identifier.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when you use one of the identifiers 'design', 'instance' or 'cell', which are reserved keywords in Verilog-2001, without escaping it. In future releases, this restriction will be enforced as a syntax error.

## WHAT NEXT

Either modify the code, so that it doesn't use a keyword without escaping it, or disable Verilog 2001 features by setting hdlin\_vrlg\_std to 1995.

## SEE ALSO

`analyze (2), read (2).`

**VER-943 (error) %s** Implicit net declaration for '%s' prohibited by ''default\_nettpe none' compiler directive.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when a net is implicitly declared within the scope of a ''default\_nettpe none'' compiler directive.

## WHAT NEXT

Modify the code, so that either the net is explicitly declared or its implicit declaration is not in the scope of a ''default\_nettpe none'' compiler directive.

## SEE ALSO

`analyze (2), read (2).`

**VER-951 (error) %s** The destination of a procedural continuous assignment must not be an array reference, bit select, or part select.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters an invalid destination for a procedural continuous assignment. The destination must not be an array reference, bit select, or part select.

Either of the procedural continuous assignments in the following example causes this error.

```
module foo (A, B);
 output [1:0] A;
 input B;
 reg [1:0]A;
 reg C[1:0];

 always
```

```
begin
 assign A[1] = B; // This is an error.
 assign C[1] = B; // This is an error.
end

endmodule
```

## WHAT NEXT

Correct any similar invalid instances in your code and then run the command again.

## SEE ALSO

`analyze(2)`  
`read (2)`

# VER-952 (error) %s Assignment to '%s' requires that it be a register.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters assignments that are not registers but should be.

In the following example, `a` and `c` should be registers.

```
always
begin
a = b;
c = d;
end
```

## WHAT NEXT

Redefine the assignments as registers.

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-953 (error) %s Deassigning argument '%s' requires that

# '%s' be a register.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it encounters a value for a deassignment that is not a register.

The code in the following example causes the error because *B* is not a register type:

```
module foo (A, B);
 input A;
 output B;

always
 deassign B;
endmodule
```

## WHAT NEXT

Change the value of the deassignment to a register.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-954 (error) %s The register symbol '%s' has already been defined.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the **analyze** or **read** command when it encounters a register defined twice in the code. It is illegal to define a register twice.

The code in the following example generates this error:

```
module foo;
 reg C;
 reg C;
endmodule
```

## WHAT NEXT

Correct the code so that it defines a register once only.

## SEE ALSO

`analyze (2), read (2).`

# VER-955 (error) %s Assigning to output '%s' requires that it be a register.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters assignments that should be registers.

In the following example, `a` and `c` should be registers:

```
always
begin
assign a = b;
assign c = d;
end
```

## WHAT NEXT

Redefine the assignments as registers.

## SEE ALSO

`analyze (2), read (2).`

# VER-956 (error) %s The symbol '%s' is not defined.

## DESCRIPTION

The Presto HDL Compiler issues this error message during execution of the `analyze` or `read` command when it encounters the use of a symbol or variable that has not been defined.

For example, the code in the following example generates the error:

```
module foo (A);
 input A;

always
 undefined = A;
endmodule
```

## WHAT NEXT

Define the symbol or variable.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-957 (error) %s Too many delay values supplied in the delay list.

## DESCRIPTION

When specifying the delay of gates, you cannot supply more delay values than the gate supports.

For example, the following code attempts to instantiate a buffer:

```
module foo (A, B);
 input A;
 output B;

 buf # (0, 1, 2, 3, 4, 5) (B,A);
endmodule
```

The buf gate uses only 2 delay values, so providing 6 delay values is an error.

## WHAT NEXT

To correct the above example, the code should read as follows:

```
module foo (A, B);
 input A;
 output B;

 buf # (0, 1) (B,A);
endmodule
```

## SEE ALSO

`analyze` (2), `read` (2).

# VER-958 (error) %s The triggered named event '%s' has not

been declared.

## DESCRIPTION

This error is issued whenever the named event to be triggered on has not been declared. (NOTE: Event triggers are not supported by synthesis.)

For example,

```
module m;
 always
 begin
 -> nonexistent ;
 end
 endmodule
```

generates an error because the event 'nonexistent' has not been defined.

## WHAT NEXT

Add an 'event' declaration to declare the named event, and wrap the event trigger with "'ifndef SYNTHESIS ... 'endif" to avoid a VER-193 error.

For example,

```
module m;
 event nonexistent ;
 always
 begin
 'ifndef SYNTHESIS
 -> nonexistent ;
 'endif
 end
 endmodule
```

## SEE ALSO

**analyze** (2), **read** (2).

**VER-959 (error) %s** The triggered event '%s' not declared as an event.

## DESCRIPTION

This error is issued when the event name to be triggered was declared as some type other than 'event'. (NOTE: Event triggers are not supported by synthesis.)

For example,

```
module foo;
 reg nonevent;
 always
 begin
 -> nonevent ;
 end
endmodule
```

generates an error because the name 'nonevent' has been declared as a 'reg' instead of an event.

## WHAT NEXT

Modify the declaration be an 'event' declaration, and wrap the event trigger with "'ifndef SYNTHESIS ... 'endif" to avoid a VER-193 error.

For example,

```
module m;
 event nonevent ;
 always
 begin
 'ifndef SYNTHESIS
 -> nonevent ;
 'endif
 end
endmodule
```

## SEE ALSO

[analyze](#) (2), [read](#) (2).

**VER-960 (error) %s** Lack of register declaration requires combinational primitive.

## DESCRIPTION

This is a syntax error.

## WHAT NEXT

Change the relevant code to conform to the IEEE Std 1364.

**VER-961 (error) %s** Register declaration '%s' supported only for

**output.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-962 (error) %s Existence of register declaration requires sequential primitive.**

## **DESCRIPTION**

This is a syntax error.

## **WHAT NEXT**

Change the relevant code to conform to the IEEE Std 1364.

# **VER-963 (error) %s Illegal part select of memory '%s'.**

## **DESCRIPTION**

In Verilog, it is illegal to index a slice of a memory using a part select. The following example illustrates a part select of a memory that results in this error message.

```
module foo;
 reg [10:0] mem [10:0];
 reg [10:0] temp [3:0];

 always
 temp[3:0] = mem[3:0];
endmodule
```

## **WHAT NEXT**

Rewrite this part of your design with a looping construct. Or, if available, read the file as SystemVerilog, in which it is legal to index a slice of a memory with a part select.

## SEE ALSO

`analyze (2), read (2).`

# VER-964 (error) %s Port '%s' incompatibly declared as scalar and vector.

## DESCRIPTION

You get this message when the width declarations for a port are inconsistent. For example,

```
module m(dataout);
 output dataout;
 reg [2:0] dataout;
endmodule
```

## WHAT NEXT

Modify the declarations to be consistent with each other. Usually, but not necessarily, this entails adding vector range information to the scalar declaration.

# VER-965 (error) %s Premature end-of-file encountered in a '%s' block begun at line %d.

## DESCRIPTION

This message, issued during execution of the `analyze` or `read` command, indicates that the Presto HDL Compiler has encountered a block of code that does not have its terminating token. For example, a *module* that has no `endmodule` or a comment that begins with `'/*'` but has no `'*/'` to terminate it.

## WHAT NEXT

Review your code to locate such missing tokens and insert them.

## SEE ALSO

`analyze (2), read (2).`

# VER-966 (error) %s Procedural-continuous assignments are not

# supported by synthesis.

## DESCRIPTION

This message, issued during execution of the **analyze** or **read** command, indicates that the Presto HDL Compiler has encountered a procedural-continuous assignment. Synthesis ignores such assignments.

The following example illustrates a procedural-continuous assignment, assign B = A, that synthesis ignores:

```
module foo (A, B);
 input A;
 output B;
 reg B;

 always
 assign B = A; // this is a procedural-continuous assignment.

endmodule
```

## WHAT NEXT

Because synthesis ignores procedural-continuous assignments, consider removing them if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-967 (error) %s The 'force' construct is not supported by synthesis.

## DESCRIPTION

This message, issued during execution of the **analyze** or **read** command, indicates that the Presto HDL Compiler has encountered a force construct. Synthesis ignores such constructs.

The following example illustrates a force construct, force B, that synthesis ignores:

```
module foo (B);
 output B;
 reg B;

 always
```

```
force B = 1'b1; // force is not supported
endmodule
```

## WHAT NEXT

Because synthesis ignores force constructs, consider removing the force construct if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-968 (error) %s The 'release' construct is not supported by synthesis.

## DESCRIPTION

This warning, issued during execution of the **analyze** or **read** command, indicates that the Presto HDL Compiler has encountered a release construct. Synthesis ignores such constructs.

The following example illustrates a release construct, release B, that synthesis ignores:

```
module foo (B);
 output B;
 reg B;

 always
 release B; // release is not supported

endmodule
```

## WHAT NEXT

Because synthesis ignores release constructs, consider removing the release construct if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-969 (error) %s The 'deassign' construct is not supported by

# synthesis.

## DESCRIPTION

This warning, issued during execution of the **analyze** or **read** command, indicates that the Presto HDL Compiler has encountered a deassign construct. Synthesis ignores such constructs.

The following example illustrates a deassign construct, deassign B, that synthesis ignores:

```
module foo (B);
 output B;
 reg B;

 always
 deassign B; // deassign is not supported

endmodule
```

## WHAT NEXT

Because synthesis ignores deassign constructs, consider removing the deassign construct if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-970 (warning) %s The delay specification for gate instantiation is ignored.

## DESCRIPTION

This warning, issued during execution of the **analyze** or **read** command, indicates that the Presto HDL Compiler has encountered a delay information for gate instantiation. Synthesis ignores such a delay specification.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
 input A,B;
 output C;
 and #(1,2) (C,A,B);
endmodule
```

## WHAT NEXT

Because synthesis ignores delay information on gate instantiation, consider removing the delay information if the code is intended for synthesis only.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-971 (warning) %s The delay specification for tri-state gate instantiation is ignored.

## DESCRIPTION

This warning, issued during execution of the `analyze` or `read` command, indicates that the Presto HDL Compiler has encountered delay information for a tri-state gate instantiation. Synthesis ignores such delay information.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
 input A,B;
 output C;
 bufif0 #(1,2) (C,A,B);
endmodule
```

## WHAT NEXT

Because synthesis ignores delay information on tri-state gate instantiation, consider removing the delay information if the code is intended for synthesis only.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-972 (warning) %s The delay specification for mos switch instantiation is ignored.

## DESCRIPTION

This warning, issued during execution of the `analyze` or `read` command, indicates that the Presto HDL Compiler has encountered delay information for a mos switch instantiation. Synthesis ignores such delay information.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
 input A,B;
 output C;
 nmos #(1,2) (C,A,B);
endmodule
```

## WHAT NEXT

Because synthesis ignores delay information for mos switch instantiation, consider removing the delay information if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-973 (warning) %s The delay specification for cmos switch instantiation is ignored.

## DESCRIPTION

This warning, issued during execution of the **analyze** or **read** command, indicates that the Presto compiler has encountered delay information for a cmos switch instantiation. Synthesis ignores such delay information.

The following examples illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C,D);
 input A,B,C;
 output D;
 cmos #(1,2) (D,A,B,C);
endmodule
```

## WHAT NEXT

Because synthesis ignores delay information on a cmos switch instantiation, consider removing the delay information if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-974 (warning) %s The delay specification for bi-directional

# switch instantiation is ignored.

## DESCRIPTION

This warning, issued during execution of the **analyze** or **read** command, indicates that the Presto compiler has found delay information for a bidirectional switch instantiation. Synthesis ignores such delay information.

The following example illustrates delay information, #(1,2), that synthesis ignores:

```
module foo (A,B,C);
 input C;
 inout A,B;
 tranif0 #(1,2) (A,B,C);
endmodule
```

## WHAT NEXT

Because synthesis ignores delay information on bidirectional switch instantiation, consider removing the delay information if the code is intended for synthesis only.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-975 (warning) %s The delay specification for pull gate instantiation is ignored.

## DESCRIPTION

This warning, issued during execution of the **analyze** or **read** command, indicates that the compiler has found a delay specification for a pull gate instantiation.

The following example illustrates a delay specification, #(1), that synthesis ignores:

```
module foo (A);
 output A;
 pullup #(1) (A);
endmodule
```

## WHAT NEXT

Because synthesis ignores delay specifications on pull gate instantiations, consider removing the delay specification if the code is intended for synthesis only.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-976 (warning) %s The delay specification for net declaration is ignored.

## DESCRIPTION

This warning, issued during execution of the `analyze` or `read` command, indicates that the compiler has found a delay specification in a net declaration.

The following example illustrates a delay specification, #(1), that synthesis ignores:

```
module foo;
 wire #(1) w;
endmodule
```

## WHAT NEXT

Be aware that synthesis ignores delay specifications on nets. If the code is intended for synthesis only, consider removing the delay specification.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-977 (warning) %s The strength specification for a net declaration is ignored by synthesis.

## DESCRIPTION

This warning, issued during execution of the `analyze` or `read` command, indicates that the compiler has found a strength specification in a net declaration.

## WHAT NEXT

Be aware that synthesis ignores strength specifications on nets. If the code is intended for synthesis purposes only, consider removing the strength specification.

## SEE ALSO

`analyze (2), read (2).`

# VER-978 (error) %s Ambiguous genvar ('%s') used in generate loop statement.

## DESCRIPTION

You receive this error message because the two genvar assignments used in a generate loop specification must have the same genvar on the left hand sides. For example:

```
generate
 for (i=0; i<5; j=i+1) // 2 different genvars "i" and "j" used
 ...
endgenerate
```

## WHAT NEXT

Change the generate loop so that the same genvar is used on the left side of both assignments, and then run the command again.

## SEE ALSO

`analyze (2), read (2).`

# VER-979 (error) %s Two nested generate loops using the same genvar '%s'.

## DESCRIPTION

You receive this error message because the same genvar is used as loop index by two nested generate loops. According to the language standard, using the same genvar by two nested generate loops is not allowed. The situation is demonstrated by the following example:

```
generate
 for (i=0; i<5; i=i+1) // genvar 'i' as index
 for (i=1; i<4; i=i+1) //ERROR: nested loop using the same genvar 'i' as index
 ...
endgenerate
```

## WHAT NEXT

Rewrite one of the generate loops to use a different genvar as index.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-980 (error) %s Illegal assignment to genvar '%s'.

## DESCRIPTION

You receive this error message because the design contains an assignment to a genvar outside of a generate loop header. The value of genvars can only be defined by assignments inside generate loop headers. For example:

```
generate
 for (i=0; i<5; i=i+1) // only valid assignments to genvar 'i'
 ...
 i = 5; // ERROR: invalid assignment to genvar 'i'
 ...
endgenerate
```

## WHAT NEXT

Rewrite the RTL description so that genvars are only assigned values inside the generate loop headers.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-981 (error) %s Macro definition is recursive '%s'.

## DESCRIPTION

The Presto HDL Compiler issues this error message when a recursively defined macro is called while executing the **analyze** or **read** command.

Macros are defined using the define directive in Verilog.

## WHAT NEXT

Redefine the macro to eliminate all self-references, including indirect self-

references occurring in the definitions of other macros.

## SEE ALSO

**analyze** (2), **read** (2).

# VER-982 (error) %s The "elsif" directive was found without a corresponding "ifdef" directive.

## DESCRIPTION

You receive this error message when the 'elsif' directive is found with no corresponding 'ifdef'. The 'ifdef' might not exist, or the 'ifdef' might not be followed by an identifier name.

The following is an example of a missing 'ifdef':

```
'elsif SYNOPSIS_SYNTHESIS
'else
'endif

// the 'ifdef is missing
```

The following shows an example of an 'ifdef' without an identifier name:

```
'ifdef
'elsif SYNOPSYS_SYNTHESIS
'else
'endif

// the 'ifdef exists, but no identifier name follows it
```

## WHAT NEXT

Correct the 'elseif' directive so it includes the 'ifdef' directive as shown in the example:

```
'ifdef SOMETHING_ELSE
// ...

'elsif SYNOPSYS_SYNTHESIS
// ...

'else
// ...

'endif
```

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-983 (error) %s The “ifndef” directive must have an identifier name after it.

## DESCRIPTION

The tool issues this error message when the token following an ‘ifndef’ directive is not an identifier name. A common mistake is using a literal constant.

The following example shows an invalid identifier name, resulting in this error message.

```
'ifndef 5
'endif
```

## WHAT NEXT

Correct the identifier name after the ‘ifndef’ directive, as shown in the following example:

```
'ifndef SYNOPSYS_SYNTHESIS
'endif
```

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-984 (error) %s The “elsif” directive must have an identifier name after it.

## DESCRIPTION

The tool issues this error message because the token following an ‘elsif’ directive is not an identifier name. A common mistake is using a literal constant.

The following example shows an invalid identifier name, resulting in this error message.

```
'elsif 5
```

## WHAT NEXT

Correct the identifier name after the 'elsif' directive, as shown in the example of a valid 'elsif':

```
'elsif SYNOPSYS_SYNTHESIS
```

## SEE ALSO

[analyze](#) (2), [read](#) (2).

# VER-985 (warning) %s The "line" directive requires a %s.

## DESCRIPTION

You receive this warning message because the Verilog 'line compiler directive cannot find the expected arguments.

The expected arguments are a nonnegative decimal number, a double-quoted string, and a level of 0, 1, or 2.

## WHAT NEXT

No action is required on your part.

## SEE ALSO

[analyze](#) (2), [read](#) (2).

# VER-986 (warning) %s Empty port in module declaration.

## DESCRIPTION

You receive this warning message when the port list of a module declaration has an unconnected port.

## EXAMPLE

The following legal Verilog statement indicates a module with four ports, the last of which is unconnected.

```
...
module m(a,b,c,); /* Legal, but perhaps not intended */
```

...

## WHAT NEXT

This is a warning message only. No action is required on your part.

However, if the unconnected port is not your intention, remove a comma and then run the command again.

## SEE ALSO

`analyze(2)`  
`read(2)`

# VER-987 (warning) %s Port %s is implicitly typed

## DESCRIPTION

The port warned has been declared previously with a different type.

### Verilog

```
module test (..., dataout);
 output dataout;
 reg [2:0] dataout;
```

Here `dataout` has been previously declared as one-bit, and later on declared as `[2:0]`. This may cause simulation, synthesis and formal verification mismatch due to the different interpretation in different tools as what's type of `dataout`.

## WHAT NEXT

Change your Verilog source code to remove the inconsistent declaration for the port.

## SEE ALSO

`analyze (2)`, `read (2)`.

# VER-999 (error) %s Only simple identifiers are allowed in

# pragma signal list.

## DESCRIPTION

You receive this error message when the pragma signal list contains expression list or non-simple identifiers.

## EXAMPLE

The following verilog code won't work as identifier associated with pragam is not an simple identifier.

```
// synopsys sync_set_reset "reset[0]"

reg Y ;
always @ (posedge clk)
begin : synchronous_reset
if (reset[0])
y = 1'b0;
else
y = d1;
end
```

## WHAT NEXT

Use a wire and replace non-simple identifier.

## SEE ALSO

**analyze** (2), **read** (2)

**VER-1000** (warning) The **hdlin\_enable\_presto** variable will be ignored in a future release.

## DESCRIPTION

The HDL Compiler (Presto Verilog) tool was introduced as the default Verilog reader in the 2001.08 release. In a future release, you will no longer be able to disable it using the **hdlin\_enable\_presto** variable.

## WHAT NEXT

Remove the **hdlin\_enable\_presto** variable from your scripts.

## SEE ALSO

`hdlin_enable_presto` (3).

# VER-1005 (warning) %s Port %s of type input is being assigned.

## DESCRIPTION

The port of type input is being assigned.

### Verilog

```
module test (..., datain);
 input datain;
 assign datain = ...;
```

The port of type input has been assigned. This may cause simulation, synthesis and formal verification mismatch due to the different interpretation in different tools as what's type of dataout.

## WHAT NEXT

Change your Verilog source code to remove the inconsistent declaration for the port.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-1006 (error) %s Entity of architecture '%s' cannot be found.

## DESCRIPTION

This error message occurs during an `analyze` or `read` command activity if the entity of an architecture cannot be found.

## WHAT NEXT

Ensure the desired entity exists and has been specified correctly. Check if there are any unsupported embedded configurations inside the architecture.

## **SEE ALSO**

`analyze(2)`  
`read (2)`

# **VER-1007 (error) %s Only one event control allowed on always\_ff block.**

## **DESCRIPTION**

You receive this error message because SystemVerilog does not support multiple event statements on an always\_ff block.

## **WHAT NEXT**

Change the source code to remove the use of multiple events in the always\_ff block.

## **SEE ALSO**

`elaborate (2)`, `read (2)`.

# **VER-1008 (error) %s Incompatible DW encrypted file %s, the encrypted file is version %s, only version lower than or equal to %s can be read by the current DC.**

## **DESCRIPTION**

This error message occurs when the tool detects that there is an incompatible version of an encrypted DW file.

## **WHAT NEXT**

You need another version of DC to read the file.

## **SEE ALSO**

`analyze (2)`, `read (2)`.

# **VER-1009 (error) %s No delays are allowed on an always\_ff,**

`always_comb` or `always_latch` block.

## DESCRIPTION

You receive this error message because SystemVerilog does not support delays on an `always_ff`, `always_comb` or `always_latch` block.

## WHAT NEXT

Change the source code to remove the use of delays in the `always_ff`, `always_comb` or `always_latch` block.

## SEE ALSO

`elaborate` (2), `read` (2).

# VER-1010 (error) %s Port '%s' of type input is being assigned

## DESCRIPTION

SystemVerilog has two kinds of input ports: variable input ports and net input ports. (SEE LRM 6.7) It is legal to assign to net input ports, but not legal to assign to variable input ports.

## Sverilog

```
module test (..., datain);
 input datain;
 assign datain = ...;
```

## WHAT NEXT

Change your source code to remove the inconsistent declaration for the port.

## SEE ALSO

`analyze` (2), `read` (2).

# VER-1011 (error) %s Tasks cannot contain event control

statements.

## DESCRIPTION

You receive this error message because you have attempted to use an event control statement inside of a task. This is not supported by Presto.

## WHAT NEXT

Rewrite the source code so that tasks don't contain events.

## SEE ALSO

`analyze` (2), `read` (2).

**VERIL**

**VERIL-0** (warning) %s

**DESCRIPTION**

**WHAT NEXT**

**VERIL-1** (error) %s

**DESCRIPTION**

**WHAT NEXT**

**VERIL-2** (fatal) %s

**DESCRIPTION**

**WHAT NEXT**

**VERIL-3** (fatal) %s

**DESCRIPTION**

**WHAT NEXT**

## **VFM**

**VFM-1** (warning) Variable '%s' has been set to '%s', which conflicts with the verification friendly mode.

### **DESCRIPTION**

You turned on an optimization that may reduce the likelihood that the design can be formally verified.

### **WHAT NEXT**

In case you run into problems during formal verification, you should consider turning off this optimization.

**VFM-2** (error) Options '%s' and '%s' are incompatible.

### **DESCRIPTION**

You selected two incompatible options.

### **WHAT NEXT**

Re-issue the command command.

**VFM-3** (information) Enabled verification friendly mode with dp\_optimization\_effort level '%s'.

### **DESCRIPTION**

You successfully enabled the verification friendly mode.

### **WHAT NEXT**

NA

## **VFM-4 (error) Failed to enable verification friendly mode.**

### **DESCRIPTION**

DC was unable to enable the verification friendly mode.

### **WHAT NEXT**

Please address the problems highlighted by previous messages and re-issue the command.

## **VFM-5 (error) You need to provide a filename for the svf information.**

### **DESCRIPTION**

set\_verification\_friendly\_mode will enable generation of setup information for Formality. You need to provide the name of a file to write this information to.

### **WHAT NEXT**

Re-issue the command command with the 'filename' option.

## **VFM-6 (information) Disabled verification friendly mode. All optimizations have been turned to their default settings.**

### **DESCRIPTION**

You successfully disabled the verification friendly mode.

### **WHAT NEXT**

NA

## **VFM-7 (warning) You need to perform set\_svf to enable**

# generation of setup information for formality.

## DESCRIPTION

Use set\_svf to generate a Formality setup information file to ensure efficient compare point matching in Formality. For set\_verification\_friendly\_mode to enable generation of setup information for Formality, you will need to create the file using set\_svf.

## WHAT NEXT

To avoid receiving this message, perform a set\_svf prior to issuing set\_verification\_friendly\_mode

## SEE ALSO

set\_svf(2) .

## VFP

# VFP-001 (error) Failed to create placement netlist.

## DESCRIPTION

This error message occurs during the loading of the virtual flat placement netlist. It indicates that the loading was not successful, and thus placement did not run. The most common reason for this error is that you have voltage areas in the design, but the voltage area information is not consistent.

## WHAT NEXT

Check that your voltage area and operating condition information is consistent. Check the log file to see what errors occurred before this error and address those errors. Do not proceed ahead in the flow with this result as placement did not run.

## SEE ALSO

`set_operating_conditions(2)`

# VFP-002 (error) Missing the required license, %s.

## DESCRIPTION

This error message occurs because you have accessed a command or feature that requires a license which is not available.

## WHAT NEXT

Check if there are any licenses available or if there is any problem with the license server.

# VFP-003 (error) No design is loaded.

## DESCRIPTION

This error message occurs if there is no design loaded and a loaded design is needed.

## **WHAT NEXT**

Load your design.

## **SEE ALSO**

`open_mw_cel(2)`  
`open_mw_lib(2)`

# **VFP-004 (error) The options %s and %s are mutually exclusive.**

## **DESCRIPTION**

This error message occurs when you use two options which are mutually exclusive.

## **WHAT NEXT**

Check the man page of the command to determine why these options are mutually exclusive. Do not use one of the two options.

# **VFP-005 (error) Pad scaling error -- %s.**

## **DESCRIPTION**

This error message occurs during MinChip IO placement scaling. Depending on the detail of the message, it could be a design data issue or it could be that the IO placement of the design is too complicated for the command to handle or there is simply not enough space for shrinking.

## **WHAT NEXT**

Check that the design is opened properly, and it has periphral IO pad cell or bump cell. You may also seek to use core sizing only for MinChip.

## **SEE ALSO**

`estimate_fp_area(2)`

## **VFP-006 (error) Failed to get MW lib id.**

### **DESCRIPTION**

This error message occurs while the command is reading the design. It is probably because the design library is not loaded to the tool or the design database is corrupted.

### **WHAT NEXT**

Check if the design library is loaded to the tool.

### **SEE ALSO**

[open\\_mw\\_cel\(2\)](#)

## **VFP-007 (error) Failed to open file %s for %s.**

### **DESCRIPTION**

This error message occurs when the command tries to open a file to read or write but fails.

### **WHAT NEXT**

Check the permission of the directory and the file with the name indicated in the message.

### **SEE ALSO**

## **VFP-008 (error) %s.**

### **DESCRIPTION**

This error message occurs when the objects specified with option -align\_pins is not one design port and one macro cell pin.

### **WHAT NEXT**

Check the objects specified in the command with the option -align\_pins. Make sure to give one design port and one macro cell pin.

## **SEE ALSO**

`set_fp_macro_options (2)`

## **VFP-009 (error) %S.**

### **DESCRIPTION**

This error message occurs when one or more macro cells specified with the `-elements` option is already defined in an existing macro array constraint.

### **WHAT NEXT**

This error indicates conflicting macro array constraints being defined. The later constraint is accepted by the tool. It is user's call to either remove the previously defined array constraint and set the new one, or keep the existing macro array constraint and ignore the new one.

## **SEE ALSO**

`set_fp_macro_array (2)`

## **VFP-010 (error) %S.**

### **DESCRIPTION**

This error message occurs when the array name specified with the option `-name` is the same as the name of an existing macro array constraint.

### **WHAT NEXT**

This error indicates conflicting macro array constraints being defined. The later constraint is accepted by the tool. It is user's call to either remove the previously defined array constraint and set the new one, or keep the existing macro array constraint and ignore the new one, or change the new array constraint to use another name.

## **SEE ALSO**

`set_fp_macro_array (2)`

## **VFP-011 (error) %s.**

### **DESCRIPTION**

This error message occurs when the tool couldn't find any macro cell instance in the collection specified with the option -elements.

### **WHAT NEXT**

Check the values passed to option -elements in the command line. Make sure there are proper numbers of macro cells in the collection.

### **SEE ALSO**

`set_fp_macro_array (2)`

## **VFP-012 (error) %s.**

### **DESCRIPTION**

This error message occurs when each collection in the list of collections specified with option -elements contain different numbers of macro cells for a 2D rectangular array constraint.

### **WHAT NEXT**

Check whether the array constraint is supposed to be a rectilinear one. If the array is supposed to be a rectilinear shape array, please specify option -rectilinear. Otherwise, check the values passed to option -elements in the command line and make sure that all the collections in the list contain the same number of macro cells.

### **SEE ALSO**

`set_fp_macro_array (2)`

## **VFP-013 (error) %s.**

### **DESCRIPTION**

This error message occurs when the macro cells specified with the option -elements belong to different plan groups.

## WHAT NEXT

Plan groups are exclusive. Macro cells defined in one array constraint are going to be packed together. All the cells within an array constraint has to be in one plan group. Please check the specified array element cells. You may want to break this array constraint into two or more arrays for different plan groups.

## SEE ALSO

`set_fp_macro_array (2)`

# VFP-014 (error) The command %s is obsolete. Please use command %s instead.

## DESCRIPTION

This error message occurs when you use an obsolete command. Use the suggested replacement command instead.

## WHAT NEXT

Check the man page of the replacement command to make sure that it will meet your requirements. Change scripts to use the replacement command.

# VFP-015 (error) Invalid value for option %s.

## DESCRIPTION

This error message occurs when you give an invalid value to an option.

## WHAT NEXT

Check the man page of the command to determine what are the valid values for the option.

# VFP-016 (error) No plan groups are specified.

## DESCRIPTION

This error message occurs when incremental placement on plan groups was requested, but no plan groups were given.

## **WHAT NEXT**

Use `-plan_groups` option to specify the plan groups. Check the man page for more details on the command and its options.

# **VFP-017 (error) No voltage areas are specified.**

## **DESCRIPTION**

This error message occurs when incremental placement on voltage areas was requested, but no voltage areas were given.

## **WHAT NEXT**

Use `-voltage_areas` option to specify the voltage areas. Check the man page for more details on the command and its options.

# **VFP-018 (error) The options %s and %s must be used together.**

## **DESCRIPTION**

This error message occurs when certain options are related and need to be used together or not at all.

## **WHAT NEXT**

Use both related options, or do not use them at all. Check command man page for more details.

# **VFP-019 (error) All IO cells must be on the same edge of the design.**

## **DESCRIPTION**

This error message occurs when you have specified IO cells on more than one edge of the design. This command requires that all IO cells be on the same edge of the design.

## **WHAT NEXT**

Check the specified IO cells, remove the ones not on the correct edge. Check command

man page for more details.

## **VFP-020 (error) Failed to get chip boundary.**

### **DESCRIPTION**

This error message occurs when there is no chip/cell boundary created in the design.

### **WHAT NEXT**

Use initialize\_floorplan to create the cell and core before running this command.

### **SEE ALSO**

initialize\_floorplan(2)

## **VFP-021 (error) Failed to find any IO cells in design.**

### **DESCRIPTION**

This error message occurs when there are no IO cells in the design. This command requires that there be IO cells to execute.

### **WHAT NEXT**

If there appears to be IO cells in design, check the type of those cells. They may be marked as macros instead of IOs.

## **VFP-022 (error) No IO cell instances are specified.**

### **DESCRIPTION**

This error message occurs when there are no IO cells specified for the command. This command requires that there be IO cells specified to execute.

### **WHAT NEXT**

Determine what IO cells you want the command to operate on, then give them as input to command. Check the type of the IO cells to make sure they are really marked as IOs.

## **VFP-023 (error) Failed to load %s information.**

### **DESCRIPTION**

This error message occurs when there is a problem with loading certain fundamental information from database. This is likely because something is not set up correctly in database.

### **WHAT NEXT**

Check for issues related to the information that was not found. Try recreating the database.

## **VFP-024 (error) Failed to find any nets in design.**

### **DESCRIPTION**

This error message occurs when there were no nets found in design. Placement requires that there be nets in the design.

### **WHAT NEXT**

Check if there are nets in design. If there are nets, it is possible that those nets were filtered out because they had more pins than -max\_fanout option specifies, or that they had a net weight of 0.

### **SEE ALSO**

`create_fp_placement(2)`

## **VFP-025 (error) Internal error: %s**

### **DESCRIPTION**

This error message occurs when there is a serious internal error. It is possible that the database is corrupt or some other unexpected situation has happened.

