PNA-027 (error) The specified offset from pad to ring %.3f microns is less than the minimum %s spacing %.3f.

DESCRIPTION

The specified ring offset is smaller than the minimum spacing, which may cause DRC error between pin shapes of pads and ring segments.

WHAT NEXT

Please use a larger ring offset by the command and option `set_fp_rail_constraints -set_ring -ring_offset value`

SEE ALSO

`set_fp_rail_constraints` (2)

PNA-028 (error) The %s edge (%.3f %.3f) (%.3f %.3f) in PNS region is overlapped with the IO cells %s with the boundary (%.3f %.3f) (%.3f %.3f)

DESCRIPTION

PNS does not synthesize straps of the region overlapping with IO area in order to

avoid DRC errors.

WHAT NEXT

Please redefine the region with GUI or Tcl command `set_fp_rail_region_constraints`.

SEE ALSO

`set_fp_rail_region_constraints` (2)
`synthesize_fp_rail` (2)

PNA-029 (error) Cannot find %s %s in the design.

DESCRIPTION

These is no the specified objects in the design.

WHAT NEXT

Please use the following commands to check if the object is in the design.

`get_mw_cels` -> `instance get_cells` -> `master get_plan_groups` -> `plan group`

SEE ALSO

`get_mw_cels` (2)
`get_cells` (2)
`get_plan_groups` (2)

PNA-030 (error) The %s constraints %7.3f for layer %s is larger than the maximum allowable width %7.3f.

DESCRIPTION

PNS derives the maximum allowable width based on straps constraints and the size of the core area. The error message means that the minimum width constraints of the layer is larger than the derived maximum width, causing PNS unable to synthesize straps.

WHAT NEXT

Please set a smaller minimum width constraint by using

`set_fp_rail_constraints -add_layer -layer layer_name -direction direction -min_width`

width

SEE ALSO

set_fp_rail_constraints (2)
synthesize_fp_rail (2)

PNA-031 (error) The specified PG spacing for layer %s is larger than the maximum allowable spacing %.3f.

DESCRIPTION

The specified PG spacing is so large that PNS is unable to even synthesize straps with specified minimum strap number.

WHAT NEXT

Please specify a smaller PG spacing by using

```
set_fp_rail_constraints -add_layer -layer layer_name -direction direction -min_width  
width -spacing value
```

SEE ALSO

set_fp_rail_constraints (2)
synthesize_fp_rail (2)

PNA-032 (error) The %s constraints %7.3f for layer %s is smaller than the minimum allowable width %7.3f.

DESCRIPTION

PNS computes the minimum allowable width based on the minimum width in the technology file plus 2*via_cut_to_boundary to avoid DRC errors when power and ground straps next to each other.

WHAT NEXT

Please set a larger maximum width by using

```
set_fp_rail_constraints -add_layer -layer layer_name -direction direction -max_width  
width
```

SEE ALSO

`set_fp_rail_constraints` (2)
`synthesize_fp_rail` (2)

PNA-033 (error) No voltage area constraint is set for %s.

DESCRIPTION

PNS cannot find any power network constraint set for voltage area/design %s. User need to specify power network constraint for each voltage area in which power/ground mesh will be created.

WHAT NEXT

Please specify PNS constraints for a voltage area using the command `set_fp_rail_voltage_area_constraints`.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)
`report_fp_rail_voltage_area_constraints` (2)

PNA-034 (error) Net name is not specified for voltage area %s.

DESCRIPTION

The name of the net to be synthesized in the voltage area %s is required for PNS to proceed. There are two ways to specify the nets. One way is using the PNS voltage area constraints command. The other way is to use UPF. PNS can automatically obtain the primary power and ground net for a particular power domain from UPF.

WHAT NEXT

Please use the following command to specify net name in PNS voltage area constraints:

```
set_fp_rail_voltage_area_constraints -voltage_area voltage_area -nets nets
```

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)
`report_fp_rail_voltage_area_constraints` (2)

PNA-035 (error) Voltage supply is not specified for voltage area %S.

DESCRIPTION

The voltage supply is missing for setting MVDD PNS constraints.

WHAT NEXT

Please set the supply voltage by using

```
set_fp_rail_voltage_area_constraints -voltage_area VA_name -voltage_supply
supply_voltage -nets net_names
```

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)

PNA-036 (error) Net %s is not power/ground net.

DESCRIPTION

PNA/PNS analyzes/synthesizes only for power and ground nets. The specified net is not power or ground net.

WHAT NEXT

Please specify the correct PG net names.

SEE ALSO

`analyze_fp_rail` (2)
`synthesize_fp_rail` (2)

PNA-037 (error) Cell %s.CONN has no port %s.

DESCRIPTION

There is no PG ports in the CONN view, causing PNA unable to read PG geometries stored in the CONN view.

WHAT NEXT

Please regenerate CONN view using ICC command `create_connview` or PrimRail.

SEE ALSO

`create_connview` (2)

PNA-038 (error) Cannot find net %s in %s.CONN.

DESCRIPTION

There is no analyzed net defined in the CONN view, causing PNA unable to read PG geometries stored in the CONN view.

WHAT NEXT

Please regenerate CONN view using ICC command `create_connview` or PrimRail.

SEE ALSO

`create_connview` (2)

PNA-039 (error) Fail to open cell %s.CONN.

DESCRIPTION

PNA is uanble to open the CONN view.

WHAT NEXT

Please regenerate CONN view using ICC command `create_connview` or PrimRail.

SEE ALSO

`create_connview` (2)

PNA-040 (error) Fail to read net geometry from %s.CONN.

DESCRIPTION

PNA is unable to read net geometry in the CONN view.

WHAT NEXT

Please regenerate CONN view using ICC command `create_connview` or PrimRail.

SEE ALSO

`create_connview` (2)

PNA-041 (error) No cell instances connected to net %s in the specified region.

DESCRIPTION

WHAT NEXT

PNA-042 (error) cannot write file %s.

DESCRIPTION

The file cannot be written.

WHAT NEXT

Please make sure files can be created under `./pna_output` directory. If not, users can change the output directory by usig the option `-output_directory` in the `analyze_fp_rail` (PNA) or `synthesize_fp_rail` (PNS) command. Please make sure the specified dierctory exists or can be created before running PNA or PNS.

SEE ALSO

`analyze_fp_rail` (2)

`synthesize_fp_rail` (2)

PNA-043 (error) Power network synthesis cannot synthesize more than one power net.

DESCRIPTION

PNS can synthesize only one power and one ground nets.

WHAT NEXT

Please specify only one power net.

SEE ALSO

`synthesize_fp_rail (2)`

PNA-044 (error) Power network synthesis cannot synthesize more than one ground net.

DESCRIPTION

PNS can synthesize only one power and one ground nets.

WHAT NEXT

Please specify only one ground net.

SEE ALSO

`synthesize_fp_rail (2)`

PNA-045 (error) Cannot get preferred routing direction on layer %d.

DESCRIPTION

The preferred routing direction for the layer is not defined.

WHAT NEXT

PNA-046 (error) Ring width must be larger than %.3f microns..

DESCRIPTION

PNS calculates the minimum width based on the minimum wire width of the layer and the minimum via size from the technology file.

WHAT NEXT

Increase the ring width so it is no smaller than the minimum width.

PNA-047 (error) Ring width must be smaller than %.3f microns..

DESCRIPTION

PNS calculates the maximum ring width based on the ring width and spacing constraints, and the size of the core area.

WHAT NEXT

Reduce the ring width so it is no larger than the maximum width.

PNA-048 (error) Power is not enabled for design %s.

DESCRIPTION

PNS or PNA with "-analyze_power" option requires design with power analysis capability.

WHAT NEXT

Try to use "Link" command first or make sure power analysis related licences are included.

PNA-049 (error) The maximum strap width considering standard cell rail alignment is %g microns, and is smaller than the

specified minimum strap width %g microns at layer %s.

DESCRIPTION

PNS with -align_strap_with_m1_rail strategy will re-calculate the maximum width to avoid standard cell power (or ground) rails blocked by ground (or power) straps. The specified minimum width constraint cannot be satisfied.

WHAT NEXT

Adjust the layer width constraint as suggested.

PNA-050 (error) The straps at layer %s cannot be put inside standard cell rows to avoid standard cell rail blockage.

DESCRIPTION

PNS with -align_strap_with_m1_rail strategy will re-calculate the maximum width to avoid standard cell power (or ground) rails blocked by ground (or power) straps. The specified minimum width constraint cannot be satisfied. The maximum allowed width becomes a non-positive value considering the location of standard cell rows and power pins height, and spacing constraint.

WHAT NEXT

To flip every other cell row or increase the distance between two adjacent cell rows.

PNA-051 (error) Cannot find pin %s at layer %s.

DESCRIPTION

PNA is unable to find the switching cell pin at the specified layer.

WHAT NEXT

Please specify the correct switching cell pin and layer by using

```
set_attribute [get_physical_lib_cell master_name] "mtcmos_pin_layers" "pin1_name  
pin1_layername pin2_name pin2_layername"
```

PNA-052 (error) Cannot get %s net from UPF in power domain %S.

DESCRIPTION

PNS/PNA is unable to find the %s net information from UPF defined for power domain %S.

WHAT NEXT

Please check the UPF information defined for power domain %S. Or specify supply nets explicitly using **-nets** option.

SEE ALSO

`set_fp_rail_voltage_area_constraints (2)`

PNA-053 (error) %s must be a positive value.

DESCRIPTION

The value of %s is either negative or zero or unspecified. PNS/PNA requires this value to be positive to proceed correctly.

WHAT NEXT

Please specify a positive value for %s.

PNA-054 (error) Cannot specify both strap and pitch constraints.

DESCRIPTION

PNS cannot synthesize the P/G network based on both the number of straps and strap pitch constraints.

WHAT NEXT

Please specify either number of straps constraints or strap pitch constraints, but not both of them.

SEE ALSO

`set_fp_rail_constraints` (2)
`set_fp_rail_voltage_area_constraints` (2)

PNA-055 (error) The core area is too small for the minimum number of horizontal straps %d for layer %s

DESCRIPTION

The design is too small to fulfill the specified minimum number of horizontal straps for the specified layer constraints. Note that the default minimum number of straps is 16.

WHAT NEXT

Please decrease the minimum number of straps for the synthesized horizontal layer.

SEE ALSO

`set_fp_rail_constraints` (2)

PNA-056 (error) The core area is too small for the minimum number of vertical straps %d for layer %s

DESCRIPTION

The design is too small to fulfill the specified minimum number of vertical straps for the specified layer constraints. Note that the default minimum number of straps is 16.

WHAT NEXT

Please decrease the minimum number of straps for the synthesized vertical layer.

SEE ALSO

`set_fp_rail_constraints` (2)

PNA-057 (error) There is not enough space to synthesize core

ring.

DESCRIPTION

The design is too small such that core ring cannot be synthesized.

WHAT NEXT

Please disable core ring generation by using the following command and options:
`set_fp_rail_constraints -skip_ring -extend_strap boundary` Or change the floorplan by increasing the die size.

SEE ALSO

`set_fp_rail_constraints` (2)
`initialize_floorplan` (2)

PNA-058 (error) Cannot specify multiple voltage area names.

DESCRIPTION

This option cannot take multiple voltage area names.

WHAT NEXT

Please use separate command to specify for each voltage area.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)
`report_fp_rail_voltage_area_constraints` (2)
`remove_fp_rail_voltage_area_constraints` (2)

PNA-059 (error) Cannot find P/G pad of net %s in the design.

DESCRIPTION

PNS fail to read in the P/G pad of net %s from the design. This could be due to the following reasons:

- (1) There is no pad in the design.
- (2) No pad is logically connected to net %s.

WHAT NEXT

Please check if there exists P/G pad for net %s in the design. If the P/G pads are not connected to net %s, please use the command `derive_pg_connection` to connect them. If there is no pad, please use the command `create_fp_virtual_pad` to define virtual pad for PNS.

SEE ALSO

`create_fp_virtual_pad` (2)
`derive_pg_connection` (2)

PNA-060 (error) All the pads of net %s cannot reach any power port of the leaf cells or blocks.

DESCRIPTION

PNS can find pads for net %s in the design; however, these pads are not able to be connected to the cell instances through P/G network. This means the pads have been defined, but there is no direct connection between the pads and the power network. The following reasons could cause this problem:

- (1) There is blockages between pads and the closest power straps.
- (2) There are no cell instances in the design.
- (3) Pads are connected to the nearest power strap, however that power strap cannot be connected to the cell instances in the design.
- (4) The power mesh is not created successfully due to blockage or DRC violation.
- (5) In MV design, other voltage areas block the connection path between pads and the logically connected power network.
- (6) In MV design, if the voltage area is a power-down voltage area, there is no direction connection from the pads to the existing permanent power strap or synthesized permanent power straps. Please check the log message to see if the MT莫斯 alignment straps are synthesized successfully.

WHAT NEXT

Please remove the blockage between pads and power networks, or use the option `-ignore_blockage` in the `synthesize_fp_rail` command to debug. If the pads are virtual pads, please define virtual pads at a different location. In the MVDD design, please check if the pads are able to reach the voltage area. In the power-down voltage area, please check if the power switch cells are inserted and connected properly and set the alignment strategy using the command `set_fp_rail_strategy -align_strap_with_mtcmos_cells`.

SEE ALSO

`synthesize_fp_rail` (2)
`set_fp_rail_strategy` (2)

```
set_fp_rail_voltage_area_constraints (2)
```

PNA-061 (error) Voltage area name is not specified in Power Switch Array Synthesis.

DESCRIPTION

In the Power Switch Array Synthesis flow, user must specify the voltage area that is to be powerd-down.

WHAT NEXT

Please specify the voltage area name using the **-voltage_area** option.

SEE ALSO

```
synthesize_fp_rail (2)  
set_fp_rail_voltage_area_constraints (2)
```

PNA-062 (error) Cannot specify more than one voltage area in Power Switch Array Synthesis.

DESCRIPTION

In the Power Switch Array Synthesis flow, user cannot specify more than one power-down voltage area.

WHAT NEXT

Please specify only one voltage area name using the **-voltage_area** option.

SEE ALSO

```
synthesize_fp_rail (2)  
set_fp_rail_voltage_area_constraints (2)
```

PNA-063 (error) Cannot get the reference library cell name of

power switch for voltage area %s.

DESCRIPTION

PNS cannot find the reference library cell name (master name) of the power switch. This could be either user did not define power switch cell in UPF mode; or user did not specify the **-power_switch** option in non-UPF mode.

WHAT NEXT

Please first check if power switch cell is specified. If not, please specify it using option **-power_switch**. If power switch is already specified using the power switch name defined in UPF, it could be that PNS cannot find such power switch in the voltage area %s. Please double check UPF definition for voltage area %s.

SEE ALSO

create_power_switch (2)
set_fp_rail_voltage_area_constraints (2)

PNA-064 (error) Cannot find power switch cell %s in the library.

DESCRIPTION

PNS cannot find power switch cell %s in the library.

WHAT NEXT

Please use **get_cells** command to check if the power switch cell is in the library.

SEE ALSO

get_cells (2)
get_physical_lib_cel (2)
set_fp_rail_voltage_area_constraints (2)

PNA-065 (error) Cannot get the on-resistance of power switch cell %s.

DESCRIPTION

PNS cannot get the on-resistance of power switch cell %s. Therefore, power switch cell will not able to be synthesized in the flow and IR drop result can be very

inaccurate.

WHAT NEXT

Please specify the on-resistance for power switch cell %s using the following command:

```
set_attribute [get_physical_lib_cells <master_name>] "mtcmos_resistance"  
<resistance_value>
```

SEE ALSO

`synthesize_fp_rail` (2)
`set_fp_rail_voltage_area_constraints` (2)

PNA-066 (error) The power net type of layer %s has not been defined.

DESCRIPTION

Power switch array synthesis will synthesize the permanent and virtual power nets on different metal layers in the power-down voltage area. Therefore, user should define the net type for each layer using command **`set_fp_rail_voltage_area_constraints`**.

WHAT NEXT

Please specify the net type for layer %s as the example below:

```
set_fp_rail_voltage_area_constraints \  
-layer %s \  
-mtcmos_net_type <permanent | virtual>
```

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)

PNA-067 (error) No synthesized power network.

DESCRIPTION

In order to commit a power plan, user need to synthesize the power network first.

WHAT NEXT

Please use command `synthesize_fp_rail` to synthesize the power network.

SEE ALSO

`commit_fp_rail` (2)
`synthesize_fp_rail` (2)

PNA-099 (error) %s

DESCRIPTION

Under normal scenario, PNA/PNS should not reach this state. Possibly caused by internal tool error.

WHAT NEXT

Please contact R&D.

PNA-101 (warning) Layer constraint is not set in %s.

DESCRIPTION

PNS synthesizes P/G network based on user-specified layer constraints. By default, PNS uses the highest two metal layers.

WHAT NEXT

Set layer constraints using `set_fp_rail_constraints` command for single-voltage PNS or `set_fp_rail_voltage_area_constraints` command for multi-voltage PNS.

PNA-102 (warning) Ring constraint is not set in %s.

DESCRIPTION

PNS synthesizes core ring based on user-specified ring layer constraints. By default, PNS uses the highest two metal layers and twice the strap width to synthesize core ring.

WHAT NEXT

Set core ring constraint using *set_fp_rail_constraints* command for single-voltage PNS and *set_fp_rail_voltage_area_constraints* command for multi-voltage PNS.

PNA-103 (warning) Power/Ground pad constraint is not set in %S.

DESCRIPTION

Power pad synthesis (PPS) needs pad constraints to synthesize P/G pads.

WHAT NEXT

Set power/ground pad constraints using *set_fp_power_pad_constraints* command.

PNA-104 (warning) Block ring width is not set.

DESCRIPTION

PNS needs block ring width to synthesize block ring.

WHAT NEXT

Use the minimum width from technology file.

PNA-105 (warning) Cannot find any blocks with the given block type.

DESCRIPTION

The block name and block type do not match

WHAT NEXT

No blocks will be selected.

PNA-106 (warning) %d pad instances cannot connect to power

net wires due to %s.

DESCRIPTION

If PG pad instances do not physically connect to power network, PNA/PNS will create virtual wires for connection. However, if there is blockage between the connected path, PNA is unable to make this connection such that the pad cannot be used during IR drop analysis.

WHAT NEXT

Please change the locations of pads or the blocking hard macros if users would like to use ths pads to supply current to core area.

PNA-107 (warning) There are %d pad instances which do not have any pin shape.

DESCRIPTION

For such pads, PNA will not use them during IR drop analysis.

WHAT NEXT

Please check if they are reasonable pad instances.

PNA-108 (warning) Target IR drop for net %s cannot be satisfied.

DESCRIPTION

PNS is unable to synthesize power plan reaching the specified target IR drop. However, the power plan is still synthesized with the lowest possible IR drop values.

WHAT NEXT

PNA-109 (warning) Total %d pad(s) for net %s have currents

over target pad current constraint %f.

DESCRIPTION

PPS is unable to synthesize power pads satisfying maximum pad current constraints.

WHAT NEXT

Please add more pads or change power plan to satisfy the maximum pad current constraints.

SEE ALSO

`set_fp_power_pad_constraints` (2)

PNA-110 (warning) The specified ring spacing is less than the minimum spacing of %.3f microns.

DESCRIPTION

For such a case, PNS uses the required minimum ring spacing.

WHAT NEXT

PNA-111 (warning) There are no wires in net %s.

DESCRIPTION

There is no PG wires in the specified net. PNA will skip the net for IR drop analysis.

WHAT NEXT

PNA-112 (warning) Power budget in %s is not specified. Power

will be assigned automatically by PNS.

DESCRIPTION

If the power budget of a voltage area is not specified, PNS assigns power budget to this voltage area automatically in one of the following three ways:

(1) If -

analyze_power is used in the *synthesize_fp_rail* command, PNS will obtain power consumption of each cell instance from Power Compiler and use them as power budget.

(2) If power consumption file from Power Compiler, PrimeTime PT-

PX or default power consumption file is used in the *synthesize_fp_rail* command, PNS will obtain power consumption of each cell instance from the power consumption file and use them as power budget.

(3) If none of the above options are used, by default, PNS will use the total power budget specified in the *synthesize_fp_rail* command and assign it to each voltage area based on the total instance area and the supply voltage in the voltage area. Note that, if power budget in some voltage areas have already been specified, PNS will honor the specified power budget and assign the rest of power budget to the remaining voltage areas.

WHAT NEXT

SEE ALSO

***synthesize_fp_rail* (2)**

PNA-113 (warning) Cannot find layer constraint for layer %s.

DESCRIPTION

PNS cannot find layer constraints for the specified layer. It could be due to unspecified layer constraints or internal error.

WHAT NEXT

Please check if user has set layer constraints for the specified layer.

PNA-114 (warning) Cannot find layer constraint for layer %d.

DESCRIPTION

PNS cannot find layer constraints for the specified layer. It could be due to unspecified layer constraints or internal error.

WHAT NEXT

Please check if user has set layer constraints for the specified layer.

PNA-115 (warning) Number of % straps aligned with top-level pin is 0.

DESCRIPTION

When user specifies strategy `align_strap_with_top_pin` and also set the variable `pns_pin_alignment_strap_only` to `true`, PNS will only generate power mesh with the pin alignment straps. In this case the number of % alignment straps is 0 and PNS may not generate a proper power/ground mesh.

WHAT NEXT

Set the variable `pns_pin_alignment_strap_only` to `false`.

SEE ALSO

`set_fp_rail_strategy` (2)

PNA-116 (warning) Virtual pad at (%s %s) for net %s cannot be used.

DESCRIPTION

The defined virtual pad cannot be used. This could be due to the following reasons:

- (1) The virtual pad is inside hard macros.
- (2) The area from virtual pad to the closest power net wires/vias is blocked by hard macros.
- (3) The virtual pad cannot find a straight route to connect to any power net wires.

WHAT NEXT

PNA-117 (warning) The power value %.3f mW for master %s from PWR view, power consumption file, or LM view is higher

than the power budget of the design %.3f mW.

DESCRIPTION

The engine uses area ratio rather than this power value to assign power to the instances.

WHAT NEXT

PNA-118 (warning) Cannot find port %s in %s.

DESCRIPTION

PNA/PNS will skip the instances whose PG ports are missing.

WHAT NEXT

PNA-119 (warning) The % block ring width of %s is too large..

DESCRIPTION

The block ring width constraint is larger than 1/6 of the chip width. PNS will ignore such block ring constraint.

WHAT NEXT

Choose a smaller block ring width.

PNA-120 (warning) cannot find standard cell pin for generating virtual straps for net %s.

DESCRIPTION

PNA is unable to find any standard cells connecting to the specified net. The information is needed when generating virtual rail.

WHAT NEXT

PNA-121 (warning) Cannot find %s %s in the design.

DESCRIPTION

WHAT NEXT

PNA-122 (warning) The power value of %s %s is negative and is ignored.

DESCRIPTION

The specified power file contains instances with negative power values. PNA will ignore them.

WHAT NEXT

PNA-123 (warning) The IR drop of the synthesized net is higher than the target IR drop %.2f (mV).

DESCRIPTION

The maximum IR drop in the power network synthesized by PNS is greater than the user-specified target. This could be due to the target IR drop is too small, or the constraints for the power network is too tight.

WHAT NEXT

Increase the target IR drop or relax the power network constraints, or add more power/ground pads.

SEE ALSO

```
synthesize_fp_rail (2)  
set_fp_rail_constraints (2)
```

PNA-124 (warning) Warning: %s has more than %d equivalent layers

DESCRIPTION

The layer has more than 16 equivalent layers. PNA can take at most 16 equivalent layers.

WHAT NEXT

PNA-125 (warning) Warning: minimum number of straps of layer %s needs to be less than %d, the current setting is %d, PNS will ignore this constraint

DESCRIPTION

The minimum straps should be less than maximum straps.

WHAT NEXT

PNA-126 (warning) Warning: Minimum strap constraints needs to be less than %d, PNS will ignore this constraints

DESCRIPTION

The minimum straps should be less than maximum straps.

WHAT NEXT

PNA-127 (warning) layer_name %s cannot be found, ignored

DESCRIPTION

It is unable to find the specified layer name.

WHAT NEXT

PNA-128 (warning) Warning: Virtual Segment setting error, support only vertical or horizontal wire, (x1, y1) = (%d, %d), (x2, y2) = (%d, %d)

DESCRIPTION

PNA supports only vertical or horizontal virtual segments.

WHAT NEXT

PNA-129 (warning) Cannot get supply voltage of net %s from UPF.

DESCRIPTION

PNS/PNA cannot find supply voltage of net %s from UPF definition.

WHAT NEXT

Please check the UPF information defined for supply net %s, or specify the supply voltage explicitly using **-voltage_supply** option.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)

PNA-130 (warning) Supply voltage of net %s specified by user is inconsistent with the supply voltage defined in UPF.

DESCRIPTION

Supply voltage of net %s specified by user is inconsistent with the supply voltage defined in UPF.

WHAT NEXT

User-specified supply voltage will be honored. Please check the UPF definition.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)

PNA-131 (warning) Cannot find net %s from UPF definition in power domain %s.

DESCRIPTION

Supply net %s specified by user is not defined in UPF in power domain %s.

WHAT NEXT

PNS will honor the supply net specified by the users. However, user should also explicitly specify the supply voltage of this net, since it is not available in UPF.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)

PNA-132 (warning) Fail to align net %s with MTCMOS power switch cells. PNS may not deliver power to instances in voltage area %s.

DESCRIPTION

PNS cannot align net %s with MTCMOS power switch cells that are used to shutdown voltage area %s. It could be due to the following reasons:

- (1) There are no MTCMOS cells inserted in the design.
- (2) User did not specify the MTCMOS cell name and on-resistance.
- (3) MTCMOS cells are not logically connected to the net %s.
- (4) There are blockages in the design that disallow alignment straps to be generated.

WHAT NEXT

If the reason is:

- (1) Insert MTCMOS cells first.
- (2) Specify the MTCMOS cell name and on-resistance using the following Tcl command:
`set_attribute [get_physical_lib_cells <master_name>] "mtcmos_resistance" <resistance_value>`
`set_attribute [get_physical_lib_cells <master_name>] "mtcmos_pin_layers" <pin1_name> <pin1_layer> <pin2_name> <pin2_layer>`
- (3) Connect MTCMOS cells to the primary and internal net.
- (4) Check if there are blockages that block the alignment straps. If it is blocked by other voltage area, you may set the global constraints -
`allow_routing_over_voltage_area`, otherwise, you may change the layer and/or direction of the alignment straps by setting the PNS strategy -
`align_strap_with_mtcmos_cells`.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)
`set_fp_rail_strategy` (2)
`derive_pg_connection` (2)

PNA-133 (warning) No power switch cell found in voltage area %s. PNS may not generate P/G network for the power-down voltage area correctly.

DESCRIPTION

PNS cannot find any MTCMOS power switch cells placed in the power-down voltage area %s, or the internal P/G pin of the power switch cell does not connect to the shutdown net of the voltage area. This could be due to the following reasons:

- (1) Power switch cells have not been physically inserted.
- (2) User did not define the power switch cell name and on-resistance in the library.
- (3) Logical connection is not made correctly between the power switch and the supply P/G net.

WHAT NEXT

If the reason is:

(1) Please insert power switch cells using the command **add_header_footer** command.
(2) Specify the power switch cell master name and on-resistance using the following command:
`set_attribute [get_physical_lib_cells <master_name>] "mtcmos_resistance" <resistance_value>`
`set_attribute [get_physical_lib_cells <master_name>] "mtcmos_pin_layers" <pin1_name> <pin1_layer> <pin2_name> <pin2_layer>`
(3) Connect power switch to the corresponding P/G net by **derive_pg_connection** command.

SEE ALSO

PNA-134 (warning) The primary power net %s is different from the primary power net defined in UPF.

DESCRIPTION

The primary power net specified by user for the voltage area is different from the primary power net defined in UPF. This may cause cells in the voltage area not connect to the correct power supply net. Especially in power-down voltage area, the permanent and virtual power network may be generated incorrectly.

WHAT NEXT

Check your power net specification. Update the primary power net with the correct net name.

SEE ALSO

set_fp_rail_voltage_area_constraints (2)
report_power_domain (2)
derive_pg_connection (2)

PNA-135 (warning) Found broken %s ring wire at (%s %s)

DESCRIPTION

The ring of %s net is not connected to any other ring net at the location.

WHAT NEXT

Check the ring wire at (%s %s).

SEE ALSO

`check_fp_rail` (2)

PNA-136 (warning) Found floating %s wire segment at (%s %s).

DESCRIPTION

The wire at (%s %s) is not connected to any other wires or vias of the same net.

WHAT NEXT

Check the wire segment at (%s %s).

SEE ALSO

`check_fp_rail` (2)

PNA-137 (warning) Found power switch instance %s at (%s %s) unconnected to net %s

DESCRIPTION

There is no wire or via to connect the input power pin of the power switch to the permanent power net. Power switch cannot deliver power to the power down voltage area.

WHAT NEXT

Check the power switch connection of instance %s.

SEE ALSO

`check_fp_rail` (2)

PNA-138 (warning) No power/ground pads are specified and no

virtual pads are defined.

DESCRIPTION

Power/ground pad master/instance is not defined by user; and no virtual pad is created in the design.

WHAT NEXT

PNS/PNA will regard all the IO pads that are logically connected to the analyzed power/ground net as power pads.

SEE ALSO

`create_fp_virtual_pads` (2)

PNA-139 (warning) The %s option will be ignored in the MVDD power network synthesis.

DESCRIPTION

When `-synthesize_voltage_areas` or `-synthesize_power_switch_array` option is specified, PNS is performed per voltage area base (MVDD PNS). Therefore, this %s option will be ignored in this command. User should specify this %s option for each voltage area individually using `-set_fp_rail_voltage_area_constraints`.

WHAT NEXT

Specify the %s option using `-set_fp_rail_voltage_area_constraints`.

SEE ALSO

`set_fp_rail_voltage_area_constraints` (2)
`synthesize_fp_rail` (2)

PNA-140 (warning) All the %d pad instances are not connected to the power network or no direct pseudo wire can be made to

the nearest power straps.

DESCRIPTION

WHAT NEXT

Please check the blockage between power pad pins and the designated power network area. In PNS, this could also be due to the power straps closer to the power pad pins are being cut because of blockage or DRC violation. Please use '--ignore_blockage' option to debug.

SEE ALSO

```
set_fp_rail_constraints (2)
set_fp_rail_voltage_area_constraints (2)
synthesize_fp_rail (2)
```

PNA-141 (warning) All the %d virtual pads cannot make direct pseudo wire to the nearest power straps.

DESCRIPTION

WHAT NEXT

Please check the blockage between virtual pads and the designated power network area. In PNS, this could also be due to the power straps closer to the power pad pins are being cut because of blockage or DRC violation. Please use '--ignore_blockage' option to debug.

SEE ALSO

```
set_fp_rail_constraints (2)
set_fp_rail_voltage_area_constraints (2)
synthesize_fp_rail (2)
analyze_fp_rail (2)
```

PNA-142 (warning) One %s strap at (%.3f %.3f %.3f %.3f) is not created successfully due to DRC violation with nearby %s wires.

DESCRIPTION

A %s strap can not be synthesized by PNS because it has DRC violation with the

nearby ring wires or existing wires.

WHAT NEXT

Please enlarge the distance between the synthesized strap and the nearby existing wire or ring wire. If the nearby wire is ring wire, please increase the offset of rings. If the synthesized strap is to align the power switch cells, please replace the power switch cells or increase the offset of rings.

SEE ALSO

`synthesize_fp_rail` (2)

PNA-143 (warning) Synthesized P/G straps may overlap with plangroup edges. Please use `-cut_plangroup_edge_layers` strategy to remove them.

DESCRIPTION

In top-level PNS, synthesized straps may overlap with plangroup edges. After the top-level straps are pushed down to soft macros, these overlapping straps may create pins overlapping with soft macro boundaries and result in undesirable results when running PNS at block level. Therefore, if user uses the the hierachical PNS flow by specifying `-create_hierachical_pns_script` strategy, it is suggested that user also specifies the `-cut_plangroup_edge_layers` strategy during top-level PNS, in order to achieve a DRC clean power mesh at block level.

WHAT NEXT

Please specify the following stragegy:

`set_fp_rail_strategy -cut_plangroup_edge_layers <layer_name>`

SEE ALSO

`set_fp_rail_strategy` (2)

PNR-101 (error) No Milkyway CEL view is open.

DESCRIPTION

No Milkyway CEL view is open.

WHAT NEXT

Make sure that a Milkyway CEL view is open before proceeding.

SEE ALSO

```
current_mw_cel(2)  
open_mw_cel(2)
```

PNR-129 (Warning) net '%s' is marked as ideal net, this is not a clock net, and it will not be optimized.

DESCRIPTION

You receive this error message during `check_physical_design`, because a net has `ideal_net` attribute while it is not a clock.

This situation disables timing update and optimization of cells and nets in the transitive fanout of the specified objects during `place_opt` or `psynopt`.

WHAT NEXT

Check if the net should be defined as `Clock`, it is a High Fanout Net, or just regular net. Use `create_clock` if it could have been a clock. Use `remove_ideal_network` to remove this restriction from ports or pins in the current design as sources of an ideal network.

SEE ALSO

```
create_clock(2) remove_ideal_network(2) report_ideal_network(2) set_ideal_netwok(2)
```

PNR-130 (Warning) This is a dont_touch non-clock net (%s) that has fanout of over 100.

DESCRIPTION

This error message tells you that the design has non-clock nets with 100+ fanout that are set as don't touch.

WHAT_NEXT

Make sure that is exactly what you want. Or use `remove_attribute` to remove the don't touch attribute for the net.

SEE ALSO

`remove_attribute(2)`
`set_dont_touch_network(2)`
`set_dont_touch(2)`
`all_dont_touch(2)`

PNR-131 (Warning) Non-clock net (%s) has fanout of over 500.

DESCRIPTION

This error message tells you that the design has non-clock nets which have high fanout of over 500.

WHAT_NEXT

SEE ALSO

PNR-133 (Warning) Net (%s) has fanout of over 1000 and not marked as ideal net.

DESCRIPTION

This error message tells you that the design has nets with fanout of over 1000.

WHAT_NEXT

SEE ALSO

PNR-137 (error) Area for %s %s is not defined.

DESCRIPTION

This error message tells you that the design contains move bound or group bound with undefined area or area of 0.

WHAT_NEXT

Use `update_bounds` to update the area attribute of the bound.

SEE ALSO

update_bounds(2)
create_bounds(2)
remove_bounds(2)
report_bounds(2)

PNR-138 (error) Utilization of the design is at (%d%).

DESCRIPTION

This error message tells you that the design currently at 100% or above for utilization.

WHAT_NEXT

SEE ALSO

PNR-139 (error) Initial location is not set for cell (%s).

DESCRIPTION

This error message tells you that the design has cells without proper location, this design is not ready for routing.

WHAT_NEXT

Please run place_opt.

SEE ALSO

PNR-140 (error) No corresponding physical cell for logical cell %s.

DESCRIPTION

This error message tells you that this design contains logical cell which does not have a corresponding physical cell, this cell will not be placed.

WHAT_NEXT

Check to make sure that the DEF input file matches with the verilog input file.

SEE ALSO

PNR-141 (error) Cannot get height and width for cell %s.

DESCRIPTION

This error message tells you that the design contains cell whose dimension was not specified.

WHAT_NEXT

SEE ALSO

PNR-142 (warning) The %s utilization of (%d) exceeds specified threshold (%d).

DESCRIPTION

This error message tells you that the design contains a move bound or group bound where the total cell area within the bound exceeds the specified threshold.

WHAT_NEXT

If exceeding the threshold is unacceptable, remove cells from the bound (move bounds only) or remove and re-create the bound with a larger area.

SEE ALSO

```
update_bounds(2)
create_bounds(2)
remove_bounds(2)
report_bounds(2)
get_bounds(2)
```

PNR-143 (warning) Utilization of the design is at (%d%).

DESCRIPTION

This error message tells you that the design currently at 90% or above for utilization.

WHAT_NEXT

SEE ALSO

PNR-146 (warning) The design contains only (%d) routing layers, this might lead into congestion issue.

DESCRIPTION

This error message tells you that the design does not have enough routing layers(<3), which might cause congestion issue.

WHAT_NEXT

Define more routing layers for the design

SEE ALSO

```
set_net_routing_layer_constraints(2)  
report_net_routing_layer_constraints(2)  
remove_net_routing_layer_constraints(2)
```

PNR-148 (warning) Placement area is less than specified site width of %d.

DESCRIPTION

This error message tells you that the design has placement areas that are less than site width.

WHAT_NEXT

SEE ALSO

PNR-149 (error) Core area is bigger than die size.

DESCRIPTION

This error message tells you that the core area of the design is bigger than the specified die size.

WHAT_NEXT

Reset the die area use **set_die_area**

SEE ALSO

`get_die_area(2)`
`set_die_area(2)`
`get_core_area(2)`

PNR-151 (error) Found macro cell without fixed placement: '%s'

DESCRIPTION

The tool has found a macro cell without fixed placement.

WHAT NEXT

Macro cells must have fixed placement before the placer can be run.

SEE ALSO

`all_fixed_placement(2)`
`all_macro_cells(2)`
`set_dont_touch_placement(2)`

PNR-152 (error) Clock '%s' has hierarchical pin '%s' as source.

DESCRIPTION

A clock was found to have a hierarchical pin as source. A hierarchical pin cannot be the root for a clock-tree. CTS will fail for this clock.

WHAT NEXT

Redefine the clock source.

SEE ALSO

`create_clock(2)`
`set_driving_cell(2)`

PNR-153 (error) verify_pg_nets failed.

DESCRIPTION

Some power/ground pins in the design are not properly connected to the power/ground nets.

WHAT NEXT

SEE ALSO

`connect_pg_nets(2)`

PNR-155 (error) %s is not define for this %s %s.

DESCRIPTION

This error message tells you that the design does not either have the unit or track defined.

WHAT_NEXT

SEE ALSO

PNR-156 (warning) Macro (%s) has no keepout margins.

DESCRIPTION

This error message tells you that the specified macro does not have keepout margins.

The `set_keepout_margin` command creates keepout margins for the specified cells and library cells. The tool will derive the keepout margins for the cells in the following order.

1. keepout margin specified on the cell itself
2. keepout margin specified on the lib cells of the cell
3. Pin count based derived keepout margin values in case of macro cells.

WHAT_NEXT

Use `set_keepout_margin` to define the keepout region for the macro, or create placement blockages around the macro.

SEE ALSO

```
get_attribute(2)
report_keepout_margin(2)
set_keepout_margin(2)
remove_keepout_margin(2)
create_placement_blockage(2)
```

PNR-158 (warning) Fixed placement cell (%s) has no keepout margins.

DESCRIPTION

This error message tells you that the specified fixed placement cell does not have keepout margins.

WHAT_NEXT

SEE ALSO

PNR-159 (warning) %s for design %s.

DESCRIPTION

This error message tells you that either the die area or ports are not fixed for the current design. These are the basic floorplan elements which need to define prior to running place_opt.

WHAT_NEXT

SEE ALSO

PNR-160 (warning) Cell (%s) is a standard cell which has fixed placement.

DESCRIPTION

This error message tells you the specified standard cell has fixed placement.

WHAT_NEXT

SEE ALSO

PNR-161 (warning) Macro cell (%s) is not fixed.

DESCRIPTION

This error message tells you the specified macro cell is not fixed, and to run create_placement and place_opt need macro cell fixed.

WHAT_NEXT

Please fix the macro cell location use *set_cell_location*.

SEE ALSO

`get_attribute(2)`
`set_attribute(2)`
`set_cell_location(2)`

PNR-162 (warning) %s under congested area are: (%s)

DESCRIPTION

This error message tells you that the listed nets or cells are in the congested area of over 95%.

WHAT_NEXT

SEE ALSO

PNR-163 (Info) The design has existing routes.

DESCRIPTION

This error message tells you that the design has existing routes.

WHAT_NEXT

SEE ALSO

PNR-164 (Info) Report design vs library layers and preferred

routing directions.

DESCRIPTION

WHAT_NEXT

SEE ALSO

PNR-165 (Info) Report track info.

DESCRIPTION

WHAT_NEXT

SEE ALSO

PNR-166 (Warning) Net (%s) has DRC violation but is set as don't touch.

DESCRIPTION

This error message tells you that the design has nets with DRC violations but are set as dont touch.

WHAT_NEXT

Check to see where don't touch attributes are coming from. Use **set_dont_touch** to remove the don't touch attribute or/and fix the DRC violation.

SEE ALSO

`set_attribute(2)`
`set_dont_touch(2)`

PNR-167 (Warning) The design has %d congested areas with

over %.2f utilization. Only display %d congested areas.

DESCRIPTION

This error message tells you the design has more congested areas than specified by the variable snps_cpd_congestion_area_limit (default 100). Criteria for congestion is specified by the variable snps_cpd_congestion_threshold (default 95%).

WHAT_NEXT

SEE ALSO

PNR-168 (Error) Port (%s) has geometry on layer (%s), which is set as ignored layer.

DESCRIPTION

This error message tells you that the design has port which has geometry set on unaccessible layers.

WHAT_NEXT

SEE ALSO

PNR-169 (Warning) Port (%s) is long port.

DESCRIPTION

This error message tells you that the design has long ports without the flag physopt_long_port_support set to TRUE.

WHAT_NEXT

SEE ALSO

PNR-171 (Info) port (%s) is a physical only port.

DESCRIPTION

This error message tells you that the design has physical only ports and it is listing the port names.

WHAT_NEXT

SEE ALSO

PNR-172 (error) Track is not define for layer %s.

DESCRIPTION

This error message tells you that the layer does not have the track defined, and the layer is a preferred routing layer.

WHAT_NEXT

Use **create_track** to define the tracks.

SEE ALSO

```
create_track(2)
report_track(2)
report_ignored_layers(2)
reportt_preferred_routing_layer_direction(2)
```

PNR-173 (error) Length unit is not define for design %s.

DESCRIPTION

This error message tells you that the design does not have the length unit defined.

WHAT_NEXT

Please update the tech file for missing design units. Please define unitLengthName and lengthPrecision inside tech file.

For example:

```
icc_shell> write_mw_lib_files -technology -output dumped.tf myLib;  
Look for Technology section, add unitLengthName and lengthPrecision if not available. The format looks like:  
Technology {  
    unitLengthName      = "micron"  
    lengthPrecision     = 1000  
}  
cc_shell> close_mw_lib;  
icc_shell> set_mw_technology_file -technology changed_from_dump.tf myLib;  
icc_shell> open_mw_lib myLib;
```

SEE ALSO

`report_mw_lib(2)`

PNR-175 (error) Move Bound %s is over-utilized (%s used).

DESCRIPTION

This error message tells you that the indicated move bound has more cells inside it than can fit.

WHAT_NEXT

Use `update_bounds` to update the dimensions of the bound, or remove cells from the bound.

SEE ALSO

`update_bounds(2)`
`create_bounds(2)`
`remove_bounds(2)`
`report_bounds(2)`
`get_bounds(2)`

PNR-176 (error) Fixed cell %s is outside %s move bound %s.

DESCRIPTION

This error message tells you that the indicated cell has been fixed to a location

that is outside of the hard/exclusive move bound it is associated with. This represents an unachievable goal, and will impact the runtime or quality of the placement.

WHAT_NEXT

Use **update_bounds** to update the dimensions of the move bound or remove the cell from the bound. Alternatively, removed the fixed attribute from the cell.

SEE ALSO

```
update_bounds(2)  
create_bounds(2)  
remove_bounds(2)  
report_bounds(2)  
get_bounds(2)
```

PNR-177 (Warning) %s %s cannot fit into group bound %s.

DESCRIPTION

This error message tells you that the indicated object (either a fixed cell or a hard/exclusive move bound) has an area greater than the dimensions of the group bound. This may impact runtime or quality of the placement.

WHAT_NEXT

Use **update_bounds** to update the group bound to increase its dimension attribute or remove the object from the group bound.

SEE ALSO

```
update_bounds(2)  
create_bounds(2)  
remove_bounds(2)  
report_bounds(2)  
get_bounds(2)
```

PNR-178 (Warning) %s %s and %s %s cannot both fit into group bound %s.

DESCRIPTION

This error message tells you that the two indicated objects (either fixed cells or hard/exclusive move bounds) have both been placed inside the named group bound.

However, the dimension of the group bound is too small to contain both objects at the same time. This may impact runtime or quality of the placement.

WHAT_NEXT

Use **update_bounds** to update the group bound to increase its dimension attribute or remove one or the other object from the group bound.

SEE ALSO

```
update_bounds(2)
create_bounds(2)
remove_bounds(2)
report_bounds(2)
get_bounds(2)
```

PNR-254 (error) No clocks were found.

DESCRIPTION

No clocks were found in the design.

WHAT NEXT

Define the clocks before proceeding.

SEE ALSO

```
create_clock(2)
get_clocks(2)
```

PPLI

PPLI-1 "Cannot register RTL Net %s[%d:%d], because its individuals bits are not available"

DESCRIPTION

The DesignPower PLI interface to Verilog-XL is not able to register individual bits of a bused net when the bused net is at the RTL level. An RTL level net does not have any of its individual pins connected to cells in the verilog design hierarchy. If all connections of the bus are connected in a bused fashion, Verilog PLI v1.0 does not provide a mechanism to monitor the individual nets within the bus. This is a Verilog PLI v1.0 limitation.

WHAT NEXT

The Verilog language provides compiler directives that provide a workaround to this problem. The `expand_vectornets` directive forces the verilog simulator to expand all vector nets independent of their connections. This directive must appear before module definitions that contain unexpanded bus signals. Note that this directive has a negative impact on Verilog simulation performance and memory. The corresponding directive `noexpand_vectornets` must be used after module definition in order to limit the impact on cpu performance.

You can make changes to the verilog description to work around this problem. If you ignore this message, no activity is reported for this bus or any of the component nets in the bus. Alternately, you can modify the verilog source description and connect cells or ports to a component net of the bus.

Verilog does not expand bused connections below the library cell frontier, so check to see if you are using the (-y or -v) options for designs which are not library cells.

PPLI-2 Please specify the path for the testbench module models in the \$read_rtl_saif() command.

DESCRIPTION

You did not specify the path for the testbench modules. This is likely to cause the PLI routines fail to register the RTL objects. To specify the path, use `$read_rtl_saif("file", "test_modules.design_instance")`.

WHAT NEXT

This is a warning.

PPLI-3 "Output Port %s Ignored."

DESCRIPTION

The power Verilog PLI does not register output port nets when operating in one of the two port registration modes (`dp_ports_only`, `dp_top_ports_only`). These ports are not registered because the port only modes are typically used for seeding probabalistic analysis within the DesignPower product. Not monitoring output ports can save memory and cpu runtime during the verilog simulation. This is an information message.

WHAT NEXT

No action is required.

PPLI-4 "Out of memory. Cannot create more VCL links"

DESCRIPTION

The power Verilog PLI was not able to allocate memory for its data structure. The process exceeded available memory limit.

WHAT NEXT

Increase memory limit and rerun.

PPLI-5 " \$set_toggle_region must always be done before toggle_stop"

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a `$toggle_stop()` command appears before the `$set_toggle_region` command in the testbench.

WHAT NEXT

Check the test bench and fix order of \$toggle_stop command.

PPLI-6 "\$toggle_start must always be done before calling on \$toggle_stop."

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a \$toggle_stop() command appears before the \$toggle_start() command in the testbench. The correct order is to perform \$toggle_start() before \$toggle_stop.

WHAT NEXT

Check the test bench and fix order of the \$toggle_stop command.

PPLI-7 "Out of memory. Cannot create DP Hash table/list."

DESCRIPTION

The power Verilog-PLI hash table routine can not allocate memory for its data structure. This error indicates that Verilog application exceeded memory limit for the process.

WHAT NEXT

Run with a larger memory configuration.

PPLI-8 "There are 0 nets registered. This typically happens when the only input parameter provided has no ports and you requested the dp_top_ports_only option for non-recursive-port registration."

DESCRIPTION

The power Verilog PLI did not register any design objects for monitoring during simulation. This usually indicates that there is a problem in the \$toggle_set function parameters set within the testbench.

WHAT NEXT

Check the verilog testbench and \$toggle_set parameters to determine why the error occurred.

PPLI-9 "\$toggle_report must always be done before calling on \$toggle_reset."

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a \$toggle_reset() command appears before the \$toggle_report call in the estbench.

WHAT NEXT

Check the test bench and fix order of \$toggle_reset command.

PPLI-10 "Net %s with less than 2 connections ignored."

DESCRIPTION

The power Verilog PLI attempted to monitor a net, but found the net had less than 2 connections. In this case the Verilog PLI does not monitor toggle activity on this net in an effort to save memory and CPU runtime. Single pin nets typically are not relevant to the process of power analysis.

WHAT NEXT

No action is required. You might want to review the net and ensure that this situation is correct.

PPLI-11 "The module instance %s does not match the cell specification in the SAIF file. No sdpd info is registered for this instance."

.SH DESCRIPTION The port information of this module instance does not match the cell specification in the SAIF file. For example, a port specified in the SAIF file could not be found in the module instance. In this case, Verilog PLI ignore the state-path dependencies of this intsnace.

WHAT NEXT

No action is required. You might want to review the net and ensure that this situation is correct.

PPLI-12 "\$toggle_stop must always be done before toggle_report"

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a \$toggle_report() command appears before the \$toggle_stop command in the testbench.

WHAT NEXT

Check the test bench and fix order of \$toggle_report command.

PPLI-13 "read_lib_saif() must be called before the \$set_toggle_region()

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a \$read_lib_saif() command appears after the \$set_toggle_region() command in the testbench. Please change your testbench file so that it appears before the \$toggle_start() command.

WHAT NEXT

Check the test bench and fix order of \$read_lib_saif() command.

PPLI-14 "read_rtl_saif() must be called before the \$set_toggle_region()

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a \$read_rtl_saif() command appears after the \$set_toggle_region() command in the testbench. Please change your testbench file so that it appears before the \$set_toggle_region() command.

WHAT NEXT

Check the test bench and fix order of \$read_rtl_saif() command.

PPLI-15 "set_toggle_reion() must be called before \$toggle_start().

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a \$set_toggle_region() command appears after the \$toggle_start() command in the testbench. Please change your testbench file so that it appears before the \$toggle_start() command.

WHAT NEXT

Check the test bench and fix order of \$set_toggle_region() command.

PPLI-16 "You have to also include a RTL forward SAIF file using \$read_rtl_saif() command because you included an MPM forward SAIF file.

DESCRIPTION

An MPM forward SAIF file only describes cell-specific MPM information. Since a cell could be instantiated in different places in the design, you need include a RTL forward SAIF file to identify which instance is an MPM cell. A RTL forward SAIF file is generated by using rtl2saif command from dc_shell.

WHAT NEXT

Check the test bench and add read_rtl_saif() command

PPLI-17 "set_gate_level_monitoring() must be called before \$toggle_start().

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a

`$set_gate_level_monitoring()` command appears after the `$toggle_start()` command in the testbench. Please change your testbench file so that it appears before the `$toggle_start()` command.

WHAT NEXT

Check the test bench and fix order of `$set_gate_level_monitoring()` command.

PPLI-18 "set_toggle_reion() must be called before \$toggle_report().

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a `$set_toggle_region()` command appears after the `$toggle_report()` command in the testbench. Please change your testbench file so that it appears before the `$toggle_report()` command.

WHAT NEXT

Check the test bench and fix order of `$set_toggle_region()` command.

PPLI-19 "set_toggle_reion() must be called before \$toggle_start().

DESCRIPTION

The power Verilog PLI requires a specific order of routine calls. In this case, a `$set_toggle_region()` command appears after the `$toggle_start()` command in the testbench. Please change your testbench file so that it appears before the `$toggle_start()` command.

WHAT NEXT

Check the test bench and fix order of `$set_toggle_region()` command.

PPLI-20 Two consecutive \$toggle_start() calls are not allowed.

DESCRIPTION

You can not have consecutive \$toggle_start() calls without \$toggle_stop() in between. Please go to your testbench and make sure a \$toggle_stop() is placed prior to the second \$toggle_start().

WHAT NEXT

This is an error.

PROC

PROC-1 (fatal) PROC(%s): Could not start child.

DESCRIPTION

WHAT NEXT

PROC-2 (error) Could not fork child process.

DESCRIPTION

WHAT NEXT

PROC-3 (error) Could not connect to child process.

DESCRIPTION

WHAT NEXT

PROC-4 (error) Could not establish child connection.

DESCRIPTION

WHAT NEXT

PROC-5 (information) Child process returned unexpectedly.

DESCRIPTION

The tool has tried to create a child process to help it perform some function, and that child process could not properly start up and connect to its parent. This could be for any one of a number of reasons: The system is out of memory, TCP/IP is not installed properly on the system, ...

WHAT NEXT

Check to see if your system has run out of virtual memory (swap space). Different systems do this differently, on SUNs use the /etc/pstat -s command.

Check to see if TCP/IP is installed properly on your system:

Try to rlogin localhost

Try to rlogin 'hostname' (Use backquotes around hostname)

If either of these commands fail, see you local system administrator for further help.

PROC-6 (error) Unknown host '%s'.

DESCRIPTION

WHAT NEXT

PS

PS-1 (error) Bad plot command '%s'.

DESCRIPTION

This error occurs because this command is not supported and has been obsoleted.

WHAT NEXT

Use the GUI to produce schematic and placement printouts for your design.

PS-2 (error) Bad plot command.

DESCRIPTION

This error occurs because this command is not supported and has been obsoleted.

WHAT NEXT

Use the GUI to produce schematic and placement printouts for your design.

PS-3 (error) Cannot open plot file '%s'.

DESCRIPTION

This error occurs because this command is not supported and is obsolete.

WHAT NEXT

Use the GUI to produce schematic and placement printouts for your design.

PSCH

PSCH-1 (warning) Cannot plot design '%s' because it does not have a schematic.

You can create a schematic by using the `create_schematic` command.

DESCRIPTION

This warning occurs because this command is not supported and is obsolete.

WHAT NEXT

Use the GUI to produce schematic and placement printouts for your design.

PSCH-2 (warning) Cannot plot design '%s' because it does not have a symbol view.

You can create a symbol by using the `create_schematic-symbol_view` command.

DESCRIPTION

This warning occurs because this command is not supported and is obsolete.

WHAT NEXT

Use the GUI to produce schematic and placement printouts for your design.

PSYN

PSYN-001 (error) Design has synthetic parts.

DESCRIPTION

You receive this error message because your design contains synthetic parts. You must map all synthetic parts before running the **physopt** command, **create_placement** command, or **legalize_placement** command.

WHAT NEXT

To map synthetic parts, run the **compile** command.

SEE ALSO

compile (2), **create_placement** (2), **legalize_placement** (2), **physopt** (2).

PSYN-002 (error) Design contains unmapped cells.

DESCRIPTION

You receive this error message because your design contains generic, unmapped cells. You must map all such cells before running the **physopt** command, the **create_placement** command, or the **legalize_placement** command.

WHAT NEXT

To map generic cells, run the **compile** command.

SEE ALSO

compile (2), **create_placement** (2), **legalize_placement** (2), **physopt** (2).

PSYN-003 (error) Command '%s' had an error while executing. Discontinuing.

DESCRIPTION

You receive this error message because the command you specified cannot execute and

has been discontinued. This happens when input data is insufficient or when input is not in a format the command requires.

WHAT NEXT

Correct the input using the errors and warning issued and reissue the command.

SEE ALSO

`read_lib` (2).

PSYN-004 (error) Technology data not supplied.

DESCRIPTION

You receive this error message because you did not specify the per-unit length values of resistance and capacitance in this instance.

WHAT NEXT

To set the values, use the `set_delay_estimation_options` command

SEE ALSO

`read_lib` (2), `set_delay_estimation_options`(2).

PSYN-005 (error) Design %s has no associated physical design.

DESCRIPTION

You receive this error message because you specified no physical data for your design.

WHAT_NEXT

Specify the physical data for the design in the PDEF format, and read it in using the `read_pdef` command.

SEE ALSO

`read_pdef` (2).

PSYN-006 (warning) The core area for block is not defined.

DESCRIPTION

You receive this warning because the core area for the block you specified for optimization is not defined.

WHAT NEXT

Specify the core area in using the `initialize_floorplan` command or input DEF using the `read_def` command.

SEE ALSO

`read_def` (2) `initialize_floorplan` (2)

PSYN-007 (error) Following Ports have no location.

DESCRIPTION

You receive this error message because a port in your design does not have a specified location. To run the `create_placement` command and the `physopt` command, all ports must have their location defined.

WHAT NEXT

In the input PDEF file, add locations to all of the ports, and read in the PDEF file using the `read_pdef` command.

If you do not have a port locations you can instruct the tool to generate port locations for unfixed ports by using the `-mpc` switch with the `create_placement`, `physopt` or `compile_physical` commands.

SEE ALSO

`create_placement` (2), `physopt` (2), `read_pdef` (2).

PSYN-008 (error) The following cells have no location.

DESCRIPTION

You receive this error message because one or more cells in your design do not have their locations specified.

All cells must have locations specified in the following instances:

To run the **legalize_placement** command.

To run the **physopt** command with the **-incremental** option.

WHAT NEXT

In the input PDEF file, add locations to the cells. Then read in the input PDEF file using the **read_pdef** command

or

use a floorplanner, use **set_cell_location** command, or run placement or use **legalize_placement -eco**

SEE ALSO

create_placement (2), **legalize_placement** (2), **physopt** (2), **read_pdef** (2).

PSYN-009 (error) Blockage %s has no dimensions specified.

DESCRIPTION

You receive this error message because a blockage you specified does not have a corresponding rectangle defined in the input PDEF file. It is necessary to define a corresponding rectangle for every blockage in your design.

WHAT NEXT

Add a rectangle to the blockage in the input PDEF file, and read in the PDEF file using the **read_pdef** command. Or use the **create_obstruction** command to create the blockage rectangle.