### **WHAT NEXT**

Regenerate the data base. Report this issue.

## **VFP-026 (error) Unable to remove constraint.**

### **DESCRIPTION**

This error message occurs when there is some error in removing macro constraint.

### **WHAT NEXT**

There is probably another error issued prior to this error that should give more detail about the reason of failure.

## **VFP-027 (error) Cannot find %s with name %s.**

### **DESCRIPTION**

This error message occurs when the command cannot find the object with the specified name.

### **WHAT NEXT**

Check any name specified in the command line and check the design to see whether the name is correct.

## **VFP-028 (error) Anchor object %s is not fixed or implied fixed.**

### **DESCRIPTION**

This error message occurs when the specified anchor object is not fixed or implied fixed by existing relative location constraints.

### **WHAT NEXT**

User need to decide whether to fix the anchor object, to set another relative location constraint to imply this anchor object is fixed, or to discard this relative location constraint.

## **VFP-029 (error) Constraint %s already exist.**

### **DESCRIPTION**

This error message occurs when the given name of the constraint is the same as another constraint previously set.

### **WHAT NEXT**

User can decide whether to delete the old constraint and set the new one, or discard the new constraint.

## **VFP-030 (error) Failed to get boundary of %s %s.**

### **DESCRIPTION**

This error message occurs when the command tries to get the boundary or bounding box of the object with the given name but failed.

### **WHAT NEXT**

Check the design and see whether the name is correct.

## **VFP-031 (error) %s has a utilization of %.2f.**

### **DESCRIPTION**

This error message occurs the specified utilization exceeds 100%.

### **WHAT NEXT**

Check the size of the design to make sure utilization is reasonable for placement.

## **VFP-032 (error) Error in getting design for timing analysis.**

### **DESCRIPTION**

This error message occurs when the command tries to access data for timing analysis purposes and failed.

## **WHAT NEXT**

Check if the design and its environment are set up properly for running timing analysis in the tool.

# **VFP-033 (error) Failed in updating timer.**

## **DESCRIPTION**

This error message occurs when the command tries to update timer and failed.

## **WHAT NEXT**

Check if the design and its environment are set up properly for running timing analysis in the tool, and if timing report can run through successfully.

# **VFP-034 (error) Failed preplacement check.**

## **DESCRIPTION**

This error message occurs when the preplacement check fails.

## **WHAT NEXT**

There should be some other messages before this one that tells more detail about the failure.

# **VFP-035 (error) Failed returning placement to Milkyway.**

## **DESCRIPTION**

This error message occurs when the tool tries to send placement result to Milkyway DB but failed.

## **WHAT NEXT**

There might be disk problem or DB corruption problem with the design. Try to do some editing operations like moving cells, see if that can be completed successfully.

## **VFP-036 (error) Failed in placement.**

### **DESCRIPTION**

This error message occurs when certain step in the placement failed.

### **WHAT NEXT**

There should be some other error message about the detail of the failure before this message. Look in the log file for any prior error message and decide what to do next.

## **VFP-037 (error) Problem detected with cell padding. Congestion driven will not be run..**

### **DESCRIPTION**

This error message occurs when error occurs in calculating congestion-driven cell padding. When this error occurs, the placement will run without congestion-driven even though congestion-driven option is on.

### **WHAT NEXT**

There is probably other more detailed message before this message that would point out the reason of failure. Look in the log file for the details.

## **VFP-038 (error) Failed during increment congestion/timing driven placement.**

### **DESCRIPTION**

This error message occurs when error occurs in congestion-driven or/and timing-driven incremental placement.

### **WHAT NEXT**

There should be other more detailed messages before this message that would point out the reason of failure. Look in the log file for the details.

## **VFP-039 (error) %s %s is beyond core area.**

### **DESCRIPTION**

This error message occurs when the placement detects the specified object is beyond core area while placement only handles the object being completely inside core area.

### **WHAT NEXT**

When this error is issued, if the placement continues, the tool must be taking only the object's inside core area portion into consideration for placement. Whether the placement stops or not, it is advised that user check the specified object and fix the object being outside core area (partially or completely) problem.

## **VFP-040 (error) %s with multiple instantiated plan groups not supported.**

### **DESCRIPTION**

This error message occurs when the design has multiple instantiated plan groups (MIPG) and user is trying to run a function that doesn't support MIPG.

### **WHAT NEXT**

User need to decide whether to uniquefy the MIPGs or simply not to run the specified function.

## **VFP-041 (error) Incremental placement with multiple instantiated plan groups outside the core not supported.**

### **DESCRIPTION**

This error message occurs when incremental placement is called on a design with multiple instantiated plan groups outside the core.

### **WHAT NEXT**

User need to decide whether to uniquefy the MIPGs or simply not to run the specified function.

## **VFP-042 (error) Pad file not found for multi-vdd design placement.**

### **DESCRIPTION**

This error message occurs when the tool couldn't find the pad file.

### **WHAT NEXT**

Check the command line and see whether the file exists and if the file name is spelled correctly with the pad file option.

## **VFP-043 (error) Pre-legalization check failed because of above issues.**

### **DESCRIPTION**

This error message occurs when the pre-legalization check failed.

### **WHAT NEXT**

The messages before this one should provide more detail about the failure. Please read the log file and fix the indicated problem, then call legalization again.

## **VFP-044 (error) Failed to get %s.**

### **DESCRIPTION**

This error message occurs when the tool tries to get the specified information from database but failed.

### **WHAT NEXT**

Check the design database or any technology setup for the design.

## **VFP-045 (error) Less than 3 movable cells found. Placement will**

not be run in this case.

## **DESCRIPTION**

Too few placeable instances for the placement algorithm to run.

## **WHAT NEXT**

Check whether cells are mistakenly marked as fixed.

# **VFP-046 (error) %s. Placement will not be run.**

## **DESCRIPTION**

Placeable cells all have no area.

## **WHAT NEXT**

Check design.

# **VFP-047 (error) %s area available for placement. Placement will not be run.**

## **DESCRIPTION**

The region being placed is overutilized.

## **WHAT NEXT**

This can occur due to hard macro or plan group padding. Try removing padding and placement blockages. If the error occurs on a movebound, plangroup or voltage area check whether cells from other areas are occupying the region. Another possible reason for this error is due to sliver size. As channels get changed due to macro placement, they may become smaller than sliver\_size and get blocked out. If channels around fixed macros are smaller than sliver size they will not be available for placement. In the default flow sliver size is 20 microns. Try setting it to -1 if this error comes up.

## **SEE ALSO**

`set_fp_placement_strategy(2)`

## **VFP-048** (error) Conflicting cell constraints found.

### **DESCRIPTION**

Constraints on macro cells are conflicting. Some constraints might not be satisfied.

### **WHAT NEXT**

Check macro constraints. Sometimes move bound constraints conflict with other macro constraints such as anchor bound or edge constraints.

## **VFP-049** (error) Some cells do not fit into plan group or core boundary

### **DESCRIPTION**

There are cells in the design that cannot fit into their respective plan group, movebound or voltage area constraint. Alternatively there are cells that are too large to fit within the core boundary.

### **WHAT NEXT**

Check the orientation constraints on your macros. Possibly the cell could fit with a different orientation. If the large size of the cell is desired then the cell should be placed and fixed before running placement.

## **VFP-050** (error) Fixed macro %s is outside its plan group.

### **DESCRIPTION**

Some fixed macros are violating their plangroup or movebound constraint.

### **WHAT NEXT**

Move the macro into its plangroup.

## **VFP-051** (error) Failure during simultaneous placement and pin

assignment.

## **DESCRIPTION**

This error message occurs when there was a serious error during one phase of the simultaneous placement and pin assignment. It is likely that the resulting design does not have a good placement and/or pin assignment, and thus should be discarded.

## **WHAT NEXT**

Check in the log file before this message and see what error(s) have occurred.

# **VFP-052 (error) Unable to load user grid from MW.**

## **DESCRIPTION**

This error message occurs when tool tries to get the user grid from the MW database, but fails to find the user grid.

## **WHAT NEXT**

Recreate the user grid with set\_user\_grid command and try again.

# **VFP-053 (error) Command expects only 1 plan group.**

## **DESCRIPTION**

This error message occurs when you have passed a collection with more than 1 plan group to the command or a collection with no plan groups. This command is intended to take a collection of only 1 plan group.

## **WHAT NEXT**

Look at man page to understand why only 1 plan group is allowed. Only pass 1 plan group to command.

## **VFP-054 (error) Different number of cells in MIM group.**

### **DESCRIPTION**

This error message occurs when you have 2 multiply instantiated modules (MIM) plan groups that have a different number of cells. MIM plan groups in the same MIM group are supposed to have the same number of cells.

### **WHAT NEXT**

When MIMs are created, they will have the same number of cells. It is possible that something happened after creation that changed the cells in the MIMs. Look to see if there was any optimization done, or any manual change to the netlist to cause that the MIM plan groups are no longer identical.

## **VFP-055 (error) Cannot restore placement because %s.**

### **DESCRIPTION**

This error message occurs if the restore placement has failed. There are a number of possibilities why this would happen. One is that the shape of the plan groups was changed after the original copy. If this happens, restore will not work. Another possibility is if the database got corrupted and the original placement data got lost.

### **WHAT NEXT**

Unfortunately, there is nothing to do to fix this.

## **VFP-056 (error) Plan group %s is not an MIM plan group.**

### **DESCRIPTION**

This error message because the command is expecting a multiply instantiated module (MIM) plan group, but the plan group is not an MIM plan group.

### **WHAT NEXT**

Use report\_mim to confirm that the plan group is not MIM. Determine if this plan group is supposed to be MIM and make it MIM if needed.

## **VFP-057 (error) Plan groups %s and %s are not the same shape/size.**

### **DESCRIPTION**

This error message occurs if the named plan groups are not the same shape or size. This is necessary for multiply instantiated modules (MIM) plan groups.

### **WHAT NEXT**

Use `update_mim_boundary` to make the plan group shapes the same.

## **VFP-058 (error) Plan group %s has an illegal orientation.**

### **DESCRIPTION**

This error message occurs if the specified plan group has an illegal orientation. The specified plan group should be a multiply instantiated module (MIM) plan group as those are the only ones that can have a non ROT0 orientation. MIM plan groups are only allowed to be flipped. They are not allowed to be rotated by 90 degrees.

### **WHAT NEXT**

Change orientation of plan group to ROT0 orientation which is always a legal orientation.

## **VFP-401 (warning) The command %s is obsolete. Use %s instead.**

### **DESCRIPTION**

This warning message occurs when you use an obsolete command. An obsolete command may still run, but it is unsupported and may be removed at any time. It is recommended to switch to the replacement command given in the warning message.

### **WHAT NEXT**

Change your scripts to use the replacement command given in the warning message.

## **VFP-402 (warning) Pad scaling warning -- %s.**

### **DESCRIPTION**

This warning message occurs during MinChip IO scaling. Depends on the detail of the message, it warns user of potential problems in IO scaling that might cause the output to be incorrect.

### **WHAT NEXT**

Check the output of the command to make sure that IO pad and bump cells are placed ok.

## **VFP-403 (warning) %s.**

### **DESCRIPTION**

This warning message occurs when -use\_keepout\_margin option is specified together with -x\_offset and/or -y\_offset.

### **WHAT NEXT**

The option -use\_keepout\_margin overrules the options -x\_offset and -y\_offset. When it is specified together with one or both of the options, options -x\_offset and -y\_offset are ignored by the tool.

## **VFP-404 (warning) Option %s can only be used with option %s. Option %s ignored.**

### **DESCRIPTION**

This error message occurs when you use a secondary option that can only be used in conjunction with a primary option. In this case, the secondary option is ignored.

### **WHAT NEXT**

Determine if you need the secondary option. If so, then you must also use the primary option. Check the command man page for more details.

## **VFP-405 (warning) Ref lib cel %s has too many overlap layer**

**shapes (%d), overlap layer ignored.**

## **DESCRIPTION**

This error message occurs when you have a ref lib cel that has an overlap layer, and that overlap layer is very complex, i.e., it has many shapes in it. In this case, placement will ignore the overlap layer and use the cel boundary instead. This is because having a lot of shapes will create runtime issues.

## **WHAT NEXT**

If you want to use overlap layer on this cel, then you need to simplify the overlap layer to have less than 1000 shapes.

**VFP-406 (warning) %s cell %s overlaps %s cell %s.**

## **DESCRIPTION**

This error message occurs when overlap between cells are detected.

## **WHAT NEXT**

Check the overlap and decide whether manual editing is needed to remove the overlap. It is possible that setting or changing certain parameters of the command can help resolve the overlaps.

**VFP-407 (warning) Failed to get hierarchy information.**

## **DESCRIPTION**

This error message occurs when the tool tries to access certain information in hierarchy preservation and fails.

## **WHAT NEXT**

Check if the design has hierarchy preservation information.

**VFP-408 (warning) Problem detaching cell from plan group**

during legalization.

## DESCRIPTION

This error message occurs when the tool is preprocessing the design for legalize placement.

## WHAT NEXT

This could potentially be caused by data corruption in plan group related information in the design, and it will lead to placement result violating plan group/voltage area/region constraints. One way to fix the problem is to try deleting the plan groups and re-create them.

# **VFP-409 (warning) Problem attaching cell to plan group, hierarchy may be compromised.**

## DESCRIPTION

This error message occurs when the tool is post-process the design after legalize placement.

## WHAT NEXT

This could potentially be caused by data corruption in plan group related information in the design, and it will lead to incorrect physical hierarchy. One way to fix the problem is to try deleting the plan groups and re-create them.

# **VFP-410 (warning) Less than 3 movable cells found. Placement will not be run in this case.**

## DESCRIPTION

Too few placeable instances for the placement algorithm to run.

## WHAT NEXT

Check whether cells are mistakenly marked as fixed.

# **VFP-411 (warning) Cannot find hard or exclusive plan group,**

## movebound or voltage area %s

### DESCRIPTION

No plangroup, voltage area or movrbound could be found with the specified name.

### WHAT NEXT

Check the spelling of the plangroup name.

## VFP-412 (warning) Fixed macros are overlapping

### DESCRIPTION

Overlapping fixed objects have been found.

### WHAT NEXT

If the overlap is unintentional then either unfix the macros or manually remove overlap.

## VFP-413 (warning) Cannot find a legal location for cell %s

### DESCRIPTION

The overlap removal algorithm was unable to find a legal location for one of the macros.

### WHAT NEXT

If possible try relaxing the constraints on this macro. If this is not possible the macro may need to be placed manually.

## VFP-414 (warning) Legal locations were not found for all macros. %s

### DESCRIPTION

The overlap removal algorithm was unable to find a legal location for some of the

macros.

## WHAT NEXT

If possible try relaxing the constraints on these macro. If this is not possible the macro may need to be placed manually.

# VFP-415 (warning) No hierarchy information in design. Hierarchy gravity turned off.

## DESCRIPTION

This error message occurs when you have a design that has no logical hierarchy, and you have used the -hierarchy\_gravity option for placement. In this case, the -hierarchy\_gravity option is not useful, so it is turned off automatically.

## WHAT NEXT

There is nothing to be done.

# VFP-416 (warning) Option -vertical is not applicable to rectangular 2D array. Option -vertical is ignored.

## DESCRIPTION

This error message occurs when a rectangular 2D macro array is defined with the option -vertical.

## WHAT NEXT

Option -vertical means arranging the element cells in the array vertically instead of horizontally. It is accepted for 2D rectilinear arrays defined by specifying option -rectilinear. For 2D rectangular array, you can re-arrange the cells' orders in the -element option to achieve the effect of rotating a macro array.

# VFP-417 (warning) Failure in auto hierarchy gravity detection.

## DESCRIPTION

This error message occurs when placement is analyzing hierarchy preservation data of

the design in order to find the proper hierarchy nodes as guidance to placement of a physically flat design.

## WHAT NEXT

The failure indicates problem in hierarchy gravity, and would cause placement to automatically turn off hierarchy gravity option to continue with flat placement. If you want `create_fp_placement` to run with some hierarchy guidance, please create the desired plan groups. You can leave the plan groups outside the chip area. `create_fp_placement` will use these plan groups for hierarchy gravity.

# **VFP-418 (warning) Unable to open cell %s.%s for OVERLAP layer information.**

## DESCRIPTION

This error message occurs when placement tries to open a macro cell's reference to get OVERLAP layer information but fails.

## WHAT NEXT

When placement fails to get a macro cell's OVERLAP layer information, it will continue with the cell boundary information in the design's CEL view. The failure could be and is most likely because the reference library for the macro cell is missing. If you know that the macro cell has no OVERLAP layer shapes, you can ignore this warning. If you know that the macro cell has OVERLAP layer, please find the reference library and setup the correct reference library path for the design.

# **VFP-419 (error) The placer detected conflicting constraints on the following cells:**

**%s**

## DESCRIPTION

You receive this message because, by default, the placer errors out if it detects conflicting constraints on one or more cells. These constraints can be movebounds, array constraints, or simple (non-disjunctive) spatial constraints that are impossible to meet. This can occur due to cells being fixed, the requirement for cells to fit on the chip, or constraints directly conflicting with each other.

## WHAT NEXT

Please remove or change the conflicting constraints and rerun the placer.

## **SEE ALSO**

**VFP-420** (warning) The placer detected conflicting constraints on the following cells:

`%S`

## **DESCRIPTION**

You receive this warning because the placer detected conflicting constraints on one or more cells. These constraints can be movebounds, array constraints, simple (non-disjunctive) spatial constraints that are impossible to meet. This can occur due to cells being fixed, the requirement for cells to fit on the chip, or constraints directly conflicting with each other.

## **WHAT NEXT**

No action is required on your part.

However, you can avoid receiving this warning, if you are satisfied with your macro placement, by removing or changing the conflicting constraints and rerunning the placer. If you want the placer to error out when it detects conflicting constraints, set the `physopt_error_out_on_conflicting_macro_constraints` variable to `true`.

## **SEE ALSO**

```
set_mpc_macro_options(2)
set_mpc_options(2)
physopt_error_out_on_conflicting_macro_constraints(3)
```

**VFP-421** (warning) The following bounds conflict:`%S`  
Treating groupbounds as soft constraints.

## **DESCRIPTION**

You receive this message because the placer detected conflicting movebounds and groupbounds on two or more cells. The placer will still honor the movebounds but it will treat all conflicting groupbounds as soft constraints. This means that the placer will attempt to honor the groupbounds, but they will be given the same priority as wirelength.

A conflict is defined as a physical impossibility. For example, suppose cell A is in a movebound with coordinates  $((0\ 0)(10\ 10))$ , cell B is in a movebound with coordinates  $((1000\ 1000)(1010\ 1010))$  and cells A and B are both in a groupbound with dimension  $(20\ 20)$ . There is no way for all three of those bounds to be satisfied.

Alternatively, if cell B were fixed at location (1000 1000) we would have a similar problem. This kind of situation causes the placer to perform poorly, so the tool will weaken the groupbounds.

## WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by reviewing your movebounds and groupbounds and removing all conflicts.

## SEE ALSO

`create_bounds(2)`

# VFP-422 (error) The following bounds conflict:%s

## DESCRIPTION

You receive this message because, by default, the placer errors out if it detects conflicting movebounds and groupbounds on two or more cells. These bounds can be user-specified bounds or bounds generated by the tool (designated as "auto\_bound").

A conflict is defined as a physical impossibility. For example, suppose cell A is in a movebound with coordinates ((0 0)(10 10)), cell B is in a movebound with coordinates ((1000 1000)(1010 1010)) and cells A and B are both in a groupbound with dimension (20 20). There is no way for all three of those bounds to be satisfied. Alternatively, if cell B were fixed at location (1000 1000) we would have a similar problem. This kind of situation causes the placer to perform poorly, so the tool will error out.

## WHAT NEXT

You should review your movebounds and groupbounds and remove all conflicts.

Alternatively, you can set the variable `placer_dont_error_out_on_conflicting_bounds` to `true`. This will cause the tool to automatically weaken the conflicting groupbounds and continue. If one or more of the conflicting bounds were generated by the tool ("auto\_bound") then you can either remove the bounds that you have set or use the variable described above.

## SEE ALSO

`create_bounds(2)`  
`create_placement(2)`  
`place_opt(2)`  
`placer_dont_error_out_on_conflicting_bounds(3)`

## **VFP-423 (warning) Save original placement failed.**

### **DESCRIPTION**

This warning message occurs when there was a problem with saving the current (ie original) placement. Saving the placement is necessary for the -restore\_placement option to work. If this warning has occurred, then it is likely that you will not be able to restore the original placement.

### **WHAT NEXT**

Possible reasons for this warning include a corrupted database or no available disk space.

## **VFP-424 (warning) Flipping plan group %s may result in a nonlegal placement.**

### **DESCRIPTION**

This warning message occurs when there may be a legality problem with flipping the placement in a plan group. Due to the need for standard cells to fit in a row structure, it is necessary for a plan group to correctly align with the row structure to be able to flip the placement of standard cells in the plan group.

### **WHAT NEXT**

Determine if you expect the result of flipping to be legal, or if that is not important to you right now. If you expect the result to be legal, then examine result to see if it is legal or not. If not, then adjust the plan group shapes so that a flipped plan group will also be legal. For example, if you have a double back design where there are no row gaps, then one possible legal plan group shape has a height which is even multiple of row height and the lower left corner of the plan group is on a row boundary.

## **VFP-425 (warning) No scan chain found.**

### **DESCRIPTION**

This warning message occurs when you use the -ignore\_scan option, but no scan chain was detected in design. Since there is no scan chain, this option will have no affect on placement.

## WHAT NEXT

Determine if there is a scan chain in the design. If there is no scan chain, then create the scan chain. If there is a scan chain in the design, please report this issue.

## SEE ALSO

`report_scan_chain(2)`  
`get_scan_chain(2)`

# VFP-426 (warning) %d macros are overlapping.

## DESCRIPTION

Overlapping macros have been found.

## WHAT NEXT

If the overlap is unintentional then run `create_fp_placement` to remove the overlaps or manually remove the overlaps.

## SEE ALSO

`create_fp_placement(2)`

# VFP-427 (warning) %d plan group cells not inside their plan group.

## DESCRIPTION

Cells which belong to a plan group are not inside their plan group. Because a plan group is an exclusive constraint, that could mean there is a problem with the placement.

## WHAT NEXT

If this is unintentional then run `create_fp_placement` to correct the placement.

## SEE ALSO

`create_fp_placement(2)`

## **VFP-428 (warning) Cell %s is not inside its %s %s.**

### **DESCRIPTION**

This warning means that there is a cell which is constrained to be placed in a certain area, but is not placed in that area. Typically, this is a plan group cell which is not placed inside its plan group.

### **WHAT NEXT**

If this issue is unintentional then run `create_fp_placement` or `create_placement` to place the cell in the appropriate area.

### **SEE ALSO**

`create_fp_placement(2)`  
`create_placement(2)`

## **VFP-429 (warning) Unsupported region(s) detected in design.**

### **DESCRIPTION**

This warning means that there are one or more regions in the design. Regions are a placement constraint that was used in JupiterXT/Astro, but they are not supported in ICC. In ICC, regions have been replaced by movebounds.

### **WHAT NEXT**

If you dont care about the region placement constraint, then you can ignore this warning. If you care about the constraint, then recreate the constraint using movebounds.

### **SEE ALSO**

`create_bounds(2)`

## **VFP-430 (warning) Top level cell %s is overlapping %s %s %s.**

### **DESCRIPTION**

This warning indicate that a top level cell is overlapping an exclusive placement constraint such as a plan group or a voltage area. This could indicate that there is a problem with the placment of the top level cell as exclusive placement constraints do not allow top level cells to overlap.

## WHAT NEXT

Look at the top level cell that is overlapping. If it is fixed, then that is likely the reason it is overlapping. You can unfix the cell and then run `create_fp_placement` to correct the placement. If the cell is not fixed and you have already run `create_fp_placement` then manually remove the overlap.

## SEE ALSO

`create_fp_placement(2)`

# VFP-431 (warning) %s is not a module name. Ignored.

## DESCRIPTION

This warning indicate that a given cell is not a logical hierarchy cell, while the command is expecting the input to be logical hierarchy cell(s). So the given cell with the specified name is ignored by the command.

## WHAT NEXT

Check the name of the cell in the command line to see if the name is correct for a logical hierarchy cell.

## SEE ALSO

# VFP-432 (warning) High fanout net synthesis has not performed on the design yet.

## DESCRIPTION

This warning indicates that timing-driven placement is run on the design before high fanout net synthesis. The timing analysis inside the timing-driven placement is affected by the unsynthesized high fanout nets. Although Virtual Flat placement does not consider the wire length of high fanout nets in its placement engine, these high fanout nets would still affect the timing on other nets and so to affect the timing-driven placement.

## WHAT NEXT

User can set these high fanout nets to be ideal nets to reduce their impact on timing-driven placement.

## **SEE ALSO**

`set_ideal_net`  
`set_ideal_network`

## **VFP-433 (warning) %s %s is beyond core area.**

### **DESCRIPTION**

This message occurs when the placement detects the specified object is partially beyond core area.

### **WHAT NEXT**

The tool will only take the object's inside core area portion into consideration for placement. Whether the placement stops or not, It is advised that user check the specified object and verify that the object's location is intentional.

## **VFP-801 (info) %s**

### **DESCRIPTION**

This message occurs during `set_fp_placement_strategy`. There are some placement strategy options that have corresponding tcl variable controlling the same thing. When one of these options are set or reset, this message is issued to inform the user that the corresponding tcl variable is set to new value.

### **WHAT NEXT**

## **SEE ALSO**

`set_fp_placement_strategy(2)`

## VH

# VH-005 (Error) Cannot create signature file under working directory

## DESCRIPTION

This error message is generated if the master cannot generate a signature file under the working directory. The signature file is used by slaves to check that the work directory seen by master is also visible by slaves.

## WHAT NEXT

Check the permission of the current directory from where the master is launched. The permission must be writeable, readable and executable.

# VH-014 (error) Check your tool environment on machine <name>.

## DESCRIPTION

This error occurs because the master process cannot invoke a slave using the `./.dps` script in the current working directory.

## WHAT NEXT

Run the `./.dps` script from the UNIX shell where the master shell was invoked. Determine if the `SYNOPSYS_ROOT` variable is a valid path where the shell executable is available. Also ensure that you have at least one extra license that is required to run the script.

Also you can issue the following prompt:

```
rsh <machine_name> -login <login_name> '$path/.dps'
```

where \$path is the full path to the working directory. If the command fails, you might have a problem in the environment setting. For example, the "rsh is not in the user path" problem can cause this error.

# VH-018 (error) The shell executable on machine

# <machine\_name> has a different label.

## DESCRIPTION

This error occurs because the master and the slave executables are not from the same installation. Both master and slave should have the same synopsys root. Check the csh file generated by the setup stage, and ensure that the value of synopsys\_root is the same as that in the master.

The tool can also generate this error message if it is impossible for you to perform an rsh to the slave machine. Run **rsh <machine\_name>** from the master shell, and determine if there is any problem accessing the specified machine name.

## WHAT NEXT

Fix the rsh problem. Also ensure that the master and slave run using the same synopsys root. Open the `./dps` csh script in the current working directory, and verify that the value of the **SYNOPSYS\_ROOT** variable is the same as the `synopsys_root` for the master shell.

## VHD

### **VHD-1 (error) %s The library '%s' is not mapped to a directory.**

#### **DESCRIPTION**

This message indicates that you attempted to access a library which does not have a valid directory path associated with it.

#### **WHAT NEXT**

For information on mapping between design libraries and paths, refer to the **define\_design\_lib** command manual page. Mapping can also be done via the **.synopsys\_vss.setup** file.

### **VHD-3 (error) %s You have declared more than one architectures with the same name '%s'.**

#### **DESCRIPTION**

You receive this error message if you have declared more than one architectures with the same name.

The last declared implementation of the architecture will overwrite its previous declared implementations.

#### **WHAT NEXT**

Verify that each of the architecture has been assigned a different name.

### **VHD-4 (warning) %s The architecture %s has already been analyzed. It is being replaced.**

#### **DESCRIPTION**

You receive this warning message if an architecture with the same name has already been analyzed, which occurs if either of the following are true:

- The current analyzed file has already been analyzed.

- An architecture with the same name is declared in another file and has already been analyzed.

The implementation of the architecture is overwritten by the latest declared implementation.

## WHAT NEXT

This is only a warning message.

However, you can check the overwritten file. If the result is not what you intended, change the architecture name and then run the command again.

**VHD-5 (warning) %s** the architecture %s has already been analyzed by a compiler other than Presto HDL. It is being replaced.

## DESCRIPTION

You receive this warning message if an architecture with the same name has already been analyzed by a compiler other than Presto HDL.

The implementation of the architecture is overwritten by the latest declared implementation.

## WHAT NEXT

This is a warning message only. No action is required on your part.

However, you can check the overwritten file. If the result is not what you intended, change the architecture name and then run the command again.

**VHD-6 (warning) %s** The entity '%s' has multiple architectures defined. The last defined architecture '%s' will be used to build the design by default.

## DESCRIPTION

You receive this warning message if there are multiple architectures associated with the same entity. Just one architecture will be chosen to build the design. In PRESTO-VHDL, the last defined architecture will be chosen by default.

## WHAT NEXT

Verify if the last defined architecture is what you want to use to build the design.

**VHD-7 (warning) %s Initial values for signals/variables are not supported for synthesis by default. They are ignored.**

## DESCRIPTION

You receive this warning message if the signals/variables have initial values when they are declared. Presto VHDL ignores the initial values and uses the subprogram default value instead. This may cause simulation mismatch.

If variables are declared in a function, you can enable the variable initial value support by setting the following switch to true (the default is false):

```
hdlin_support_subprogram_var_init
```

## WHAT NEXT

This is only a warning message.

If the subprogram default value is the same as the declared initial value or is acceptable, no action is required.

Otherwise, you can do either of the following:

- Use the `hdlin_support_subprogram_var_init` switch to solve the problem.
- Instead of the initial value, use an explicit assignment to set the initial value.

## SEE ALSO

`hdlin_subprogram_default_values(3)`  
`hdlin_support_subprogram_var_init(3)`

**VHD-8 (information) %s Variable '%s' is being read, but is not initialized. The subprogram default value will be used.**

## DESCRIPTION

You receive this information message from the Presto HDL Compiler when your design contains a variable which is read, but is not yet initialized. The subprogram default value is used.

The subprogram default value can be 0s (as default) or ` (grave accent), which is controlled by the following switch:

`hdlin_subprogram_default_values`

## WHAT NEXT

This is only an information message. No action is required.

However, it is best practice to verify that you intended to use the subprogram default value as the initial value of the uninitialized variable.

## SEE ALSO

`hdlin_subprogram_default_values(3)`

# VHD-100 (error) %s Elements of aggregate or string literal are out of bound, overlap or do not cover all cases.

## DESCRIPTION

This error occurs when the values specified for an aggregate do not cover all the possible elements or if more than one value is specified for the same element or if the values specified are for elements that are not part of this aggregate.

## WHAT NEXT

Modify your HDL description to ensure that there is one to one correspondence between elements of the aggregate and the values specified for it.

# VHD-101 (error) %s Invalid return value for function.

## DESCRIPTION

The output of the subprogram doesn't exist or is not valid

## WHAT NEXT

Look at the subprogram body and see if all return paths exist and are valid

## **SEE ALSO**

**VHD-200 (error) Unexpected %s  
%s. Analysis Failed.**

## **DESCRIPTION**

This message indicates an internal problem in the VHDL analysis for synthesis.

## **WHAT NEXT**

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem. In the meantime, do not use the construct that caused the error.

## VHDL

### **VHDL\_217 (error) Multiple definition of '%s' %s**

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-1 (warning) Can't find types for all ports on design '%s'. It will be written out with its ports bit-blasted.**

#### **DESCRIPTION**

This error is generated when `vhdlout_single_bit` is not set to `BIT` and if there are no bus information, then the design probably came from a format that doesn't put bus information on, and the user will expect the ports to be bit-blasted anyways.

#### **WHAT NEXT**

Try to read in a different format of netlist which can represent buses. They can be EDIF, Verilog, VHDL, etc. Or change `vhdlout_single_bit` to `BIT`.

### **VHDL-2 (warning) '%s' is both a %s and a %s.**

**The %s is being renamed to '%s'.**

#### **DESCRIPTION**

There was a name clash between these two objects. Please refer to the IEEE Standard VHDL Language Reference Manual (normally referred to as the VHDL LRM) for details on scoping rules for identifiers.