SEE ALSO

create_obstruction (2), **read_pdef** (2).

PSYN-010 (error) No site array is specified.

DESCRIPTION

You receive this error message because your macro does not contain a specified site array. To run the **legalize_placement** command and the **physopt** command, a specified site array is necessary.

WHAT_NEXT

Add a site array definition to the input PDEF file, and read in the PDEF file using the **read_pdef** command.

SEE ALSO

legalize_placement (2), **physopt** (2), **read_pdef** (2).

PSYN-011 (error) Site array has no rows specified.

DESCRIPTION

You receive this error message because the site array you specified has no rows defined. The completed site array is necessary to run the **legalize_placement** command and the **physopt** command.

WHAT_NEXT

Correct the site array definition to the input PDEF file, and read in the input PDEF file using the **read_pdef** command.

SEE ALSO

legalize_placement (2), **physopt** (2), **read_pdef** (2).

PSYN-012 (error) Row has no sites specified.

DESCRIPTION

You receive this error message because a row in your specified site array has no sites defined on it. Every row needs to have a nonzero number of sites.

WHAT NEXT

Correct the site array definition to the input PDEF file, and read in the input PDEF file using the **read_pdef** command.

SEE ALSO

read_pdef (2).

PSYN-013 (error) PhysOpt license is not enabled.

DESCRIPTION

You receive this error message because the command you used requires a PhysOpt license, and a license is not available. Your site might not have acquired a PhysOpt license, or other processes might be using all the available licenses.

WHAT NEXT

To get the PhysOpt license, invoke the **get_license PhysOpt** command or call your Synopsys representative.

SEE ALSO

get_license (2).

PSYN-014 (error) No physical library cells for following library cells

DESCRIPTION

You received this error message because one or more logical library cells do not have a corresponding physical library cell. Every library cell referenced in the input design must have a physical library cell defined for it in a physical library.

WHAT NEXT

All logical library cells in the design should have corresponding physical library cells.

Check the physical libraries specified using the command `report_mw_lib -mw_reference_library`. If this list does not contain all the expected physical libraries, update the list using the command `set_mw_lib_reference`.

If all expected physical libraries are loaded, use the `check_library` command to detect inconsistencies between the logical and physical libraries in the design.

The command `get_physical_lib_cells /*` will list all physical cells currently loaded (use appropriate patterns or filters to restrict the results).

SEE ALSO

`report_mw_lib(2)` `set_mw_lib_reference(2)` `check_library(2)` `get_physical_lib_cells(2)`

PSYN-015 (error) Dimensions of following library cells is not specified.

DESCRIPTION

You receive this error message because a library cell in your library does not have specified height or width. Every library cell must have both height and width defined.

WHAT NEXT

In the input physical library, correct the specification of the library cell. Then recompile the library using the **read_lib** command.

SEE ALSO

read_lib (2).

PSYN-016 (error) There is no physical pins for following library pins

DESCRIPTION

You receive this error message because a pin on a logical library cell has no corresponding pin in the physical library. The physical library cell should contain pins corresponding to every pin in the logical library cell.

WHAT NEXT

In the input physical library, correct the specification of the library cell. Then recompile the library using **read_lib**.

SEE ALSO

read_lib (2).

PSYN-017 (error) There is no location specified for library pin

%S/%S.

DESCRIPTION

You receive this error message because a library pin you specified has no location defined in the physical library. Every pin must have a specified location in the physical library.

WHAT NEXT

In the input physical library, correct the definition of the pin. Then recompile the library using the **read_lib** command.

SEE ALSO

read_lib (2).

PSYN-018 (error) Site %s is not defined in physical library.

DESCRIPTION

You receive this error message because the site name instantiated to create a row in the site array is not defined in the physical library.

For the **physopt** command and the **legalize_placement** command to work, the site has to be linked to a site in the physical library.

WHAT NEXT

In the physical library, add the site definition. Then recompile the library using the **read_lib** command.

SEE ALSO

legalize_placement (2), **physopt** (2), **read_lib** (2).

PSYN-019 (error) Dimensions of site %s are not specified.

DESCRIPTION

You receive this error message because the site name instantiated to create a row in the site array does not have its height and width defined in the physical library. For the **physopt** command and the **legalize_placement** command to work, the site has to

have an associated height and width defined in the physical library.

WHAT NEXT

Add the height and width attributes to the site in the physical library and recompile the library using **read_lib**.

SEE ALSO

legalize_placement (2), **physopt** (2), **read_lib** (2).

PSYN-020 (error) Site width on a row is not an integer multiple of the spacing between sites on the row.

DESCRIPTION

You receive this error message because the site array you specified does not meet certain requirements.

For horizontal rows, the width of a site on a row should be an integer multiple of the spacing between sites on the row. Also, the spacing between sites should not exceed the width of the site. For vertical rows, the height of the site on the row should meet the above requirements.

WHAT NEXT

In the input PDEF file, adjust the site array to meet the above requirements. Then read in the PDEF file using the **read_pdef** command.

SEE ALSO

read_pdef (2).

PSYN-021 (error) Could not read the following physical library.

DESCRIPTION

You specified a physical library in the **physical_library** variable, but it is not in the directories listed in the **search_path** variable. For the **link_physical_library** command to perform, a full set of physical libraries must be present.

WHAT NEXT

Add the path name of the library to the **search_path** variable or, at the command line, specify the full path to the library (as in /usr/joe/my_lib.pdb), or remove the library from the **physical_library** variable.

SEE ALSO

`link_physical_library` (2); `physical_library` (3), `search_path` (3).

PSYN-022 (error) The library cell %s has no legal orientation, or cannot fit to any row site. Check LEF/DEF.

DESCRIPTION

A library cell is legal on a row if the site type of the row matches that of the library cell and if the library cell has an orientation defined that is allowed on that row. The detailed placer will try and legalize the placement so that the cell meets the above legality condition.

WHAT NEXT

An alternative to relying on the detailed placer to legalize the placement is to change the orientation of the sites on the rows so that all library cells are legal on the rows, in some orientation.

SEE ALSO

`legalize_placement` (2), `physopt` (2).

PSYN-023 (error) Site array has rows and columns specified at the same time.

DESCRIPTION

You receive this error message because the site array you defined in the input PDEF contains both horizontal and vertical arrays. Only one orientation of arrays can be specified in the site array, horizontal rows or vertical columns, but not both.

WHAT_NEXT

Change the input PDEF, and read it back in using the `read_pdef` command.

SEE ALSO

`read_pdef` (2).

PSYN-024 (warning) The '%s' cell in the '%s' technology library does not have corresponding physical cell description.

DESCRIPTION

You see this warning because you specified a logical cell in the technology library that does not have a matching cell in the physical library. Every logical cell must have corresponding matching cell in the physical library. If there is no matching cell in the physical library then that particular logical cell is marked as don't use and won't be considered any more.

Physical synthesis requires both logical and physical library information. A matching physical cell is defined as a physical cell with the same name as the logical cell. It must contain, at least, all of the same-name pins defined in the logical cell.

WHAT NEXT

Make sure each cell in the technology library has a matching physical cell.

EXAMPLE MESSAGE

Warning: The 'AND2A' cell in the 'demo' technology library does not have corresponding physical cell description. (PSYN-24)

SEE ALSO

`physopt` (2), `list_libs` (2), `report_lib` (2).

PSYN-025 (warning) The '%s' cell in the '%s' physical library does not have corresponding logical cell description.

DESCRIPTION

You receive this warning because you have specified a cell in the physical library for which a matching logical cell description in the technology library does not

exist. Every cell in the technology library must have a matching cell in the physical library. If there is no matching logical cell, then that particular physical cell cannot be used. Physical synthesis requires both logical and physical library information. A matching logical cell is defined as a logical cell with the same name as the physical cell. The matching logical cell contains, at least, all of the same-name pins defined in the physical cell.

This warning is also issued if the pin direction of the same-name pins in the corresponding logical library cell and physical library cell do not match.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by ensuring that each cell in the technology library has a matching physical library cell and that their pin directions match.

EXAMPLE MESSAGE

Warning: The 'AND2A' cell in the 'demo' physical library does not have corresponding logical cell description. (PSYN-25)

SEE ALSO

`physopt(2)`
`list_libs(2)`
`report_lib(2)`

PSYN-026 (warning) This physical library is missing '%s' technology information.

DESCRIPTION

A physical library, at the least, needs to contain the following technology information:

- distance unit
- capacitance unit
- resistance unit
- site definition

- layer definition

Be sure that the library source for the creation of the physical library contains this information.

WHAT NEXT

Add the information and regenerate the physical library with Library Compiler, using the **read_lib** command.

SEE ALSO

read_lib (2).

PSYN-027 (error) Cannot link logical library '%s' with physical library '%s'.

DESCRIPTION

You specified a physical library in the **physical_library** variable, but it is not in the directories listed in the **search_path** variable. For the **link_physical_library** command to perform, a full set of physical libraries must be present.

WHAT NEXT

Be sure the name of the physical library is correct and is set properly. Also check that the search path is correctly stated in the **search_path** variable.

SEE ALSO

link_physical_library (2); **physical_library** (3), **search_path** (2).

PSYN-028 (error) Cannot link logical library '%s' with physical library '%s'.

DESCRIPTION

You specified a physical library in the **physical_library** variable, but the compiler cannot link the logical library and the physical library. This failure probably occurred because the name of one of the cells (and the pins therein) in the logical library do not match the names of their counterparts in the physical library.

WHAT NEXT

Be sure that the names of the cells and pins in the logical library match those in the physical library. Remember that these names are case-sensitive.

If a cell name in the logical library matches that in the physical library, but the pin name or names of the cell do not, linking will fail.

SEE ALSO

`link_physical_library` (2); `physical_library` (3), `search_path` (3).

PSYN-029 (warning) The compiler cannot locate the physical library.

DESCRIPTION

The compiler is not able to locate a physical library to link with the logical library. This failure occurred because either the `physical_library` variable is not set or the named library does not exist.

WHAT NEXT

Be sure the name of the physical library is correct and is set properly in the `physical_library` variable. Also check that the search path is correctly stated in the `search_path` variable.

SEE ALSO

`link_physical_library` (2); `physical_library` (3), `search_path` (3).

PSYN-030 (error) Failed to find physical cell '%s'.

DESCRIPTION

This error occurs because the tool cannot find the named physical cell. The cell might be missing from the physical library, or the tool failed to link the two libraries because the cell in the logical library did not match any cell in the physical library.

WHAT NEXT

Ensure that the cell name in the logical library exactly matches the cell name in the physical library. Note that the tool is case sensitive. Ensure that the pin

names also match. If a pin in the logical cell does not exist in the corresponding physical cell, there is no match and the error occurs.

SEE ALSO

`physopt(2)`

PSYN-031 (error) Failed to find physical cell pin '%s'.

DESCRIPTION

This error occurs because the tool cannot find the named physical cell pin. The cell might be missing from the physical library or the cell pin in the logical library does not match any cell pin in the physical library. Another possibility is that the tool failed to link the logical library with the physical library.

WHAT NEXT

Ensure that the cell pin name in the logical library matches the cell pin name in the physical library. Note that the tool is case sensitive. If a pin in the logical cell does not exist in the corresponding physical cell, there is no match and the error occurs.

SEE ALSO

`.nf physopt(2)`

PSYN-032 (error) Site array has irregular rows specified.

DESCRIPTION

You receive this error message because the site array is not regular, which means that all sites in the rows do not have the required equal width and equal spacing between them. Both the `physopt` command and the `legalize_placement` command require that you specify the site array as regular in the input PDEF.

WHAT NEXT

Correct the site array definition in the PDEF so that it is regular. Then read it in using `read_pdef`.

SEE ALSO

`read_pdef(2)`.

PSYN-033 (error) Site array has negative site count specified.

DESCRIPTION

You receive this error message because the input site array you defined has rows with a negative count of sites.

WHAT NEXT

Correct the input site array specification in the site array, and read it in using the **read_pdef** command.

SEE ALSO

read_pdef (2).

PSYN-034 (error) Library has no associated physical library.

DESCRIPTION

You receive this error message because you have not read in a physical library before you ran one of these commands: **create_placement**, **legalize_placement**, or **physopt**.

WHAT_NEXT

Be sure the name of the physical library is correct and is set properly in the **physical_library** variable. Also check that the search path is correctly stated in the **search_path** variable. Then invoke the command again.

SEE ALSO

create_placement (2), **legalize_placement** (2), **physopt** (2); **physical_library** (3), **search_path** (3).

PSYN-035 (warning) There is no physical library specified.

DESCRIPTION

You receive this error message because you did not specify a physical library before you issued a physopt command.

WHAT NEXT

Use the **physical_library** variable ("physical_library = ...") to indicate which library the design should be linking to. Also check that the search path is correctly stated in the **search_path** variable. Then invoke the command again.

SEE ALSO

`link_physical_library` (2); **physical_library** (3), **search_path** (3).

PSYN-036 (information) Linking logical library %s with physical library %s.

DESCRIPTION

This information message is to let you know that the compiler is loading the physical library into the system. This message is informational only and requires no action on your part.

WHAT NEXT

Every physical library you specify in the **physical_library** variable is to be loaded.

SEE ALSO

physical_library (3).

PSYN-037 (error) You must specify two PrimeTime images with two timing corners and SI enabled.

DESCRIPTION

You receive this error because **signoff_opt** is not able to automatically run **PrimeTime** with two timing corners and SI enabled. Thus, you must provide two PrimeTime saved sessions for Min and Max corner using **set_primestime_options**.

Optionally, you can also run your own Star RCXT runs, and provide directories defined by STAR_DIRECTORY command in the Star RCXT command file using **set_starrcxt_options**.

signoff_opt invokes **PrimeTime** timing engine to perform static timing analysis. With signal integrity effects enabled, such as delta delay or static noise, **PrimeTime SI** is used. **PrimeTime SI** always uses on_chip_variation (OCV) mode, therefore, if you have two timing corners with **set_min_library**, timing will be computed using both

timing corners as library OCV. This leads to pessimistic timing results which are not desired.

WHAT NEXT

There are several actions you can take to avoid this error message.

If you think you indeed WANT **signoff_opt** to perform on_chip_variation analysis based on the two timing corners that you have provided, you can use **set_operating_condition** command in **IC Compiler** to specify on_chip_variation mode. Moreover, if you have provided a signoff SDC file through **set_primedtime_options** command, you must modify the **set_operating_condition** in that SDC file to specify on_chip_variation mode.

Alternatively, you can choose to run your own **PrimeTime SI** for both timing corners, individually. You can then save a session for each run using **save_session** command in **PrimeTime**, and give both sessions to **signoff_opt** using **set_primedtime_options** commands as -max_image and -min_image.

Note when you run your own **PrimeTime**, you need to ensure:

- Both sessions contain same netlist comparing to IC Compiler
- Both sessions contain same timing exceptions and clock definitions
- Both sessions contain libraries that are also used in IC Compiler

If, for example, the timing exception needs to be different between your min and max **PrimeTime** runs (you have a false path in min corner, but not in max corner), this is not supported in regular **signoff_opt**. You must use MCMM capability of **signoff_opt** to define two scenarios, one for min and one for max.

EXAMPLES

In **IC Compiler**, you have both fast and slow libraries, with **set_min_library**, **bc_wc** operating condition, and delta delay turned ON:

- set link_library "* slow.db fast.db"
- set_min_library -min fast.db slow.db
- set_operating_conditions -analysis_type bc_wc
- set_si_options -delta_delay true

In this case, **signoff_opt** will error out with this message.

If you choose to run **PrimeTime SI** on your own, you will need to run the following two **PrimeTime SI** runs:

- PrimeTime SI max corner
- PrimeTime SI min corner

In PrimeTime SI max corner, you will need:

- set si_enable_analysis true
- set link_path "* slow.db"
- read netlist
- read max corner sdc
- read max corner parasitics
- save_session -include noise pt_run.max

In PrimeTime SI min corner, you will need:

- set si_enable_analysis true
- set link_path "* fast.db"
- read netlist
- read min corner sdc
- read min corner parasitics
- save_session -include noise pt_run.min

Note the max corner sdc should contain the same exceptions and clock definitions comparing to the min corner sdc.

You can then give pt_run.max and pt_run.min to **set_primate_options** as **-max_image** and **-min_image**, respectively, and proceed with **signoff_opt**. **signoff_opt** will use the setup information in max image and hold information in the min image to perform signoff based optimization. Hold information in max image and setup information in min image are ignored.

SEE ALSO

```
signoff_opt(2),
set_primate_options(2),
set_min_library(2),
set_operating_conditions(2),
set_si_options(2)
```

PSYN-038 (error) Site array extends beyond core area.

DESCRIPTION

You receive this error message because the input site array you specified is larger than the core area defined in PDEF.

WHAT NEXT

Change the information in the input PDEF to match the site array and the core area definitions. Then read the input PDEF back in using the **read_pdef** command.

SEE ALSO

read_pdef (2).

PSYN-039 (warning) The '%s' cell in the '%s' technology library is being marked as "dont_use".

DESCRIPTION

This warning occurs because the tool encountered a cell in the logical library but cannot find the cell's counterpart in the physical library. The tool marks this as a "dont_use" cell.

WHAT NEXT

To use this library cell, first create a physical library cell for it; and, then, use the **read_lib** command to read the physical library.

SEE ALSO

read_lib(2)

PSYN-040 (warning) Cell '%s' is being marked as "dont_touch" because it has

a `fixed_placement` attribute.

DESCRIPTION

You see this warning because a cell in your design bears a `fixed_placement` attribute in the input PDEF. The tool marks such a cell as "dont_touch".

WHAT NEXT

To modify the cell, remove the `fixed_placement` attribute in PDEF. Then read in the PDEF again, using the `read_pdef` command.

SEE ALSO

`read_pdef` (2).

PSYN-041 (error): The tool cannot place the block because it is over capacity (density is %5.1f%).

DESCRIPTION

This error occurs because the tool cannot produce a legal placement for your block. The block is over capacity.

WHAT NEXT

Increase the core site area in your Design Exchange Format (DEF) file by increasing the number of sites per row or increasing the total number of rows in the floorplan. Alternatively, use the `initialize_floorplan` command to make the same change(s).

SEE ALSO

`initialize_floorplan`(2)

PSYN-042 (error) There are blockages that lie partially or completely outside the bounds of the block.

DESCRIPTION

You receive this error message because the dimensions or locations of the specified blockages cause them to lie outside the block. Therefore, these blockages in your design are located off the chip.

WHAT NEXT

Correct the core area to include all the blockages within the block. Or correct the locations or dimensions to fit within the block.

SEE ALSO

`physopt` (2).

PSYN-043 (warning) Some cells are located at invalid locations. The cells will be snapped to the nearest legal location.

DESCRIPTION

You see this warning because some cells were fed into the placement legalizer with an invalid seed location. This situation should not occur under normal circumstances.

One possibility for it happening here might be because the cells were placed on top of a blockage. Another possibility is that the cells were placed outside the boundary of the block.

The legalizer will snap these cells to their nearest valid location. But if the distance is considerably off, it is possible that long wire lengths will result and QOR might be degraded.

WHAT NEXT

If problems in timing arise because of the situations that produce these warnings, please file a STAR and notify Synopsys.

SEE ALSO

`physopt` (2), `legalize_placement` (2).

PSYN-044 (error) A legal placement could not be found.

DESCRIPTION

This error occurs because the tool cannot find a legal placement for your block. You probably have a site array that is smaller than the core area.

WHAT NEXT

Check the site array definition, increase the size of the site array, and rerun the command.

SEE ALSO

`create_placement(2)`
`legalize_placement(2)`
`physopt(2)`
`read_pdef(2)`

PSYN-045 (error) The following library pins does not have consistent directions in the physical and logical library. This mismatch in pin direction will result in ignore of that cell.

DESCRIPTION

You receive this error message because the directions you specified on the named pin are not the same in the logical and physical library descriptions.

WHAT NEXT

Examine the libraries and correct inconsistencies in the pin directions. Then recompile the libraries using the `read_lib` command.

SEE ALSO

`read_lib (2)`.

PSYN-046 (warning) The cell %s is multirow high. This can degrade the quality of the placement result.

DESCRIPTION

You see this warning because the height of the named cell spans multiple rows. The quality of the overall placement result might be degraded.

WHAT_NEXT

This message is a warning only. The detailed placer will still produce valid results. But if the results are not satisfactory, discontinue the use of multirow-high cells in your design.

SEE ALSO

`physopt` (2), `legalize_placement` (2).

PSYN-047 (error) Cannot find site definitions in physical library.

DESCRIPTION

This error message indicates one of two things:

- There is no site definition in any physical library.
- There is no accessible physical library.

The site definition contains the description of the sites that can be used in the design, including, for each site, the site type, site width, and site height. This information is necessary to check whether the core area from the site array is consistent with the given core area.

WHAT NEXT

Add site definition information and regenerate the physical library using Library Compiler and the `read_lib` command.

SEE ALSO

`read_lib` (2).

PSYN-048 (warning) Unrecognized distance unit in the physical library. 1um assumed.

DESCRIPTION

You receive this warning because you have specified a distance unit that the compiler does not recognize. The only distance units the physical library supports are 1um or 1mm.

WHAT_NEXT

Be sure the physical distance unit in your design is either 1um or 1mm. Then regenerate the physical library using Library Compiler and the **read_lib** command.

SEE ALSO

read_lib (2); **physical_library** (3).

PSYN-049 (warning) Overwriting the given core area (%f %f) (%f %f) with the new core area (%f %f) (%f %f).

DESCRIPTION

This warning indicates the presence of an inconsistency between the given core area and the core area defined in the site array. The meaning of the message in this case is that the compiler will adjust the core area, using the site array, and ignore the given core area.

WHAT NEXT

Check the PDEF file to be sure the given core area correctly matches the core area defined in the site array.

PSYN-050 (warning) The given core area (%f %f) (%f %f) is different from the core area (%f %f) (%f %f) in the site array definition in the PDEF file.

DESCRIPTION

This warning indicates the presence of an inconsistency between the given core area and the core area defined in the site array.

WHAT NEXT

Check the PDEF file to be sure the given core area correctly matches the core area defined in the site array.

PSYN-051 (warning) Cannot find site %s in physical library.

DESCRIPTION

This warning message occurs when site definition is not defined in the physical library. Because the compiler cannot find the site in the physical library, it cannot determine whether this site belongs to CORE or IO. This warning indicates that in this case the compiler will ignore the site.

WHAT NEXT

Add the site definition to the physical library. Then recompile the physical library using the **read_lib** command.

SEE ALSO

`read_lib(2)`

PSYN-052 (error) Error in argument '%s'. '%s'.

DESCRIPTION

This error message occurs when an argument in your library has an incorrect value. Either the compiler could not find the expected object, or the number of arguments is invalid.

WHAT NEXT

Refer to the command man page for complete information about using the command.

PSYN-053 (information) '%s'.

DESCRIPTION

This information message advises you of the progression of a particular physical optimization command.

WHAT NEXT

This is only an information message. No action is required.

However, you can refer to the command man page for complete information about the physical optimization command.

PSYN-054 (information) Use the -verbose option to get details about the legality violations.

DESCRIPTION

This information message occurs when legality violations exist after detailed placement. Use the **-verbose** option to display more detailed information about each violation.

WHAT NEXT

This is only an information message. No action is required.

SEE ALSO

`legalize_placement(2)`

PSYN-055 (warning) Cell %s overlaps with cell %s.

DESCRIPTION

You see this warning to inform you that one cell overlaps one of the other cells in the design. The placement is not valid.

WHAT NEXT

To make the placement valid, use the **legalize_placement** command.

SEE ALSO

`legalize_placement (2)`.

PSYN-056 (warning) Cell %s overlaps with a blockage.

DESCRIPTION

This warning informs you that the named cell overlaps one of the blockages in the design. The placement of the cell is not valid.

WHAT NEXT

To make the placement valid, use the **legalize_placement** command.

SEE ALSO

legalize_placement (2).

PSYN-057 (warning) Cell %s is not on a row.

DESCRIPTION

You see this warning because the named cell does not lie on one of the site rows specified in the design. The placement is not valid.

WHAT NEXT

To make the placement valid, use the **legalize_placement** command.

SEE ALSO

legalize_placement (2).

PSYN-058 (warning) The pin direction of '%s' pin on '%s' cell in the '%s' technology library is inconsistent with the same-name pin in the '%s' physical library. No physical link for the logical lib cell.

DESCRIPTION

You see this warning because the specified direction of a cell pin in the technology library is different from that of the cell pin of the same name in the physical library. The logical cell will not be linked with the cell of the same name in the physical library.

WHAT NEXT

The pin direction attributes should be the same in both libraries. Make the correction and run Library Compiler again. Or make sure the technology library and physical library matches.

SEE ALSO

`read_lib` (2).

PSYN-059 (warning) Initial location does not exist for cell %s.

DESCRIPTION

You see this warning because you have not specified the initial location for the named cell. For detailed placement, the initial location is required.

WHAT NEXT

To place the cell, use the `create_placement` command or the `legalize_placement` command with the `-eco` mode.

SEE ALSO

`create_placement` (2), `legalize_placement` (2).

PSYN-060 (error) An error has occurred in the execution of the detailed placer.

DESCRIPTION

This error occurs because the tool has encountered an error while trying to legalize the placement.

WHAT NEXT

Examine the output of the detailed placer for error information.

SEE ALSO

`legalize_placement` (2)

PSYN-061 (error) lib cell '%s' of cell %s is illegal for all sites in

the block.

DESCRIPTION

You receive this message because cells exist that are illegal for all sites inside the block. Under normal circumstances, this should occur only when there are problems with the library or the row definition or when cell pins and power straps overlap.

WHAT NEXT

Use the GUI to manually check the illegal lib cell against the floorplan. Set the **psyn_debug_dpi_lib_cell*** variable in psyn_shell (.tcl) to print a detailed explanation of why the cell is illegal for all sites. Use the following format, where you replace *cellname* with the actual name of the lib cell in the message:

```
set psyn_debug_dpi_lib_cell cellname
```

Once you set this variable, the **legalize_placement** command can print a detailed message containing information pertaining to the pins that overlap with power straps.

SEE ALSO

`legalize_placement(2)` `psyn_debug_dpi_lib_cell(3)`

PSYN-062 (error) Unable to find legal locations for all multi-row cells.

DESCRIPTION

You receive this message because, although there are legal locations for all cells, as the multi-row cells are placed, their placements obstruct other multi-row cells from being placed. This error should be extremely rare.

WHAT NEXT

Ensure that the multi-row cells do not have overly-severe restrictions. If the error still occurs, increase the size of the block.

PSYN-063 (warning) Some areas of the block have densities much greater than 100%.

For example: rows %d to %d have a density of %.1f%%.

DESCRIPTION

You receive this message because some consecutive rows have densities of much greater than 100%, so it is unlikely that a good placement can result when the cells in these rows are legalized.

WHAT NEXT

If there are no timing issues with the resulting placement, no action is required. However, if there are timing problems, examine the coarse placer to determine why it created a netlist with consecutive rows over capacity. This could occur due to an unusual characteristic of the block being placed, or it could be due to a bug in the placement that is generated. In the latter case, please contact Synopsys.

PSYN-064 (warning) The average displacement of a cell after legalization is %.1f rows.

DESCRIPTION

You receive this message because when the output of the coarse placer was legalized, the average displacement of a cell was greater than the amount that is considered to be normal. This large displacement might mean that a poor placement results after it has been legalized. Examine the timing of the circuit to see if there are any unusual problems.

WHAT NEXT

This warning should never happen under a usual run. However, it might be caused by combinations of high densities, blockages, and/or over-restrictive preroutes or power straps that restrict where cells can be placed.

Determine if any of these conditions apply, and do whatever you can to make the placement less restrictive. If the block does not seem unusual in terms of density, blockages, and/or preroutes, please report this problem to Synopsys.

PSYN-065 (error) The site array contains more than two types of rows based on their heights.

DESCRIPTION

You receive this message because the site array cannot contain more than two types

of rows based on their heights.

WHAT NEXT

Update the site array information so that the number of distinct heights for all rows is no more than two.

PSYN-066 (warning) This obstruction with (%f %f) (%f %f) is exceeding its parent cluster boundary (%f %f) (%f %f).

DESCRIPTION

You receive this message because the **create_obstruction** command creates an obstruction that might be partially or completely outside its parent boundary.

WHAT_NEXT

Issue another **create_obstruction** command to overwrite the previous obstruction.

SEE ALSO

create_obstruction (2).

PSYN-067 (warning) The obstruction layer %d for %s is ignored. Obstruction %s is treated as a placement obstruction.

DESCRIPTION

You receive this message because the layer id is not defined in the PDEF, and is ignored. This obstruction is treated only as a placement obstruction.

WHAT_NEXT

Examine the PDEF to determine if the layer ID has been defined.

PSYN-068 (warning) The row (%f %f) (%f %f) exceeds the core

area (%f %f) (%f %f).

DESCRIPTION

You receive this message because the **create_site_row** command has created a row that exceeds the core area.

WHAT_NEXT

Determine the proper parameters setting for the **create_site_row** command to ensure that it does not exceed the core area.

SEE ALSO

create_site_row (2).

PSYN-069 (warning) The lib cell (%s) height (%d) is different from its site height(%d).

DESCRIPTION

You receive this message because the **lib cell height is different from its site height**.

WHAT_NEXT

Double check the library cell height and its associated site master height to ensure that this library cell has no problem.

SEE ALSO

PSYN-070 (error) The 'read_phys_info_db' command has not read in the specified phys_info_db '%s'.

DESCRIPTION

You receive this message because the value of the **read_phys_info_db** command - **phys_info_db** option must be a database the command has read in. It must be a placed net list.

WHAT NEXT

Use the **list** command with the **-design** option to determine the name of a placed database file that was read in. Read in this file with **read_phys_info_db** command by specifying that name as the **-phys_info_db** argument.

SEE ALSO

list (2), **read_phys_info_db** (2).

PSYN-071 (error) Specified phys_info_db '%s' is not unique in memory.

DESCRIPTION

You receive this message because the **-phys_info_db** argument must be a database read in by the **read_phys_info_db** command. This database must be a placed netlist.

WHAT NEXT

Choose a placed database file and use the **read_phys_info_db** command to read it. Use the **list** command with the **-design** option to determine the name for the read-in database. Specify the unique name (for example, one of the form <file>:<name>) as the **-phys_info_db** argument.

SEE ALSO

read_phys_info_db (2).

PSYN-072 (error) phys_info_db '%s' has no physical information and is not a placed netlist.

DESCRIPTION

You receive this message because the argument for the **read_phys_info_db** command must be a placed netlist.

SEE ALSO

read_phys_info_db (2).

PSYN-073 (error) Cannot find hierarchy '%s' in phys_info_db '%s'.

DESCRIPTION

You receive this message because the specified **-phys_info_db** argument must be a database read in by the **read_phys_info_db** command. This database must be a placed netlist. The *current design* must either have the same specified hierarchy as this database or be a subhierarchy of it.

WHAT NEXT

If the *current design* is a subhierarchy of this database, use the **-path_for_phys_info** argument to specify the instance of *current design* in the database.

SEE ALSO

current_design (2), **read_phys_info_db** (2).

PSYN-074 (error) Cannot find hierarchy '%s' (under instance path '%s') in phys_info_db '%s'."

DESCRIPTION

You receive this message because the **-phys_info_db** argument must be a database read in by the **read_phys_info_db** command. This database must be a placed netlist.

The *current design* must either have the same specified hierarchy as this database or be a subhierarchy of it.

WHAT NEXT

If the *current design* is a subhierarchy of this database, use the **-path_for_phys_info** argument to specify the instance of *current design* in the database.

SEE ALSO

current_design (2), **read_phys_info_db** (2).

PSYN-075 (information) Deriving physical timing model for

design '%s'.

The `compile_physical` command bases its timing calculation for wires on the information on floorplan, placement and routing.

This message is for informational purpose.

PSYN-076 (Error) Back-annotation canceled.

DESCRIPTION

You receive this message because the back-annotation structure has not been initialized.

WHAT NEXT

The `load_estimate` command builds such a structure in the database.

SEE ALSO

`load_estimate` (2).

PSYN-077 (error) Invalid value %f for %s.

DESCRIPTION

You receive this message because an invalid value has been supplied to the parameter.

WHAT_NEXT

See the appropriate man page to determine the proper usage.

PSYN-078 (Error) Cell %s has no location.

DESCRIPTION

You receive this message because the specified cell in the design does not have a specified location. Each cell must have a location in order to derive physical information for the design.

WHAT_NEXT

Ensure that the physical information database file is a placed netlist.

PSYN-079 (Error) Cell %s has location.

DESCRIPTION

You receive this message because the specified cell in the design has a specified location. Each cell must not have a location for a design to be synthesized.

WHAT_NEXT

Ensure that the *current design* is not a placed netlist.

SEE ALSO

`current_design` (2).

PSYN-080 (Error) No floorplan is defined for the current design for incremental physical synthesis.

DESCRIPTION

You receive this message because a design without floorplan information is run with `place_opt` or `physopt`.

WHAT_NEXT

Use the `initialize_floorplan` or `read_def` to create/read floorplan information for the current design.

SEE ALSO

`current_design` (2), `compile_physical` (2), `initialize_floorplan` (2), `read_def` (2).

PSYN-081 (Error) Lower-left corner coordinates are not smaller

than upper-right corner coordinates.

DESCRIPTION

You receive this message because the coordinates of a rectangle are not given in order from the lower-left corner to the upper-right corner or the coordinates form a line instead of a rectangle.

WHAT_NEXT

Place the lower-left corner coordinates before the upper-right corner coordinates, and ensure that it forms a valid rectangle.

PSYN-082 (error) The ungroup option has been disabled. Use "ungroup -all -flatten" before using "physopt".

DESCRIPTION

You receive this message because the **physopt** command with the **-ungroup** option does not retain the original attributes. If you want to retain original attributes, use the **ungroup** command with the **-all -flatten** options.

WHAT_NEXT

Use **ungroup -all -flatten**, and then use **physopt**.

SEE ALSO

physopt (2), **ungroup** (2).

PSYN-083 (information) User-specified wire load models or library wire load models are ignored in physical synthesis.

DESCRIPTION

You receive this message because timing models are derived for physical synthesis based on design physical characteristics in physical synthesis, and any customer wire load model specified for the design is ignored.

WHAT_NEXT

No action is necessary.

PSYN-084 (Error) Command %s should be issued before issuing command %s.

DESCRIPTION

This message indicates that you haven't run `set_wire_capacitance_multiplier` or `set_wire_capacitance_multiplier` before running `set_wire_min_resistance_multiplier` or `set_wire_min_capacitance_multiplier`.

WHAT NEXT

First run `set_wire_capacitance_multiplier`/`set_wire_capacitance_multiplier` before running this command. Use man page to find out the proper usage.

PSYN-085 (Error) The value of attribute %s is smaller than the value of attribute %s.

DESCRIPTION

You receive this message because you have not specified the correct value for the attribute.

WHAT NEXT

Specify the correct value for the attribute. See the appropriate man page to determine the proper usage.

PSYN-086 (warning) Net '%s' is connected to a pad cell and other cells.

DESCRIPTION

You receive this message because the specified port net is connected to a pad cell and to other cells, some of which might be pad cells.

WHAT NEXT

No action is required.

PSYN-087 (information) Port '%s' inherits its location from pad pin '%S/%S'.

DESCRIPTION

You receive this message to inform you that, for a port without a specified location, the location to which the (unique) pad pin is connected is inherited onto the port.

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-088 (information) Setting a dont_touch attribute on net '%s' because it is connected to a pad cell.

DESCRIPTION

You receive this message to inform you that a dont_touch attribute is placed on a net that is connecting a port to a pad cell. This prevents transformations such as buffering from being performed on the net.

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-089 (error) Cannot find path '%s' or its hierarchy in placed database.

DESCRIPTION

You receive this message because the `-inst_name_in_physical_db` argument must start with the design and end with the cell instance, and its hierarchy must exist in the instance tree of the design.

WHAT NEXT

Examine the instance path hierarchy for consistency with the design and compliance with the Synopsys format. For example, a leading slash (/) is not allowed; and, the instance path hierarchy should be something similar to *test_design/BLK/o*.

PSYN-090 (error) Specified -physical_db '%s' is not found or has not been read into memory.

DESCRIPTION

You receive this message because the **-physical_db** argument must be in the format of file:design, where file is a database file and has a placed netlist. The file must already be read into memory.

WHAT NEXT

Ensure that the file has been read in by the **read_db** command, and the design exists in the placed database.

SEE ALSO

read_db (2).

PSYN-091 (error) Specified '%s' '%s' is not found or cannot be read into memory.

DESCRIPTION

You receive this message because the file you specified for **-physical_db_file** or **-subdesign_mapped_db_file** argument cannot be found or is not a database file.

WHAT NEXT

Ensure that the file exists and is reachable by a search path.

PSYN-092 (error) Specified -physical_db '%s' is missing the -

inst_name_in_physical_db argument.

DESCRIPTION

You receive this message because the **-inst_name_in_physical_db** argument must exist if the **-physical_db** argument is specified.

WHAT NEXT

Choose the instance path in the placed database file and specify that path as the **-inst_name_in_physical_db** argument.

SEE ALSO

read_db (2).

PSYN-093 (error) Specified **-physical_db_file** '%s' is missing the **-inst_name_in_physical_db** argument.

DESCRIPTION

You receive this message because the **-inst_name_in_physical_db** argument must exist if the **-physical_db_file** argument is specified.

WHAT NEXT

Choose the instance path in the placed database file, and specify that path as the **-inst_name_in_physical_db** argument.

PSYN-094 (error) Specified **inst_name_in_physical_db** '%s' does not have reference design in placed database.

DESCRIPTION

You receive this message because the reference design of the **-inst_name_in_physical_db** argument must exist and be linked in the placed database that the **-physical_db_file** argument specifies.

WHAT NEXT

Choose the correct instance path and ensure that the link is correct.

PSYN-095 (error) The reference design name of the specified instance '%s' does not match the current_design name.

DESCRIPTION

You receive this message because the *current design* must either have the same hierarchy as this database or be a subhierarchy of the placed database that the **-physical_db_file** argument specifies. The *current design* name must be the same as the reference design of the instance cell.

WHAT NEXT

Set the correct *current design* and specify the correct path.

SEE ALSO

`current_design` (2).

PSYN-096 (information) Deriving initial location for cell %s.

DESCRIPTION

You receive this message because

Initial Location does not exist for the cell. Physical compiler will derive the initial location as -eco option is specified.

WHAT NEXT

Nothing. This is for information only.

PSYN-097 (error) The height (%f) of the structure block %s is more than the height (%f) of the core area.

DESCRIPTION

This error occurs because the tool has found that the structure block does not fit in the current core area. This might be due to overestimating the size of the structure block for the current core area.

WHAT NEXT

Redo the floorplan to increase the core area or use Module Compiler to shrink the structure block.

SEE ALSO

compile(2)

PSYN-098 (warning) The width (%f) of structure block %s is more than the width (%f) of the core area.

DESCRIPTION

You receive this message because the structure block might be overlapped with other cells in the current core area. This is might be due to over-estimating the structure block for the current core area.

WHAT NEXT

If placement fails, redo the floorplan to increase the core area, or use Module Compiler to shrink the structure block.

PSYN-099 (warning) The width (%f) of expanded structure block %s is more than the width (%f) of the core area and will not be expanded.

DESCRIPTION

You receive this message because the structure block is expanded by using the utilization (current total cell area / core area) and its width exceeds the core area, so it might be overlapped with other cells in the current core area. When this occurs, the width is not expanded by using the utilization.

WHAT NEXT

If placement fails, redo the floorplan to increase the core area, or use Module Compiler to shrink the structure block.

PSYN-100 (error) Layer '%s' is missing the '%s' attribute.

DESCRIPTION

You receive this message because some of the required information described below is missing. Every metal layer in the physical library must specify information about pitch, default width, preferred routing direction, and resistance and capacitance per square.

WHAT_NEXT

Generate the physical library file from the source, and use the **read_lib** command to read it in. Ensure that the required layer information is present.

SEE ALSO

read_lib (2).

PSYN-101 (warning) Layer '%s' is missing the optional '%s' attribute.

DESCRIPTION

This warning occurs because the required information described below is missing. Every metal layer in the physical library must specify information about edge capacitance. This is useful to improve the correlation between preroute and postroute timing and timing after routing.

WHAT_NEXT

Generate the physical library file from the source, and use the **read_lib** command to read it in. Ensure that the required layer information is present.

SEE ALSO

read_lib(2)

PSYN-102 (warning) Layer name '%s' is invalid.

DESCRIPTION

You receive this message because the layer name specified in user TCL variables

cannot be found in the library. This layer is ignored.

WHAT_NEXT

Ensure that the layer name is present in the physical library.

PSYN-103 (error) Keep-out Area for cell '%s' is larger than the core Area.

DESCRIPTION

You receive this message because the hard keep-out distance is causing the keepout area corresponding to the specified cell to be greater than the core area. When this condition occurs, no placement can be found.

WHAT_NEXT

Ensure that the hard keepout value is more reasonable or increase the core area to accommodate the keepout area.

PSYN-104 (warning) Soft keepout channel width is significantly large considering core area width or height. Ignoring soft keepout channel width for placement.

DESCRIPTION

You receive this message because the soft keepout channel width threshold specified by the `placer_soft_keepout_channel_width` variable is very large: It is greater than 33% of either the core area width or height. This condition can potentially lead to poor quality results. Hence, it is ignored for the purpose of obtaining placement.

WHAT_NEXT

Ensure that the soft keepout channel width value is smaller or increase the core area to accommodate the soft keepout channel width value.

SEE ALSO

`placer_soft_keepout_channel_width (3)`.

PSYN-105 (information) The design has %d physical cells.

DESCRIPTION

You receive this message to inform you that the specified number of physical cells exist in the design. These physical cells must have the FIXED_PLACEMENT attribute with location.

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-106 (error) Cannot find a valid site for %s.

DESCRIPTION

You receive this message because a valid site for this movable cell is not available. The site might not exist in the floorplan, or it might have been internally filtered out because this site is used by a black box cell and is not used by any other functional cell.

This filtering process is needed to support mixed horizontal and vertical rows in the site array. A site that is used only by unknown function cells is filtered out. Usually such a cell must be fixed, and sometimes this occurs in the opposite direction of rows.

WHAT_NEXT

Change the input PDEF to set this cell to be fixed placement, and use the **read_pdef** command to read it back in.

SEE ALSO

read_pdef (2).

PSYN-107 (warning) Overwriting the existing core area (%f %f) (%f %f) with the new core area (%f %f) (%f %f).

DESCRIPTION

You receive this message because there is an inconsistency between the specified new core area and the existing core area. The existing core area is overwritten.

WHAT_NEXT

Examine the coordinates to ensure that the new core area is correct and is intended to overwrite the existing one.

PSYN-108 (error) Cannot find this layer %s in the LAYER_DEF section.

DESCRIPTION

You receive this message because the layer_name used in the VIA_RECT clause is not defined in the LAYER_DEF section. This VIA_RECT information is not read in.

WHAT_NEXT

Add this layer to the LAYER_DEF section. For example:

```
(LAYER_DEF  
  (LAYER this_layer_was_missing 1 )  
  ...  
)
```

PSYN-109 (warning) No valid site for cell %s. Placement is not legalized for this cell.

DESCRIPTION

You receive this message because

This message indicates the tool cannot find a valid site to place this cell. since you set psyn_disable_site_check to true, the tool will continue to run. But you have to manually legalize the placement for this cell in the end.

WHAT_NEXT

Change the input PDEF to set this cell to be fixed placementand read it back in using **read_pdef**.

PSYN-110 (warning) Current floorplan is highly utilized.

Switching back to normal legalization mode.

DESCRIPTION

This warning occurs because the current floorplan is highly utilized and the congestion cost cannot be met during cell legalization. To achieve a legal placement, the tool defaults back to using normal legalization where congestion is not a cost factor. This typically occurs when a design is highly utilized and also has high routing congestion, so local congestion fixes do not address the global congestion issue with this design.

WHAT_NEXT

Your design is probably highly congested. You must run the **physopt** command with the **-congestion** option to resolve the congestion problems. Additionally, consider using the **physopt** command with the **-congestion -area_recovery** options to try to minimize utilization and congestion problems.

SEE ALSO

[physopt\(2\)](#)

PSYN-111 (warning) Given coordinates are out of the core area.

DESCRIPTION

You receive this message because the given coordinates specify an area that falls partially or totally outside of the core area. This message does not stop the command from running.

WHAT_NEXT

Examine the given coordinates to ensure that they are valid for your purpose.

PSYN-112 (error) Cannot find PDEF layer ID for the given %s layer name in the current design database.

DESCRIPTION

You receive this message because the PDEF layer ID was not found for the specified layer name. It might be because the layer name is defined, or the pdef was not read, or the pdef was missing the LAYER_DEF part.

WHAT_NEXT

Determine if the specified layer name is correct, if the PDEF was read, if the PDEF has the LAYER_DEF part.

PSYN-113 (warning) Obstruction %s is treated as a placement obstruction.

DESCRIPTION

You receive this message because the layer is not specified. The specified obstruction is considered to be only a placement obstruction.

WHAT_NEXT

Determine if you actually want to create a placement obstruction. If you want to create a routing obstruction on a specific layer, you should define the layer name by using the **-layer** option.

PSYN-114 (warning) No location specified for library pin %s of pad cell %s. Its location is assigned to the center of the cell.

DESCRIPTION

This error occurs because the library pin of a pad cell has no location specified in the physical library. The tool assigns the pin's location to the center of the cell for placement. This might affect the accuracy of timing calculation. You can ignore this warning if this is a PAD pin for an IOPAD cell and is not intended to be routed in the core area.

WHAT NEXT

Ensure that this is not a problem for your library. If necessary, correct the definition of the pin in the physical library and recompile it by using the **read_lib** command.

SEE ALSO

read_lib (2)

PSYN-115 (error) There is no capacitance unit or time unit

specified in the logical library.

DESCRIPTION

This error occurs because the tool cannot find a capacitance unit or time unit specified in the logical library. The compiler needs a capacitance unit and time unit to convert physical library units to logical library units.

WHAT_NEXT

Ensure that there is a capacitance unit and a time unit in the logical library. Then use Library Compiler to recompile it.

SEE ALSO

`compile(2)`

PSYN-116 (warning) Cell %s violates one or more power straps.

DESCRIPTION

This warning occurs because the tool has found that the named cell violates one or more of the power straps in the design. The violation occurs because the placement is not legal.

WHAT_NEXT

Use the `legalize_placement` command to make the placement legal.

```
compile(2)
legalize_placement(2)
```

PSYN-117 (error) Cannot inherit location from pad pin '%s/%s' to port '%s' because %s.

DESCRIPTION

This error occurs because a port that does not have a specific location inherits the location of the (unique) pad pin to which it is connected. The tool cannot find the location of the pad pin cell. The pad pin cell must be defined to have fixed placement and must bear the `is_pad` attribute in the library.

WHAT NEXT

Check the logical library to see if the cell bears the **is_pad** attribute using command "get_attribute". Also check the DEF file to see if fixed placement is defined for the cell.

SEE ALSO

`read_def(2)`
`get_attribute(2)`

PSYN-118 (error) Cannot determine a keepout type.

DESCRIPTION

You receive this error message because the **create_keepout_area** command expects the keepout type to be defined as soft or hard.

WHAT NEXT

Specify the proper keepout type as soft or hard, and rerun the testcase.

SEE ALSO

`create_keepout_area (2)`, `remove_keepout_area (2)`.

PSYN-119 (error) Cannot determine cell names.

DESCRIPTION

This error occurs because the tool cannot find a list of cell names that identify target cells. When you invoke the **create_keepout_area** command, you must identify the target cells that the command is to process.

WHAT NEXT

Specify the cell names or reference name for the library cell, and rerun the test case.

SEE ALSO

`create_keepout_area(2)`
`remove_keepout_area(2)`

PSYN-120 (error) Cannot determine margin parameters.

DESCRIPTION

You receive this error message because when you run the **create_keepout_area** command, you must provide a list of margin parameters. Margin parameters are of the form {left_x bottom_y right_x top_y}. All of these parameters must be nonnegative quantities. Microns are the units for specification.

WHAT NEXT

Specify proper margin parameters for the **create_keepout_area** command.

SEE ALSO

create_keepout_area (2).

PSYN-121 (Error) Error in argument '%s': '%s'.

DESCRIPTION

You receive this message because the argument has the wrong value. Either the expected object has not been found or the number of arguments is not right.

WHAT_NEXT

See the appropriate man page for the proper usage.

PSYN-122 (warning) Instance %s does not have a FIXED_PLACEMENT attribute.

DESCRIPTION

This warning occurs because only cells bearing the FIXED_PLACEMENT attribute can have a keepout area. The tool ignores cells that do not have the attribute. The cell or reference you specified for the **create_keepout_area** command does not have this attribute.

WHAT NEXT

Set the FIXED_PLACEMENT attribute on the relevant cell in the Physical Design Exchange Format (PDEF) file.

SEE ALSO

`create_keepout_area(2)`
`read_pdef(2)`
`report_keepout_area(2)`

PSYN-123 (warning) Instance %s already has a keepout of type %s with margin parameters %f %f %f %f. It will be overwritten.

DESCRIPTION

For a fixed cell, only one soft or one hard keepout is used. If more than one keepout is defined using `create_keepout_area`, the most recent one overwrites the previous one.

The instance named in this message already has a keepout associated with it. That keepout will be overwritten by the current one.

WHAT_NEXT

This is a warning only. If the placement is not satisfactory, check the keepout area using `report_keepout_area`.

SEE ALSO

`create_keepout_area (2)`, `report_keepout_area (2)`.

PSYN-124 (warning) Instance %s does not have a keepout of type %s associated with it. This command will be ignored.

DESCRIPTION

This warning occurs because the tool has found that the named instance does not have a keepout of the specified type associated with it. Keepout removal for such a cell is not possible. The tool ignores the `remove_keepout_area` command.

WHAT_NEXT

Use the `report_keepout_area` command to check cells with existing keepouts associated with them.

SEE ALSO

`create_keepout_area(2)`

```
remove_keepout_area(2)
report_keepout_area(2)
```

PSYN-125 (error) Physical libraries %s and %s have conflicting technology data.

DESCRIPTION

You receive this message because conflicts exist in technology data between the specified multiple physical libraries. The comparison is made between the first specified library and all other libraries. Any conflicting data found between any two libraries results in this error.

WHAT_NEXT

Reorder the libraries so that the first library contains data that is a superset of the libraries that follow it. This technique works unless there are true differences in the technology data values between the compared physical libraries.

PSYN-126 (warning) Net %s has no back-annotated capacitance. The report ignores this net.

DESCRIPTION

You receive this message because the reported net does not have a back-annotated capacitance value. It should have back-annotated capacitance for comparison purposes. If it does not have back-annotated capacitance, the net is not considered in the report.

WHAT_NEXT

Before executing this command, either read a database with back-annotated capacitance on the net, or execute the **set_load** command on the net to explicitly set the capacitance value.

SEE ALSO

set_load (2).

PSYN-127 (error) Design has no back-annotated capacitance.

DESCRIPTION

You receive this message because the design does not have back-annotated capacitance with which to compare estimated capacitance.

WHAT_NEXT

Before executing this command, either read a post-route database, or execute the **set_load** command on the nets of the design to explicitly set the capacitance value.

SEE ALSO

set_load (2).

PSYN-128 (Warning) Object '%s' belongs to another bound '%d' and is ignored.

DESCRIPTION

You receive this message because the specified object in the object list of the **set_bounds** command is ignored because it belongs to another bound.

WHAT_NEXT

Use the **report_bounds** command to determine the bound to which this object belongs, and use the **remove_bounds** command to reorganize the bounds in the design.

SEE ALSO

remove_bounds (2), **report_bounds** (2), **set_bounds** (2).

PSYN-129 (information) The bound %s is created successfully.

DESCRIPTION

You receive this message to inform you that the **create_bounds** command has just created a bound with the specified name. You can use this name in the **remove_bounds** command to remove the bound. You can use the **report_bounds** command to review all bounds in the design. You can use the **attach_bounds** command to attach cells to the bound. You can use the **detach_bounds** command to detach cells from the bound.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`remove_bounds` (2), `report_bounds` (2), `create_bounds` (2), `attach_bounds` (2),
`detach_bounds` (2).

PSYN-130 (Warning) Bound ID '%d' is invalid and is ignored.

DESCRIPTION

You receive this message because the specified bound ID in the object list of the command is invalid and, so, it is ignored.

WHAT_NEXT

Use the `report_bounds` command to check the bound ID.

SEE ALSO

`report_bounds` (2).

PSYN-131 (error) Design is not test ready to order the scan chains.

DESCRIPTION

This error occurs because the design is not test ready. The tool cannot order the scan chains on this design. The design might not be scan replaced or the design might have test rule violations.

WHAT NEXT

Ensure that the design is scan replaced. Run the `check_test` command to ensure that the design does not have any test rule violations.

SEE ALSO

`check_test`(2)
`physopt`(2)
`report_test`(2)

PSYN-132 (warning) MC-Pro license could not be checked out.

DESCRIPTION

MC-Pro license could not be checked out. Structured placement constraints will be ignored.

WHAT_NEXT

Make sure that MC-Pro license is available to you at your site.

PSYN-133 (warning) %d thin pnets were found along the site array direction. These are filtered out for legalization.

DESCRIPTION

This warning occurs because pnets exist in the floorplan that run along the site row direction. This might interfere with the legalization of cells, because of redundant definition of power and ground rails. The tool automatically removes these for legalization purposes.

PSYN-134 (information) Current design has no violation.

DESCRIPTION

This informational message tells you that the current design has no violations when you run the **create_buffer_tree** or **remove_buffer_tree** command. This is an informational message only. No action is required on your part.

WHAT_NEXT

To avoid receiving this message, you can set tighter constraints on the current design, then rerun the command.

SEE ALSO

create_buffer_tree (2), **remove_buffer_tree** (2).

PSYN-135 (warning) %s '%s' cannot be found in design '%s'.

DESCRIPTION

This warning message tells you that the named object you searched for in the specified design cannot be found. This failure might have occurred because the object name is misspelled.

WHAT_NEXT

Check the spelling of the object, then rerun the command.

PSYN-136 (error) Design '%s' is not a placed netlist.

DESCRIPTION

This error message tells you that you used the **create_buffer_tree** or **remove_buffer_tree** command, but there is no placement information on the design.

WHAT_NEXT

Use the **create_placement** or **physopt** command to set placement information on the design. Then, rerun the command.

SEE ALSO

create_buffer_tree (2), **create_placement** (2), **physopt** (2), **remove_buffer_tree** (2).

PSYN-137 (warning) Skipping driver %s for HFS ('%s' %s).

DESCRIPTION

You receive this warning message because the **create_buffer_tree** and **remove_buffer_tree** commands cannot run if any of the following are true:

- The specified driver is not an output pin.
- The driver is a tristate driver.
- The driver is a pad.
- The driver does not drive a load.

In addition, the specified driver must drive a Steiner routable net with either the

`ideal_net` or `dont_touch` attribute set.

The `create_buffer_tree` command cannot run on hierarchical pins. Therefore, the drivers specified with `create_buffer_tree -from` cannot be hierarchical pins, and the nets specified with the `-net` option cannot have a hierarchical pin as a driver.

WHAT NEXT

Examine the arguments and remove the offending driver or net from the argument list and rerun the command.

This warning also occurs if you are running `create_buffer_tree` on a net with more fanout than the amount specified by the `high_fanout_net_threshold` variable. Change the `high_fanout_net_threshold` variable to a higher value to resolve the warning.

SEE ALSO

`create_buffer_tree` (2), `remove_buffer_tree` (2); `high_fanout_net_threshold` (3).

PSYN-138 (error) No legitimate driver is found.

DESCRIPTION

You receive this error message because you used the `create_buffer_tree` or `remove_buffer_tree` command and specified a pin on which either no driver at all was found or no legitimate driver was found.

WHAT NEXT

Check the command and make sure you specified the options that you intended.

This problem can occur when you run `create_buffer_tree` on a net with more fanout than the amount specified by the `high_fanout_net_threshold` variable. Change the `high_fanout_net_threshold` variable to a higher value and run the command again.

SEE ALSO

`create_buffer_tree` (2), `remove_buffer_tree` (2); `high_fanout_net_threshold` (3).

PSYN-139 (information) This region is assigned with ID %d.

DESCRIPTION

This informational message means that the ID for the regional congestion parameters has been created by the `set_congestion_options` command. You can use this ID to

remove the regional congestion parameters by using the **remove_congestion_options** command and specifying the ID. You can also review congestion parameters in the design by using the **report_congestion_options** command and specifying the ID.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

remove_congestion_options (2), **report_congestion_options** (2), **set_congestion_options** (2).

PSYN-140 (information) Extractor-based RC computation is enabled.

DESCRIPTION

This informational message occurs because the tool performs automatic computation for capacitance that is based on extraction parameters. This feature does not support min/max RC computation.

Use the following command to disable extractor-based computation:

```
set physopt_enable_extractor_rc FALSE
```

The tool disables extractor based RC computation only if all of the following are true:

- User RC is not used.
- TLU+ RC model is not used.
- Optional extraction parameters are present in the physical library.

The tool requires the following extraction parameters to perform automatic computation:

- Field oxide thickness
- Field oxide permittivity
- Layer thickness for all routable layers
- Layer oxide thickness for all routable layers
- Layer oxide permittivity for all routable layers

- Layer lateral oxide thickness for all routable layers
- Layer lateral oxide permitivity for all routable layers

See *Physical Library User Guide* for the syntax of extraction parameters.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`physopt_enable_extractor_rc(3)`
PSYN-144(n)

PSYN-141 (error) Physical library %s does not contain technology data.

DESCRIPTION

This error occurs because you used the `link_physical_library` command and specified a physical library that is missing the required technology data.