There is a limitation in the intelligence of `VHDLout` when issuing this warning. If there is a port with a name that clashes with a type-name, where the type is used as a sub-type of another type in a design being written out, and this sub-type is defined in `STD.STANDARD` (a predefined package that is part of the language definition), then this warning is issued even though no type declaration for the sub-type is written out. In other words this warning may be issued for a type name that is actually not written out. With the current version of the VHDL LRM, IEEE Std 1076-1987, this will only happen for the following example:

```
entity e is
```

```
 port (bit: out bit_vector(1 downto 0));
end e;

architecture a of e is
begin
...
end a;
```

## WHAT NEXT

You can change the port names so it will not be clashed with type-name.

**VHDL-3 (warning)** Design '%s' has invalid vhdl types.  
It will be written out with its ports bit-blasted.

## DESCRIPTION

This error is generated when vhdloout\_single\_bit is not set to BIT, and type information is not supported.

## WHAT NEXT

Change the types to the supported types. one of the following: Bit,Array,Enumeration and Record

**VHDL-4 (error)** Design '%s' is not linked. Use the link command on the design  
if you would like to write out vhdl for it.

## DESCRIPTION

The design needs to be linked first in order for the VHDL writer to write out the design.

## WHAT NEXT

Run the link command in dc\_shell.

## **VHDL-5 (error) Could not process the types for the design.**

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-6 (error) Could not process the types in the design. Try setting vhdlout\_dont\_write\_types to TRUE.**

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-7 (error) You must change 'vhdlout\_bit\_type' to a bit type that includes a three-state value when writing out %s.**

### **DESCRIPTION**

*vhdlout\_bit\_type* determines what VHDL type to use when writing out ports, single-bit-wide ports, or ports that were buses in the original source but are written out bit-blasted.

This error can occur if, for instance, a generic three-state device is written out and *vhdlout\_bit\_type* is set to type "BIT," which does not contain a three-state value. Such a description cannnot simulate the high-impedance value, so VHDLOut issues this error.

Note that VHDLOut, apart from the type "BIT," does not recognize possible values of a type. So, if you use a type other than "BIT," but it does not contain a three-state value, this error will go undetected.

### **WHAT NEXT**

Set *vhdlout\_bit\_type* to a type that contains a three-state value. For example *std\_logic*.

### **EXAMPLE**

This example will cause the error if read in and then written out with

```

vhdlout_bit_type = BIT.

library IEEE;
use IEEE.std_logic_1164.all;

entity TRI_VHDL is
 port (cond : in boolean; a : in std_logic; r : out std_logic);
end TRI_VHDL;

architecture test of TRI_VHDL is
begin
 process (cond, a) begin
 if(cond) then
 r <= a;
 else
 r <= 'Z';
 end if;
 end process;
end test;

```

## EXAMPLE MESSAGE

Error: You must change 'vhdlout\_bit\_type' to a bit type that includes a three-state value when writing out generic three-state devices. (VHDL-7)

**VHDL-8 (error) This pre-v2.0 db file contains inconsistent type information.**

## DESCRIPTION

The current version of Design Compiler is not able to read the db generated before version 2.0.

## WHAT NEXT

Please re-read in the original VHDL file.

**VHDL-9 (error) You tried to write out two designs ('%s' and '%s') that contained different types with the same name ('%s').**

## **DESCRIPTION**

VHDL writer is not able to write out two designs (object) of the same names but of different types.

## **WHAT NEXT**

Please write out the designs separately.

**VHDL-10 (warning)** The type '%s' in design '%s' was renamed to '%S'.

## **DESCRIPTION**

This warning is generated when the type needs to be renamed because of the illegal VHDL character. It is generated internally for the returned types of subprograms.

## **WHAT NEXT**

Check the returned type defined for the subprograms; if it is an anonymous type, try to change it to be a real type.

**VHDL-11 (warning)** The bits in port '%s' in design '%s' have inconsistent '%s' constraints.

Some constraint information is being lost.

## **DESCRIPTION**

This warning is generated when there is more than one constraint set for the same port. It takes the first constraint you set.

## **WHAT NEXT**

Make sure the constraints are setting once, or the first constraint is the one you want.

**VHDL-12 (warning)** EQUAL and OPPOSITE attributes on multi-

bit ports are being ignored.

## DESCRIPTION

This warning is generated when EQUAL and OPPOSITE attributes exist on multi-bit ports.

## WHAT NEXT

Make sure the attributes are consistently set for multi-bit ports.

**VHDL-13 (warning)** The '%s' '%s' is not a legal vhdl identifier.  
It has been renamed to '%s'.

## DESCRIPTION

This warning is generated when the identifier contains illegal VHDL character.

## WHAT NEXT

Please refer to VHDL reference manual and change it to legal VHDL character if you do not want it to be renamed.

**VHDL-14 (error)** Record '%s' has duplicate field names '%s'

## DESCRIPTION

## WHAT NEXT

**VHDL-15 (error)** The variable '%s' should be a list of lists with each  
sub-list having exactly three strings in it.

## DESCRIPTION

The variable vhdlout\_conversion\_functions should contain a list of lists which contains exactly three strings in it. They are "from\_type", "to\_type" and "function\_name".

## WHAT NEXT

Type "help vhdlout\_conversion\_functions" for more details.

## VHDL-16 (error) Unable to model inout ports '%s' and '%s', which are wired together.

### DESCRIPTION

The **write -f vhdl** command is intended primarily for the creation of a simulation model of the contents of the **dc\_shell** database. This error occurs if there is more than one bidirectional port (port mode "inout") in the same net. Note that a bidirectional port driving a bidirectional pin will not cause this error.

This connectivity cannot be correctly modeled for simulation in VHDL, because it would require one assign statement for port A driving port B and one for port B driving port A. This circular assignment does not work.

### WHAT NEXT

The preferred remedy is to change the HDL source so that it does not contain more than one bidirectional port per net.

The least preferred remedy is to use the **dc\_shell disconnect\_net** command to disconnect all but one of the bidirectional ports in the same net. Then re-write the design. If necessary, these ports can be reconnected manually in the resulting VHDL text file.

## VHDL-17 (error) Unable to write a conversion function for the inout %s port '%s'.

### DESCRIPTION

VHDLout encountered a bidirectional port when it was creating type conversion functions. Because information about the current direction of the signal is not available at any given time, it is not possible to create a working type conversion function for bidirectional signals. Hence, one does not know whether to convert for a source or a sink signal.

Beyond looking at the port's mode, VHDLout also analyzes the net to see if the port is used both as a sink and a source. If it is used only as a unidirectional signal, VHDLout treats it as such and creates a type conversion for it. Of course, this error does not occur in that case.

## WHAT NEXT

Note that type conversion functions are created in two situations:

*vhdlout\_single\_bit = VECTOR* and *vhdlout\_write\_top\_configuration = TRUE*.

To write a VHDL description for the design in this situation, change the setting of *vhdlout\_single\_bit* to "not equal VECTOR" or set *vhdlout\_write\_top\_configuration = FALSE*.

*vhdlout\_single\_bit = USER* and *vhdlout\_preserve\_hierarchical\_types = VECTOR* and

The suggested remedy for this situation is to set  
*vhdlout\_preserve\_hierarchical\_types = USER*

To see the possible settings and their meanings, refer to the man page for the *vhdlout\_single\_bit* variable. With either of these two changes, no type conversions are created.

If the above setting does not work, then it could be this port connects to an component pin that is buffer.

## VHDL-18 (warning) '%s' is not a legal simulator. Variable '%s' is being ignored.

### DESCRIPTION

This warning is generated when *vhdlout\_target\_simulator* is set to an unknown simulates.

### WHAT NEXT

Reset *vhdlout\_traget\_simulator* to a valid simulator.

## VHDL-19 (warning) Target simulator '%s' is not supported when '%s' is set to "TRUE".

### DESCRIPTION

The warning is generated when *vhdlout\_target\_simulator* is set to a "xp" or "xp100" simulator and *vhdlout\_equations* is set to TRUE.

### WHAT NEXT

Change *vhdlout\_equations* to FALSE or change *vhdlout\_target\_simulator*.

**VHDL-20 (warning)** There are inout ports of type '%s' that are multiply driven. The type '%s' must be a resolved type or the vhdl will not simulate.

## DESCRIPTION

VHDLout cannot determine whether the port is of a resolved type. This warning is issued whenever a multiply driven inout port is found.

## WHAT NEXT

Check that the type reported in the message is a resolved type. If it is, ignore this warning. If the type is not resolved, two remedies exist.

Modify the setting of **vhdlout\_single\_bit** or **vhdlout\_preserve\_hierarchical\_types** as appropriate. Change the variable setting to "BIT" or "VECTOR." When necessary, VHDLout creates a resolved type. For more information on the use of these variables, see the appropriate man pages.

Alternately modify your VHDL source to use a resolved type for the inout ports, recreate the design, and write again. Note that the warning is issued only once for each type. In a hierarchical design, multiple entities with the same problem may exist.

## EXAMPLES

Example of warning that is safe to ignore. "std\_logic" is a resolved type.

```
library IEEE;
use IEEE.std_logic_1164.all;

entity M_VHDL is
 port (a, b : in std_logic; r : inout std_logic);
end M_VHDL;

architecture test of M_VHDL is
begin
 process (a) begin
 r <= a;
 end process;

 process (b) begin
 r <= b;
 end process;
end test;
```

Example where warning is correct. "BIT" is not a resolved type. This will cause problems in simulation.

```
entity M_VHDL is
```

```

port (a, b : in bit; r : inout bit);
end M_VHDL;

architecture test of M_VHDL is
begin
process (a) begin
 r <= a;
end process;

process (b) begin
 r <= b;
end process;
end test;

```

## **EXAMPLE MESSAGE**

Warning: There are inout ports of type 'std\_logic' that are multiply driven. The type 'std\_logic' must be a resolved type or the vhdl will not simulate. (VHDL-20)

## **VHDL-21 (warning) STD.TEXTIO package used by design '%s' in file '%s' is not supported for synthesis.**

### **DESCRIPTION**

STD.TEXTIO package is not supported for synthesis.

### **WHAT NEXT**

Remove the use of this package from the use clause

## **VHDL-22 (error) Stop processing due to a corrupted db file (%s).**

### **DESCRIPTION**

Somehow the db file contains incomplete type information. Please find out which command caused this problem and report it to the Support Center or CAE.

### **WHAT NEXT**

Please regenerate the db file.

## **VHDL-23 (error) Write command failed due to system error.**

### **DESCRIPTION**

It could be the file system is full.

### **WHAT NEXT**

**VHDL-24 (error) Can not write out the assignment statement for this inout port %s.**

### **DESCRIPTION**

This occurs probably due to the renaming on the inout port signals.

### **WHAT NEXT**

Check your design and the port assignment.

**VHDL-25 (error) Can not write out this design '%s' with memory operations in it using non-levelized writer.**

### **DESCRIPTION**

The design needs to be flatten before writing out.

### **WHAT NEXT**

Please set vhdlout\_levelize to TRUE.

### DESCRIPTION

### WHAT NEXT

## VHDL-155 (error) Type '%s' multiply defined %s

### DESCRIPTION

### WHAT NEXT

## VHDL-156 (error) Package '%s' defined more than once %s

### DESCRIPTION

More than one package body has been analyzed for a given package header. There are two ways this can happen: there are two bodies for a package in the file that was analyzed, or the package header and body are in separate files and the body was analyzed a second time.

### WHAT NEXT

A package can have only one body. If a package has more than one body, remove all but one of them.

If the package header and body are in separate files and you need to reanalyze the package body (if it has changed, for example), you must reanalyze the package header before analyzing the new package body.

## VHDL-157 (error) Package '%s' not found %s

## DESCRIPTION

## WHAT NEXT

# VHDL-232 (error) Cannot find entity %s

## DESCRIPTION

The entity for the current architecture could not be found in the library.

## WHAT NEXT

Provide the entity for the architecture.

# VHDL-233 (warning) Port '%s' of component '%s' includes a default value, which is not supported for synthesis.

## DESCRIPTION

Default values for ports of a component are not supported for synthesis. For example:

```
entity e is
 port (a: in bit;
 z: out bit);
end;

architecture a of e is
 component c
 port (p: in bit;
 q: in bit := '1';
 x: out bit);
 end component;

begin
 u1: c port map (p => a, x => z);
end;
```

## WHAT NEXT

Remove the default value for the component port and add an equivalent association in

the port map of the component instantiation. For example:

```
architecture a of e is
 component c
 port (p: in bit;
 q: in bit;
 x: out bit);
 end component;

 constant c1: bit := '1';
begin
 u1: c port map (p => a, q => c1, x => z);
end;
```

## **VHDL-240** (warning) Dc\_shell variable 'bin\_path' has incorrect value.

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-241** (warning) Cannot execute vhdl parser. Execution will continue with less error checking for the VHDL source.

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-250** (error) Cannot create work directory for VHDL parser

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-251** (error) Unable to initialize workspace for VHDL

parser

**DESCRIPTION**

**WHAT NEXT**

**VHDL-252** (error) Abnormal exit of child process

**DESCRIPTION**

**WHAT NEXT**

**VHDL-261** (error) Component name is not a simple name %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-262** (warning) Only simple configurations (specification of architecture for a top level entity) are supported. Nested block specifications and component

configurations are ignored %s

#### DESCRIPTION

#### WHAT NEXT

**VHDL-263** (error) Expected simple name for architecture %s

#### DESCRIPTION

#### WHAT NEXT

**VHDL-264** (warning) Configuration specifications are not supported. They are ignored %s

#### DESCRIPTION

#### WHAT NEXT

**VHDL-265** (warning) The value '%s' of 'vhdlout\_preserve\_hierarchical\_types' is greater than that of 'vhdlout\_single\_bit'.  
'vhdlout\_preserve\_hierarchical\_types' is changed to be equal to 'vhdlout\_single\_bit'.

#### DESCRIPTION

This error occurs when *vhdlout\_preserve\_hierarchical\_types* is set to a higher value than *vhdlout\_single\_bit*.

The variables *vhdlout\_single\_bit* and *vhdlout\_preserve\_hierarchical\_types* control how VHDLout handles types on ports and pins. See the manual pages on these variables for information on possible settings.

## WHAT NEXT

Change the value of `vhdlout_single_bit` and/or `vhdlout_preserve_hierarchical_types` and retry the `write` command.

## EXAMPLE MESSAGE

Error: The value 'ENUM' of `vhdlout_preserve_hierarchical_types` is greater than that of `vhdlout_single_bit`. `vhdlout_preserve_hierarchical_types` is changed to be equal to `vhdlout_single_bit`.

# VHDL-266 (error) '%s' contains the invalid string '%s'.

## DESCRIPTION

This error occurs when `vhdlout_single_bit` or `vhdlout_preserve_hierarchical_types` is set to an invalid value.

The variables `vhdlout_single_bit` and `vhdlout_preserve_hierarchical_types` control how VHDLout handles types on ports and pins. See the manual pages on these variables for information on possible settings.

## WHAT NEXT

Correct the setting of the variable and retry the `write` command.

## EXAMPLE MESSAGE

Error: '`vhdlout_preserve_hierarchical_types`' contains the invalid string 'RNUM'.

# VHDL-267 (error) The current setting, '%s', of '`vhdlout_package_naming_style`' does not produce a valid VHDL identifier.

## DESCRIPTION

VHDLout infers the name of the type-conversion package (if it is needed) from the variable `vhdlout_package_naming_style`. The setting of this variable must result in a legal VHDL identifier. See the manual page for `vhdlout_package_naming_style` for more details.

This error occurs when `vhdlout_package_naming_style` is set to a value that results in an illegal name for the type conversion package.

## WHAT NEXT

Correct the setting of the variable and retry the `write` command.

## EXAMPLE MESSAGE

Error: The current setting, '`%s`', of `vhdlout_package_naming_style` does not produce a valid VHDL identifier.

# VHDL-268 (error) '`%s`' is not valid for '`vhdlout_package_naming_style`'.

## DESCRIPTION

VHDLout infers the name of the type-conversion package (if it is needed) from the variable `vhdlout_package_naming_style`. The setting of this variable must result in a legal VHDL identifier. See the manual page for `vhdlout_package_naming_style` for more details.

This error occurs when `vhdlout_package_naming_style` is set to a string that cannot be understood by VHDLout. The string (or substring) begins with a '%' followed by an unexpected character.

## WHAT NEXT

Correct the setting of the variable and retry the `write` command.

## EXAMPLE MESSAGE

Error: '%' is not valid for `vhdlout_package_naming_style`.

# VHDL-269 (warning) The `dc_script` '`%s`' will be applied to all subsequent entities in this file.

## DESCRIPTION

This use of `dc_scripts` is discouraged because it does not have the same scope as `library` and `use` clauses.

## WHAT NEXT

To apply a `dc_script` to a single design unit, the script must be declared in the declarative region of that design unit.

You can suppress this message by setting the *suppress\_errors* variable.

## **VHDL-270 (warning) Configurations are written out only when the 'vhdlout\_single\_bit' mode is 'vector'.**

### **DESCRIPTION**

Configurations between the test bench and your top-level design are written out only when the variable *vhdlout\_single\_bit* is set to type *vector*.

The purpose of the configuration is to map between the original and new types. If *vhdlout\_single\_bit* is set to *user*, the original types are used, and a configuration is unnecessary. If *vhdlout\_single\_bit* is set to *bit*, the new ports do not map well to the original types. In this case, a configuration is impractical.

### **WHAT NEXT**

If you are using the original types (*vhdlout\_single\_bit* is set to *user*), you can ignore this message, or, to disable the writing of configurations, you can set *vhdlout\_write\_top\_configuration* to "FALSE."

If you want to write out a configuration with your design, set *vhdlout\_single\_bit* to *vector*, and rewrite the design.

**NOTE:** Setting *vhdlout\_single\_bit* to *vector* does not affect the acceleration of your design.

## **VHDL-271 (error) Design %s contains a type with name matching**

**the current setting of 'vhdlout\_bit\_type' (%s), that is more than one bit wide. Cannot write a VHDL description including this design.**

### **DESCRIPTION**

The '*vhdlout\_bit\_type*' must be a one-bit wide type for VHDLOut to be able to produce a legal description.

## WHAT NEXT

Check your type definition and ensure it is one bit wide. If the type definition is an enumerated type with more than two possible values, it may be missing the ENUM\_ENCODING attribute.

**VHDL-272 (warning)** You must change 'vhdlout\_bit\_type' to a bit type that includes a three-state value when writing out three-state resolution functions. If left as is, this description may or may not simulate.

## DESCRIPTION

Vhdlout found a possible clash between two connected objects. An object A, that may drive a three-state value. An object B, being driven by object A and that is of a type not including a three-state value.

For example: a signal of type 'bit' may drive a port in mode 'inout'. This is legal and works as long as that port is never driven by the outside world. This may also happen if the source description language was less rigorous on types than VHDL.

Note that such a clash is caught by simulation during run-time.

## WHAT NEXT

The alternatives are:

A - locate the clash and correct the HDL description, re-analyze, re-synthesize and re-write vhdl. In the example above, one can either use a resolved type for the signal or change the port's mode to 'out'.

B - leave as is and simulate to find out if this was a true error.

**VHDL-273 (error)** There is a latch in this un-compiled design. Unfortunately, this release cannot write VHDL for latches pre-compile.

## DESCRIPTION

This will be fixed in a future release.

## WHAT NEXT

Work around, compile design before writing out VHDL.

**VHDL-274 (warning)** Library cell %s has a pin of unsupported three-state driver type. It will be treated as a regular three-state driver type. The description may not simulate correctly.

## DESCRIPTION

Driver type may be specified for three-state cell pins in Synopsys' Library format, which is used to describe technology libraries. This warning is issued when VHDLout is writing a behavioral description and don't recognize the driver type at hand. The resulting description may have problems simulating weak signal values properly.

Please inform Synopsys when this happens.

## WHAT NEXT

This warning is issued only when vhdlout\_equations = TRUE. The warning can be avoided by setting the variable to FALSE in which case a structural description is written. For such a description, the driver type isn't relevant to VHDLout.

An alternate approach is to use the dont\_use attribute on the library cell in question, prior to compiling the design. Please refer to man-page for the dc\_shell command set\_dont\_use for details.

**VHDL-275 (warning)** Library cell %s have three-state pins of different driver types, VHDLout cannot handle more than one type on same cell. All pins on this cell will be treated as regular three-state driver type. The description may not simulate correctly.

## DESCRIPTION

Driver type may be specified for three-state cell pins in Synopsys' Library format, which is used to describe technology libraries. This warning is issued when VHDLout is writing a behavioral description and encounters different pin driver types on the same library cell. VHDLout is not capable of handling more than one driver type per cell.

The resulting description may have problems simulating weak signal values properly.

Please inform Synopsys when this happens.

## WHAT NEXT

This warning is issued only when `vhdlout_equations = TRUE`. The warning can be avoided by setting the variable to FALSE in which case a structural description is written. For such a description, the driver type isn't relevant to VHDLout.

An alternate approach is to use the `dont_use` attribute on the library cell in question, prior to compiling the design. Please refer to man-page for the `dc_shell` command `set_dont_use` for details.

**VHDL-276 (warning)** The acceleratable VHDL description that you requested could not be written, because your design, '%s', cannot be described using the XP-supported VHDL subset. The VHDL description is being written without setting the BACKPLANE attribute.

## DESCRIPTION

The XP accelerator accepts as input only a limited subset of VHDL constructs. A design that cannot be described using this subset is not acceleratable by the XP accelerator.

By setting the variable `vhdlout_target_simulator` to `XP`, you requested a VHDL output that is targeted at the XP accelerator. If `vhdlout_target_simulator` is set to `XP`, `write -f vhdl` attempts to describe the design using the XP-supported VHDL subset. If this is successful, then `write -f vhdl` adds the BACKPLANE attribute to the output VHDL file, indicating that the design is to be simulated using the XP Accelerator.

If, however, `vhdlout_target_simulator` is set to `XP` and the design cannot be described using the XP-supported VHDL subset, then `write -f vhdl` does not add the BACKPLANE attribute to the generated VHDL description, and issues this warning message.

The XP-supported VHDL subset cannot describe type conversions or user-defined types. (For more information on allowed types, refer to the ZyCad XP manuals.) If you receive this warning message, your design might require type conversions and/or might contain user-defined types.

## WHAT NEXT

If your design contains user-defined types or requires type conversions, check the setting of the variable `vhdlout_single_bit` and, if it is set to `USER`, change it to `VECTOR` or `BIT`. Then re-execute `write -f vhdl`.

## **VHDL-277 (error) The VHDL PROCESS on line %d must be labelled.**

### **DESCRIPTION**

The process statement contains an attributed object in its scope and, as a result, must be labelled.

### **WHAT NEXT**

Label the process statement.

## **VHDL-278 (error) The port '%s' in design '%s' has unknown direction.**

### **DESCRIPTION**

The VHDL writer does not know the port direction, so it cannot write it out. This is probably caused by some modules that are missing when reading Verilog files.

### **WHAT NEXT**

Read in the complete design that has specified the port direction and try again.

## **VHDL-279 (warning) STD.TEXTIO package is not supported for synthesis.**

### **DESCRIPTION**

STD.TEXTIO package is not supported for synthesis.

### **WHAT NEXT**

Remove the use of this package from the use clause

## **VHDL-280 (error) Only global constants are supported as the**

index constraint for aliasing.

## DESCRIPTION

Only global constants are supported as the index constraint for aliasing. Generics are also not supported in this position.

## WHAT NEXT

Modify the alias declaration so that index constraint is a global constant.

**VHDL-281 (error)** You cannot take an index or slice of a non-vector alias %s.

## DESCRIPTION

You received this message because you attempted to apply indexing or slicing to an alias that was not declared as a vector type.

Note that this error can occur even if the VHDL language permits indexing or slicing to be applied to the alias. For example, consider the following:

```
subtype T is bit_vector(0 to 2);
alias b: T is a(1 to 3);
```

In the alias declaration, HDL Compiler does not recognize 'T' as a vector type. Thus, this error will occur if any attempt is made to apply slicing or indexing to 'b'; for example, "b(0)" or "b(0 to 1)".

## WHAT NEXT

Modify the alias declaration so that the type of the alias is an array type; for example, std\_logic\_vector. The example shown above could be rewritten as follows:

```
alias b: bit_vector(0 to 2) is a(1 to 3);
```

**VHDL-283 (error)** Aliased objects may only be a simple name, an index of a simple name, or a slice of a simple name.

## DESCRIPTION

An attempt was made to declare an alias to a non-simple name. Aliases may be declared only for simple names, simple names with indexes, or simple names with

slices. For example, the following aliases are acceptable:

```
alias a: bit is foo;
alias a: bit is foo(0);
alias a: bit_vector(0 to 1) is foo(2 to 3);
```

## WHAT NEXT

Modify the alias declaration so that the aliased object is either a simple name, an index of a simple name, or a slice of a simple name.

# **VHDL-284 (error) Arbitrary expression for bussed clock index is not supported.**

## DESCRIPTION

Arbitrary expression for a bussed clock index is not supported. Only single variable index or integer expressions are supported.

## WHAT NEXT

Use supported expressions for a bussed clock index.

# **VHDL-285 (warning) "BAD CONNECTION - primary in/out port %s of %s is driven or read by an internal node. Using intermediate signal to generate a syntactically correct VHDL description. Consequently, this will violate the definition of structural VHDL description syntax."**

## DESCRIPTION

VHDL syntax rule does not allow primary port of "in" mode be updated by an internal node, or a primary port of "out" mode be read by an internal node. VHDL writer is generating an intermediate signal of the form portName\_port to handle this bad connection, so it can write out a syntactically correct VHDL file. The intermediate signal will be assigned a value in the body of the architecture, and this signal assignment will violate the rule for structural VHDL description.

## WHAT NEXT

Fix this bad connection in your design.

## **VHDL-286** (warning) There is a data discrepancy between synopsys database and the output file.

### **DESCRIPTION**

VHDL/verilog writer detects that the names of the netlist objects have changed to fit syntax and semantic requirement for VHDL/verilog. The change might cause a back-annotation problem in the flow. For example, if the VHDL/verilog output file is used to generate sdf or saif file. The netlist object names in the sdf or sail might not able to back-annotate to synopsys database.

### **WHAT NEXT**

Run the **change\_names** command with the **-rule vhdl/verilog** and then rewrite the netlist.

### **SEE ALSO**

**change\_names** (2).

## **VHDL-287** (error) "BAD CONNECTION - port %s of mode other than out is unconnected. Consequently, this will violate the definition of structural VHDL description syntax."

### **DESCRIPTION**

VHDL syntax rule does not allow port of mode other than "out" be unconnected.

### **WHAT NEXT**

Run **change\_names** to create a dummy net to connect the port.

## **VHDL-288** (error) "BAD CONNECTION - bussed port %s is partially connected."

### **DESCRIPTION**

VHDL syntax rule does not allow bussed port to be partially connected.

## WHAT NEXT

Run `change_names` to create a dummy net to connect each bit of the port.

**VHDL-289 (error)** Bussed clock is not longer supported in VHDL. Use Presto VHDL instead.

## DESCRIPTION

Bussed clock is no longer supported in VHDL.

## WHAT NEXT

Please either recode the VHDL source code, or use Presto VHDL instead.

**VHDL-290 (warning)** A dummy net '%s' is created to connect open pin '%s'.

## DESCRIPTION

VHDL writer detects that a pin is not connected. The writer creates a dummy net connected to the pin to satisfy syntax requirement for VHDL. You may use variable `vhdlout_unconnected_pin_prefix` to control the prefix of the dummy nets. The dummy net appears in the output VHDL file only. It does not exist in the db file. To let db file contain dummy nets, `change_names` needs to be executed before VHDL writer.

## WHAT NEXT

## SEE ALSO

`change_names` (2). `vhdlout_unconnected_pin_prefix` (3).

**VHDL-291 (warning)** You are using an older version of the VHDL netlist reader/writer, which will be obsoleted in the X-

2005.06 release.

## DESCRIPTION

You are using an older version of the VHDL netlist reader/writer, which will be obsoleted in the X-2005.06 release. To use the current VHDL reader/writer, please make sure these variables are set as follows:

```
VHDL netlist reader: enable_2003.03_vhdl_reader true
VHDL netlist writer: enable_2003.03_vhdl_writer true
```

## WHAT NEXT

## SEE ALSO

**VHDL-292** (error) Verilog In Error, %d modules are possible top modules.

## DESCRIPTION

Unsupport more then one top modules.

## WHAT NEXT

Please check the design file, and make sure there is only one top module.

**VHDL-2001** (warning) Statements in an entity declaration are not supported for synthesis. They are ignored in entity %s %s

## DESCRIPTION

supported for synthesis. They are ignored %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-2045** (warning) Guard conditions for blocks are not supported %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-2046** (warning) Declaration and use of generics and ports in a block header is not supported %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-2047** (error) The attribute '%s' defined on line %d is not contained within an architecture. Attribute '%s' only applies to processes, and it must be defined inside of the architecture that contains the process.

#### **DESCRIPTION**

Attributes that need to be applied to processes must occur inside of the architecture that contains them.

#### **WHAT NEXT**

Move the attribute to inside of the architecture.

**VHDL-2048** (error) Could not find process '%s' inside of the architecture%s  
at line %d. The process is referred to by the attribute  
'%s' defined on line %d.

#### **DESCRIPTION**

The attribute '%s' is meant to apply to processes only, and the process defined could not be found.

#### **WHAT NEXT**

Check the names of the processes and the definition of the attribute for errors.

**VHDL-2049** (Warning) The attribute '%s' is only valid when applied to one of the following:  
%s.  
On line %d, the attribute is applied to a(n) %s.  
The attribute will be ignored.

#### **DESCRIPTION**

The name attribute is only allowed to attribute certain classes.

#### **WHAT NEXT**

Check to make sure that the attribute is applied to the correct object.

**VHDL-2050** (warning) Timeout clause not supported for

# synthesis in wait statement %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2060 (error)** The translate\_on/translate\_off pragma has been incorrectly used here inside a construct %s.

## DESCRIPTION

Only use the translate\_on and translate\_off pragmas on complete constructs, not on parts of constructs. For example, do not use these pragmas to comment out one of more branches of a "case" statement or the "if" construct as shown in the following examples.

### Example 1

```
. . .
-- pragma translate_off
if (Is_X(svec)) then
 assert (now < 20 ns)
 report "logic vector contains U, X, Z or W"
 severity error;
else
-- pragma translate_on
 if (t > 20) then -- synthesize this RTL
 . . .
-- pragma translate_off
end if;
-- pragma translate_on
. . .
```

### Example 2

```
. . .
case (expr_1) is
 -- pragma translate_off
 when value_1 => -- incomplete case statement missing this branch
 . . .
 -- pragma translate_on
 when value_2 =>
```

```
 . . .
when . . .
 . . .
end case;
```

## WHAT NEXT

Modify the placement of translate\_on and translate\_off pragmas. When you use the translate\_on and translate\_off pragmas, use them around the entire "if"/"case" statement. When this isn't possible, then "translate\_off" parts of a construct that aren't part of VHDL syntax. In the modified example below, the "if", "then" and "else" constructs are all "translated", the "else" clause is interpreted to synthesis as a "null".

### Example 1

```
 . . .
temp := (others => "X");
if (svec /= temp) then
 if (t > 20) then -- synthesize this RTL
 . . .
else
-- pragma translate_off
 assert (now < 20 ns)
 report "logic vector contains U, X, Z or W"
 severity error;
-- pragma translate_on
end if;
. . .
```

### Example 2

```
 . . .
case (expr_1) is
 when value_1 =>
-- pragma translate_off
 . . .
-- pragma translate_on
 when value_2 =>
 . . .
 when . . .
 . . .
end case;
```

**VHDL-2090 (warning)** Declarations in a configuration declaration statement are not supported for synthesis. They are

ignored %s

**DESCRIPTION**

**VHDL-2094** (warning) File types are not supported for

**VHDL-2095** (warning) Physical types are not supported for synthesis. They are ignored %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2095** (warning) Physical types are not supported for synthesis. They are ignored %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2096** (warning) Incomplete type declarations are not supported for synthesis. They are ignored %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2097** (warning) Signal assignment delays are not supported for synthesis. They are ignored %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2098** (warning) 'Transport' construct is not supported for

**synthesis. It is ignored %s**

## **DESCRIPTION**

## **WHAT NEXT**

**VHDL-2099 (warning)** Assert and report statements are not supported for synthesis. They are ignored %s

## **DESCRIPTION**

The VHDL "assert" and "report" statements have no meaning for synthesis. These statements are ignored by HDL Compiler.