WHAT_NEXT

Check that the first physical library in the physical library list contains technology information, then rerun the command.

SEE ALSO

`link_physical_library (2)`.

PSYN-142 (warning) Physical library specifies a single lateral oxide and a multiple lateral oxide. Using data from multiple lateral oxide.

DESCRIPTION

You receive this warning message because the physical library specifies both a single lateral oxide and a multiple lateral oxide. The single lateral oxide syntax is obsolete. Only the multiple lateral oxide is used.

WHAT NEXT

No action is required on your part. However, to avoid this warning message, remove the single lateral oxide from the physical library.

PSYN-143 (information) Extractor-based RC computation is disabled.

DESCRIPTION

This informational message occurs because the tool will not perform automatic computation for capacitance that is based on the given extraction parameters although you have specified them in the physical library.

The tool uses the following extraction parameters:

field oxide thickness

field oxide permitivity

layer thickness for all routable layers

layer oxide thickness for all routable layers

layer oxide permitivity for all routable layers

layer lateral oxide thickness for all routable layers

layer lateral oxide permitivity for all routable layers

See *Physical Library User Guide* for the syntax of extraction parameters. See the **PSYN-140** error message for conditions that determine whether this feature is enabled.

If your physical library does not contain extraction parameters, you will not see this message

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

PSYN-140(n)

PSYN-144 (information) TLU+-based RC computation is

enabled.

DESCRIPTION

This informational message occurs because the tool performs automatic computation for capacitance that is based on the TLU+ model.

You can set the **physopt_enable_tlu_plus** variable to *False* to turn off this feature. However, the tool performs this automatic computation only if both of the following conditions are true:

- User RC is not used.
- TLU+ technology file is available.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`physopt_enable_tlu_plus(3)`

PSYN-145 (information) TLU+-based RC computation is disabled.

DESCRIPTION

This informational message occurs because the tool does not perform automatic computation for capacitance that is based on the TLU+ model.

WHAT NEXT

This is an informational message only. No action is required on your part.

See *Physical Library User Guide* for the syntax of extraction parameters. See the **PSYN-144** error message for conditions that determine whether this feature is enabled.

SEE ALSO

`PSYN-144(n)`

PSYN-146 (error) No TLU+ files were found.

DESCRIPTION

This error indicates that no TLU+ files could be found.

WHAT NEXT

TLU+ files can be set using "set_tlu_plus_files".

SEE ALSO

`set_tlu_plus_files(2)`, `report_tlu_plus_files(2)`

PSYN-147 (warning) TLU+ files are already attached to the Milkyway library.

DESCRIPTION

This message indicates that TLU+ files are already attached to the Milkyway library.

WHAT NEXT

No action is needed from the user.

SEE ALSO

`report_tlu_plus_files(2)`

PSYN-148 (error) TLU+ file checking failed.

DESCRIPTION

This error indicates that TLU+ file checking failed.

WHAT NEXT

Verify the data in the TLU+ files before proceeding.

SEE ALSO

`set_tlu_plus_files(2)`, `report_tlu_plus_files(2)`

PSYN-149 (information) Running signoff_opt with ILMs.

DESCRIPTION

You receive this information message because you're running `signoff_opt` with ILMs.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt(2)`
`set_si_options(2)`

PSYN-150 (error) No physical design for current logical design.

DESCRIPTION

You receive this error because there is no physical design for the current logical design in `create_placement -mpc` and `physopt -mpc` flows.

You may have physical information for the top module, and are doing current design to a sub module. In this case `create_placement -mpc` and `physopt -mpc` flows will not generate physical information for the sub module.

WHAT NEXT

Fix your input data to include the necessary physical information for this module.

SEE ALSO

`current_design(2)`
`create_placement(2)`
`physopt(2)`
`set_mpc_options(2)`

PSYN-151 (error) Design is not ready to run signoff_opt

because it has %s.

DESCRIPTION

You receive this error because you are trying to run **signoff_opt** command on a design that is not ready. A design is considered as not ready if any of the following conditions are true:

- it has shorted routes in the routing database
- it has too many routing design rule violations
- it has too many unrouted signal nets
- it has too many violating timing paths
- it has too many logic design rule violations (max_transition, max_capacitance, max_fanout ...)

WHAT NEXT

Run **report_design -physical** and **report_constraint -all_violators** to see the details of violations.

Use **IC Compiler** to fix the violations first, and then come back to run **signoff_opt**.

SEE ALSO

```
signoff_opt(2)
report_design(2)
report_constraint(2)
```

PSYN-152 (warning) Your design contains unsupported port names.

DESCRIPTION

You receive this warning because you are trying to run **signoff_opt** command on a design which has the following conditions:

- A port is driving a net with different name, AND,
- A port has more than one pin (shape)

WHAT NEXT

Use **change_names** command to rename the offending ports.

SEE ALSO

`signoff_opt(2)`
`change_names(2)`

PSYN-153 (error) No arguments are specified for switch '%s'.

DESCRIPTION

You receive this message because the specified switch of the **set_power_rail_connection** command has empty arguments.

WHAT_NEXT

Specify the arguments for the switch, and invoke the **set_power_rail_connection** command again.

SEE ALSO

`set_power_rail_connection (2)`.

PSYN-154 (error) A mismatch has occurred between the number of '%s' and '%s'.

DESCRIPTION

You receive this message because the specified lists must map one-to-one. Both lists must have the same number of entries.

WHAT_NEXT

Specify the **set_power_rail_connection** command with the **-lib_rail_name rail_name_list**, **-pnet_name pnet_name_list**, and **-port_type (input / output)list** options. The values assigned to these options must be lists and must have one-to-one mapping among the three lists. Then, execute **set_power_rail_connection** again.

SEE ALSO

`set_power_rail_connection (2)`.

PSYN-155 (error) Switch -force must be specified with -hierarchy.

DESCRIPTION

You receive this message because the you have activated the switch specified by the **-force** option of the `set_power_rail_connection` command without also specifying the **-hierarchy** option.

WHAT_NEXT

Specify the **-hierarchy** option, and invoke the `set_power_rail_connection` command again.

SEE ALSO

`set_power_rail_connection (2)`.

PSYN-156 (error) No power rail connection annotations exist in '%S'.

DESCRIPTION

You receive this message because the specified design object does not have any power rail connection annotations.

WHAT_NEXT

See the man page for the `set_power_rail_connection` command to determine what options to use for power rail connection annotations. Specify the command with the appropriate options, and invoke it again.

SEE ALSO

`set_power_rail_connection (2)`.

PSYN-157 (warning) Power rail '%s' does not exist.

DESCRIPTION

You receive this warning because the specified power rail does not exist in the library.

WHAT_NEXT

No action is required on your part. However, you can use the **report_lib** command to determine the valid power rails.

SEE ALSO

report_lib (2).

PSYN-158 (warning) The tool is overriding the previous power annotations on '%s'.

DESCRIPTION

You receive this warning because the **set_power_rail_connection** command is overriding the previous annotations on the specified subdesign.

WHAT_NEXT

No action is required on your part. However, you can use the **set_power_rail_connection** command without specifying the **-force** option to preserve the previous annotations.

SEE ALSO

set_power_rail_connection (2).

PSYN-159 (warning) The tool is ignoring the current annotations on design '%s'.

DESCRIPTION

You receive this warning because the tool is ignoring annotations applied to the specified design by using the **set_power_rail_connection** command. Thus, the previous

annotations are preserved.

WHAT_NEXT

No action is required on your part. However, you can specify the **-force** option to set a switch to override the previous annotations with the current ones.

SEE ALSO

`set_power_rail_connection` (2).

PSYN-160 (error) set_row_type command simultaneously specifies -site and row_name_list.

DESCRIPTION

You receive this message because you have specified the **-site** and *row_name_list* options of the **set_row_type** command at the same time, and they are mutually exclusive. These options specify switches that used to set *row_types*.

WHAT_NEXT

Use the **set_row_type** command with either the **-site** option, to set the *row type* based on all rows in the specified site array, or the *row_name_list* option, to set the *row_type* on individual rows in the list; but you cannot use both options at once.

SEE ALSO

`set_row_type` (2).

PSYN-161 (error) Specify either the -site or row_name_list option for the set_row_type command.

DESCRIPTION

You receive this message because you have not specified any switches for the **set_row_type** command. These switches are used to set *row_types*. You can specify a switch by using the **set_row_type** command with the **-site** or *row_name_list* option. The **-site** option specifies a site array. The *row_name_list* option specifies rows in a list form. These options are mutually exclusive.

WHAT_NEXT

Use the **set_row_type** command with either the **-site** option or the **row_name_list** option; but do not use both options at once.

SEE ALSO

set_row_type (2).

PSYN-162 (warning) The previous row type '%d' of row '%s' is changed to '%d'.

DESCRIPTION

You receive this warning because you have changed the row type of the specified row.

WHAT_NEXT

No action is required on your part. However, if you did not intend to change the row type of the specified row, use the **set_row_type** command with the **-type** option to set the row type to its previous value.

SEE ALSO

set_row_type (2).

PSYN-163 (error) Specify either the **-all** or **net_list** option for the '%s' command.

DESCRIPTION

You receive this message because you have not specified any switches for the **set_preroute_check** command or **remove_preroute_check** command. The tool uses these switches to select the net or nets for which the preroute checks should be enabled or disabled. The **-all** option tells the tool to select all nets with preroutes. The **net_list** option specifies the list of net or nets. These options are mutually exclusive and cannot be used together.

WHAT NEXT

Use the **set_preroute_check** command or **remove_preroute_check** command with either the **-all** option or the **net_list** option defined. But do not use both options at once in the same command.

SEE ALSO

`remove_preroute_check (2)`, `set_preroute_check (2)`.

PSYN-164 (error) '%s' command simultaneously specifies -all and net_list.

DESCRIPTION

You receive this message because you have specified at the same time the `-all` option and the `net_list` option of either the `set_preroute_check` command or the `remove_preroute_check` command. These options are mutually exclusive and cannot be used together. The tool uses these options to specify switches it uses to enable or disable preroute checks during placement.

WHAT NEXT

Use the `set_preroute_check` command or the `remove_preroute_check` command with either the `-all` option or the `net_list` option. But do not use both options at once in the same command.

SEE ALSO

`remove_preroute_check (2)`, `set_preroute_check (2)`.

PSYN-165 (error) Cannot find any pre-routes for the specified net(s).

DESCRIPTION

You receive this message because the `set_preroute_check` command, the `remove_preroute_check` command, or the `report_preroute_check` command cannot find any preroute geometries for the net or nets you specified in your design.

WHAT NEXT

Check the DEF file and the PDEF file; make sure that preroutes exist for the specified net or nets.

SEE ALSO

`remove_preroute_check (2)`, `report_preroute_check (2)`, `set_preroute_check (2)`.

PSYN-166 (error) %s: Wrong physopt_hfs_remove_effort specified.

DESCRIPTION

You receive this message because a wrong effort is set.

WHAT_NEXT

To set the correct effort, use the **physopt_hfs_remove_effort** variable with the appropriate option. The available options are **-none**, **-med**, and **-high**.

SEE ALSO

physopt_hfs_remove_effort (3).

PSYN-167 (warning) Your design has %d unrouted signal nets.

DESCRIPTION

You receive this warning because you are trying to run **signoff_opt** command on a design that has some unrouted signal nets.

WHAT NEXT

It is recommended that you use **IC Compiler** to route all signal nets before running **signoff_opt**.

SEE ALSO

signoff_opt(2)
route(2)

PSYN-168 (warning) The row '%s' already has row type '%d'.

DESCRIPTION

You receive this warning because you are trying to specify a row type for a row that already has that type set on it.

WHAT NEXT

No action is required.

SEE ALSO

`set_row_type(2)`

PSYN-169 (warning) PrimeTime image does not contain detail parasitics.

DESCRIPTION

This warning message occurs because at least one of the specified **PrimeTime** image from **save_session** does not contain detail parasitics from **read_parasitics** command. As a result, **signoff_opt** will not be able to perform additional signoff analysis after optimization and incremental place and route.

WHAT NEXT

Provide a **PrimeTime** image with detail parasitics.

SEE ALSO

`signoff_opt(2)`
`set_primate_time_options(2)`

PSYN-170 (error) You are using an invalid StarRCXT image for '%S'.

DESCRIPTION

This error message occurs because you specified an invalid **StarRCXT** image for **signoff_opt**. **IC Compiler** requires the image was created with exactly the same StarRCXT binary that you run **signoff_opt**.

WHAT NEXT

Recreate the image with the same StarRCXT binary.

SEE ALSO

`signoff_opt(2)`

```
set_starrcxt_options(2)
```

PSYN-171 (error) You are using a StarRCXT command file that consists of unsupported options.

DESCRIPTION

This error message occurs because you are using a **StarRCXT** command file that consists of unsupported options. In order to run **signoff_opt**, **IC Compiler** requires certain options to be reserved and does not support them in the user command file.

Here is the list of reserved options:

- MILKYWAY_DATABASE
- MILKYWAY_EXPAND_HIERARCHICAL_CELLS
- TCAD_GRD_FILE
- MAPPING_FILE
- COUPLE_TO_GROUND
- STAR_DIRECTORY
- TARGET_ANALYSIS
- INCREMENTAL
- NETLIST_INCREMENTAL
- NETLIST_FORMAT
- NETLIST_COMPRESS_COMMAND
- NETLIST_NODE_SECTION
- NETLIST_TAIL_COMMENTS
- NETLIST_FILE
- EXTRA_GEOMETRY_INFO
- BLOCK
- HIERARCHICAL_SEPARATOR
- MULTI_CPU_ON_LICENSE_ONLY

WHAT NEXT

Remove the unsupported options from your command file.

SEE ALSO

`signoff_opt(2)`
`set_starrcxt_options(2)`

PSYN-172 (error) Duplicate keepout name : '%s'. '%s'.

DESCRIPTION

You receive this error message because you tried to perform one of the following actions:

- You tried to create a wiring keepout and give it the same name as that of an already existing wiring keepout.
- You tried to create a placement keepout and give it the same name as that of an already existing placement keepout.

You can have a wiring keepout and a placement keepout of the same name. But you cannot have two wiring keepouts with the same name nor two placement keepouts with the same name.

WHAT NEXT

Using the `report_wiring_keepout` command and the `report_placement_keepout` command, check the names of existing wiring keepouts and placement keepouts, respectively. Make appropriate correction.

SEE ALSO

`create_placement_keepout(2)`
`create_wiring_keepout(2)`
`report_placement_keepout(2)`
`report_wiring_keepout(2)`

PSYN-173 (error) You are using an incompatible platform of

StarRCXT.

DESCRIPTION

This error message occurs because you are using a **StarRCXT** binary that is different with the current platform of **IC Compiler**. In order to run **signoff_opt**, you must use the same platform for all tools.

WHAT NEXT

It is recommended that you use the same platform of **StarRCXT** with **IC Compiler**.

SEE ALSO

`signoff_opt(2)`
`set_starrcxt_options(2)`

PSYN-174 (error) You are using an incompatible platform of PrimeTime.

DESCRIPTION

This error message occurs because you are using a **PrimeTime** binary that is different with the current platform of **IC Compiler**. In order to run **signoff_opt**, you must use the same platform for all tools.

WHAT NEXT

It is recommended that you use the same platform of **PrimeTime** with **IC Compiler**.

SEE ALSO

`signoff_opt(2)`
`set_primestime_options(2)`

PSYN-175 (warning) Physical information will not be written to '.ddc' format from the tool.

DESCRIPTION

This warning occurs because the Synopsys logical database (.ddc) format cannot store the physical information. Writing the design in .ddc format from a session of the

tool can result in a loss of physical information associated with the design. This is a current limitation of the ddc format. Use .ddc format only if your design contains no physical information.

WHAT NEXT

If the design contains physical information, the recommended storage format is Milkyway. You can use the **write_milkyway** command to write the design into the Milkyway database.

SEE ALSO

`write(2)`

PSYN-176 (error) The tool cannot write 'COMPACT' parasitic from a non-Milkyway design.

DESCRIPTION

This error occurs because the COMPACT format can be written only with the design that is read from Milkway by using the **read_milkyway** command. If you use other read commands to read the design, such as the **read_db** or **read_verilog** command, the tool cannot write COMPACT parasitics.

WHAT NEXT

Use the **read_milkyway** command to read the design from the Milkyway database, or use another parasitic format such as Standard Parasitic Exchange Format (SPEF) or Synopsys Binary Parasitic Format (SBPF).

PSYN-177 (error) The tool cannot read 'COMPACT' parasitic from non-Milkyway design.

DESCRIPTION

This error occurs because the COMPACT format can be read only with a design that is read from Milkway by using the **read_milkyway** command. If you read the design using other read commands, such as the **read_db** or **read_verilog** command, the tool cannot read in COMPACT parasitics.

WHAT NEXT

Use the **read_milkyway** command to read a design from Milkyway database. Or, use other

parasitic format such as Standard Parasitic Exchange Format (SPEF) or Synopsys Binary Parasitic Format (SBPF).

PSYN-178 (Information) setting %s as ignored_layer due to min_max layer setting.

DESCRIPTION

You receive this error message because you have set the **Min/Max** using this command. In order to be consistent, ICC will set all the metal layers below/above this layer as "ignored layer" automatically.

WHAT NEXT

Using report_ignored_layers command to see current min/max/ignored layer status.

SEE ALSO

report_ignored_layers (2) remove_ignored_layers (2)

PSYN-179 (Information) setting %s as %s routing layer.

DESCRIPTION

You receive this error message because you have set the **Min/Max** using this command. Setting Min/Max routing layers will affect the following routing.

WHAT NEXT

Using report_ignored_layers command to see current Min/Max layer status.

SEE ALSO

report_ignored_layers (2) remove_ignored_layers (2)

PSYN-180 (error) Invalid value %s for switch %s. Valid values

are %s.

DESCRIPTION

You receive this error because the value you specify for the given switch is not valid. Check **signoff_opt** man page for more information.

WHAT NEXT

Correct your input by using one of the valid values.

SEE ALSO

`signoff_opt(2)`

PSYN-181 (error) Command can only be run with a Milkyway design.

DESCRIPTION

You receive this error because you are trying to run **signoff_opt** command on a non-Milkyway design. In order to run **signoff_opt**, the design must be read from Milkyway, such as **open_mw_cel**.

WHAT NEXT

Use **open_mw_cel** to open your design.

SEE ALSO

`signoff_opt(2)`

PSYN-182 (warning) You are using a newer version of PrimeTime that might not be compatible.

DESCRIPTION

This warning message occurs because you are using a newer version of **PrimeTime** that might not be compatible with the current version of **IC Compiler**.

WHAT NEXT

This is only a warning message. However, it is recommended that you use a compatible version of **PrimeTime** with **IC Compiler** to avoid potential problems.

SEE ALSO

`signoff_opt(2)`

PSYN-183 (warning) You are using an older version of StarRCXT that might not be compatible.

DESCRIPTION

This warning message occurs because you are using an older version of **StarRCXT** that might not be compatible with the current version of **IC Compiler**.

WHAT NEXT

This is only a warning message. However, it is recommended that you use a compatible version of **StarRCXT** with **IC Compiler** to avoid potential problems.

SEE ALSO

`signoff_opt(2)`

PSYN-184 (information) SI analysis and fixing is enabled for signoff_opt.

DESCRIPTION

You receive this information message because the analysis and fixing for signal integrity problems are enabled.

WHAT NEXT

This is an informational message only. However, if you do not intend to enable SI analysis and fixing, you can use **set_si_options** command to modify your SI options, and then re-run **signoff_opt**.

SEE ALSO

`signoff_opt(2)`

```
set_si_options(2)
```

PSYN-185 (error) Cannot find an appropriate shell.

DESCRIPTION

You receive this error because **IC Compiler** is not able to find an appropriate shell to run **signoff_opt**.

WHAT NEXT

Correct this problem by contacting your UNIX system administrator.

SEE ALSO

```
signoff_opt(2)
```

PSYN-186 (error) Path to PrimeTime is not specified.

DESCRIPTION

You receive this error because you didn't specify the path to **PrimeTime** before running **signoff_opt**. The path is required for **IC Compiler** to locate the **PrimeTime** executable to run **signoff_opt**.

WHAT NEXT

You can use **-exec_dir** switch with **set_primestime_options** to specify the path to **PrimeTime**.

SEE ALSO

```
set_primestime_options(2)
report_primestime_options(2)
signoff_opt(2)
```

PSYN-187 (information) Use PrimeTime path %s.

DESCRIPTION

IC Compiler uses this information message to tell you what is that path that we used to search for **PrimeTime** executable during **signoff_opt**.

WHAT NEXT

This is an informational message only. You can change the path by using **-exec_dir** switch of **set_primestime_options**.

SEE ALSO

`set_primestime_options(2)`
`report_primestime_options(2)`
`signoff_opt(2)`

PSYN-188 (information) Use StarRCXT path %s.

DESCRIPTION

IC Compiler uses this information message to tell you what is that path that we used to search for **StarRCXT** executable during **signoff_opt**.

WHAT NEXT

This is an informational message only. You can change the path by using **-exec_dir** switch of **set_starrcxt_options**.

SEE ALSO

`set_starrcxt_options(2)`
`report_starrcxt_options(2)`
`signoff_opt(2)`

PSYN-189 (error) Path to StarRCXT is not specified.

DESCRIPTION

You receive this error because you didn't specify the path to **StarRCXT** before running **signoff_opt**. The path is required for **IC Compiler** to locate the **StarRCXT** executable to run **signoff_opt**.

WHAT NEXT

You can use **-exec_dir** switch with **set_starrcxt_options** to specify the path to **StarRCXT**. Please also specify **-max_nxtgrd_file** and **-map_file** as they are also required to run StarRCXT. **-min_nxtgrd_file** is optional.

SEE ALSO

`set_starrcxt_options(2)`
`report_starrcxt_options(2)`
`signoff_opt(2)`

PSYN-190 (warning) Your design has %d shorted routes in the routing database.

DESCRIPTION

You receive this warning because you are trying to run `signoff_opt` command on a design that has several shorts in the routing database.

WHAT NEXT

Run `report_design -physical` to see the details of routing violations.

It is recommended that you use **IC Compiler** to fix the routing violations first, and then come back to run `signoff_opt`.

SEE ALSO

`signoff_opt(2)`
`report_design(2)`

PSYN-191 (warning) Your design has %d routing violations.

DESCRIPTION

You receive this warning because you are trying to run `signoff_opt` command on a design that has some routing violations.

WHAT NEXT

Run `report_design -physical` to see the details of routing violations.

It is recommended that you use **IC Compiler** to fix the routing violations first, and then come back to run `signoff_opt`.

SEE ALSO

`signoff_opt(2)`
`report_design(2)`

PSYN-192 (error) Command cannot be run with a readonly Milkyway design.

DESCRIPTION

You receive this error because you are trying to run **signoff_opt** command on a readonly Milkyway design. In order to run **signoff_opt**, the Milkyway design must be writeable.

WHAT NEXT

Do not use any **-readonly** switch when opening your Milkyway design.

SEE ALSO

`signoff_opt(2)`

PSYN-193 (error) You are using an incompatible version of StarRCXT.

DESCRIPTION

This error message occurs because you are using an incompatible version of **StarRCXT** comparing with the current version of **IC Compiler**. Your **StarRCXT** is either too new or too old. **IC Compiler** is not forward-compatible with newer **StarRCXT**, and a too old **StarRCXT** does not have all the features that are required to run **signoff_opt**.

WHAT NEXT

It is recommended that you use a compatible version of **StarRCXT** with **IC Compiler** to avoid potential problems.

SEE ALSO

`signoff_opt(2)`

PSYN-194 (error) You are using an incompatible version of

PrimeTime.

DESCRIPTION

This error message occurs because you are using an older version of **PrimeTime** comparing with the current version of **IC Compiler**. **PrimeTime** is not forward-compatible with **IC Compiler**.

WHAT NEXT

It is recommended that you use a compatible version of **PrimeTime** with **IC Compiler** to avoid potential problems.

SEE ALSO

`signoff_opt(2)`

PSYN-195 (error) Command can only be run with a routed design.

DESCRIPTION

You receive this error because you are trying to run **signoff_opt** command on an unrouted design. In order to run **signoff_opt**, the design must be fully routed. It is also highly recommended to run optimization before running **signoff_opt**.

WHAT NEXT

Use **route** command to route your design.

SEE ALSO

`signoff_opt(2)`

PSYN-196 (warning) Switch '%s' is not scenario specific. The last value will be used for all scenarios.

DESCRIPTION

You receive this warning because you are using a switch that is not scenario specific in a multi scenario setting. For example, the path to PrimeTime exec is not scenario specific. That is, you cannot use different PrimeTime executables for

different scenarios. The last value will be used for all scenarios, overwriting previous setting specified by this switch.

WHAT NEXT

Modify your script to only use scenario specific switches in a multi scenario setting. Set the switch that is not scenario specific before creating the first scenario.

SEE ALSO

```
set_primestime_options(2)  
set_starrcxt_options(2)
```

PSYN-197 (warning) Switch '%s' has no effect in multi scenario.

DESCRIPTION

You receive this warning because you are using a switch that is not supported in multi scenario. The switch will be ignored.

You will also receive this warning if you have applied this switch in non multi scenario mode, then start your signoff_opt run in multi scenario mode.

WHAT NEXT

Modify your script to remove the switch.

SEE ALSO

```
set_primestime_options(2)  
set_starrcxt_options(2)  
signoff_opt(2)
```

PSYN-198 (information) Running signoff_opt with multi scenarios.

DESCRIPTION

You receive this information message because you're running signoff_opt with multi scenario capability.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt(2)`
`create_scenario(2)`

PSYN-199 (warning) '%s' is not supported in multi scenario.

DESCRIPTION

You receive this warning because you are using a feature that is not supported in multi scenario signoff optimization. This request to use this feature will be ignored.

For example, traditional min/max timing analysis is not supported in multi scenario signoff optimization. Each scenario will be analyzed with either single or `on_chip_variation` mode (where `on_chip_variation` is the recommended analysis type). Therefore, if you specify min tech file for StarRCXT, or use `set_min_library` to sepcify a min library, these settings will be ignored during multi scenario signoff optimization. Note this does not affect the non-signoff multi scenario optimization, nor single or bcwc (best case - worst case) signoff optimization.

WHAT NEXT

Modify your script so that it does not use the feature.

SEE ALSO

`signoff_opt(2)`
`set_primetetime_options(2)`
`set_starrcxt_options(2)`

PSYN-200 (warning) '%s' pin on '%s' cell in the '%s' technology library is missing in the '%s' physical library.

DESCRIPTION

You receive this message because a cell pin in the technology library is missing from the same-name cell pin in the physical library. Consequently, the logical cell cannot be linked with the same-name cell in the physical library.

WHAT NEXT

Examine this cell pin in both libraries. Add the missing cell pin to your physical library.

PSYN-201 (error) Cannot determine net names.

DESCRIPTION

This error occurs because you used the **set_net_width_options** command but did not specify a list of net names. A list of net names must be specified as target nets.

WHAT NEXT

Rerun the command and specify a list of net names.

SEE ALSO

set_net_width_options (2).

PSYN-202 (warning) Cell %s has illegal orientation on the row.

DESCRIPTION

This warning message tells you that the specified cell is illegally placed on the row. The cell orientation does not match the row site orientation definition in the flooorplan.

WHAT_NEXT

Rerun the **legalize_placement** command to make the cell placement legal.

SEE ALSO

legalize_placement (2).

PSYN-203 (warning) Cell %s located on the wrong row site.

DESCRIPTION

This warning message tells you that the specified cell is located on the wrong row

site. The cell must be located on the site that is defined in the physical library. For example, if the cell is defined as the "CORE" site cell in the LEF, then the placement tool must place the cell on the "CORE" site array. If the placement tool places the cell on the "CORE1" site array, it is an illegal cell.

Another case is the cell be placed outside the row bbox, for example, the cell is placed outside the right end of the row site, or left end of the row side. Please check the cell bbox against its row site bbox.

WHAT_NEXT

Maker sure the site is defined in the physical library, or, check the GUI or PDEF to see the cell is placed inside the site row. Use **legalize_placement** to make the cell placement legal.

SEE ALSO

`check_legality` (2), `legalize_placement` (2).

PSYN-204 (error) Cannot find PDEF layer ID for given layer name '%s'.

DESCRIPTION

This error message tells you that the PDEF layer ID for the given layer name was not found. This might be because you specified the wrong layer name, the layer name is not defined, or the PDEF file was not read.

WHAT_NEXT

Check for one of the factors above. Make the appropriate change, then rerun the command.

PSYN-205 (warning) Value '%g' specified to switch '%s' is out of range.

DESCRIPTION

This warning message tells you that the specified value is out of the normal range. Though the command still runs, the results might not be accurate.

WHAT_NEXT

Rerun the command and specify a valid value to the switch.

PSYN-206 (error) Invalid value '%d' specified to switch '%s'.

DESCRIPTION

This error message tells you that the value specified to the switch is invalid.

WHAT_NEXT

Rerun the **set_net_width_options** command and specify a valid value to the switch.

SEE ALSO

set_net_width_options (2).

PSYN-207 (error) Number of layer names, width multipliers and space multipliers do not match.

DESCRIPTION

This error occurs because the number of layer names, width multipliers and space multipliers do not match.

WHAT_NEXT

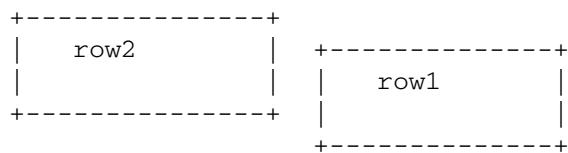

Rerun the command and specify an equal number of layer names, width multipliers and space multipliers.

PSYN-208 (error) Row %s (y=%d) and row %s (y=%d) are not aligned in Y coordinates. Check DEF data.

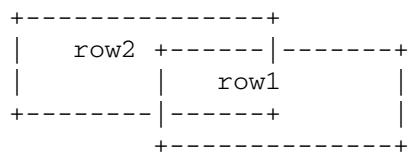

DESCRIPTION

This error message tells you that the specified rows are not aligned in the Y coordinates. The detailed placement requires that rows with the same site type, such as row1 and row2 in site CORE, are aligned in Y (X may not fully overlap). See the following examples. Note that both rows are of the same site type.

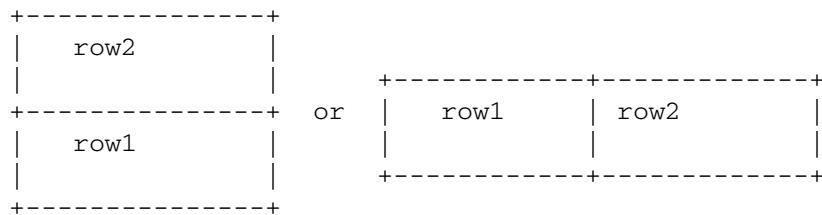

The following example shows an unsupported floorplan:

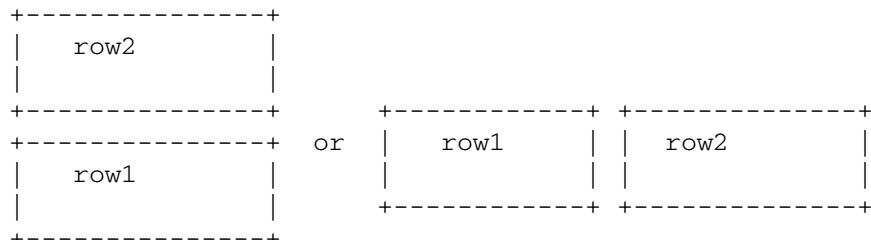

or

The following example shows a supported floorplan:

or

WHAT_NEXT

Modify rows use command `cut_row` and `add_row`, or check the DEF data and change the rows so that they align in the Y coordinates.

SEE ALSO

`read_def(2)`
`cut_row(2)`
`add_row(2)`

PSYN-209 (warning) physopt_row_overlap_threshold setting as

%.3f is too big.

DESCRIPTION

This warning message tells you that the value specified with **physopt_row_overlap_threshold** exceeds the recommended threshold for detailed placement. This can negatively effect the quality of the results.

WHAT_NEXT

Check the floorplan and make sure that the site arrays are overlapping within the recommended threshold.

SEE ALSO

physopt_row_overlap_threshold (3).

PSYN-210 (error) Site array type %s overlapping is beyond overlapping threshold of site array type %s (normal core site).

DESCRIPTION

This error message occurs because site arrays are not overlapping within the threshold that has been set using `physopt_row_overlap_threshold`. If multiple types of `site_arrays` are defined in the floorplan the detail placer requires that the `site_arrays` overlap with in a threshold. Abnormal core site arrays should overlap with normal core site arrays within the threshold setting range. Row differences should not be larger than the threshold. The threshold is set using the **physopt_row_overlap_threshold** variable. For example, if the threshold is set to 0.1, 10 percent difference of normal core area is allowed.

WHAT_NEXT

Check the floorplan and make sure that multitype site arrays are overlapping within a small threshold.

You can turn off overlap checking by setting **physopt_check_site_array_overlap** to FALSE, or by increasing the threshold setting using the **physopt_row_overlap_threshold** variable. Note that this will negatively effect the quality of results.

SEE ALSO

physopt_check_site_array_overlap (3), **physopt_row_overlap_threshold** (3).

PSYN-211 (error) Site type %s height %d is not an integer multiple of site type %s height %d.

DESCRIPTION

This error occurs because the abnormal site height is not an integer multiple of the normal site height. Detail placement requires that the abnormal site height is an integer multiple of the normal site height.

WHAT_NEXT

Check the physical library make sure that the multiheight site is an integer multiple of the normal site height.

PSYN-212 (warning) '%s' pin on '%s' macro in the '%s' physical library is missing in the '%s' technology library.

DESCRIPTION

You receive this message because a macro pin in the physical library is missing from the same-name cell pin in the technology library.

WHAT NEXT

Examine this cell pin in both libraries. Add the missing cell pin to your technology library. Ignore this message if this is a physical-only pin.

PSYN-213 (information) Your design has no logic design rule violation left.

DESCRIPTION

You receive this message because there is no logic design rule violation left in your design. **signoff_opt** might stop.

WHAT NEXT

It is just an information message.

SEE ALSO

`signoff_opt(2)`

PSYN-214 (information) Your design has at least %d %s logic design rule violations.

DESCRIPTION

You receive this message because you are trying to run **signoff_opt** command on a design that has some logic design rule violations, such as max_transition, max_capacitance and max_fanout violations.

WHAT NEXT

Run **report_constraint -all_violators** to see the details of violations.

It is recommended that you use **IC Compiler** to fix the violations first, and then come back to run **signoff_opt**.

SEE ALSO

`signoff_opt(2)`
`report_constraint(2)`

PSYN-215 (error) There are some cells with an illegal placement.

DESCRIPTION

This error message tells you that the detail placement is illegal for one or more of the following reasons:

- Cell is not placed on a row
- Cells overlap each other
- Cell overlaps a blockage
- Cell has illegal orientation on the row
- Cell is placed on a wrong site type
- Cell pin overlaps power strap or violates physical spacing rule

- Cell is placed outside core area.

WHAT_NEXT

Use the **check_legality -verbose** command to see more detailed messages about the placement issues. Run `legalize_placement` if it has not already been run.

SEE ALSO

`check_legality` (2), `legalize_placement` (2).

PSYN-216 (information) Your design has no timing violation left.

DESCRIPTION

You receive this message because there is no timing violation left in your design. `signoff_opt` might stop.

WHAT NEXT

It is just an information message.

SEE ALSO

`signoff_opt`(2)

PSYN-217 (error) Cannot run incremental signoff analysis without running full analysis first.

DESCRIPTION

You receive this error because you are trying to run `run_signoff` command with incremental signoff analysis, before running it first with full signoff analysis. A full signoff analysis is required before any incremental signoff analysis.

WHAT NEXT

Use `run_signoff` command to perform a full signoff analysis first.

SEE ALSO

`run_signoff`(2)

PSYN-218 (warning) QoR report might not include all violating paths.

DESCRIPTION

You receive this warning because you are trying to run **signoff_opt** or **run_signoff** command on a design that has excessive number of violating paths as reported by **PrimeTime**. **report_qor** command after **signoff_opt** or **run_signoff** only reports TNS and number of violating paths based on a limited number of violations. Thus, the TNS and number of violating paths in the QoR report might not include all violating paths in your design.

WHAT NEXT

Run **report_constraint -all_violators** to see the details of violations.

SEE ALSO

```
signoff_opt(2)
run_signoff(2)
report_constraint(2)
```

PSYN-219 (information) Static noise analysis and fixing is enabled for signoff_opt.

DESCRIPTION

You receive this information message because the static noise analysis and fixing is enabled in **signoff_opt**.

WHAT NEXT

This is an informational message only. However, if you do not intend to enable static noise analysis and fixing, you can use **set_si_options** command to modify your SI options, and then re-run **signoff_opt**.

SEE ALSO

```
signoff_opt(2)
set_si_options(2)
```

PSYN-220 (information) lib cell: %-16s: %.2f%% (%d/%d)

legality check pass rate.

DESCRIPTION

You receive this information message showing the rate at which the physical library cells can be legalized, when you run the **check_physical_constraints** command.

A high rate of legalization means that it is easy for the cell to find a legal site. All physical library cells should have a high legalization rate.

A low rate of legalization means that it is difficult for the cell to find a legal site, causing a large amount of displacement, and the timing might be negatively effected. This might also cause legalization failure. For example, if only 50 percent of the sites of a cell can be legalized, then only 50 percent placement area can fit the cell. However, in the design, this library cell might need more than 50 percent placement area. In this case, legalization fails because there is not enough space to place the cell legally.

Another example is when 50 percent of the sites of a library cell are legal sites, and 30 percent of the sites of another library cell are legal sites. The combinational legal rate for the two library cells might be lower than the individual rate because they might share the same legal sites. To prevent legalization failure, make sure the legal rate is high for all of the physical library cells the design is using.

The following command can be used to analyze the legalization rate for the library cells against the floorplan.

```
psyn_shell> check_physical_constraints -analyze_legality -lib_cell <> -verbose
```

WHAT NEXT

Check the library cell and floorplan to ensure the legal rate is high for every library cell. You might have to modify the floorplan (such as power straps) to make the cell easy to be legalized, or set **dont_use** on some library cells to prevent the design from linking to these cells.

SEE ALSO

check_physical_constraints (2).

PSYN-221 (error) %d cells could not be placed during ECO placement.

DESCRIPTION

This error occurs because the tool expects that new ECO cells must be connected to

the existing placed netlist. The exception occurs when individual unplaced, unconnected cells are introduced in the ECO flow (such as spare cells). These are placed evenly within the core area.

It is possible that the ECO changes in this design have a set of connected, unplaced cells which, as a collection, have no connection to the existing placed design. This type of netlist change is not currently supported through the ECO flow.

WHAT_NEXT

Continue by restructuring the ECO changes to satisfy the above requirements. Alternatively, perform coarse placement on the entire design using either the **create_placement** or **physopt** command.

PSYN-222 (error) The x-scale and y-scale for the physical timing model must be nonnegative.

DESCRIPTION

This error message tells you that you used the **compile_physical** command and specified negative physical timing model scale values. The **compile_physical** command expects nonnegative values. Negative values result in negative delays.

WHAT_NEXT

Check the values of the scales and make sure that they are nonnegative.

SEE ALSO

compile_physical (2).

PSYN-223 (error) Failed to derive physical timing model scales.

DESCRIPTION

The design might not have sufficient physical information. As a result, the command was not successful in deriving the physical timing models for the design.

WHAT_NEXT

Make sure the design has sufficient physical information.

PSYN-224 (warning) %d cells have no location.

DESCRIPTION

This warning message tells you that some of the cells specified with the **check_legality** command do not have placement information. As a result, no legality information was gathered for those cells.

WHAT_NEXT

Perform coarse placement, or make ECO changes to place all the cells. Then, rerun the **check_legality** command.

SEE_ALSO

check_legality (2), **create_placement** (2), **legalize_placement** (2), **physopt** (2).

PSYN-225 (error) Cannot assign location for cell %s added for wired logic.

DESCRIPTION

This error occurs because you used the **compile_physical -incremental** or **physopt -incremental** command before the design was placed. Once the wired logic is replaced by mapped gates, the newly-added gates must have locations assigned to them. This message tells you that the location assignment was not successful.

WHAT NEXT

Make sure the design is placed before using **compile_physical -incremental** or **physopt -incremental**.

SEE ALSO

compile_physical (2), **physopt** (2).

PSYN-226 (information) Assigned location for cell %s added for

wired logic.

DESCRIPTION

This message tells you that the location assignment for the specified cell was successful. For incremental physical compile, once the wired logic is replaced by mapped gates, the newly-added gates must be assigned locations.

WHAT NEXT

Make sure the wired logic in the design is functioning as expected.

SEE ALSO

`compile_physical` (2), `physopt` (2).

PSYN-227 (error) Site array (%s) has irregular rows specified for location (%d %d), spacing (%d) > width (%d).

DESCRIPTION

You receive this error message because the tool has found a discrepancy between the PDEF file definition of spacing in the named row and the spacing defined for the same row in the physical library. The spacing defined in the PDEF file is larger than the spacing defined for the row in the physical library. The tool requires that you define the site array as "regular," so that the width and the spacing between the sites are equal.

The `physopt` command and the `legalize_placement` command require that you specify the site array as regular in the PDEF input.

WHAT NEXT

Correct the site array definition in the PDEF file so that it is regular, and read in the PDEF file using the `read_pdef` command.

SEE ALSO

`legalize_placement`(2)
`physopt`(2)
`read_pdef`(2)

PSYN-228 (error) The via ID cannot be -1. Examine the PDEF

file to ensure that the via is defined.

DESCRIPTION

This error occurs because an error occurred when the tool was using the **read_pdef** command to read the Physical Design Exchange Format (PDEF) file. That error was caused by an invalid via ID of -1. A valid via ID is one which has a correct reference to the VIA_DEF section inthe PDEF.

WHAT NEXT

Specify a valid via ID from the VIA_DEF section of the PDEF and execute the **read_pdef** command.

SEE ALSO

[read_pdef\(2\)](#)

PSYN-229 (warning) Inconsistent library data found. Layer %s is ignored for resistance and capacitance computation.

DESCRIPTION

You receive this warning because the library data for the specified layer is inconsistent. For example, you receive this message if the pitch is less than the width plus the spacing. As a result, the layer is excluded from resistance and capacitance computation. However, this does not impact congestion computation.

WHAT NEXT

No action is required on your part. However, you can examine the library data for possible problems, fix the library resistance and capacitance inconsistency problem, and regenerate the physical library.

SEE ALSO

[GR-15 \(n\)](#) , [GR-16 \(n\)](#) .

PSYN-230 (error) Unable to complete detailed placement.

DESCRIPTION

You receive this error message because a problem with the initial placement of cells or the relocation of cells is preventing the completion of the detailed placement.

WHAT NEXT

Place all of the cells in the design, and then rerun the **optimize_placement** command.

SEE ALSO

create_placement (2), **legalize_placement** (2), **optimize_placement** (2), **physopt** (2).

PSYN-231 (error) Cannot receive paths array.

DESCRIPTION

You receive this error message because the compiler is unable to generate an array of worst paths of the design using the **optimize_placement** command.

WHAT NEXT

Run the **report_timing** command before running **optimize_placement**.

SEE ALSO

optimize_placement (2), **report_timing** (2).

PSYN-232 (error) Unable to perform placement optimization.

DESCRIPTION

You receive this error message because errors when executing the **optimize_placement** command. Possible causes are as follows:

- An incorrect netlist is specified.
- Inconsistent units are used.
- The structure of the critical paths is invalid.

- Unable to estimate the changes in timing parameters after replacement.
- The initial placement was illegal; for example, some cells were placed outside the core area.

WHAT NEXT

Perform placement and use the `run_router` command before using the `optimize_placement` command. If the `-no_legalize` switch is not set, run `legalize_placement` before running `optimize_placement`.

SEE ALSO

`create_placement` (2), `legalize_placement` (2), `optimize_placement` (2), `physopt` (2), `run_router` (2).

PSYN-233 (error) Cannot remove old location of cell %s from the map.

DESCRIPTION

You receive this error message because the placement map created during initialization of the detailed placer is invalid. Possible causes are the following:

- Incorrect initial placement. Some cells are outside of the core area.
- If the `-no_legalize` switch for the `optimize_placement` command is not set, the initial placement has legality violations.

WHAT NEXT

Perform coarse placement or make ECO changes to place all of the cells before using the `optimize_placement` command. If the `-no_legalize` switch for `optimize_placement` is not set, run `legalize_placement` before running `optimize_placement`.

SEE ALSO

`create_placement` (2), `legalize_placement` (2), `optimize_placement` (2), `physopt` (2).

PSYN-234 (error) Cannot place the cell %s in the new location (

`%d, %d).`

DESCRIPTION

You receive this error message because the named cell cannot be placed in the specified location during placement optimization.

WHAT NEXT

Perform coarse placement or make ECO changes to place all of the cells before running the **optimize_placement** command.

SEE ALSO

`create_placement` (2), `legalize_placement` (2), `optimize_placement` (2), `physopt` (2).

PSYN-235 (error) Unable to perform placement optimization for path group %s.

DESCRIPTION

You receive this error message because an error occurred during placement optimization. The possible causes are as follows:

- An incorrect netlist is specified.
- Inconsistent units are used.
- The structure of the critical paths is invalid.

WHAT NEXT

Perform placement to place all of the cells, and then use the **run_router** command before executing the **optimize_placement** command.

SEE ALSO

`create_placement` (2), `legalize_placement` (2), `optimize_placement` (2), `physopt` (2), `run_router` (2).

PSYN-236 (error) Invalid or absent layer information.

DESCRIPTION

You receive this error message because the compiler is unable to receive the library parameters (capacitance and resistance per unit length in both directions) of the layer.

WHAT NEXT

Make sure that the capacitance and resistance parameters exist in the library, and then rerun the **optimize_placement** command.

SEE ALSO

optimize_placement (2).

PSYN-237 (error) Illegal data found for net %s.

DESCRIPTION

You receive this message because the specified net has an irregular structure; the tool detects no pins or bounds.

WHAT_NEXT

Examine the initial net list. Perform coarse placement or make engineering change order (ECO) changes to place all the cells before using the **optimize_placement** command.

SEE ALSO

optimize_placement (2).

PSYN-238 (error) Illegal timing data for cell %s.

DESCRIPTION

You receive this error message because the specified cell has no available arcs corresponding to input and output pins found in some critical paths.

WHAT NEXT

Check the libraries for corresponding library cells that exist in loaded libraries. If a corresponding library cell exists in a loaded library, remove it from the library and rerun the `optimize_placement` command.

SEE ALSO

`optimize_placement` (2).

PSYN-239 (warning) Unable to find the location of cell %s near (%d,%d).

DESCRIPTION

You receive this warning because detailed placement cannot find the legal location for the given cell near the specified point.

WHAT NEXT

No action is required on your part unless you want to examine the specified location and cell to ensure that they are as you intended.

PSYN-240 (error) %s: No current design.

DESCRIPTION

You receive this error message because you did not set a current design before using the `optimize_placement` command.

WHAT NEXT

Set the current design and then run the `optimize_placement` command.

SEE ALSO

`optimize_placement` (2).

PSYN-241 (information) %s: Number of optimized paths set is more than the number of generated paths. The number of

optimized paths must equal the number of generated paths.

DESCRIPTION

This message informs you that you set the number of paths to be optimized to more than the the number of paths to be generated. As a result, the number of paths to be optimized is automatically reset to equal the number of paths to be generated.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`optimize_placement` (2).

PSYN-242 (error) Unable to initialize detailed placement.

DESCRIPTION

You receive this error message because the compiler is unable to initialize detailed placement for incremental relocations.

WHAT NEXT

Perform placement to place all of the cells and then rerun the `optimize_placement` command.

SEE ALSO

`create_placement` (2), `legalize_placement` (2), `optimize_placement` (2), `physopt` (2).

PSYN-243 (error) Conflicting parameter %s for the core. Cannot set more than two of -utilization, -core_width, -core_height, -aspect_ratio options.

DESCRIPTION

You receive this message because there is a conflict in the parameters passed for the core area. These parameters are set by using the `set_floorplan_options` command. See the man page for `set_floorplan_options` or the user guide to determine the

allowable combinations for the following options:

- utilization
- core_width
- core_height
- aspect_ratio

WHAT_NEXT

Try to use only two of the options listed above. You can use the **report_floorplan_options** command to view the parameters that have been set for core area.

SEE_ALSO

report_floorplan_options (2), **set_floorplan_options** (2).

PSYN-244 (warning) Corner keepout %2f is too big to fit the core area. Resetting it to 0.

DESCRIPTION

You receive this warning because the corner keepout you specified for port placement is too big. A keepout this size would completely block every side of the core area, so that ports could not be placed. The tool resets the corner keepout to 0 (zero) and continues as if there is no corner keepout constraint.

WHAT NEXT

No action is required on your part unless you want to examine the value of the corner keepout compared with the generated core area. You can see the core area by using the **write_pdef** command to write the Physical Design Exchange Format (PDEF) file from the flow or by using the **report_design** command with the **-physical** option on the resulting .db design. You can specify the target placement utilization for the core area by using the **set_floorplan_options** command with the **-corner_keepout** option. Note that the **-corner_keepout** option is specified in microns.

SEE_ALSO

report_design (2), **set_floorplan_options** (2), **write_pdef** (2).

PSYN-245 (warning) Cell '%s' is too big to fit the core area.

Fixing it to the lower-left corner.

DESCRIPTION

You receive this warning because the width or height of the cell is bigger than the core area's width or height; This is not allowed for placement. The tool fixes this cell to the lower-left corner of the core area so that the flow can continue.

WHAT NEXT

No action is required on your part unless you want to examine the placement result and adjust the core area constraints, utilization, aspect_ratio, and so on, to ensure that the core area is feasible for the design. Then you can rerun the flow. You can also define the legal orientation for this cell to place it in the desired orientation and match its shape with the core area.

SEE ALSO

`set_floorplan_macro_options` (2), `set_floorplan_options` (2).

PSYN-246 (error) No layer name(s) specified.

DESCRIPTION

You receive this error message because the `create_track`, `remove_track`, or `shift_track` command cannot execute without a specified layer name.

WHAT NEXT

Specify the layer name and run the command again. Refer to the command man page for information about the optional and required parameters.

SEE ALSO

`create_track` (2), `remove_track` (2), `shift_track` (2).

PSYN-247 (warning) Direction is not specified. Using the library-specified direction.

DESCRIPTION

You receive this warning because the direction is not specified in the command

invoked, so the tool uses the library-specified direction.

WHAT NEXT

No action is required on your part unless you want to specify a direction. You can examine the library to see the direction being used and the man page for the command that caused the warning for detailed information on specifying a direction value.

SEE ALSO

`create_track` (2), `remove_track` (2), `report_track` (2), `shift_track` (2).

PSYN-248 (error) No offset is specified for shifting tracks.

DESCRIPTION

You receive this message because no offset is specified for shifting tracks.

WHAT_NEXT

See the man page for the command that caused the error for detailed information on optional and required parameters, then specify the offset.

SEE ALSO

`create_track` (2), `remove_track` (2), `report_track` (2), `shift_track` (2).

PSYN-249 (warning) Count value is not specified. Covering placement area, depending on pitch.

DESCRIPTION

You receive this warning because the number of tracks to be created is not specified. When the count value is not specified, the tool attempts to cover the entire placement area with tracks. The distance between the tracks is equal to the pitch.

WHAT_NEXT

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

SEE_ALSO

`create_track (2)`, `remove_track (2)`, `report_track (2)`, `shift_track (2)`.

PSYN-250 (warning) Coordinate value is not specified.
Defaulting to half pitch.

DESCRIPTION

You receive this warning because the value of the start of the first track is not specified. First the tool attempts to get it from the library; but if this is not successful, it uses half of the pitch value.

WHAT NEXT

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

SEE_ALSO

`create_track (2)`, `remove_track (2)`, `report_track (2)`, `shift_track (2)`.

PSYN-251 (warning) Space is not specified. Considering using pitch.

DESCRIPTION

You receive this warning because the space between the tracks is not provided. The tool uses the default value, which is the pitch value provided by the library.

WHAT NEXT

No action is required on your part. You can see the man page for the command that caused the warning for detailed information on specifying optional and required parameters.

SEE_ALSO

`create_track (2)`, `remove_track (2)`, `report_track (2)`, `shift_track (2)`.

PSYN-252 (warning) Ignoring bound for port '%s'. Compare bound (%d %d %d %d) against core area (%d %d %d %d).

DESCRIPTION

You receive this warning because you have used the `set_floorplan_port_options` command with the `-x_bounds` and/or `-y_bounds` options to set bound for this port. However, the coordinates of the specified bound conflict with the core area or are not meaningful. For example, you might have specified a bounding box not within the core area or not overlapping with it. The placement tool cannot honor this bound.

WHAT NEXT

No action is required on your part. Check the value you specified for the `-x_bounds` or `-y_bounds` options. Ensure that the bound is reasonable for the intended floorplan.

SEE ALSO

`set_floorplan_options` (2), `set_floorplan_port_options` (2).

PSYN-253 (warning) Cell %s is outside of its hard bound.

DESCRIPTION

You receive this warning because the tool has found that the named cell is not placed within its specified hard bound. The violation occurs because its placement is not legal.

WHAT NEXT

No action is required on your part unless you want to use the `legalize_placement` command to make the placement legal.

`legalize_placement` (2).

PSYN-254 (warning) lib cell '%s' height(%d) is different from its site height(%d).

DESCRIPTION

You receive this warning because the specified cell height is different from its lib

site height. In the physical library, you might have defined a cell linked to the lib site with a different height.

WHAT NEXT

No action is required on your part unless you want to examine the physical library to see if the cell is linked to the correct lib site.

SEE ALSO

`report_cell` (2), `report_lib` (2).

PSYN-255 (warning) Cannot derive the location for port '%s' from placement.

DESCRIPTION

You receive this warning because the tool cannot determine the port location from placement. Usually this is because this port is not connected to a cell in the netlist. In this case, the tool sets its location to an available routing track. Side constraint will be honored for such a port.

WHAT NEXT

No action is required on your part unless you want to check the netlist and, if necessary, set the location for this port by using the `set_port_location` command.

SEE ALSO

`set_port_location` (2).

PSYN-256 (warning) Orientation for the fixed cell '%s' does not match legal orientations. Ignoring legal orientations.

DESCRIPTION

You receive this warning because the named cell is fixed but its orientation does not match any defined, legal orientation. Since it is a fixed cell, the tool uses its orientation and ignores any legal orientation. The legal orientation can be set by the user or can sometimes be obtained from the library. Sometimes it exists in Synopsys database format (.db) because a previously-executed application might have set it.

WHAT NEXT

No action is required on your part if the cell is in the orientation you want. Otherwise, you can set the legal orientation for the fixed cell by using the **set_floorplan_macro_options** command with the **-legal_orient** option.

SEE ALSO

set_floorplan_macro_options (2).

PSYN-257 (warning) Cell '%s' has a relative constraint with cell '%s'. Its legal orientations have to be with same footprint of initial orientation '%s'.

DESCRIPTION

You receive this warning to let you know that the tool has detected a relative constraint (an alignment) for the named cell with another cell. The placement tool rotates the cell only within legal orientations. For cells with relative constraint: If the defined legal orientations do not have the same footprint, to start orientation the tool chooses those orientations that do. (The default is north, or first legal orientation.)

WHAT NEXT

If the orientation the tool set is the one you want, you do not have to do anything. If the orientation is not what you want, define legal orientations for the named cell, using the **set_mpc_macro_options** command and its **-legal_orientation** option with a value of **list**. Then start the orientation by invoking the **rotate_objects -to** command with the legal orientations defined, as follows: **rotate_objects -to legal_orientation**.

SEE ALSO

rotate_objects (2)
set_mpc_macro_options (2)

PSYN-258 (warning) '%s' is invalid with '%s'. Ignore it ...

DESCRIPTION

You receive this warning message from the **set_floorplan_macro_options** command or the **set_floorplan_macro_array** command because you did not correctly specify the **-x_offset** or **-y_offset** arguments for the macro bound or macro array, respectively,

when you ran these commands.

Specify the anchor offset for a macro cell or macro array involving the edges of the core area by defining **-x_offset** or **-y_offset** as follows:

- For anchor bound top (**t**) and bottom (**b**), only the **-y_offset** is allowed. The value specifies the distance to the top or bottom edge, and the value must be positive (>0).
- For anchor bound left (**l**) and right (**r**), only the **-x_offset** is allowed. The value specifies the distance to the left edge or the right edge, and the value must be positive (>0).
- For anchor bound at corners (**bl**, **tl**, **br**, **tr**), both the **-x_offset** and the **-y_offset** are allowed; you can specify either or both offsets. The values specify the distance to the edges of each corner, and the values must be positive (>0).
- For anchor bound bottom-middle (**bm**), top-middle (**tm**), right-middle (**rm**), left-middle (**lm**), and center (**c**), both the **-x_offset** and the **-y_offset** are allowed. The value can be positive or negative.

For **tm** or **bm**:

- The **-y_offset** specifies the distance to the top edge or the bottom edge.
- The **-x_offset** specifies the offset of the center of the macro or the macro array to the middle line. A negative value defines the center as left of the middle line. A positive value defines the center as right of the middle line.

Apply this interpretation also to the values for **lm**, **rm**, and **center**.

WHAT NEXT

This message is only a warning and requires no action on your part. However, you might want to confirm that you intended to specify offset values. Also confirm that the tool can ignore the offset you specified, without causing unwanted alteration of your design.

SEE ALSO

`set_floorplan_macro_array` (2), `set_floorplan_macro_options` (2).

PSYN-259 (error) Unable to fix static noise without enabling delta delay in signoff_opt.

DESCRIPTION

You receive this error because you are trying to run **signoff_opt** command on a design that has enabled static noise fixing but not delta delay.