## **WHAT NEXT**

**VHDL-2100 (error)** Allocators are not supported for synthesis %s

## **DESCRIPTION**

## **WHAT NEXT**

**VHDL-2103 (error) %s**

## **DESCRIPTION**

Slang functions cannot have a return data-type that is unconstrained. The return-type cannot be a record or multi-dimensional array.

The legal data types allowed are:

Scalar types: enumeration, integer, physical, floating-point Composite types: single dimensional array only Access Types File Types

Slang procedures and functions cannot have parameters whose data-type is a record or multi-dimensional array.

The legal data types allowed are:

Scalar types: enumeration, integer, physical, floating-point  
Composite types: single dimensional array only  
Access Types File Types

## WHAT NEXT

**VHDL-2104** (error) indexing of access-type line is not supported %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2105** (error) The suffix all is not supported %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2106** (error) generalized Wait statements are supported only in architectures that are attributed as TESTBENCH %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2107** (error) generalized Wait statements are not supported in architectures whose TESTBENCH attribute is not

set TRUE %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2108** (error) Wait statements are not supported in subprograms %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2109** (error) Event and Stable attributes are not supported in subprograms %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2110** (error) An expression of this kind is supported for synthesis, when only one variable is used. This expression has two variables %s and %s %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2111** (error) Aggregate assignment by name is not

**supported for the field names of a record.**

## **DESCRIPTION**

The fields of a record were assigned using named aggregate assignment, which is not supported for synthesis. The following is an example of this style of assignment:

```
type myrec_type is record
 vecpart : bit_vector(0 to 4);
 count : integer range 0 to 4;
end record;

signal myrec : myrec_type;

...
myrec <= (vecpart => input_vecpart, count => input_count);
```

In the above example, "vecpart" and "count" are fields of a record. For records, aggregate assignment using named notation is not supported.

## **WHAT NEXT**

Assign each field of the record individually, or use positional notation. The following example shows both positional notation and assignment of each field individually.

```
type myrec_type is record
 vecpart : bit_vector(0 to 4);
 count : integer range 0 to 4;
end record;

signal myrec_positional : myrec_type;
signal myrec_eachfield : myrec_type;

...
myrec_eachfield.vecpart <= input_vecpart;
myrec_eachfield.count <= input_count;

myrec_positional <= (input_vecpart, input_count);
```

## **VHDL-2112 (error) %S**

## **DESCRIPTION**

File names in the file declaration should be constants, generics or constant string literals. Use of expression or argument of the subprogram parameter is not supported by Cyclone.

## WHAT NEXT

**VHDL-2120** (error) In a port map statement, formals that are not simple names or simple subelements are not supported for synthesis %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2121** (error) Type conversion on formal associations is not supported for synthesis %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2130** (error) Only simple configurations are supported for synthesis. This configuration declaration is not supported %s

## DESCRIPTION

## WHAT NEXT

**VHDL-2131** (error) Configurations are not supported for direct instantiation during synthesis %s.

## DESCRIPTION

The following usage is not supported in VHDL Compiler.

```
LABEL: configuration library_name.configuration_name
 generic map (...)
port map (...);
```

## WHAT NEXT

**VHDL-2132 (warning)** Explicit architecture specification is not supported for direct instantiation during synthesis %s.

### DESCRIPTION

The following usage is not correct in VHDL Compiler.

```
LABEL: library_name.entity_name(architecture_name)
 generic map (...)
port map (...);
```

VHDL Compiler reads the architecture to be used from the .mra file. Therefore, only the most recently analyzed one is meaningful to synthesis.

## WHAT NEXT

Remove the architecture specification from the statement and analyze the architecture you want to use first.

**VHDL-2140 (error)** Multi-dimensional arrays are not supported for synthesis %s

### DESCRIPTION

## WHAT NEXT

**VHDL-2141 (error)** Multiple waveform elements are not supported for synthesis %s

### DESCRIPTION

## WHAT NEXT

**VHDL-2142 (error)** Attribute ‘RANGE or ‘REVERSE\_RANGE

can't have index with it %s.

#### **DESCRIPTION**

Multiple-dimensional array is not supported for synthesis. So 'RANGE(i) or 'REVERSE\_RANGE(i) is meaningless for synthesis.

#### **WHAT NEXT**

**VHDL-2150** (error) This form of wait statement is not supported for synthesis %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-2151** (error) Attribute %s%s is not supported for synthesis %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-2152** (error) Literal '%s' is not supported for synthesis %s

#### **DESCRIPTION**

#### **WHAT NEXT**

**VHDL-2153** (error) Physical types are not supported for

**synthesis %s**

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2154 (error)** Cannot mix named and positional elements in same aggregate for synthesis %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2155 (error)** Deferred constants are not supported for synthesis %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2156 (error)** Floating point types are not supported for synthesis %s

**DESCRIPTION**

The VHDL predefined type "REAL" is an example of a floating point type.

**WHAT NEXT**

Remove any floating point types from the VHDL source.

## **VHDL-2157 (error) Type %s not found %s**

### **DESCRIPTION**

This error occurs if a type is used but not declared. It is likely to happen if the type declaration is enclosed in *translate\_off* or *synthesis\_off* comments.

### **WHAT NEXT**

Declare the type before you use it.

## **VHDL-2158 (error) Record types (%s) are not supported in generic declarations for synthesis %s**

### **DESCRIPTION**

Record types are not support in generics, only in ports, signals variables, and constants.

### **WHAT NEXT**

Use multiple smaller generics.

## **VHDL-2159 (error) Empty string constants are not supported for synthesis %s.**

### **DESCRIPTION**

A string with no characters or spaces is not supported by VHDL Compiler. For example, the following is not supported:

```
entity test is
 generic(str : string := ""); -- This is not supported
 port(data_in : in std_logic;
 data2_in : in std_logic;
 data_out : out std_logic);
end test;
architecture one of test is
constant c1 : string := ""; -- This is not supported
begin
end test;
```

## WHAT NEXT

Use a blank string (i.e. " ") instead of an empty string (i.e. ""). The above code should be modified to:

```
entity test is
 generic(str : string := " "); -- Add a space. This is allowed.
 port(data_in : in std_logic;
 data2_in : in std_logic;
 data_out : out std_logic);
end test;
architecture one of test is
constant c1 : string := " "; -- Add a space. This is allowed.
begin
end test;
```

**VHDL-2160 (error)** The 'event or 'stable attribute (%s) is supported only when the attribute is used in conformance with the style described in the Synopsys manual for the VHDL compiler.

## DESCRIPTION

An example of the use of the 'event attribute is:

```
if (clk'event and clk = '1') then ...
```

or

```
wait until clk'event and clk = '1';
```

An example for the use of the 'stable attribute is:

```
if (not clk'stable and clk = '1') then ...
```

or

```
wait until not clk'stable and clk = '1';
```

This error will occur in cases such as the following:

```
if(clock'event and clock = '1' and enable = '1') then ...
```

or

```
wait until clk'stable and clk = '1';
```

## WHAT NEXT

Modify the statement containing the '`stable`' or '`event`' attribute so that it is in conformance with the suggested style.

# VHDL-2161 (warning) Synopsys attribute %s's value is not set to TRUE, the attribute is ignored %s

## DESCRIPTION

This is a Boolean attribute. To have any effect, it must be set to "TRUE."

## WHAT NEXT

Check that the attribute specification assigns the value "TRUE." Case doesn't matter.

# VHDL-2162 (error) Usage of parameters or variables declared in parent subprogram is not supported %s

## DESCRIPTION

VHDL Compiler doesn't allow parameters or variables declared in parent subprogram to be used in nested child subprograms. For Example, the following usage of "j" and "v" are prone to bad logic:

```
library ieee ;
use ieee.std_logic_1164.all ;
entity my_test is
port(d : in std_logic ;
 q : out std_logic
);
end my_test ;
architecture synthesize of my_test is
begin
process(d)
 procedure outer_procedure(signal j : out std_logic) is
 variable v : std_logic;
 procedure inner_procedure is
 begin
 j <= v;
 end ;
begin
 v := '1';
 inner_procedure(j);
```

```
 end ;
begin
 outer_procedure(q);
end process;
end synthesize ;
```

## WHAT NEXT

Change the usage of parameters or variables in your VHDL code.

**VHDL-2163 (error)** The `rising_edge` or `falling_edge` function (%s) is supported only when used in conformance with the style described in the VHDL Compiler Reference Manual.

## DESCRIPTION

You receive this error message if you use the `rising_edge` or `falling_edge` function in a way that does not conform to the style described in the *VHDL Compiler Reference Manual*.

The following are examples of uses that would generate this error message.

```
if rising_edge(ck) and enable = '1' then ...
```

or

```
if falling_edge(ck) and ck = '0' then ...
```

The following is an example of a supported use of the `rising_edge` function.

```
if rising_edge(ck) then ...
```

or

```
wait until rising_edge(ck);
```

Similarly, the following is an example of a supported use of the `falling_edge` function.

```
if falling_edge(ck) then ...
```

or

```
wait until falling_edge(ck);
```

## WHAT NEXT

Refer to the *VHDL Compiler Reference Manual* and modify the statement containing the

*rising\_edge* or *falling\_edge* function so that it conforms to the suggested style. Then, re-execute the command.

**VHDL-2201** (error) An entity named '%s' already exists in this library. (It may be an internal Synopsys design). Please use a different name for your entity.

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2202** (error) %s is the name of an internal Synopsys design. Please use a different name for your entity.

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2203** (error) Cannot find entity %s %s

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2204** (error) Could not find object %s %s. This error can occur if a package (%s) that exists in memory also exists in another library referred to in a Library statement. This error can also occur if the package uses

# synthesis\_off/synthesis\_on directives around the object.

## DESCRIPTION

This error occurs because the synthesis tool searches for packages in memory before it searches the libraries.

A package exists in memory if it has been analyzed in the current session of the tool. The error can also occur if two or more libraries have packages of the same name and if the packages are used in the same design.

If the object contains synopsys synthesis\_off/on or translate\_off/on directives around it, the object is not synthesized. As a result, the object cannot be found when it is referenced in the design. The problem can also occur if the directives are placed incorrectly around part of the object. For example, consider the following procedure declaration:

```
procedure my_proc (variable data_in: in std_logic;
 variable clk: in std_logic;
 variable data_out: out std_logic;
-- synopsys synthesis_off
 variable delay: in time);
-- synopsys synthesis_on
```

In this case, the directives have not been inserted properly, so the procedure is not synthesized. To make the code usable for both synthesis and simulation, this procedure declaration should be:

```
procedure my_proc (variable data_in: in std_logic;
 variable clk: in std_logic;
 variable data_out: out std_logic
-- synopsys synthesis_off
 ;
 variable delay: in time
-- synopsys synthesis_on
);
```

## WHAT NEXT

To get around this problem, if you have more than one package of the same name (even if they are in different libraries), rename one of the packages. If you do not have more than one package of the same name, analyze the package and the design that uses the package in separate sessions of **dc\_shell** or **design\_analyzer**.

If the problem has to do with the synthesis\_off/on or translate\_off/on directives, modify the code to use the directives appropriately. Please see the DESCRIPTION section above for additional information on this.

## **VHDL-2205 (warning) Package '%s' defined more than once %s**

### **DESCRIPTION**

This warning occurs if the same package is multiply declared in same HDL source file.

It also occurs if multiple HDL source files are read by the same **read** or **analyze** command and if the same package is defined in more than one of the files.

### **WHAT NEXT**

Be sure to read or analyze a package only once.

## **VHDL-2206 (error) You have declared two architectures with the same name %s %s**

### **DESCRIPTION**

You are using two (or more) architectures with the same name, belonging to the same entity.

### **WHAT NEXT**

Rename the architecture(s) so that they have unique names.

## **VHDL-2207 (error) You have declared a component inside a for generate loop.**

### **DESCRIPTION**

VHDL-compiler does not allow component declaration inside a for generate loop.

### **WHAT NEXT**

Move the component declaration outside the for loop.

## **VHDL-2221** (error) Type %s is not defined %s

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-2230** (error) '%s' used more than once as the label for an instance.

### **DESCRIPTION**

This error occurs if two or more instances in the same scope are labelled with the same name using the "label" pragma.

### **WHAT NEXT**

Change the names of one instances to make them distinct. You can do this by changing the label pragma for each instance.

## **VHDL-2231** (error) Undefined resource %s %s

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-2232** (error) Entity class must be 'type' for data\_class attribute %s

### **DESCRIPTION**

### **WHAT NEXT**

**VHDL-2233** (error) Type %s has already been assigned a data

**class %s**

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2234 (error) Object %s not found %s**

**DESCRIPTION**

An object was referenced but not declared. This can happen if a pragma *synthesis\_off* hides the declaration.

**WHAT NEXT**

Change the HDL description so that the declaration is visible for the HDL Compiler.

**VHDL-2235 (warning) Type %s not found %s**

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2236 (warning) Pragma "out\_port\_type" must have exactly two arguments %s**

**DESCRIPTION**

**WHAT NEXT**

**VHDL-2237 (warning) The pragma '%s' on line %d is not a supported pragma**

**It will be ignored.**

## **DESCRIPTION**

This error is given when the user has a comment of the form

```
-- pragma <pragma_name>
```

And the `pragma_name` is not one of the pragmas that is supported.

## **WHAT NEXT**

This is just a warning, so no action is required. However, the user may want to check the `pragma_name` to see if it has been mis-typed.

**VHDL-2241 (error) Cannot encode multiple types in same attribute specification %s**

## **DESCRIPTION**

## **WHAT NEXT**

**VHDL-2242 (error) All encodings must be of equal length in enumeration %s**

## **DESCRIPTION**

## **WHAT NEXT**

**VHDL-2243 (error) The value of Synopsys attribute %s is expected to be name of port, signal or variable %s**

## **DESCRIPTION**

The attribute value does not match the name of an object of the class of port, signal, or variable.

## **WHAT NEXT**

Change the attribute value.

**VHDL-2244 (error)** Synopsys attribute %s's value is expected to be name of a process label %s

## **DESCRIPTION**

The attribute value does not match name of a process label.

## **WHAT NEXT**

Change the attribute value.

**VHDL-2245 (error)** Label %s already has a Synopsys set\_reset attribute %s

## **DESCRIPTION**

The process label has more than one Synopsys *set\_reset* attribute, which is illegal.

## **WHAT NEXT**

Change source code to put only one *set\_reset* attribute on the process.

**VHDL-2246 (error)** More than one Synopsys attribute master\_process\_is and/or slave\_process\_is specified for same process label %s

## **DESCRIPTION**

A process label can have only one *master\_process\_is/slave\_process\_is* attribute.

## **WHAT NEXT**

Change source code to put only one attribute on the process.

# **VHDL-2247 (error) Pragma translate\_off inside an expression is not supported %s**

## **DESCRIPTION**

Inside an expression, the VHDL Analyzer cannot deal with pragma *translate\_off* or *translate\_on*.

## **WHAT NEXT**

In the case of an after-clause, like the example below, take out the pragmas. After-clauses are ignored for synthesis. A warning is issued in that case.

To suppress warnings, refer to the man page for the *suppress\_errors* variable.

## **EXAMPLE**

The following example will cause error VHDL-2247:

```
entity pragma is
 port (input : in bit; output : out bit);
end pragma;

architecture test of pragma is
begin
output <= input
 -- synopsys translate_off
 AFTER 7 ns
 -- synopsys translate_on
;
end test;
```

# **VHDL-2248 (error) Body of package %s seen before or without its declaration %s**

## **DESCRIPTION**

The package declaration must be analyzed before the corresponding package body. There was probably a problem with the declaration part related to the synthesis subset, causing the analysis of the declaration to terminate. Since the analysis of the package declaration was terminated, the body cannot be analyzed.

## **WHAT NEXT**

Correct the problem in the package declaration, and this error will go away.

## EXAMPLE

This example will cause error VHDL-2248:

```
package P is
 constant C : bit; -- deferred constant, not supported by synthesis.
end P;

package body P is
 constant C : bit := '0';
end P;
```

**VHDL-2249** (warning) The attribute '%s' requires a list of more than one signal %s.

## DESCRIPTION

### WHAT NEXT

**VHDL-2250** (warning) Incorrect computation may result because range of the left hand side does not cover range of the right hand side for assignment %s.

## DESCRIPTION

When the value of the right-hand side is outside the range of the left-hand side, a run-time error occurs in simulation. However, no logic is built by the VHDL Compiler to detect this kind of run-time error.

### WHAT NEXT

Declare a proper range for the left-hand side. Or type-convert the right-hand side to ensure that the range of the left-hand side covers that of the right-hand side.

**VHDL-2251** (error) Enabling expression not permitted outside

# wait statements %s

## DESCRIPTION

This error occurs with statements of the form: if(clk'event and clock = '1' and enable = '1') then .. Such expressions are only permitted in: wait until clk'event and clock = '1' and enable = '1' ... at present

## WHAT NEXT

Modify the if statement with the enabling condition to conform to suggested style.

**VHDL-2252 (information)** Make sure there is an assertion statement in the design for attribute '%s' %s.

## DESCRIPTION

Attribute 'one\_hot' indicates at most one object in its group can have a *Logic1* value at any instance of time, all other objects must have a *Logic0* value. Attribute 'one\_cold' indicates at most one object in its group can have a *Logic0* value at any instance of time, all other objects must have a *Logic1* value.

## WHAT NEXT

For "attribute *one\_hot* of *c1, c2, c3 : signal* is "true", add a process in the design like the following example.

```
-- synopsys synthesis_off
process (c1, c2, c3)
begin
 assert not ((c1='1' and c2='1') or
 (c1='1' and c3='1') or
 (c2='1' and c3='1'))
 report "One-hot violation"
 severity Error;
end process
-- synopsys synthesis_on
```

For "attribute *one\_cold* of *c1, c2, c3 : signal* is "true", add a process in the design like the following example.

```
-- synopsys synthesis_off
process (c1, c2, c3)
begin
 assert not ((c1='0' and c2='0') or
```

```

 (c1='0' and c3='0') or
 (c2='0' and c3='0'))
 report "One-cold violation"
 severity Error;
end process
-- synopsys synthesis_on

```

## **VHDL-2253 (error) Unsupported type of value in attribute specification - %s.**

### **DESCRIPTION**

Synthesis VHDL subset does not include this type of a value in a attribute specification. Value could be of concatenation type.

### **WHAT NEXT**

Rewrite the attribute specification using the VHDL synthesis subset.

## **VHDL-2254 (error) "Time" is an unsupported type - %s**

### **DESCRIPTION**

Synthesis VHDL subset does not include the VHDL type TIME. Your HDL should not depend on simulation-specific delays for its proper behavior.

### **WHAT NEXT**

You can prevent synthesis from using simulation-specific HDL by enclosing it within the synthesis\_off / synthesis\_on pragmas.

### **EXAMPLE**

The following is a sample usage of the TIME type used in a declaration:

```
GENERIC(DelayAmount : TIME);
```

To prevent the TIME type from going through synthesis, change the above HDL to:

```
GENERIC(--synopsys synthesis_off DelayAmount : TIME --synopsys synthesis_on);
```

This will ensure the HDL is present for simulation, but is ignored during synthesis.

## **VHDL-2255 (error) Generics of type string are not supported - %S**

### **DESCRIPTION**

Synthesis VHDL subset does not include generics of type string.

### **WHAT NEXT**

Rewrite the attribute specification using the VHDL synthesis subset.

## **VHDL-2256 (error) Range of enum types is not supported %s.**

### **DESCRIPTION**

Ranges of enumerated types using the *TO* construct are not supported in VHDL Compiler. The following CASE statement using the *TO* construct is not supported.

```
type STATE_TYPE is (STATE0, STATE1, STATE2, STATE3);
signal STATE, NEXT_STATE : STATE_TYPE;

process
begin
 case STATE is
 when STATE0 =>
 DOUT <= '0';
 when STATE1 to STATE3 =>
 DOUT <= '1';
 end case;
end process;
```

### **WHAT NEXT**

The workaround is to use the " | " construct which performs an *OR* operation.

```
type STATE_TYPE is (STATE0, STATE1, STATE2, STATE3);
signal STATE, NEXT_STATE : STATE_TYPE;

process
begin
```

```

case STATE is
when STATE0 =>
 DOUT <= '0';
when STATE1 | STATE2 | STATE3 =>
 DOUT <= '1';
end case;
end process;

```

## VHDL-2257 (error) unsupported function call %s

### DESCRIPTION

Some remote functions can not be called.

### WHAT NEXT

Move to a local package.

## VHDL-2260 (error) Bit-slice is not supported in generic for '%s', %S.

### DESCRIPTION

Bit slices in the generic map of a component instantiation are not supported. For example:

```
U1: GATE1 generic map (INIT(0) => '0', INIT(1 to 7) => init_val)
 port map (DINPUT(0) => d0, DINPUT(1) => d1, DOUTPUT => dout);
```

### WHAT NEXT

Concatenate the values assigned to slices in the generic map or port map. Assign this concatenation to an intermediate signal or variable, and use this signal or variable in the component instantiation. For example:

```
aggr1 <= ('0' & init_val);
U1: GATE1 generic map (INIT => aggr1)
 port map (DINPUT(0) => d0, DINPUT(1) => d1, DOUTPUT => dout);
```

## VHDL-2262 (error) Enumeration values may not be used as for

## or for-generate loop bounds

### DESCRIPTION

Enumeration values may not be used to define the bounds of a for or for-generate loop in Synopsys' synthesizable subset of VHDL. These bounds must be integer values that can be computed at compile time.

## VHDL-2263 (error) Number of enumeration encoding values does not match the number of enumeration values, line %d.

### DESCRIPTION

The number of enumeration encoding values defined via the ENUM\_ENCODING attribute must match the number of enumeration values for the type.

### WHAT NEXT

Modify the number of enumeration or enumeration attribute values.

## VHDL-2264 (error) Incorrect way to use '%s attribute .

### DESCRIPTION

### WHAT NEXT

event and 'stable attributes are allowed to be used only when inferring a clock edge . For example

```
(clock'event and clock = '1')
```

and

```
((not clock'stable) and clock = '1')
```

following are not allowed

```
((not clock'event and clock = '1')
```

and

```
(clock'stable and clock = '1')
```

## **VHDL-2270 (error) The alias declaration%sis invalid because object %s is an alias. Aliases to existing aliases are not supported for synthesis .**

### **DESCRIPTION**

HDL Compiler supports aliases to signals, variables and constants only. HDL Compiler does not support aliases that refer to existing aliases.

### **WHAT NEXT**

Either remove the alias to an alias and replace references to the first alias with references to the second, or replace the second alias with an alias to the original object. For example, given:

```
signal B : std_logic_vector(0 to 31); alias MSB : std_logic_vector(0 to 7) of B(24 to 31); alias MSN : std_logic_vector(0 to 3) of MSB(4 to 7);
...
MSN <= "0000";
```

You could remove the definition of MSN and replace its use with:

```
MSB(4 to 7) <= "0000";
```

Or, you could transform the declaration of MSN and leave its use intact:

```
alias MSN : std_logic_vector(0 to 3) of B(28 to 31);
...
MSN <= "0000";
```

## **VHDL-2271 (error) Cannot use predefined attributes with alias %s%, as the alias's range is not locally static.**

### **DESCRIPTION**

HDL Compiler does not support the use of predefined attributes (such as 'LEFT, 'HIGH, 'RANGE, and so on) with aliases when the alias range is not locally static.

### **WHAT NEXT**

Replace the predefined attribute with the corresponding components of the alias's range. For example, given

```

procedure foo(B : inout std_logic_vector) is begin constant b_left : integer :=

B'length-1; alias b_alias : std_logic_vector(b_left downto 0) of B;

...

for I in b_alias'RANGE loop ... end loop;

... end foo;

replace the loop with

for I in 0 to b_left loop ... end loop;

```

## VHDL-2280 (error) 'IMAGE is used outside of an attribute statement in a for-generate loop.

### DESCRIPTION

HDL Compiler supports the 'IMAGE attribute only as part of an attribute specification of the following type:

```
attribute RELATIVE_LOCATION of <object> : label is <string_literal> &
INTEGER'IMAGE(<indexvar>) & <string_literal>
```

Where <indexvar> is the index variable of a for-generate loop.

### WHAT NEXT

The following is an example of the situation in which 'IMAGE might be used.

```
G : FOR d IN 0 TO 7 GENERATE B : BLOCK ATTRIBUTE RELATIVE_LOCATION OF flop : LABEL

IS "R" & INTEGER'IMAGE(d) & "C0"; BEGIN flop : dff PORT MAP (D => INP(d),

Q=>OUTP(d), CK=>CLK); END BLOCK; END GENERATE G;
```

In this case, you're instantiating a set of eight DFFs that will be used to latch the value of an eight-bit bus. Note that 'IMAGE can be used only

- + Within a block within a for-generate loop.
- + As part of an attribute statement, where the attribute name is "RELATIVE\_LOCATION" and the value is a concatenation of three strings: a prefix, the 'IMAGE expression, and a suffix. In the previous example, "R" is the prefix and "C0" is the suffix. The prefix and suffix must be literals.
- + With the index variable for the for-generate loop.

Note that choices for the following are left to you:

- + The label for the for-generate loop and the block.
- + The number and contents of the instantiation statements within the block.

You can also specify more than one entity name in the attribute statement. For example, you can use

```
ATTRIBUTE RELATIVE_LOCATION OF flop,rflop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0";
```

if you were instantiating two series of entities:

```
flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); rflop : dff PORT MAP (D => INP(d), Q=>R_OUTP(8-d), CK=>CLK);
```

You can also have more than one such attribute statement if you want to specify a different prefix or suffix.

## **VHDL-2281 (error) The attribute RELATIVE\_LOCATION does not have a value of the form <string\_literal> & INTEGER'IMAGE(<indexvar>) & <string\_literal>**

### **DESCRIPTION**

HDL Compiler supports the use of the RELATIVE\_LOCATION attribute only with a very specific value. The attribute statement must be of the form:

```
attribute RELATIVE_LOCATION of <object> : label is <string_literal> & INTEGER'IMAGE(<indexvar>) & <string_literal>
```

Where <indexvar> is the index variable of a for-generate loop.

### **WHAT NEXT**

The following is an example of the situation in which you may use the attribute RELATIVE\_LOCATION:

```
G : FOR d IN 0 TO 7 GENERATE B : BLOCK ATTRIBUTE RELATIVE_LOCATION OF flop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0"; BEGIN flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); END BLOCK; END GENERATE G;
```

In this case, we're instantiating a set of eight DFFs that will be used to latch the value of an eight-bit bus. Note that 'IMAGE can be used only:

- + Within a block within a for-generate loop.
- + As part of an attribute statement, where the attribute name is "RELATIVE\_LOCATION" and the value is a concatenation of three strings: a prefix, the 'IMAGE expression, and a suffix. In the above example, "R" is the prefix and "C0" is the suffix. The prefix and suffix must be literals.
- + With the index variable for the for-generate loop.

Note that choices for the following are left to you:

- + The label for the for-generate loop and the block.
- + The number and contents of the instantiation statements within the block.

You may also specify more than one entity name in the attribute statement. For

example, you could use

```
ATTRIBUTE RELATIVE_LOCATION OF flop,rflop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0";
```

if you were instantiating two series of entities:

```
flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); rflop : dff PORT MAP (D => INP(d), Q=>R_OUTP(8-d), CK=>CLK);
```

You may also have more than one such attribute statement, if you want to specify a different prefix and/or suffix.

## **VHDL-2282 (error) The argument to 'IMAGE is not a for-generate loop index variable.**

### **DESCRIPTION**

HDL Compiler supports the 'IMAGE attribute only as part of an attribute specification of the following type:

```
attribute RELATIVE_LOCATION of <object> : label is <string_literal> & INTEGER'IMAGE(<indexvar>) & <string_literal>
```

Where <indexvar> is the index variable of a for-generate loop.

### **WHAT NEXT**

The following is an example of the situation in which 'IMAGE might be used.

```
G : FOR d IN 0 TO 7 GENERATE B : BLOCK ATTRIBUTE RELATIVE_LOCATION OF flop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0"; BEGIN flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); END BLOCK; END GENERATE G;
```

In this case, you're instantiating a set of eight DFFs that will be used to latch the value of an eight-bit bus. Note that 'IMAGE can be used only

- + Within a block within a for-generate loop.
- + As part of an attribute statement, where the attribute name is "RELATIVE\_LOCATION" and the value is a concatenation of three strings: a prefix, the 'IMAGE expression, and a suffix. In the previous example, "R" is the prefix and "C0" is the suffix. The prefix and suffix must be literals.
- + With the index variable for the for-generate loop.

Note that choices for the following are left to you:

- + The label for the for-generate loop and the block.
- + The number and contents of the instantiation statements within the block.

You can also specify more than one entity name in the attribute statement. For

example, you can use

```
ATTRIBUTE RELATIVE_LOCATION OF flop,rflop : LABEL IS "R" & INTEGER'IMAGE(d) & "C0";
```

if you were instantiating two series of entities:

```
flop : dff PORT MAP (D => INP(d), Q=>OUTP(d), CK=>CLK); rflop : dff PORT MAP (D => INP(d), Q=>R_OUTP(8-d), CK=>CLK);
```

You can also have more than one such attribute statement if you want to specify a different prefix or suffix.

## **VHDL-2283 (error) Only the type INTEGER is supported for the prefix of the attribute 'IMAGE %s**

### **DESCRIPTION**

Presently 'IMAGE attribute has a limited support in HDL compiler. Only Integer may appear as a prefix to it

### **WHAT NEXT**

Please rewrite the use of 'image attribute so that it has integer as its prefix

## **VHDL-2284 (error) Declarative regions of generate statements is not supported %s**

### **DESCRIPTION**

This version of VHDL Compiler doesn't support declarative regions of generate statements.

### **WHAT NEXT**

Use block statement inside the generate statement.

Example:

You replace the following VHDL codes

```
----- build_blk:
FOR i IN 1 TO 4 GENERATE
 SIGNAL int_connect: unsigned(3 DOWNTO 0); BEGIN
 blk1: blk_in PORT MAP(a_in(i - 1),
 int_connect(i - 1));
 blk2: blk_out PORT MAP(int_connect(i - 1),
 b_out(i - 1));
 END
```

```

GENERATE build_blks; -----

by
----- build_blks:
FOR i IN 1 TO 4 GENERATE
THE_BLOCK : block SIGNAL int_connect: unsigned(3 DOWNTO 0); BEGIN blk1: blk_in PORT
MAP(a_in(i - 1), int_connect(i - 1)); blk2: blk_out PORT MAP(int_connect(i - 1),
b_out(i - 1)); end block;
END GENERATE build_blks; -----

```

## VHDL-2285 (warning) VHDL-93 generates different concatenation results from VHDL-87 %S.

### DESCRIPTION

You receive this message if **read** or **elaborate** detects that the concatenation result generated by VHDL-93 for your design differs from the result that would have been generated by VHDL-87. This message is to warn you to expect different results from those you might have become accustomed to with VHDL-87.

By default, currently VHDL Compiler uses VHDL-93 concatenation, which generates a different left bound and/or direction from VHDL-87. (For details of the concatenation definition, see the *IEEE VHDL-93 Language Reference Manual*.) You can override the default behavior by setting the **hdlin\_vhdl93\_concat** environment variable to *false*.

### WHAT NEXT

If you receive this message, proceed as follows:

1. Read the *VHDL-93 Language Reference Manual* to understand the concatenation results generated by VHDL-93.
2. If this is acceptable for your design, you need take no further action.
3. If you want to revert to VHDL-87 behavior, set **hdlin\_vhdl93\_concat** to *false*.

### SEE ALSO

**hdlin\_vhdl93\_concat** (3); *VHDL-93 Language Reference Manual*.

## VO

**VO-1** (warning) Changed instance name %s to %s in module %s. Please use the `change_names` command to make the correct changes before invoking the verilog writer.

### DESCRIPTION

This warning is generated when the instance name has the same name as the port net name. In Verilog, both port and module have its own name space, which include instance names and net names. Implicit nets are used for those nets connected to ports: meaning the port net is using the same name as its port. Because instance names and net names are sharing the same space, they can not use the same names.

### WHAT NEXT

If you do not want it to be renamed by the writer, use the `change_name` command to make sure the instance name is correctly changed.

**VO-2** (warning) Changed wire name %s to %s in module %s. Please use the `change_names` command to make the correct changes before invoking the verilog writer.

### DESCRIPTION

This warning is generated when the net, which does not connect to port, has the same name as the port. Because the net does not connect to port, under the implicit net declaration, this net has to be renamed.

### WHAT NEXT

If you do not want it to be renamed by the writer, use the `change_name` command to make sure the net name is correctly changed.

**VO-3** (warning) Net(s) of type 'tri' are written out.

### DESCRIPTION

This description may not be acceleratable for simulation.

## WHAT NEXT

Change the value of the variable `verilogout_no_tri`. For instructions about how to use the variable, see the man page. Then, rewrite the Verilog description.

## VO-4 (warning) Verilog 'assign' or 'tran' statements are written out.

### DESCRIPTION

In this design, ports are attached to other ports, which forces Verilogout to use `assign` or `tran` statements to write out a correct description.

The description may not be acceleratable for simulation.

### WHAT NEXT

If the problem exists, it can be solved by the `compile` command with proper setting of the variable `set_fix_multiple_port_nets`. For instructions about how to use the variable, see the man page. Then, compile and rewrite the Verilog description.

## VO-5 (error) The db file contains inconsistent information about the bussed port '%s'. Its width is %d, but the actually elements only have %d.

### DESCRIPTION

In this design, ports are maybe previously processed without updated the bussed information correctly.

### WHAT NEXT

If the problem exists, Please use the bit-blast verilog.

## VO-6 (error) Can not write out this design '%s' with memory

operations in it using non-levelized writer.

## **DESCRIPTION**

This error happened when verilogout\_levelize is set to FALSE, there is a memory component in the design.

## **WHAT NEXT**

Please set verilogout\_levelize to TRUE.

**VO-7 (warning)** In design '%s', port '%s' has negative indeces [%d:%d] which will be converted into [%d:%d].

## **DESCRIPTION**

This warning is generated when there is a negative indeces in the type, because Verilog does not like negative indeces.

## **WHAT NEXT**

If the resulting indeces are not wanted, recreate design with positive indeces.

**VO-8 (warning)** Unknown direction port '%s' is assumed to be inout in module '%s'.

## **DESCRIPTION**

This warning is generated when the port name has no specific direction. It will be assumed that the port is inout.

## **WHAT NEXT**

Make sure the port direction is defined.

**VO-9 (warning)** The output verilog file contains power/ground

information, and is not supported by the verilog reader.

## DESCRIPTION

This warning is generated when the variable `verilogout_show_power_pins` is set to true. With this option turned on, the verilog writer writes out power/ground information as specified in the library.

## WHAT NEXT

This verilog file will need to be modified before it can be read by verilog reader.

# VO-10 (warning) no rail connection specified for (%s)

## DESCRIPTION

This warning is generated when there is a power rail is specified and no rail connection specified in the library.

## WHAT NEXT

Either specify the rail connection in the library or the verilog writer will try to inherit the rail connection from the reference.

# VO-11 (warning) Verilog writer has added %d nets to module %s using %s as prefix. Please use the `change_names` command to make the correct changes before invoking the verilog writer.

## DESCRIPTION

This warning is generated when the verilog writer adds extra nets to designs to make the verilog output legal. Verilog syntax does not allow a partially connected bus. For the unconnected bus bits of the partially connected bused, verilog writer generates dummy nets.

## WHAT NEXT

If you do not want dummy nets to be generated by the writer, use the `change_name` command to make sure the net name is correctly changed.

## **VO-12 (warning) Module %s contains unmapped components. The output netlist might not be read back into the system.**

### **DESCRIPTION**

This warning is generated when the verilog writer detects that there are references of SELECT\_OP or GTECH components in the module. When the design is not mapped, Formality, DC, and PC might not able to process netlist with unmapped components.

### **WHAT NEXT**

## **VO-13 (warning) Bus naming style currently specified as %s, verilog syntax requires bus naming style to be "[]".**

### **DESCRIPTION**

This warning is generated when the verilog writer detects that the specified bus naming style is different from what verilog syntax is required. Please check design busses to conform to verilog bus pattern (%s[%d]). If the db bus pattern does not match the verilog bus pattern, the verilog writer will bit blast the bus.

### **WHAT NEXT**

If you do not want busses to be bit blasted by the writer, use the **change\_name** command to make sure the busses name is correctly changed.

## **VO-14 (warning) Verilog writer will obsolete the variable verilogout\_levelize in 2005.06.**

### **DESCRIPTION**

This warning is generated when the user is trying to write a flat verilog netlist from a hierarchical design by setting the variable verilogout\_levelize to TRUE. This feature will no longer be supported and the variable will become obsolete starting from 2005.06 release.

### **WHAT NEXT**

Please change your script so that it will not use the variable starting from 2005.06 release.

## **VO-15** (warning) The design cannot be written out as leveled, reverting to writing out hierarchical netlist.

### **DESCRIPTION**

This warning is generated when the user is trying to write a flat verilog netlist from a hierarchical design by setting the variable verilogout\_levelize to TRUE. However, the writer is detecting that this design cannot be written out as a leveled netlist and it is reverting to the non-levelized mode.

### **WHAT NEXT**

## **VO-16** (warning) XG mode verilog writer does not support the variable verilogout\_levelize. The design will be written in hierarchical style.

### **DESCRIPTION**

This warning is generated when the user is trying to write a flat verilog netlist from a hierarchical design by setting the variable verilogout\_levelize to TRUE in XG mode. However, the verilog writer in XG mode does not support this variable, and it is reverting to the non-levelized mode.

### **WHAT NEXT**

## **VO-17** (warning) You are using an older version of the Verilog netlist reader/writer, which will be obsoleted in the X-2005.06 release.

### **DESCRIPTION**

You are using an older version of the Verilog netlist reader/writer, which will be obsoleted in the X-2005.06 release. To use the current Verilog reader/writer, please make sure these variables are set as follows:

```
Verilog netlist reader: enable_2003.03_verilog_reader true Verilog netlist writer:
enable_2003.03_verilog_writer true
```

## WHAT NEXT

## SEE ALSO

**VO-18** (warning) You are using an older version of the Verilog netlist reader/writer, which will be obsoleted in the X-2005.06 release.

## DESCRIPTION

You are using an older version of the Verilog netlist reader/writer, which will be obsoleted in the X-2005.06 release. To use the current Verilog reader/writer, please make sure these variables are set as follows:

```
Verilog netlist reader: enable_2003.03_verilog_reader true Verilog netlist writer:
enable_2003.03_verilog_writer true
```

## WHAT NEXT

## SEE ALSO

**VO-19** (error) Cannot write out this design '%s' in SystemVerilog format.

## DESCRIPTION

This format is not supported if any of this is true, (a) Multiple designs have been specified to the write command. (b) RTL for this design is not in SystemVerilog format. (c) Design ports in the RTL follow non-ANSI styled port declaration.

## WHAT NEXT

If multiple designs have to be specified in the write command, specify either a single design or no design list. Current design is written, if no design is specified.

## **VO-20** (error) Clock name is not defined.

### **DESCRIPTION**

This error message occurs when running the **write** command without defining a clock name.

### **WHAT NEXT**

Name each clock and run the command again.

### **SEE ALSO**

[write\(2\)](#)

## **VO-21** (warning) Carry-outs are not currently supported while writing functional synthesizable RTLout.

### **DESCRIPTION**

This warning message occurs because carry-outs are not currently supported while writing functional, synthesizable RTL output.

### **WHAT NEXT**

This is only a warning message. No action is required.

However, if possible, you might want to remove carry-outs in order to write out functional, synthesizable RTL out.

### **SEE ALSO**

[write\(2\)](#)

## **VO-22** (warning) Two's complement multiplier cannot be written functionally in Verilog.

### **DESCRIPTION**

This warning message is generated because the two's complement multiplier cannot be written functionally in Verilog.

## WHAT NEXT

This is only a warning message. No action is required.

However, if possible, you might want to remove the two's complement multiplier in order to write out functional Verilog.

## SEE ALSO

`write(2)`

# VO-23 (warning) Unable to determine direction of port '%s' of cell '%s'. Cannot write functional model.

## DESCRIPTION

This warning message occurs when the direction of port cannot be determined and the functional model cannot be written.

## WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you intended, set port direction and run the command again.

## SEE ALSO

`write(2)`

# VO-24 (error) Bus bag is missing for the port '%s'.

## DESCRIPTION

This error message occurs when bus bag is missing for the port. This database is corrupted.

## WHAT NEXT

Fix the database with the bus bag for the port and run the command again.

## SEE ALSO

`write(2)`

## VTC

### **VTC-1 (error) Port '%s' in design '%s' does not have a type.**

#### **DESCRIPTION**

This error should only result from corrupt data being generated by a Synopsys tool.

#### **WHAT NEXT**

Either try to re-generate the design, or write out the design in single-bit or vector format.

### **VTC-2 (error) Type '%s' is duplicated in design '%s' and design '%s'**

**but the types are not equivalent.**

#### **DESCRIPTION**

You tried to write out multiple designs that have types with the same name, but the types are not equivalent. Since all of the necessary type conversion functions are written out into a single package, this cannot be done without generating incorrect VHDL.

#### **WHAT NEXT**

If the designs are in the same hierarchy, turning the lower levels of hierarchy into "vector" mode will solve the problem. If the designs are not in the same hierarchy, then the problem will go away if they are written out separately.

### **VTC-3 (error) A conversion function for inout port '%s' in design '%s' cannot be written out.**

#### **DESCRIPTION**

When conversion functions are written out inside of a design, it is not possible in VHDL to convert a port to a set of signals bidirectionally using conversion functions. The only way that this can be done is by using a configuration.

## **WHAT NEXT**

Either write out the mode in single\_bit or vector mode, or else write out a configuration.

## **VTC-4 (error) Port '%s' in design '%s' has unknown direction.**

### **DESCRIPTION**

This error should only occur when an unlinked verilog reference is trying to be written out. Until the verilog reference is linked, the direction of the ports are not known.

### **WHAT NEXT**

Get the design to link successfully.

## **VTC-5 (error) In order to write out type conversions in configuration the setting of the variable %s must be 'VECTOR'.**

### **DESCRIPTION**

When writing out vhdl with type conversions being done in the configuration (set by setting vhdlout\_write\_top\_configuration to TRUE), the value of vhdlout\_single\_bit must be set to 'VECTOR'.

### **WHAT NEXT**

Either set vhdlout\_write\_top\_configuration to FALSE, or set vhdlout\_single\_bit to VECTOR.

## WC

**WC-1** (error) '%s' is an invalid write\_constraints format. Valid formats are '%s'.

### DESCRIPTION

The `write_constraints` command has three valid formats: `synopsys`, `sdf` and `sdf-v2.1`. By default the constraints file is generated in synopsys format.

### WHAT NEXT

Use `write_constraints -format synopsys` or `write_constraints -format sdf` or `write_constraints -format sdf-v2.1`. Read the `write_constraints` man page for more information on writing a constraint file for layout tools.

**WC-2** (warning) nworst\_value must be an integer greater than 0.  
Using -nworst 1.

### DESCRIPTION

The `-nworst` option of the `write_constraints` command requires an integer greater than 0. `nworst_value` specifies the maximum number of paths ending at each end point considered by `write_constraints`. By default, one (worst) timing path per end point is considered. Set `nworst` to the number of paths that must be considered for each end point.

### WHAT NEXT

Reenter the `write_constraints` command with `-nworst <nworst_value>`, where `<nworst_value>` is an integer greater than 0.

**WC-3** (warning) Both `-by_input_pin_name` and `-by_output_pin_name` can't be selected.  
Using '%s'.

### DESCRIPTION

Those two options are contradictory, both cannot be used with `write_constraints`.

Read the **write\_constraints** man page for more information on the **write\_constraints** options.

## WHAT NEXT

Re-enter the **write\_constraints** command with either **-by\_input\_pin\_name** or **-by\_output\_pin\_name**.

**WC-4** (warning) `max_path_value` must be an integer greater than 0.

Using `-max_paths 1`.

## DESCRIPTION

The **-max\_paths** option of the **write\_constraints** command requires an integer greater than 0. `max_path_value` specifies the maximum number of timing paths selected for writing constraints. By default, one timing path is selected, it is the most critical paths (the paths with the smallest timing slack).

## WHAT NEXT

Re-enter the **write\_constraints** command with **-max\_paths <max\_path\_value>**, where `<max_path_value>` is an integer greater than 0.

**WC-5** (warning) The `-max_nets` value is a percentage, it must be greater than 0.0 and less or equal to 1.0. Using '`%s`'.

## DESCRIPTION

The **write\_constraints** command has the option **-max\_nets <max\_net\_number>** to specify the maximum number of nets written to the constraints file. `<max_net_number>` is a percentage of the total number of nets in the current design.

The default value for `<max_net_number>` is 0.05 (5% of all nets are written to the constraints file). `<max_net_number>` must be a real number between 0 and 1. If you want to write all nets on the selected paths in the constraints file, use `<max_net_number> = 1` (for 100%). For more information about the options of this command, read the **write\_constraints** man page.

## WHAT NEXT

Reenter the **write\_constraints** command with **-max\_nets <max\_path\_value>**, where `<max_path_value>` is a percentage greater than 0.0 and less or equal to 1.0.

## WC-6 (warning) The -min\_net\_priority value must be greater or equal to 0. Using '%s'.

### DESCRIPTION

The **write\_constraints** option **-min\_net\_priority** specifies the minimum net priority number. This number must be an integer greater or equal to 0. The default is 0. The minimum net priority number used was invalid, the minimum net priority used is the one specified in this warning message. Refer to **write\_constraints** man page for more information on net priority numbers.

### WHAT NEXT

If the minimum net priority number is acceptable, keep the constraint file generated, otherwise use the **write\_constraints** again with a valid minimum net priority number.

## WC-7 (warning) The maximum net priority must be greater than the minimum net priority.

Using **max\_net\_priority = '%s'**.

### DESCRIPTION

The **write\_constraints** option **-min\_net\_priority** specifies the maximum net priority number. This number must be an integer greater than the minimum net priority number. The default is 100. The maximum net priority number used was invalid, the maximum net priority used is the one specified in this warning message. Refer to **write\_constraints** man page for more information on net priority numbers.

### WHAT NEXT

If the maximum net priority number used is acceptable, keep the constraint file generated, otherwise use the **write\_constraints** again with a valid maximum net priority number.

## WC-8 (information) Writing constraints to file '%s'.

### DESCRIPTION

The command **write\_constraints** is writing a constraints file to disk. Check the **write\_constraints** man page for information on how to use the command. Use the **write** command to write a netlist for the current design before using the **write\_constraints**

command. This is because **write** can change names and the new names should appear in the constraints file as well. This message indicates the disk location of the constraints file created with **write\_constraints**.

## WHAT NEXT

The constraints file can be used in layout tools or other tools reading **write\_constraints** file formats.

# WC-9 (warning) A path starting at '%s' and ending at '%s' has a violated constraint.

## DESCRIPTION

The design constraints violated constraints on the selected paths for **write\_constraints**. One of the paths starting and ending at the specified pins in this message has a timing constraint which is not met in Design Compiler. This means that this path constraint might be violated after layout as well. The violated constraints are still written in the constraint file unless the constraints are invalid. A constraint is invalid if it can never be met.

## WHAT NEXT

Use **report\_constraint -all\_violators** to see if the violation is severe enough to hold going into layout. Compile the design until all constraints are met or slightly violated such that the layout tool can fix the violations and create a new constraint file.

# WC-10 (warning) No more net constraints can be written; the maximum number (%.2f percent of all nets in the design) has been reached.

## DESCRIPTION

Design Compiler writes net constraints for up to a specified percentage of the number of nets in the design. (The default value is 5%.)

This message is issued when there are more nets on constrained paths than can be written into the constraint file.

## WHAT NEXT

To write more net constraints, use the option **-max\_nets** of the command

`write_constraints` to specify the maximum percentage of nets that can be written. For example, to allow 50 percent of all nets in the design to be written as constraints, use `-max_nets 0.5`.

Take care when you set the maximum number of constraints, however: layout tools are usually limited in the number of constraints they can accept.

## WC-11 (warning) '%s' is not supported with the SDF format.

### DESCRIPTION

With the SDF format, the only options available for `write_constraints` are `[-output file] [-max_paths number] [-max_path_timing] [-from pin_list] [-to pin_list]` and `[-through pin_list]`

### WHAT NEXT

Re-enter the `write_constraints` command with the valid options.

## WC-12 (error) No valid constraint selected with the SDF format. Valid selections are '%s'.

### DESCRIPTION

With the SDF format, the only constraint type available for `write_constraints` is `-max_path_timing`.

### WHAT NEXT

Re-enter the `write_constraints` command with the valid constraint type.

## WC-13 (information) Design '%s' has %g paths.

### DESCRIPTION

This message indicates the total number of timing paths in the design.

### WHAT NEXT

The information can be used to constrain a certain percentage of paths in the design.

## **WC-14 (information) The constraint file has '%d' path constraints.**

### **DESCRIPTION**

The **write\_constraints** command has generated path constraints for all the paths selected. There will never be more path constraints generated than paths selected. There can be less path constraints than paths selected if some paths selected have no constraints or if the constraints are impossible: for example if the arrival to a path starting point is 10 and the required arrival time at the end of the path is 5, the constraint will never be met, the constraint will not be written in the constraint file for that path.

### **WHAT NEXT**

Verify that all paths selected have valid constraints.

## **WC-15 (warning) The path : '%s'-'%s' has a non-positive constraint, constraint value changed to %g.**

### **DESCRIPTION**

The required arrival time at a path endpoint is smaller than, or equal to, the actual arrival time at the path startpoint. There is no way that this constraint can ever be met. In addition, many tools don't support negative or zero values in an SDF. Because the variable environment variable sdfout\_allow\_non\_positive\_constraints is 'false', the value was changed to prevent a problem in a downstream application.

### **WHAT NEXT**

Verify that all paths selected have valid constraints. If you want the non-positive constraints to appear in the SDF file, set the sdfout\_allow\_non\_positive\_constraints variable to the value 'true'.

## **WC-17 (warning) '%s' is not supported when using any of the design covering**

options (**-cover\_design** or **-cover\_nets**).

## DESCRIPTION

The specified option can not be used in conjunction with and of the covering options to **write\_constraints**. It will be ignored.

## WHAT NEXT

If you want the option to take effect, don't use a covering option. If you just want to eliminate the warning message, then remove the offending option from the **write\_constraints** command line.

**WC-18 (error)** no other constraint types are supported when using **-environment**.

## DESCRIPTION

The **-environment** option cannot be used in conjunction with any other constraint types.

## WHAT NEXT

Generate constraints using only the **-environment option**, or without the **-environment** option, depending on your needs.

**WC-19 (error)** You cannot specify both **-cover\_design** and **-cover\_nets**.

## DESCRIPTION

Only one of the path coverage options can be specified on a call to **write\_constraints**. You can specify either **-cover\_design** or **-cover\_nets**, but not both.

## WHAT NEXT

Re-execute **write\_constraints** using one or the other of **-cover\_design** or **-cover\_nets**.

## **WC-20 (error) '%s' is not supported with the Synopsys format.**

### **DESCRIPTION**

The `-environment` option is only supported when using the SDF format.

### **WHAT NEXT**

Try again with the format specified as SDF (`-format SDF`).

## **WC-21 (warning) Can't use the %s option with the -environment option.**

### **DESCRIPTION**

The specified option can not be used with the `-environment` option. It will be ignored.

### **WHAT NEXT**

## **WC-30 (warning) -max\_path\_slack is only supported when using -cover\_design.**

### **DESCRIPTION**

The `-max_path_slack` option is only supported when used in conjunction with the `-cover_design` option when using the `write_constraints` command. The generated constraints are valid but the `-max_path_slack` option was ignored.

### **WHAT NEXT**

In general, use of the `-cover_design` option will result in a set of paths which are more unique than a like number of paths generated without this option. Therefore, the best course of action is to add the `-cover_design` option to the `write_constraints` command line and run the command again.

## **WINSEL**

```
WINSEL-001.n
```

## **WINSEL-001 (Warning) Invalid object class %s. Supported objects are : %s**

### **DESCRIPTION**

The specified object class does not exist.

### **WHAT NEXT**

Verify that the object class exists and the spelling is correct.

## **WINSEL-002 (ERROR) Bad syntax for rectangle: %s**

### **DESCRIPTION**

The syntax specified for the rectangle was not acceptable. Correct syntax is, a rectangle must be of the form

```
{ <lower_left_point> <upper_right_point> }
```

and the point is

```
{ <x_dist> <y_dist> }
```

Note that distances are fixed point numbers, like 17.25 or 13000.1 or 2500.

### **WHAT NEXT**

Please fix the syntax and try again.

```
WINSEL-003.n
```

## **WINSEL-003 (error) Nothing matched for search constraints.**

### **DESCRIPTION**

No objects satisfied the constraints you specified.

## **WHAT NEXT**

Check the command arguments you gave, and see if the constraints can be changed or relaxed to make a match.

## WL

### WL-1 (Warning) Overwriting library file '%s'.

#### DESCRIPTION

The library file specified with **create\_wire\_load -output** already existed. It has been overwritten with a new library file.

#### WHAT NEXT

If it's not necessary to keep the old library file, nothing needs to be done. If it's necessary to keep the old library file, to avoid losing it, look for a backup copy and rename it.

### WL-2 (Error) File '%s' cannot be opened for writing.

#### DESCRIPTION

The library file cannot be opened for writing.

#### WHAT NEXT

Check the user-writing privileges in the current directory and in the directory specified by the path. Check to see if a file with the same location and name already exists and cannot be overwritten by the user.

### WL-3 (Warning) Smoothing is unused, creating possibly unrealistic models.

#### DESCRIPTION

The **create\_wire\_load** command created models without "smoothing" the wire load model curve. Which means that the models might not be realistic. Using linear approximations, the smoothing operations ensure that the model curve is gradually increasing with the fanout. Smoothing also adds pessimism to high fanouts.

#### WHAT NEXT

The models are created from basic averages of the back-annotation data. Use **report\_wire\_load** to check the validity of the models created. The models may be

inaccurate if the average capacitance is not increasing with the fanout, or if the number of points used to calculate the average capacitance is small (less than 50) and the standard deviation is high.

If the model is invalid, use the *output* option to write the model to a text file. Then edit the text file before updating the model into a library using **update\_lib**. To smooth the model's curve, use **create\_wire\_load** without the *dont\_smooth* option.

## WL-4 (Information) Writing wire load model(s) to library file '%s'.

### DESCRIPTION

The **create\_wire\_load** command generated wire load models in the specified file. The models were not set on the current design.

### WHAT NEXT

Using **report\_wire\_load**, verify the accuracy of the wire load created. To set wire load models on the design, use **create\_wire\_load** without the *output* option. Use **update\_lib** to save the wire load models in a library file.

## WL-5 (Information) Creating wire load model(s) for design '%s'.

### DESCRIPTION

The **create\_wire\_load** command generated wire load models for the identified design. The wire load models created are set on the design, and when *hierarchy* is set, its subdesigns. If the *update\_lib* option is used, they are also stored in a library file.

### WHAT NEXT

Verify the validity of the wire load models created and set on the design. To check the wire loads set on designs/clusters, and to verify the accuracy of the designs/clusters, use **report\_wire\_load**, **report\_design**, and **report\_clusters**.

## WL-6 (Error) Current design is not unqualified.

### DESCRIPTION

The design has multiple instances of the same subdesign.

## WHAT NEXT

Uniquify the design before creating wire load models. Use the **uniquify** command to eliminate multiple instances. This command creates a unique copy of the design for each instance and names the new designs according to the *uniquify\_naming\_style* variable. You can also manually uniquify by using the **copy\_design** and **change\_link** commands.

## WL-7 (Error) Could not find cluster '%s' in design '%s'.

### DESCRIPTION

The **create\_wire\_load** command could not find the cluster identified with the *cluster* option.

### WHAT NEXT

Using the **report\_clusters** command, verify the name of the clusters on the current design. Add cluster information to the design with the **read\_clusters** command.

## WL-8 (Information) Setting wire load model mode from '%s' to '%s' for design '%s'.

### DESCRIPTION

The **create\_wire\_load** command is setting the wire load model mode to "enclosed" if the *hierarchy* or *top* options are used, or to the mode specified by *fmode* otherwise.

With "top" mode, all nets in the design are estimated with the wire load model set at the top level of the design. This mode is not recommended if the design is hierarchical or if subdesigns have different wire load models than the top design has. This mode is recommended if the design has no hierarchy.

With "enclosed" mode, nets in the design are estimated with the wire load model set at the lowest level of hierarchy containing all segments of the net. This mode is recommended for hierarchical designs.

With "segmented" mode, each net segment in the design is estimated with the wire load model set at the level of hierarchy containing the net segment. This mode is recommended for hierarchical designs, but it is not as accurate as the "enclosed" mode is.

## WHAT NEXT

Verify that the wire load model set on the specified design is acceptable.

## WL-9 (Information) Changing wire load model from '%s' to '%s' for %S '%S'.

### DESCRIPTION

The **create\_wire\_load** command overwrites wire load models previously created and set on the design or its clusters.

### WHAT NEXT

Use **create\_wire\_load** with the **-output** option to save the model into a file. Before running the timing verifier or compiling the design, verify with the **report\_wire\_load** command that the expected wire load model is set on the design or its clusters.

## WL-10 (Error) The wire model name '%s' is already used in %s '%S'.

### DESCRIPTION

There is already a wire load model with the same name in the specified design/cluster.

### WHAT NEXT

Use another name with **create\_wire\_load -name**, or remove the wire load model set on the design/cluster with **set\_wire\_load\_model**.

## WL-11 (Warning) Wire load model '%s' unused because design '%s' has clusters.

### DESCRIPTION

Because the current design contains clusters or because the **-hierarchy** option was used, the **create\_wire\_load** command did not use the model name defined with the **name** option. Because only one name is defined with the **name** option, it is ambiguous as to

which cluster or design the defined wire load model name should apply to.

## WHAT NEXT

Use the options *cluster* and *name* to define the wire load model name for a specific cluster. Do not use the *-hierarchy* option with the *-name* option. Verify the wire load names on the clusters with **report\_clusters**.

# WL-12 (Information) Creating wire load models for clusters of design '%s'.

## DESCRIPTION

The current design has cluster information. Because the cluster information is useful for creating more accurate wire load models, wire load models are created for the clusters by default.

## WHAT NEXT

Use **remove\_clusters** to remove the cluster information from the current design if you wish to create wire load models for the logical hierarchy.

# WL-13 (Warning) The wire model name '%s' is already used in %s '%s'.

## DESCRIPTION

There is already a wire load model with the same name in the specified library. The wire load model has been created.

## WHAT NEXT

The wire load model created should not be updated in the specified library unless you intend to overwrite the wire load in the library.

# WL-14 (Error) Bad percentile value, must be between 0 and 100.

## DESCRIPTION

The **create\_wire\_load** command failed because the *percentile* option was used with an

invalid value. Valid values are numbers between 0 and 100.

The "average" of net capacitance for a fanout is chosen so that there is a certain percentage of data points below the "average" value. For example, with 10 capacitances—1, 2, 3, 4, 6, 7, 9, 10, 12, 17—and a percentile of 75, the "average" capacitance for this fanout is such that 75% of the capacitances are below the "average," which in this case is 10. The default value is 0. In this case, standard averages are calculated. In the previous example, the average is 7.1. This option allows the creation of more pessimistic wire load models.

## WHAT NEXT

Use `create_wire_load` with a valid percentile value.

# WL-15 (Error) Bad trim value. Must be 0 <= trim\_value < 50.

## DESCRIPTION

The `create_wire_load` command failed because the *trim* option was used with an invalid value. Valid values are numbers greater than or equal to zero (0) and less than 50. Each fanout has a capacitance range, which is bound by the minimum capacitance and the maximum capacitance annotated on nets.

The trim value is the percentage of data points removed from each end of the capacitance range. The trim operation assures that data points at the extremes of the capacitance range are not used for calculating the average capacitance. The trim increases the accuracy of the model created. The trim does not occur if there is less than 10 data points.

## WHAT NEXT

Use `create_wire_load` with a valid trim value. The default value is 10; that is, 20% of data points are not used.

# WL-16 (Warning) There is no default\_wire\_load\_resistance in library '%s'. Using 0!

The models created will estimate 0 interconnect delays.

## DESCRIPTION

The defined library has no *default\_wire\_load\_resistance* value. The `create_wire_load` command created models that estimate net resistances to zero (0), and thus interconnect delays to zero (0).

## WHAT NEXT

If you have a Library Compiler license, add a `default_wire_load_resistance` in the technology library. The `default_wire_load_resistance` can either be the worst of all routing layers' resistance per unit length or their average.

If you do not have a Library Compiler license, but know the routing layers resistance per unit length, use `create_wire_load -output` to write models into a file. Then update the "resistance" field in the models in the file. Then update the file into a technology library on the link path, with `update_lib`.

The resistance per unit length should be the same as the one for other wire load models of the same technology. Use `report_lib` to check the resistance per unit length of wire load models in the technology library.

## WL-17 (Warning) There is no `default_wire_load_capacitance` in library '%s'. Using 1.

### DESCRIPTION

The defined library has no `default_wire_load_capacitance` value. The `create_wire_load` command created models that assume a net capacitance per unit length of 1.

## WHAT NEXT

If you have a Library Compiler license, add a `default_wire_load_capacitance` in the technology library. The `default_wire_load_capacitance` can either be the worst of all routing layers' capacitance per unit length or their average.

If you do not have a Library Compiler license, keep the created models. The net length is not exact, but the capacitance calculated from the net length is correct.

Because the net length is incorrect, the net resistance and net area will not be estimated accurately unless you modify the "resistance" and "area" per unit length of the models created. To do so, identify with `report_lib` the resistance per unit length and area per unit length of wire load models in the technology library. Then, use `create_wire_load -output` to write models into a file. Then update the "resistance" and "area" fields in the models in the file. Finally, with `update_lib`, update the file into a technology library on the link path.

## WL-18 (Warning) The `default_wire_load_capacitance` in library '%s' is invalid.

# Using 1.

## DESCRIPTION

The defined library has no valid `default_wire_load_capacitance` value. Valid `default_wire_load_capacitance` values are numbers greater than zero (0). The `create_wire_load` command created models that assume a net capacitance per unit length of 1.

## WHAT NEXT

If you have a Library Compiler license, add a valid `default_wire_load_capacitance` in the technology library. The `default_wire_load_capacitance` can either be the worst of all routing layers' capacitance per unit length or their average.

If you do not have a Library Compiler license, keep the created models. The net length is not exact, but the capacitance calculated from the net length is correct.

Because the net length is incorrect, the net resistance and net area will not be estimated accurately unless you modify the "resistance" and "area" per unit length of the models created. To do so, identify with `report_lib` the resistance per unit length and area per unit length of wire load models in the technology library. Then, use `create_wire_load -output` to write models into a file. Then update the "resistance" and "area" fields in the models in the file. Finally, with `update_lib`, update the file into a technology library on the link path.

# WL-19 (Error) can't use -mode top for -cluster or -hierarchy

## DESCRIPTION

We do not support `mode` on a cluster. It is always assumed to be `enclosed`.

Also, mode `top` for `hierarchy` does not make sense. In `top` mode, any wire load model on a lower level hierarchy will be overwritten, therefore those wire load models created by `hierarchy` on lower level hierarchy have no effect at all.

## WHAT NEXT

Remove unwanted options.

# WL-20 (Warning) this combination of options does not usually

make sense.

## DESCRIPTION

We recommend use all enclosed nets (including child hierarchy) for mode **top**; and only nets in this level of hierarchy for mode **enclosed**. If you do need other combinations, it is still legal to do so, but you must take extra precaution.

## WHAT NEXT

Change the options according to the methodology.

# WL-21 (Warning) Design '%s' is flat.

## DESCRIPTION

You should specify *hierarchy* only if your design does have physical or logical hierarchy. Because the design is flat, *hierarchy* will be ignored.

## WHAT NEXT

Remove this option if it is a typo.

# WL-22 (Error) The mode '%s' is not supported.

## DESCRIPTION

Only **top** and **enclosed** are supported.

## WHAT NEXT

Please use **top** or **enclosed** mode.

# WL-23 (Error) Library '%s' is not in memory.

## DESCRIPTION

The `-update_lib` option only works on a library which already resides in memory.

## WHAT NEXT

If you want to update a library after `create_wire_load`, do not remove it from the memory with the `remove_lib` command. You should not update a library which is not linked with the current design, either. Also check whether there is any typo in the library name given.

# WL-24 (Information) Creating wire load model(s) for cluster '%s'.

## DESCRIPTION

The `create_wire_load` command generated wire load models for the identified cluster. The wire load models created are set on the cluster, and when *hierarchy* is set, its subclusters. If the `update_lib` option is used, they are also stored in a library file.

## WHAT NEXT

Verify the validity of the wire load models created and set on the cluster. To check the wire loads set on designs/clusters, and to verify the accuracy of the designs/clusters, use `report_wire_load`, `report_design`, and `report_clusters`.

# WL-25 (Error) Design '%s' has no net capacitance annotated.

## DESCRIPTION

The `create_wire_load` command generates wire load models from net capacitance annotated on the current design. There is no net capacitance annotated on the current design, so no wire load model can be created.