In **signoff_opt**, it is required to have enabled delta delay in order to fix static

noise.

It is not required to enable static noise fixing if you just want to fix delta delay.

WHAT NEXT

Run `set_si_options` to enable delta delay together with static noise.

SEE ALSO

`signoff_opt(2)`
`set_si_options(2)`

PSYN-260 (warning) Resistance of layer %s varies more than the specified factor (%.2f) from layer %s.

DESCRIPTION

You receive this warning because the resistance for the given routing layer varies more than the specified factor from another routing layer. This determination is made to check for the possibility of specifying the wrong resistance or "Poly" values as the routing layer. "Poly" should not be specified as a routing layer. You might receive this warning only because of differences in metal width for different routing layers:

WHAT NEXT

No action is required on your part.

SEE ALSO

`check_physical_constraints (2)`.

PSYN-261 (warning) Capacitance of layer %s varies more than the specified factor (%.2f) from layer %s.

DESCRIPTION

You receive this warning because the capacitance for the given routing layer varies more than the specified factor from another routing layer. This determination is made to check for the possibility of specifying the wrong capacitance or "Poly" values being as the routing layer. "Poly" should not be specified as a routing

layer. You might receive this warning only because of differences in metal width for different routing layers:

WHAT NEXT

No action is required on your part.

SEE ALSO

`check_physical_constraints` (2).

PSYN-262 (error) RC values for Layer : %s, Resistance : %g, Capacitance : %g.

DESCRIPTION

You receive this message because the resistance or capacitance for the routing layer %s is set to zero. The resistance or capacitance for the routing layer should not be zero.

WHAT NEXT

Examine the physical library, and correct the RC values for the given layer.

SEE ALSO

`check_physical_constraints` (2).

PSYN-263 (error) Library %s has no metal layer information.

DESCRIPTION

You receive this error message because the physical library does not contain the metal layers information.

WHAT NEXT

Check the physical library and provide the missing routing layer information, and then rerun the command.

SEE ALSO

`check_physical_constraints (2)`.

PSYN-264 (error) %s is set to 0 (illegal) for metal layers.

DESCRIPTION

You receive this message because the width, spacing, or pitch is set to zero for metal layers.

WHAT NEXT

Examine the physical library, and provide the missing metal layer information.

SEE ALSO

`check_physical_constraints (2)`.

PSYN-265 (error) The pitch and width difference is less than min space for metal layer %s.

DESCRIPTION

You receive this message because the width, spacing, and pitch do not follow the rule:

space > pitch - width

If the minimum spacing is not followed, design rules are violated and the design might not be fabricated.

WHAT NEXT

Correct the values for the specified metal layer.

SEE ALSO

`check_physical_constraints (2)`.

PSYN-266 (warning) Missing %s nets in the floorplan.

DESCRIPTION

You receive this warning because there are no power or ground nets in the floorplan.

WHAT NEXT

No action is required on your part. However, you can determine whether ground and power nets are defined in the floorplan. Absence of power nets might lead to illegal placements later.

SEE ALSO

`check_physical_constraints` (2).

PSYN-267 (error) Cell '%s' (lib_cell: %s, lib_site: %s) has no associated site row defined in the floorplan.

DESCRIPTION

You receive this warning because the site type of the specified cell is not defined in the floorplan. For example, suppose a standard library cell is defined as the "CORE" site cell in the physical library. However, no site row is defined for the "CORE" site type in the floorplan Physical Design Exchange Format (.pdef) file. In this case, the `legalize_placement` command cannot place this cell anywhere in the placement area because there is no site row defined for the site type.

WHAT NEXT

1. Examine the physical library to see if the cell is linked to a correct lib site.
2. Examine the library linking to see there is any missing physical library.
3. Examine the floorplan to see if there is unmatched site or unitTile.

SEE ALSO

`legalize_placement` (2)

PSYN-268 (error) The design is not legalized.

DESCRIPTION

You receive this error message because the `insert_spare_cells` command requires the design to be legalized before any spare cells can be inserted.

WHAT NEXT

Legalize the design using the `legalize_placement` command, and then rerun the `insert_spare_cells` command.

SEE ALSO

`insert_spare_cells` (2), `legalize_placement` (2).

PSYN-269 (error) Cannot find lib cell (%s) or it is not a technology cell.

DESCRIPTION

You receive this message because the `insert_spare_cells` command cannot insert spare cells for the given library cell. This is because it either does not exist in the linked libraries or is not a technology cell.

WHAT NEXT

Examine the cell name and determine that it exists and is of the correct type.

SEE ALSO

`insert_spare_cells` (2).

PSYN-270 (warning) Layer %s is missing definition in the physical library.

DESCRIPTION

You receive this warning message when the floorplan has information for the given layer but it is not defined in the physical library.

WHAT NEXT

Check the floorplan and the physical library. The layers defined in the floorplan should have a corresponding definition in the physical library. Check for the correct version of the physical library.

SEE ALSO

`check_physical_constraints(2)`.

PSYN-271 (warning) Via %s is using a layer that is not defined in the physical library.

DESCRIPTION

You receive this warning because the floorplan has information for the given via, but it is not defined in the physical library.

WHAT NEXT

No action is required on your part, unless you want to examine the floorplan and the physical library. A via defined in the floorplan should have a corresponding definition in the physical library. You can also ensure that the version of the physical library is correct.

SEE ALSO

`check_physical_constraints (2)`.

PSYN-272 (warning) The movebound '%s' has also been removed.

DESCRIPTION

This warning message occurs when the `remove_voltage_area` command removes the named movebound, because the movebound was created in and resided within the voltage area that was removed. When the `remove_voltage_area` command removes a specified voltage area, it deletes all movebounds within the voltage area.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Use the **remove_bounds** command to remove movebounds within a voltage area before you remove the voltage area with **remove_voltage_area**.

SEE ALSO

`create_bounds(2)`
`remove_bounds(2)`
`remove_voltage_area(2)`
`report_bounds(2)`

PSYN-273 (error) Object %s belongs to voltage area %s.

DESCRIPTION

This error message occurs when the object you specified to the **update_voltage_area** command already resides in the voltage area named in this error message. An object cannot reside in two different voltage areas.

WHAT NEXT

Decide which voltage area you want the object to reside in. Then verify the top-level objects associated with that voltage area, using the **report_voltage_area** command. Remove the object from the inappropriate voltage area, using the **update_voltage_area** command with the **-delete** option. Then rerun **update_voltage_area** with the **-add** option.

SEE ALSO

`create_voltage_area(2)`
`remove_voltage_area(2)`
`update_voltage_area(2)`

PSYN-274 (error) Design contains bounds. No voltage areas allowed.

DESCRIPTION

This error message occurs when running the **create_voltage_area** command, because the design you specified contains bounds you created earlier with the **create_bounds** command. Create voltage areas first, then create bounds.

WHAT NEXT

Remove the bounds in your design using the **remove_bounds** command. Then rerun the **create_voltage_area** command to create the voltage area. You can now create bounds,

but only after you create the voltage area.

SEE ALSO

`create_voltage_area(2)`
`remove_bounds(2)`
`remove_voltage_area(2)`
`report_voltage_area(2)`

PSYN-275 (error) Voltage area %s already exists in the design.

DESCRIPTION

This error message occurs when running the `create_voltage_area` command, because the name of the voltage area you defined already exists in the design. The voltage areas have unique names for identification purposes.

WHAT NEXT

To create a new voltage area with a name that does not already exist in the design, use the `report_voltage_area` command to verify the names of all voltage areas already present in the design. Then use the `create_voltage_area` command to create the voltage area with a new name.

SEE ALSO

`create_bounds(2)`
`create_voltage_area(2)`
`remove_bounds(2)`
`remove_voltage_area(2)`
`report_bounds(2)`

PSYN-276 (error) Cell %s must be top-level hierarchical cell of the current design.

DESCRIPTION

This error message occurs when running the `create_voltage_area` command, because the named cell is not a top-level hierarchical cell in your design. The command can only create a voltage area when the specified cell is a top-level hierarchical cell.

WHAT NEXT

Verify the top-level cells associated with your design using the `report_voltage_area` command. Select the top-level hierarchical cell for which you want to create a

voltage area. Rerun **create_voltage_area**, specifying the name of the top-level cell you selected.

SEE ALSO

```
create_bounds(2)
create_voltage_area(2)
remove_bounds(2)
remove_voltage_area(2)
report_bounds(2)
```

PSYN-277 (error) Voltage area %s has utilization greater than 1.

DESCRIPTION

This error message occurs when running the **create_voltage_area** command, because the tool finds that the area of the voltage area you defined is smaller than the total area of the fixed and standard cells. When you create a voltage area with the **-coordinate** option of the **create_voltage_area** command, and it is too small, you need to change the coordinates, to make the voltage area larger.

WHAT NEXT

Determine the total area of the cells associated with the voltage area you defined, using the **report_cell** command. Using the **-coordinate** option of **create_voltage_area**, adjust the coordinates to enlarge the voltage area. Or use the **-anchor** option of **create_voltage_area** to specify that the anchor point is to automatically derive the shape of the voltage area. Run the **create_voltage_area** command again.

SEE ALSO

```
attach_voltage_area(2)
create_voltage_area(2)
detach_voltage_area(2)
remove_voltage_area(2)
report_cell(2)
```

PSYN-278 (error) Cannot find a legal location for '%d' spare cells.

DESCRIPTION

You receive this message because the **insert_spare_cells** command cannot insert the specified number of spare cells. This is because there are no legal locations for those cells in the placed design.

WHAT NEXT

Examine the floorplan for chip density and site types.

SEE ALSO

`insert_spare_cells` (2).

PSYN-279 (error) The specified subdesign '%s' does not exist.

DESCRIPTION

You receive this message because the `insert_spare_cells` command cannot find the specified design hierarchy object.

WHAT NEXT

Examine the specified object name and reissue the command.

SEE ALSO

`insert_spare_cells` (2), `report_cell` (2), `report_hierarchy` (2).

PSYN-280 (error) Unable to load PrimeTime image due to %s.

DESCRIPTION

You receive this error because `signoff_opt` is not able to load a PrimeTime image that is specified in `set_primateime_options`. `signoff_opt` could fail to load the image due to one or more of the following reasons:

- The specified image contains inconsistent netlist
- The specified image contains inconsistent library
- The specified image contains inconsistent timing exception
- The specified image contains inconsistent power domain

WHAT NEXT

If the specified image contains inconsistent netlist, you can either re-generate the PrimeTime image using the same MW CEL as **IC Compiler**, or re-generate a MW CEL for **IC**

Compiler using the same netlist your **PrimeTime** uses.

If the specified image contains inconsistent library, please ensure that all target libraries in **IC Compiler** (or its corresponding min version if the image is intended for min corner) are visible in the image. You can re-generate the PrimeTime image using the correct link path.

If the specified image contains inconsistent timing exception, you can correct the mistake in your standalone **PrimeTime** run, and re-generate the PrimeTime image by saving a new session using **save_session** in PrimeTime.

EXAMPLE

You're running **signoff_opt** in BCWC mode, and you have the following settings in your **IC Compiler** run:

```
set target_library "slow.db" set link_library "* slow.db" set_min_library -min  
fast.db slow.db ... open_mw_cel -lib mymw mycel
```

Your standalone max corner **PrimeTime** script should look like:

```
set link_path "* slow.db" read_milkyway -library mymw mycel
```

And your standalone min corner **PrimeTime** script should look like:

```
set link_path "* fast.db" read_milkyway -library mymw mycel
```

SEE ALSO

```
signoff_opt(2)  
set_primestime_options(2)
```

PSYN-281 (error) Voltage area %s does not exist in the design.

DESCRIPTION

This error message occurs when running the **update_voltage_area** command, because the tool finds that the specified voltage area does not exist in your design, so the tool is unable to continue.

WHAT NEXT

Run the **report_voltage_area** command to verify the names of all voltage areas that exist in the design. Rerun the **update_voltage_area** command, using the correct voltage_area name.

SEE ALSO

```
create_bounds(2)
```

```
create_voltage_area(2)
remove_voltage_area(2)
report_voltage_area(2)
update_voltage_area(2)
```

PSYN-282 (error) Default voltage area '%s' already specified.

DESCRIPTION

This error message occurs when running the **create_voltage_area** command, because a default voltage area, which is already present in the design and covers all of the cells that are not within any specified voltage areas, is in conflict with the voltage area you want to create now.

WHAT NEXT

Remove the default voltage area using the **remove_voltage_area** command. Rerun the **create_voltage_area** command.

SEE ALSO

```
create_voltage_area(2)
remove_voltage_area(2)
report_voltage_area(2)
```

PSYN-283 (warning) Given coordinates are greater than MAX_INT.

DESCRIPTION

You receive this warning message because one or more of the given coordinates are greater than MAX_INT (0x7FFFFFFE).

WHAT NEXT

No action is required on your part. However, you can check the value of the coordinates to ensure that they are valid for your purpose.

PSYN-284 (warning) Ignoring variable %s, use

set_pnet_options command.

DESCRIPTION

You receive this warning to inform you that the variable named in the message is obsolete, and the tool ignores it. To set the pnet layer options, use the **set_pnet_options** command. The obsolete variables that evoke this warning are: **physopt_minimum_pnet_height**, **physopt_minimum_pnet_width**, **physopt_pnet_complete_blockage_layer_names**, **physopt_pnet_partial_blockage_layer_names**, and **physopt_pnet_via_additive**.

For example: the variable: `set physopt_pnet_complete_blockage_layer_names "M1 M2"` should be replaced by command: `set_pnet_options -complete {M1 M2}`

the variable: `set physopt_pnet_partial_blockage_layer_names "M1 M2"` should be replaced by command: `set_pnet_options -partial {M1 M2}`

WHAT NEXT

Verify the pnet settings using the **report_pnet_options** command. Then set or change the pnet option settings using **set_pnet_options**. To remove pnet options, use the **remove_pnet_options** command.

SEE ALSO

remove_pnet_options (2), **report_pnet_options** (2), **set_pnet_options** (2).

PSYN-285 (warning) Not enough space (too thin).

DESCRIPTION

You receive this warning to let you know that, within the region you specified, gaps exist in the row of sites.

You receive this message for one of two reasons:

- The filler cells you specified are not small (or thin) enough to fill in all the spaces between all cells in your design.
- The placement boundary is not on the site grid, which leaves a space between a placement boundary and a valid site grid location.

WHAT NEXT

Define a list of narrower filler cells for the same region of your floorplan. Then

rerun the **insert_filler** command on that region. Or snap your placement obstruction to a site grid before you run **insert_filler**.

SEE ALSO

insert_filler (2), **remove_filler** (2), **report_filler** (2).

PSYN-286 (warning) Not enough space (too short).

DESCRIPTION

You receive this warning message because some sites are not filled by filler cells within the region you specified with the **insert_filler** command. This is because the filler cells you specified are too tall to fit into the available space in the sites.

WHAT NEXT

Define a list of shorter filler cells for the same region of your floorplan. Rerun the **insert_filler** command on that region.

SEE ALSO

insert_filler (2), **remove_filler** (2), **report_filler** (2).

PSYN-287 (information) This region is assigned with ID %d.

DESCRIPTION

You receive this message to let you know that the **set_routing_wire_model** command has created an ID for the regional routing wire model in your design. Use this ID with the **remove_routing_wire_models** command if you want to remove the regional routing wire model. Use it also with the **report_routing_wire_models** command to review regional routing wire models in the design.

The tool always assigns an ID of 0 to a routing wire model for a design, and IDs beginning from 1 to regional routing wire models.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`remove_routing_wire_models (2)`, `report_routing_wire_models (2)`,
`set_routing_wire_model (2)`.

PSYN-288 (Warning) Routing wire model ID '%d' is invalid and is ignored.

DESCRIPTION

You receive this message from the `report_routing_wire_models` command or the `remove_routing_wire_models` command because the routing wire model ID you specified in the command is not a valid ID; and the tool ignores it.

WHAT NEXT

Use the `report_routing_wire_models` command to check the routing wire model ID. Then run the command again.

SEE ALSO

`remove_routing_wire_models (2)`. `report_routing_wire_models (2)`.

PSYN-289 (Error) Via '%s' is already defined in design db.

DESCRIPTION

You receive this message from the `define_via` command, because the via you specified in your design is already defined in the design .db file.

WHAT NEXT

Use the previously defined via in your design, or define the new via using a different name. Then run the command again.

SEE ALSO

`define_via (2)`.

PSYN-290 (Error) No '%s' defined for define_via command.

DESCRIPTION

You receive this message from the **define_via** command, because you did not specify for the command the option named in the error.

WHAT NEXT

Make sure you are using the correct command syntax. Then run the command again.

SEE ALSO

define_via (2).

PSYN-291 (Error) Layer '%s' is not defined in current design db (rect list '%s').

DESCRIPTION

You receive this message from the **define_via** command, because the layer you specified is not defined in the design .db file.

WHAT NEXT

Make the necessary correction to the layer name. Then run the command again.

SEE ALSO

define_via (2).

PSYN-292 (Error) Cannot recognize the pattern of given list '%s' for -rect option.

DESCRIPTION

You receive this message from the **define_via** command, because the geometry pattern you specified for the **-rect** option of the command is not correct.

WHAT NEXT

Make sure you are using the correct syntax. Then run the command again.

SEE ALSO

`define_via` (2).

PSYN-293 (Error) No via def is found in current design db.
You have to read in PDEF file before defining a special via.

DESCRIPTION

You receive this message from the `define_via` command, because the tool cannot generate a special via (and therefore fails). This occurs because no via definition exists in the current design.

WHAT NEXT

Read in the PDEF file that contains the via definition. Then run the command again.

SEE ALSO

`define_via` (2).

PSYN-294 (warning) Setting default orientation '%s' on the object '%s'.

DESCRIPTION

This warning occurs because you tried to set the location on an object for which you have not defined an orientation by using the `set_cell_location` command. The tool sets a default orientation on such objects.

WHAT NEXT

This message is only a warning and requires no action on your part if you accept the default orientation the tool sets on the object.

To set a desired orientation for the object named in the message, first execute the `rotate_object` command, then run the `set_cell_location` command again.

SEE ALSO

`rotate_object(2)`
`rotate_objects(2)`
`set_cell_location(2)`

PSYN-295 (warning) `legalize -timing` option can only be used with `-incr` option, `-timing` is disabled.

DESCRIPTION

You receive this warning because you tried to run the `legalize_placement` command, with its `-timing` option specified, without also specifying the command's `-incremental` timing mode. The message is to inform you that the tool therefore disables the `-timing` option.

WHAT NEXT

This message is a warning only and requires no action on your part. However, you most likely want to rerun the command, with both the `-timing` option and the `-incremental` option defined.

SEE ALSO

`legalize_placement (2)`.

PSYN-296 (warning) `legalize -clip` option can only be used with `-coord` option, `-clip` is disabled.

DESCRIPTION

You receive this warning because you tried to run the `legalize_placement` command, with its `-clip` option specified, without also specifying the command's `-coordinate` option, which is the regional legalize mode. The message is to inform you that the tool therefore disables the `-clip` option.

WHAT NEXT

This message is a warning only and requires no action on your part. However, you most likely want to rerun the command, with both the `-clip` option and the `-coordinate` option defined, as shown in this example:

```
legalize_placement -coord {llx lly urx ury} -clip ...
```

SEE ALSO

`legalize_placement (2)`.

PSYN-297 (warning) Setting the value of option %s removes the value of the conflicting option %s automatically.

DESCRIPTION

You receive this warning message because the above two options cannot be valid at the same time.

WHAT NEXT

To prevent this warning message, remove the first option before setting the second option.

SEE ALSO

`remove_xtalk_router_options (2)`, `set_xtalk_router_options (2)`.

PSYN-298 (warning) Removing routing for non dont touch nets.

DESCRIPTION

You get this warning because you are modifying netlist on a post-route design. The routing information may not be valid, hence need to be deleted. You may need to re-route your design after completing this command.

WHAT NEXT

Run "route" command if you need a routed design.

PSYN-299 (warning) Physical net %s has %s type. Potential special net should have either GND,PWR or CLOCK type.

DESCRIPTION

You receive this warning message because the named physical net has an incorrect type and cannot be treated as a special net.

WHAT NEXT

Check the initial floorplan and the PDEF (Physical Design Exchange Format) file for the correct type of the net, and then run the command again.

SEE ALSO

`compile_clock_tree` (2), `physopt` (2).

PSYN-300 (warning) Non-rectilinear edge was found in port/obstruction geometry.

DESCRIPTION

This warning occurs because there is a polygon-shaped port or obstruction geometry that contains at least one non-rectilinear edge. The tool ignores this type of non-rectilinear geometry.

WHAT NEXT

This is a warning message only. No action is required on your part.

However, you can check the original Synopsys Physical Library (.plib) file or Library Exchange Format (LEF) file to ensure that all polygons are rectilinear and make changes as necessary. Then, run the command again.

PSYN-301 (warning) cannot find location in physical lib cell for the pin %s

DESCRIPTION

You receive this warning message because the tool cannot set the bounds for a specific pin in the macro cell, since there is no location information in the physical library view for the specified pin.

The cause might be that the pin is logical only, the cell is logical only, or there is no port geometry definition in the physical library definition.

WHAT NEXT

You can either check the `link_physical_library` command information to ensure that the physical cell is linked, or you can use the following command to bound a specific location of the macro cell directly.

`set_macro_cell_bound_spot -coordinate {x y} [get_cells "<macro_cell_name>"]`

This command works around the pin problem by allowing you to specify the spot of the macro cell that needs to be bounded.

SEE ALSO

`create_bounds` (2), `link_physical_library` (2), `set_macro_cell_bound_spot` (2),
`update_bounds` (2).

PSYN-302 (Information) bound pin %s in cell %s at (%d %d) only.

DESCRIPTION

You receive this information message because the `create_bounds` or `update_bounds` command set the bounds for a specific pin location in the macro cell.

The pin might have multiple port geometries in various locations. Only the first selected location is used and the tool only bounds that spot of the macro cell. All other port locations of the same pin are not bounded.

For example, the macro cell might have multiple CLK port geometries in different locations. In the following example, the `create_bounds` command finds the first port location of the CLK pin in the macro cell and applies the move bound on this port location.

```
create_bounds -coord {0 0 100 100} [get_pins "macro_cell/CLK"]
```

WHAT NEXT

This is an informational message only. No action is required on your part.

However, if you want to force the `create_bounds` command to apply to a different port location, use the following command to directly bound a specific location of the macro cell, substituting the coordinates `0 0 100 100` and `x y`, and the `macro_cell_name` as necessary.

```
create_bounds -coord {0 0 100 100} [get_cells "<macro_cell_name>"]
set_macro_cell_bound_spot -coord {x y} [get_cells "<macro_cell_name>"]
```

SEE ALSO

`create_bounds` (2), `set_macro_cell_bound_spot` (2), `update_bounds` (2).

PSYN-303 (warning) object %s is not a cell object

DESCRIPTION

You receive this warning message because the object specified in the command line is not a cell object in the design db. A cell object must be specified in the command line.

The command `[get_cells "cell_name"]` requires that the cell name be a full path name, such as `top/blk1/blk1_1/.../cell_name`, where `top` is the top cell name in the current design.

WHAT NEXT

Check the object specified in the command line. Use the `get_cells` command to determine if the object is a cell.

SEE ALSO

`get_cells` (2).

PSYN-304 (information) Backward compatibility mode is enabled for signoff_opt.

DESCRIPTION

You receive this information message because the backward compatibility mode is enabled in `signoff_opt`.

Backward compatibility mode will be automatically enabled if `signoff_opt` detects that you have passed a version of signoff tool, such as `StarRCXT` or `PrimeTime` that is not fully compatible with `IC Compiler` to run `signoff_opt`. You will notice some impacts on both runtime and quality of results.

WHAT NEXT

This is an informational message only. However, it is recommended that you always use a version of signoff tool, such as `StarRCXT` or `PrimeTime` which at least has the same major version of `IC Compiler`. For example, `IC Compiler Z-2007.03` should be used with `StarRCXT Z-2006.12` and `PrimeTime Z-2006.12`, not `StarRCXT Y-2006.06` or `PrimeTime Y-2006.06`.

SEE ALSO

`signoff_opt(2)`
`set_primestime_options(2)`

```
set_starrcxt_options(2)
```

PSYN-305 (warning) Macro pdbs %s have more layers than the layers in tech pdb %.s. The additional layers are ignored.

DESCRIPTION

This warning occurs because you are linking in technology physical library database (.pdb) files and macro .pdb files. Technology .pdb files describe the process layers, and macro .pdb files describe the standard cells and RAMs that you want to use.

This warning occurs if all of the conditions in the following example are met. Given a technology .pdb file that has n layers and macro .pdb files that have $m_1, m_2 \dots$ layers, and the macro .pdb file layers ($m_1, m_2 \dots$) are greater than the technology .pdb file layers (n).

The extra layers in the macro .pdb files are used to describe routing obstructions. These layers do not form any functional part of the cells, but the tool uses them for RC calculations. The library vendor creates cells with extra layers so that a single cell definition can be used by multiple process libraries without duplicating the same cell description.

Example Message

```
Warning: Macro pdbs SIARC_WIDE1 SIARC_WIDE2 have more layers than the layers in tech pdb SIARC25. The additional layers are ignored. (PSYN-305)
```

```
Tech pdb SIARC25      : 5 layers
Macro pdb SIARC_WIDE1 : 6 layers
Macro pdb SIARC_WIDE2 : 7 layers
```

WHAT NEXT

Ensure that you have specified the correct physical libraries. If the specified libraries are correct, ignore the warning message.

SEE ALSO

```
physopt(2)
report_timing(2)
```

PSYN-306 (warning) All cells with more than %d rows are set

back to original location.

DESCRIPTION

You receive this warning message because the legalizing process does not move cells that would be displaced more than the number of specified rows. This warning message occurs when you set following variable:

```
set physopt_max_displace_rows <number>
```

The <number> indicates the maximum number of rows a cell can be moved from its original location. This occurs during the intermediate step in some flows. For example, if you set the number to 10 (as shown below), the legalizing process does not move the cell more than 10 rows away from its original location.

```
set physopt_max_displace_rows 10
```

WHAT NEXT

Some cells may not be legalized at the end of the legalizing process, because of the row displacement constraint. Ensure that you unset this variable before the final legalization step in the flow.

SEE ALSO

```
physopt_max_displace_rows (2).
```

PSYN-307 (warning) you are using %s, please use set_pnet_options command.

DESCRIPTION

You receive this warning message because you used variables that may now be obsolete to set the pnet options. Use the **set_pnet_options** command, as described in the **set_pnet_options** man pages.

The obsolete variables that produce this warning message are as follows:

```
physopt_minimum_pnet_height  
physopt_minimum_pnet_width  
physopt_pnet_complete_blockage_layer_names  
physopt_pnet_partial_blockage_layer_names  
physopt_pnet_via_additive
```

Replace prior usages of the command with the **set_pnet_options** command, as shown below.

- Example of the prior usage: **set physopt_pnet_partial_blockage_layer_names "M1 M2"**

- Example of the new usage: **set_pnet_options -partial {M1 M2}**

The **set_pnet_options** command can only be applied after the design is read. This is different from prior usage, which allowed the variable to be set anywhere before placement.

WHAT NEXT

Verify the pnet settings using the **report_pnet_options** command. Set or change the pnet option settings using **set_pnet_options**. To remove pnet options, use the **remove_pnet_options** command.

SEE ALSO

remove_pnet_options (2), **report_pnet_options** (2), **set_pnet_options** (2).

PSYN-308 (information) Critical range constraint is used for TNS optimization.

DESCRIPTION

You receive this information message when the **physopt** command takes the critical range constraint set by the **set_critical_range** command into consideration during timing optimization.

WHAT NEXT

This message is informational only and requires no action on your part.

All of the paths from the critical range specified in the **set_critical_range** command are optimized.

SEE ALSO

physopt (2), **set_critical_range** (2).

PSYN-309 (information) Your design has at least %d %s violating end points.

DESCRIPTION

You receive this message because you are trying to run **signoff_opt** command on a design that has some timing violations. The number of timing violations reported is

the lower bound of all timing violations existing in your design.

WHAT NEXT

Run **report_constraint -all_violators** to see the details of violations.

SEE ALSO

`signoff_opt(2)`
`report_constraint(2)`

PSYN-310 (warning) '%s' %s keepout does not extend upto block boundary.

DESCRIPTION

You receive this warning message because the keepout being inverted does not extend up to the die area boundary (or the core area boundary, if the die area is not specified).

Problems at the top level might arise if the coordinates are not adjusted. When propagating keepouts to the top level using the **propagate_ilm** command, the inverted keepout area is made available as a placement or wiring resource, and the rest of the ILM block area is marked as a keepout at the top level. The result is a placement or wiring resource surrounded by keepouts.

WHAT NEXT

Check and adjust the keepout coordinates as needed.

- Use the **report_placement_keepout** or the **report_wiring_keepout** command to obtain the keepout coordinates.
- Use the **get_die_area** or the **get_placement_area** command to obtain the block coordinates.

SEE ALSO

`get_die_area (2)`, `get_placement_area (2)`, `propagate_ilm (2)`,
`report_placement_keepout (2)`, `report_wiring_keepout (2)`, `set_die_area (2)`,
`set_inverted_placement_keepout (2)`, `set_inverted_wiring_keepout (2)`.

PSYN-311 (error) '%s' option for this command is only available

in psyn_shell.

DESCRIPTION

You receive this error message because you are either running a command or passing an argument that requires you to be running in the psyn_shell.

WHAT NEXT

Invoke the psyn_shell and run the command again.

PSYN-312 (error) '%s' No ILM sub-designs in current design.

DESCRIPTION

You receive this error message because the command requires ILM subdesigns in the current design in order to run.

WHAT NEXT

Read in the ILM models for the ILM subdesigns and run the command again.

PSYN-313 (error) Could not create %s keepout named '%s'.

DESCRIPTION

You receive this error message because the **propagate_ilm -keepout** command tried to subtract the inverted keepouts from the area of the block and then create keepouts, but an error occurred in the creation of the keepout.

WHAT NEXT

Delete all of the propagated keepouts and run the command again.

SEE ALSO

remove_placement_keepout (2), **remove_wiring_keepout** (2).

PSYN-314 (error) Cell '%s' not an ILM cell.

DESCRIPTION

You receive this error message when the `propagate_ilm` command cannot run on the specified cell because it is not an ILM cell.

WHAT NEXT

Delete the cell from the cell list and run the command again.

SEE ALSO

`extract_ilm` (2), `identify_interface_logic` (2), `propagate_ilm` (2).

PSYN-315 (error) To run xtalk_reduction, please enable SI.

DESCRIPTION

You receive this error message because xtalk_reduction is enabled but SI flow is not enabled. The xtalk_reduction is effective on delta delay, switching noise and static noise. To run xtalk_reduction, at least one of SI effects such as delta delay, switching noise and static noise has to be used. To enable SI effect, please use `set_si_options`.

WHAT NEXT

Please set any one of SI effects through `set_si_options`.

SEE ALSO

`signoff_opt` (2) `set_si_options` (2)

PSYN-316 (Warning) The %s is not big enough to accommodate all the IO pads, some IO pads may be placed outside of IO sites!

DESCRIPTION

You receive this message because the core size is not big enough to accommodate the IO pads. Some IO pads may be placed outside of IO sites.

WHAT_NEXT

You can enlarge the core size to avoid this problem.

SEE ALSO

PSYN-317 (Warning) The %s IO Margin is not big enough to accommodate the IO Pads! Expand the IO Margin(Die Area) automatically !

DESCRIPTION

You receive this message because the IO Margin is not big enough to accommodate the IO pads. MPC will expand the IO Margin (Die boundary) in order to place the IO cells.

WHAT_NEXT

If you would like, you can set the IO Margin again. Otherwise MPC will expand the IO Margin automatically.

SEE ALSO

PSYN-318 (Warning) The destination core size can not accommodate all of the children cells, expanding core size automatically. The user-specified utilization/aspect_ratio value(s) may not be respected !

DESCRIPTION

You receive this message because there are some conflicts among user specified values of core_width, core_height, utilization and aspect_ratio. Also MPC will make sure that both generated core_height and core_width should be no less than the maximum child_height and maximum child_width of all the children cells.

WHAT_NEXT

Set the options (core_width, core_height, utilization, aspect_ratio) again and make sure that there will be no conflict among your setting. Also your setting need to make sure that the destination core_height and core_width should not be less than

the maximum child_height and maximum child_width of all the children cells.

SEE ALSO

PSYN-319 (Error) The core height setting of %s is less than the height of its children !

DESCRIPTION

You receive this message because you have set the core_height less than the height of its children.

WHAT_NEXT

Set the core_height again using command `set_floorplan_options`, and make sure that the core_height is not less than the maximum height of its children.

SEE ALSO

PSYN-320 (error) Width of trunk -width '%f' less than minimum in the physical library '%f'.

DESCRIPTION

You receive this error message when you specify the `-width` value of the pnet to be less than the width specified for the metal layer (`-metal`) in the physical library.

This is a violation because the width must be equal to or greater than the width specified for the layer in the physical library.

The tool does not assume a default for the width, since it might default to a very narrow power trunk, and that might be an optimistic assumption.

WHAT NEXT

Specify the `-width` value to be greater than or equal to the minimum metal width specified for the library shown in the error message.

SEE ALSO

`set_floorplan_pnet_options` (2).

PSYN-321 (error) Pitch between trunks -pitch '%f' less than minimum in the physical library '%f'.

DESCRIPTION

You receive this error message when you specify the **-pitch** value of the pnet trunks to be less than the width specified for the metal layer (**-metal**) in the physical library.

This is a violation because the pitch must be equal to or greater than the pitch specified for the layer in the physical library.

The tool does not assume a default for the pitch, since it might default to a highly congested power structure, and that might be a pessimistic assumption.

WHAT NEXT

Specify the **-pitch** value to be greater than or equal to the minimum pitch specified for the library shown in the error message.

SEE ALSO

set_floorplan_pnet_options (2).

PSYN-322 (Error) The core width setting of %s is less than the width of its children !

DESCRIPTION

You receive this error message because the **core_width** is set to less than the width of its children.

WHAT NEXT

Reset the **core_width** using the **set_floorplan_options** command. Ensure that the **core_width** is not less than the maximum width of its children.

SEE ALSO

set_floorplan_options (2).

PSYN-323 (Error) There are no meaningful cells in the netlist of

design %s!

DESCRIPTION

You receive this error message because the design does not contain any meaningful cells in the netlist. For example, the tool filtered all dangling cells that do not have any connection in the netlist.

WHAT NEXT

Check the input data, make the necessary corrections, and then run the command again.

PSYN-324 (Warning) ignore user set_via_region on pin %s of lib cell %s because via is not defined.

DESCRIPTION

This message shows the uset set_via_region on the particular pin is ignored because the via on the pin layer and its upper layer has no VIA defined (or loaded) from physical lib. Please check your physical lib and make sure the via is defined and report the physical lib to make sure the via is loaded. If via is not defined, the via_region is meaningless. For example, if the pin layer is metal1, you set via region of via12 on the pin. However if the via12 is not defined in the lib, then the via_region is meaningless.

WHAT NEXT

check physical lib and report physical lib to see if the via is defined.

PSYN-325 (warning) Corrupted SI options found in database.

DESCRIPTION

You receive this warning message because **IC Compiler** found your SI options in the database are corrupted.

WHAT NEXT

Please use **report_si_options** to check your SI options, and re-run **set_si_options** to set your SI options if necessary.

SEE ALSO

`signoff_opt` (2) `set_si_options` (2) `report_si_options` (2)

PSYN-326 (error) The distance between the left edge of the core area and the left edge of row %s is not of multiple site width.

DESCRIPTION

This error occurs because the distance between the left edge of the core area and the left edge of the row is not of multiple site width. The tool does not support this irregular site array. This might create a routing track alignment problem.

WHAT_NEXT

Check your floorplan (site array) and the core area setting to ensure that the distance of the row X location and the core area left X is of multiple site width. For example, given a row location at (10, 0) with a core site width of 5, and a core area of $llx = 0$, then the equation $(10-0)/5=2$ is an integer (that is, it is a multiple site width), so this is a correct site row. If, for example, the row is located at (8, 0), then $(8-0)/5$ does not equal an integer (that is, it is not a multiple site width), so this is not a correct row.

PSYN-327 (information) Using auto-derived max SDC %s and min SDC %s.

DESCRIPTION

You receive this message because `signoff_opt` automatically runs two `PrimeTime` with two timing corners, using two SDC files that are derived from your original SDC file.

`signoff_opt` invokes `PrimeTime` timing engine to perform static timing analysis. With signal integrity effects enabled, such as delta delay or static noise, `PrimeTime SI` is used. `PrimeTime SI` always uses `on_chip_variation` (OCV) mode, therefore, if you have two timing corners with `set_min_library`, timing will be computed using both timing corners as library OCV. This leads to pessimistic timing results which are not desired.

In this case, `signoff_opt` will pass only max library to the max corner `PrimeTime` run, and only min library to the min corner `PrimeTime` run. `signoff_opt` will also pass the max corner SDC file and min corner SDC file to the corresponding `PrimeTime` runs. These SDC files are automatically derived from your original SDC file.

WHAT NEXT

If needed, please examine the auto-derived SDC files specified.

SEE ALSO

`signoff_opt (2)`,
`set_min_library(2)`,
`set_si_options`

PSYN-328 (error) legalize -coordinate option must be used with -cells option.

DESCRIPTION

You receive this warning because you tried to run the `legalize_placement` command, with its `-coordinate` option specified, without also specifying the command's `-cells` option, which indicates which cells are going to be legalized inside the region specified with `-coordinate`. The message is to ask you to re-enter the `legalize_placement` command with the correct options.

WHAT NEXT

This message is an error and ask user to re-enter the correct usage. For example,
`legalize_placement -coordinate {llx lly urx ury} -cells [get_cells BLK_A/*]`

SEE ALSO

`legalize_placement (2)`.

PSYN-329 (error) Please specify 'X' or 'Y' for direction.

DESCRIPTION

You receive this error because the tool does not recognize the direction you specified for the routing tracks. Valid values for direction are X or Y.

WHAT NEXT

Specify X or Y as the routing track direction, as shown:

```
create_track -dir X  
report_track -dir Y
```

SEE_ALSO

```
create_track(2)
remove_track(2)
report_track(2)
shift_track(2)
```

PSYN-330 (error) Placeable area (%.2f) of the voltage area is less than total cell area (%.2f).

DESCRIPTION

This error message occurs when the placeable area is too small to place cells inside the voltage area. Areas occupied by macro cells and hard placement keepouts inside the voltage area are excluded from the placeable area. Macro cells are also not considered in the total cell area.

WHAT NEXT

Adjust the coordinates to fit all cells inside voltage area and run the command again.

SEE_ALSO

```
create_voltage_area(2)
```

PSYN-331 (information) Saved a snapshot for %s as %s.

DESCRIPTION

You receive this message because a snapshot for **StarRCXT** or **PrimeTime** is saved by **signoff_opt**. A **StarRCXT** snapshot is the run directory of the **StarRCXT** run, and a **PrimeTime** snapshot is the directory created by the **save_session** command in **PrimeTime**. The snapshot contains all the setup that **signoff_opt** uses to run these tools.

You can re-use the corresponding snapshots from **StarRCXT** and/or **PrimeTime** by specifying them in **set_starrcxt_options** or **set_primestime_options**, using **-max_image** or **-min_image**. Running **signoff_opt** with images saves runtime because **signoff_opt** can skip the initial runs of **StarRCXT** and/or **PrimeTime**. Subsequent runs of incremental **StarRCXT** and/or **PrimeTime** will not be affected.

WHAT NEXT

This is just an information message.

SEE ALSO

```
signoff_opt (2),  
run_signoff (2),  
set_primetime_options (2),  
set_starrcxt_options (2),  
report_primetime_options (2),  
report_starrcxt_options (2)
```

PSYN-332 (error) The %s option can only be used in conjunction with the %s command.

DESCRIPTION

The specified option is not valid without specifying the command.

WHAT NEXT

To see the correct use of options, refer to the appropriate documentation.

PSYN-333 (information) Revert back to snapshot %d.

DESCRIPTION

You receive this message to inform you that **signoff_opt** decides to revert back to a snapshot that was saved earlier, which has better quality of results (QoR).

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-334 (error) Command is disabled in signoff mode.

DESCRIPTION

You receive this error message because you try to run a command that is disabled in signoff mode. **IC Compiler** enters signoff mode after you call **run_signoff**. In order

to use the command, you must exit the signoff mode by calling **run_signoff -signoff_analysis false**.

WHAT NEXT

Call **run_signoff -signoff_analysis false** to exit the signoff mode, and then re-issue this command. Note after you call **run_signoff -signoff_analysis false**, you will lose all signoff data. To see signoff data again, you must call **run_signoff** again.

SEE ALSO

signoff_opt(2),
run_signoff(2)

PSYN-335 (error) Cannot %s signoff mode without running run_signoff or signoff_opt.

DESCRIPTION

You receive this error because you are trying to run **run_signoff -signoff_analysis false|sleep|wakeup** command on a design that has not been run with **run_signoff** or **signoff_opt** yet. You must run **run_signoff** or **signoff_opt** first before you can run this command.

WHAT NEXT

Use **run_signoff** or **signoff_opt** command to perform signoff analysis or signoff optimization first.

SEE ALSO

signoff_opt(2),
run_signoff(2)

PSYN-336 (Warning) Dropping %s '%s' because its lower-left corner coordinates are bigger than upper-right corner coordinates.

DESCRIPTION

You receive this message because the coordinates of a rectangle are not given in order from the lower-left corner to the upper-right corner.

WHAT_NEXT

Fix the input so the object mentioned has lower-left corner coordinates before the upper-right corner coordinates, otherwise this object will be ignored.

PSYN-337 (warning) Design readiness check is disabled in signoff_opt.

DESCRIPTION

You receive this warning message because you are running **signoff_opt** command with **-ignore_design_readiness** switch.

signoff_opt has a built-in readiness checker which checks the following conditions:
- design shall have no more than 100 violating end points in either best case or worst case analysis
- design shall have no routing shorts
- number of routing design rule violations shall be no more than 0.1% of number of nets or 100 (whichever is bigger)
- number of logic design rule violations shall be no more than 0.1% of number of nets or 100 (whichever is bigger)

If your design fails the design readiness check, and you still force **signoff_opt** to run signoff driven optimization with **-ignore_design_readiness**, the design might not converge to a solution with better quality of results (QoR).

WHAT NEXT

It is recommended that the designs still need to go through regular timing/SI closure flows within **IC Compiler** to reduce the number of violations seen by signoff tools as much as possible.

SEE_ALSO

`signoff_opt(2)`

PSYN-338 (information) Any existing PrimeTime or StarRCXT image is removed.

DESCRIPTION

IC Compiler uses this information message to tell you that all previously specified PrimeTime and StarRCXT images using **set_primestime_options** and **set_starrcxt_options** are now removed.

You receive this message typically after running **signoff_opt**. After signoff driven optimization, the images are no longer valid due to changes in the database. Thus,

IC Compiler removes all specified images that are stored in the database to avoid them being used in the subsequent signoff driven analysis or optimization.

WHAT NEXT

This is an informational message only. You can verify the change by calling **report_primestime_options** or **report_starrcxt_options**. You can also specify new images by calling **set_primestime_options** or **set_starrcxt_options**.

SEE ALSO

```
set_primestime_options(2)
report_primestime_options(2)
set_starrcxt_options(2)
report_starrcxt_options(2)
signoff_opt(2)
```

PSYN-339 (information) Hold time fixing is enabled in signoff_opt.

DESCRIPTION

You receive this information message because the hold time fixing is enabled in **signoff_opt**. **signoff_opt** enables hold time fixing if any of your clock object has **fix_hold** attribute set.

WHAT NEXT

This is an informational message only. However, if you do not intend to enable hold time fixing, you can remove the **fix_hold** attribute from all your clock objects.

SEE ALSO

```
signoff_opt(2)
set_fix_hold(2)
```

PSYN-340 (Error) No snapshot exists.

DESCRIPTION

You receive this message because no any snapshot created yet.

WHAT_NEXT

PSYN-341 (Information) No congestion report in current snapshot.

DESCRIPTION

WHAT_NEXT

PSYN-342 (Information) No constraint report in current

snapshot.

DESCRIPTION

WHAT_NEXT

PSYN-343 (Information) No power report in current snapshot..

DESCRIPTION

WHAT_NEXT

PSYN-344 (Information) No qor report in current snapshot..

DESCRIPTION

WHAT_NEXT

PSYN-345 (Information) No route report in current snapshot..

DESCRIPTION

WHAT_NEXT

PSYN-346 (Warning) Can not find snapshot '%s'.

DESCRIPTION

You receive this message because Can not find the specified snapshot.

WHAT_NEXT

PSYN-347 (Information) No clock tree report in current snapshot.

DESCRIPTION

WHAT_NEXT

PSYN-348 (error) Macro cell %s is not fixed.

DESCRIPTION

You receive this error because one or more macros in your design are not fixed. The coarse placer and the detail placer will error out if any macros are not fixed.

By default, ICC detail placement will treat "very tall" standard cells as "hard macros". By default, the standard cells which have more than 6x site heights will be treated as "hard macros". Please check whether the problematic hard macro is the one that has been described above. If yes, then users will also see "PSYN-442" error message. User can either change their design, or adjust the "default hard macro height threshold" to overcome this issue. For more information for how to adjust the "default hard macro height threshold", user can refer to the man page of "PSYN-442".

WHAT NEXT

If your macros are not placed, you should run **create_fp_placement** to place them.

If your macros are placed, you should mark them fixed and try again.

SEE_ALSO

```
set_dont_touch_placement(2)
create_fp_placement(2)
legalize_fp_placement(2)
create_placement(2)
refine_placement(2)
place_opt(2)
legalize_placement(2)
```

PSYN-349 (error) You must specify PrimeTime image(s)/tcl(s)

to run %s.

DESCRIPTION

You receive this error because **signoff_opt** is not able to automatically run **PrimeTime** with one of the following reasons:

- Running with advanced on-chip-variation mode (AOCVM)
- Running with variation based analysis (VX)

Thus, you must provide **PrimeTime** saved session for each corner/scenario, or provide PT TCL file, using **set_primestime_options**.

Optionally, you can also run your own Star RCXT run(s), and provide directories defined by STAR_DIRECTORY command in the Star RCXT command file using **set_starrcxt_options**.

WHAT NEXT

signoff_opt invokes **PrimeTime** timing engine to perform static timing analysis. The default setting used by **signoff_opt** to run **PrimeTime** does not support running AOCVM or VX. Therefore, if you would like to see AOCVM or VX effects in **signoff_opt**, you must run your own **PrimeTime** runs with proper setup, and provide the saved session(s) to **IC Compiler** using **set_primestime_options**. Alternatively, you can provide a TCL script which defines the environment to **set_primestime_options**, using either **-common_file** or **-specific_file** switch.

Note when you run your own **PrimeTime**, you need to ensure:

- Saved session(s) contain same netlist comparing to IC Compiler
- Saved session(s) contain same timing exceptions and clock definitions
- Saved session(s) contain libraries that are also used in IC Compiler

SEE ALSO

`signoff_opt(2),
set_primestime_options(2),
set_starrcxt_options(2)`

PSYN-350 (information) '%s'.

DESCRIPTION

You receive this information message because the spacing specified to well-tie

placement is invalid. The spacing must be greater than both the site spacing and the cell height. The tool changes the spacing internally to greater of the two values.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, consider the new spacing indicated in the message when invoking well-tie placement in the future.

PSYN-351 (information) '%s'.

DESCRIPTION

You receive this information message when a full row is skipped during well-tie cell placement, because the height of the cell is more than the available space in the row.

This occurs when the area specified in the **insert_filler** command does not align fully with the rows. If the specified area causes the top and the bottom rows to be partially covered, then this message is shown.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, you can avoid the message by adjusting the area specified in the **insert_filler** command.

SEE ALSO

insert_filler (2).

PSYN-352 (information) %s.

DESCRIPTION

You receive this information message when a well-tie cell cannot be placed at the specified location due to a blockage. The message indicates the type of blockage preventing the placement of the well-tie cell.

WHAT NEXT

This is an informational message only. No action is required on your part.

However, if you want to place a well-tie cell at that location, you can remove the blockage. If you want to place a well-tie cell over the blockage, specify the `-ignore_keepouts` option with the `insert_filler` command.

SEE ALSO

`insert_filler` (2).

PSYN-353 (information) Wiring obstruction (%f %f %f %f) at bottom layer is being treated as placement obstruction

DESCRIPTION

You receive this information message when the wiring obstruction or keepout in the lowest metal layer is treated as a placement obstruction. This is a default feature of the tool. You can disable this feature using the following variable:

`psyn_enable_auto_keepout_generation`

WHAT NEXT

This is an informational message only. No action is required on your part.

Refer to the `create_wiring_keepout` man page for a description of how lowest layer wiring keepouts are automatically converted to placement keepouts.

If there are too many wiring keepouts in the lowest metal layer and the legalizer process is having problems, you can turn off this feature by setting the following variable to FALSE:

`physopt_enable_auto_keepout_generation`

You can also control the threshold for automatic conversion of lowest layer wiring keepouts into placement keepouts by using the following variable.

`physopt_auto_placement_keepout_threshold_value`

SEE ALSO

`create_wiring_keepout` (2); `physopt_auto_placement_keepout_threshold_value` (3),
`physopt_enable_auto_keepout_generation` (3).

PSYN-354 (information) '%s'.

DESCRIPTION

You receive this information message because the wiring obstruction or keepout in the lowest metal layer is being treated as a placement obstruction. This is a

default feature of the tool. You can disable this feature using the following variable:

psyn_enable_auto_keepout_generation

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-355 (information) '%s'.

DESCRIPTION

You receive this information message because the wiring obstruction or keepout in the lowest metal layer is being treated as a placement obstruction. This is a default feature of the tool. You can disable this feature using the following variable:

psyn_enable_auto_keepout_generation

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-356 (error) '%s'.

DESCRIPTION

You receive this error message because the coordinates specified lie outside the core area and the command cannot proceed to execute.

WHAT NEXT

For the commands related to well-tie or filler cells placement, check that the coordinates lie inside the core area.

For all other commands, check the core area coordinates and the coordinates specified to the command.

After making your corrections, run the command again.

PSYN-357 (information) %s.

DESCRIPTION

The tool issues this information message to advise you of the total number of well-tie or filler cells added, or removed, or reported by the previous command.

WHAT NEXT

This is an informational message only. No action is required on your part.

PSYN-358 (error) '%s'.

DESCRIPTION

You receive this error message because negative spacing information has no meaning during well-tie placement.

WHAT NEXT

Provide valid positive spacing and run the command again.

PSYN-359 (error) %s.

DESCRIPTION

You receive this error message because you cannot specify the **-density** option along with the **-complete** or **-none** option in the **set_pnet_options** command.

WHAT NEXT

Use the **-density** and the **-partial** options for density control of cells under power nets.

Refer to the **set_pnet_options** man page for detailed information about the options to use.

SEE ALSO

set_pnet_options (2).

PSYN-360 (warning) Macro placement timed out. Some macros may be illegally placed.

DESCRIPTION

You receive this warning because macro placement timed out. By default, macro placement fails early if runtime is too long when compared to the rest of coarse placement. This occurs to prevent excessively long runtimes. Although you receive this warning, coarse placement runs to completion; however, some macros, (particularly smaller ones) may be illegally placed.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by setting the **placer_disable_macro_placement_timeout** variable to **true**. Alternatively, you can try reducing the number of floating macros in the design.

SEE ALSO

```
set_mpc_macro_options(2)  
set_mpc_options(2)  
placer_disable_macro_placement_timeout(3)
```

PSYN-361 (information) %s

DESCRIPTION

You receive this information because a movebound is completely covered by a blockage. When this occurs, the placer ignores the bound.

WHAT NEXT

This is an informational message only. No action is required on your part.

Although it is not required, it is good practice to avoid this situation by reviewing the movebounds to ensure that they do not conflict with the blockages.

SEE ALSO

```
create_bounds(2)
```

PSYN-362 (warning) Placer unable to satisfy constraints on

macro cell %s.

DESCRIPTION

You receive this warning because the placer was unable to satisfy one or more constraints on the specified macro cell. The macro may be overlapping another macro, or it may be violating a user-specified constraint such as a movebound, macro array, or spatial constraint. This is usually due to a high density of macros or constraints that are difficult or impossible to satisfy.

WHAT NEXT

No action is required on your part if your floorplan is usable despite the violated constraint.

However, you can avoid receiving this warning by following the guidelines described below:

- If the problem is minor, then you can either modify your constraints and rerun placement or edit the floorplan by hand.
- If the problem is more severe, then increase the size of your core area or reduce the number of constraints.

SEE ALSO

```
set_mpc_macro_options(2)  
set_mpc_options(2)
```

PSYN-363 (error) The placer detected conflicting constraints on the following cells:

%s

DESCRIPTION

You receive this message because, by default, the placer errors out if it detects conflicting constraints on one or more cells. These constraints can be movebounds, array constraints, or simple (non-disjunctive) spatial constraints that are impossible to meet. This can occur due to cells being fixed, the requirement for cells to fit on the chip, or constraints directly conflicting with each other.

WHAT NEXT

If you want the placer to run to completion despite conflicting constraints, set the **physopt_error_out_on_conflicting_macro_constraints** variable to **false**. Otherwise,

remove or change the conflicting constraints and rerun the placer.

SEE ALSO

```
set_mpc_macro_options(2)
set_mpc_options(2)
physopt_error_out_on_conflicting_macro_constraints(3)
```

PSYN-364 (warning) The placer detected conflicting constraints on the following cells:

%s

DESCRIPTION

You receive this warning because the placer detected conflicting constraints on one or more cells. These constraints can be movebounds, array constraints, simple (non-disjunctive) spatial constraints that are impossible to meet. This can occur due to cells being fixed, the requirement for cells to fit on the chip, or constraints directly conflicting with each other.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning, if you are satisfied with your macro placement, by removing or changing the conflicting constraints and rerunning the placer. If you want the placer to error out when it detects conflicting constraints, set the **physopt_error_out_on_conflicting_macro_constraints** variable to **true**.

SEE ALSO

```
set_mpc_macro_options(2)
set_mpc_options(2)
physopt_error_out_on_conflicting_macro_constraints(3)
```

PSYN-365 (warning) The following bounds conflict:%s
Treating groupbounds as soft constraints.

DESCRIPTION

You receive this message because the placer detected conflicting movebounds and groupbounds on two or more cells. The placer will still honor the movebounds but it will treat all conflicting groupbounds as soft constraints. This means that the placer will attempt to honor the groupbounds, but they will be given the same

priority as wirelength.

A conflict is defined as a physical impossibility. For example, suppose cell A is in a movebound with coordinates ((0 0)(10 10)), cell B is in a movebound with coordinates ((1000 1000)(1010 1010)) and cells A and B are both in a groupbound with dimension (20 20). There is no way for all three of those bounds to be satisfied. Alternatively, if cell B were fixed at location (1000 1000) we would have a similar problem. This kind of situation causes the placer to perform poorly, so the tool will weaken the groupbounds.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by reviewing your movebounds and groupbounds and removing all conflicts. If you want the placer to error out when it detects conflicting bounds, set **placer_dont_error_out_on_conflicting_bounds** to **false**.

SEE ALSO

```
create_bounds(2)
create_placement(2)
place_opt(2)
placer_dont_error_out_on_conflicting_bounds(3)
```

PSYN-366 (error) The following bounds conflict:%s

DESCRIPTION

You receive this message because, by default, the placer errors out if it detects conflicting movebounds and groupbounds on two or more cells. These bounds can be user-specified bounds or bounds generated by the tool (designated as "auto_bound").

A conflict is defined as a physical impossibility. For example, suppose cell A is in a movebound with coordinates ((0 0)(10 10)), cell B is in a movebound with coordinates ((1000 1000)(1010 1010)) and cells A and B are both in a groupbound with dimension (20 20). There is no way for all three of those bounds to be satisfied. Alternatively, if cell B were fixed at location (1000 1000) we would have a similar problem. This kind of situation causes the placer to perform poorly, so the tool will error out.

WHAT NEXT

You should review your movebounds and groupbounds and remove all conflicts. Alternatively, you can set the variable **placer_dont_error_out_on_conflicting_bounds** to **true**. This will cause the tool to automatically weaken the conflicting groupbounds and continue. If one or more of the conflicting bounds were generated by the tool ("auto_bound") then you can either remove the bounds that you have set or

use the variable described above.

SEE_ALSO

```
create_bounds(2)
create_placement(2)
place_opt(2)
placer_dont_error_out_on_conflicting_bounds(3)
```

PSYN-367 (warning) Placer detected excessive or conflicting groupbounds. All groupbounds will be treated as extra-soft bounds for this placement.

DESCRIPTION

You receive this warning because you have too many groupbounds in your design, or you have conflicting bounds. These may be bounds you have set yourself with `create_bounds` or bounds that have been generated by the tool.

The placer will still attempt to honor your groupbounds, but it will give them the same priority as wirelength.

The placer does not allow the number of groupbounds to exceed 5% of the number of nets in the design. This is because the placer performs poorly when it is overconstrained.

Additionally, if the placer detects any conflicts then it will convert all groupbounds containing less than two cells to extra-soft bounds. A conflict is defined as a physical impossibility, such as two cells confined to opposite corners by movebounds but being pulled close together by a groupbound. This is because the placer performs poorly when it is given conflicting constraints.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by reducing the number of groupbounds you generate with `create_bounds`.

SEE_ALSO

```
create_bounds(2)
create_placement(2)
physopt(2)
```

PSYN-368 (warning) -quick option not supported in current flow.

Running low effort placer instead.

DESCRIPTION

You receive this warning because you have specified the -quick option to create_placement or physopt and you are running a flow (such as region placement) that interacts poorly with the -quick option.