## WHAT NEXT

Use the `set_load` command to annotate net capacitance on the current design. The net capacitances are given from the net reports of the layout tools.

# WL-26 (Information) %d wire load model(s) written to file '%s'.

## DESCRIPTION

The `create_wire_load` command generated wire load models in the specified file. The wire load models were not set on the design.

## WHAT NEXT

Use **create\_wire\_load** without the *output* option to create and set wire load models on the current design. To save the wire load model created, update the wire load models in the specified file into a library file with the command **update\_lib**.

## WL-27 (Information) Creating wire load model '%s' for cluster '%S'.

### DESCRIPTION

The **create\_wire\_load** command generated a wire load model for the given cluster. Note that the wire load model is set on the cluster if the *output* option was not used. If the *output* option was used, the wire load model is stored in the library text file.

### WHAT NEXT

For more information about creating wire load models, see the **create\_wire\_load** man page.

## WL-28 (Warning) Model '%s' had a slope of %.2g, changing to slope = 1.

### DESCRIPTION

The **create\_wire\_load** command generated a wire load model with a negative slope. Negative slopes do not represent reality. A negative slope implies that high fanout nets can be driven faster than low fanout nets. The slope has been changed to 1.

### WHAT NEXT

The wire load model you created is not accurate because all nets annotated have the same fanout number. Edit the model to set the slope.

To edit the wire load, use the *output* option of the **create\_wire\_load** command to write the wire load in a text file. Then, if necessary, edit this text file to change the slope value. With the **update\_lib** command, the edited wire load model can be stored in a library and, with **set\_wire\_load\_model**, set on a design.

## WL-29 (Warning) No wire load model created for the design/

**cluster '%s'.**

## **DESCRIPTION**

The **create\_wire\_load** command could not find any enclosed nets on the specified design/cluster, or those nets have no net capacitance annotated. So, no wire load model could be created. Capacitances annotated on nets connected to top level ports are not used for creating wire load models.

## **WHAT NEXT**

Annotate net capacitances on the design/cluster, with the **set\_load** command. Use values from the net reports of the layout tools. Make sure the design/cluster does have nets which are not connected to top level ports.

# **WL-30 (Warning) Not all nets had capacitance annotated.**

## **DESCRIPTION**

The **create\_wire\_load** command generated a wire load model. Not all nets in the design or cluster had a net capacitance annotated. Which means that the wire load model may not be accurate. Nets without annotated capacitance are not taken into account for creating the wire load models.

## **WHAT NEXT**

You can identify the nets with missing back-annotation using command "check\_design -post\_layout" and annotate capacitances on those nets. Otherwise, you can verify the accuracy of the wire load model created with **report\_wire\_load**. The standard deviation is rating the accuracy of the net length for each fanout.

# **WL-31 (Information) Creating wire load model '%s' for design '%s'.**

## **DESCRIPTION**

The **create\_wire\_load** command generated a wire load model for the given design. Note that the wire load model is set on the design if the *output* option was not used. If the *output* option was used, the wire load model is stored in the library text file.

## **WHAT NEXT**

For more information about creating wire load models, see the **create\_wire\_load** man

page.

**WL-32** (warning) Total area (%g) not greater than cell area (%g) for %s.

The -total\_area option will be ignored as a result.

## DESCRIPTION

The total area specified for the named design/cluster is not greater than the cell area. This implies a negative area for the wires. Area coefficients will not be calculated for any created wire load models. Note that wire load models may still end up with area coefficients if there is a default area value in the library.

## WHAT NEXT

Remove the -total\_area option from the create\_wire\_load command line or increase the area value such that it is greater than the cell are of the design or cluster.

**WL-33** (warning) Area coefficients will not be calculated because the variable create\_wl\_dont\_set\_wire\_load has been set to true.

## DESCRIPTION

The variable create\_wl\_dont\_set\_wire\_load has been set to true, which means that wire loads generated by create\_wire\_load are not to be set on the design or clusters. Area coefficients can not be calculated unless the wire load models are set on the design or cluster, so they will not be calculated.

## WHAT NEXT

Remove the -total\_area option from the create\_wire\_load command line or change the value of the variable create\_wl\_dont\_set\_wire\_load to false.

**WL-34** (Information) %d wire load model(s) written to library

'%S'.

## DESCRIPTION

Wire load models generated by the **create\_wire\_load** command are saved into the library. The library must already reside in memory, and will not be write back to disk after being updated.

## WHAT NEXT

Use the **write\_lib** to write the library back to disk.

**WL-35 (Information)** set\_wire\_load\_model command written to script file '%S'.

## DESCRIPTION

A set\_wire\_load\_model command corresponding to the wire load model generated by the **create\_wire\_load** command is written into the script file. The new command is appended to any existing content of the file.

## WHAT NEXT

Use the script to set wire load models in another run.

**WL-37 (Warning)** Cannot set wire load on '%S'.

## DESCRIPTION

For instances, you can only set wire load models or selection groups on hierarchical cell instances.

## WHAT NEXT

Respecify the command.

## **WL-40 (error) Could not find user specified selection group: %s.**

### **DESCRIPTION**

The user specified selection group could not be found. If the selection group was specified using `set_wire_load_selection_group` with the `-library` switches, then the selection group was not found in the user specified library (must be in the link path). Otherwise the selection group was not found in the first used target library or in the first library of the link path.

### **WHAT NEXT**

Either change the current selection group name to something which can be found in the link library or target library variables, or update the link library or target library variables such that the current selection group name can be found.

## **WL-50 (Error) The -cell option does not work for physical hierarchy.**

### **DESCRIPTION**

It is an error to specify both `cell` and `cluster`, because `cell` specifies a logical hierarchy, but logical hierarchy and physical hierarchy are not corresponding to each other at all.

It is also an error to specify both `cell` and `hierarchy` with cluster information. Again this is because `cell` specifies logical hierarchy.

### **WHAT NEXT**

Remove unwanted options.

## **WL-51 (Error) Empty list given with the -cell option.**

### **DESCRIPTION**

The `cell` option expects a list of hierarchical cells.

### **WHAT NEXT**

Check whether it is the option you want.

## WL-52 (Warning) Cell '%s' is not a hierachial cell.

### DESCRIPTION

We do not create wire load model for leaf cells.

### WHAT NEXT

Check if it is a typo.

**WL-53 (Warning)** Variable '%s' is set true. Wire resistance is ignored. Using this variable can invalidate the DesignWare cache. Refer to the 'compile\_ignore\_wire\_resistance' man page for more details.

### DESCRIPTION

If you receive this message, **compile** has detected that the variable **compile\_ignore\_wire\_resistance** is set to *true*, indicating that **compile** is to ignore wire resistance when performing wire delay calculations.

Changing the value of either **compile\_ignore\_wire\_resistance** or **compile\_ignore\_wire\_area** invalidates the contents of the DesignWare cache.

### WHAT NEXT

If you want **compile** to use wire resistance in wire delay calculations, set **compile\_ignore\_wire\_resistance** to *false*.

After you change either **compile\_ignore\_wire\_resistance** or **compile\_ignore\_wire\_area**, you must regenerate the DesignWare cache. For instructions, see the man page for the **compile\_ignore\_wire\_resistance** variable.

### SEE ALSO

**compile** (2), **compile\_ignore\_wire\_area** (3), **compile\_ignore\_wire\_resistance**(3).

**WL-54 (Warning)** Variable '%s' is set true. Wire area is ignored. Using this variable can invalidate the DesignWare cache. Refer

to the '`compile_ignore_wire_area`' man page for more details.

## DESCRIPTION

If you receive this message, `compile` has detected that the variable `compile_ignore_wire_area` is set to `true`, indicating that `compile` is to ignore wire area when performing wire delay calculations.

Changing the value of either `compile_ignore_wire_area` or `compile_ignore_wire_resistance` invalidates the contents of the DesignWare cache.

## WHAT NEXT

If you want `compile` to use wire area in wire delay calculations, set `compile_ignore_wire_area` to `false`.

After you change either `compile_ignore_wire_area` or `compile_ignore_wire_resistance`, you must regenerate the DesignWare cache. For instructions, see the man page for the `compile_ignore_wire_area` variable.

## SEE ALSO

`compile` (2), `compile_ignore_wire_area` (3), `compile_ignore_wire_resistance`(3).

# WL-55 (Warning) Wire load table size must be greater than 15.

## DESCRIPTION

Wire load table size must be greater than 15, otherwise the value will be ignored and the default value of 20 will be used.

## WHAT NEXT

Decide on a value greater than 15.

## **WMDB**

**WMDB-1** (error) Internal error in creating mdb object for design '%s'.

### **DESCRIPTION**

### **WHAT NEXT**

**WMDB-2** (error) Layer information not converted to mdb in design '%s'.

### **DESCRIPTION**

**WHAT NEXT**

**WMDB-12** (error) Entry already in the hash table for site object%*s*.

**DESCRIPTION**

**WHAT NEXT**

**WMDB-13** (error) Entry already in the hash table for wirecode object %*s*.

**DESCRIPTION**

This error message occurs when routes in the Milkyway database contain wires with duplicate IDs.

## **WHAT NEXT**

Check the routes by reviewing the PDEF file for duplicate layers. Remove the duplicate layers and rerun the command.

## **WMDB-14 (error) Entry already in the hash table for via object '%S'.**

### **DESCRIPTION**

This error message occurs when the routes in the Milkyway database contain vias that have duplicate IDs.

### **WHAT NEXT**

Check the routes by reviewing the PDEF file for duplicate layers. Remove the duplicate layers and rerun the command.

## **WMDB-15 (warning) Rectilinear shape for core area are not supported .**

### **DESCRIPTION**

The rectilinear core shapes on the floorplan are not supported by write\_mdb. No floor plan data will be translated correctly by write\_mdb.

### **WHAT NEXT**

Dumpout PDEF and update the rectilinear shape to a rectangular shape until this feature is supported.

## **WMDB-16 (error) Die size of the chip not set correctly for design**

'%S'.

## **DESCRIPTION**

### **WHAT NEXT**

**WMDB-17 (information)** The tool detected and pre-existing cell instance group "%s

## **DESCRIPTION**

This message advises you that the cell group that existed in the CEL has been deleted and updated with an instance group from the tool.

### **WHAT NEXT**

This is only an informational message. No action is required.

**WMDB-18 (warning)** Creation of MDB to set the cell boundary failed for design '%s'.

## **DESCRIPTION**

### **WHAT NEXT**

**WMDB-19 (information)** The tool detected the pre-existing cell plan group "%s

## **DESCRIPTION**

This message advises you that the plan group that existed in the CEL has been deleted and updated with bounds from the tool.

### **WHAT NEXT**

This is only an informational message. No action is required.

However, if the existing plangroup was a exclusive plangroup, you might have to re-apply the properties again, since the tool does not support the exclusive plangroup and the property might have been lost during a read or write operation.

## **WMDB-20** (error) creation of milkway DB for baseArray failed for design '%s' .

**DESCRIPTION**

**WHAT NEXT**

**WMDB-128** (warning) Failed to attach hierarchical port instance un-connect net!.

**DESCRIPTION**

**WHAT NEXT**

**WMDB-129** (warning) Failed to attach hierarchical port instance

to cell instance!.

## DESCRIPTION

## WHAT NEXT

**WMDB-130** (warning) Failed to query cell instance ('%s') by name during hierarchy preservation.

## DESCRIPTION

This warning message occurs when the Milkyway libraries are corrupted and the flat instance does not match the database file.

## WHAT NEXT

This is only a warning message.

However, you can eliminate this warning message by writing to a new cell.

**WMDB-131** (error) Failed to attach the reference library '%s'.

## DESCRIPTION

This error message occurs when the specified reference libraries cannot be set for the design library.

## WHAT NEXT

Check that the reference library path is valid. Check that the libraries have the necessary permissions. Ensure that the reference libraries are relative to the design library (and not the current directory).

**WMDB-132** (warning) Failed to create instance '%s', for master '%s'.

## DESCRIPTION

This warning message occurs when the FRAM libraries are missing. Some cells are

treated as a black box and are not recognized by the Astro router.

## WHAT NEXT

Check the reference libraries added to the design libraries and verify that the master name exists in the corresponding reference library.

# WMDB-133 (error) Failed to create net '%s'.

## DESCRIPTION

This error message occurs when the creation of the specified net fails. This failure may be caused by corrupted Milkyway libraries.

## WHAT NEXT

Rerun the design from a clean directory. Make sure that the permissions are correct and there is enough disk space.

# WMDB-134 (error) Failed to bind the design with '%s'.

## DESCRIPTION

This error message occurs when the FRAM libraries do not exist for all of the leaf cells.

## WHAT NEXT

Check the reference libraries that are added for the design libraries and ensure that the necessary STD cells are present in the reference libraries.

# WMDB-135 (error) Failed to create port '%s' for net '%s'.

## DESCRIPTION

This error message occurs when the tool fails to create the specified port because of a mismatch in FRAM libraries and the hierarchy cells.

## WHAT NEXT

Make sure that the library preparation is performed using the **gePrepLibs** command.

For the reported reference name, make sure that the FRAM libraries are consistent with the .lib file.

## SEE ALSO

gePrepLibs(2)

# WMDB-136 (error) Failed to connect port instance '%s' in cell '%s' with net '%s'.

## DESCRIPTION

This error message occurs when the specified port instance is not connected with the specified net. This may be due to inconsistent FRAM libraries and .lib files.

## WHAT NEXT

Make sure that your libraries are consistent and run the command again.

# WMDB-137 (error) Top design is not set correctly.

## DESCRIPTION

This error message occurs when the current design is not set correctly.

## WHAT NEXT

Run the **current\_design** command and set the top design for the **write\_mdb** command to work correctly.

## SEE ALSO

current\_design(2)  
write\_mdb(2)

# WMDB-138 (warning) Link the design prior to running the

## **write\_mdb command.**

### **DESCRIPTION**

This warning message occurs to advise you to run the **link** and the **link\_physical** commands before running the **write\_mdb** command.

### **WHAT NEXT**

This is only a warning message. You can eliminate this warning message by following the steps below.

Run the **link** command, and then run the **link\_physical** command, making sure each command completes successfully. Then run the **write\_mdb** command.

### **SEE ALSO**

**link(2)**  
**link\_physical(2)**  
**write\_mdb(2)**

## **WMDB-139 (warning) Failed to create port '%s', for ref\_name '%s'.**

### **DESCRIPTION**

This warning message occurs when the specified port cannot be created for the specified reference name. The port is not created because of a mismatch in the FRAM libraries and the hierarchy cells.

### **WHAT NEXT**

This is only a warning message. You can eliminate this warning message by following the steps below.

Make sure that the library preparation is done using the **gePrepLibs**. Also, make sure that the FRAM libraries are consistent with the

### **SEE ALSO**

**gePrepLibs(2)**

## **WMDB-140** (warning) Unable to save cell master '%s'.

### **DESCRIPTION**

This warning message occurs when the specified cell cannot be stored to the Milkyway NETL view.

### **WHAT NEXT**

This is only a warning message.

You can safely ignore this warning message if you are using Astro and you are not dependent on the NETL view.

If you want to use the NETL view, use the ASCII flow and the **auVerilogIn** Astro command.

### **SEE ALSO**

The **auVerilogIn** Astro command in Physical Implementation Online Help.

## **WMDB-141** (warning) Unable to save cell master '%s'.

### **DESCRIPTION**

This warning message occurs when the specified cell cannot be stored to the Milkyway NETL view.

### **WHAT NEXT**

This is only a warning message.

You can safely ignore this message if you are using Astro and you are not dependent on the NETL view.

If you want to use the NETL view, use the ASCII flow and **auVerilogIn** Astro command.

### **SEE ALSO**

The **auVerilogIn** Astro command in Physical Implementation Online Help.

## **WMDB-142** (warning) Instance doesn't exist '%s' .

### **DESCRIPTION**

### **WHAT NEXT**

## **WMDB-143** (error) Directory not writable '%s'.

### **DESCRIPTION**

This error message occurs when the directory pointed by the `mw_design_library` variable is not writable.

### **WHAT NEXT**

Verify that the directory pointed by `mw_design_library` is a valid directory and that you have the correct file permissions.

### **SEE ALSO**

`mw_design_library(3)`

## **WMDB-144** (warning) Logical design data exists in '%s'.

### **DESCRIPTION**

This warning message occurs when the LOGIC view design data already exists. This may be due to a previous `write_mdb` command. This may also be due to very low memory available on the system.

### **WHAT NEXT**

This is only a warning message. You can eliminate this warning message by following the instructions below.

Run the command again on a new `mw_design_library` directory or use a machine with more swap space.

### **SEE ALSO**

`write_mdb(2)`

## WMDB-146 (error) Failed to create netlist view for design '%s'.

### DESCRIPTION

This error message occurs when the netlist view is not created for the specified design. This NETL view does not exist.

### WHAT NEXT

Check that the permissions are correct for the value pointed to by the **mw\_design\_library** variable and verify that the directory is writable.

Also, check that the values pointed to by the **mw\_reference\_library** variable exist.

If you are using Astro, you can use the CEL view to do routing without any issues and the NETL view can be ignored.

### SEE ALSO

`mw_design_library(3)`  
`mw_reference_library(3)`

## WMDB-147 (info) Starting to Expand the netlist for design '%s' .

### DESCRIPTION

### WHAT NEXT

## WMDB-148 (error) Failed to create expand view for cell '%s'.

### DESCRIPTION

### WHAT NEXT

## WMDB-149 (warning) Flat instance does not exist '%s'.

### DESCRIPTION

This warning message occurs when the flat instances that are added for multi-voltage do not exist in Milkyway. The region object in the tool may not be translated

correctly to Milkyway.

## WHAT NEXT

This is only a warning message.

However, if the result is not what you intended, you can check the flat object where the multi-voltage property is set and determine if it exists in Milkyway.

Create the voltage area in Astro after performing the **write\_mdb**. Also, make sure that the hierarchies are consistent in Milkway by running the **astRepairHierPreservation** Astro command.

## SEE ALSO

`write_mdb(2)`  
`astRepairHierPreservation`

# WMDB-150 (error) Top design is not set correctly.

## DESCRIPTION

This error message occurs when the current design is not set correctly.

## WHAT NEXT

Run the **current\_design** command and set the current design correctly.

## SEE ALSO

`current_design(2)`

# WMDB-151 (information) Applications of Milkyway do not accept a port name the same as the net name for design '%s', and are not connected.

## DESCRIPTION

This error message occurs because the design has the same name on a net and on a port, but they are not connected in the specified design and are not accepted by the Milkyway database.

## WHAT NEXT

Define the name rules and change the names on the design before running the `write_mdb` command.

The following example shows one method you can use to change the names on the design:

```
prompt> define_name_rules snps_milkyway -equal_ports_nets
prompt> define_name_rules snps_milkyway -check_internal_net_name
prompt> change_names -rule snps_milkyway -hier
```

The second way to change the names on the design is by running the following command:

```
prompt> change_names -rule verilog -hier
```

## SEE ALSO

`change_names(2)`  
`define_name_rules(2)`

## WMDB-152 (information) Cannot perform incremental operation; using non-incremental mode to save cell '%s'.

### DESCRIPTION

This information message occurs when performing an incremental update using the `write_mdb` command, if either of the following conditions exist:

- The cell with the same name already exists in the Milkyway design library.
- The `write_mdb` follows a `read_mdb` command, such as if the database is created or updated using `read_mdb`.

The routing data and all of the floorplan data that exists in the LOGIC database is saved in the Milkyway database.

In incremental mode, the route information that is changed in the tool is only transferred to Milkyway. The change of route information is normally detected by changes in nets or changes to cell locations in the design w.r.t to the Milkyway database.

## WHAT NEXT

This is an information message only. No action is required.

However, if you want the routing data to be transferred to Milkyway from the LOGIC database, make sure that there are no versions of cells with the same name in the Milkyway design library.

You can create a new design library using the **create\_mw\_design** command and use **write\_mdb** to save the CEL from which to transfer the routes.

## SEE ALSO

`read_mdb(2)`  
`write_mdb(2)`

# WMDB-153 (warning) Failed to get the master name for cell instance '%s'.

## DESCRIPTION

This warning message occurs when the **write\_mdb** command cannot get the master name for the given cell instance, possibly due to a corrupted Milkyway database.

## WHAT NEXT

Check that the **mw\_reference\_library** variable is set correctly and verify that the reference libraries are added to the design library.

## SEE ALSO

`create_mw_design(2)`  
`set_mw_design(2)`  
`mw_reference_library(3)`

# WMDB-154 (error) Failed to initiate a iterator.

## DESCRIPTION

`write_mdb` can not initiate an iterator to iterate through mdb objects.

## WHAT NEXT

Please verify your data and try again in need.

## **SEE ALSO**

**WMDB-155 (error)** Failed to iterate through expanded cell instances.

## **DESCRIPTION**

`write_mdb` failed to iterate through `mdb` expanded cell instances. The `mdb` may be corrupted.

## **WHAT NEXT**

Please verify your data and try again in need.

## **SEE ALSO**

**WMDB-156 (warning)** Failed to delete cell instance '%s'.

## **DESCRIPTION**

`write_mdb` failed to delete a `mdb` cell instances. This cell instance may not exist or the `mdb` has been corrupted.

## **WHAT NEXT**

Please verify your data and try again in need.

## **SEE ALSO**

**WMDB-157 (warning)** Failed to get port type. (port id: %d)

## **DESCRIPTION**

`write_mdb` can not get the port type attribute of a certain port. Port may not exist or `mdb` has been corrupted.

## **WHAT NEXT**

Please verify your data and try again in need.

## SEE ALSO

# WMDB-158 (error) Fail to create port '%s'.

## DESCRIPTION

`write_mdb` can not create a port specified by name '%s' in mdb.

## WHAT NEXT

Please verify your data and try again.

## SEE ALSO

# WMDB-159 (error) Failed to connect net '%s' to port '%s'.

## DESCRIPTION

This error message occurs when the `write_mdb` command cannot connect the specified net to the specified port. Refer to the log file for details.

## WHAT NEXT

Check that the reference libraries are correct, and that the specified ports exist in the reference libraries.

Also, you can try writing into a new design library by creating it with the `create_mw_design` command.

## SEE ALSO

`create_mw_design(2)`  
`write_mdb(2)`

# WMDB-160 (error) Failed to connect pin '%s/%s' to net '%s'.

## DESCRIPTION

This error message occurs when the `write_mdb` command fails to connect the pin with the specified net. This error indicates the Milkyway database may be corrupted.

## WHAT NEXT

Create the design\_library by changing the value of the `mw_design_library` variable in a new directory.

Make sure that the value of the `mw_reference_library` variable is set correctly and that all of the FRAM libraries exist.

Check that the reference libraries are correct and that the specified ports exist in the reference libraries.

You can try writing into a new design library by creating it using the `create_mw_design` command.

## SEE ALSO

# WMDB-165 (warning) Failed to create port vector info object.

## DESCRIPTION

This warning message occurs when the **write\_mdb** command fails to create a vector info object for a hierarchical port. This could cause an inconsistent bus port for the design.

## WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Verify your data and run the command again.

## SEE ALSO

`write_mdb(2)`

# WMDB-166 (warning) Failed to set port vector info object.

## DESCRIPTION

This warning message occurs when the `write_mdb` command fails to build the relationship between a vector info object and a hierarchical port. This causes an inconsistent bus in the design. The bus information for ports may be lost during `read_mdb` or `write_mdb` command activity.

## WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Check your design for RAMS, which may result from BUSES in the RAMS. If you are writing out a NETL view, there should not be any problems in the flow, since Astro can use the information from NETL. This is also true for `read_mdb`.

## SEE ALSO

`read_mdb(2)`  
`write_mdb(2)`

# WMDB-167 (error) Failed to create hierarchical cell instance master '%s'.

## DESCRIPTION

This error message occurs when the the hierarchical cell instance with the specified name for the design cannot be created in Milkyway. The result may cause inconsistent hierarchy data.

## WHAT NEXT

Run the `write_mdb` command on a new Milkyway design library and save it to a new CEL.

If the design is a flat design and if it is a one way flow, you may be able to ignore this message.

## SEE ALSO

`write_mdb(2)`

# WMDB-168 (error) Failed to create hierarchical port instance master '%s'.

## DESCRIPTION

This error message occurs when the hierarchical port instance with the specified name for the design cannot be created in Milkyway. The result may be inconsistent hierarchy data. There is an internal error with the hierarchy preservation of Milkyway.

## WHAT NEXT

Run the `write_mdb` command on a new Milkyway design library and save it to a new CEL.

If the design is a flat design and if it is a one way flow, you may be able to ignore this message.

See the `astRepairHierPreservation` Astro command in Physical Implementation Online Help.

## SEE ALSO

`write_mdb(2)`

# WMDB-169 (error) Hashing error during write\_mdb.

## DESCRIPTION

This error message occurs during `write_mdb` command activity and indicates an internal error with the hierarchy preservation of Milkyway.

## WHAT NEXT

Run the `write_mdb` command on a new Milkyway design library and save it to a new CEL.

If the design is a flat design and if it is a one way flow, you may be able to ignore this message.

## SEE ALSO

## **WMDB-170** (error) Failed to attach hier port inst master '%s' to hier cell inst master '%s'.

### **DESCRIPTION**

This indicates an internal error, during hierarchy preservation.

### **WHAT NEXT**

File a star, and if the design is FLAT, maybe you can ignore this warning message. Try running `change_names -rule verilog` and save the design.

### **SEE ALSO**

## **WMDB-171** (error) Failed to create cell instance '%s'.

### **DESCRIPTION**

This indicates an internal error, during hierarchy preservation.

### **WHAT NEXT**

File a star, and if the design is FLAT, maybe you can ignore this warning message. Try running `change_names -rule verilog` and save the design.

### **SEE ALSO**

## **WMDB-172** (error) Failed to attach vcell instance '%s' to its parent '%s'.

### **DESCRIPTION**

This indicates an internal error, during hierarchy preservation.

### **WHAT NEXT**

File a star, and if the design is FLAT, maybe you can ignore this warning message. Try running `change_names -rule verilog` and save the design.

## **SEE ALSO**

**WMDB-173 (warning)** Failed to get cell instance data from hash table (%s)..

## **DESCRIPTION**

This indicates an internal error, during hierarchy preservation.

## **WHAT NEXT**

File a star, and if the design is FLAT, maybe you can ignore this warning message. Try running change\_names -rule verilog and save the design.

## **SEE ALSO**

**WMDB-174 (information)** Initializing hierarchy preservation...

## **DESCRIPTION**

This indicates the hierarchy perservation is getting initialized by write\_mdb.

The old hierarchy data, if any will be deleted, and the new hierarchy preservation data will be created in the CEL.

## **WHAT NEXT**

## **SEE ALSO**

**WMDB-175 (warning)** Failed to delete hierarchy preservation records.

## **DESCRIPTION**

The hierarchy preservation data that exists in the CEL specified by mw\_cell\_name or -cell option cannot be deleted. If you see this error, it is likely that the hierarchy information is not correct, and needs to be fixed for hierarchy designs.

## WHAT NEXT

The could indicate the data is already corrupted. The user cannot delete the hierarchy preservation manually using Astro and do write\_mdb again.

## SEE ALSO

# WMDB-176 (error) Failed to create new Milkyway library '%s'.

## DESCRIPTION

This error message occurs when the Milkyway design library is not created as specified by the **mw\_design\_library** variable.

## WHAT NEXT

Check that the technology file is correct and that there are no errors when parsing the technology file.

Verify that the value specified in **mw\_design\_library** is correct and the file has the necessary permissions.

Make sure there is enough disk space available to create a new design library.

## SEE ALSO

#### **DESCRIPTION**

#### **WHAT NEXT**

You need to specify a Milkyway library either from the command line or through setting the 'mw\_design\_library' var previous to 'read\_mdb/write\_mdb' command. e.g., to set the var, please follow, set mw\_design\_library design\_lib\_name write\_mdb

view man page to see how to specify from command line.

## SEE ALSO

# WMDB-355 (warning) No reference libraries set for Milkyway design.

## DESCRIPTION

This warning message occurs when a reference library is not specified to the main Milkyway database library (the design library). Link errors may occur if the reference libraries are not specified for the design.

## WHAT NEXT

This is only a warning message. A reference library is required for resolving cell instances.

You can specify a reference library by setting the **mw\_reference\_library** variable, as shown in the example below, before using the **create\_mw\_design** command:

```
psyn_shell-t> set mw_reference_library "ref_lib_name1 ref_lib_name2"
```

You can also specify the reference library by running the **set\_mw\_design** command as shown in the following example:

```
psyn_shell-t> set_mw_design
```

## SEE ALSO

```
create_mw_design(2)

#### **DESCRIPTION**

#### **WHAT NEXT**

#### **SEE ALSO**

**WMDB-365** (error) Failed to open reference library '%s'.

#### **DESCRIPTION**

This error message occurs when the tool fails to open the specified reference library.

A reference library is required for resolving cell instances.

#### **WHAT NEXT**

Make sure you specified the correct reference libraries and that all of the libraries are accessible.

#### **SEE ALSO**

```
create_mw_design(2)
set_mw_design(2)
```

**WMDB-366** (warning) No pdb library present for the reference

**library '%s'.**

## **DESCRIPTION**

This warning message occurs when the **create\_mw\_design** command cannot find the physical library database for the specified reference library.

Physical library databases that provide physical information are required by the **link\_physical\_library** command. The **create\_mw\_design** command automatically adds the physical library databases from reference libraries to the **physical\_library** variable.

## **WHAT NEXT**

This is only a warning message. No action is required.

However, if you want the physical information from the reference Milkyway database library, make sure that sure that the physical database library exists for it.

## **SEE ALSO**

`create_mw_design(2)`

**WMDB-367 (information) Dumping plib from milkyway technology file...**

## **DESCRIPTION**

This information message occurs when the **create\_mw\_design** command is in the process of dumping the physical library from the Milkyway technology file.

## **WHAT NEXT**

This is only an informational message. No action is required.

## **SEE ALSO**

`create_mw_design(2)`

**WMDB-368 (error) Failed to dump physical library from**

## Milkyway design library '%s'.

### DESCRIPTION

This error message occurs when the **create\_mw\_design** command fails to dump the physical library based on the specified technology file.

### WHAT NEXT

Check that your technology file is correct and run the command again.

### SEE ALSO

`create_mw_design(2)`

## WMDB-369 (information) Replacing reference libary for design library '%s'.

### DESCRIPTION

This information message occurs when the **set\_mw\_design** command is replacing the old reference libraries in current **mw\_design\_library** with the new libraries.

### WHAT NEXT

This is only an information message. No action is required.

### SEE ALSO

`set_mw_design(2)`  
`mw_design_library(3)`  
`mw_reference_library(3)`

## WMDB-370 (error) Failed to get reference library for design library '%s'.

### DESCRIPTION

This error message occurs when the tool cannot obtain the reference libraries for a specific Milkyway design library.

## WHAT NEXT

Make sure that the **mw\_reference\_library** is properly set for the current **mw\_design\_library** variable.

## SEE ALSO

```
create_mw_design(2)
set_mw_design(2)
mw_design_library(3)
mw_reference_library(3)
```

# WMDB-371 (error) Failed to create Milkyway design library '%s'.

## DESCRIPTION

This error message occurs when the tool fails to create a Milkyway design library.

## WHAT NEXT

Make sure you run the flow correctly. For a detailed description of how to run the flow, refer to the **create\_mw\_design** command man page.

## SEE ALSO

```
create_mw_design(2)
```

# WMDB-372 (error) Failed to import the physical library '%s'.

## DESCRIPTION

This error message occurs when the **create\_mw\_design** command fails to import the specified physical library database.

## WHAT NEXT

Verify that you provided the correct physical library database by checking the value of the **physical\_library** variable.

## SEE ALSO