Because quick mode is not compatible with your flow, the placer will automatically run in low effort mode instead of quick mode. This is equivalent to using the -effort low option instead of -quick.

WHAT NEXT

No action is required on your part.

SEE ALSO

`physopt(2)`
`create_placement(2)`

PSYN-369 (error) The following fixed cells have no location:

DESCRIPTION

You receive this error message because one or more fixed cells in your design do not have their locations specified.

All fixed cells must have locations specified before running placement.

WHAT NEXT

Either remove the `fixed_placement` attribute or specify a location for the listed cells.

SEE ALSO

`create_placement (2)`, `place_opt (2)`,

PSYN-370 (warning) Site %s has different height(width) in the pdbs

%s and %s . Site defined in %s will be used.

DESCRIPTION

You receive this warning message because there is conflicting site information in the .pdb files you specified in the **set physical_library** command. This warning occurs if two .pdb files have a site with the same name, but different heights or widths. The tools uses the site definition from the first .pdb file in which the site is defined.

Example Message

```
Warning: Site core1 has different height (width) in the pdbs SIARC_WIDE1  
and SIARC_WIDE2. Site defined in SIARC_WIDE2 will be used.  
(PSYN-370)
```

WHAT NEXT

This is a warning message only. No action is required on your part.

However, you can check that the physical libraries have the correct site definitions. To avoid future problems, ensure that no two .pdb files have conflicting site information (the same name, but different heights or widths).

SEE ALSO

physical_library (3).

PSYN-371 (warning) %s.

DESCRIPTION

This warning message indicates that density value is specified wrongly.

WHAT NEXT

Specify a density value ranging between 0 and 1.

PSYN-372 (warning) Net '%s' is connecting to a spare cell '%s'.

DESCRIPTION

You receive this warning because a cell identified as a spare cell is connected to a net. The tool considers all cells which are not on a path from an input port to an

output port as spare cells.

WHAT NEXT

No action is required on your part.

However, it is recommended that you review your netlist for accuracy.

SEE ALSO

`insert_spare_cells(2)`
`all_spare_cells(2)`

PSYN-373 (warning) Possible syntax error found in SDC file.

DESCRIPTION

You receive this warning message because **IC Compiler** found your SDC file contains possible syntax errors. The errors found are displayed after this message.

WHAT NEXT

In **signoff_opt** or **run_signoff**, only **PrimeTime** will read this SDC file. Thus, if you believe **PrimeTime** is able to read this SDC file successfully, you can ignore this message.

SEE ALSO

`signoff_opt (2)` `run_signoff (2)` `set_primestime_options (2)` `report_primestime_options (2)`

PSYN-374 (information) Using auto-derived max script %s and min script %S.

DESCRIPTION

You receive this message because **signoff_opt** automatically runs two **PrimeTime** with two timing corners that might need different timing derate settings.

signoff_opt invokes **PrimeTime** timing engine to perform static timing analysis. However, **IC Compiler** supports timing derating with both min/max and early/late, for best-case-worst-case analysis, but SDC syntax only allows early/late. Therefore, if you have both min/max and early/late derate settings in your database, and you didn't provide a signoff SDC file, ICC's sdc output will not be sufficient to run

PrimeTime. Thus, two auto-derived script files are used in addition to the SDC file, which contain proper derate setting for min and max corner of **PrimeTime**.

WHAT NEXT

If needed, please examine the auto-derived script files specified.

SEE ALSO

```
signoff_opt (2),  
run_signoff (2),  
set_timing_derate(2)
```

PSYN-375 (severe) Fatal error: Placer did not complete.

DESCRIPTION

You receive this warning because the coarse placer did not complete successfully. You should also receive a more specific error message telling you why the placement failed.

WHAT NEXT

You should fix the problem with your setup and rerun the command.

SEE ALSO

```
create_placement(2)  
refine_placement(2)  
place_opt(2)
```

PSYN-376 (information) %d inactive scenario(s) will not be analyzed/optimized.

DESCRIPTION

You receive this message because **signoff_opt** finds that you have some inactive scenarios in your database. Only active scenarios will be analyzed and optimized by **signoff_opt**.

WHAT NEXT

Use **set_active_scenarios** to change the set of active scenarios.

SEE ALSO

```
signoff_opt (2),  
run_signoff (2),  
all_scenarios(2),  
all_active_scenarios(2),  
set_active_scenarios(2)
```

PSYN-377 (error) Cannot use -skip_initial_analysis without previous signoff analysis.

DESCRIPTION

You receive this error because you are trying to run **signoff_opt** with -
skip_initial_analysis on a design that has not been run with signoff analysis first.

You can run **run_signoff** first before you run **signoff_opt** with -
skip_initial_analysis.

WHAT NEXT

Use **run_signoff** command to perform initial signoff analysis first.

SEE ALSO

```
signoff_opt(2),  
run_signoff(2)
```

PSYN-378 (information) %d %s process(es) will be run on local host.

DESCRIPTION

This message tells you how many processes will be run on your local host, where you invoke **icc_shell**.

WHAT NEXT

Use **add_distributed_hosts** to change the number of remote hosts.

SEE ALSO

```
signoff_opt (2),  
run_signoff (2),
```

```
add_distributed_hosts(2)
```

PSYN-379 (Information) Updated utilization of voltage area %s is %f.

DESCRIPTION

WHAT_NEXT

PSYN-380 (error) Leakage constraint is not set, but -power_recovery or -only_power_recovery flag has been used.

DESCRIPTION

You receive this message because you tried to perform power optimization without setting a required leakage constraint.

WHAT NEXT

Change the script to include a leakage constraint, using the **set_max_leakage_power** command.

You must set as true the value of the **physopt_enable_power_optimization** variable before the tool can perform power recovery.

SEE ALSO

```
physopt(2)
report_power(2)
set_max_leakage_power(2)
physopt_enable_power_optimization(3)
```

PSYN-381 (warning) There are design rule checking (DRC) violations in constant nets due to hierarchy.

DESCRIPTION

This warning occurs because in your design you defined a hierarchy pin that is driven by a constant net. This situation limits the corrections the tool can make to DRC violations on the net connected to the hierarchical pin. The tool always

preserves the design hierarchy and does not add buffers or inverters to correct DRC violations on constant nets.

WHAT NEXT

Change the interface of the module, and push constants to the lower hierarchy. You can make these changes by using the **set_boundary_optimization** command or by changing the netlist so that no hierarchical pins are driven by constant nets.

SEE ALSO

`set_auto_disable_drc_nets(2)`
`set_boundary_optimization(2)`

PSYN-382 (warning) The pin %s is driven by constant %d cell from the voltage_area %s to the voltage area %s.

DESCRIPTION

This warning message occurs when the design has a constant net that crosses the voltage area boundary. When the voltage areas are bound to the power supply, crossing the voltage area may cause some issues. It is considered best practice to ensure that constant nets are within the voltage area boundary.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Change the interface of the module and push the constants to the lower hierarchy.

SEE ALSO

`create_voltage_area(2)`
`set_auto_disable_drc_nets(2)`

PSYN-383 (Warning) Target library does not have any constant lib_cells. Therefore tool cannot replace virtual constants.

DESCRIPTION

This warning message occurs when target library does not have any constant lib_cells.

WHAT NEXT

Add a library with constant lib_cells to Target_library.

PSYN-384 (error) Incremental StarRCXT directory cannot be used as image.

DESCRIPTION

You receive this error because you are trying to specify a StarRCXT image, using a StarRCXT run directory which has been run with incremental extraction.

When you specify a StarRCXT image using **set_starrcxt_options** command, you must use a StarRCXT run directory that does not run with incremental extraction.

WHAT NEXT

Re-run non-incremental StarRCXT extraction, and use the new run directory as the image.

SEE ALSO

`signoff_opt(2)`,
`set_starrcxt_options(2)`

PSYN-385 (warning) Incremental signoff analysis is disabled.

DESCRIPTION

You receive this warning message because incremental signoff analysis is disabled in **signoff_opt**, which could significantly increase your runtime.

By default, **signoff_opt** invokes **StarRCXT** and **PrimeTime** in incremental mode whenever is possible. However, user can overwrite this behavior by using **-full_extract** and/or **-full_analysis**. Always using full StarRCXT extraction and full PrimeTime analysis could lead to significant increase in runtime.

WHAT NEXT

You can ignore this warning message if you indeed want to turn off incremental signoff analysis.

SEE ALSO

signoff_opt (2)

PSYN-386 (warning) The variable %s is obsolete. The correct name is %S.

DESCRIPTION

You receive this warning because you are using an obsolete variable. Your setting is still valid in this release, but it will be ignored in future releases.

WHAT NEXT

You should update your scripts to use the correct variable name.

PSYN-387 (error) Found unsupported syntax in common file %S.

DESCRIPTION

You receive this error because you are trying to specify a TCL file to **set_primestime_options -common_file**, which contains unsupported syntax.

In this TCL file, you can only change TCL variables.

In addition, only a subset of PrimeTime TCL variables are allowed.

- all rc variables
- all case analysis variables
- all ccs variables
- all pba variables
- all report variables
- all sdc variables
- all timing variables except timing_save_pin_arrival_and_slack
- all si variables except si_enable_analysis

- all parasitics variables except `read_parasitics_load_locations`
- all variation variables except `variation_enable_analysis` and `variation_derived_scalar_attribute_mode`

Variables starting with "myvar_" are also allowed.

Example:

```
set timing_remove_clock_reconvergence_pessimism true
```

WHAT NEXT

Remove contents in the file other than setting tcl variables.

SEE ALSO

`set_primetime_options(2)`

PSYN-388 (error) Found unsupported syntax in specific file %S.

DESCRIPTION

You receive this error because you are trying to specify a TCL file to **`set_primetime_options -specific_file`**, which contains unsupported syntax.

In this TCL file, you can change TCL variables using the same rule defined in the man page for PSYN-387.

In addition, you can also use the following TCL commands:

- all report commands
- all check commands
- all update commands
- all set commands except `set_program_options`, `set_units` and `set_unix_variable`
- all reset commands except `reset_design`
- `group_path`
- `scale_parasitics` and `complete_net_parasitics`
- `read_aocvm` and `remove_aocvm`
- `create_correlation`, `create_operating_conditions` and `create_variation`

- `define_design_mode_group` and `define_scaling_lib_group`

Note TCL procedures and flow control (if, while, etc.) are not supported.

WHAT NEXT

Remove contents in the file other than the allowed commands.

SEE ALSO

`set_primetimetime_options(2)`
PSYN-387 (n)

PSYN-389 (error) %s %s is not allowed at line %d in PT TCL file.

DESCRIPTION

You receive this error because you are trying to specify a TCL file to `set_primetimetime_options -specific_file` or, to `set_primetimetime_options -common_file`, which contains unsupported syntax.

Check PSYN-387 and/or PSYN-388 for allowed syntax.

WHAT NEXT

Remove contents in the file other than the allowed commands.

SEE ALSO

`set_primetimetime_options(2)`
PSYN-387 (n)
PSYN-388 (n)

PSYN-390 (warning) Switch '%s' only has effect in multi scenario.

DESCRIPTION

You receive this warning because you are using a switch that is only supported in multi scenario. The switch will be ignored in non-multi scenario.

WHAT NEXT

You can ignore this message if you will define scenarios later.

SEE ALSO

```
set_primestime_options(2)
set_starrcxt_options(2)

run_signoff(2)
```

PSYN-393 (information) Ignore cover macro %s in the logical netlist.

DESCRIPTION

The cover macro cell's name exists as a name of logical cell in a netlist. The logical cell is deleted to avoid conflict, since cover cell cannot be a logical cell.

WHAT_NEXT

Check if it is alright that the logical cell with the name mentioned is removed from logical netlist. If it is not alright, please change the name of the logical cell or the cover cell.

PSYN-394 (warning) Layer %s used in the physical library %s is not defined %s

%s.

DESCRIPTION

This warning occurs because you are linking in technology physical library database (.pdb) files and macro .pdb files. Technology .pdb files describe the process layers and macro .pdb files describe the standard cells and RAMs that you want to use.

This warning occurs if all of the conditions in the following example are met. Given a technology .pdb file that has n layers and macro .pdb files that have $m_1, m_2 \dots$ layers, and the macro .pdb file layers ($m_1, m_2 \dots$) are greater than the technology .pdb file layers (n).

The extra layers in the macro .pdb files are used to describe routing obstructions. These layers do not form any functional part of the cells, so all the geometry specifications on them are ignored, but the tool uses them for RC calculations. The library vendor creates cells with extra layers so that a single cell definition can be used by multiple process libraries without duplicating the same cell description.

WHAT NEXT

Ensure that you have specified the correct physical libraries. If the specified libraries are correct, ignore the warning message.

SEE ALSO

`physopt (2)`
`report_timing (2)`

PSYN-395 (warning) Enabling path based analysis with too many violating paths will slow down your runtime.

DESCRIPTION

You receive this warning because you are enabling path based analysis in `signoff_opt` or `run_signoff`, while your design still has a lot of violating paths.

Path based analysis will recalculate violating paths to reduce pessimism. Additional runtime is required for this recalculation. If you have too many violating paths, you could experience a significant increase in runtime.

WHAT NEXT

Disable path based analysis to save runtime.

SEE ALSO

`signoff_opt(2)`
`run_signoff(2)`

PSYN-396 (warning) '%s' variable is obsolete. Please use `set_physopt_cpulimit_options` command instead.

DESCRIPTION

You receive this warning message because you used a variable that is obsolete. Use the `set_physopt_cpulimit_options` command, as described in the `set_physopt_cpulimit_options` man pages.

WHAT NEXT

Remove the obsolete variable, and replace it with the new command.

SEE ALSO

`set_physopt_cpulimit_options (2)`.

PSYN-397 (information) Released license %s.

DESCRIPTION

IC Compiler uses this information message to tell you a license is released. When running **signoff_opt** or **run_signoff**, we release the license while signoff tools begin running. It will be re-acquired from the license server after signoff tools finish running.

WHAT NEXT

This is an informational message only.

SEE ALSO

PSYN-398 (n)
PSYN-399 (n)

PSYN-398 (information) Re-acquired license %s.

DESCRIPTION

IC Compiler uses this information message to tell you a license is re-acquired from the license server. When running **signoff_opt** or **run_signoff**, we release the license while signoff tools begin running. After signoff tools finish running, we re-acquire it from the license server.

WHAT NEXT

This is an informational message only.

SEE ALSO

PSYN-397 (n)
PSYN-399 (n)

PSYN-399 (information) Waiting for license %s.

DESCRIPTION

IC Compiler uses this information message to tell you that we're waiting for a license to become available. When running **signoff_opt** or **run_signoff**, we release the license while signoff tools begin running. After signoff tools finish running, we need to re-acquire it from the license server. If the key is not available at this

time, **IC Compiler** will wait until the license becomes available again. We will try to acquire the license every 60 seconds.

WHAT NEXT

This is an informational message only.

PSYN-411 (information) Following commands are now PrimeTime based.

DESCRIPTION

This message gives you a list of commands that are now PrimeTime based. This happens after you run `signoff_opt` or `run_signoff`.

WHAT NEXT

Use `run_signoff -signoff_analysis false` to revert these commands back to IC Compiler based.

SEE ALSO

`signoff_opt (2)` `run_signoff (2)`

PSYN-412 (information) Following PrimeTime commands are now available.

DESCRIPTION

This message gives you a list of PrimeTime commands that now become available in **IC Compiler**. This happens after you run **signoff_opt** or **run_signoff**.

WHAT NEXT

Running **run_signoff -signoff_analysis false** will disable these commands.

SEE ALSO

signoff_opt (2) **run_signoff** (2)

PSYN-413 (information) Following commands are now IC Compiler based.

DESCRIPTION

This message gives you a list of commands that were PrimeTime based after **signoff_opt** or **run_signoff**, which are now IC Compiler based. This happens after you run **run_signoff -signoff_analysis false**.

WHAT NEXT

Use **signoff_opt** or **run_signoff** to switch them to be PrimeTime based.

SEE ALSO

signoff_opt (2) **run_signoff** (2) **PSYN-411** (n)

PSYN-414 (information) Following PrimeTime commands are now disabled.

DESCRIPTION

This message gives you a list of PrimeTime commands that were available after **signoff_opt** or **run_signoff**, which are now disabled. This happens after you run

```
run_signoff -signoff_analysis false.
```

WHAT NEXT

Use **signoff_opt** or **run_signoff** to make them available again.

SEE ALSO

signoff_opt (2) **run_signoff** (2) **PSYN-412** (n)

PSYN-415 (warning) Circuit has no valid timing end points.

DESCRIPTION

This warning message occurs when you are running timing driven placement without defining the timing constraints.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Check your design timing constraints, make the necessary corrections, and then run the command again.

PSYN-416 (warning) Missing signoff SDC, using ICC SDC instead.

DESCRIPTION

You receive this warning message because you did not specify a signoff SDC file with **set_primate_options -sdc_file**.

WHAT NEXT

You can ignore this warning message if you indeed want to use the ICC SDC file.

SEE ALSO

signoff_opt (2) **run_signoff** (2) **set_primate_options** (2)

PSYN-417 (information) Following commands are now disabled.

DESCRIPTION

This message gives you a list of commands that are disabled. This happens after you run **run_signoff**.

WHAT NEXT

Use **run_signoff -signoff_analysis false** to re-enable these commands.

SEE ALSO

signoff_opt (2) **run_signoff** (2)

PSYN-418 (information) Following commands are now re-enabled.

DESCRIPTION

This message gives you a list of commands that were disabled after **run_signoff**, which are now re-enabled. This happens after you run **run_signoff -signoff_analysis false**.

WHAT NEXT

SEE ALSO

signoff_opt (2) **run_signoff** (2) **PSYN-417** (n)

PSYN-419 (information) No changes were made during optimization.

DESCRIPTION

IC Compiler uses this information message to tell you that there were no changes made during optimization. There were no netlist changes, such as added/deleted/modified instances, nor routing changes.

Since there were no changes made, **signoff_opt** will stop.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt (2)`

PSYN-420 (Information) Generating dummy physical description for cell %s. Generated physical library cell is having height %f and width %f.

DESCRIPTION

You receive this Information message because one of the physical cells doesn't have a physical library cell in any of the physical libraries specified. Tool is generating dummy physical description of this missing physical library cell.

Physical compiler needs physical description of all the logical cells to proceed further and gives PSYN-024 warning for this.

These created ummy physical cells are not persistent in the design DB and are recreated everytime a new physical compiler session is started.

These dummy physical cells are required mainly for the exploration flow and finnally should be replaced by the correct physical description using correct physical libraries.

To turn off this feature, please set "physopt_create_missing_physical_libcells" variable to FALSE.

WHAT NEXT

Check the physical libraries specified. All physical cells in the design should have physical library cells.

SEE ALSO

`physopt_create_missing_physical_libcells(3)`

PSYN-421 (Error) No sequential or combinational cells in the lib

- %S

DESCRIPTION

You receive this error message because tool is not able find any sequential or combinational cells in the specified library. Tool will continue to find a base cell in other target libraries, until it finds a one. Tool is finding these cells, so that it can be used to create dummy physical description of other missing physical libraries cells.

WHAT NEXT

Check the physical libraries specified. All physical cells in the design should have physical library cells. Dummy physical description of missing phlib cell is generated only when physopt_create_missing_physical_libcells variable is set to TRUE. If you do not want to generate dummy physical description, set this variable to FALSE.

PSYN-422 (information) PrimeTime path based analysis is enabled.

DESCRIPTION

IC Compiler uses this information message to tell you that PrimeTime path based analysis is enabled in **signoff_opt** or **run_signoff**.

Path based analysis is a **PrimeTime** technology which reduces pessimism during static time analysis.

WHAT NEXT

This is an informational message only.

SEE ALSO

[signoff_opt \(2\)](#)

PSYN-423 (information) PrimeTime advanced OCV mode is

enabled.

DESCRIPTION

IC Compiler uses this information message to tell you that PrimeTime advanced OCV mode is enabled in **signoff_opt** or **run_signoff**.

Advanced OCV mode (AOCVM) is a **PrimeTime** technology which reduces pessimism during static time analysis.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt (2)`
`run_signoff (2)`

PSYN-424 (information) Variation aware signoff analysis is enabled.

DESCRIPTION

IC Compiler uses this information message to tell you that variation aware analysis is enabled in **signoff_opt** or **run_signoff**. **signoff_opt** or **run_signoff** will invoke **PrimeTime-VX** and **StarRC-XT-VX**.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt (2)`
`run_signoff (2)`

PSYN-425 (information) PrimeTime rail analysis is enabled.

DESCRIPTION

IC Compiler uses this information message to tell you that rail analysis is enabled in **signoff_opt** or **run_signoff**.

Rail based analysis is a **PrimeTime** technology which analyzes the IR drop effects on rail voltages.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt` (2)
`run_signoff` (2)

PSYN-426 (warning) Cell %s and cell %s violate a spacing rule.

DESCRIPTION

You get this warning because the specified cells violate a user-defined spacing rule.

WHAT_NEXT

Use **legalize_placement** to make the cell placement legal.

SEE ALSO

`check_legality` (2), `legalize_placement` (2).

PSYN-427 (warning) Placement utilization is %s.

DESCRIPTION

You get this warning because the placement utilization is extremely high. Placement will continue, but you may get poor results or errors later in the flow due to the high utilization.

WHAT_NEXT

No action is required.

SEE ALSO

`create_placement` (2), `place_opt` (2).

PSYN-428 (error) Must exit signoff mode before running correlation analysis.

DESCRIPTION

You receive this error because you are trying to run `run_signoff -correlation` command on a design that has been run with `run_signoff` or `signoff_opt`. You must run `run_signoff -signoff_analysis false` first before you can run `run_signoff -correlation`.

WHAT NEXT

Run `run_signoff -signoff_analysis false`.

SEE ALSO

`run_signoff(2)`

PSYN-429 (error) Image directory %s must be writeable.

DESCRIPTION

You receive this error because you are trying to specify a PrimeTime image whose directory is not writeable.

WHAT NEXT

Change the permission of the directory.

SEE ALSO

`set_primestime_options(2)`

PSYN-430 (Warning) The snapshot file is corrupted, can't be loaded.

DESCRIPTION

This warning message occurs when the snapshot file is corrupted.

SEE ALSO

report_qor_snapshot (2)

PSYN-431 (information) Using high effort path based analysis.

DESCRIPTION

IC Compiler uses this information message to tell you that PrimeTime path based analysis is enabled with high effort in **signoff_opt** or **run_signoff**.

Path based analysis is a **PrimeTime** technology which reduces pessimism during static time analysis.

There are two ways of invoking path based analysis in **PrimeTime**:

- `get_recalculated_timing_paths [get_timing_paths ...]`
- `get_timing_paths -recalculate ...`

The first method runs faster because it has less number of paths to re-analyze, but it might also miss the real critical path.

The second method runs slower (and if you have a lot of near critical timing paths, this method can run much slower), but it will eventually give you the real critical path.

By default, **IC Compiler** uses the first method during **run_signoff** or **signoff_opt**.

If you enable advanced OCV mode (AOCVM) with path based analysis (PBA), we will switch to high effort.

WHAT NEXT

This is an informational message only.

SEE ALSO

`signoff_opt (2)`
`run_signoff (2)`
PSYN-422 (n)
PSYN-423 (n)

PSYN-432 (warning) Only the following scenarios will be set

active: %s.

DESCRIPTION

You receive this warning message because you try to run **set_active_scenarios** on a design with only a subset of scenarios that were analyzed/optimized by **run_signoff** or **signoff_opt**.

EXAMPLE

If your design contains three scenarios, SC1, SC2, and SC3, and you run **set_active_scenarios {S1 S2}** before you run **run_signoff** or **signoff_opt**, **IC Compiler** will only perform signoff analysis/optimization on S1 and S2. S3 will not be analyzed/optimized by **run_signoff** or **signoff_opt**. You should notice a **PSYN-376** to tell you how many inactive scenarios that will not be analyzed/optimized by **run_signoff** or **signoff_opt**.

If you run **set_active_scenarios -all** on this design, you will receive this warning message to tell you that **IC Compiler** will not activate scenario S3 because it was not analyzed by signoff tools.

You will only receive this warning message after **run_signoff** or **signoff_opt**.

WHAT NEXT

You can ignore this warning message if you are satisfied with the given set of active scenarios.

You can also re-run signoff analysis for all scenarios by:

- **run_signoff -signoff_analysis false**
- **set_active_scenarios -all**
- **run_signoff**

SEE ALSO

signoff_opt (2) **run_signoff** (2) **set_active_scenario** (2) **PSYN-376** (n)

PSYN-433 (Error) None of given scenarios can be set active.

DESCRIPTION

You receive this error message because **IC Compiler** is not able to set active the given scenarios.

EXAMPLE

If your design contains three scenarios, SC1, SC2, and SC3, and you run **set_active_scenarios {S1 S2}** before you run **run_signoff** or **signoff_opt**, **IC Compiler** will only perform signoff analysis/optimization on S1 and S2. S3 will not be analyzed/optimized by **run_signoff** or **signoff_opt**. You should notice a **PSYN-376** to tell you how many inactive scenarios that will not be analyzed/optimized by **run_signoff** or **signoff_opt**.

If you run **set_active_scenarios S3** on this design, you will receive this error message to tell you that **IC Compiler** will not activate scenario S3 because it was not analyzed by signoff tools.

You will only receive this error message after **run_signoff** or **signoff_opt**.

WHAT NEXT

You can also re-run signoff analysis for all scenarios by:

- **run_signoff -signoff_analysis false**
- **set_active_scenarios -all**
- **run_signoff**

SEE ALSO

signoff_opt (2) **run_signoff** (2) **set_active_scenario** (2) **PSYN-376** (n) **PSYN-432** (n)

PSYN-434 (information) Timing constraint changes will not be saved in signoff mode.

DESCRIPTION

IC Compiler uses this information message to tell you that you will not be able to

save timing constraint changes after **run_signoff**.

If you change your timing constraints after **run_signoff**, such as **set_timing_derate**, these changes will not be saved in your database, and will be lost after you exit signoff mode.

WHAT NEXT

Use **run_signoff -signoff_analysis false** to exit signoff mode, and then re-apply the timing constraint changes.

SEE ALSO

[run_signoff \(2\)](#)

PSYN-435 (information) Signoff timing constraints will not be updated in signoff mode.

DESCRIPTION

IC Compiler uses this information message to tell you that you will not be able to update signoff timing constraints after **run_signoff** or **signoff_opt**.

If you change your signoff timing constraints after **run_signoff** or **signoff_opt**, such as calling **set_timing_derate**, you will not see the effort in timing reports.

WHAT NEXT

Use **run_signoff -signoff_analysis false** to exit signoff mode.

SEE ALSO

[run_signoff \(2\)](#)
[signoff_opt \(2\)](#)

PSYN-436 (warning) Scenario '%s' will be analyzed with On-Chip-Variation.

DESCRIPTION

IC Compiler uses this warning message to tell you that the given scenario will be analyzed with On-Chip-Variation in PrimeTime.

Each active scenario in IC Compiler will be analyzed by PrimeTime DMSA. PrimeTime

uses On-Chip-Variation as its default analysis mode. Therefore, if you specify an operating condition other than On-Chip-Variation (such as BC_WC) for a scenario, you will receive this warning message. You could notice additional pessimism during static timing analysis for this scenario.

WHAT NEXT

You can ignore this warning if you're satisfied with On-Chip-Variation analysis.

For BC_WC analysis, you could split the original scenario into two scenarios, one for BC corner (with OCV), and another for WC corner (with OCV).

SEE ALSO

`signoff_opt` (2) `run_signoff` (2) `set_operating_conditions` (2)

PSYN-437 (Error) Inconsistent NUM_PARTS found in StarRCXT command file.

DESCRIPTION

You receive this error message because **IC Compiler** found that your **StarRCXT** NUM_PARTS settings are not consistent across different corners.

NUM_PARTS is a reserved keyword in **StarRCXT** command file to enable distributed processing capability. It is an integer number that defines how many partitions **StarRCXT** will create and run in parallel.

When **IC Compiler** invokes **StarRCXT**, we require that this setting is consistent among all extraction corners. If you have defined different NUM_PARTS for different extraction corners, you will receive this error message.

There are three places you can define NUM_PARTS:

- `set_starrcxt_options -num_parts`
- `set_starrcxt_options -option_file`
- `set_starrcxt_options -max_image or -min_image`

The first method directly use the command line switch `-num_parts` of **set_starrcxt_options** to define the number of partitions.

The second method specify an option file for **StarRCXT** which could also include a line that defines NUM_PARTS.

The third method specify a **StarRCXT** run directory, which contains a copy of the original command file that could also include a line that defines NUM_PARTS.

All the values specified using above methods need to be consistent.

WHAT NEXT

Examine your settings of NUM_PARTS, and make them consistent.

SEE ALSO

```
save_upf (2)
```

PSYN-440 (Error) Incorrect cell type.

DESCRIPTION

You receive this error message because you have specified a wrong cell_type attribute to the given library reference cell. set_cell_type command only accepts following cell_types, "BLOCK", "COVER", "RING", "PAD" and "CORE". First three cell_types are used to mark any cell as macro cell. If you want to put any cell as a normal cell, you can mark this cell as "CORE" type.

WHAT NEXT

Please check -cell_type argument to set_cell_type command and give correct type as per your requirement. To mark any cell as Macro cell, please use "BLOCK", "COVER" or "RING" type. To remove macro cell attribute from any cell, please use "CORE" or "PAD" type.

SEE ALSO

```
all_macro_cells (2), set_cell_type (2).
```

PSYN-441 (warning) PrimeTime image for '%s' does not enable eco.

DESCRIPTION

This warning message occurs because at least one of the specified **PrimeTimage** image from **save_session** does not enable eco. You must enable eco in PrimeTime to allow **signoff_opt** to perform additional signoff analysis after optimization and incremental place and route.

WHAT NEXT

Provide a new **PrimeTime** image with eco enabled. You need to call **set_program_options -enable_eco** in PrimeTime first, and source the rest of your regular PrimeTime script, before generating the saved session for **signoff_opt**.

SEE ALSO

```
signoff_opt(2)  
set_primerime_options(2)
```

PSYN-442 (Warning) lib cell "%s" of size (%d sites x %d rows) will be treated as macro cell because it is larger than 6 site heights (default threshold).

DESCRIPTION

You receive this warning message because the lib cell is defined as core cell type in the physical library but its size is large enough (cell height is more than "physopt_macro_cell_height_threshold" row height) so that it is treated as macro cell in placement legalization. There are two cases the cell can be treated as macro cell in legalization and check legality:

- CASE 1. the "cell type" is set as BLOCK or RING or COVER in the phsyical lib, or
- CASE 2. the cell height is larger then "physopt_macro_cell_height_threshold".

The default value of "physopt_macro_cell_height_threshold" is 6, i.e. a cell can be treated as macro cell if its height is larger then 6 core site rows (even its "cell type" is CORE in the physical library).

WHAT NEXT

Please check the physical lib and modify the cell type in the cell definition.

User can adjust the "physopt_macro_cell_height_threshold" to prevent a std cell be treated as macro cell. For example, if user has a design which contains some 10x site height standard cells. By default, ICC detail placement will treat these 10x site height cells as "hard macros". If the user still wants these 10x site height cells be placed as "standard cells", then the user can set hidden variable "physopt_macro_cell_height_threshold" to a value which is more than 10, for example, 18:

```
set physopt_macro_cell_height_threshold 18
```

Then, these 10x site height cells will be placed as "standard cells". However, such a practice is not recommended, because the detail placement enginre is not designed for such a design style. Please use it with caution.

SEE ALSO

```
set_cell_type (2). all_macro_cells (2),
```

PSYN-443 (information) signoff_opt stopped due to %s in

PrimeTime image.

DESCRIPTION

IC Compiler uses this information message to tell you that **signoff_opt** is not able to perform additional signoff analysis after optimization and incremental place and route, due to the fact that some of the given PrimeTime images are either missing parasitics, or having eco disabled.

WHAT NEXT

You can save the CEL, and proceed to run your own signoff analysis manually. Or, if you would like to see **signoff_opt** to perform additional signoff analysis after optimization and incremental place and route, please provide corrected PrimeTime images.

SEE ALSO

`signoff_opt(2)`

PSYN-169(n)
PSYN-441(n)

PSYN-444 (warning) Fill metals exist in CEL view.

DESCRIPTION

This warning message occurs because your database contains fill metals in your CEL view. This could interfere with eco router.

WHAT NEXT

Remove the fill metals before running `signoff_opt`. Or use FILL view instead of CEL view for fill metals.

SEE ALSO

`signoff_opt(2)`
`insert_metal_filler(2)`

PSYN-445 (warning) Option '%s' is ignored in signoff mode.

DESCRIPTION

This warning message occurs because you specified an option that is not supported in signoff mode. The specified option is ignored.

WHAT NEXT

You can ignore this warning message if the specified option can be safely ignored.

SEE ALSO

`signoff_opt(2)`
`run_signoff(2)`

PSYN-446 (error) Cannot change signoff mode to %s because %S.

DESCRIPTION

You receive this error because you are trying to change signoff mode by running `run_signoff -signoff_analysis true|false|sleep|wakeup` command on a design that has not been run with proper command before.

For example, you cannot change signoff mode to wakeup if it is not in sleep mode. You cannot change signoff mode to sleep if it is already in sleep mode too.

WHAT NEXT

Check the user manual of `run_signoff` or `signoff_opt` to determine what is the command you need to run.

SEE ALSO

`signoff_opt(2)`,
`run_signoff(2)`

PSYN-447 (error) Option %s is not allowed at line %d in

StarRCXT option file.

DESCRIPTION

You receive this error because you are trying to specify a StarRCXT option file to **set_starrcxt_options -option_file**, which contains unsupported syntax.

Check PSYN-171 for allowed syntax.

WHAT NEXT

Remove contents in the file other than the allowed options.

SEE ALSO

[set_starrcxt_options\(2\)](#)
[PSYN-171\(n\)](#)

PSYN-448 (warning) Skipping '%s" because it requires '%s'.

DESCRIPTION

This warning message occurs because a requested PrimeTime feature is skipped for the given reason.

WHAT NEXT

Please fix reported problem to re-enable this feature.

SEE ALSO

[signoff_opt\(2\)](#)
[run_signoff\(2\)](#)

PSYN-449 (warning) Soft macro '%s' is not expanded.

DESCRIPTION

This warning message occurs because PrimeTime is not able to expand the named soft macro.

WHAT NEXT

Please check path and permission of CEL view of the named soft macro.

SEE ALSO

`signoff_opt(2)`
`run_signoff(2)`

PSYN-450 (error) %s.

DESCRIPTION

You get this error because the placement utilization is extremely high. The utilization reported here may be different than the utilization reported in other parts of the tool due to placer constraints such as soft placement blockages.

WHAT_NEXT

You should modify your placement constraints to bring the utilization down to less than 100%.

SEE ALSO

`create_placement (2)`, `place_opt (2)`. `create_placement_blockage (2)`.

PSYN-467 (Warning) This design -- %s does NOT have max transition time constraint.

DESCRIPTION

You receive this warning because this design does not have the `max_transition` time constraint set. If the `max_transition` time is not set on the design, it will be ascertained from the library and may not always be correct. Setting a proper `max_transition` time reduces the possibility of cross-talk/SI issues later in the flow.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by setting the `max_transition` time. You can do this by using the `set_max_transition` command. The recommended values are:

```
0.25 Micron technology - 1.2 ns
0.18 Micron technology - 0.9 ns
0.13 Micron technology - 0.5 ns
0.09 Micron technology - 0.3 ns
```

SEE ALSO

`set_max_transition(2)`

PSYN-468 (Warning) This clock -- %s does NOT have transition attribute set.

DESCRIPTION

You receive this warning because this clock is an ideal clock and does not have the transition attribute set. If the correct transition time is not set on an ideal clock, it may result in an under-optimized design and may have problems later in the flow during Clock Tree Synthesis (CTS).

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by setting the correct transition time. You can do this by using the `set_clock_transition` command with the correct `-rise` or `-fall` option and the appropriate combination of the `-min` and `-max` options to properly set the transition time for this clock.

SEE ALSO

`set_clock_transition(2)`
`remove_clock_transition(2)`

PSYN-469 (Warning) This design has low (%.2f) utilization and placer_max_cell_density_threshold is NOT set.

DESCRIPTION

You receive this warning because this design has low utilization.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by setting the **placer_max_cell_density_threshold** variable to the proper value for this design to get a better Quality of Results (QOR). For example, the value could be set to 0.7; however, the proper value for this design depends on the utilization figure.

SEE ALSO

`placer_max_cell_density_threshold(3)`

PSYN-470 (Warning) This cell '%s' is appeared in '%d' Failing paths and is having '%s' attribute.

DESCRIPTION

You receive this warning because this particular cell is on multiple critical paths of the design and has the `dont_touch` or `size_only` attribute set. These attributes restrict the tool's capability during optimization.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by examining this particular cell and determining whether the `dont_touch` or `size_only` attribute is intended to be set. If the attribute is not required to be there, you can remove it.

SEE ALSO

`check_constraints(2)`
`check_physical_constraints(2)`
`check_design(2)`

PSYN-471 (Warning) This Net '%s' is appeared in '%d' Failing paths and is having '%s' attribute.

DESCRIPTION

You receive this warning because this particular net is on a critical path of the design and has the `dont_touch` attribute set. This attribute restricts the tool's capability during optimization.

WHAT NEXT

No action is required on your part.

However, you can avoid receiving this warning by examining this particular net and determining whether this attribute is intended to be set. If the attribute is not required to be there, you can remove it.

PSYN-475 (warning) Mismatch in the main library and the Milkyway library timing units. In the main library it is %.3f ns and in the Milkyway technology file it is %.3f ns. Check and correct the timing units in the .tf and .db files.

DESCRIPTION

This warning message occurs when there is a mismatch in the timing units in the main library and the Milkyway design library. The main library is the first library specified in the link library. In Milkyway, timing units are taken from the .tf technology file.

Ensure that the timing units are consistent between the two tools to avoid errors in the flow.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Make the timing units consistent in the main library database and the Milkyway .tf technology file.

SEE ALSO

`check_constraints(2)`
`check_design(2)`
`check_physical_constraints(2)`

PSYN-476 (warning) Mismatch in the main library and the Milkyway library resistance units. In the main library it is %.3f kohm and in the Milkyway design library it is %.3f kohm. Check

and correct the resistance units in the .tf and .db files.

DESCRIPTION

This error message occurs when there is a mismatch in the resistance units in the main library and the Milkyway design library. The main library is the first library specified in the link library.

Ensure that the resistance units are consistent between the two libraries to avoid errors in the flow.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Make the resistance units consistent in the main library database and the Milkyway .tf technology file.

SEE ALSO

```
check_constraints(2)  
check_design(2)  
check_physical_constraints(2)
```

PSYN-477 (warning) Mismatch in the main and the Milkyway library capacitance units. In the main library it is %.3f pf and in the Milkyway design library it is %.3f pf. Check and correct the capacitance units in the .tf and .db files.

DESCRIPTION

This warning message occurs when there is a mismatch in the capacitance units in the main library and the Milkyway design library. The main library is the first library specified in link library.

Ensure that the capacitance units are consistent between the two libraries to avoid errors in the flow.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Make the capacitance units consistent in the main library database and the Milkyway .tf technology file.

SEE ALSO

```
check_constraints(2)
check_design(2)
check_physical_constraints(2)
```

PSYN-481 (Error) Change site name failed because can not mapping site name between DB and Milkway.

DESCRIPTION

This error message occurs in `xg` mode, because Physical Compiler can not find site name mapping between DB and Milkyway, please check the value of the variable `mw_site_name_mapping`. The value should be a string list. For example:

```
dc_shell-xg-t> set mw_site_name_mapping [list old_name1 new_name1
                                         old_name2 new_name2 ...]

psyn_shell-xg-t> set mw_site_name_mapping "old_name1 new_name1
                                         old_name2 new_name2 ..."
```

The variable must be set before loading the database and each `old_name` must pair off with a `new_name`.

WHAT NEXT

Refer to the `mw_site_name_mapping` man page for complete information.

SEE ALSO

```
mw_site_name_mapping(3)
```

PSYN-482 (Error) Routing Layer %s direction not defined, please check library unitTile.

DESCRIPTION

You receive this message because routing layer preferred direction is not set in design library unitTile. Please set all routing layers direction in design library before starting any physical commands.

WHAT NEXT

Set all routing layer direction in design library. Or set derive_default_routing_layer_direction TRUE to let the tool derive default directions

SEE ALSO

PSYN-483 (2)

PSYN-483 (Information) To enable the tool to derive default directions, set derive_default_routing_layer_direction TRUE.

DESCRIPTION

You receive this message because there is routing layer missing preferred direction definition in design library unitTile. When this variable is set to true, the tool will derive default routing direction for layers missing direction definition. e.g if Metal1 has been defined as H in unitTile, Metal2 has been defined as V, but Metal3 is missing direction, the tool will derive Metal3's direction as H. If none layer direction is defined, the tool will derive all layer directions as HVHV for Metal1/Metal2/Metal3/Metal4, etc. If this deriving is not the desired behavior, please don't set this variable but define the directions in design library unitTile.

WHAT NEXT

SEE ALSO

PSYN-482 (2)

PSYN-485 (warning) Layer %s preferred routing direction is defined as %s in design(CEL), but in library it's defined as %s.

DESCRIPTION

This error message occurs when there is a mismatch in the design(CEL) defined routing direction and library defined one for same layer. The design(CEL) defined one will be used as layer routing direction.

Make sure the design(CEL) defined routing direction is the correct one, if need to use library defined one, don't define the preferred routing direction for the layer

```
in design(CEL)
```

WHAT NEXT

Doublecheck to make sure the direction is set as expected, If not, change the routing layer direction using `set_preferred_routing_layer_direction`.

SEE ALSO

```
set_preferred_routing_layer_direction(2)
reporttt_preferred_routing_layer_direction(2)
report_ignored_layers(2)
```

PSYN-486 (error) Layer %s does not have preferred routing direction defined, neither in design(CEL) nor in library.

DESCRIPTION

This error message occurs when layer routing direction not defined. Layer preferred routing direction can be defined in `design(CEL)` or in `library`, the `design(CEL)` defined one will be used if defined in both `design(CEL)` and `library`.

Make sure at least one place has the definition of preferred routing direction, either define it in `design(CEL)` or define it in `library`.

WHAT NEXT

This is only an Error message, the tool cannot continue with this Error.

SEE ALSO

```
set_preferred_routing_layer_direction(2)
```

PSYN-487 (information) Net '%s' is being marked as "dont_touch" because it has (nearly) abutted pins.

DESCRIPTION

You see this information because a net in your design has nearly abutted pins. To avoid any change to that net the tool mark such net as "dont_touch".

WHAT NEXT

SEE ALSO

PSYN-500 (error) This db has inconsistency multiple port shape storage.

DESCRIPTION

You receive this error message because the database does not correctly store the port shape in cdb.

WHAT NEXT

Set the `psyn_get_port_shape_from_user_attrs` variable to TRUE before writing out the .pdef file. Read the same .pdef file back in to regenerate the database. Rerun the command reading the new database.

SEE ALSO

`read_pdef (2)`, `write_pdef (2)`.

PSYN-501 (Warning) Net '%s' is not routed.

DESCRIPTION

You receive this warning message because the net is not routed. physopt -on_route can not perform optimization on the net.

WHAT NEXT

PSYN-502 (Warning) Pin '%s' is not connected by routing.

DESCRIPTION

You receive this warning message because the pin is not connected to its net by routing. physopt -on_route can not perform optimization on the net.

WHAT NEXT

PSYN-503 (Infomation) RC extraction has been freed.

DESCRIPTION

WHAT NEXT

PSYN-504 (error) Cannot find lib cell (%s) characterized for P=%f, V=%f, T=%f and library subset = %s.

DESCRIPTION

You receive this message because the **insert_spare_cells** command cannot insert spare cells for the given library cell. This is because it either does not exist in the linked libraries or has no timing information for specified process, voltage or temperature.

WHAT NEXT

Examine the cell name and determine that it exists and is of the correct type.

SEE ALSO

insert_spare_cells (2).

PSYN-508 (information) %-5s CPU: %6d s (%5.2f hr) ELAPSE: %6d s (%5.2f hr) MEM-PEAK: %5lu Mb %s

DESCRIPTION

When **monitor_cpu_memory** is true, the cpu time, elapse time and memory peak usage will be printed out at the major steps in ICC commands, such as place_opt, clock_opt etc.

CPU/Elapse time is the total time spent on main process and all the child processes or multiple threads, e.g. when you use -num_cpus option, the reported CPU time contains the sum of the main process and all child process or threads CPU usage. Just like the output of

command of "cputime -self -child" or "cputime -all".

Following is a special note for **Multiple threads**:
when use -num_cpus ICC will run in multiple threads.
Currently OS system measures the cputime by adding all
the threads usage. It does not take into account of
parallelization of the threads. This means user may see
the CPU usage reported larger than elapse time when -num_cpus
option is used and ICC is running in multi-threading mode.

Following are the special notes for **Elapse time**: the
elapse time (e.g. wall-clock time) is depended on many
external factors and can vary from every run. It depends on
the IO traffic, network traffic, RAM/Swap usage, other
processes running on the same machine, etc. When user sees
elapse time is much longer than the CPU time, it may point
out the inefficiency of the computing environment, such as
insufficient memory, too many processes running on the same
machine, slow network, etc. The only way to make the elapse
time close to CPU time is to run only one icc_shell on the
machine with enough RAM and using local disk.

Memory peak is defined as the memory high-water-mark
of the main process. When ICC report memory peak, it
means the maximum memory ICC allocated from the system.
When child process exits, ICC will report the maximum
number of main and child memory usage. User can also
use following command to get the ICC memory information
interactively: **mem -all -verbose**

EXAMPLE

If you set monitor_cpu_memory true in the TCL, you will see following message in the log file.

```
Information: CPU: 23 s ( 0.01 hr) ELAPSE: 89 s ( 0.02 hr) MEM-PEAK: 155 Mb Mon Oct  
27 17:22:16 2008. (PSYN-508)
```

SEE ALSO

`monitor_cpu_memory (3)`
`cputime (2)`
`mem (2)`

PSYN-509 (Information) MEM-PEAK in main process: %5lu Mb,

MEM-PEAK in child processes: %5lu Mb.

DESCRIPTION

You receive this information message because variable **physopt_monitor_cpu_memory** is set to *true*, and there are child processes invoked under the main process.

It displays the memory peak usage of the main process, and the maximum memory peak usage of all the child processes.

SEE ALSO

`physopt_monitor_cpu_memory (3)`
PSYN-508 (n)

PSYN-511 (information) Set variable mw_site_name_mapping to change site name.

DESCRIPTION

This information message occurs in *xg* mode, because you need to use the **mw_site_name_mapping** variable to change to a new site name.

The format is as follows:

```
dc_shell-xg-t> set mw_site_name_mapping [list old_name1 new_name1  
      old_name2 new_name2 ...]  
  
psyn_shell-xg-t> set mw_site_name_mapping "old_name1 new_name1  
      old_name2 new_name2 ..."
```

The variable must be set before loading the database and each *old_name* must pair off with a *new_name*.

The **change_site_name** command cannot be used in *xg* mode because the site name mapping must be performed before you load the design. The **change_site_name** command is only valid after the design is loaded, so it does not work in *xg* mode.

You can use the **change_site_name** command in normal mode.

WHAT NEXT

Refer to the **mw_site_name_mapping** man page for complete information.

SEE ALSO

`mw_site_name_mapping(3)`

PSYN-512 (warning) Different TLU+/NXTGRD between IC Compiler and StarRCXT

DESCRIPTION

You receive this warning because you are trying to run `run_signoff -correlation` command with different TLU+ or NXTGRD version. Please check the version name, version number, or technology name in both files.

WHAT NEXT

Have consistent TLU+/NXTGRD files for correlation.

SEE ALSO

`run_signoff`

PSYN-513 (warning) SDC commands for IC Compiler and PrimeTime correlation

DESCRIPTION

You receive this warning because you are trying to run `run_signoff -correlation` command, some SDC commands may cause correlation issues.

`set_input_transition`: For correlation purpose, user has to use "set_driving_cell" for input pin in SDC file.

`set_input_delay`: For correlation purpose, user has to use "set_clock_latency - source" for clock port in SDC file.

`set_clock_latency`: For correlation purpose, the latency value should be larger than 0 in SDC file.

`set_propagated_clock`: For correlation purpose, user has to set it on all clocks to make sure all clocks will be propagated.

`set_load`: For correlation purpose, any net specified should not be used in `set_load` command

`set_resistance`: For correlation purpose, any net specified should not be used in

```
set_resistance command
```

WHAT NEXT

Check and modify SDC file for correlation.

SEE ALSO

```
run_signoff
```

PSYN-514 (warning) Tcl commands for IC Compiler and PrimeTime correlation

DESCRIPTION

You receive this warning because you are trying to run **run_signoff -correlation** command with some correlation related Tcl commands between IC Compiler and PrimeTime.

`set_delay_calculation`: Use `arnoldi` in both IC Compiler and PrimeTime.

`set_operating_condition`: Use `on_chip_variation` in both IC Compiler and PrimeTime when this design is MCMM.

`set_clock_gating_check`: Turn on `set_clock_gating_check` in both IC Compiler and PrimeTime.

WHAT NEXT

Have a correct setting for correlation.

SEE ALSO

```
run_signoff
```

PSYN-515 (warning) Inconsistent SI settings between IC Compiler and PrimeTime

DESCRIPTION

You receive this warning because you are trying to run **run_signoff -correlation** command with different SI settings. To use SI for correlation purpose, user has to set delta delay. To use static noise, the delta delay should be set first.

WHAT NEXT

Have a consistent setting for correlation.

SEE ALSO

`run_signoff`

PSYN-516 (warning) Different setting or value between IC Compiler and PrimeTime

DESCRIPTION

You receive this warning because you are trying to run `run_signoff -correlation` command with different setting or value between IC Compiler and PrimeTime.

WHAT NEXT

Always have a consistent setting and value for correlation.

SEE ALSO

`run_signoff`

PSYN-517 (warning) Different setting or value between IC Compiler and PrimeTime

DESCRIPTION

You receive this warning because you are trying to run `run_signoff -correlation` command with different setting or value between IC Compiler and PrimeTime.

WHAT NEXT

Always have a consistent setting and value for correlation.

SEE ALSO

`run_signoff`

PSYN-518 (warning) Different setting or value between IC

Compiler and StarRCXT

DESCRIPTION

You receive this warning because you are trying to run **run_signoff -correlation** command with different setting or value between IC Compiler and StarRCXT.

WHAT NEXT

Always have a consistent setting and value for correlation.

SEE ALSO

[run_signoff](#)

PSYN-519 (error) Correlation script problem

DESCRIPTION

You receive this warning because you are trying to run **run_signoff -correlation** command, but there is a problem for a script generated automatically. By default, there is a script called "signoff_correlation_setup.user_name.process_id.tcl" created after **run_signoff -correlation**. This problem may happen when tool can not detect user name, find a valid process id, or have permission problem to write. Check the permission issue first. Latest result will be appended to end of file in multiple run.

WHAT NEXT

Solve permission problem first.

SEE ALSO

[run_signoff](#)

PSYN-541 (warning) All cells and nets in cluster '%s' is being marked as "dont_touch" because the cluster has a fixed_logic attribute.

DESCRIPTION

You see this warning because a cluster in your design bears a *fixed_logic* attribute

in the input PDEF. The tool marks all cells and nets in such cluster as "dont_touch".

WHAT NEXT

To modify the cluster, remove the *fixed_logic* attribute in PDEF. Then read in the PDEF again, using the **read_pdef** command.

SEE ALSO

read_pdef (2).

PSYN-543 (error) cell instance '%s' does not have a reference design.

DESCRIPTION

You see this error because there is cell instance in your design which does not have a design reference.

WHAT NEXT

Fixed the reference to the cell instance mentioned in the error message. You may have a corrupted db, and it might be necessary to regenerate the db file.

SEE ALSO

PSYN-544 (warning) design cluster '%s' is an obstruction without design objects.

DESCRIPTION

This warning occurs because the specified cluster is designated as a design cluster. However, it is an obstruction cluster and does not have any design objects in it. The tool considers sub-clusters, cells, and nets to be design objects. In this case, the tool ignores this design cluster and treats it as an obstruction.

WHAT NEXT

You might want to remove the design cluster designation from the obstruction cluster.

PSYN-555 (error) Checking any commands accessing wrongly DC/NID attribute (id: %d)for already ported attributes

DESCRIPTION

You see this error because there is a commands accessing wrongly DC/NID attribute for already ported attributes

WHAT NEXT

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

SEE ALSO

PSYN-590 (Warning) No physical library cell for physical instance %s.

DESCRIPTION

You received this warning message because a physical instance doesn't have a physical library cell in any of the physical libraries specified.

WHAT NEXT

All instances in the design must have an associated physical library cell.

Check the physical libraries specified using the command report_mw_lib - mw_reference_library. If this list does not contain all the expected physical libraries, update the list using the command set_mw_lib_reference.

The command get_physical_lib_cells /* will list all physical cells currently loaded (use appropriate patterns or filters to restrict the results).

SEE ALSO

report_mw_lib(2) set_mw_lib_reference(2) get_physical_lib_cells(2)

PSYN-600 (error) Number specified is invalid

DESCRIPTION

You receive this error message because the input numbers are invalid. The last command aborted due to this error.

WHAT NEXT

Examine the input numbers to the last command, correct the invalid numbers, and run the command again.

PSYN-601 (error) Current directory is not writable!

DESCRIPTION

You receive this error message because the current directory is not writable. In stand-alone mode detail placement, the current directory must be writable. The last command aborted due to this error.

WHAT NEXT

Examine current directory, make sure it is writable, and run the command again.

PSYN-602 (error) Failed in reading back data.

DESCRIPTION

This error occurs because the stand-alone process cannot read back the data from the disk. The reason for this failure might be due to some problem with the swapping directory .sdp or might be because you have changed some of the content of the swapping directory. The tool prohibits any change to the files inside swapping directory because they are internal data and might be constantly changing. The last command aborted due to this error.

WHAT NEXT

Check current directory, ensure that it is writable, and do not alter it. Then, rerun the command.

PSYN-603 (error) Can not get the site master of cell '%s'.

DESCRIPTION

You receive this error because the tool can not get the site master of the specified cell. The option -measurement num_sites need to get site master for each specified cell to computer the keepout margin.

WHAT_NEXT

You need to check and make sure the cells you set keepout margin have correct information of site master.

SEE ALSO

`set_keepout_margin (2)`

PSYN-604 (Error) Can not define option 'num_sites' together with 'soft|all_macros|macro_masters|macro_instances'.

DESCRIPTION

You receive this message because you specify 'num_sites' and 'soft|all_macros|macro_masters|macro_instances' together at the same time.

These options are mutually exclusive and cannot be used together at the same time in command `set_keepout_margin`.

WHAT NEXT

Use either '-measurement num_sites' or 'soft|all_macros|macro_masters|macro_instances'.

SEE ALSO

`set_keepout_margin (2)`

PSYN-605 (information) Running stand-alone coarse placer in a

separate process using temp directory '%s'.

DESCRIPTION

This message indicates that the coarse placer will run in a separate process. Placer separate process can be disabled by using the variable placer_run_in_separate_process. The temp directory can be changed using the UNIX environment variable TMPDIR.

WHAT_NEXT

SEE ALSO

placer_run_in_separate_process

PSYN-606 (information) Preparing to run stand-alone detail placer (SDP) in remote ...

DESCRIPTION

This message indicates that the detail placer will be run in a separate process.

WHAT_NEXT

PSYN-607 (information) The stand-alone detail placer (SDP) is running in remote ...

DESCRIPTION

This message indicates that the detail placer is running in a separate process.

WHAT_NEXT

PSYN-608 (information) The stand-alone detail placer (SDP)

%s!

DESCRIPTION

This message indicates whether the stand-alone detail placer is successful or not.

WHAT_NEXT

PSYN-609 (information) %d filler cells have been removed!

DESCRIPTION

This message indicates that filler cells are present during detail placement. IC Compiler will first remove all of the movable filler cells, then perform the legalization. Users will need to insert filler cells again later.

WHAT_NEXT

PSYN-610 (warning) '%s' command is obsoleted. Although it will still function normally now, please use '%s' command to replace this command in the future.

DESCRIPTION

This warning occurs because the tool is obsoleting this command. However, it is still functional in this version. In the future, please use the replacement command.

WHAT NEXT

Remove the obsolete command, and replace it with the new command.

PSYN-611 (warning) '%d' cells placed outside their hard bounds

DESCRIPTION

This message indicates that there are some cells which are not in their assigned hard-bounds after floorplan region based legalization. Following are some of the reasons:-

- The region or bound is over the capacity.
- There is no site in the bound which is legal for some cells.

WHAT NEXT

Verify the feasibility of the region constraints for cells and the floorplan.

PSYN-612 (error) The cell '%s' does not fall in any region.

DESCRIPTION

This message indicates that the mentioned cell does not belong to any floorplanning region in the design. The physopt requires that if regions exists in the design, then all cells must belong to some region. Following are some of the reasons:-

- The cell was meant to be in default region which is not yet created.
- The floorplan is not correctly partitioned into physical regions.

WHAT NEXT

Verify the feasibility of the region constraints for cell and the floorplan.

PSYN-613 (Error) The value of '-measurement percentage' can not be negative or all zero.

DESCRIPTION

You receive this message because the value (lx by rx ty) you are inputting with 'set_keepout_margin -measurement percentage' is negative or all zero.

WHAT_NEXT

Provide a percentage value larger than zero. For example, 0.1 (10 percent).

SEE ALSO

`set_keepout_margin (2)`

PSYN-614 (Error) The inputting (lx by rx ty) are equal or greater

than 1.

DESCRIPTION

You are inputting (lx by rx ty), ICC considers them as (lx*100% by*100% rx*100% ty*100%) since you have defined the '-measurement' as percentage, ICC believes the normal scope should be 0.01-0.99 (1%-99%).

WHAT_NEXT

Provide positive and proper value (lx by rx ty).

SEE ALSO

`set_keepout_margin (2)`

PSYN-615 (Error) The '-measurement' option takes only microns|percentage|num_sites as argument.

DESCRIPTION

You receive this error message because you are inputting wrong argument for -measurement option.

WHAT_NEXT

You should input microns|percentage|num_sites for -measurement.

SEE ALSO

`set_keepout_margin (2)`

PSYN-616 (Warning) Converge problem found, The max_net_length constraint of net %s might not be met!

DESCRIPTION

This message indicates that the detail placer is trying to fix the max_net_length constraint of a certain net, but it failed. The possible reasons may be: 1) Too many nets have this max_net_length constraint; 2) Too many cells/nets with this constraint are overlapping each other; 3) The constraint threshold is too tight; 4)

There are some fixed cells with this net, and the bbox net length of the fixed cells is larger than the user defined threshold; 5) There may exist some constraint loop among the existing max_net_length nets, which makes such a fixing an impossible task.

WHAT_NEXT

Once this error message shows up, the users need to check their design data, and try to relax some constraint setting.

PSYN-617 (Warning) Violating Net: %s orig_length/current_length/threshold = %d/%d/%d

DESCRIPTION

This message indicates that some nets may have "max_net_length" violation. This message is to report the "original net_length", "current net_length", and the "threshold" which has been set by the users.

WHAT_NEXT

Once this error message shows up, the users need to check their design data, and try to relax some constraint setting such as make the threshold value bigger.

PSYN-618 (Error) At lease one of the "left padding" or "right padding" should be specified!

DESCRIPTION

This message indicates that neither "left padding" nor "right padding" has been defined with command "set_cell_padding". Users should define at least one of the "-left" or "-right" option.

WHAT_NEXT

Correct the mistake and run command "set_cell_padding" again.

PSYN-619 (Error) One and only one of [-reference_name] or

[object_list] should be specified!

DESCRIPTION

This message indicates that users have specified either both of [-reference_name] and [object_list] or none of them. Users should define only one of them.

WHAT_NEXT

Correct the mistake and run command "set_cell_padding" again.

PSYN-620 (Error) The bounding box or rectangle of '%s' is illegal,
it's lower-left corner coordinates are not smaller than upper-right
corner coordinates.

DESCRIPTION

You receive this message because the coordinates of a bounding box or rectangle are not given in order from the lower-left corner to the upper-right corner or the coordinates form a line instead of a bounding box or rectangle.

WHAT_NEXT

Place the lower-left corner coordinates before the upper-right corner coordinates, and ensure that it forms a valid bounding box or rectangle.

PSYN-621 (error) %s: Invalid buffer cell(s) specified for the -default_reference option.

DESCRIPTION

You receive this message because an invalid buffer cell is set.

WHAT_NEXT

To set the correct buffer reference, make sure the cell name specified in **physopt_hfs_default_reference** variable is a valid and active buffer cell for current design.

SEE ALSO

`set_ahfs_options (2)`.

PSYN-625 (warning) Removed the physical data of design '%s' in order to load physical data for the current design or another design.

DESCRIPTION

This warning occurs because the command you have run is trying to read physical design data, and a design already exists that has physical design data. Currently, the tool can have only one design with physical data in memory. You must remove existing physical design data before you read physical design data for another design.

If you remove the physical data of a design, you can still apply `current_design` to that design, but you will not be able to see, modify, or create any physical information of that design.

WHAT_NEXT

Follow the recommended flow of reading designs and physical data into memory.

PSYN-626 (error) No additional PSYN-XG licenses are available.

DESCRIPTION

You receive this error message because no PSYN-XG or no more PSYN-XG licenses are available.

WHAT NEXT

SEE ALSO

PSYN-650 (warning) Cell %s has no orientation; check %s

library %s cell symmetry.

DESCRIPTION

This warning message occurs when the cell symmetry is not found in the physical library or in the FRAM library. The tool sets the symmetry to one (the default value), which impacts the detail placement result.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Add the symmetry to the physical library or the FRAM library for the cell.

SEE ALSO

PSYN-651(n)

PSYN-651 (warning) Cell %s orientation is set to the default.

DESCRIPTION

This warning message occurs when cell symmetry is not found in the physical library or the FRAM library. The symmetry is set to 1 (the default value), which impacts the detail placement result.

This warning message is always issued after the **PSYN-650** message.

The default orientation is set during the data preparation flow of Milkyway while running the **auSetPRBoundary** command. In Milkyway, you can set the orientations by using the **dbBdbSetStdCellOrient** command. The syntax for this command is:

```
dbSetStdCellOrient libName cellName  
orientation
```

where *orientation* is either one of the following keywords: Any, Reflect, or **Noreflect**, or any combination of the following keywords: R0, R0_MX, R0_MY, R180, R90, R90_MX, R90_MY, and R270, such as "R0 R0_MY R180 R90_MX".

WHAT NEXT

This is only a warning message. You can eliminate this warning message by adding symmetry to the physical library or the FRAM library for the cell.

SEE ALSO

PSYN-650 (n)

PSYN-652 (warning) Cell %s (%d %d) overlaps with exclusive_region (%d %d) (%d %d).

DESCRIPTION

This warning message occurs when one cell overlaps an exclusive_region that you have defined. The placement is not valid.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Use the **legalize_placement** command to make the placement valid.

SEE ALSO

`legalize_placement(2)`

PSYN-653 (warning) Library Cell %s has invalid boundBox, size is set to 0, please check the library.

DESCRIPTION

This warning message occurs when the Cell's boundBox is invalidated. Set the size as 0.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Please check the library.

SEE ALSO

PSYN-654 (n)

PSYN-654 (warning) Cell size will be set as 0.

DESCRIPTION

This warning message occurs when the Cell's width or height is invalidated. Set the size as 0.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Please check the library.

SEE ALSO

PSYN-655 (n)

PSYN-655 (warning) Library Cell %s has invalid width:%d or height:%d, please check library cell PRbbox (%d %d)(%d %d).

DESCRIPTION

This warning message occurs when the Cell's width or height is invalidated. Set the size as 0.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Please check the library.

SEE ALSO

PSYN-654 (n)

PSYN-656 (error) Multiple pin with same name %s defined in

physlib design %s.

DESCRIPTION

This message indicates that there are more than one pin named as same.

WHAT NEXT

Verify the physlib design.

PSYN-657 (warning) MW mode rc layer plate_cap loading not working, no support.

DESCRIPTION

This warning message occurs when run this command under MW mode.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Please check the mode.

PSYN-658 (warning) nondrule layer shield_width and shield_spacing not working for MW mode.

DESCRIPTION

This warning message occurs when run this command under MW mode.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

R&D must do before release.

PSYN-659 (warning) FRAM loading %s has problem getting

layer number.

DESCRIPTION

This warning message occurs when load layer has problem getting layer number.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Please check the layer.

PSYN-660 (warning) No routing direction for layer : %s, set to %s.

DESCRIPTION

This warning message occurs when no routing direction for this layer.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Please check the direction.

PSYN-661 (error) MW TF layer loading number mismatch, multiple layers defined with same maskname.

DESCRIPTION

This message indicates that there are more than one layers defined with same maskname.

WHAT NEXT

Please correct the TF for the design library.

PSYN-665 (warning) Setting fixed placement attribute on

hierarchical cell not allowed.

DESCRIPTION

This warning message occurs when you are trying to set fixed placement attribute by set_dont_touch_placement command or by set_attribute command on a object and the object is hierarchical cell.

WHAT NEXT

Hierarchical cells does not have location and no physical properties. Please check your script first and find out why you setting fixed placement attribute on hierarchical cell.

PSYN-666 (warning) Object %s does not have location. Can not set fixed placement attribute.

DESCRIPTION

This warning message occurs when you are trying to set the fixed placement attribute (by using the set_dont_touch_placement or set_attribute command) on an object and the object is not yet placed. This warning message is issued only for leaf cells and not for hierarchical cells that also do not have a location.

WHAT NEXT

Assign a location to the object and reissue the set_dont_touch_placement or set_attribute (with restrictions attribute) command.

PSYN-670 (warning) Unable to remove keepout margin on '%s' '%s'.

DESCRIPTION

You receive this message because remove_keepout_margin command is not able to remove the keepout margin on the specified cells or lib cells or all macro cells or all macro instances etc..

WHAT_NEXT

Please make sure that the cell or lib cell has keepout margin before calling remove_keepout_margin

PSYN-671 (Info) Over writing the existing keepout margin values on '%s' '%s'.

DESCRIPTION

You receive this message when you are over writing the keepout margin values of cells or lib cells using set_keepout_margin command

WHAT_NEXT

PSYN-672 (warning) Unable to set keepout margin on object '%s'.

DESCRIPTION

You receive this message because set_keepout_margin command is unable to set the keepout margin on cells or lib cells. This may be because you are trying to set keepout margin on hierarchical cell or any other object other than cell or lib cell.

WHAT_NEXT

Please make sure that you are setting keepout margin on leaf cells or lib cells

PSYN-673 (warning) Invalid value specified for '%s'.

DESCRIPTION

You receive this message because you have specified out of range value for one of -tracks_per_macro_pin or -max_padding_per_macro or -min_padding_per_macro.

WHAT_NEXT

Please make sure that you follow the following range $0.0 \leq \text{tracks_per_macro_pin} \leq 10.0$ $-1.0 \leq \text{max_padding_per_macro} \leq 1.0$ $0.0 \leq \text{min_padding_per_macro} \leq 0.5$

PSYN-674 (warning) Unable to set pin count based keepout

margin.

DESCRIPTION

You receive this message because set_keepout_margin is not able to set the pin count based keepout margin.

WHAT_NEXT

Please make sure that the CEL is opened in write mode.

PSYN-675 (warning) Ignoring object '%s' not a macro.

DESCRIPTION

You receive this message because you are trying to set keepout margin on non macro cell or non macro lib cell with -macro_masters/-macro_instances options

WHAT_NEXT

Please make sure that the cell or lib cell are macros when ever using one of the options -macro_masters/-macro_instances

PSYN-676 (warning) Invalid value specified for -type.

DESCRIPTION

You receive this message because you have specified invalid value for -type option. Only hard or soft can be specified for -type

WHAT_NEXT

Please make sure that you hard/soft for -type

PSYN-677 (Error) Unable to remove pin count based keepout

margin.

DESCRIPTION

You receive this message because there is no pin count based keepout margin exist or CEL is opened in read-only mode.

WHAT_NEXT

Please make sure that pin count based keepout margin exist before removing it and make sure the CEL is opened in write mode

PSYN-678 (Error) Require argument 'object list' | '-paramter' not found.

DESCRIPTION

You receive this message because you have not specified 'object list' or '-parameter' option for report_keepout_margin

WHAT_NEXT

Please make sure you specify one of 'object list' or '-parameter' for report_keepout_margin

PSYN-679 (warning) Unable to get keepout margin on '%s' '%s'.

DESCRIPTION

You receive this message because you are not able to get the keepout margin specified on cell or lib cell.

WHAT_NEXT

Please make sure that the cell or lib cell has keepout margin

PSYN-680 (warning) Either user defined or pin count based

keepout margin should be specified.

DESCRIPTION

You receive this message because you have specified both user defined keepout margin (usign -outer) and global pin count based derived keepout margin together.

WHAT_NEXT

Please make sure that you specify only one for set_keepout_margin command

PSYN-681 (warning) Pin count based keepout margin is always hard.

DESCRIPTION

You receive this message because you have specified pin count based keepout margin along with soft for -type option. Pin count based keepout margin is always hard and '-type soft' will be ignored.

WHAT_NEXT

PSYN-700 (error) The `mw_design_library` variable is not specified. Checkpointing cannot be enabled without `mw_design_library`.

DESCRIPTION

This error message occurs in `xg` mode when you have enabled checkpointing by setting the `physopt_checkpoint_stage` variable, but the `mw_design_library` variable is not defined. In `xg` mode, checkpointing is done in the CEL view for which the `mw_design_library` variable is necessary. The last command aborted due to this error.

WHAT NEXT

Set the `mw_design_library` variable to a string and run the command again.

SEE_ALSO

`physopt(2)`
`mw_design_library(3)`

```
physopt_checkpoint_stage(3)
```

PSYN-725 (error) Voltage area %s has utilization of %f which is greater than 1.

DESCRIPTION

This error message occurs when the tool tries to operate on voltage areas. It finds that the specified voltage area is over utilized and thus it cannot proceed further. The utilization is inferred as ratio of moveable cells area and placement area of a voltage area.

WHAT NEXT

To fix this error, you can either remove the specified voltage area and re-create it with adjusted coordinates and hierarchies or just remove some hierarchies from voltage area.

SEE ALSO

```
create_voltage_area(2)
remove_voltage_area(2)
update_voltage_area(2)
report_cell(2)
```

PSYN-750 (Warning) For net %s, %s is less than %s.

DESCRIPTION

You receive this message because either threshold or bound specified with all_drc_violated_nets command is less than the required value (constraint). If it is threshold then the command will report the violated nets only and ignore all the non-violated nets even if they cross threshold. If it is bound then command may not report any net at all.

WHAT_NEXT

Provide a more appropriate value of threshold/bound with all_drc_violated_nets command.

PSYN-840 (warning) Object '%s' not found in design. Attribute

'%s' will not be set.

DESCRIPTION

This warning is issued in PC-XG if an object exists in the instance tree but not in the actual design. The most likely cause of this problem is that the instance tree is not up-to date and needs to be cleaned up.

WHAT NEXT

Setting the hidden variable update_instance_data_in_db to TRUE in PC-XG will clean up the instance tree during read_db. Alternately in PC-DB mode, the hidden command update_instance_data can be used to clean up the instance tree and then save the db file. Use this cleaned up db file in PC-XG mode in a new shell.

PSYN-850 (warning) New port '%s' is generated to sub_module '%s' as an additional of original port '%s'.

DESCRIPTION

This warning is issued in AHFS when a new port is added into a sub_module. It happens only when AHFS port punching is enabled.

WHAT NEXT

`physopt_enable_placement_hfs (3), physopt_hfs_hf_new_port (3),
physopt_hfs_hf_new_port_map (3).`

PSYN-860 (warning) The automatic high-fanout synthesis variable %s is being replaced. The recommended flow is to use the set_ahfs_options command.

DESCRIPTION

This warning message occurs because the specified user variable to control the automatic high-fanout synthesis behavior is being replaced by the **set_ahfs_options** command

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following

the instructions below.

Use the **set_ahfs_options** command to set the specified variable and then run the command again.

SEE ALSO

`set_ahfs_options(2)`

PSYN-861 (warning) Automatic high-fanout synthesis is disabled in the region based design.

DESCRIPTION

This warning message occurs when automatic high-fanout synthesis is disabled because the design has physical regions.

WHAT NEXT

This is only a warning message. No action is required.

SEE ALSO

`create_buffer_tree(2)`

PSYN-862 (warning) Automatic high-fanout synthesis has been done. It will not be executed now.

DESCRIPTION

This warning message occurs when automatic high-fanout synthesis has already been executed and will not be performed again.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the instructions below.

Use the **set_ahfs_options** command to set the preferred settings for automatic high-fanout synthesis to run again.

SEE ALSO

`set_ahfs_options(2)`

PSYN-863 (error) No current library defined!

DESCRIPTION

This message is to inform users that no current logical library has been defined during Automatic High-Fanout Synthesis.

WHAT_NEXT

User should make sure that all the library settings are correct before running physopt or Automatic High-Fanout Synthesis.

PSYN-864 (information) Automatic high-fanout synthesis adds %d new cells.

DESCRIPTION

This information message advises you of the number of new cells that automatic high-fanout synthesis has added to the design.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-865 (information) Total number of drivers is %d.

DESCRIPTION

This information message advises you of the the number of drivers that are selected by automatic high-fanout synthesis.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-866 (error) Automatic high-fanout synthesis failed.

DESCRIPTION

This error message occurs when automatic high-fanout synthesis fails on the selected drivers.

WHAT NEXT

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

PSYN-867 (information) Automatic high-fanout synthesis removes all buffer trees.

DESCRIPTION

This information message advises you that automatic high-fanout synthesis is removing all buffer trees.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-868 (information) Automatic high-fanout synthesis removes critical buffer trees.

DESCRIPTION

This information message advises you that automatic high-fanout synthesis is removing only buffer trees that are timing critical.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-869 (information) Automatic high-fanout synthesis in

progress for high fanout nets.

DESCRIPTION

This information message advises you that automatic high-fanout synthesis is optimizing the nets that have fanouts higher than the **hf_threshold** that is specified with the **set_ahfs_options** command.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-870 (information) Automatic high-fanout synthesis in progress for medium fanout nets.

DESCRIPTION

This information message advises you that automatic high-fanout synthesis is now optimizing nets that have fanouts higher than the **mf_threshold** and lower than the **hf_threshold** that is specified with the **set_ahfs_options** command.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

`set_ahfs_options(2)`

PSYN-871 (information) No driver found.

DESCRIPTION

This information message advises you that no driver has been selected by automatic high-fanout synthesis for optimization.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-872 (error) The %s net has no netgroup.

DESCRIPTION

This error message occurs when the specified net does not have an associated netgroup.

WHAT NEXT

Contact the Synopsys Customer Support Center by sending an email message to support_center@synopsys.com.

PSYN-873 (error) Automatic high-fanout synthesis could not open the port mapping file %s for writing.

DESCRIPTION

This error message occurs when the specified file cannot be opened by automatic high-fanout synthesis for write permission.

WHAT NEXT

Ensure that the specified file has the correct file permissions before starting the run.

PSYN-874 (warning) Keepout margin on '%s' falls outside core/die area.

DESCRIPTION

This warning message occurs when the keepout margin parameters are not within the core/die area.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by following the directions below.

Check the PDEF file to be sure that the given keepout margin values are well within the core/die area.

PSYN-875 (information) Time units from Milkyway: '%s'.

DESCRIPTION

This information message advises you about the time units Milkyway is using. There may be a difference between the timing units followed in tool and Milkyway database.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-876 (information) Timing units are matched - '%.3f' ns.

DESCRIPTION

This information message advises you that both tool and Milkyway database use the same timing units and shows the exact match of units.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-877 (information) Executable name is '%s'.

DESCRIPTION

This information message advises you of the executable name used during placement.

WHAT NEXT

This is an informational message only. No action is required.

PSYN-878 (Information) linking reference library : %s.

DESCRIPTION

You receive this information message because the **link_physical** command is linking logical libraries with reference libraries.

WHAT NEXT

PSYN-879 (warning) '%s' pin on '%s' cell in the '%s' physical library is missing in the '%s' technology library.

DESCRIPTION

You receive this message because a cell pin in the physical library is missing from the same-name cell pin in the technology library. Consequently, the logical cell cannot be linked with the same-name cell in the physical library.

WHAT NEXT

Examine this cell pin in both libraries. Add the missing cell pin to your technology library.

PSYN-880 (error) Need buffers and inverters to proceed.

DESCRIPTION

You receive this message because there is no buffer or inverter available for optimization in the target library.

WHAT NEXT

Examine if your library has both buffers and inverters. Add the missing cell to your library.

PSYN-882 (warning) Consecutive metal layers have the same preferred routing direction.

DESCRIPTION

This error message occurs when two or more consecutive metal layers have the same prefferred routing direction. The preferred routing direction of a metal layer is the library defined preferred routing direction unless a user defined library direction is explicitly set in the design(CEL).

WHAT NEXT

This is only a warning message. Use `set_preferred_routing_direction` command to set a user defined direction for a layer in the design(CEL). To remove a user defined direction & default to using the library defined direction, use `remove_preferred_routing_direction` command.

SEE ALSO

`set_preferred_routing_layer_direction(2)`
`remove_preferred_routing_direction`

PSYN-883 (error) Can't use non-metal layer '%s'.

DESCRIPTION

You get this error because you are trying to set direction on a non-metal layer in layer list.

WHAT NEXT

Run `set_layer_preferred_direction` on existing routable metal layers from the physical library.

PSYN-884 (warning) All metal layers have the same preferred routing direction.

DESCRIPTION

This error message occurs when all metal layers have the same preferred routing direction set for them. The preferred routing direction of a metal layer is the library defined preferred routing direction unless a user defined library direction is explicitly set in the design(CEL).

WHAT NEXT

This is only a warning message. Use `set_preferred_routing_direction` command to set a user defined direction for a layer in the design(CEL). To remove a user defined direction & default to using the library defined direction, use

remove_preferred_routing_direction command.

SEE ALSO

set_preferred_routing_layer_direction(2)
remove_preferred_routing_direction

PSYN-885 (error) '%s' is invalid layer in option -%s list.

DESCRIPTION

You get this error because you specified an invalid layer. User-defined layer name, or mask name "poly", "metal1", "metal2", ..., "metal12" are acceptable.

PSYN-886 (error) '%s' is invalid value in option -%s list.

DESCRIPTION

In -dir list, 'V', 'H', 'v', 'h' are acceptable as direction. In -offset list, double value is acceptable as offset.

PSYN-887 (Error) cell %s is not on a row! this cell will be ignored!

DESCRIPTION

This message indicates that the input data has an issue: "same_row_eco" mode legalization requests that all input cells should reside in a row. If a cell does not reside in any row, ICC legalization will ignore it as if it does not exist at all. Users may end up with some overlapping between this cell and other cells.

WHAT_NEXT

Once this error message shows up, the users need to check their design data. If this is a user error, users need to run a "normal-mode" legalization before they run this "same_row_eco".

PSYN-888 (Error) row %s{%.3f %.3f %.3f %.3f} is over-capacity! The demand is: %d

sites(%d+%d+%d)(cell+padding+blockage), but the supply is: %d sites.

DESCRIPTION

This message indicates that the input data has an issue: "same_row_eco" mode legalization requests that a row should have enough room to accommodate all the cells on this row. If the row does not have enough room to place the cells, users may end up with some overlapping among cells.

WHAT_NEXT

Once this error message shows up, the users need to check their design data. In this situation, users need to relax their design constraints.

PSYN-889 (Information): Porosity Control is ON (%s). Now the utilization with Porosity Control is: %s

DESCRIPTION

This message indicates that the users have set the variable "legalize_porosity_control" to a non_zero value. Doing so may over-constrain the detail placement. As a result, it is easier for detail placement to fail in such a situation. So please use this constraint cautiously.

WHAT_NEXT

If the legalization fails with this constraint, users need to relax the constraint and try again.

PSYN-890 (Information) cell %s is not on a legal location at the beginning of Same_Row_ECO!

DESCRIPTION

This message indicates that one cell is illegal at the original location when ICC "Same_Row_ECO" is reading in the data. Ideally, ICC "Same_Row_ECO" legalization is expecting all cells are located at legal locations at the beginning. However, ICC "Same_Row_ECO" will try its best to legalize it during "Same_Row_ECO".

WHAT_NEXT

Once this error message shows up, the users need to check their design data. If this is a user error, users need to run a "normal-mode" legalization before they run this "same_row_eco".

PSYN-891 (Warning) cell %s (%.3f %.3f) inside row %s (%.3f %.3f %.3f %.3f)(sub_row: %d %d) is not on a legal location after Same_Row_ECO!

DESCRIPTION

This message indicates that one cell can not be legalized by ICC "Same_Row_ECO".

WHAT_NEXT

Once this error message shows up, the users need to check their design data. One potential reason is: this row may be overcapacity, so there may be no way for "Same_Row_ECO" to finish its work. Also, this violation may be due to other reasons. If this is a user error, users need to run a "normal-mode" legalization before they run this "same_row_eco". Also, users need to make sure that there is enough space to accommodate all the cells within this row before they run ICC "Same_ROW_CEO".

PSYN-892 (Information) User "porosity_control" has been disabled in Same_Row_ECO!

DESCRIPTION

This message indicates that ICC Same_Row_ECO has detected that user "porosity_control" is ON. In "Same_Row_ECO" legalization, user "porosity_control" is not recommended. As a result, ICC "Same_Row_ECO" will disable the user "porosity_control" automatically.

WHAT_NEXT

Once this error message shows up, the users need to check whether the user "porosity_control" is really needed in "Same_Row_ECO". In ICC "Same_Row_ECO", there should not be any user "porosity_control".

PSYN-893 (Error) cell %s {%.3f %.3f} has "single-site-gap"

violation!

DESCRIPTION

This message indicates that the cell has a "single-site-gap" violation: this cell is neighboring with a "single-site-gap".

WHAT_NEXT

Once this error message shows up, if users want to fix such kind of "single-site-gap" violations, they can run detail placement to fix them, with the below variable being set to a non_zero value: set legalize_skip_site_gap n

n is an integer which is greater than 0.

PSYN-895 (warning) With preferred routing direction on poly layer doesn't make poly layer routable.

DESCRIPTION

This warning message occurs when set prefferred routing direction on poly layer. This doesn't mean poly layer is a routing layer.

WHAT NEXT

This is only a warning message. Use set_preferred_routing_direction command to set a user defined direction for a layer in the design(CEL). To remove a user defined direction & defult to using the library defined direction, use remove_preferred_routing_direction command.

SEE ALSO

`remove_preferred_routing_direction`
`report_preferred_routing_direction`

PSYN-896 (Error) Cell %s does not have a location!

DESCRIPTION

This warning message occurs when command connect_dft_eco finds that a new scan cell

does not have a location. If a new scan cell does not have a location, then this cell will not be added into the existing scan chain.

WHAT NEXT

The cell must have been assigned a location before it is being added into a scan chain using command `connect_dft_eco`.

SEE ALSO

`connect_dft_eco`

PSYN-897 (Error) Can't find SCAN-IN/SCAN-OUT pins for cell %s!

DESCRIPTION

This error message occurs when command `connect_dft_eco` can not find the corresponding "SCAN-IN" and/or "SCAN-OUT" pins for this specific cell. Basically, this will happen if users try to add this cell into a scan chain, but command `connect_dft_eco` can not find the corresponding "SCAN-IN" and/or "SCAN-OUT" pins.

WHAT NEXT

When a cell is being added into a scan chain, it is required that `connect_dft_eco` command find its "SCAN-IN" and "SCAN-OUT" pins. Such information is either located inside the logical library, or can be set by using command "`set_dft_eco_options`".

SEE ALSO

`connect_dft_eco`
`set_dft_eco_options`

PSYN-898 (Error) cell %s can not be added into chain %s

because it is already inside this scan chain!

DESCRIPTION

This error message occurs when command connect_dft_eco can not add a cell into a scan chain because this cell is already inside this chain, a cell can not be added into a chain twice. This belongs to user error.

WHAT NEXT

No need to add this cell because it is already inside the current scan chain.

SEE ALSO

connect_dft_eco
set_dft_eco_options

PSYN-909 (Warning) Obsolete Command. It will be removed in future version of the tool.

SH DESCRIPTION This error occurs when user is using a command which is not officially supported command for the current release. There are following possibilites Command is going to be EoL'ed in later versions and currently hidden. Command is not production ready yet and hidden. Internal hidden command and not meant for customer usage.

WHAT NEXT

Contact your Synopsys representative and get clarity on alternatives.

SEE ALSO

PSYN-941 (Error) Cannot add new cellInst %s.

SH DESCRIPTION This error occurs while writing a new cell into milkway cell view if the cell instance in dc can not be created in milky way.

WHAT NEXT

SEE ALSO

PSYN-942 (Error) No objects specified to the command get_bounding_box.

DESCRIPTION

This error occurs when no object(s) specified in the command get_bounding_box. The command will not be executed.

WHAT_NEXT

At least one object has to be specified to execute the command.

PSYN-943 (warning) Deprecated command.

DESCRIPTION

You are getting this error because it is deprecated command. Use only the officially supported command.

WHAT NEXT

Instead of the above command which you used, use the other officially supported command and rerun.

PSYN-945 (Error) threshold/bound need(s) exactly one of following -max_transition, -max_capacitance, -max_fanout.

SH DESCRIPTION If threshold and bound options are specified, then exactly one among "max_trans", "max_cap", and "max_fanout" must be specified. Otherwise this error will show.

WHAT NEXT

SEE ALSO

PSYN-946 (Error) Only the lowest metal layer is allowed to this command.

SH DESCRIPTION This error occurs when there are more than one layer to the set wiring keepout options command.

WHAT NEXT

SEE ALSO

`ui_set_wiring_keepout_options_cmd_incr(2)`

PSYN-947 (Error) Cannot find the layer in the library.

SH DESCRIPTION This error occurs if the layer can not be found in the library.

WHAT NEXT

Specify the correct layer.

SEE ALSO

PSYN-948 (Error) The name of the lowest metal layer doesn't match with the given name.

SH DESCRIPTION This error occurs when the lowest metal layer doesnot match with the given name.

WHAT NEXT

Give the correct metal layer name.

SEE ALSO

`ui_set_wiring_keepout_options_cmd_incr(2)`

PSYN-949 (Error) Design doesn't have even two horizontal or vertical rows.

SH DESCRIPTION This error occurs if the design does not have even two horizontal or vertical rows.

WHAT NEXT

SEE ALSO

PSYN-950 (warning) Unmapped cell %s is ignored to set location.

DESCRIPTION

You receive this warning message because it is illegal to set location for unmapped cells.

WHAT NEXT

SEE ALSO

`set_cell_location (2)`, `extract_physical_constraints (2)`,

PSYN-951 (Error) Hierarchical cell %s is not an ICC or DCT ILM or a DCT physical hierarchy. No location will be set on it.

DESCRIPTION

You receive this error message because for a hierarchical cell to have a fixed location from `set_cell_location`, it must be an ICC or DCT ILM or a DCT physical hierarchy.

WHAT NEXT

To have the location set on the hier cell, please provide a DCT physical hierarchy, or an ICC or DCT ILM netlist for it.

SEE ALSO

`set_cell_location (2)`, `extract_physical_constraints (2)`, `set_physical_hierarchy (2)`,
`create_ilm (2)`

PSYN-952 (error) Hierarchical cell %s is not an ILM or Design Compiler topographical placed physical hierarchy; keepout and placement propagation failed.

DESCRIPTION

This error message occurs because in order to propagate a hierarchical cell's keepout and placement, the cell must be an ILM or Design Compiler topographical placed physical hierarchy.

WHAT NEXT

Use the `set_physical_hierarchy` command to set the cell as a physical hierarchy, or provide an ILM netlist.

SEE ALSO

`set_physical_hierarchy(2)`

PSYN-953 (Information) Hierarchical cell %s is not set as physical hierarchy prior to `set_cell_location`. The cell will be set as physical hierarchy as part of `set_cell_location` command.

DESCRIPTION

You receive this information message because setting location on a hierarchical cell that is not an ICC or DCT ILM makes the cell a physical hierarchy automatically. A physical hierarchy is `dont_touch` by default.

SEE ALSO

`set_cell_location (2)`, `extract_physical_constraints (2)`, `set_physical_hierarchy (2)`

PSYN-954 (information) The bound %s will be created during

compile.

DESCRIPTION

This information message advises you that the **create_bounds** command has just recorded a bound with the specified name, and the real bound will be created during compile. Design Compiler topographical technology delays the creation of a bound after a netlist is mapped during compile. The delay is necessary to ensure the bound has correct cells.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

`create_bounds(2)`
`remove_bounds(2)`
`report_bounds(2)`
`update_bounds(2)`

PSYN-955 (Warning) Option root_coord ignored in command get_bounding_box.

DESCRIPTION

Command `get_bounding_box` ignores the `root_coord` option. If you specify this option in this command, this messages warns you that this option will be ignored and boudning box returned by this command will have absolute value in its `llx lly urx ury`.

WHAT_NEXT

If you are using the output of this command to some other command, and if you need relative value of this boudning box, you need to add root coordinate of your core area to this boudning box.

PSYN-956 (warning) Report all physical cells include non filler

physical cells.

DESCRIPTION

If library cell type OR filler cells instances regexp not specified in this command, this command will report all the physical only cells of the design, which include non-filler cells also.

WHAT NEXT

Specify the proper library cell for filler cells OR filler cell regexp to report filler cells.

SEE ALSO

`all_physical_only_cells`

PSYN-957 (Error) %s is not a valid magnet object.

DESCRIPTION

This error occurs when the port information of the magnet object is not valid for place all magnets commands.

WHAT NEXT

Specify the correct information.

SEE ALSO

PSYN-958 (error) No valid link library specified, please check library setup.

DESCRIPTION

This error comes when there is no valid link library specified to link reference libraries and logical libraries.

WHAT NEXT

Please check the library setup.

SEE ALSO

PSYN-959 (Error) Invalid name type for illegality checkings.

DESCRIPTION

This warning shows that a valid -name option is not specified to this command get_illegal_cell_collection. User has to enter one of the following, cells_not_on_row, cells_overlap, blocks_overlap, orientation_violations, site_violations, power_strapViolation etc.

WHAT NEXT

Specify the correct option and rerun this command.

PSYN-960 (error) Create_keepout_area command is renamed to set_keepout_margin. Please use set_keepout_margin instead.

DESCRIPTION

This error comes when the command create_keepout_area is used create keepout. This command renamed to to set_keepout_margin. So, instead of the previous command use set_keepout_margin.

WHAT NEXT

Specify set_keepout_margin command in place of create_keepout_area.

PSYN-961 (Error) All four horizontal and vertical resistance and capacitance units are not specified.

DESCRIPTION

This error occurs when all the four horizontal and vertical resistance and capacitance units are not specified. Thenames of these units are horizontal minimum capacitance, vertical minimum capacitance, horizontal minimum resistance and vertical minimum resistance.

WHAT NEXT

Specify all these four units correctly and run the command again.

PSYN-962 (error) All four horizontal and vertical resistance and capacitance units are not specified.

DESCRIPTION

This error occurs when all the four horizontal and vertical resistance and capacitance units are not specified. The names of these units are horizontal maximum capacitance, vertical maximum capacitance, horizontal maximum resistance and vertical maximum resistance.

WHAT NEXT

Specify all these four units correctly and rerun the command.

SEE ALSO

PSYN-963 (error) No objects specified to get_location.

DESCRIPTION

Error occurs if no objects are specified for get_location_cmd.

WHAT NEXT

SEE ALSO

PSYN-964 (error) Routing rule "%s" not found.

DESCRIPTION

This error occurs when valid routing rule is not found.

WHAT NEXT

Specify the correct routing rule and rerun this command.

PSYN-965 (Error) Could not create region %s .Failed in region boundary continuity check.

DESCRIPTION

This error occurs when user is specified non-continuous boundary in the command `create_region`.

WHAT NEXT

Specify the continuous boudnary for the command and rerun this command.

SEE ALSO

`create_voltage_area(2)`

PSYN-966 (Warning). Obsolete options used in the command `create_region`.

DESCRIPTION

This error comes when obsolete options like `-anchor`, `-utilization`, `-cut`, `-aspect_ratio`, `-edge_anchor` and `-end_points` are specified to the command `create_region`. These options are not supported by this command anymore and results will be unpredictable.

WHAT NEXT

Do not use these options.

SEE ALSO

`create_voltage_area(2)`

PSYN-967 (Error) %s is not a valid magnet object.

DESCRIPTION

This error occurs when the magnet object is not a valid magnet object under conditions like when the cell is not in ILM mode.

WHAT NEXT

SEE ALSO

PSYN-968 (Warning) Voltage area %s with guard band margins x=%g and y=%g is overlapping with the neighbouring voltage areas.

DESCRIPTION

This error occurs when user specifies a guard band margin to a voltage area such that it starts overlapping with neighbouring voltage areas.

WHAT NEXT

Either reduce the guard band margin OR re-create the voltage area with proper size so that overlapping can be avoided.

PSYN-969 (Error) Unable to update guard-band value of the VA in in-memory Milkyway database.

DESCRIPTION

This error occurs when tool is unable to update the value of the guard band in the in-memory milkyway CEL.

WHAT NEXT

Ensure all the parameters are correctly specified during VA creation. MW CEL is correctly opened and no errors are there while opening the MW CEL.

PSYN-970 (warning) More than one operating conditions are defined for one hier cell instance.

DESCRIPTION

This error occurs when more than one min or max or normal operating conditions associated with a hier cell instance.

WHAT NEXT

Ensure only one operating condition is defined for one hier cell instance for each min/max/normal type.

PSYN-971 (Warning) Voltage area %s with guard band margins is overlapping with the neighbouring voltage areas.

DESCRIPTION

This error occurs when user specifies a guard band margin to a voltage area such that it starts overlapping with neighbouring voltage areas.

WHAT NEXT

Either reduce the guard band margin OR re-create the voltage area with proper size so that overlapping can be avoided.

PSYN-972 (error) report_congestion failed because some cells are placement illegalized.

DESCRIPTION

This error message occurs when some cells are placement illegalized in the design before call of report_congestion.

WHAT_NEXT

Use the **legalize_placement** command to make the placement legal, and then use **check_legality** command to check the placement legality.

```
legalize_placement (2), check_legality (2).
```

PSYN-973 (Error) %s is not set.

DESCRIPTION

This error occurs when the variable from the user environment does not exist.

WHAT NEXT

SEE ALSO

PSYN-974 (Warning) An attribute with this name is already exposed.

DESCRIPTION

This error occurs when you try to expose an attribute which is already exposed.

WHAT NEXT

SEE ALSO

PSYN-975 (Error) Failed to create region %s.

DESCRIPTION

This error occurs when create region command could not create region for a logical block due to geometry check failures like when the region is not continuous or it is with disjoint rectangles or overlapping with existing regions.

WHAT NEXT

Please check the library setup.

SEE ALSO

PSYN-976 (Error) could not add cell %s to dpi.

DESCRIPTION

This error occurs when the cell could not be placed in a clean area. It may not be placed if the cell already exists or if it is not a standard cell.

WHAT NEXT

Check whether if it is not a standard cell or if it already exists.

SEE ALSO

PSYN-977 (Error) -critical_cells_only option is being used but there are no critical cells in the design.

DESCRIPTION

This error occurs when critical cells only option is used and also there are no critical cells.

WHAT NEXT

When there are no critical cells, do not use the critical cells only option.

SEE ALSO

PSYN-978 (Warning) There is no path between the specified magent and endpoints.

DESCRIPTION

This error occurs when set of eligible cells that lie on a path from startpoint to endpoint can not be generated. So, normal magnet placement will be done.

WHAT NEXT

SEE ALSO

PSYN-979 (Warning) Moving a fixed cell because -move_fixed

specified.

DESCRIPTION

This warning occurs when a fixed cell is moved because move_fixed is specified.

WHAT NEXT

SEE ALSO

PSYN-980 (Warning) Moving a soft fixed cell because -move_soft_fixed specified.

DESCRIPTION

This warning occurs when a soft fixed cell is moved because move_soft_fixed is specified.

WHAT NEXT

SEE ALSO

PSYN-981 (Error) Unrecognized object class %s.

DESCRIPTION

This error occurs when the object class used is not an existing one.

WHAT NEXT

Specify the correct object name and rerun the command.

SEE ALSO

PSYN-982 (Error) Unrecognized object class %s.

DESCRIPTION

This error occurs when the object class used is not an existing one.

WHAT NEXT

Specify the correct object name and rerun the command.

SEE ALSO

PSYN-983 (Error) -class is required for -source option.

DESCRIPTION

The -class is required for -source option when trying to find an attribute using find attribute command.

WHAT NEXT

SEE ALSO

PSYN-984 (Error) attribute %s is not found.

DESCRIPTION

This error occurs when the attribute is not found in the attribute table.

WHAT NEXT

Specify the correct attribute name.

SEE ALSO

PSYN-985 (Error)attribute name %s is already in use.

DESCRIPTION

This error occurs when you are trying to use an attribute which is already in use.

WHAT NEXT

Use new attribute.

SEE ALSO

PSYN-986 (Error) Attempt to alias non-existent attribute %s.

DESCRIPTION

This error occurs when the attribute does not exist in the attribute table and the alias for the attribute can not be created.

WHAT NEXT

Use existing attributes.

SEE ALSO

PSYN-987 (Error) no voltage_area specified for report.

DESCRIPTION

While trying to execute report voltage area command if the voltage area is not specified, this error occurs.

WHAT NEXT

Specify voltage area and rerun the command.

SEE ALSO

PSYN-988 (Error) not able to get extra port instance master data.

DESCRIPTION

This error occurs when extra port instance master data is unable to get when object is deleted or object id is in invalid format.

WHAT NEXT

SEE ALSO

PSYN-989 (Error) could not get cell of this internal pin %s.

DESCRIPTION

This error occurs when the internla pin of a cell can not be obtained while translateing an object for DC to XCLS.

WHAT NEXT

SEE ALSO

PSYN-990 (Error) could not map hier MW port to flat port %d.

DESCRIPTION

This error occurs when hier MW port can not be mapped to flatport.

WHAT NEXT

Use existing attributes.

SEE ALSO

PSYN-991 (Error) Expected AX_HierPortinst_tld or AX_Port_tld for MW id %d.

SH DESCRIPTION

WHAT NEXT

SEE ALSO

PSYN-992 (Error) Could not get type of MW id %d.

SH DESCRIPTION This error occurs when type of MW id can not be get.

WHAT NEXT

SEE ALSO

PSYN-993 (Error) could not get cel_inst from pin.

SH DESCRIPTION While translating an object from DC to XCLS, this error occurs when unable to get cell instance from pin.

WHAT NEXT

SEE ALSO

PSYN-994 (Warning) DC to MW translation failed - no CEL view open.

SH DESCRIPTION This warning occurs when either current status of design is not from MW or CEL view id is not open.

WHAT NEXT

SEE ALSO

PSYN-995 (Warning) ignored object with id %d.

SH DESCRIPTION This warning occurs when it fails to get the MW name of XCLS object.

WHAT NEXT

SEE ALSO

PSYN-996 (Error) Could not call dbGetObjType in xcls_a_port_box.

SH DESCRIPTION This error occurs when object id is not found or deleted it could not call get object type.

WHAT NEXT

SEE ALSO

PSYN-997 (Error) Could not axGetTypedObjData for port bbox.

SH DESCRIPTION

WHAT NEXT

SEE ALSO

ui_galileo_get_hier_cell_inst_of_hier_port_inst(2)

PSYN-998 (Error) cannot find the top cell instance.

SH DESCRIPTION This error occurs the topmost hier cell instance is unable to get.

WHAT NEXT

SEE ALSO

PSYN-999 (Error) can't get bounding box of %s:%s.

SH DESCRIPTION This error occurs when bounding box can not be obtained for object or pin or design or wiring keepout. The error occurs if sufficient core area is not found for design or the design is not found.

WHAT NEXT

SEE ALSO

PSYN-1000 (error) report_congestion fails to report GR congestion data.

DESCRIPTION

This error message occurs when report_congestion fails to read GR congestion data from MW.

WHAT_NEXT

SEE ALSO

PSYN-1001 (error) report_congestion fails due to no CEL associated with current design.

DESCRIPTION

This error message occurs when no CEL is associated with current design.

WHAT_NEXT

SEE ALSO

PSYN-1002 (warning) AHFS skipped the high-fanout net '%s' because %s.

DESCRIPTION

This warning message occurs when AHFS does not buffer a high-fanout net. The possible reasons may be 1) The net is marked as don't touch; 2) The net is tristate net; 3) DRC checking is disabled on the net; 4) The net is constant net; 5) The net is ideal; 6) The net has multiple drivers; 7) Driver pin has no timing arcs; 8) The net is part of the clock network.

WHAT_NEXT

For multi-voltage designs, some net segments may be inferred as don't touch implicitly. You can set the variable "physopt_pccts_dont_touch_support" to true to allow AHFS to work on those nets.

SEE ALSO

PSYN-1003 (warning) '%s'.

DESCRIPTION

This message indicates user uses incorrect hfs mode or variable.

WHAT NEXT

To clarify the proper use of the physopt command you used, see the man page for the command.

PSYN-1004 (error) Invalid value %s for switch '%s'. Valid values

are %s.

DESCRIPTION

You receive this error because the value you specify for the given switch is not valid. Check **set_ahfs_options** man page for more information.

WHAT NEXT

Correct your input by using one of the valid values.

SEE ALSO

`set_ahfs_options(2)`

PSYN-1005 (information) Pin %s is not bufferable for ILM preprocessing as net %s is %s

DESCRIPTION

This message is generated while preprocessing ILMs for high fanout synthesis. You will see this message when a buffer can not be inserted in net.

The current preprocessing of ILMs does not insert buffers if the net is . an ideal . dont touch . three state bus . tristate . drc disabled . multiple driver . constant

WHAT NEXT

This is an informative message. No action required.

SEE ALSO

`PSYN-1006 PSYN-1007`

PSYN-1006 (information) Inserted buffer on net %s for isolating ILM pin %s.

DESCRIPTION

This message is generated while preprocessing ILMs for high fanout synthesis. You will see this message when the preprocessing step inserts a buffer to isolate the ILM pin.

WHAT NEXT

This is an informative message. No action required.

SEE ALSO

PSYN-1005 PSYN-1007

PSYN-1007 (error) No suitable buffer found for isolating %s pin.

DESCRIPTION

This message is generated while preprocessing ILMs for high fanout synthesis. You are seeing this message because preprocessing step was not able to find a suitable buffer in the library to isolate the ILM pin.

WHAT NEXT

Make sure that you have buffer definitions in the library and rerun the high fanout synthesis command.

SEE ALSO

PSYN-1005 PSYN-1006

PSYN-1008 (error) "get_congested_regions -GR" fails to query GR Congested Map sine no GR Congested Map is available

DESCRIPTION

This error message occurs when no GR Congested Map is available

WHAT_NEXT

Please run route_global or report_congestion to build GR Congested Map first.

SEE ALSO

PSYN-1009 (information) A %d row (%.2f micron) radius region

**centered at %.2f,%.2f
has a local density of %.1f%%**

DESCRIPTION

This condition happens when a region of the block being placed has a local density of over 100%. It is only an informational message, and if the results of the placement run are acceptable, then nothing needs to be done.

However, if the legalization step seems to be causing timing degradations, it could be because of these local "hotspots".

WHAT NEXT

Results may improve if these local hot spots can be reduced. You can check the floorplan to see if the hotspots are floorplan related. You could also try turning on area recovery (or running error recovery on a higher effort) or even increasing the size of the core area.

PSYN-1010 (warning) Density is %.1f%%

DESCRIPTION

This message is printed when the density is high going into legalization. If the QOR is acceptable, nothing needs to be done about this. The legalizer can often handle high densities without serious problems.

However, if you are seeing timing degradations during legalization, you might get better QOR if you could reduce the density somewhat.

WHAT NEXT

If necessary, reduce density by either running area recovery at a higher effort, or increase the size of the core area.

**PSYN-1011 (warning) Estimated density including spacing rules
is %.1f%%**

DESCRIPTION

This message is printed when the density is high going into legalization. If the QOR is acceptable, nothing needs to be done about this. The legalizer can often handle high densities without serious problems.

The density number here is somewhat higher than the normal calculation for density because this calculation tries to estimate the amount of "forced" empty sites due to spacing rules.

If you are seeing timing degradations during legalization, you might get better QOR if you could reduce the density somewhat.

WHAT NEXT

If necessary, reduce density by either running area recovery at a higher effort, or increase the size of the core area.

PSYN-1012 (warning) There is high fragmentation caused by many blockages or fixed cells.

The median subrow width (space between blockages) is %d sites

and the median cell width is %d sites. This makes it difficult for the legalizer to pack in the cells and can result in high displacements and long runtimes.

DESCRIPTION

Typically, this message will be printed when there are a large number of fixed cells which fragment the rows and make it difficult for the legalizer to place the remaining cells.

WHAT NEXT

If the QOR is acceptable, then nothing needs to be done. However, if you are seeing poor QOR and if the timing degrades after legalization, then you can probably achieve better QOR by ensuring that fewer cells are fixed.

PSYN-1013 (warning) %.1f%% sites did not pass cell specific legality checks.

If too many callbacks fail, legalization QOR may suffer.

DESCRIPTION

Various rules or conditions can make it illegal for cells to be placed in certain areas of the chip. For example, if there are preroutes (such as power straps), the

location of the pins in a cell may make it illegal for a cell to be placed on some sites. If this happens too often, the legalizer may have difficulty legalizing the design.

WHAT NEXT

If you are not seeing QOR issues, or timing degradations after legalization, then there is nothing that you need to do. In general, the legalizer can handle these illegal sites without a significant degradation. However, if you suspect that legalization is causing timing problems, then you might achieve better if there were less "tricky areas" for the legalizer to deal with. For example, you could try making the power straps complete blockages.

PSYN-1014 (error) Legalizer timed out.

Generally this happens due to bad input that is likely to yield poor QOR anyway. However, if you would like to over-ride this limit,

please set the variable:

```
set legalizer_enable_timeout false
```

DESCRIPTION

When given a poor starting point, the legalizer can sometimes run for a very long time. In general, when this happens, legalization (as well as the following optimizations) can often run for a very long time, and will likely yield poor QOR. This error is an attempt to abort the command before a lot of CPU is wasted to achieve unacceptable results.

WHAT NEXT

If you think that this error can be ignored, you can bypass it by setting the variable `legalizer_enable_timeout` to true.

However, it is more likely that the source of the bad input needs to be fixed. Usually, this error is associated with large "hot spots" that contain over capacity regions, and the legalizer has a hard time spreading out all of the cells. If this happens, you might consider increasing the core area of the block, or turning on higher effort area recovery.

PSYN-1015 (error) Fixed cell '%s' overlaps

fixed cell '%s'.

DESCRIPTION

Fixed cells are not supposed to overlap each other.

WHAT NEXT

Modify the floorplan so the fixed cells are not overlapping each other.

PSYN-1016 (error) Aborting due to high local densities.

Continuing is possible, but will likely result in long runtimes and poor QOR. Add the following command to over-ride this check and continue anyway:

```
set legalizer_skip_overcapacity_check true
```

DESCRIPTION

In general, when this happens, legalization (as well as the following optimizations) can often run for a very long time, and will likely yield poor QOR. This error is an attempt to abort the command before a lot of CPU is wasted to achieve unacceptable results.

WHAT NEXT

If you think that this error can be ignored, you can bypass it by setting the variable `legalizer_skip_overcapacity_check` to `true`.

However, it is more likely that the source of the bad input needs to be fixed. Usually, this error is associated with large "hot spots" that contain over capacity regions, and the legalizer has a hard time spreading out all of the cells. If this happens, you might consider increasing the core area of the block, or turning on higher effort area recovery.

PSYN-1017 (warning) A %d row (%.2f micron) radius region centered at %.2f,%.2f

has a local density of %.1f%%

DESCRIPTION

This condition happens when a region of the block being placed has high local densities. This is a warning because the local densities are high enough that it is likely that QOR will not be acceptable.

However, if the legalization step seems to be causing timing degradations, it could be because of these local "hotspots".

WHAT NEXT

Results may improve if these local hot spots can be reduced. You can check the floorplan to see if the hotspots are floorplan related. You could also try turning on area recovery (or running error recovery on a higher effort) or even increasing the size of the core area.

There is also a chance that the overcapacity region is being caused by a flaw in the tool. If you think this might be the case, please contact Synopsys support.

PSYN-1018 (error) A %d row (%.2f micron) radius region centered at %.2f,%.2f has a local density of %.1f%%

DESCRIPTION

This condition happens when a region of the block being placed has a high local density. An error is generated because the local densities are high enough that poor QOR will almost certainly result.

WHAT NEXT

You can check the floorplan to see if the hotspots are floorplan related. You could also try turning on area recovery (or running error recovery with a higher effort) or even increasing the size of the core area.

Another option would be to try running refine_placement on the over-capacity region to re-place the cells (make sure that you specify a region that is large enough to fit all of the cells).

If you believe that the results will be acceptable despite the local density issues, you can bypass the error by setting the variable `legalizer_skip_overcapacity_check` to true.

There is also a chance that the overcapacity region is being caused by a flaw in the

tool. If you think this might be the case, please contact Synopsys support.

PSYN-1019 (warning) There are %d scan chains with no PARTITION label which can result in lower QoR.

DESCRIPTION

This condition happens when there are scan chains with no PARTITION label. A warning is generated because scan cells in those chains cannot be re-partitioned across the chains, which may result in lower QoR.

WHAT NEXT

You can continue without the PARTITION labels and check the scan chain structure if QoR is low. If you need repartitioning, consider using your DFT-insertion tool to update the SCANDEF to include PARTITION labels.

PSYN-1020 (error) NO SCANCHAIN defined in SCANDEF.

DESCRIPTION

This message appears when there is no SCANDEF data loaded into the Milkyway Database. No physical DFT optimizations can be done without SCANDEF data.

WHAT NEXT

If you want to perform physical scan chain optimizations, you need to load SCANDEF by either read_def or by reading a .ddc with embedded SCANDEF. The SCANDEF data should be consistent with the netlist data to be loaded properly.

PSYN-1021 (error) there are %d components in the SCANDEF of the scan chain

DESCRIPTION

This error lists all components of specific scan chain exist in the SCANDEF, but do not exist in scan netlist.

WHAT NEXT

You need check your scan design flow and load correct SCANDEF file consistent with scan netlist.

PSYN-1022 (error) The pin %s is not connected.

DESCRIPTION

The error reports a specific floating scan in pin in the netlist, which is not connected to any other pin. The scan chain appears broken.

WHAT NEXT

Update the design without any floating pins along the scan path.

PSYN-1023 (error) the pin %s is connected to logic zero.

DESCRIPTION

The error reports a specific problematic scan in pin, which connect to logic zero. The scan chain appears broken.

WHAT NEXT

Update the design without any pins along the scan path tied off. You need check your scan design flow and scan netlist.

PSYN-1024 (error) the pin %s is connected to logic one.

DESCRIPTION

The error reports a specific problematic scan in pin, which connect to logic one. The scan chain appears broken.

WHAT NEXT

Update the design without any pins along the scan path tied off.

PSYN-1025 (error) could not find correspondence in the SCANDEF for netlist output pin %s.

DESCRIPTION

When tracing back on a scan chain, the tool reached a netlist pin for which there is no correspondence found in the SCANDEF. This indicates the SCANDEF data does not correspond to the netlist.

WHAT NEXT

Examine the design netlist to find the pin and its scan path load. Update the SCANDEF to ensure both pins exist and are specified to be in the same chain.

PSYN-1026 (warning) Ordered list checking failed in chain - %s. The connection before %s is inconsistent between the SCANDEF and the netlist.

DESCRIPTION

When the tool is doing backward tracing from CELL's input pin, it cannot reach any of output pins in the SCANDEF. This could be caused by: 1) Inconsistent input pin of CELL specified in warning message. 2) Inconsistent output pin of the previous cell. 3) the previous cell is not specified in the SCANDEF. This inconsistency will not affect the DFT optimization, but the source of the inconsistency should be investigated.

WHAT NEXT

You need to check if there is any of the three violations and make a fix to ensure the SCANDEF is consistent with the netlist.

PSYN-1027 (warning) Ordered list checking failed in chain - %s. There are

DESCRIPTION

When an ordered list is checked, some scan cells specified in the SCANDEF are not found in the netlist accordingly.

This inconsistency will not affect the DFT optimization, but the source of the

inconsistency should be investigated.

WHAT NEXT

You need to check both the SCANDEF and netlist to make them consistent.

PSYN-1028 (Warning) there are '%d' failed scan chains, and these scan chains will not be reordered.

DESCRIPTION

You receive this warning because there are some failed scan chains in the design. This scan chain data corruption prevents the chain order to be optimized.

WHAT NEXT

Use `check_scan_chain` to see which scan chains are not valid. Check your input SCANDEF file to correct the scan data corruption.

SEE ALSO

`check_scan_chain(2)`

PSYN-1029 (error) Pin '%s' appears in several scan chains in the SCANDEF: %s

DESCRIPTION

The specified pin appears in several scan chains as shown. This is not allowed and all the related chains are marked as FAILED.

WHAT NEXT

You need to update the SCANDEF with the true scan chains.

PSYN-1032 (Warning) Command %s option %s will soon

become obsolete.

DESCRIPTION

You receive this warning because this command option is to be obsoleted in the next ICC release.

WHAT NEXT

Contact Synopsys representative regarding replacement command and options.

PSYN-1033 (Warning) Command %s will soon become obsolete.

DESCRIPTION

You receive this warning because this command is to be obsoleted in the next ICC release..

WHAT NEXT

Contact Synopsys representative regarding replacement command.

PT

PT-001 (fatal) %s is not enabled.

DESCRIPTION

The application tried to reserve the specified license, but it was not available.

WHAT NEXT

Verify that the key file is up to date and that sufficient licenses are available.

PT-002 (error) Unrecognized feature name '%s'.

DESCRIPTION

You tried to get or remove a license that does not exist in the key file.

WHAT NEXT

Verify that the key file is up to date and that the feature name is spelled correctly.

PT-003 (information) You already have a '%s' license.

DESCRIPTION

You tried to get a license that is already checked out.

WHAT NEXT

Verify that the feature name is spelled correctly in case it was a different feature that you wanted to get.

PT-004 (error) You don't have a '%s' license to remove.

DESCRIPTION

You tried to remove a license that is not checked out.

WHAT NEXT

Verify that the feature name is spelled correctly in case it was a different feature that you wanted to remove.

PT-005 (error) Can't remove your '%s' license: %s.

DESCRIPTION

You tried to remove a license that is locked by the application. For example, this might be the license that is required to launch the application, or the license might be required by a design that is in memory. The message will indicate the condition that triggered it.

WHAT NEXT

Action based on the message text.

PT-006 (error) %s is not supported on '%s' platform.

DESCRIPTION

This is an error message indicating the command or option is not supported on the specified platform.

WHAT NEXT

Please check the command manpage or product manuals for supported platforms. Make sure you run this command on the platforms that are supported.

PT-007 (warning) %s will be obsoleted and removed from future releases

of %s starting %s on %s platforms.

DESCRIPTION

This is a warning message indicating the specified command, option or variable is in the process of being obsoleted and will not be supported in future releases on the specified platform.