```
create_mw_design(2)
physical_library(3)
```

## WMDB-373 (error) Failed to create TLUPlus model for Library '%s'.

### DESCRIPTION

This error message occurs when the `create_mw_design` command fails to create the TLUPlus model for the current `mw_design_library` variable.

### WHAT NEXT

Verify that both the TLU table file and the layer map file are correct and then run the command again.

### SEE ALSO

`create_mw_design(2)`  
`mw_design_library(3)`

## WMDB-374 (error) Failed to get TLUPlus attach file '%s'.

### DESCRIPTION

This error message occurs when the `create_mw_design` command fails to get the TLUPlus attach file for the current `mw_design_library` variable.

### WHAT NEXT

Verify that the TLUPlus file is created correctly.

### SEE ALSO

`create_mw_design(2)`  
`mw_design_library(3)`

## WMDB-375 (error) Failed to remove reference libraries for design library '%s'.

### DESCRIPTION

This error message occurs when the `create_mw_design` command fails to remove old reference libraries from the current design library while attempting to replace them with the new libraries.

## WHAT NEXT

Verify that you are using the correct design library and run the command again.

## SEE ALSO

`create_mw_design(2)`

## WMDB-376 (warning) Failed to add reference library '%s' for design library.

### DESCRIPTION

This warning message occurs when the `create_mw_design` command fails to add the specified reference library to the design library.

### WHAT NEXT

Verify that the reference libraries you specify meet the following criteria:

1. The reference library does exist.
2. The reference library is not the same as the design library.
3. The reference library is accessible.
4. The reference library is consistent with the main library in the technology file.
5. The reference library does not exist in the main library reference list.

**WHAT NEXT**

**SEE ALSO**

**WMDB-380** (warning) Failed to get hierarchical net name.

**DESCRIPTION**

**WHAT NEXT**

**SEE ALSO**

**WMDB-381** (warning) Failed to set routing segment width on a

layer for net '%s'.

#### DESCRIPTION

#### WHAT NEXT

#### SEE ALSO

**WMDB-382** (warning) Failed to read the GCEL grid from milkway design library.

#### DESCRIPTION

#### WHAT NEXT

#### SEE ALSO

**WMDB-383** (information) 'stop at any level' functionality is disabled by variable 'disable\_mdb\_stop\_points'.

#### DESCRIPTION

This information message occurs when the `disable_mdb_stop_points` is set to `true`, which disables the "stop at any level" function for the current command.

#### WHAT NEXT

This is only an information message. No action is required.

#### SEE ALSO

`disable_mdb_stop_points(3)`

## WMDB-384 (information) Cell '%s' is a stop\_point (module %s).

### DESCRIPTION

This information message occurs when the current cell is a stop point module. The `write_mdb` command will not explore the submodules of the current cell. The `write_mdb` command will annotate the nonleaf macro modules as the stop points.

### WHAT NEXT

This is only an information message. No action is required.

### SEE ALSO

`write_mdb(2)`  
`disable_mdb_stop_points(3)`

## WMDB-385 (error) region %s is disjointed, which is not allowed in Milkyway.

### DESCRIPTION

Current region contains disjointed areas, which is not supported by Milkyway.  
`write_mdb` will not save this region to Milkyway.

### WHAT NEXT

Change the disjointed region into different regions and do `write_mdb` again.

### SEE ALSO

`create_region (3)` `remove_region (3)`

## WMDB-386 (error) Failed to create/update property %s for %s.

### DESCRIPTION

`write_mdb` failed to create or update the property for the given object. This will lead to the property missing in the design.

## WHAT NEXT

Please make sure the disk space is enough for milkyway. Also verify your data and try again.

## SEE ALSO

**WMDB-387** (error) Failed to add hierarchical cell %s to the voltage area %s.

## DESCRIPTION

write\_mdb failed to add a hierarchical cell (and its sub-cells) into the voltage area. This is usually caused by a corrupted hierarchy on the db side.

## WHAT NEXT

Verify your data and try again.

## SEE ALSO

`create_region (3)`

**WMDB-388** (Warning) Unit conversion needed, this could lead to precision loss.

## DESCRIPTION

Current design has different "distance unit" value than the one in target mdb library (specified in the tf file). Therefore write\_mdb needs to do the unit conversion.

## WHAT NEXT

## SEE ALSO

`write_mdb (2)`

**WMDB-389** (error) Unit conversion could lead to precision loss

due to roundoff errors. To proceed regardless of precision loss, use the **-enforce\_scaling** option.

## DESCRIPTION

This error occurs because the tool defines the distance unit based on the unit described in the first physical input (for example, in DEF). The error is caused because the current design has a higher distance unit value than the one in the target mdb library (specified in the tf file). Writing does not continue due to the possible data loss caused by roundoff errors during unit conversion.

## WHAT NEXT

Use the **-enforce\_scaling** option to enforce this unit conversion regardless of potential precision loss due to roundoff errors.

**WMDB-390 (Info)** Unit conversion between pdb and mdb. This could lead to precision loss.

## DESCRIPTION

The specified pdb file(s) have different "distance unit" value as the one in target mdb library (specified in the tf file). Therefore the unit conversion could have precision loss. This usually happens when you specify your own pdb file instead of the one generated by write\_mdb.

## WHAT NEXT

Adjust the unit per micro value in pdb files before write\_mdb.

## SEE ALSO

`write_mdb (2)`

## WP

**WP-1** (error) '%s' is an invalid write\_parasitics format. Valid formats are '%s'.

### DESCRIPTION

The `write_parasitics` command has two valid formats: `reduced` and `actual`. By default the parasitics file is generated in reduced format.

### WHAT NEXT

Use `write_parasitics -format reduced` or `write_parasitics -format actual`. Read the `write_parasitics` man page for more information on writing a parasitics file.

**WP-2** (error) '%.2f' is an invalid write\_parasitics ratio. It will be ignored. Valid ratio is in the range 0.0-1.0.

### DESCRIPTION

The `write_parasitics` command ratio has to be in the range 0.0 - 1.0. By default the nets in the reduced format are generated with ratio equal to 0.5. The capacitor closest to the driver is 0.5 times the total net capacitance.

### WHAT NEXT

Read the `write_parasitics` man page for more information on writing a parasitics file.

**WP-3** (information) Writing parasitics to file '%s'.

### DESCRIPTION

The command `write_parasitics` is writing a parasitics file to disk. Check the `write_parasitics` man page for information on how to use the command. Use the `write` command to write a netlist for the current design before using the `write_parasitics` command. This is because `write` can change names and the new names should appear in the parasitics file as well. This message indicates the disk location of the parasitics file created with `write_parasiticspp`.

## WHAT NEXT

The parasitics file can be used in layout tools or other tools reading `write_parasitics` file formats.

## WP-4 (warning) Can't use the '%s' option with the -format "actual" option.

### DESCRIPTION

The specified option cannot be used with the -format "actual" option. It will be ignored.

### WHAT NEXT

Read the `write_parasitics` man page for more information on writing a parasitics file.

## WP-5 (warning) The -format '%s' option is currently unsupported. The reduced format will be used to generate the parasitics file.

### DESCRIPTION

The nets in the parasitics file will be in the reduced SPEF format.

### WHAT NEXT

Read the `write_parasitics` man page for more information on writing a parasitics file.

## WP-6 (error) The design does not have routed information.

### DESCRIPTION

You receive this message because using the `write_parasitics` command with the `-distributed` option requires routed information in psyn\_shell. In icc\_shell you need to run extract\_rc before you can write parasitics.

## WHAT NEXT

In psyn\_shell before running this command, you must run the **compile\_physical**, **legalize\_placement**, **physopt**, or **run\_router** command. In icc\_shell you must run **extract\_rc**.

## SEE ALSO

**compile\_physical** (2), **legalize\_placement** (2), **run\_router** (2), **write\_parasitics** (2).  
**extract\_rc** (2).

**WP-7** (warning) Net %s has more than max number of fanouts.  
Not putting net information in SPEF.

## DESCRIPTION

You receive this message because the **write\_parasitics** command with the **-distributed** option writes out only information for nets with less than the maximum number of fanouts. The **high\_fanout\_net\_threshold** variable defines the maximum number of fanouts.

## WHAT NEXT

You must use the **set\_load** and **set\_resistance** commands for any net with greater than the maximum number of fanouts.

## SEE ALSO

**set\_load** (2), **set\_resistance** (2), **write\_parasitics** (2), **steiner\_route\_fanout\_limit** (3).

**WP-8** (warning) Header information is missing: %s.

## DESCRIPTION

You receive this warning message because you issued the **extract\_rc** command but did not specify all header information. The SPEF writer continues to print out the file even though it is missing the indicated field. This missing field might cause problems for the SPEF reader.

## WHAT NEXT

Ensure that you provide all header information and reexecute the command.

## SEE ALSO

`extract_rc` (2).

# WP-9 (warning) Unsupported direction. Using default direction (BIDIRECTION).

## DESCRIPTION

You receive this warning message because the specified direction of a port is not supported by the SPEF file format. The default direction is used.

The SPEF file format supports three directions: INPUT, OUTPUT, and BIDIRECTION.

## WHAT NEXT

Specify a supported direction for the port and reexecute the `extract_rc` command.

## SEE ALSO

`extract_rc` (2).

# WP-10 (error) Only supports the writing out of the net type.

## DESCRIPTION

You receive this error message because you executed the `write_sdc` command and specified a file type to be written out that is not supported. The SPEF writer can only write out the net type.

## WHAT NEXT

Reexecute the `write_sdc` command and specify a net type.

## SEE ALSO

`write_sdc` (2).

## **WP-12 (error) Not able to write out the %s of net %s.**

### **DESCRIPTION**

The writer has problem writing out the indicated section due to an internal error.

### **WHAT NEXT**

Please call the application support center and report the problem.

## WSCR

### WSCR-001 (error) Cannot open the output file %s

#### DESCRIPTION

The output file for write\_script cannot be opened.

#### WHAT NEXT

Verify that the path for the file name exists. If the path does exist, make sure you have access permission.

### WSCR-002 (information) SDC supports a subset of the constraints supported by Primetime.

Some constraints may not be preserved by write\_sdc.

#### DESCRIPTION

The Synopsys Design Constraints (SDC) format is a subset of the constraints supported by PrimeTime. Some of the constraints which you applied to the design may not be written to SDC. Others may only be partially written.

The following is a complete list of the constraints which are written to SDC with limitations:

- For `set_driving_cell`, the -min and -max options are not supported.
- For `set_port_fanout_number`, the -min and -max options are not supported.

#### WHAT NEXT

### WSCR-003 (information) The design has rise/fall qualified exceptions which will not be written out.

#### DESCRIPTION

Rise/Fall qualified exceptions are only supported by Primetime. So write\_script will

not write out these exceptions for dcsh or dctcl mode. write\_sdc also will not write these exceptions.

## WHAT NEXT

**WSCR-004 (warning)** Your SDC output may contain ambiguous names because you have set the variable `sdc_write_unambiguous_names` to FALSE.

## DESCRIPTION

Beginning with version 1.2, the Synopsys Design Constraints (SDC) format has features ensuring that the cell, net, pin, lib\_cell, and lib\_pin names written to the file are unambiguous. Some third party applications do not understand these features.

You can set the `sdc_write_unambiguous_names` variable to `false` to suppress these features. This warning reminds you that the setting of this variable may cause your SDC output to be ambiguous.

## WHAT NEXT

Verify that you really want to disable the writing of unambiguous names. Review the man pages for the `write_sdc` command and the `sdc_write_unambiguous_names` variable.

## SEE ALSO

`write_sdc` (2), `sdc_write_unambiguous_names` (3).

**WSCR-005 (warning)** Clock '%s' created with -add option will not be written out.

## DESCRIPTION

Multiple clock definition on same pin/port is only supported by PrimeTime. So write\_script will not write out these clocks for dcsh or dctcl mode. write\_sdc also will not write these clocks.

## WHAT NEXT

# WSCR-006 (warning) Cannot disable %s objects from %s to %s.

## DESCRIPTION

The `write_script` command has found multiple arcs between the pins noted in the message, such that a non-zero subset of the arcs is disabled and at least one arc is not disabled. Moreover, the `write_script` command is unable to generate a **filter expression** based on the attributes of the arc objects that can completely distinguish the subset of disabled arcs from the non-disabled ones. If it is the case that some, but not all, of the disabled arcs can be distinguished, then the `write_script` command will cause that subset only to be disabled.

## WHAT NEXT

To match the set of disable arcs between the pins, you need to replicate the methodology by which the arcs were disable in the first place and append the necessary commands to the script file generated by the `write_script` command.

## WT

### WT-3 (information) Writing timing information to file '%S'.

#### DESCRIPTION

The command **write\_timing** is writing a timing file to disk. Check the **write\_timing** man page for information on how to use the command. Use the **write** command to write a netlist for the current design before using the **write\_timing** command. This message indicates the disk location of the timing file created with **write\_timing**.

#### WHAT NEXT

The timing file can be used in simulation tools or other tools reading **write\_timing** file formats.

### WT-4 (warning) Invalid time scale specified. Assuming '1'.

#### DESCRIPTION

The time scale is set with the variables **vhdlout\_time\_scale** and **sdfout\_time\_scale** for the sdf and synopsys\_vhdl timing formats. The time scale must be an integer value greater than zero.

In the synopsys\_vhdl format, timing information is written in 1ns, 1ps or 1us only. The time unit chosen is the time unit specified in the technology library. For example, if the time unit is specified in nanoseconds, the timing data will be written in nanoseconds. If the library time unit is "10ns", the scaling is 10 and the unit is nanoseconds, the timing data is multiplied by 10 and is written in nanoseconds. If there is no time unit in the library, the unit is assumed to be nanoseconds, and the scale is the value of the environment variable **vhdlout\_time\_scale**. For example, if the library has no time unit specified but is in 0.1 ns, set **vhdlout\_time\_scale** to 0.10 in order to scale the data to nanoseconds. If **vhdlout\_time\_scale** is not specified, 1 is the default.

In the sdf format, timing information can be written in 1 10 and 100 multiples of ns ps and us. The time unit in the sdf file is the time unit specified in the technology library and will be written in the timing file under TIMESCALE. If there is no time unit in the library, the unit is assumed to be a multiple of nanoseconds, and the multiple is the value of the environment variable **sdfout\_time\_scale**. For example, if the library has no time unit specified but is in 10 ns, set **sdfout\_time\_scale** to 10 in order to specify the time unit as 10ns and write a timing file in 10ns. If **sdfout\_time\_scale** is not specified, 1 is the default.

## WHAT NEXT

The timing file was written with a default time scale of 1. If the library was not in 1ns, 1ps or 1us, you need to re-write the timing file after setting the value of **vhdlout\_time\_scale** or **sdfout\_time\_scale**. To avoid this warning message, set the value of **vhdlout\_time\_scale** or **sdfout\_time\_scale** to 1 if the library is already in 1ns, 1ps or 1us, or to the scale unit of the library. The value of **sdfout\_time\_scale** can only be 1, 10 or 100.

## WT-5 (error) Invalid write\_timing format specified. Valid formats are synopsys\_vhdl, sdf, sdf-v2.1.

### DESCRIPTION

An invalid format was requested for the **write\_timing** command. The **write\_timing** command valid formats are synopsys\_vhdl, sdf-v2.1 and sdf.

### WHAT NEXT

Re-write the timing file using either **write\_timing -format synopsys\_vhdl** or **write\_timing -format sdf** or **write\_timing -format sdf-v2.1**.

## WT-6 (warning) Using '%s' vhdl time scale of '%f %s'.

### DESCRIPTION

The technology library has timing for cells but no timing unit explicitly specified. This warning indicates the time scale used when writing a timing file in synopsys\_vhdl format.

### WHAT NEXT

The timing unit of the timing in the technology library should be the same as the time scale specified in this message. If it is different, set **vhdlout\_time\_scale** to the timing unit of the library. For example, if the technology library is in 10ns, use: **vhdlout\_time\_scale = 10**.

To determine the current value of **vhdlout\_time\_scale**, use: **list vhdlout\_time\_scale**.

## WT-7 (warning) Design contains black-box components. These

cells will have no timing information.

## DESCRIPTION

A timing file is written for the current design but the design contains cells with no timing. Those cells have no timing because they were not found in the technology libraries in the search path.

## WHAT NEXT

Use the **link -all** command to list which cells are black-box components. Modify the **search\_path** if necessary to solve the link errors before writing the timing file again.

# WT-9 (warning) Using '%s' sdf time scale of '%f %s'.

## DESCRIPTION

The technology library has timing for cells but no timing unit explicitly specified. This warning indicates the time scale used when writing a timing file in sdf format.

## WHAT NEXT

The timing unit of the timing in the technology library should be the same as the time scale specified in this message. If it is different, set **sdfout\_time\_scale** to the timing unit of the library. For example, if the technology library is in 10 ns, use: **sdfout\_time\_scale = 10**.

The valid values for **sdfout\_time\_scale** are 1, 10 and 100. To determine the current value of **sdfout\_time\_scale**, use: **list sdfout\_time\_scale**.

# WT-12 (error) Invalid write\_timing context. Valid contexts are vhdl, verilog.

## DESCRIPTION

The **-context** option of **write\_timing** indicates if the sdf timing file will be used with a verilog or a vhdl netlist. The context name must be one of "vhdl" or "verilog". "vhdl" is the default. With the synopsys\_vhdl format, the context is implicitly "vhdl". With the vhdl context, when library cell names have invalid vhdl names, cell names are modified to follow vhdl naming conventions before being written in the timing file. With the verilog context, the library cell names are written to the timing file without modifications.

## WHAT NEXT

Use `write_timing` with `-context vhdl` or `-context verilog`.

**WT-13 (warning)** The timing file might contain invalid vhdl names if the library '%s' has invalid vhdl cell names.

## DESCRIPTION

The library used for timing the design is older than v2.2. Libraries created before v2.2 can have cell reference names invalid under the VHDL naming conventions. With invalid vhdl names in the library, the timing file might contain invalid vhdl names if the design refers to cells with invalid names.

## WHAT NEXT

If the cell reference names in the library are invalid, the timing file will contain invalid vhdl names. The library needs to be recompiled with Library Compiler of v2.2 or later release.

**XDC**

**XDC-1 (error) Can't open an X Window.**

**DESCRIPTION**

**WHAT NEXT**

## XG

**XG-100** (error) The command '%s' is not yet supported in XG mode.

### DESCRIPTION

This version of XG mode does not support the requested command. This will be supported in a future release.

### WHAT NEXT

### SEE ALSO

**XG-101** (error) The option '%s' for command '%s' is not yet supported in XG mode.

### DESCRIPTION

This version of XG mode does not support the requested option of the command. This will be supported in a future version.

### WHAT NEXT

### SEE ALSO

**XG-102** (error) The command '%s' will not be supported in XG mode.

### DESCRIPTION

XG mode does not support the requested command.

## **WHAT NEXT**

### **SEE ALSO**

**XG-103** (error) The option '%s' for command '%s' will not be supported in XG mode.

## **DESCRIPTION**

XG mode does not support the requested option for this command.

## **WHAT NEXT**

### **SEE ALSO**

**XG-104** (error) EDIF format support is disabled in XG mode.

## **DESCRIPTION**

This error message occurs when you are trying to read or write EDIF format which is not supported in XG mode.

## **WHAT NEXT**

Use supported standard formats.

### **SEE ALSO**

## **XNFI**

### **XNFI-1 (error) %s**

#### **DESCRIPTION**

An error message from the XNF reader.

#### **WHAT NEXT**

Correct the problem in your XNF file and reread.

### **XNFI-2 (warning) %s**

#### **DESCRIPTION**

A warning message from the XNF reader.

#### **WHAT NEXT**

Verify the cause of the warning, correct your XNF file, and reread the file if necessary.

### **XNFI-3 (info) %s**

#### **DESCRIPTION**

An informational message from the XNF reader.

#### **WHAT NEXT**

### **XNFI-4 (error) Cannot open file '%s'.**

#### **DESCRIPTION**

The XNF reader was unable to open a particular file.

## **WHAT NEXT**

Be sure that the file you have identified in the **read** command actually exists.

## **XNFI-5 (error) Cannot create design '%s'.**

### **DESCRIPTION**

The XNF reader was unable to create the named design.

### **WHAT NEXT**

**XNFI-6 (warning) Xilinx family '%s' is currently not supported by the XNF reader.**

The following format(s) are currently supported: %s.

### **DESCRIPTION**

The components that can be specified in XNF are different for different Xilinx families. This message indicates that, according to the Xilinx reader, the family for this particular XNF file is not currently supported.

### **WHAT NEXT**

Convert your XNF design to a family that is supported.

**XNFI-7 (warning) Assuming Xilinx family '%s' for the reading of these XNF file(s).**

### **DESCRIPTION**

The XNF reader is making an assumption regarding the family for these XNF files.

## WHAT NEXT

# XNFI-8 (info) Reading submodule '%s' in file '%s'

## DESCRIPTION

The XNF parser is reading a hierarchical submodule of the XNF design, which is contained in the given file.

## WHAT NEXT

# XNFI-9 (warning) No ports were created in design '%s' because the XNF file had no EXT records.

## DESCRIPTION

Design Compiler requires that a design's interface be completely defined when it is read in. The "external interface" for an XNF design is defined by the EXT records in the XNF file. The XNF reader defines a port on your design for each EXT record the XNF file contains. This message warns that your XNF file has no EXT records and, as a result, the design just created has no ports.

Unfortunately, XNF is not rigorous about defining the external interface to a hierarchical element of a design. In fact, any signal inside a hierarchical design can be used as an "interface" to the outside world. Which means that the interface for a design depends on the particular instantiation, because it is legal for different instantiations of the same design to use different signals as "interfaces." Although this situation probably brings joy to the hearts of hackers, imagine as an analogy a function written in C that could have ANY of its internal variables available to the calling routine.

This "feature" of XNF causes problems for Synopsys tools and leads us to "uniquify" a design "on the fly" as it is being read in, creating a unique design reference for each instance of a hierarchical design.

This works just fine for every design in the hierarchy except the top level, where we are forced either to require a definition for the interface to the design, or to create a port for every net that exists in the design. We've opted for the former, so that means you need to do one of the following:

- Add EXT records to your XNF so that we can build an interface for your design when reading in the XNF.
- Use the `create_port`, `create_net`, and `connect_net` commands to do this from inside

**dc\_shell**.

Good luck.

## WHAT NEXT

Add EXT records to your XNF file, defining the external interface for your design. Or use the **create\_port**, **create\_net**, and **connect\_net** commands to do this from inside **dc\_shell**.

## XNFO

**XNFO-1** (warning) %s '%s' is renamed to '%s' in design '%s' because it isn't a legal name.

### DESCRIPTION

The Xilinx Netlist Format (XNF) language has a restricted character set for naming component symbols and signals. This message indicates that the XNF writer has renamed a component in your design so that it will be syntactically legal in the XNF language.

### WHAT NEXT

You may want to alter your design description to use names that are legal in XNF. For more information about legal names in XNF, see the specification for the language, available from Xilinx.

**XNFO-2** (warning) %s '%s' is renamed to '%s' in design '%s' because of %s of the same name.

### DESCRIPTION

This message indicates that the XNF writer has renamed a component or net in your design to remove a name clash between the component or net and another component or net.

### WHAT NEXT

You may want to alter your design description to use names that do not conflict.

**XNFO-3** (warning) Pin '%s' on cell '%s' has no direction. Not written.

### DESCRIPTION

The Xilinx Netlist Format (XNF) language assumes that all pins on components must have a direction attribute. This message indicates that the XNF writer has encountered a pin in your design without a direction attribute.

## WHAT NEXT

Check your design description to see if you specified the correct pin. Also, make sure your design is correctly linked (via the **link** command).

## XNFO-6 (error) Unable to open XNF output file '%s'.

### DESCRIPTION

This error message occurs when the XNF writer is unable to open a file where XNF output will be placed. Remember that the XNF language specifies hierarchy in a design through the use of separate files, and that an XNF file will be written out for each level of the hierarchy.

### WHAT NEXT

Find out why the named file cannot be opened, fix the problem, and try writing out your design again.

## XNFO-7 (information) Writing XNF output file '%s' for submodule '%s'.

### DESCRIPTION

This informational message tells you that the XNF writer is writing a separate file for a submodule in your hierarchical design. Remember that the XNF language specifies hierarchy in a design through the use of separate files, and that an XNF file will be written out for each level of the hierarchy.

### WHAT NEXT

You do not need to take any action regarding this message. If you do not want your design to be written out flat instead of hierarchically, you need to flatten the design inside the dc\_shell. First, use the *ungroup* command to remove the hierarchy. Second, generate gates for the XNF writer, using the *replace\_fpga* command. Then use the *write* command to write out the XNF for the design.

## XNFO-8 (error) Cell instance '%s' in design '%s' is a CLB. Xilinx does not allow CLB symbols in XNF for their 4000 family FPGAs.

Please run the command 'replace\_fpga' to convert the CLBs in this design to gates.

## DESCRIPTION

Xilinx does not currently (as of March 1992) support a representation for programming 4000 family CLB components directly in XNF, even though previous Xilinx families have in the past supported this capability. This error message is issued whenever the XNF writer detects a CLB component in your design.

## WHAT NEXT

Use the **replace\_fpga** command to convert all CLBs into primitive gates. During the conversion, the **replace\_fpga** command notates the internal design representation with information that describes the boundaries of F, G and H logic generators in each CLB. [ This programming information for the F, G and H blocks is the only kind of CLB programming currently allowed by Xilinx for the 4000 family. ] The netlist writer uses the annotated boundary information to "program" the logic generator blocks in each CLB.

After the **replace\_fpga** command converts all CLBs, call the **write** command.

**XNFO-9 (warning)** Design '%s' was modified after it was converted to gates using the command 'replace\_fpga', and the 'write' command cannot insure that the FMAP and HMAP information on the design is still valid. Therefore, no FMAP or HMAP information will be written for this design.

## DESCRIPTION

Xilinx does not currently (as of March 1992) support a representation for programming 4000 family CLB components directly in XNF, even though previous Xilinx families have in the past supported this capability.

This warning message indicates that the design has been modified between the time that **replace\_fpga** and **write** were run. Therefore, the XNF writer can not guarantee that the mapping information on the design for FMAP and HMAP constructs is still correct.

## WHAT NEXT

Use the **replace\_fpga** command to convert all CLBs into primitive gates. During the conversion, the **replace\_fpga** command notates the internal design representation with information that describes the boundaries of F, G and H logic generators in each CLB. [ This programming information for the F, G and H blocks is the only kind of CLB programming currently allowed by Xilinx for the 4000 family. ] The netlist writer uses the annotated boundary information to "program" the logic generator blocks in each CLB.

After the **replace\_fpga** command converts all CLBs, call the **write** command. Do not call any commands that could change the design representation between the calls to **replace\_fpga** and **write**.

**XNFO-10 (error)** Map information contained in map\_bag '%s' on design '%s' is not valid. This mapping information will not be written out as FMAP or HMAP constructs in XNF.

## DESCRIPTION

Xilinx does not currently (as of March 1992) support a representation for programming 4000 family CLB components directly in XNF, even though previous Xilinx families have in the past supported this capability. Therefore you must the **replace\_fpga** command to convert all CLBs into primitive gates. During the conversion, the **replace\_fpga** command will notate the internal design representation with information that describes the boundaries of F, G and H logic generators in each CLB. [ This programming information for the F, G and H blocks is the only kind of CLB programming that is currently allowed by Xilinx for the 4000 family. ] The netlist writer will use the annotated boundary information to "program" the logic generator blocks in each CLB. This mapping information is stored in a set of "map\_bag"s on the design. If the design is somehow modified between the time that the map bags are created and the time that XNF is written out, this message will occur, to indicate that the FMAP and HMAP mapping information contained in the bag is invalid, and that this information will not be written to XNF. This can result in a lower quality of results for Xilinx designs.

## WHAT NEXT

Run the **replace\_fpga** command to remove the CLB(s) from your design, and then call the **write** command. Do not call any commands that could change the design representation between the calls to **replace\_fpga** and **write**.

**XNFO-11 (error)** Cell instance '%s' in design '%s' is an IOB.  
Xilinx  
does not allow IOB symbols in XNF for their 4000 family FPGAs.

Please run the command 'replace\_fpga' to convert the IOBs in this design to gates.

## DESCRIPTION

Xilinx does not currently (as of March 1992) support a representation for programming 4000 family IOB components directly in XNF, even though previous Xilinx families have in the past supported this capability. Therefore you must the **replace\_fpga** command to convert all IOBs into primitive gates.

This error message is issued whenever the XNF writer detects an IOB component in your design. To fix the error, you need to run the **replace\_fpga** command to remove the IOB(s) from your design, and then call the **write** command.

## WHAT NEXT

Run the **replace\_fpga** command to remove the IOB(s) from your design, and then call the **write** command.

**XNFO-12 (warning)** At least one GSR pin in this design is being driven by a signal other than logic zero. This presents a potential problem, because we do not write out any connection information about GSRs to XNF.

## DESCRIPTION

The XNF (Xilinx Netlist Format) language does not support a GSR pin on a CLB. Therefore, we must assume that all GSR pins in the design are grounded. As a result, any logic in your design that drives a GSR pin will be removed from the actual design written out to XNF. This is serious, because it will certainly result in a design that has a different GSR behavior than the one you've described.

## WHAT NEXT

Modify your design, removing the GSR logic.

## XNFO-13 (information) %d XNF Timing Constraints Written.

### DESCRIPTION

This message indicates the number of XNF timing constraints written in the XNF format. A timing constraint is written for each combinational path in the design.

The information provides feedback on the number of constraints generated so as to inform the user of the impact on the size of the XNF file and the potential runtime increase of placement and routing.

To modify this number, set to zero (0) the io\_variable *xnfout\_constraints\_per\_endpoint*.

### WHAT NEXT

Run placement and routing. Then, either analyze timing within place and route environment, or back-annotate wire delays. Determine whether final wire delays meet the generated timing constraints.

## XNFO-14 (information) Generating XNF Timing Constraints

### DESCRIPTION

This information indicates that XNF timing constraints are being generated for output to the XNF format.

The variable value *xnfout\_constraints\_per\_endpoint* is used to control the number of constraints written per sequential endpoint. In addition, the **dc\_shell** variable *xnfout\_default\_time\_constraints* value controls whether default time constraints will be written.

The information is provided for the user to recognize that timing constraints will be written into the XNF netlist format.

To disable generation of timing constraints, set to zero (0) the **dc\_shell** variable *xnfout\_constraints\_per\_endpoint*.

### WHAT NEXT

## XNFO-15 (warning) Multi-clock design, this design has %d clocks,

XNF time constraints may not be accurate between sequential

elements driven by different clock types.

## DESCRIPTION

This message informs that the design has multiple clocks defined.

The XNF timing constraints format does not support more than one **Clock\_To\_Setup** constraint per flip-flop. Therefore, only a single C2P constraint is written per flip-flop. Which means that a flip-flop with incident paths driven by flip-flops with different clocks will have a "worst case" constraint of the two paths written out. This situation may cause timing constraints that are more constraining than necessary. This in turn can cause the Xilinx PPR program to complain about failing to meet timing constraints. When in fact the timing may be within the actual design requirements.

## WHAT NEXT

Proceed with caution. Or consider disabling generation of XNF timing constraints by setting `xnfout_constraints_per_endpoint` to zero (see `io_variables`).

# XNFO-16 (Error) Port %s does not have a pad inserted.

## DESCRIPTION

This error indicates that a port in the design, which has been marked as a pad cell using `set_port_is_pad`, does not have a pad cell connecting to it. This is an illegal XNF netlist. Most likely there was an error during `insert_pads` or `replace_fpga` which prevented I/O pad insertion.

## WHAT NEXT

Determine what failed in the `insert_pads`, or `replace_fpga` commands. Most likely there is a `dont_touch` on library pad cell preventing pad insertion.

## **XSCHDB**

**XSCHDB-1** (error) '%s' is not a valid color. Cannot color the cursor.

### **DESCRIPTION**

### **WHAT NEXT**

## **XUI**

**XUI-1** (error) '%s' is not a valid color. Cannot color the cursor.

**DESCRIPTION**

**WHAT NEXT**

**XUI-2** (warning) Can't find font '%s'

**DESCRIPTION**

**WHAT NEXT**

**XUI-3** (warning) Using the default font

**DESCRIPTION**

**WHAT NEXT**

**XUI-4** (fatal) Can't find the default font '%s'.

**DESCRIPTION**

**WHAT NEXT**

## ZRT

### **ZRT-001 (error) Failed to save CEL.**

#### **DESCRIPTION**

This error message indicates that the design CEL could not be saved into the Milkyway library. The reasons for this could be one of the following.

- No write permission for the Library/CEL.
- No disk space is available.

#### **WHAT NEXT**

Please check that the Milkyway design library and CEL are writeable and that there is sufficient disk space available.

### **ZRT-002 (error) Failed to load CEL.**

#### **DESCRIPTION**

This error message indicates that the router failed to read in all the required information from the data base. The reason for this could be one of the following:

- There is some inconsistency issue in the design.
- There is some problem in the technology file.
- Certain information that is needed for the router is missing.

#### **WHAT NEXT**

Please check the Milkyway design or/and the technology file.

## **ZRT-003 (warn) Fail to create eco route attach file.**

### **DESCRIPTION**

This message indicates that the router failed to create or update an attachment file that describes the nets that have been changed by the eco route command. Without this file, the signoff flow may be broken. The reasons for this could be one of the following:

- No write permission for the Library/CEL.
- No disk space is available.

### **WHAT NEXT**

Please check that the Milkyway design library and CEL are writeable and that there is sufficient disk space available.

## **ZRT-004 (error) Number of routing layers has to be greater than 1.**

### **DESCRIPTION**

The design only has one routing layer and the router can only route design with two or more routing layers.

### **WHAT NEXT**

Please add more routing layer to the design.

## **ZRT-005 (error) Unable to support design with more than %d routing layers.**

### **DESCRIPTION**

The router currently only supports maximum of 15 routing layers.

## **WHAT NEXT**

Please reduce the number of routing layers.

## **ZRT-006 (warn) Both adjacent cut rule and enclosed cut rule are specified, supporting only enclosed cut rule.**

### **DESCRIPTION**

Enclosed cut rule is a super set of adjacent cut rule which is an older rule the router supports for backward compatibility. So if both rules are specified, only enclosed cut rule is honored.

### **WHAT NEXT**

Please remove adjacent cut rule and use enclosed cut rule to specify adjacent cut rule.

## **ZRT-007 (warn) Ignore fat rule on layer %s.**

### **DESCRIPTION**

The reason for receiving this warning could be one of the following:

- Fat threshold table is not in ascending order.
- Fat spacing table is not symmetric.

### **WHAT NEXT**

Please check the technology file and make sure the fat rule is specified correctly.

## **ZRT-008 (warn) Ignore protrusion rule on layer %s.**

### **DESCRIPTION**

The reason for receiving this warning could be one of the following:

- Protrusion threshold table is not in ascending order.

## WHAT NEXT

Please check the technology file and make sure the protrusion rule is specified correctly.

# ZRT-009 (warn) Ignore %s rule on layer %s.

## DESCRIPTION

This warning is issued because the spacing for this rule is not specified in increasing order.

## WHAT NEXT

Please check the technology file and make sure the rule is defined correctly.

# ZRT-010 (warning) Cannot find a fat contact for layer '%s'.

## DESCRIPTION

This error message indicates that a suitable fat contact cannot be found for the given layer. This is most likely due to missing fat contact definition in the technology, and it will restrict the router's ability to resolve fat contact violations.

## WHAT NEXT

Please check that the Milkyway technology file and add fat contact definition.

# ZRT-011 (warning) Found more than one fat contacts for layer '%s'.

## DESCRIPTION

This warning message indicates that more than one fat contact was found for the

given layer. This is most likely due to multiple fat contact definitions in the technology. The router will arbitrarily use one of the fat contacts to fix fat contact violations.

## WHAT NEXT

Please check that the Milkyway technology file and remove duplicate fat contact definitions.

# ZRT-012 (error) illegal fat contact '%s' for layer '%s'.

## DESCRIPTION

This error message indicates that an illegal fat contact rule was found in the technology file. This will restrict the router's ability to fix fat contact violations.

## WHAT NEXT

Please check that the Milkyway technology file and fix the fat contact specification.

# ZRT-013 (error) illegal extension fat contact '%s' for layer '%s'.

## DESCRIPTION

This error message indicates that an illegal extension fat contact rule was found in the technology file. This will restrict the router's ability to fix extension fat contact violations.

## WHAT NEXT

Please check that the Milkyway technology file and fix the extension fat contact specification.

# ZRT-014 (warn) Ignore stub spacing definition on layer %s.

## DESCRIPTION

The reason for this warning message is most likely because the stub spacing value is less or equal to 0

## **WHAT NEXT**

Please check the technology file and make sure the stub spacing is defined correctly.

## **ZRT-015 (warn) Ignore contact %s.**

### **DESCRIPTION**

The reason for receiving this warning could be one of the following:

- Lower, upper, or cut layer of the contact is not a valid routing layer.
- The contact has the same lower and upper layer.

### **WHAT NEXT**

Please check the technology file and make sure the contact is defined correctly.

## **ZRT-016 (warn) Inconsistent %s design rule found between %s and %s.**

### **DESCRIPTION**

This warning message indicates that inconsistent design rule values are found. This is most likely due to the design rule being defined multiple times with the same two layers but with different values. Only the first definition read by the router is honored.

### **WHAT NEXT**

Please check the technology file and make sure the design rule is only defined once for the same two layers.

## **ZRT-017 (warn) No diode ratio set for %s, turning off antenna**

rule mode %d.

## DESCRIPTION

When an antenna rule of diode mode 5 or greater is defined, diode ratio also needs to be specified for every routing layer. In this case, one or more layers are found without diode ratio and so the antenna rule is ignored.

## WHAT NEXT

Please use `define_antenna_layer_rule` to specify diode ratio for every routing layer.

**ZRT-018 (warn)** No scale factor set for %s, turning off antenna rule mode %d.

## DESCRIPTION

When an antenna rule of diode mode 11 or 12 is defined, scale factor also needs to be specified for every routing layer. In this case, one or more layers are found without scale factor and so the antenna rule is ignored.

## WHAT NEXT

Please use `define_antenna_layer_rule` to specify scale factor for every routing layer.

**ZRT-019 (warn)** Illegal min/max layer constraint on net %s.

## DESCRIPTION

This warning occurs when the min layer constraint is on a higher layer than the max layer constraint. This constraint is ignored for the net.

## WHAT NEXT

Please use `set_net_routing_layer_constraints` to redefine the min/max layer constraint or use `remove_net_routing_layer_constraints` to remove the constraint on the net.

## **ZRT-020 (warn) Illegal cell min/max layer constraint.**

### **DESCRIPTION**

This warning occurs when the min layer constraint is on a higher layer than the max layer constraint. This cell constraint is ignored.

### **WHAT NEXT**

Please redefine or reset this cell layer constraint.

## **ZRT-021 (info) Multiple default contact %s found for layer %s.**

### **DESCRIPTION**

This message indicates that more than one default contact was found for the given layer. This is most likely due to multiple default contact definitions in the technology. The router will arbitrarily use one of the default contacts depending on the available routing resource.

### **WHAT NEXT**

No action necessary unless allowing multiple default contacts is not the correct intention. In that case, please remove duplicate default contact definition from the technology file.

## **ZRT-022 (warn) Cannot find a default contact for layer %s.**

### **DESCRIPTION**

This warning message indicates that no default contact was found for the given layer. This is most likely due to missing default contact definition in the technology.

### **WHAT NEXT**

Please add default contact definition to the technology file.

## **ZRT-023 (warn) BPV on %d macros were done with "treat**

blockage as thin".

## DESCRIPTION

"Treat blockage as thin" flag was on during the BPV process and thus blockages inside these macros will be treated as thin by the router.

## WHAT NEXT

If treating the blockages as thin is not the desired behavior, please re-run `extract_blockage_pin_via`.

# ZRT-024 (error) %s has no corresponding % layer.

## DESCRIPTION

The given layer does not have a corresponding wire/via layer. This limits the router's ability to move from one layer to another.

## WHAT NEXT

Please define the corresponding wire/via layer in the technology file.

# ZRT-025 (warn) Layer %s does not have a preferred direction, assigning to %s.

## DESCRIPTION

This message indicates that the layer does not have a preferred direction assigned to it. If the adjacent layer has a preferred direction, the opposite direction is set for the layer. Otherwise, metal 1 is assigned to horizontal, metal 2 to vertical, and so forth.

## WHAT NEXT

Please use `set_preferred_routing_direction` to assign preferred direction.

# ZRT-026 (warn) Layer %s pitch %.3f may be too small: wire/via-

**down %.3f, wire/via-up %.3f.**

## **DESCRIPTION**

The pitch defined for the layer may be too small due to a larger up via and/or down via requirement. The router will use the larger spacing when placing those via.

## **WHAT NEXT**

This is only a warning message.

**ZRT-027 (warn) Ignore %d top cell ports with no pins.**

## **DESCRIPTION**

This warning message indicates that the design's top cell has logical ports which have no physical shapes attached to them. The router will ignore such ports.

## **WHAT NEXT**

Please check the top cell and create physical shapes for those ports if needed.

**ZRT-028 (error) Failed to open child cell %s.%s.**

## **DESCRIPTION**

This warning message indicates that the router was not able to open the child cell for read. This could be because the reference library where the child cell resides does not have read permission or is missing.

## **WHAT NEXT**

Please make sure the reference library is linked and readable to the current design.

**ZRT-029 (error) Cell %s has inconsistent number of logical ports**

in the library and in the top cell.

## DESCRIPTION

This warning message indicates that the counts for the logical ports are different between the child library cell's record and the top cell's record. This could happen if the library cell got modified after the top cell was created.

## WHAT NEXT

Please check and update the design hierarchy.

# ZRT-030 (warn) Ignore pin (cell %s, port %s) on layer %d.

## DESCRIPTION

This warning message occurs because physical pin shape on non-routing layer was found. The router will ignore such pin.

## WHAT NEXT

Please check to see if the pin shape is on the correct layer.

# ZRT-031 (warn) Invalid routing layer '%s' on wire

## DESCRIPTION

This warning message indicates that a wire from the database is on an invalid routing later. The wire will be ignored by the router.

## WHAT NEXT

Please check the database and fix the wire to be on valid routing layer.

# ZRT-032 (warn) Invalid routing layer '%s' on path

## DESCRIPTION

This warning message indicates that a path from the database is on an invalid routing later. The path will be ignored by the router.

## **WHAT NEXT**

Please check the database and fix the path to be on valid routing layer.

## **ZRT-033 (warn) Invalid contact array %d.**

### **DESCRIPTION**

This warning message indicates that an invalid contact array is in the database. The router was unable to find a master via corresponding to the specified contact code from database.

## **WHAT NEXT**

Please check the database and specify the correct contact code for the contact array

## **ZRT-034 (warn) Invalid contact %d.**

### **DESCRIPTION**

This warning message indicates that an invalid contact is in the database. The router was unable to find a master via corresponding to the specified contact code from database.

## **WHAT NEXT**

Please check the database and specify the correct contact code for the contact.

## **ZRT-035 (warn) Invalid routing layer '%s' on global route**

### **DESCRIPTION**

This warning message indicates that a global route from database is on an invalid routing layer. The router will ignore the global route.

## **WHAT NEXT**

Please check the database and fix the global route to be on valid routing layer.

## **ZRT-036 (warn) Ignore polygon pin (cell %s, port %s) on layer %d.**

### **DESCRIPTION**

This warning message occurs because polygon pin shape was found. The router currently does not handle polygon pin and thus this pin will be ignored.

### **WHAT NEXT**

Please modify the polygon into rectangles.

## **ZRT-037 (warn) Ignore polygon via-region in cell %s.**

### **DESCRIPTION**

This warning message occurs because polygon via-region was found. The router currently does not handle polygon via-region and thus this via region will be ignored.

### **WHAT NEXT**

Please re-run `extract_blockage_pin_via`.

## **ZRT-038 (warn) Cannot find contact %d for via-region in cell %s.**

### **DESCRIPTION**

This warning message indicates that contact cannot be found for the contact code stored with the via-region. This via-region will be ignored by the router.

### **WHAT NEXT**

Please use a correct contact code for the via-region and re-run `extract_blockage_pin_via`.

## **ZRT-039 (warn) Contact %s for via-region in cell %s cannot be**

rotated.

## DESCRIPTION

This warning message indicates that non-rotatable contact was found for a rotated via-region. The via-region is ignored in this case.

## WHAT NEXT

Please re-run extract\_blockage\_pin\_via.

# ZRT-040 (warn) Cell %s's boundary has exceeded the limit.

## DESCRIPTION

This warning message occurs because the cell boundary size is larger than the system's limit. The cell boundary has been adjusted to fit the limit.

## WHAT NEXT

Please re-size the cell boundary to be smaller.

# ZRT-041 (error) Cannot find port %s in cell %s.

## DESCRIPTION

This warning message occurs when master port cannot be found during the instance port processing. This could happen if the library cell got modified after the top cell was created and the hierarchical information is out of date.

## WHAT NEXT

Please check and update the design hierarchy.

# ZRT-042 (warn) Contact %s's %s layer enclosure %s does not

satisfy end of line enclosure design rule.

## DESCRIPTION

The router depends on correct construction of contacts to avoid the end of line enclosure rule. In this case, the contact's metal enclosure does not satisfy the requirement and there may be end of line enclosure design rule violation at the end of routing stage.

## WHAT NEXT

Please modify the contact to satisfy the end of line enclosure requirement or remove the design rule from the technology file.

**ZRT-043 (warn)** Found must join pins on port %s without any net.

## DESCRIPTION

Must join pins without net information were found. The router won't be able to connect them unless net is assigned to them.

## WHAT NEXT

Please create net for those pins.

**ZRT-044 (warn)** Standard cell pin %s/%s has no via regions.

## DESCRIPTION

Via regions are useful in avoiding DRCs in accessing pins and in accessing pins off the routing grid.

## WHAT NEXT

Please check for DRCs in accessing this pin and generate the via regions if necessary.

**ZRT-045 (warn)** Via regions for port %s/%s may block other

ports completely.

## DESCRIPTION

Via regions are useful in avoiding DRCs in accessing pins and in accessing pins off the routing grid.

## WHAT NEXT

Please check for DRCs in accessing this pin and generate the via regions if necessary.

# ZRT-046 (warn) Conflicting voltage-areas for instance %s.

## DESCRIPTION

This warning message indicates that the instance belongs to two conflicting voltage-areas. In the case of a conflict, the voltage-area of the smallest enclosing instance will take precedence. The reasons for this could be one of the following.

- The leaf-level instance has been assigned a voltage-area that conflicts with the enclosing hierarchical voltage-area.

## WHAT NEXT

Please make sure that each instance belongs to only one voltage-area.

# ZRT-047 (error) Ignoring voltage-area %s because maximum number of voltage-areas allowed is %d.

## DESCRIPTION

This error message indicates that the number of voltage-areas in this design exceeds the maximum allowed. The reasons for this could be one of the following.

- Too many voltage-areas are being used in this design.

## **WHAT NEXT**

Please make sure that the number of voltage-areas is within the limit.

## **ZRT-048 (error) Failed to write cel %s.**

### **DESCRIPTION**

Failed to save back to the database.

### **WHAT NEXT**

Check preceding error messages for specific failure reasons.

## **ZRT-049 (error) Failed to load cel %s.**

### **DESCRIPTION**

Failed to read design from the database.

### **WHAT NEXT**

Check preceding error messages for specific failure reasons.

## **ZRT-050 (warn) Invalid rotated polygon in master cell '%s'**

### **DESCRIPTION**

This warning message indicates that a rotated polygon in the master cell has invalid dimensions. This rotated polygon will be ignored by the router.

### **WHAT NEXT**

Please check the database and fix the rotated polygon dimensions.

## **ZRT-051 (warn) Illegal Jog wire end of line rule (%s, %s).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

## **ZRT-052 (warn) Illegal Jog wire end of line rule (%s, %s), (%d %d).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

## **ZRT-053 (warn) Illegal Special end of line enclosure rule (%s, %s).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

## **ZRT-054 (warn) Illegal Special end of line enclosure rule (%s,**

**%s), (%d %d).**

## **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

## **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

**ZRT-055 (warn) Illegal T-shape end of line enclosure rule (%s, %s).**

## **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

## **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

**ZRT-056 (warn) Illegal T-shape end of line enclosure rule (%s, %s), (%d %d).**

## **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

## **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

## **ZRT-057 (warn) Illegal Jog wire off limits rule (%s, %s).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

## **ZRT-058 (warn) Illegal Jog wire off limits rule (%s, %s), (%d %d).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

## **ZRT-059 (warn) Illegal Fat wire off limits rule (%s, %s).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between a cut and metal layer.

## **ZRT-060 (warn) Illegal Fat wire off limits rule (%s, %s), (%d %d).**

### **DESCRIPTION**

This warning message indicates that end of line rule is specified between two inconsistent layers.

### **WHAT NEXT**

Please check the technology file and make sure the end of line rule is specified between adjacent cut and metal layer.

## **ZRT-061 (warn) Port %s (cell %s) of net %s has no pin.**

### **DESCRIPTION**

This warning message indicates that the port has no physical shape attached to it. The router will ignore such port and the net will be left open at the end of the routing stage.

### **WHAT NEXT**

Please check the cell and create pin shape for the port.

## **ZRT-062 (warn) Value %s is not one among the predefined values for option %s. Assigning the default value.**

### **DESCRIPTION**

This warning message indicates that the value specified for the string token option is not among the list of predefined values. This can happen if the set of predefined values change and an old value which no longer exists is read from a saved cell. In this case, the option is assigned the default value.

### **WHAT NEXT**

Please set the right value for the option, if the default value is not correct.

## **ZRT-063 (warn) Cover cell '%s' contains a non PG port '%s'.**

## Ignoring it.

### DESCRIPTION

This warning message indicates that the cover cell contains a port which is connected to non PG net. This is not handled currently based on our methodology.

### WHAT NEXT

Please make sure that the cover cell does not contain non PG port.

## ZRT-064 (error) Cell %s is not placed.

### DESCRIPTION

This error message indicates that the cell has not been legally placed and it will be ignored by the router.

### WHAT NEXT

Please make sure all the cells are placed before running the router.

## ZRT-065 (warn) Ignore net %s's connection to port %s (cell %s).

### DESCRIPTION

This warning message indicates that the port will be ignored by the router, and the reason is most likely due to some data error with the cell.

### WHAT NEXT

Please check the port's cell and fix any problem associated with it.

## ZRT-066 (error) Net %s not found.

### DESCRIPTION

Failed to find the net in the current design.

## WHAT NEXT

Check the spelling of the net name. Make sure net of that name exists.

# ZRT-067 (error) Net %s is not a power/ground net.

## DESCRIPTION

Found net is not a power/ground net.

## WHAT NEXT

Make sure net is a power or a ground net.

## SEE ALSO

`connect_pg_nets(2)`

# ZRT-068 (error) Ground net not found.

## DESCRIPTION

Failed to find the ground net in the current design.

## WHAT NEXT

Add a ground net to the current design.

## SEE ALSO

`connect_pg_nets(2)`

# ZRT-069 (error) Too many ground nets, please specify one.

## DESCRIPTION

This command found more than one ground net in the current design.

## WHAT NEXT

Specify a ground net as an argument to a command.

## **ZRT-070 (error) Could not find any nets in the design that match the specification.**

### **DESCRIPTION**

The command expects the list of nets to be specified. Either the specification is incorrect, or there are no nets in the design that match the specification.

### **WHAT NEXT**

Please check to make sure that the syntax for specifying the nets is correct.

## **ZRT-071 (error) Could not set a zroute option.**

### **DESCRIPTION**

The tool was not able to set a zroute option. This is caused by a bug in the tool.

### **WHAT NEXT**

Please file a star.

## **ZRT-072 (error) Top cell not open.**

### **DESCRIPTION**

The top cell is not open.

### **WHAT NEXT**

Open the top cell to run the current command.

## **ZRT-073 (error) The -from\_file option specifies: %s but that file is not found .**

### **DESCRIPTION**

This warning message occurs because route\_zrt\_group cannot find a file by the name specified.

## WHAT NEXT

Please ensure that the file exists and has been generated correctly.

## ZRT-074 (error) The file: %s does not contain any valid net names.

### DESCRIPTION

This warning message occurs because route\_zrt\_group cannot find any valid net names in the file specified by the -from\_file option.

## WHAT NEXT

Please ensure that the file was generated correctly and contains some valid net names.

## ZRT-075 (warn) The the file: %s specifies a net: %s which does not exist.

### DESCRIPTION

This warning message occurs because the -from\_file option for the route\_zrt\_group command has encountered a putative net name which does not specify a net.

## WHAT NEXT

Please ensure that the file was generated correctly and contains some valid net names.

## ZRT-076 (warn) Invalid contact array pitch (contact code %d) (location %d %d).

### DESCRIPTION

The contact array at the specified location has pitch smaller than the pitch required by the router. The router will continue, using the larger pitch. DRC's reported against the via arrays will be conservative.

## WHAT NEXT

Please check the database and verify that contact array pitch is even multiple of min grid.

## ZRT-077 (warn) %s has different horizontal and vertical net weight.

### DESCRIPTION

The net has different horizontal weight and vertical weight specified. The router currently only supports one net criticality value per net, and the larger of the two values will be used. This message is only printed once for the first net found with the issue.

### WHAT NEXT

Please check the setup for the net and make sure it is correct.

## ZRT-078 (warn) Illegal enclosed via metal minLength rule (%s, %s).

### DESCRIPTION

This warning message indicates that enclosed via metal minLength rule is defined between inconsistent layers. It should be defined between a cut layer and the metal layer just above it.

### WHAT NEXT

Please check the technology file and make sure the enclosed via metal minLength rule is specified between a cut layer and metal layer.

## ZRT-079 (warn) Illegal enclosed via metal minLength rule (%s, %s), (%d %d).

### DESCRIPTION

This warning message indicates that enclosed via metal minLength rule is defined between inconsistent layers. It should be defined between a cut layer and the metal

layer just above it.

## WHAT NEXT

Please check the technology file and make sure the enclosed via metal minLength rule is specified between a cut layer and the metal layer just above it.

# ZRT-080 (error) Layer %s has no routing tracks.

## DESCRIPTION

The given layer does not have any routing tracks. This prevents the router from assigning wires and vias on the layer.

## WHAT NEXT

Please check if the routing tracks have been correctly defined on the layer. If the intent is to have the router automatically generate routing tracks then please make sure that the value of the zroute common option "-track\_auto\_fill" is set to true (the default value).

# ZRT-100 (warning) Pin %s of net %s has no valid shapes to connect.

## DESCRIPTION

This message indicates that pin has no shapes inside design boundary.

## WHAT NEXT

Please make sure that the pin has valid shapes to connect.

# ZRT-101 (warning) Power net %s has no power preroutes, skip tie-off.

## DESCRIPTION

Power net has no power preroutes. Tie-off will be turned off for this net.

## **WHAT NEXT**

Please add power preroutes.

# **ZRT-102 (info) %d of the existing global routes are deleted.**

## **DESCRIPTION**

All existing global routes are deleted at the beginning of global routing stage, unless incremental option is set to true. In route\_zrt\_group flow, only nets not specified in the net group will be deleted if incremental option is true.

## **WHAT NEXT**

No action necessary.

# **ZRT-200 (error) Skipping track assignment because this design has no global routes.**

## **DESCRIPTION**

This message indicates that there are no global routes in this design, so the router cannot perform track assignment. This happens because either global routing is not correctly finished, or track assignment is already done.

## **WHAT NEXT**

First check whether track assignment was already completed. Then check whether global routing was completed before running track assignment.

# **ZRT-300 (warn) Antenna diodes cannot protect any pin.**

## **DESCRIPTION**

Under certain antenna calculation modes, diode cells do not offer any protection to violating pins.

## **WHAT NEXT**

Please check the antenna calculation mode. If diode cells are desired, set the antenna diode calculation mode appropriately.

## **ZRT-301 (warn) Antenna diode insertion will be off.**

### **DESCRIPTION**

Antenna diode insertion is set on by the input options, but will be off in this run because diode insertion could not be initialized.

### **WHAT NEXT**

Please preceding warnings for specific problems in initializing diode insertion.

## **ZRT-302 (warn) No antenna diodes found, or could not link them.**

### **DESCRIPTION**

Antenna diode insertion is set on by the input options, but no diode cells were found in the linked library.

### **WHAT NEXT**

Check the library to find diode cells.

## **ZRT-303 (warn) Failed to initialize legalizer for antenna diode insertion.**

### **DESCRIPTION**

Antenna diode insertion is set on by the input options, but the router could not initialize the legalizer for diode insertion.

### **WHAT NEXT**

Check the preceding messages from the legalizer for specific problems.

## **ZRT-304 (info) Skip final DRC merging, too many DRCs.**

### **DESCRIPTION**

DRC merging reduces redundant DRCs by merging aligned and coincident DRCs. However, DRC merging is skipped if there are too many DRCs, as it might take too long.

### **WHAT NEXT**

No action necessary.

## **ZRT-305 (info) Merged away %d aligned/redundant DRCs.**

### **DESCRIPTION**

DRCs can be merged if at least two opposing edges are aligned and they are of the same type, layer, and nets. For example, if two overlapping different-net-metal-spacing DRCs are between shapes of the same layer, from the same two nets, and have top and bottom edges aligned, then they will be merged to one DRC. Merging is done to give the user a more realistic number of DRCs, and to minimize the effect of the router's internal representation of the shapes on the DRC count.

### **WHAT NEXT**

No action necessary.

## **ZRT-306 (info) Discarded %d drcs of internal-only type.**

### **DESCRIPTION**

DRCs of internal-only type are not violations of technology rules and may be discarded.

### **WHAT NEXT**

No action necessary.

## **ZRT-307 (info) Skip DR iteration %d for new DRC type to start.**

### **DESCRIPTION**

Some DRC analysis may be deferred until later global iterations. In that case, the router may skip iterations while the number of DRCs is zero, until all DRC analysis is on.

### **WHAT NEXT**

No action necessary.

## **ZRT-308 (error) Design has global route wires. Please run track assignment before detailed route.**

### **DESCRIPTION**

Track assignment is required before detailed routing.

### **WHAT NEXT**

Run track assignment.

## **ZRT-309 (warn) No antenna rules defined, Skip antenna analysis.**

### **DESCRIPTION**

Antenna rules must be defined in the library in order to do antenna analysis.

### **WHAT NEXT**

Define antenna rules in the library.

## **ZRT-310 (error) Failed to store hierarchical antenna property.**

### **DESCRIPTION**

Attempt to store hierarchical antenna property in top level pins failed.

## **WHAT NEXT**

It is a bug. Please report it.

**ZRT-311 (warning) Skipping antenna analysis for net %s (not enough gate area information).**

## **DESCRIPTION**

One or more input pins of this net do not have the correct gate area values. So antenna analysis will not be done for this net.

## **WHAT NEXT**

Check and set correct gate area for all the input pins of the net and also for all the metal & cut layers.

**ZRT-400 (error) Cannot open timing file '%s'.**

## **DESCRIPTION**

The reasons for this could be one of the following.

- The file does not exist.
- You do not have the required permissions to read it.

## **WHAT NEXT**

Please make sure the timing file exists and that you have the required permissions to read it.

**ZRT-401 (error) Corrupted or incomplete timing file.**

## **DESCRIPTION**

The reasons for this could be one of the following.

- There was not enough disk space when the timing file was saved.
- The timing file was saved using a different executable from the one that is being used to read it.

## WHAT NEXT

Please re-run after making sure that there is enough disk space available.

# ZRT-402 (error) Cannot find the user specified timing file '%s'.

## DESCRIPTION

The reasons for this could be one of the following.

- The file does not exist or the full path to the file was not specified.
- You do not have the required permissions to read it.

## WHAT NEXT

Please make sure the full path to the file is specified and that you have the required permissions to read it.

# ZRT-403 (warn) Hidden %s parameter %s of %s is not supported by Zroute.

## DESCRIPTION

This debug/hidden parameter has been set or has a different value than the default value, but the parameter to option translator does not support translation of this parameter.

## WHAT NEXT

If possible, please remove this parameter from the script or reset the value if it's coming from the cell parameter setting.

# ZRT-404 (warn) Unable to translate %s of %s because %s -%s does not support value %d.

## DESCRIPTION

The parameter is set to a value that is not supported by the option and thus can not be translated.

## WHAT NEXT

Please do not use the unsupported value with the parameter.

# ZRT-405 (warn) Unable to translate %s -%s because %s of %s does not support mode %s.

## DESCRIPTION

The option is set to an additional mode that is not supported by the parameter and thus can not be translated.

## WHAT NEXT

Please do not set the option to this mode if the translation of this option to parameter is required.

# ZRT-406 (warn) Unable to translate %s to %s because %s.

## DESCRIPTION

The translator cannot perform the translation because there is no exact correspondence between the option and the parameter.

## WHAT NEXT

Please review the setting of the option or the parameter.

## **ZRT-407 (error) Failed in separate process.**

### **DESCRIPTION**

This error message indicates that the command failed in the separate process. The reasons for this could be one of the following.

- Crash in separate process flow.
- No disk space is available.

### **WHAT NEXT**

Please check that there is sufficient disk space available. If disk space is not the issue, please contact customer service. This is a bug.

## **ZRT-408 (error) Using -nets option without -antenna, -open\_net, or -voltage\_area.**

### **DESCRIPTION**

This error message indicates that the command verify\_zrt\_route failed. The option "-nets" is specified without any accompanying options. The reason could be one of the following:

- Check open nets option is not specified.
- Check antennas is not specified.
- Check voltage areas is not specified.

### **WHAT NEXT**

1) Specify one or more of these three options in this Tcl command. or 2) Remove the "-nets" option and rerun the command.

## **ZRT-409 (warn) %s parameter %s is not supported by Zroute.**

### **DESCRIPTION**

The translator cannot perform the translation because the parameter is currently not supported by Zroute.

### **WHAT NEXT**

Please review the setting of the parameter.

## **ZRT-410 (info) %s parameter %s is obsolete in Zroute.**

### **DESCRIPTION**

The translator cannot perform the translation because the parameter is obsolete in Zroute. Most likely Zroute is already handling the parameter automatically and there is no need for an user option, or the parameter is useless in Zroute.

### **WHAT NEXT**

## **ZRT-411 (warn) %s parameter %s is supported by Zroute only in MW technology file.**

### **DESCRIPTION**

The parameter is not supported as an option in Zroute and needs to be defined in Milkyway technology file.

### **WHAT NEXT**

Please define the design rule criteria in the technology file.

## **ZRT-412 (warn) %s parameter %s cannot be translated exactly to corresponding Zroute option.**

### **DESCRIPTION**

Zroute has a similar option, but the approach it takes is different and does not

match the parameter with one to one correspondence.

## WHAT NEXT

Please set the option manually and refer to the application notes for more details.

# ZRT-413 (warn) Invalid coordinates for area routing.

## DESCRIPTION

The router cannot perform area routing because the specified coordinates are invalid.

## WHAT NEXT

Please use the correct format to specify the coordinates.

# ZRT-414 (error) Abnormal exit of child process

## DESCRIPTION

Child process crashed.

## WHAT NEXT

This is a bug. Please report it.

# ZRT-415 (warn) The number of threads for this run is reduced to %d.

## DESCRIPTION

Based on the maximum number of threads set, an attempt is made to checkout the required number of license keys of each type. However all the required keys are not available. Based on available number of keys of each type, a reduced number of threads is calculated and used for this run.

## WHAT NEXT

Please check if license keys of each type are available for this run.

## **ZRT-416 (warning) %d %s cell PG pins connected to net NULL and not PG.**

### **DESCRIPTION**

This warning message indicates that the filler cell removal command detects PG pins of some cells in the design connected to NULL net. Short violations between the PG pins connected to NULL net and PG pins connected to valid PG nets will be detected during the command, and filler cells with such violations will be removed.

### **WHAT NEXT**

Please run the connect\_pg\_nets command to ensure valid PG connections to PG pins.

## **ZRT-417 (warning) Deleted instance %s is not a standard filler cell**

### **DESCRIPTION**

This warning message indicates that the filler cell removal command detects a violation on a cell which name matches a given name pattern, but is not classified as a standard filler cell. Filler cells are standard cells without any connections to signal nets. Filler cells that were inserted with insert\_stdcell\_filler command have a prefix of "xofiller".

### **WHAT NEXT**

Please check the given name pattern if it is indeed intended for filler cell deletion. You may use a default name pattern if only filler cells with a prefix of "xofiller" were intended for deletion.

## **ZRT-418 (warning) Instance %s which is connected to signal nets is not deleted.**

### **DESCRIPTION**

This warning message indicates that the filler cell removal command detects a violation on a cell which name matches a given name pattern, but has connections to signal nets. Such cells can not be removed.

## **WHAT NEXT**

Please check the given name pattern if it is indeed intended for filler cell deletion.

# **ZRT-419 (warning) Cell %s has internal violations**

## **DESCRIPTION**

This warning message indicates that the filler cell removal command detects a cell which has violation on objects inside the cell. Such violation is ignored for cell removal purpose.

## **WHAT NEXT**

Please check the filler library cell for violations.

# **ZRT-420 (error) It is not recommended to use classic router commands after Zroute commands.**

## **DESCRIPTION**

Routing was done with Zroute on the current design. Now an attempt is made to run commands of classic router. This is not recommended because the DRC analysis and routing graph interpretations are different between the two routers.

## **WHAT NEXT**

Continue to run all the routing commands in Zroute. If the intention to use the classic router for the flow, delete all the existing routes and start the flow with classic router.

# **ZRT-421 (error) Cannot open file '%s' for '%s'.**

## **DESCRIPTION**

The file cannot be opened.

## **WHAT NEXT**

Please make sure you have the required permissions on the directory.