WHAT NEXT

Please check the command/variable manpages, product manuals or release notes for more details about the obsolescence, and whether there are alternative approaches or replacements for this feature being obsoleted.

PT-008 (error) %s has been obsoleted since %s release and is no longer supported on %s platforms.

DESCRIPTION

This is an error message indicating that the specified command, option or variable has been obsoleted and no longer supported on the specified platform.

WHAT NEXT

Please check the command/variable manpages, product manuals or release notes for more details about the obsolescence, and whether there are alternative approaches or replacements for this feature being obsoleted.

PT-009 (warning) The BC_WC analysis mode will be phased out in future releases.

DESCRIPTION

The analysis mode you are setting, best case - worst case, is potentially inaccurate and should be avoided for sign-off. It will be obsoleted in a future release of PrimeTime.

For a thorough analysis, both setup and hold times should be checked at each corner of interest using the on_chip_variation analysis mode. In the BC_WC analysis mode, two corners are analyzed simultaneously. Hold times are checked at the fast (min) corner, and setup times are checked at the slow (max) corner. In the fast corner, fast slews are propagated along both the launch and capture sides of hold timing paths. As a result, worst-case slow timing cannot be guaranteed on the hold capture

paths. In the slow corner, slow slews are propagated along both the launch and capture sides of setup timing paths. Again, worst-case fast timing cannot be guaranteed on the setup capture paths. In addition, the BC_WC analysis is incomplete because setup times are not cross-checked in the fast corner, and hold times are not cross-checked in the slow corner.

WHAT NEXT

Migrate flows and scripts to avoid setting BC_WC analysis mode.

PT-010 (error) %s is not enabled.

DESCRIPTION

The application tried to reserve the specified license, but it was not available.

WHAT NEXT

Verify that the key file is up to date and that sufficient licenses are available.

PT-014 (information) Successfully checked out feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

[PT-018 \(n\)](#).

PT-015 (information) Started queuing for feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE.

WHAT NEXT

This is an informational message only. No action is required on your part.

PT-016 (information) Still waiting for feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

PT-018 (n) .

PT-017 (information) Timeout while waiting for feature '%s'.

DESCRIPTION

You receive this message because you have enabled licensing queuing by setting environment variable SNPSLMD_QUEUE to TRUE in pt_shell.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

PT-018 (n) .

PT-018 (information) License queuing is enabled.

DESCRIPTION

You receive this message because you have enabled licensing queuing.

The license queuing is enabled by setenv SNPSLMD_QUEUE TRUE

When enabled the following timeouts can be adjusted:

Timeout for the initial license: setenv SNPS_MAX_WAITTIME <number of seconds>

Timeout for all subsequent licenses: setenv SNPS_MAX_QUEUEETIME <number of seconds>

Defaults are equivalent to setenv SNPS_MAX_WAITTIME 259200 setenv SNPS_MAX_QUEUEETIME 28800

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

PTE

PTE-001 (Error) There are no arcs from pin '%s' to pin '%s' on cell '%s'.

DESCRIPTION

This error occurs when any arc does not exist between the two pins specified by the -from option and the -to option of `set_disable_timing` or `remove_disable_timing` commands.

WHAT NEXT

Make sure the pins really exist on the cell or the libcell.

PTE-003 (warning) Some timing arcs have been disabled for breaking timing loops
or because of constant propagation. Use the '`report_disable_timing`' command to get the list of these disabled timing arcs.

DESCRIPTION

This message is displayed when timing arcs are disabled by tool to break combinational feedback loops or when propagating constant value due to case analysis. It is not displayed for arcs that are manually disabled with the `set_disable_timing` command.

WHAT NEXT

If you want to manually break a timing loop, examine the design to see why there is combinational feedback, then choose a different point at which to break the loop. To do this, use the `set_disable_timing` command instead of letting the tool automatically break the loop. To see details on the timing loops in the design, use `check_timing -include_loops -verbose`.

EXAMPLE MESSAGE

Warning: Some timing arcs have been disabled for breaking timing loops or because of constant propagation. Use the '`report_disable_timing`' command to get the list of these disabled timing arcs. (PTE-003)

PTE-004 (error) The pin '%s', which is a generated clock pin, is either in a loop or is in the fanout of two clock sources.

DESCRIPTION

The generated clock pin is in a loop or is in the fanout of two clock sources. You cannot have loops in the clock network, nor can you have a generated clock in the fanout of two clock sources.

WHAT NEXT

If it is a loop, break the loop. If the generated clock is in the fanout of two clock sources, try to isolate it or use internal clocks instead.

PTE-005 (information) Invalidating all auto-disabled timing arcs.

DESCRIPTION

Some arcs have been enabled, forcing the tool to do loop detection from scratch. The tool therefore enables all auto-disabled arcs.

WHAT NEXT

To view all timing loops in your design, use `check_timing -loops`. To manually break the loops, use `disable_timing`.

PTE-006 (error) Cannot specify '%s' as the group name.

DESCRIPTION

Some path groups are internal and cannot be modified by you.

WHAT NEXT

Use `group_path` with a valid group name.

PTE-007 (warning) Attempting to remove a clock gating check

that was not previously set.

DESCRIPTION

Removal of clock gating check on an object is valid only if a clock gating check was set before on that object.

WHAT NEXT

This command will be ignored. Please check the spelling of the object for the `remove_clock_gating_check` command.

PTE-008 (error) No%*s* timing arc in cell '%*s*(%*s*)' from pin %*s*'%*s*' to pin '%*s*'.

DESCRIPTION

Some cell timing arcs specified in the SDF file cannot be found in the current design.

WHAT NEXT

Check if your SDF file is up-to-date with your design.

PTE-009 (warning) No %*s* arcs from pin '%*s*'.

DESCRIPTION

Delay annotation does not match netlist. The message is issued because some timing arcs specified in the SDF file, or by `set_annotated_delay` command cannot be found in the current design.

This can happen for example when SDF file was written for one design and applied with `read_sdf` to a different design.

The message is also issued if `set_annotated_delay` command is used to annotate timing arcs that do not exist. For example due to incorrect directions of ports, such as bidirectional pin u1/PAD being connected to a net with single input port IN. Then command `set_annotated_delay -net -from u1/PAD 10.2` results in PTE-009 because arc u1/PAD to IN does not exits.

The message is automatically suppressed when annotating only delta delay.

WHAT NEXT

If the message occurs during read_sdf then check that your SDF file is up-to-date with your design. If the missing arc is due to false path (e.g., in the example above the path from u1/PAD to IN would never be functionally sensitized) then suppress the message.

SEE ALSO

`read_sdf` (2), `set_annotated_delay` (2), `suppress_message` (2), `si_enable_analysis` (3).

PTE-010 (error) No %s arcs to pin '%s'.

DESCRIPTION

Some timing arcs specified in the SDF file cannot be found in the current design.

WHAT NEXT

Check if your SDF file is up-to-date with your design.

PTE-011 (warning) No%s timing arc in cell '%s(%s)' with condition '%s' from pin %s'%s' to pin '%s'.

DESCRIPTION

Some timing arcs specified in the SDF file cannot be found in the current design.

WHAT NEXT

Check if your SDF file is up-to-date with your design.

PTE-012 (warning) A non-unate path in clock network detected. Propagating noninverting sense for clock '%s' to endpoints through pin '%s'.

DESCRIPTION

The clock tree for the specified clock contains non-unate paths. Clock networks

normally do not contain cells such as exclusive-OR gates which have non-unate behavior. This implies that both inverting and noninverting clock waveforms reach the specified pin. Since it is ambiguous PrimeTime always uses the noninverting sense of clock at clock pins down stream from these pins.

WHAT NEXT

If you want to analysis both the inverted and non_inverted clock from this point set the variable `timing_non_unate_clock_compatibility` to false. If you want to control the sense of the clock used through this pin, use the command '`set_clock_sense`'.

PTE-013 (warning) Some clock relationships result in a common base period which require

clock waveforms to be expanded more than 1000 times.

PrimeTime limits

clock waveforms expansion to be no more than 1000. Please check your

clocks and apply `set_false_path` between unrelated clock domains.

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime computes a base period (over all the clocks in the set).

If the large base period is due to the fact that clock periods do not divide evenly then PrimeTime tries to tweak the periods so that they divide evenly. Use `report_clock` to find out the exact clock period used. In any case, the PrimeTime restricts clock waveform expansion to no more than 1000.

Sometimes unexpected clock relationships due to automatically inferred clock-gating checks may cause a very large base period. You can disable clock-gating checks by setting the environment variable `timing_disable_clock_gating_checks` to "true".

WHAT NEXT

Use `set_false_path` to declare that timing paths between unrelated clocks are false.

PTE-014 (error) No net timing arc from pin '%s' to pin '%s'.

DESCRIPTION

There were no timing arcs between the specified pins. You received this error because the net timing arcs specified in the SDF cannot be found in the current design, or the entered command requires the existance of a timing net arc between the two pins.

WHAT NEXT

Check if both nets are connected to the same net. If the error is issued during reading of a SDF file, make sure that the SDF file is up-to-date with your design.

PTE-015 (error) Net delay from pin '%s' to pin '%s' cannot be annotated because of a timing assertion on hierarchical pin '%s'.

DESCRIPTION

When a timing assertion such as create_clock or a max_delay is specified on a hierachical pin, SDF annotation cannot be performed between the 'from_pin' and 'to_pin' of the net. This is because of the net segmentation performed on the hierarchical pin which is inbetween the 'from_pin' and 'to_pin'.

WHAT NEXT

It is recommended that you do not specify timing assertion on hierarchical pins.

PTE-016 (information) Expanding clock '%s' to base period of %.2f (old period was %.2f, added %d edges).

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using

the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime computes a base period (over all the clocks in the set) and expands the clock waveforms to the base period.

WHAT NEXT

It is recommended that you mark paths between unrelated clocks as false.

PTE-017 (information) Inferring %d clock-gating checks.

DESCRIPTION

PrimeTime automatically checks setup and hold violations on gating inputs. This ensures that the clock signal is not interrupted or clipped by the gate. Disable clock gating checks by setting the variable `timing_disable_clock_gating_checks` to true.

WHAT NEXT

To disable automatic inferring of clock-gating checks, set the environment variable `timing_disable_clock_gating_checks` to true.

PTE-018 (information) Abandoning fast timing updates.

DESCRIPTION

PrimeTime has a built-in efficient algorithm to update the timing of a design, after it has been timed at least once, to accommodate a change that requires this update.

When the user makes a change that invalidates the timing of the design such as new assertions, exceptions, etc, PrimeTime automatically tries to do an incremental `update_timing` whenever a query is made that requires a timing update. When the number and severity of changes made since the last update is small, the incremental update provides over 10X runtime improvement over the initial timing update.

However, when those changes are large, the incremental update becomes inefficient. To ensure that the incremental update does not result in any slowdown, PrimeTime automatically switches to update from scratch a larger portion of the design than the portion immediately affected by the changes. This message informs the user of this switching. The incremental update remains faster than the update executed after an `update_timing -full` command.

PrimeTime provides the variable '`timing_update_effort`', which can be set to "low", "medium", and "high" to control the switch to full timing updates. It is unlikely that the user would need to change the default setting of the variable. See the

manual page for this variable for more information.

WHAT NEXT

Use 'set timing_update_effort low' if timing_update_effort is medium. Use 'set timing_update_effort medium' if timing_update_effort is high.

PTE-019 (error) report_delay_calculation is not enabled for library '%s'.

DESCRIPTION

The delay calculation report shows detailed performance information about library cells. By default, cell delay reporting is disabled. The technology library vendor can enable delay calculation for a library by specifying the following in the **.lib** source:

```
library_features(report_delay_calculation);
```

WHAT NEXT

Contact your library vendor to request a library with this feature enabled.

PTE-020 (error) The master clock %s has %d edges in a period. Cannot do frequency multiplication.

DESCRIPTION

If the master clock of a generated clock has more than 3 edges in a period, you cannot generate a frequency multiplied clock from that master clock.

WHAT NEXT

You can use -edges option to generate the clock.

PTE-021 (error) The generated clock '%s' is in the fanout of

clock
source %s.

DESCRIPTION

A generated clock can only be in the fanout of a clock source from which it is generated. Here the generated clock is found to be in the fanout of some other clock source.

WHAT NEXT

Generate this clock from a clock in whose fanout it is in.

PTE-022 (error) Generated clock '%s' is not in the fanout of its master clock.

DESCRIPTION

The generated clock is not in the fanout of the master clock with respect to which it has been defined. A generated clock must be in the fanout of its master clock.

WHAT NEXT

Please check the design and redefine the generated clock to be in the fanout of its master clock.

**PTE-023 (warning) The generated clock '%s' has not been expanded,
please create or activate its master clock.**

DESCRIPTION

A generated clock will not expand if the master clock from which it is generated has not been created or activated. Also if the master clock was given with a -master_clock but does not reach the pin given with -source, this message will be given.

WHAT NEXT

Please create or activate the master of the generated clock or change the -source

pin given. Use the **report_clock** command to see if the master clock is created or inactive.

SEE ALSO

`create_clock(2), set_active_clocks(2), report_clock(2).`

PTE-024 (error) The following generated clocks '%s' form a loop.

DESCRIPTION

The generated clock listed are defined in a loop. A loop of generated clocks is formed in that there is a circular dependency of generated clock to master clock.

For example, if A and B are generated clocks, and A is generated from B, and B is generated from A, there is a circular dependency.

WHAT NEXT

Remove circular dependency in the generated clock sources.

PTE-025 (error) The master of the generated clock '%s' is not connected to any clock source.

DESCRIPTION

The master clock of a generated clock must be either a clock source, or must be connected to a clock source. If it is neither, it is an error.

WHAT NEXT

Make sure that the master source from which the clock is generated is a clock source or is connected to a clock source.

PTE-026 (information) Found %d generated clock master pins

that are not connected to clock sources.

DESCRIPTION

It gives a summary of the number of generated clock master pins that are not connected to clock sources.

WHAT NEXT

For a more detailed description of which generated clock master pins are not connected to any source, do `check_timing -with -verbose` option.

PTE-027 (information) Found %d loops in the generated clock network.

DESCRIPTION

This message gives a summary of the number of loops in the generated clock network. If there is a circular dependency of generated clock sources and its master, there will be a loop in the generated clock network.

WHAT NEXT

To get a more detailed description of where the generated clock loops are, use `check_timing -verbose`.

PTE-028 (warning) The variables
`timing_disable_bus_contention_check`
and `timing_disable_floating_bus_check` are both set to true.
Reverting the
setting of these variables to the default (false) value.

DESCRIPTION

It is a contradiction to set the variables `timing_disable_bus_contention_check` and `timing_disable_floating_bus_check` both to true. This is because setting the variable `timing_disable_bus_contention_check` implies that the user guarantees that on all multi-driven tri-state busses, disabling of the old drivers in the previous clock cycle is done before the enabling of the new drivers in the current clock cycle. This contradicts what is implied by setting the variable

`timing_disable_floating_bus_check` that enabling of the new drivers occurs before disabling of the old drivers. PrimeTime detects this contradiction and resets the value of the two variables to the default (false) value. In most cases, the user need not adjust these default values.

WHAT NEXT

Change your script to set both variables `timing_disable_bus_contention_check` and `timing_disable_floating_bus_check` to false, or to set only one of them to true.

PTE-030 (warning) No annotated %ss from '%s' to '%s'

DESCRIPTION

You attempted to remove an annotated delay or check between two pins and there was no annotation to remove.

WHAT NEXT

Verify that the `-from` and/or `-to` arguments in the command are correct.

PTE-031 (Warning) No annotated timing checks were removed

DESCRIPTION

The `remove_annotated_check` command did not find any checks to remove. If you did not limit the scope of the objects searched, then there are no checks in the design. If you did limit the search to a set of pins, cells, etc., then there are no checks on the objects which you specified.

WHAT NEXT

PTE-032 (Error) Cannot %s annotated check from '%s' to '%s':%s

DESCRIPTION

An attempt to set or remove an annotated check failed because the from and to pins specified are on different cells.

WHAT NEXT

Specify pins which are on the same cell.

PTE-033 (warning) Some related clocks cannot be expanded to a common clock period within the expansion limit of 100 times per pair of related clock. The subject clocks are: %s, %s, ...

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime computes a base period (over all the clocks in the set) and expands the clock waveforms to the base period.

The timing analysis when this warning is present can potentially miss some paths from being analyzed since some clock pulse relations would not be known.

If the large base period is due to the fact that clock periods do not divide evenly then PrimeTime tries to tweak the periods so that they divide evenly. Use **report_clock** to find out the exact clock period used. In any case, the PrimeTime restricts clock waveform expansion to no more than 100 times per pair clocks.

Sometimes unexpected clock relationships due to automatically inferred clock-gating checks may cause a very large base period. You can disable clock-gating checks by setting the environment variable `timing_disable_clock_gating_checks` to "true".

WHAT NEXT

Use **set_false_path** to declare that timing paths between unrelated clocks are false.

PTE-035 (warning) Dynamic loop breaking causes `report_timing` to track a large number of paths; PrimeTime may run out of memory.

Please consider manually breaking some loop paths before

issuing `report_timing`.

DESCRIPTION

You receive this message if the `timing_dynamic_loop_breaking` variable is set to `true` and your design contains a large number of loops, long paths in the loops, and many non-unate arcs in the path. In this case, the `report_timing` command could consume a large amount of memory, eventually causing PrimeTime to run out of memory.

WHAT NEXT

There are two potential solutions, as follows:

1. Manually break some long loops, then reexecute `report_timing`.
2. Reset the `timing_dynamic_loop_breaking` variable to `false` to return to static loop breaking mode, then reexecute `report_timing`. While in dynamic loop breaking mode, use `report_constraint -all_violators` to verify if there are more constraining paths than static loop breaking mode reports. `report_constraint -all_violators` consumes less memory and always works in dynamic loop breaking mode.

PTE-036 (warning) User specified '%s' in set_clock_gating_check command

overwrites what the logic function of the cell or pin implies
that clock gating check at pin '%s' should be against the '%s' of
the clock.

DESCRIPTION

You receive this message if you execute `set_clock_gating_check` with the `-high` or `-low` option, and this specification is different from the PrimeTime inference based on the logic function of the cell. This message warns you that your current specification takes precedence over the PrimeTime inference.

WHAT NEXT

Verify that your specification of `-high` or `-low` is correct; the PrimeTime inference is usually accurate. If you are satisfied that your specification is correct, no action is required on your part. Otherwise, reexecute the `set_clock_gating_check` command and do not specify `-high` or `-low` so that the PrimeTime inference remains.

PTE-037 (information) Issuing set_operating_conditions for

setting analysis mode on_chip_variation.

DESCRIPTION

You receive this message when PrimeTime puts the design in on_chip_variation analysis mode during linking a design. PrimeTime issues a **set_operating_conditions** command with **-analysis_type on_chip_variation**, using best-case and worst-case operating conditions that are the same as the default operating condition in the main library.

WHAT NEXT

This is an informational message only; no action is required on your part.

PTE-038 (warning) Net "%s" has many driver/load combinations (%d); expect performance degradation.

DESCRIPTION

You receive this message if the **update_timing** command finds a net with a large number of driver/load combinations. This message warns you that PrimeTime could run out of memory, because creating net arcs for each driver/load pair is very memory-intensive. You should expect a performance degradation.

WHAT NEXT

PrimeTime can, under certain conditions, reduce the timing arcs in the net's fanin to alleviate the problem. This can be achieved by setting **timing_reduce_multi_drive_net_arcs** to true. Please refer to the man page for **timing_reduce_multi_drive_net_arcs(3)** for more details.

PTE-039 (information) Issuing set_operating_conditions corresponding to timing_slew_propagation_mode setting.

DESCRIPTION

You receive this message when you set the **timing_slew_propagation_mode** variable to **worst_arrival** and have specified a single operating condition using **set_operating_conditions -analysis_type single**. PrimeTime cannot compute accurate transition time for hold timing paths if the analysis type is *single*. In this case, PrimeTime issues this message and executes a **set_operating_conditions** command with **-analysis_type on_chip_variation**, using best-case and worst-case operating conditions that are the same as the single operating condition under which you set the

variable.

Conversely, if you set the **timing_slew_propagation_mode** variable back to its default value of `worst_slew`, PrimeTime again issues this message and executes a **set_operating_conditions** command with **-analysis_type single**.

In both cases, PrimeTime echoes the exact command that was issued.

WHAT NEXT

This is an informational message only; no action is required on your part. However, you can avoid receiving this message by changing your script to use a **set_operating_conditions -analysis_type on_chip_variation** command with an appropriate operating condition.

PTE-040 (Warning) Source Latency defined on pin/port '%s' will overwrite the clock source latency for clock '%s' .

DESCRIPTION

You receive this message if clock source latency is defined for both a clock and its port (source pin). In this case, the source latency for the port takes precedence, because it is more specific.

WHAT NEXT

If it is acceptable to you for the source latency on the specified pin/port to overwrite the clock source latency, no action is required on your part. Otherwise, reexecute the **set_clock_latency** command with the required specifications.

PTE-041 (warning) Unable to find specified driving cell for port '%s':

expected %s/%s %s -> %s.

DESCRIPTION

The driving cell information for the specified port indicates that the port should inherit its drive capability from a certain library cell. This error indicates that the application was unable to locate a matching library cell, a pin on that library cell, or an arc between the pins. This might happen if the **link_path** variable does not contain the library for that cell, or if the cell name or pin name is incorrect. The driving cell information, set by the **set_driving_cell** command, is specified in the text of the message, and you can see it by using the **report_port** command with the **-drive** option.

WHAT NEXT

If the driving cell requires a library that has not been identified in the link path, the **link_path** variable should be changed to include that library. Otherwise, check the information for errors in the library name, library cell name, or library cell pin name.

SEE ALSO

report_port (2), **set_driving_cell** (2), **link_path** (3).

PTE-042 (warning) Conflicted logic driving pin %s, setting resolved logic value %s on pin %s.

DESCRIPTION

You receive this message because, during the propagation of case analysis or logic constants, update_timing detects two conflicting logic values propagated to a pin. (The update_timing may occur as a result of executing the **update_timing** command or other commands, such as **report_timing**.)

For example, if two strong drivers drive a net with one carrying case analysis **0** and the other carrying case analysis **1**, then a logic conflict would arise.

In these situations, **update_timing** resolves the logic conflict to **0** and continues propagating this forward in the design. The message warns you that a logic conflict has occurred at the specified pin and that it has been resolved to the specified logic value.

WHAT NEXT

The case analysis values that propagated to the pin in question should be changed to prevent the logic conflict from arising, if the resolved value propagated forward is unsuitable. To identify the case values causing the problem, perform the following steps:

1. Enable the generation of a case analysis propagation log file by setting the **case_analysis_log_file** variable to a filename of your choice.
2. Reexecute update_timing, and review the log file to determine the reason for the conflicting values.
3. Correct the problem and reexecute **update_timing**.

SEE ALSO

set_case_analysis (2), **report_timing** (2), **update_timing** (2), **case_analysis_log_file** (3).

PTE-044 (warning) In the data check from reference pin '%s' to constraint

pin '%s', multiple clocked signals arrive at the reference pin.
The signal driven by clock '%s' is selected by default. You can use

`set_data_check -clock` to select the clock.

`timing_enable`

DESCRIPTION

You receive this message during data checks performed by `update_timing`, if your design contains multiple clocks per register, the `timing_enable_multiple_clocks_per_reg` variable is set to false, and you did not specify a clock using `set_data_check -clock`. For these conditions, PrimeTime selects a random clock among all clocks that arrive at the reference pin, and issues this message.

PrimeTime supports multiple clocks when the `timing_enable_multiple_clocks_per_reg` variable is at its default setting of true. Normally, if your circuit contains more than one clocked signal that arrives at a reference pin, you should leave this variable at its default setting of true to analyze all clocks, or specify which clock you want to use with `set_data_check -clock`. You can use the `-clock` option even if you are using a library cell for the data check.

If only one clock arrives at the reference pin, you do not need to specify the clock.

WHAT NEXT

If it is acceptable to you for the specified clock to be used by default, no action is required on your part. Otherwise, verify that you intended for multiple clocked signals to arrive at the reference pin of the specified data check. If not, adjust your design accordingly.

If so, do one of the following:

- If you want all clocks to be analyzed simultaneously, set the `timing_enable_multiple_clocks_per_reg` variable to true.
- If you want to select one clock to be analyzed, use `set_data_check -clock` to select the clock to be used.

Finally, reexecute `update_timing`.

SEE ALSO

`set_data_check` (2), `update_timing` (2); `timing_enable_multiple_clocks_per_reg` (3).

PTE-045 (warning) The generated clock '%s' does not have a valid master clock because its master clock has been removed.

DESCRIPTION

When a generated clock is created using -add option , it's master clock must be specified using -master_clock option. But if at a later time, the master clock is deleted then the dependent generated clocks would not have a valid master.

WHAT NEXT

Please make sure if the deletion of master clock is really intended. If it was intended, define a master clock for the generated clock, otherwise the generated clock would not be expanded.

SEE ALSO

`create_generated_clock` (2)

PTE-046 (information) Reducing %d parallel drivers:
Reduction at net: '%s'
Reduced to timing arcs from cell: '%s'

DESCRIPTION

The parallel timing arcs through the specified net will be reduced to a single driver cell for timing analysis purposes. This optimization is triggered when the variable `timing_reduce_multi_drive_net_arcs` is set to true.

WHAT NEXT

Refer to the man pages of `timing_reduce_multi_drive_net_arcs`(3) and `timing_reduce_multi_drive_net_arcs_threshold`(3) for more details.

PTE-047 (information) Cannot reduce parallel timing arcs at net '%s'

which has %d drivers x loads
Reason: Driving cell %s%s%

DESCRIPTION

Even though the net drivers-loads product exceeds the threshold value set in `timing_reduce_multi_drive_net_arcs_threshold(3)`, the cells driving this net will not be reduced for the reason specified.

WHAT NEXT

For more details regarding the restrictions on clock network parallel buffers collapse, check the man pages for `timing_reduce_multi_drive_net_arcs`.

PTE-048 (information) No net arcs %s pin '%s' due to multi-drive timing arcs reduction

DESCRIPTION

The necessary timing arc to annotate does not exist because it was subject to parallel drivers reduction instigated by setting `timing_reduce_multi_drive_net_arcs` to true. Annotations specified as such will be ignored.

WHAT NEXT

For more details regarding reducing multi-drivers in the clock network, check the man pages for `timing_reduce_multi_drive_net_arcs`. These messages may be suppressed using the following command: "suppress_message PTE-048".

PTE-049 (warning) power rails of operating condition on port '%s' are incompatible with power rails of driving cell '%s'. Driving cell ignored.

DESCRIPTION

The power rails specified in the library of a driving cell must be a subset of those specified in the operating condition. Rails are matched by name, and the order of rails must also be identical.

WHAT NEXT

Consider another operating condition or driving cell.

SEE ALSO

```
report_port (2), set_operating_condition (2), create_operating_condition (2),  
set_driving_cell (2),
```

PTE-051 (warning) Using minimum CRP value due to mismatch in the launching and %s clock edges at the common point.

DESCRIPTION

You receive this message when you execute the `report_crpr` command. This message will occur for one of two reasons. One, the transition sense of the launching and capturing clocks at the common point differ. For example, a rising clock edge through the common point triggers the launching register and a falling clock edge through the common point triggers the capturing register. Two, the capturing register is a level-sensitive latch. In this case two CRP values will be calculated, one corresponding to the opening edge and one corresponding to the closing edge. This means that there will be a mismatch in one of these CRP values and the minimum CRP value will be used.

WHAT NEXT

For the case when the capturing device is a level-sensitive device the report should clearly indicate what edge is using the minimum CRP.

SEE ALSO

```
timing_remove_clock_reconvergence_pessimism (3), report_crpr (2).
```

PTE-052 (warning) For computing a common base period for a number of clocks

PrimeTime limits the waveform expansion of the smallest period to be no more than %d times and the waveform expansion of the largest period to be no more than %d times.

Since the largest period is too large compared to the smallest period,

no common base period is possible satisfying these limits, and PrimeTime has taken the largest period as the common base period

but still has not expanded the smallest period beyond its limit.

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime computes a base period (over all the clocks in the set).

PrimeTime must ensure that the common base period of a set of related clocks is evenly divisible by every clock in the set. Since clock periods can be arbitrary floating-point numbers, this may require some adjustments to the clock periods. Moreover, to prevent the common base period from becoming too large, PrimeTime must restrict clock waveform expansions by the limits mentioned in the warning message.

Therefore, three cases can occur while computing the common base period: (1) The largest clock period is so large compared to the smallest clock period that no common base period can be computed satisfying the limits. In this case, PrimeTime takes the largest clock period as the common base period but still does not expand the smallest period beyond its limit; (2) A common base period is computed but it has to be decreased to satisfy the limits; and (3) A common base period is computed and it already satisfies the limits. This warning message handles the first case.

Sometimes unexpected clock relationships due to automatically inferred clock-gating checks may cause a very large common base period. You can disable clock-gating checks by setting the environment variable `timing_disable_clock_gating_checks` to "true".

WHAT NEXT

Use `set_false_path` to declare that timing paths between unrelated clocks are false.

PTE-053 (warning) For computing a common base period for a number of clocks

PrimeTime limits the waveform expansion of the smallest period to be no more than %d times and the waveform expansion of the largest period to be no more than %d times.

PrimeTime has computed a common base period bounded by these limits.

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime computes a base period (over all the clocks in the set).

PrimeTime must ensure that the common base period of a set of related clocks is evenly divisible by every clock in the set. Since clock periods can be arbitrary floating-point numbers, this may require some adjustments to the clock periods. Moreover, to prevent the common base period from becoming too large, PrimeTime must restrict clock waveform expansions by the limits mentioned in the warning message.

Therefore, three cases can occur while computing the common base period: (1) The largest clock period is so large compared to the smallest clock period that no common base period can be computed satisfying the limits. In this case, PrimeTime takes the largest clock period as the common base period but still does not expand the smallest period beyond its limit; (2) A common base period is computed but it has to be decreased to satisfy the limits; and (3) A common base period is computed and it already satisfies the limits. This warning message handles the second case.

Sometimes unexpected clock relationships due to automatically inferred clock-gating checks may cause a very large common base period. You can disable clock-gating checks by setting the environment variable `timing_disable_clock_gating_checks` to "true".

WHAT NEXT

Use `set_false_path` to declare that timing paths between unrelated clocks are false.

PTE-054 (Information) Zero transition time used at to pin of annotated arcs. Delays on not annotated delay arcs will be estimated using best available slew.

DESCRIPTION

This message is issued when `timing_use_zero_slew_for_annotation_arcs` has been set to TRUE. This functionality is intended for use only on a design that is completely (or almost completely) SDF annotated, and in a flow which does not require transition times.

WHAT NEXT

See man page of **timing_use_zero_slew_for_annotated_arcs** for more details on this functionality.

PTE-055 (warning) Variable "%s" must be set before link

DESCRIPTION

The PrimeTime variable indicated can only be consumed before the design is linked. That is, the current change in value will only be honored the next time the link_design command is invoked.

WHAT NEXT

Please verify that the current setting is correct. If so, either invoke the link_design command or move the variable setting to a position prior to invoking the link_design command and rerun your script.

SEE ALSO

timing_propagate_through_unclocked_registers (3)

PTE-056 (Warning) Due to the value set by timing_crpr_threshold_ps, the CRP displayed in the timing_report will lie in the range: %g < CRP < %g.

DESCRIPTION

You receive this message when you execute the **report_crpr** command. In order to reduce the computational complexity of deriving a CRP value during update_timing, different compute mechanisme are utilized in the production of the CRP values for **report_timing** and **report_crpr**. This may result in a difference between the CRP values produced by report_timing and report_crpr. The difference will not be greater than the value of the variable, **timing_crpr_threshold** and will lie in the range: CRP(report_crpr)-threshold < CRP < CRP(report_crpr). Hence, the value of CRP used in report_timing, if different to report_crpr, will always be more pessimistic.

WHAT NEXT

If more accuracy is required in the CRP value issued by **report_timing** set the variable **timing_crpr_threshold_ps** to a lower value and execute a full **update_timing**. Setting the variable ftiming_crpr_threshold_ps to a low value will result in significantly increased runtime and memory usage.

SEE ALSO

`report_crpr (2), timing_remove_clock_reconvergence_pessimism (3),
timing_crpr_threshold_ps (3).`

PTE-057 (Warning) Transition times on not annotated delay arcs have been set to zero. Cannot perform max_transition checking.

DESCRIPTION

This message is issued only when `timing_use_zero_slew_for_annotated_arcs` has been set to `TRUE`. Enabling the functionality of this variable causes transitions times on fully annotated delay arcs to be set to zero. For this reason, `report_constraint -max_transition` is disabled.

WHAT NEXT

See man page of `timing_use_zero_slew_for_annotated_arcs` for more details on this functionality. Setting this variable to `FALSE` will re-enable calculation of slews, and max_transition constraint checking.

PTE-058 (Warning) `timing_use_zero_slew_for_annotated_arcs` will be disabled when slew propagation mode is not `worst_slew`.

DESCRIPTION

The functionality enabled by `timing_use_zero_slew_for_annotated_arcs` is compatible only with `worst_slew` slew propagation and will not be invoked when `timing_slew_propagation_mode` is set to anything other than `worst_slew`.

WHAT NEXT

See man page of `timing_use_zero_slew_for_annotated_arcs` for more details on this functionality.

PTE-059 (Error) `timing_use_zero_slew_for_annotated_arcs` cannot be enabled unless `timing_slew_propagation_mode` is

wost_slew.

DESCRIPTION

The functionality enabled by `timing_use_zero_slew_for_annotation_arcs` is compatible only with `worst_slew B slew propagation mode`.

WHAT NEXT

Setting `timing_slew_propagation_mode` to `worst_slew` will allow `timing_use_zero_slew_for_annotation_arcs` to be enabled. See man page of `timing_use_zero_slew_for_annotation_arcs` for more details on this functionality.

PTE-060 (warning) No clock-gating check is inferred for clock %s at pins %s and %s of cell %s.

DESCRIPTION

Unless the variable `timing_disable_clock_gating_checks` is set to true, PrimeTime automatically infers clock-gating checks. For this cell, PrimeTime cannot infer a clock-gating check. This happens because the logic of this cell does not provide enough information to determine whether to perform a gating check on the high level or low level of the input clock signal.

WHAT NEXT

Use `set_clock_gating_check` with either the `-high` or `-low` option to specify the level of the clock.

PTE-061 (Warning) Since the launching device is a level-sensitive latch and the variable `timing_early_launch_at_borrowing_latches` is set to TRUE, the CRP for any paths launched from the latch data pin will be zero.

DESCRIPTION

You receive this message when you execute the `report_crpr` command. Since the same (early) clock arrival time is used to both launch and capture data at a level-sensitive latch with borrow, normal application of CRPR may be optimistic. For this

reason the CRP is set to zero for such paths. For more details see the man page for the variable **timing_early_launch_at_borrowing_latches**.

WHAT NEXT

In order to apply CRPR to paths launched from a borrowing data pin set the variable **timing_early_launch_at_borrowing_latches** to FALSE. This is recommended for PrimeTime to minimize the overall pessimism throughout a latch-based design.

SEE ALSO

`report_crpr (2), timing_remove_clock_reconvergence_pessimism (3),
timing_early_launch_at_borrowing_latches (3).`

PTE-062 (information) Accepted db inherited disable timing arcs to break loops.

DESCRIPTION

Accepted db inherited disable timing arcs to break loops due to a true value of the variable **timing_keep_loop_breaking_disabled_arcs**. Variable **timing_keep_loop_breaking_disabled_arcs** is false by default.

There may still be loops in the design that the db inherited disabled timing arcs did not break, they are broken using the default loop breaking technique.

There is a difference between DC and PT where additional `set_case_analysis` and `set_disable_timing` commands will not remove db inherited disabled timing arcs.

A boolean attribute **is_db_inherited_disabled** has been added to the class `timing_arcs`, where true indicates an arc is a db inherited disabled arc.

The command **remove_disable_timing** may be used to remove db inherited disabled timing arcs, since these arcs are considered to be under user control.

To remove all db inherited disable timing arcs for loop breaking, issue command
`remove_disable_timing [get_timing_arcs -of [get_cell *] -filter
"is_db_inherited_disabled == true"]`

SEE ALSO

`report_disable_timing (2), timing_keep_loop_breaking_disabled_arcs (3).`

PTE-063 (warning) Resetting value of variable

timing_keep_loop_breaking_disabled_arcs will have no effect.

DESCRIPTION

Resetting value of variable **timing_keep_loop_breaking_disabled_arcs** will have no effect after accepting db inherited disable timing arcs to break loops. This value of this variable is only checked during linking.

If the user wishes to remove the db inherited disable timing arcs, issue command
remove_disable_timing [get_timing_arcs -of [get_cell *] -filter
"is_db_inherited_disabled == true"]

SEE ALSO

report_disable_timing (2), **timing_keep_loop_breaking_disabled_arcs** (3).

PTE-064 (information) Related clock set %d includes clock '%s' with period %.2f.

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime assigns an integer identification number and computes a base period (over all the clocks in the set). This message says that this clock is a member of this clock set.

WHAT NEXT

It is recommended that you mark paths between unrelated clocks as false.

SEE ALSO

set_clock_groups (2), **set_false_path** (2).

PTE-065 (information) Related clock set %d has base period

%.2f.

DESCRIPTION

Two clocks are related if there exists a true path between them. They can also be related if they are respectively related to a third clock. For example, if CLK1 is related to CLK2 and CLK2 is related to CLK3, then CLK1 is related to CLK3. That is, CLK1 is related to CLK3 even though there may not be a true path between them. Using the relatedness relation, PrimeTime partitions the clocks in the design into mutually exclusive (related) clock sets. For each clock set, PrimeTime assigns an integer identification number and computes a base period (over all the clocks in the set). This message shows the base period of this clock set.

WHAT NEXT

It is recommended that you mark paths between unrelated clocks as false.

SEE ALSO

`set_clock_groups` (2), `set_false_path` (2).

PTE-066 (Warning) Setting

`timing_use_zero_slew_for_annotated_arcs` to true since more than 95 percent of delay arcs are annotated. Zero transition time will be used at pins of annotated arcs. Delays on not annotated delay arcs will be estimated using best available slew.

DESCRIPTION

When `report_annotated_delay`, called implicitly following a `read_sdf` finds that more than 95 percent of delay arcs on a design have annotated values, the variable `timing_use_zero_slew_for_annotated_arcs` is set to true. This functionality enabled with the variable is intended for use on a design that is completely (or almost completely) SDF annotated, and in a flow which does not require transition times.

WHAT NEXT

See man page of `timing_use_zero_slew_for_annotated_arcs` for more details on this functionality.

To avoid this variable being automatically switched on following a `read_sdf`, use `read_sdf -quiet`.

PTE-067 (warning) Setting this variable to a lower value can cause a significant performance degradation during a timing update.

DESCRIPTION

You receive this message when setting the variable `timing_crpr_threshold_ps`. Turning CRPR on can cause a noticeable performance degradation both in terms of CPU and capacity. Further to this, setting the variable to values lower than the default (20ps) can further degrade performance with little corresponding increase in the accuracy of the CRP calculation. See the man page for `timing_crpr_threshold_ps` for more details.

WHAT NEXT

The recommended setting for the variable `timing_crpr_threshold_ps` is about one half of the stage (gate plus net) delay of a typical stage in the clock network.

PTE-068 (information) Using CRPR on a pre-layout clock network can cause performance degradation during a timing update.

DESCRIPTION

You receive this message during a timing update. The CRPR algorithm is optimized for post layout clock networks. Because of this fact it is not recommended to use this algorithm on a pre-layout (pre-clock tree synthesis) clock network as it can lead to degradation in both CPU performance and in capacity.

WHAT NEXT

In order to alleviate performance concerns turn CRPR off by setting the variable `timing_remove_clock_reconvergence_pessimism` to false.

SEE ALSO

`timing_remove_clock_reconvergence_pessimism` (3).

PTE-069 (error) The requested clock sense at pin '%s' for clock '%s' does not exist.

Propagating the '%s' sense of the clock through this pin.

DESCRIPTION

There is a 'set_clock_sense' directive at the pin given and the requested clock sense does not exist at the pin for the given clock. This may be due to a conflicting 'set_clock_sense' directive on a previous pin or it may be because the only clock paths to that pin are not of the sense requested.

WHAT NEXT

Remove the conflicting 'set_clock_sense' directives.

PTE-070 (information) A non-unate path in clock network detected.

Propagating both inverting and noninverting senses of clock '%s' from pin '%s'.

DESCRIPTION

The clock tree for the specified clock contains non-unate paths. Clock networks normally do not contain cells such as exclusive-OR gates which have non-unate behavior. This implies that both inverting and noninverting clock waveforms reach the specified pin. This is an informational message that such a pin has been detected and that PrimeTime is propagating both senses of clock.

WHAT NEXT

If you want to control the sense of the clock used through this pin, use the command 'set_clock_sense'.

PTE-071 (warning) The '%s' edge of clock '%s' through pin '%s' causes the clock to both rise and fall. A generated clock is needed at this pin.

DESCRIPTION

The clock tree for the specified clock contains two half unate paths such that the clock edge given causes both a rising and falling clock edges and the other edge of

clock causes no change. This type of edge relationship requires that a generated clock be added. In the 'create_generated_clock' command, use of non-monotonic edges such as (1 1 3) or (2 2 4).

WHAT NEXT

Place a generated clock at the given pin.

PTE-072 (Warning) SI analysis is not enabled, therefore the adaptive CRPR engine will not be used.

DESCRIPTION

You receive this message during a timing update if the variable **timing_crpr_enable_adaptive_engine** is set to TRUE and SI analysis is turned off (**si_enable_analysis**). The adaptive CRPR engine applicable only when SI is turned on therefore will have no effect on the non-SI timing update.

See the man page for **timing_crpr_enable_adaptive_engine** for more details.

WHAT NEXT

If the users intention is to perform an SI analysis then set the variable **si_enable_analysis** to TRUE. Otherwise turn off the adaptive CRPR engine by setting **timing_crpr_enable_adaptive_engine** to FALSE.

SEE ALSO

timing_crpr_enable_adaptive_engine (3), **timing_remove_clock_reconvergence_pessimism** (3).

PTE-073 (Warning) Turning off Adaptive CRPR.

DESCRIPTION

You receive this message during a timing update if the variable **timing_crpr_enable_adaptive_engine** is set to TRUE and either the max SI iteration count (set by **si_xtalk_exit_on_max_iteration_count**) or the max SI incremental iteration count (set by **si_xtalk_exit_on_max_iteration_count_incr**) is set to 1.

The adaptive CRPR engine requires at least two SI iterations to perform its analysis. Because of this the adaptive engine is turned off and standard CRPR analysis is performed.

See the man page for **timing_crpr_enable_adaptive_engine** for more details.

WHAT NEXT

Set the variable `si_xtalk_exit_on_max_iteration_count` to at least 2 and repeat the timing update.

SEE ALSO

`si_xtalk_exit_on_max_iteration_count` (3) `timing_crpr_enable_adaptive_engine` (3),
`timing_remove_clock_reconvergence_pessimism` (3).

PTE-074 (warning) At pin '%s' clock '%s' does not have the needed %s edge.

DESCRIPTION

The clock tree contains half unate timing arcs or disable timing commands that have disabled the needed rise or fall edge. The register clock pin given will not have the clock assigned to it and will not be timed.

WHAT NEXT

Alter clock network to propagate the needed clock edge to this register.

PTE-075 (warning) Generated clock '%s' has no path to its master clock.

DESCRIPTION

The generated clock has no path to the master clock on which it has been defined. This may be because there is no physical path, or because the generated clock has been defined as a -combinational and the generated clock is not in the direct fanout of the master clock. A propagated source latency of zero will be used from the master clock to the generated clock.

WHAT NEXT

Please check the design and redefine the generated clock to be in the fanout of its master clock.

DESCRIPTION

To conserve memory, PrimeTime retains arrival, required and slack information only where necessary to service the timing update and standard reporting requirements. This warning was issued to indicate that the command the user issued does not work under the current analysis settings.

WHAT NEXT

No explicit action is required on your part - under these circumstances PrimeTime adjusts the analysis settings as needed, updates timing and proceeds with the execution of the command.

SEE ALSO

`timing_save_pin_arrival_and_slack (3)` `timing_save_pin_arrival_and_required (3)`

DESCRIPTION

This command requires that additional slack-related info be available throughout the design for execution. To produce this information, an additional timing update will be incurred. In order to avoid the extra CPU cost of this additional update the variable should be set to TRUE before the initial timing update in this flow.

WHAT NEXT

The optimal flow for any commands requiring pin arrivals and slacks is to set the associated variable to TRUE before the initial timing update. This prevents the need for additional work before a command requiring arrivals and slacks is executed.

PTE-079 (Warning) The %s attribute does not exist on the given pin because %s is set to FALSE.

DESCRIPTION

To conserve memory, PrimeTime retains arrival, required and slack information only where necessary to service the timing update and standard reporting requirements. This warning was issued to indicate that the attribute the user queried does not exist for the given pin under the current analysis settings.

WHAT NEXT

Set the variable appearing in the warning message to TRUE.

SEE ALSO

`timing_save_pin_arrival_and_slack (3) timing_save_pin_arrival_and_required (3)`

PTE-080 (Error) pulse clock sense merging at pin: '%s'

for clock: '%s'

The clock will not propagate forward from this pin.

DESCRIPTION

A pulse clock is combinationally combining with another sense of the same clock. PrimeTime does not resolve this conflict. Any registers down stream from this point will be have this clock assigned to them.

WHAT NEXT

Resolve the conflict by specifying the sense of the clock used through this pin by using the command '`set_clock_sense`'.

PTE-081 (error) Can not honor set_clock_sense -pulse option at pin '%s'.

Clock '%s' is missing needed rise and/or fall, or has conflicting high or low pulse types at this pin

DESCRIPTION

The user has specified a `set_clock_sense -pulse` option at the given pin. The needed clock senses were not available at this pin. For example, a '`rise_triggered_high_pulse`' expects to find a clock source rise to this pin rise path and a clock source rise to this pin fall path. If both paths can not be found this message will be issued. There can be conflict between the pulse type propagating and that set by `set_clock_sense -pulse`. For example, if the propagating pulse is high and user sets a low pulse type at a pin, then this message will be issued. The pulse clock assignment for registers down stream from this pin will not be correct.

WHAT NEXT

Change the options to the command '`set_clock_sense`'.

PTE-082 (warning) Connected pin groups were detected that may generate a very large number of loops. Please check the validity of this feedback logic by inspecting the connected pin groups above. Dynamic loop breaking is being disabled.

DESCRIPTION

The design contains one or more regions of logic which have combinational feedback. PrimeTime has identified these regions of connected pin groups which have the potential to generate a large number of combinational loops. Because the number of loops increases exponentially with the number of pins, these regions have the potential to exceed the limits of the machine during dynamic loop breaking. Dynamic loop breaking is being disabled.

WHAT NEXT

Check the listed pin groups to ensure that the combinational feedback loops are expected and correct in the design. If they are unavoidable, manually disable dynamic loop breaking by setting the variable timing_dynamic_loop_breaking to false.

PTE-083 (warning) Connected pin groups were detected that generate a large number of loops. Here is the connected pin group that has generated the largest number of loops so far. Dynamic loop breaking will continue, which may exceed the machine's capabilities.

DESCRIPTION

The design contains one or more regions of logic which have combinational feedback. PrimeTime has identified a region of logic which has a very large number of combinational loops. The pins in this group will be reported, and PrimeTime will continue to attempt dynamic loop breaking. This may result in exceeding the limits of the machine. The system may become unstable and an "out of memory" error may occur.

WHAT NEXT

Check the listed pin groups to ensure that the combinational feedback loops are expected and correct in the design. If they are unavoidable and dynamic loop breaking proves to be too costly, manually disable dynamic loop breaking by setting the variable `timing_dynamic_loop_breaking` to false.

PTE-084 (warning) Parasitics on the net "%s" have been overridden, because the net is part of an ideal network.

DESCRIPTION

This message is displayed during a timing update for ideal nets that have parasitics annotated. The effect of leaving ideal networks in the design is that the parasitics are ignored and the net delay is ideal. This may obscure timing violations.

WHAT NEXT

To display the ideal networks in the design use the `report_ideal_network` command. To remove ideal networks that are not intended use the `remove_ideal_network` command.

SEE ALSO

`remove_ideal_network` (2), `report_ideal_network` (2).

PTE-085 (Warning) the calculated SHPR curve is not monotonic.

DESCRIPTION

The calculated interdependent setup/hold curve is not monotonic. The results of `setup_hold_pessimism_reduction` (SHPR) may be inaccurate.

WHAT NEXT

Check SHPR library data of setup/hold value and make sure they are characterized properly.

PTE-086 (Warning) Target constraint value is beyond the boundary of characterized SHPR library. Using nearest

boundary value instead.

DESCRIPTION

The target constraint value, which is required by SHPR optimization parameter, is beyond the boundary of characterized SHPR library. To avoid optimism, PrimeTime uses the nearest boundary value as the updated target constraint value.

WHAT NEXT

Check SHPR library data of setup/hold value and make sure they are characterized properly and the characterization scale covers the target constraint value.

PTE-087 (Warning) %s constraint set on %s '%s' will be ignored.

DESCRIPTION

Pulse clock constraint set on the design, lib cell, instance or clock will be ignored. This can be due to the fact that the design may not have any pulse generator cells, the constrained lib cell may not be a pulse generator or is not instantiated in the design, the constrained instance is not a pulse generator or the clock may not drive any pulse generators.

WHAT NEXT

PTE-088 (Information) report_analysis_coverage was reported with timing_enable_pulse_clock_constraints variable set to FALSE.

DESCRIPTION

timing_enable_pulse_clock_constraints was set to FALSE during report_analysis_coverage for -check_type min_pulse_width and then set to its preset value i.e. TRUE after reporting.

WHAT NEXT

PTE-089 (Warning) Abandoning distributed timing update.

DESCRIPTION

PrimeTime was unable to successfully perform a distributed timing update and has set the **multi_core_enable_analysis** variable to FALSE.

WHAT NEXT

PTE-090 (Error) No output clock defined on the output '%s' of the PLL.

DESCRIPTION

You receive this message if the design has a PLL and there is no clock defined on the output that is connected to the feedback pin of the PLL.

WHAT NEXT

You should define a generated clock at the output of every PLL using the **create_generated_clock** command with the required specifications.

PTE-091 (Error) The feedback pin '%s' has no path to its PLL output clock.

DESCRIPTION

You receive this message if the design has a PLL and the feedback path is not connected correctly. Ideally, the feedback pin of a PLL should be connected to an output pin of the PLL. In addition, a generated clock should be defined on the output that is connected to the feedback pin.

WHAT NEXT

You should check that there is a path from the output of the PLL to the feedback pin. In addition, define a generated clock at the output of every PLL using the **create_generated_clock** command with the required specifications.

PTE-092 (Warning) The timing arcs from the reference pin to the output pin of the PLL '%s' are not unate. Not performing the PLL adjustment.

DESCRIPTION

You receive this message if the library model of the PLL does not have unate arcs from the reference clock pin to the output clock pin.

WHAT NEXT

PTE-093 (Warning) the -delay_calculation_only_mode flag is ignored because of the current variable settings

DESCRIPTION

You may receive this message in the following case(s) :

```
timing_use_zero_slew_for_annotated_arcs == true
```

WHAT NEXT

PTE-094 (Warning) the si_xtalk_exit_on_max_iteration_count variable is ignored; only one iteration is performed

DESCRIPTION

You receive this warning because the **-delay_calculation_only_mode** option of the **write_sdf** command is exclusive with:

```
si_enable_analysis==true and si_xtalk_exit_on_max_iteration_count>1
```

Since only one iteration is performed, the results may be less accurate (but always pessimistic.)

WHAT NEXT

Do nothing if this behavior is acceptable to you or remove the **-delay_calculation_only_mode** option if you insist in running multiple SI iterations. Note the general issue that using SDF generated after several SI iterations can lead

to optimistic results if not done properly.

PTE-095 (Error) Generated clock is not defined on the output pin of the PLL connected to the feedback pin; not performing the PLL correction.

DESCRIPTION

You receive this error because PLL cell output defined using **-pll_output** connected to the feedback pin defined using **-pll_feedback** does not have a generated clock defined on it.

Since the generated clock is not defined, no PLL correction would be performed.

WHAT NEXT

If you want to perform PLL correction, define a generated clock at the PLL output connected to the feedback pin of the PLL.

PTE-096 (Warning) The variable multi_core_enable_analysis has been automatically set to FALSE as the following flow is not supported - '%s'. The update will now complete in scalar mode and no remote processes will be launched.

DESCRIPTION

You have attempted to perform a distributed update_timing but PrimeTime has detected a flow which is not supported in distributed mode. All remote_processes will be killed and your update will now complete as a scalar update.

WHAT NEXT

You can continue with your timing analysis. All commands will execute in scalar mode.

PWR

PWR-1 (error) Clock '%s' has not been created.

DESCRIPTION

The clock '%s' has not been created in the design.

WHAT NEXT

Use the `create_clock` command to create a clock and define its period.

PWR-2 (error) The static probability must have a value between 0 and 1.

DESCRIPTION

The static probability argument cannot be greater than 1 or less than 0.

WHAT NEXT

Use a legal value for the `static_probability` field of the `set_switching_activity` command.

PWR-3 (error) The toggle rate value must be non-negative.

DESCRIPTION

A signal's toggle rate represents the number of transitions the signal makes during a specific amount of time. This must be a non-negative number.

WHAT NEXT

Use a legal value for the `toggle_rate` field of the `set_switching_activity` command.

PWR-4 (error) The period value must be greater than 0.

DESCRIPTION

The period argument represents the time over which the transitions in the toggle_rate argument occur. This must be a positive number.

WHAT NEXT

Use a legal value (that is, a value greater than 0) for the period field of the `set_switching_activity` command.

PWR-5 (warning) -period and -clock option both specified. Using the value from -period.

DESCRIPTION

The -period and -clock option are mutually exclusive. Both are used to specify a time period to scale the toggle rate value. Only one option is necessary.

WHAT NEXT

This is a warning.

PWR-6 (information) Propagating switching activity (%s effort %S).

DESCRIPTION

Power Compiler is estimating the power switching activity of all the design nets. The switching activity estimation mechanism uses the switching activity that has been annotated by the user to derive the switching activity of the unannotated design nets. The user can annotate switching activity using the `read_saif`, `set_switching_activity` and `merge_saif` commands.

WHAT NEXT

This is an information message. No user action is required.

PWR-7 (error) Unknown value '%s' for option '-power_mode' of

psynopt command.

DESCRIPTION

The '-power_mode' of psynopt command only accepts the value none, all, leakage, dynamic, only_power, only_leakage and only_dynamic. The specified value is not one of them.

WHAT NEXT

Please correct the option value and run the command again.

PWR-8 (warning) Gate level '%s' power optimization is not turned on in the place_opt/psynopt command, and '%s' power constraints is ignored.

DESCRIPTION

Gate level power optimization will only be run when proper value is specified for '-power_mode' option of the place_opt/psynopt command and there are corresponding power constraints.

WHAT NEXT

Please check the option of place_opt/psynopt and make sure power is turned on.

PWR-9 (error) Unknown value '%s' for option '-power_mode' of place_opt command.

DESCRIPTION

The '-power_mode' of place_opt command only accepts the value none, all, and leakage. The specified value is not one of them.

WHAT NEXT

Please correct the option value and run the command again.

PWR-10 (warning) Black-box output '%s/%s' has not

been annotated with switching information. Using default values of (%f, %f) for static probability and toggle rate, respectively.

DESCRIPTION

The specified black-box output pin does not have any functional description. Therefore, the tool cannot estimate the switching activity of that output as a function of the cell's input switching activities. In addition, the pin's net has not been annotated with switching activity information.

In this case, the tool assumes some default switching activity for the output pin. Usually, DesignPower will try to generate a reasonable default based on the switching activity of the clock(s) in the design. Therefore, you should make sure that you have defined valid clocks for the design so that the tool will use reasonable defaults. You can use the **report_clocks** command to check the design's clocks.

WHAT NEXT

Use the **set_switching_activity** command to explicitly specify switching activity information for this pin.

PWR-11 (warning) Breaking combinational loop at cell '%s'. This cell
will be treated as a primary input for purposes of power estimation.

DESCRIPTION

There are combinational loops in the design. During probabilistic mode, all combinational loops are broken and the "loop-breakers" are treated as primary inputs. The tool assumes a default switching activity for the output pin of the cell. The static probability is set to 0.5, and the toggle rate is set to 0.5. In order to get around the default behaviour, you can use commands such as **disable_timing** to break loops and annotate the correct switching information for such cells. To find the combinational loops in the design, use the **report_timing** command with the **-loops** option.

WHAT NEXT

Use the **set_switching_activity** command to explicitly specify correct switching activity information for the output of this cell.

PWR-12 (warning) The derived %s value (%f) for the clock net '%s' conflicts with the annotated value (%f). Using the %s value.

DESCRIPTION

One or more of the toggle rate and static probability switching activity values annotates on the clock net using the `read_saif` or `set_switching_activity` commands does not match the value derived from the clock net. The switching activity value annotated by the user is used for power calculation.

This warning indicates that the switching activity values annotated by the user may be invalid.

WHAT NEXT

The warning message contains both the derived and annotated switching activity values. Compare the two values, the difference might be very small, in which case the calculated power values will use a slightly inaccurate clock rate.

If the user annotated switching activity values are obtained by simulation then the clocks used during simulation is different from the one used for synthesis, or that the target library time units are different from the time units used by simulation. In either case, the annotated switching activities may give invalid dynamic power calculations. Check the annotated switching activity values. If you used the `read_saif` command, make sure that you specified the target library time unit using the `-scale` and `-unit` options.

PWR-13 (error) Target library(s) are not characterized for internal power. Compile with power constraints is NOT recommended.

DESCRIPTION

This error is issued when the `compile` command is invoked with a dynamic (or total) power constraint (see `set_dynamic_power`) and the target libraries has not been characterized for cell internal power. Without internal power information, power optimization proceeds but reduces power due only to net and pin capacitance. Without internal power characterized libraries, using compile with power constraints can lead to increased power.

WHAT NEXT

This is a error. It is highly recommended that a version of the target libraries characterized for internal power be obtained from the library vendor.

PWR-14 (warning) Clock %s no longer exists. set_switching_activity will be discarded for net %s.

DESCRIPTION

This warning occurs when toggle information for the net is specified with the -clock option of the **set_switching_activity** command and the given clock no longer exists in the design.

WHAT NEXT

This is a warning. The switching activity previously annotated on the net is discarded. **report_power** calculates switching_activity values for the net.

PWR-15 (information) Net '%s' has a static probability value but no toggle rate. Estimating the toggle rate from the static probability.

DESCRIPTION

The specified net was explicitly annotated with a static probability value, but it was not given a toggle rate. Toggle rates indicate the number of transitions that a net makes during a specified period of time.

Using the static probability value for the net, the tool will estimate the net's toggle rate (as $2*sp*[1-sp]$).

WHAT NEXT

If the estimate is acceptable, nothing needs to be done. However, if the estimate is inaccurate, use the **set_switching_activity** command to explicitly specify a toggle rate for the net.

Alternatively, the **set_switching_activity** command can be used to remove the static_probability value for the specified net and allow the probabilistic analysis feature to estimate the toggle rate for that net given toggle rates for the design's primary inputs.

PWR-16 (information) Design '%s' does not have any dynamic power information. Use the report_power command to perform a

dynamic power analysis of the design.

DESCRIPTION

The design must undergo power analysis to compute the dynamic power values for the entire design. This message indicates that the design has not undergone power analysis; therefore, dynamic power information is not available for the design.

WHAT NEXT

Use the `report_power` command to force a dynamic power analysis of the design. Then proceed normally; the design should then have dynamic power information.

PWR-17 (warning) There is set_max_%s_power constraint unit but the library is unitless.

DESCRIPTION

`set_max_dynamic/leakage/total_power` has been specified but the library parameters are without units (eg. nW, mV). During power analysis, the units specified with `set_max_dynamic/leakage/total_power` will be ignored and all comparisons will be unitless. During optimization, total power will still be defined as a weighted sum of dynamic and leakage power, although no unit conversions will be performed. This may result in undesirable results, since typically libraries have different units for dynamic and leakage power.

WHAT NEXT

This is a warning. Ask your vendor to provide units in the library.

PWR-18 (warning) There is conflicting switching activity information on %s %s.

DESCRIPTION

This error occurs when there are two or more nets, pins, or ports on the same hierarchical net with different switching activity information. In such cases the switching activity information having the highest toggle rate is used for power calculations.

WHAT NEXT

This is a warning message.

PWR-19 (warning) There are %d switching activity information conflicts.

DESCRIPTION

This error occurs when there are two or more nets, pins, or ports on the same hierarchical net with different switching activity information. In such cases the switching activity information having the highest toggle rate is used for power calculations.

WHAT NEXT

For more detailed warning messages, unsuppress the PWR-18 warning message.

PWR-20 (error) Object '%s' is not a %s.

DESCRIPTION

The -only argument of the report_power command should contain a list of cells if the -cell flag is specified; a list of nets of the -net flag is specified; and a list of cells and nets if both -net and -cell are specified.

WHAT NEXT

Re-invoke the command with a valid object list with the -only argument.

PWR-21 (warning) The %s option must be positive.

DESCRIPTION

A positive number was expected for the specified option. Instead a negative number or zero was specified as the value for the option. The value will be overwritten with the default of infinity (max_int), and the command will proceed normally.

WHAT NEXT

This is a warning; the command will resume normally with the default value for the

option. In the future, a positive value should be specified for this option.

PWR-22 (warning) The %s can only be used in conjunction with the %s.

DESCRIPTION

An invalid combination of options has been specified. The first option(s) will be ignored (default value will be used), and the command will continue normally.

WHAT NEXT

This is a warning; the command will resume normally with the default value for the specified option(s). Refer to the appropriate documentation for correct usage of the option(s).

PWR-23 (error) '%s' is not a valid value for the '%s' option.

DESCRIPTION

The command was issued with an invalid option argument.

WHAT NEXT

Refer to the usage statement (or the command's documentation) for this command for a list of the valid values for the option. To see the usage statement, use the -help option of the command. Rerun the command with a valid value for the option.

PWR-24 (information) The target library(s) contains cell(s), other than black boxes, that are not characterized for internal power.

DESCRIPTION

This informational message is issued when the **compile** command is invoked with a dynamic (or total) power constraint (see **set_max_dynamic_power** or **set_max_total_power**) and the target library(s) contains cells which have not been characterized for cell internal power. Power optimization will proceed but will reduce power due only to net and pin capacitance for those cells that have not been characterized for internal power.

WHAT NEXT

This is an informational message. Check with your library vendor to make sure that all non black box, non IO pad cells are characterized for internal power.

PWR-25 (information) The design contains cell(s), other than black boxes, that are not characterized for internal power.

DESCRIPTION

This informational message is issued when the **report_power** command is invoked and the design contains some cells which are characterized for power and others that are not. Report_power will proceed but will report power due only to net and pin capacitance for those cells that have not been characterized for internal power.

WHAT NEXT

This is an informational message. Check with your library vendor to make sure that all non black box, non IO pad cells are characterized for internal power.

PWR-26 (warning) The library cells used by your design are not characterized for internal power.

DESCRIPTION

This warning is issued when the **report_power** command is invoked and all of the library cells which are used by your design have not been characterized for cell internal power. Without internal power information, report_power proceeds but reports power due only to net and pin capacitance. Without internal power characterized libraries, using compile with power constraints can lead to increased power.

WHAT NEXT

This is a warning. It is highly recommended that a version of the library(s) characterized for internal power be obtained from the library vendor.

PWR-27 (warning) The design %s has been mapped to the gate.

rtl2saif only works on the pre-mapped GTECH level netlist.

DESCRIPTION

This warning is issued because part of the circuit has been mapped into the gate. The **rtl2saif** command only works on the pre-mapped GETCH level netlist. If your design has been mapped to the gate, none of the sequential elements inside the design will be reported by **rtl2saif**.

WHAT NEXT

This is a warning. It is highly recommended that you use **rtl2saif** only on pre-mapped GTECH level netlist.

PWR-28 (error) Can't set both `-dynamic_weight` and `-leakage_weight` to 0.0 in `set_max_total_power` command.

DESCRIPTION

This error message is issued because both the values of `-dynamic_weight` and `-leakage_weight` are 0.0.

WHAT NEXT

Check and correct the options of `set_max_total_power` command.

PWR-29 (warning) Unknown '`%s`' power effort in '`set_max_total/dynamic/leakage_power` commands'.

DESCRIPTION

This error message is issued because the value of `-effort` is not as expected in `set_max_total/dynamic/leakage_power` commands. The option will be ignored.

WHAT NEXT

Check and correct the options for `set_max_total/dynamic/leakage_power` command.

PWR-30 (warning) The `%s` option cannot be used in conjunction

with the %s option(s). The %s option is ignored.

DESCRIPTION

An invalid combination of options has been specified. One of the options will be ignored, and the default value will be used; then, the command will continue normally.

WHAT NEXT

This is a warning; the command will resume normally with the default value of the specified option. Refer to the appropriate documentation for correct usage of the options.

PWR-31 (error) No valid %s specified.

DESCRIPTION

The -only argument needs a list of cells if -cell is specified; a list of nets if -net is specified; and a list of nets and cells if both -cell and -net are specified. Note that if both -cell and -net are specified the -only argument should contain at least one cell and at least one net.

WHAT NEXT

Re-invoke the command with a valid list of objects in the -only argument and with a valid combination of the -cell and -net flags.

PWR-32 (error) Sort mode '%s' applies only to the %s option.

DESCRIPTION

An invalid sort_mode value was specified. The sort_mode should be applicable to cells if the -cell option is specified; to nets if the -net option is specified; and to both nets and cells if both -net and -cell are specified.

WHAT NEXT

Refer to the usage statement of this command for a list of the valid sort modes. To see the usage statement, use the -help option of the command.

PWR-33 (error) Transition_type must be either rising or falling.

DESCRIPTION

An invalid transition_type option was set. The transition_type option takes only "rising" or "falling". It is case sensitive.

WHAT NEXT

Respecify `set_switching_activity` command with a valid transition_type option.

PWR-34 (warning) %d incomplete rise or fall specifications for pin %s of cell %s.

DESCRIPTION

There were a certain number of user specified rise (fall) toggle rates without the corresponding fall (rise) toggle rates. Design power assumes that the rise and fall toggle rates are the same and annotate the corresponding toggle rates which were left unspecified. However, for completeness, you should specify both rising and falling toggle rates.

WHAT NEXT

If you want the rise and fall toggle rates to be equal, proceed with `report_power`. However, if the rise and fall toggle rates should be different, specify the missing toggle rate specifications with `set_switching_activity`.

PWR-35 (warning) Incorrect state-dependent static probability for cell %s. This state-dependent static probability is being ignored.

DESCRIPTION

The user-specified state-dependent static probability does not match the state-dependent leakage power tables on the library cell. Therefore, this user-specified state-dependent static probability is ignored. The user-specified conditions for static probability must be logically equivalent to those on the leakage power groups of the library cell.

WHAT NEXT

Do `report_lib -power` to see the leakage power state dependencies. You can then redo `set_switching_activity` to respecify the state-dependent static probabilities. If user-specified state-dependent static probabilities are not provided, `report_power` computes them.

PWR-36 (warning) The static probabilities specified on cell %s add up to more than 1. These probabilities are being scaled.

DESCRIPTION

The static probability information you provided for this cell is not accurate. The static probability for each state condition in the state-dependent leakage power model adds up to more than 1. The sum of the leakage power states must add up to 1. Therefore, the static probability for each leakage state is scaled to add up to 1.

WHAT NEXT

If the scaled values are OK, go ahead with `report_power`. Otherwise, reset the switching activity using `set_switching_activity`. To see the leakage power state dependencies, use `report_lib -power`.

PWR-37 (warning) The static probabilities specified on cell %s add up to less than 1. These probabilities are being scaled.

DESCRIPTION

The static probability information you provided for this cell is not accurate. The static probability for each state condition in the state-dependent leakage power model adds up to less than 1. The sum of the leakage power states must add up to 1. Therefore, the static probability for each leakage state is scaled to add up to 1.

WHAT NEXT

If the scaled values are OK, go ahead with `report_power`. Otherwise, reset the switching activity using `set_switching_activity`. To see the leakage power state dependencies, use `report_lib -power`.

PWR-38 (warning) Overriding existing static probability for same

condition on cell %s.

DESCRIPTION

There was already a previous user-specified static probability for the same condition for this cell. Therefore, the old specification is ignored.

WHAT NEXT

If you want the old static probability for this condition for this cell, respecify it using `set_switching_activity`. Otherwise, proceed with `report_power`.

PWR-39 (warning) Low effort leakage power optimization is suggested not to use with `-use_sd_info` option.

DESCRIPTION

Using state dependent information to calculate leakage power can slow down the performance. In the case of low effort, the state dependent leakage power information does not help a lot on the quality of the results, but will make the tool run slower. It's suggested that low effort leakage power optimization should not be used together with `-use_sd_info` option.

WHAT NEXT

To consider state dependent leakage power in optimization, please use high effort mode, otherwise please remove the `-use_sd_info` option.

PWR-40 (error) Unable to obtain a Power-Analysis license.

DESCRIPTION

Power commands such as `report_power` or `report_constraints` require that a Power-Analysis key be checked out.

WHAT NEXT

To determine who is using the Power-Analysis license, use the `license_users` command. Should problems occur with the license server, contact your system administrator.

PWR-41 (error) The '%s' command is not supported in dp_shell.

DESCRIPTION

This error occurs when a valid Design Compiler command is used, but the command is not supported in **dp_shell**, the power-analysis user interface. Commands such as **compile** are supported only in **dc_shell**, and are ignored in **dp_shell**.

WHAT NEXT

If you need to use the command, use the **dc_shell** program instead.

PWR-42 (warning) Unable to obtain a HighLevel-Power-Analysis license.

DESCRIPTION

The command **report_power** for unmapped parts requires that a HighLevel-Power-Analysis key be checked out. The **report_power** command will proceed but will only analyze gate-level mapped parts.

WHAT NEXT

To determine who is using the HighLevel-Power-Analysis license, use the **license_users** command. If problems occur with the license server, contact your system administrator.

PWR-43 (information) Processing library '%s' for lib2saif information.

DESCRIPTION

Power Compiler is processing the specified library in order to obtain the power characterization information needed for generating a forward SDPD library SAIF file.

WHAT NEXT

This is an information message. Very large libraries with detailed power characterization may take a few minutes to load and process the required information.

PWR-44 (information) Library SAIF file generated %s RISE/FALL dependent path dependent directives.

DESCRIPTION

The forward SAIF file generated by the lib2saif command can include directives to generate separate rise and fall values for path-dependent toggle rates that are not state-dependent. The variable **power_lib2saif_rise_fall_pd** controls the generation of such directives. Generating separate rise and fall values results in better accuracy, but older simulators and SAIF generation applications may not be able to understand such directives. The SAIF generation PLI provided with X-2005.09 supports such directives but older versions do not.

WHAT NEXT

Check whether the client reading the generated forward SAIF file supports path-dependent toggle rate directives for separate rise and fall values, and set the value of the **power_lib2saif_rise_fall_pd** variable accordingly.

PWR-50 (warning) Switching activity has been annotated on nets connected to combinational logic. This information may be lost during a full compile.

DESCRIPTION

This warning is issued when the **compile** command is invoked with a dynamic (or total) power constraint (see **set_max_dynamic_power**, **set_max_total_power**) and switching activity has been annotated on nets connected to combinational logic (see **set_switching_activity**). The switching activity values might be discarded because a full **compile** might map the logic to a new structure with different switching activity. However, switching activity annotated to primary input ports and sequential outputs are preserved.

WHAT NEXT

This is a warning. Use the **-incremental** option of **compile** if the design is fully mapped and you want to preserve as much switching activity as possible.

PWR-51 (error) Cannot read library %s.

DESCRIPTION

The library or one of the libraries in the **lib2saif** specification could not be found. The libraries must be in .db form (not .lib form) and must be accessible from the search_path variables.

WHAT NEXT

Update the search_path to include the path to this library or respecify **lib2saif** with the whole path of this library.

PWR-52 (error) Cannot find file name to write state and path dependent SAIF forward-annotation file.

DESCRIPTION

There is no file specified to write the state-dependent and path-dependent SAIF forward annotation file. Specify the -output option for the **lib2saif** command or set the variable power_sdःpd_saif_file to something other than "".

WHAT NEXT

Either modify the power_sdःpd_saif_file variable or specify the -output option for the **lib2saif** command.

PWR-53 (error) Cannot open file %s to be written.

DESCRIPTION

The file where the forward-annotation SAIF file created by the *lib2saif* command is to be written is not able to be written. This file is specified with the -output option on the **lib2saif** command or by the variable power_sdःpd_saif_file. This file needs to be specified.

WHAT NEXT

Change the permissions for this file or respecify another file name using the -output option of **lib2saif** or changing the power_sdःpd_saif_file variable. To see the current value of the power_sdःpd_saif_file variable, use **list -variables power**.

PWR-54 (error) The number of library files and library paths must be the same.

DESCRIPTION

If the `-lib_pathname` option is specified with the **lib2saif** command, the number of libraries and number of library path names must be the same. The library path name is used to tell the simulator where the library is. The number of library path names need to be the same as the number of libraries to associate the correct path name with the correct library.

WHAT NEXT

Respecify the **lib2saif** command without any `-lib_pathname` options or with the same number of libraries and library path names. If a particular library does not have a path name just specify " " for its path name.

PWR-55 (warning) The library does not contain SDPD power information, or SDPD information is not needed in the SAIF file.

DESCRIPTION

The **lib2saif** command only works with a library that contains cells with state and/or path dependent internal power and/or state dependent leakage power characterization. If the library does not contain such SDPD power characterization, or if the SDPD power information in the library is not needed, then no forward SAIF information is generated.

The SAIF file generated by the **lib2saif** command excludes certain SDPD information that is not needed to generate backward SAIF files with complete switching activity information. For example, if the internal power of a cell pin is fully characterized by only one SDPD table, then the SDPD characterization for this pin is not needed in the library forward SAIF file, since SDPD toggle rate information can be accurately derived from the non-SDPD toggle rate on the cell pin. (Basically, the SDPD toggle rate for the power table is exactly equal to the SDPD toggle rate on the pin.) Note, that the internal power characterization on the output pins of single input buffers and inverters are usually characterized this way.

WHAT NEXT

Check your library and make sure it has cells with SDPD power characterization.

PWR-56 (warning) The bus naming style specified, %s, is

invalid.

DESCRIPTION

The bus naming style specified is invalid. This `bus_naming_style` will be ignored and the default `bus_naming_style`. If this is not your intent please specify a valid `bus_naming_style`.

WHAT NEXT

If you are happy with the default, you need to do nothing. Otherwise, you need to change the `bus_naming_style` to a valid one.

PWR-57 (error) Target libraries must be specified when running power analysis.

DESCRIPTION

You must either set the `target_libraries` variable or set the `-target_libs` option on the command line. In order to do rtl level power analysis, we need to know the target library to correlate power numbers.

WHAT NEXT

Specify the `target_libraries` variable or use the `-target_lib` option.

PWR-58 (error) The value of `-dynamic_weight` or `-leakage_weight` is negative.

DESCRIPTION

This error message is issued because the value of `-dynamic_weight` or `-leakage_weight` is negative which is not an acceptable value.

WHAT NEXT

Check and correct the options of `set_max_total_power` command.

PWR-59 (warning) Ignoring 'power_effort' option since there is

no power constraint.

DESCRIPTION

You receive this message if you specify **compile -power_effort**, but there is no power constraint for the current design. In this case, power optimization will not be enabled, and **-power_effort** is ignored.

WHAT NEXT

Set power constraints.

PWR-60 (error) The time unit in the -unit option must be one of these: s, ms, us, ns, ps, fs.

DESCRIPTION

The -unit option specifies the synthesis base time unit. It can be either s, ms, us, ns, ps, or fs. If not specified, the default is ns.

WHAT NEXT

Re-invoke the command with a valid time unit.

PWR-61 (error) Invalid -scale value, the valid -scale values are 1, 10, and 100.

DESCRIPTION

The -scale option specifies the scale factor of the synthesis time unit. It can be 1, 10 or 100. If not specified, the default is 1.

WHAT NEXT

Re-invoke the command with a valid value for the -scale argument.

PWR-62 (warning) The -unit_base option is not specified, the

default is ns.

DESCRIPTION

The **-unit_base** option specifies the base unit of the intended synthesis time unit. It can be either **us**, or **ns**, or **ps**. The synthesis time unit is usually obtained from the target library. However, if the target library is not available when the user applies the **read_saif** command, the **-scale** and **-unit_base** arguments can be used to specify the intended synthesis time unit.

WHAT NEXT

Specify the -scale and -unit and options if the intended synthesis time unit is not 1 ns.

PWR-63 (warning) The -scale option is not specified, the default is 1.

DESCRIPTION

The **-scale** option specifies the scaling factor of the intended synthesis time unit. It can be either **1**, **10**, or **100**. The synthesis time unit is usually obtained from the target library. However, if the target library is not available when the user applies the **read_saif** command, the **-scale** and **-unit_base** arguments can be used to specify the intended synthesis time unit.

WHAT NEXT

Specify the -scale and -unit and options if the intended synthesis time unit is not 1 ns.

PWR-64 (warning) The -strip option is obsolete in this release. PowerCompiler will use it as if the -instance option is specified. In the future, please use the -instance option.

DESCRIPTION

The -strip option is no longer supported. Instead, the user should use -instance option to indicate which instance in the SAIF file will be annotated on the current design.

WHAT NEXT

Please see the man page for `read_saif` on the usage of `-instance` option.

PWR-65 (error) Conflicting -instance and -strip options specified.

DESCRIPTION

The `-strip` option is obsolete, and is not required if the `-instance` option is specified. This error occurs when the `-strip` and `-instance` options are specified and their arguments are different. If the command is invoked with the same `-strip` and `-instance` arguments, then the `-strip` argument is ignored.

WHAT NEXT

Re-invoke the command with a valid `-instance` option, and without the `-strip` option.

PWR-66 (information) Please use '%s' variable for the related feature.

DESCRIPTION

The message indicates that this variable may be used to turn on and off a feature. The old way to turn on and off this feature has been obsolete.

WHAT NEXT

Use this variable to turn on and off the feature.

PWR-68 (warning) Variable '%s' is obsolete.

DESCRIPTION

The message indicates that the variable used to control power optimization is no longer supported.

WHAT NEXT

No action.

PWR-70 (warning) The cell %s does not comply with the bus naming style

DESCRIPTION

The current `bus_naming_style` does not match the name of the cell. Please check the style and correct it appropriately.

WHAT NEXT

This is a warning.

PWR-71 (warning) The bus naming style %s is not supported.

DESCRIPTION

The bus naming styles supported now must match the pattern of "`*%s?%d*`". zero or more separators, and ? means one or more separators. Only two bus naming styles are supported at this moment: `%s[%d]` and `%s_%d`.

WHAT NEXT

This is a warning.

PWR-72 (error) The path_dep option must be a pin or set of pins on cell %s

DESCRIPTION

The path dependent option must contain pins that are on the same cell as the pin for which you are specifying the `set_switching_activity`. This pin or set of pins should be the name of the pins, such as Z, A, or B, not an instance specific pin such as U1/Z.

WHAT NEXT

If you want to specify a path-dependent toggle rate, respecify `set_switching_activity` with a pin name or set of pin names which are on the same cell that the toggle rate is being specified for.

PWR-73 (error) The path source '%s' is not a valid pin name for the cell instance '%s'.

DESCRIPTION

The given path source does not specify a pin name. The path source needs to be a valid library cell pin name for the cell that is being annotated with switching activity. Also note that it needs to be just the simple name instead of the hierarchical pin name; for example "U1/A" is not valid, but "A" is.

WHAT NEXT

Use a valid path source.

PWR-74 (error) Specification of state-dependent toggle rate must be for a pin.

DESCRIPTION

When specifying a state-dependent toggle rate, it must be for a pin. In other words, the <object_list> portion of the **set_switching_activity** command must have exactly 1 pin. State-dependent toggle rates for cells or ports are not allowed.

WHAT NEXT

Respecify **set_switching_activity** with a pin.

PWR-75 (error) The conditions in the state-dependent toggle rate must be in terms of pins on that cell.

DESCRIPTION

The state_dep option must be a boolean equation of pins that are on the same cell as the pin for which you specify the **set_switching_activity**. The pins in the condition should be the name of the pins, such as A and B, not an instance specific pin such as U1/A.

WHAT NEXT

If you want to specify a state-dependent toggle rate, respecify **wfIset_switching_activity** with a boolean equation of pins that are on the same cell

that the toggle rate is specified for.

PWR-76 (warning) The current static probability on %s is different from the existing one. Using new static probability.

DESCRIPTION

There was a previously set user-specified static probability for this object. The new user-specified static probability takes precedence over the previously specified one.

WHAT NEXT

If the new static probability is what you want, continue. Otherwise, respecify the old value using **set_switching_activity**.

PWR-77 (error) Specification of a path-dependent toggle rate can only be for an output or inout pin.

DESCRIPTION

When specifying a path-dependent toggle rate, the <object_list> portion of the **set_switching_activity** command must be an output or an inout pin. This is because path dependency does not work for input pins.

WHAT NEXT

To specify toggle rates on input pins, respecify **set_switching_activity** without the -path_dep option. To specify a path-dependent switching activity, you must use -path_dep and an output pin like the <object_list>.

PWR-78 (error) The path_dep option must contain either input or inout pins.

DESCRIPTION

The path dependent option must contain input or inout pins that are on the same cell as the pin for which you are specifying the **set_switching_activity**. This pin or set of pins should be the name of the pins, such as Z, A, or B, not an instance specific pin such as U1/Z. It does not make sense to have path dependency from output pins,

so only input or inout pins are allowed in the -path_dep option.

WHAT NEXT

To specify a path-dependent toggle rate, respecify **set_switching_activity** with an input/inout pin name or set of input/inout pin names that are on the same cell that the toggle rate is specified for.

PWR-79 (error) The start and end point of a path must be different pins.

DESCRIPTION

Any pin in the -path_dep option and the <object_list> of the *set_switching_activity* command cannot be the same pin. This is because you cannot have path dependency from one pin to itself.

WHAT NEXT

If you want to specify a path-dependent toggle rate, respecify *set_switching_activity* with pins in the -path_dep option that are different from the one in the <object_list>.

PWR-80 (warning) There is no defined clock in %s.

DESCRIPTION

This warning occurs when there is no clock in the entire design (or in a scenario for multi-scenario designs). For the purposes of power analysis, the cycle based simulation requires reference timing unit which is obtained from design clock. The latter can be virtual. In case no clock has been created, the library timing unit is used as a reference unit for the simulation.

WHAT NEXT

This is a warning. Use **create_clock** to define the clocks of the design.

PWR-81 (warning) Sequential cell %s with no output activity

annotation.

DESCRIPTION

This warning occurs when there is a sequential cell with no switching activity annotated on either of its outputs. In this case, DesignPower will propagate the switching activity from the cell's inputs, however, to increase the accuracy of the power estimation, annotate the outputs with valid switching activity.

WHAT NEXT

This is a warning. Annotate the outputs with valid switching activity.

PWR-82 (error) Incorrect toggle rate specification for %s.

Specification of state-dependent, path-dependent, or separate specification of rise/fall toggle rates must be for a pin.

DESCRIPTION

When specifying state-dependent, path-dependent, or separate rise/fall toggle rates, the `<object_list>` of the `set_switching_activity` command must be a pin. Cells and ports are not allowed.

WHAT NEXT

Only specify state-dependent, path-dependent, or separate rise/fall toggle rates on pins.

PWR-83 (error) Specification of state-dependent static probability must be for a cell.

DESCRIPTION

When using the `-static_prob` and `-state_dep` options of the `set_switching_activity` command, you can only have cells in the `<object_list>`.

WHAT NEXT

To specify state-dependent static probabilities, use a cell in the `<object_list>` of the `Set_switching_activity` command.

PWR-84 (error) Specification of a path-dependent toggle rate must be for only one pin.

DESCRIPTION

When specifying a path-dependent toggle rate, the <object_list> portion of the **set_switching_activity** command must be for only one output or inout pin.

WHAT NEXT

To specify toggle rates on input pins, respecify *set_switching_activity* without the -path_dep option. To specify a path-dependent switching activity, use -path-dep and only one output/inout pin as the <object_list>.

PWR-85 (error) Specification of a path-dependent toggle rate must be for a pin.

DESCRIPTION

When specifying a path-dependent toggle rate, the <object_list> portion of the **set_switching_activity** command must be an output or an inout pin. Cells and ports are not allowed for path-dependent toggle rates.

WHAT NEXT

To specify toggle rates on input pins, respecify *set_switching_activity* without the -path_dep option. To specify a path-dependent switching activity, use -path-dep and an output/inout pin as the <object_list>.

PWR-86 (warning) The option '%s' of '%s' command is obsolete.

DESCRIPTION

The message indicates that the option of the command is obsolete. Although it may still work, users are recommended to use the proposed new interface if the feature still exists.

WHAT NEXT

Change to the new interface.

PWR-87 (warning) The state dependent toggle rate specification for pin %s of cell %s does not match the state dependent specification for the library cell. Ignoring this toggle.

DESCRIPTION

The state dependencies specified for toggle rates must be the same state dependencies specified on the library cell. If the state dependencies do not match, your specified toggle rate is ignored.

WHAT NEXT

To see the state dependencies on the library cell, use *report_lib -power*. To respecify state-dependent toggle rates use *set_switching_activity* with the *-state_dep* options.

PWR-88 (warning) The path-dependent toggle rate specification for pin %s of cell %s is not complete, all of the related pins are not specified.

DESCRIPTION

This pin of this cell has a path-dependent internal power model in its library cell. The path-dependent toggle rate you specified did not take into account all of the paths specified in the library. Therefore, the path-dependent toggle rates you specified will be ignored for this pin.

WHAT NEXT

To see the path dependencies in the library cells use *report_lib -power*. Then use *set_switching_activity* with the *-path_dep* option to specify all of the path dependencies. If you want *report_power* to proceed with calculated toggle rates, just continue.

PWR-89 (warning) Multiple equivalent path-dependent toggle rate specifications for pin %s of cell %s. Ignoring all your toggle

rate specifications for this pin.

DESCRIPTION

You specified two or more equivalent path-dependent toggle rates. Therefore, all your specified toggle rates for this pin will be ignored.

WHAT NEXT

To override path-dependent toggle rates, first delete the old toggle rates using `set_switching_activity <pin>`. Then you can respecify the path-dependent toggle rate using the `-path_dep` option of `set_switching_activity`. If it is alright to use calculated path-dependent toggle rates, proceed with `report_power`.

PWR-90 (warning) There was an extra rise/fall toggle rate specification for pin %s of cell %. Because all of the state and path dependencies for this pin were already specified, this specification is ignored.

DESCRIPTION

The user specified a rise/fall toggle rate without any state or path dependencies. Because this cell had state and path dependent switching activity already specified, these rise/fall toggle rates are ignored.

WHAT NEXT

Remove the other toggle rates using `/fIset_switching_activity/fP <pin>` and respecify only the rise/fall toggle rates. Otherwise, if it is acceptable that the rise/fall toggle rates are ignored, proceed with `/fIreport_power/fP`.

PWR-91 (warning) The state dependent toggle rate specification for pin %s of cell %s is not complete. All states must be specified.

DESCRIPTION

This pin of this cell has a state-dependent internal power model in its library cell. You specified state-depedent toggle rates that did not cover all of the state dependencies specified for this library cell.

WHAT NEXT

To see the state dependencies in the library cells use `report_lib -power`, then use `/fIset_switching_activity/fP` with the `-state_dep` options to specify all of the state dependencies. If you want `report_power` to proceed with calculated toggle rates, just continue.

PWR-92 (warning) Too many state or path dependent toggle rate specifications for pins %s of cell %. Ignoring all user-specified toggle rates for this pin.

DESCRIPTION

You specified two or more equivalent path-dependent or state-dependent toggle rates. Therefore, all user specified toggle rates for this pin will be ignored. To override path-dependent or state-dependent toggle rates, first delete the old toggle rates using `set_switching_activity <pin>`.

WHAT NEXT

To override state-dependent or path-dependent toggle rates, first delete the old toggle rates using `set_switching_activity <pin>`. Then you can respecify the state-dependent or path-dependent toggle rate using the `-state_dep` or `-path_dep` options of `set_switching_activity`. If it is alright to use calculated state-dependent or path-dependent toggle rates, proceed with `report_power`.

PWR-93 (warning) There is both a separate rise/fall and an average toggle rate specification for pin %s of cell %. Because this library cell has a separate rise/fall internal power model, the average specification is ignored.

DESCRIPTION

You specified rise or fall toggle rates and the average toggle rate for a pin. The library cell has a separate rise/fall internal power specification, so the average toggle rate specification is ignored.

WHAT NEXT

If it is acceptable to assume to ignore the user specified toggle rate, proceed with `report_power`. Otherwise, delete the existing specifications for this pin using `set_switching_activity <pin_name>` and respecify the average toggle rate for this

pin.

PWR-94 (error) Cannot find file name to write RTL forward-annotation SAIF.

DESCRIPTION

There is no file specified to write the RTL forward annotation SAIF file. Specify the -output option for the **rtl2saif** command or set the variable power_rtl_saif_file to something other than "".

WHAT NEXT

Modify the power_rtl_saif_file variable or specify the -output option for the **rtl2saif** command.

PWR-95 (error) Cannot open file %s to be written.

DESCRIPTION

The file where the forward-annotation SAIF file created by the **rtl2saif** command is to be written is not able to be written. Verify you have the write permission in the current directory.

WHAT NEXT

Change the permissions for this file or respecify another file name using the -output option of **rtl2saif** or changing the power_rtl_saif_file variable. To see the current value of the power_rtl_saif_file variable, use **list -variables power**.

PWR-96 (warning) There are sequential cells with no output activity annotation.

DESCRIPTION

This warning occurs when there is a sequential cell with no switching activity annotated on either of its outputs. Unsuppress warning PWR-81 for more information.

WHAT NEXT

This is a warning.

PWR-97 (error) You have not set the environment variable 'power_preserve_rtl_hier_names' to TRUE. The rtl2saif command cannot proceed.

DESCRIPTION

The environment variable 'power_preserve_rtl_hier_names' must be set to TRUE when you analyze and elaborate a design and issue the rtl2saif command. This variable enables important information to be saved in DB, which is necessary for generating the forward-annotated SAIF file.

WHAT NEXT

Set the variable and reanalyze and elaborate the design.

PWR-98 (error) There must be a toggle rate or static probability specified when you specify the -toggle option.

DESCRIPTION

When you specify the -toggle option for **set_switching_activity** command, you must also specify either the tr or sp options or both. Therefore this specification is being ignored.

WHAT NEXT

Respecify the **set_switching_activity** command with either a -tr or -sp option. Otherwise, if you want to specify a clock period only, do a **create_clock** with a specified period.

PWR-99 (error) The -instance option is not specified.

DESCRIPTION

While annotating switching activity with the `read_saif` command, you must specify which instance in the SAIF file is to be annotated onto the current design. For example, `read_saif -input my.saif -instance top/U1` to specify that the instance `top/U1` in the SAIF file contains switching activity for the current design inside `dc_shell`.

WHAT NEXT

Specify the `-instance` option for the `read_saif` command and rerun the command again.

PWR-100 (error) The state dependent condition cannot contain the pin that has the switching activity specified.

DESCRIPTION

Any pin in the `-state_dep` option and the `<object_list>` of the **`set_switching_activity`** command cannot be the same pin. This is because you cannot have state dependency from a pin to itself.

WHAT NEXT

If you want to specify a state-dependent toggle rate, respecify **`set_switching_activity`** with pins in the `-state_dep` option that are different from the one in the `<object_list>`.

PWR-101 (error) Clock gating element missing in design %s.

DESCRIPTION

User probably has manually removed clock gating elements.

WHAT NEXT

Use `remove_clock_gating` command to remove gating elements. period.

PWR-102 (warning) replace_clock_gating_cells

DESCRIPTION

reserved

WHAT NEXT

reserved

PWR-103 (error) The %s command expects at least one option.

DESCRIPTION

The command was issued without valid options. The command expects at least one option.

WHAT NEXT

Re-issue the command with one or more valid options. Use the -help option to list all possible options. More information can be found in the man page for this command.

PWR-104 (error) The '%s' option cannot be used in combination with other options.

DESCRIPTION

The command was issued with an invalid combination of options.

WHAT NEXT

Re-issue the command with a valid combination of options. Use the -help option to list all possible options. More information can be found in the man page for this command.

PWR-105 (warning) Not clock-gating register %s since -

minimum_bitwidth constraint is violated after splitting.

DESCRIPTION

You receive this warning message when certain registers are not clock-gated due to the **-minimum_bitwidth** constraint. During **elaborate** large register banks are split between multiple clock-gating elements when the **-max_fanout** constraint is specified. This may result in some clock-gating elements gating a fewer number of registers than the constraint specified by the **-minimum_bitwidth** option.

WHAT NEXT

The **-minimum_bitwidth** variable can be modified by using the **set_clock_gating_style** command to control the minimum width of the register banks that can be clock gated.

PWR-106 (error) The -max_fanout option cannot be honored unless the variable hdlin_no_group_register is set to TRUE.

DESCRIPTION

You receive this warning message when you execute the **set_clock_gating_style** command with the **-max_fanout** option and the **hdlin_no_group_register** environment variable is not set to TRUE. For HDL Compiler to limit the fanout load of the clock-gating cells, the environment variable **hdlin_no_group_register** should be set to TRUE. Otherwise, the **-max_fanout** option cannot be honored.

WHAT NEXT

If you want the **elaborate** command to limit the fanout of each clock-gating cell, set the environment variable **hdlin_no_group_register** to TRUE. If you do not want the **elaborate** command to limit the fanout, do not use the **-max_fanout** option to the **set_clock_gating_style** command. Setting the variable **hdlin_no_group_register** to TRUE disables multi-bit registers optimizations during **compile**.

PWR-107 (error) The value of -max_fanout (%d) cannot be less than the value of -minimum_bitwidth (%d).

DESCRIPTION

You receive this error message when an invalid argument to the **-max_fanout** option for the **set_clock_gating_style** command has been specified. The entire command will be ignored, and the clock gating style, if defined, is not changed. The **set_clock_gating_style** command terminates without changing the clock gating style.

WHAT NEXT

The argument to the **-max_fanout** option (default value is 2048) should be a positive whole number which is greater than or equal to the argument to the **-minimum_bitwidth** option (default value is 3).

SEE ALSO

`set_clock_gating_style(2).`

PWR-108 (warning) The register %s could not be considered for splitting since the variable %s is not set to TRUE.

DESCRIPTION

When you execute the **elaborate** command, register banks may be grouped (internally) to enable multi-bit optimizations during compile. However, these registers cannot be split to satisfy the `max_fanout` constraint on the clock-gating cells. In order to allow the splitting of register banks to limit the `max_fanout` of individual clock-gating cells, the registers must be ungrouped internally during **elaborate**.

WHAT NEXT

Set the required variable `hdlin_no_group_registers` to TRUE. Setting the variable to TRUE will not allow Design Compiler to select multi-bit cells for this register.

SEE ALSO

`elaborate(2), set_clock_gating_style(2).`

PWR-109 (error) The `max_fanout` value cannot be non-positive: %d.

DESCRIPTION

You receive this error message when an invalid argument has been specified for the `-max_fanout` option of the **set_clock_gating_style** command. The command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

Specify a valid value for the `-max_fanout` option. The argument to the `-max_fanout` option should be a positive whole number.

SEE ALSO

`set_clock_gating_style(2).`

PWR-110 (warning) The setup/hold time for the clock gate is negative: %s.

DESCRIPTION

The setup or hold time specified by the `set_clock_gating_style` command is negative. This may corrupt the clock waveform.

WHAT NEXT

Check if the setup/hold time should really be negative.

PWR-111 (error) The minimum register bank size cannot be negative: %d.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-112 (error) The circuitry specified for gating the clocks of %s-edge triggered registers does not match the specified latch style.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-113 (error) The gate %s specified for clock gating has multiple outputs. This is not allowed.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-114 (error) The gate %s specified for clock gating is not a %s.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-115 (error) The cell list specified for clock gating is too short: %s.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-116 (error) The cell list specified for clock gating is too long: %s.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-117 (error) The pre gate specified for the clock gating circuitry has an invalid function %s.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-118 (error) The main gate specified for the clock gating circuitry has invalid function %s.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-119 (error) The post gate specified for the clock gating circuitry has invalid function %s.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-120 (error) Clock gating cannot be performed if no clock gating style has been set.

DESCRIPTION

You need to set the clock gating style using the command `set_clock_gating_style` before clock gating can be performed. The command is terminated.

WHAT NEXT

Specify the clock gating style.

PWR-121 (error) The gate %s specified for clock gating does not have the correct number of %d input pins.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-122 (error) The gate %s specified for clock gating does not exist in the target library.

DESCRIPTION

The clock gating style specifies a cell from a certain target library to be used in the clock gating circuitry, but the cell cannot be found in the target library. There are two possible reasons: first, a target library with the specified name does not exist. Note that you need to give the library name as used, for example, with the report_lib command, and not the library file name. This error can also occur if the target library with the specified name exists, but a cell with the specified name does not exist in the library. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-123 (warning) The enable signal of cell %s is computed by circuitry which is fed by flip-flops triggered by different edges. Clock gating will not be applied to the current cell.

DESCRIPTION

Latch-free clock gating requires that the enable signal arrives at the 2-input clock gate before the inactive clock edge (clock of the flip-flop which is to be gated). This cannot be guaranteed if the logic driving the enable signal depends on the other clock edge or on other clocks. Therefore, the clock of a flip-flop is not gated if its enable logic is fed by any flip-flop that is not triggered by the same clock edge. Similarly, for module level clock gating, a manually inserted clock gate is not replaced if its enable logic is fed by any flip-flop that is not triggered by the same clock edge.

WHAT NEXT

This restriction only applies to latch-free clock gating. Use latch-based clock gating to achieve larger power reduction.

PWR-124 (warning) The enable signal of cell %s is computed by circuitry which is fed by a design input port. Clock gating will not be applied to the current cell.

DESCRIPTION

Latch-free clock gating requires that the enable signal arrives at the 2-input clock gate before the inactive clock edge (clock of the flip-flop which is to be gated). This cannot be guaranteed if the logic driving the enable signal depends on an input port of the design. Therefore, the clock of a flip-flop is not gated if its enable logic is fed by any design input port. Similarly, for module level clock gating, a manually inserted clock gate is not replaced if its enable logic is fed by any design input port.

WHAT NEXT

This restriction only applies to latch-free clock gating. Use latch-based clock gating to achieve larger power reductions.

PWR-125 (warning) The enable signal of flip-flop %s is computed by circuitry which is fed by flip-flops triggered by unknown edges. Clock gating will not be applied to the current flip-flop.

DESCRIPTION

Latch-free clock gating requires that the enable signal arrives at the 2-input clock gate before the inactive clock edge (clock of the flip-flop which is to be gated). This cannot be guaranteed if the logic driving the enable signal depends on the other clock edge or on other clocks. Therefore, the clock of a flip-flop is not gated if its enable logic is fed by any flip-flop that is not triggered by the same clock edge. For the current flip-flop, it was not possible to determine the clocks of the flip-flops feeding the enable logic.

WHAT NEXT

This restriction only applies to latch-free clock gating. Use latch-based clock gating to achieve larger power reduction.

PWR-126 (error) The clock gating style is incorrect.

DESCRIPTION

The clock gating style has been corrupted since its last setting.

WHAT NEXT

Set the clock gating style using the command `set_clock_gating_style`.

PWR-127 (error) Incorrect specification of the control point in the clock gating style.

DESCRIPTION

The command `set_clock_gating_style` has been used with invalid control point specification.

WHAT NEXT

For the control point option, use `set_clock_gating_style` with one of the following arguments: `none`, `before_latch`, or `after_latch`.

PWR-128 (error) Incorrect specification of the control signal in the clock gating style.

DESCRIPTION

The command `set_clock_gating_style` has been used with an invalid control signal specification.

WHAT NEXT

For the control signal option, use `set_clock_gating_style` with one of the following arguments: `scan_enable` or `test mode`.

PWR-129 (error) The observability logic's xor tree depth did not

have a non-negative value.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored and the clock gating style, if defined, is not changed.

WHAT NEXT

The command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-130 (error) The sequential cell is neither none nor latch: %S.

DESCRIPTION

The sequential cell specified by the set_clock_gating_style must either be none or latch.

WHAT NEXT

Check the clock gating style.

PWR-131 (warning) With the specified clock gating style, an inverter will be created to connect the ENCLK pin of the clock gating circuitry with the clock pin of gated cell.

DESCRIPTION

Due to the clock gating circuitry chosen by the set_clock_gating_style command, and possibly due to an inverter in the register block, another inverter needs to be inserted on the clock net to produce the correct clock waveform. The input of the new inverter is connected to the ENCLK pin of the clock gating circuitry; the output of the new inverter is connected to the clock pin of the gated subdesign. This design can be a register, a clock gate or a module. It depends on your compile methodology (ungrouping, boundary optimization) if this inverter will be mapped with the generic sequential cell to a flip-flop of the target library or will be integrated with the gated module. Note that you may end up with the additional inverter on the clock network after compilation. This may impact clock tree synthesis.

WHAT NEXT

Choose a different clock gating style such that the additional inverter on the clock network is not needed.

PWR-132 (warning) The clock gating style was not changed.

DESCRIPTION

Setting a new clock gating style failed. The old clock gating style (if it exists) is still in use.

WHAT NEXT

Be aware that you correctly set the new clock gating style before performing clock gating.

PWR-133 (error) Incorrect specification of the observation point in the clock gating style.

DESCRIPTION

The command `set_clock_gating_style` has been used with invalid observation point specification.

WHAT NEXT

Use `set_clock_gating_style` with one of the following arguments to the observation point option: `true`, `false`.

PWR-134 (warning) No warnings will be given about testability implications of clock gating style.

DESCRIPTION

The specified scan style is none or combinational. Therefore, you will not get any warnings alerting you about testability implications of your clock gating style.

WHAT NEXT

Specify a noncombinational scan style if you want to perform clock gating of registers.

PWR-135 (warning) Clock pins of flip-flops are not controllable after clock gating.

DESCRIPTION

Clock pins of flip-flops with gated clocks will not be controllable during scan shift. Therefore, such flip-flops cannot be included in the scan chain. This can result in a loss of fault coverage.

WHAT NEXT

If you cannot accept the loss in fault coverage, use the **-control_point** option of the **set_clock_gating_style** command to specify control point insertion.

PWR-136 (warning) Clock gating signals will not be observable.

DESCRIPTION

The signals used to gate register clocks will not be observable because the test mode signal is constant during testing. Therefore, this configuration will result in a loss of fault coverage.

WHAT NEXT

If you cannot accept the loss of fault coverage, either specify a scan enable signal instead of a test mode signal using the **-control_signal** option, or introduce observability circuitry using the **-observation_point** option of the **set_clock_gating_style** command.

PWR-137 (warning) The test clock waveform must be compatible with the clock gating cell.

DESCRIPTION

Because the control point is after the latch, the scan enable signal can corrupt the clock signal at gated clock registers during testing, if the test clock waveform is

not chosen properly.

WHAT NEXT

Define the test clock waveform at the scan enable port such that the resting value of the clock at the port reaches the clock pins of gated clock registers. That is, the resting value of the clock at the port implies the controlling value of the clock gating cell.

PWR-138 (warning) For this scan style, the clock gating style need not specify a control point.

DESCRIPTION

Due to the specified scan style, the clock pins of the registers with gated clocks are controllable. Therefore, no control point need be inserted during clock gating.

WHAT NEXT

Use `-control_point none` with the `set_clock_gating_style` command to designate no control point.

PWR-139 (error) The library cell %s specified for clock gating has the dont_use attribute set, but not the is_clock_gating_cell attribute.

DESCRIPTION

The specified library cell has the `dont_use` attribute set. Since the `is_clock_gating_cell` attribute is not set on the library cell, the cell cannot be used in the clock gating circuitry.

WHAT NEXT

If you want to use this library cell, you need to have the `is_clock_gating_cell` attribute on the cell.

PWR-140 (warning) Command was called without an option and

has no effect.

DESCRIPTION

The **propagate_constraints** command was called without option **-gate_clock**. The command does not have an effect.

WHAT NEXT

Call **propagate_constraints -gate_clock**.

PWR-141 (error) The pin specification for the clock gate is incorrect.

DESCRIPTION

The names of the clock gate pins must match the names of the specified library cell.

WHAT NEXT

Check pin specification %s.

PWR-142 (error) The operand isolation style is not set.

DESCRIPTION

The operand isolation style is not set.

WHAT NEXT

Set the operand isolation style using the **set_operand_isolation_style** command.

PWR-143 (error) Operand isolation style is incorrect.

DESCRIPTION

The operand isolation style has been corrupted since its last setting.

WHAT NEXT

Set the operand isolation style using the `set_operand_isolation_style` command.

PWR-144 (warning) The operand isolation style was not changed due to errors.

DESCRIPTION

Setting a new operand isolation style has failed. The old operand isolation style (if it exists) is still in use.

WHAT NEXT

Make sure that you are satisfied with the operand isolation style that is set before proceeding.

PWR-145 (error) The percentage area penalty allowed cannot be negative.

DESCRIPTION

The percentage area penalty allowed cannot be negative.

WHAT NEXT

Set the percentage area penalty allowed to a positive number using the "`-area <number>`" option in the `set_operand_isolation_style` command.

PWR-146 (error) The logic specified for operand isolation is not valid.

DESCRIPTION

The logic specified for operand isolation is not valid. The isolation logic can be AND, OR, or adaptive only.

WHAT NEXT

Set the isolation logic to AND, OR or adaptive using the -logic option in the `set_operand_isolation_style` command.

PWR-147 (error) The specified values are out of range.

DESCRIPTION

The maximum negative slack value specified with the `set_operand_isolation_slack` command should be non-negative. The value for the weight should be between 0.0 and 1.0.

WHAT NEXT

Correct the values specified as arguments to the `set_operand_isolation_slack` command.

PWR-148 (Warning) Isolation operations list is empty.

DESCRIPTION

The list of operations to be included/excluded for isolation is empty.

WHAT NEXT

If you do not want to manually isolate(or not) any operations, do not use the `set_isolation_operations` command. This command is used to specify operations that the user wants to include/exclude irrespective of the results of the automated technique.

PWR-149 (warning) Conflict between included and excluded isolation operations.

DESCRIPTION

There is a conflict between included and excluded operations from operand isolation.

WHAT NEXT

Check the options to the `set_isolation_operations` command for any conflicts.

PWR-150 (error) Syntax error in MPML file.

DESCRIPTION

This error is a result of syntax errors in the MPML file, which is being compiled using the `load_mpm` command.

WHAT NEXT

Fix errors in the source MPML file and reload it using the `load_mpm` command.

PWR-151 (error) Error in executing the code in an MPM.

DESCRIPTION

This error occurs during the execution of the code in an MPM during the power estimation process. It is due to a logical error in the MPML file source file describing the MPM.

WHAT NEXT

Debug the MPM using the `test_mpm` command and make changes in the source MPML file. Reload the corrected MPM using the `load_mpm` command and use the updated library to estimate power.

PWR-152 (error) Error while linking MPM with design object.

DESCRIPTION

This error is due to a failure to link a power model with a design object. The most likely cause is a mismatch in pin definitions between the MPM and the design object it is being used for. The mismatch can result from different pin names, different pin sizes, or missing pins.

WHAT NEXT

Change the pin definitions in the MPML file to be consistent with the pin definition of the design object.

PWR-153 (error) Error while calculating library information.

DESCRIPTION

This error is due to an error in initialization of library related information for use with an MPM.

WHAT NEXT

Check if the target_library environment variable is set to the desired library.

PWR-154 (error) No library name specified in the parameter for -mpm_name option.

DESCRIPTION

The -mpm_name option requires a string of the form "mpm_lib/mpm_name", where the mpm_lib is the name of the library and the mpm_name is the name of the MPM in the library.

WHAT NEXT

Use the command with the name of the library specified.

PWR-155 (error) One and only one option (-prop_sa|-sim|-dynamic_power| -static_power) can be used with the **test_mpm command.**

DESCRIPTION

The **test_mpm** command tests individual functions inside the MPM. Every invocation of the command can test only one function at a time.

WHAT NEXT

Use only one option (-prop_sa|-sim|-dynamic_power| -static_power).

PWR-156 (error) Wrong combination of options while defining

association. The `-remove` cannot be used with the `%s` option.

DESCRIPTION

Commands that define the associations between MPMS and design components (`set_mpm_on_instance`, `set_mpm_on_lib_cell` and `set_reference_on_mpm`) are also used to remove existing associations. The `-remove` option is used to remove existing associations. This option cannot be used with the `-mpm_name` (for the `set_mpm_on_instance` and `set_mpm_on_lib_cell` commands), or the `-reference` option (for the `set_reference_on_mpm` command), which are used to set the associations.

WHAT NEXT

Use the command with only one option (`-remove` or `-mpm_name/-reference`).

PWR-157 (error) Wrong combinations of options for the `load_mpm` command. One, and only one of the two options `-compile_only` and `-mpm_name` can be used. The `-newlib` option can be used only with the `-mpm_name` option.

DESCRIPTION

The `load_mpm` command is used to compile MPML code and load it into a library. If the `-compile_only` option is used, the code is checked for syntax errors, but it is not loaded into a library. The `-compile_only` option cannot be used with the `-mpm_name` or the `-newlib` option.

WHAT NEXT

In case you are interested in detecting syntax errors, only use the `-compile_only` option. If you want to compile the MPML and load it into a library as an MPM, use the `-mpm_name` option.

PWR-158 (error) MPM %s not found in library %s.

DESCRIPTION

The specified library does not contain the desired MPM.

WHAT NEXT

Check if the MPM name is misspelt.

PWR-159 (error) %s file %s not found.

DESCRIPTION

The specified file was not found in search path. The filename might be misspelt or the file might not exist in the search_path.

WHAT NEXT

Check to see if the file exists and the search_path variable is set properly.

PWR-160 (error) The design contains cells other than combinational ones.

DESCRIPTION

The command is intended for combinational designs only.

WHAT NEXT

For other types of designs, look at your characterization methods manual.

PWR-161 (error) Unable to write to file %s.

DESCRIPTION

The file is either protected or an invalid file name has been specified.

WHAT NEXT

Change the permissions for this file or respecify another file name using the -output option .

PWR-162 (warning) The switching activity propagation model is

too large.

DESCRIPTION

This warning occurs when a arithmetic block suitable for `mpm_propagate_logic` is modelled with its switching activity propagation. Typical examples are huge multipliers and dividers, where those can be nicely described with a brief arithmetic `mpm_propagate_logic` model.

WHAT NEXT

You can still use the automatically generated model at your discretion. Reexamine the designs and if it is an arithmetic block, model it with `mpm_propagate_logic`.

PWR-163 (error) Internal error in the MPM module.

DESCRIPTION

This error is due to an internal error in the MPM module.

WHAT NEXT

Check if the MPML file used to create the MPM has the correct syntax.

PWR-164 (error) MPM %s already exists in the library %s.

DESCRIPTION

This error occurs, when the `load_mpm` or the `copy_mpm` or the `rename_mpm` command is used to add/ rename an MPM to a library which already has one with the same name. These commands do not overwrite an existing MPM in a library.

WHAT NEXT

If you want to replace the existing MPM, use the `delete_mpm` command followed by the `load_mpm/copy_mpm/rename_mpm` command.

PWR-165 (error) Cannot use -remove option with -mpm_name

option.

DESCRIPTION

This error occurs when either the set_mpm_on_instance or the set_mpm_on_lib_cell command is used with both the -remove and the -mpm_name options. You can either set an attribute on the instance/lib_cell by specifying the MPM using the -mpm_name option, or remove the attribute using the -remove option, but cannot do both simultaneously.

WHAT NEXT

If you want to remove the attribute, use the -remove option. If you want to add an attribute, use the -mpm_name option.

PWR-166 (error) Cannot use -remove option with -reference option.

DESCRIPTION

This error occurs when the set_reference_on_mpm command is used with both the -remove and the -reference options. You can either set an attribute on the MPM using the -reference option, or remove the attribute using the -remove option, but cannot do both simultaneously.

WHAT NEXT

If you want to remove the attribute on the MPM, use the -remove option. If you want to add an attribute on the MPM, use the -reference option.

PWR-167 (error) Neither -referene nor -remove option specified.

DESCRIPTION

This error occurs when the set_reference_on_mpm command is used without either the -remove or the -reference option. At least one option has to be specified.

WHAT NEXT

If you want to remove the attribute, use the -remove option. If you want to add an attribute, use the -reference option.

PWR-168 (error) Neither -mpm_name nor -remove option specified.

DESCRIPTION

This error occurs when either the set_mpm_on_instance or the set_mpm_on_lib_cell command is used without either the -remove or the -mpm_name option. At least one option has to be specified.

WHAT NEXT

If you want to remove the attribute, use the -remove option. If you want to add an attribute, use the -mpm_name option.

PWR-169 (error) Wrong combinations of options for the load_mpm command. The -newlib option has to be used with the -mpm_name option.

DESCRIPTION

The **load_mpm** command is used to compile an MPML file and load it into a library. The -newlib option is used to create a new library object to store the MPM. This option can be used only with the -mpm_name option.

WHAT NEXT

In case you are interested in detecting syntax errors only, use the -compile_only option. If you want to compile the MPML file and create a new library to store the MPM, use the -newlib along with the -mpm_name options.

PWR-170 (error) The %s with name %s that was specified for clock gating only has inverted outputs.

DESCRIPTION

An invalid option value has been specified. The complete command will be ignored, and the clock gating style, if defined, is not changed.

WHAT NEXT

The `set_clock_gating_style` command terminates without changing the clock gating style. Refer to the appropriate documentation for correct usage of the option.

PWR-171 (information) The library cell %s specified for clock gating has the `dont_use` and the `is_clock_gating_cell` attribute set.

DESCRIPTION

The specified library cell has the `dont_use` attribute set. This is ok since the library cell has the `is_clock_gating_cell` attribute set to true as well.

WHAT NEXT

Continue.

PWR-173 (error) Creating a reference for the library cell %s is not possible since another reference with the same name exists already.

DESCRIPTION

The `set_clock_gating_style` command has specified a certain library cell to be used in the clock gating circuitry. A reference for this library cell cannot be built because the current design already has a reference that has the same name and refers to a different design.

WHAT NEXT

Check the other reference with the same name. If it refers to a subdesign, give the subdesign a different name. If the reference refers to another library cell, chose a different library cell.

PWR-174 (error) Library %s already exists in memory.

DESCRIPTION

The -newlib option is used to create a new library object to store the MPM. However, if the library specified with the -mpm_name option already exists in memory, a new library is not created.

WHAT NEXT

If you wish to create a new library, check that a library with the same name does exist already. In case you wish to create another library with the same name, remove the old library from dc_shell using the **free** command. The new library created with the -newlib option will replace the old library in memory.

PWR-175 (error) Cannot use -newlib option for a library which already exists in memory.

DESCRIPTION

The -newlib option is used to create a new library object to store the MPM. However, if the library specified with the -mpm_name option already exists in memory, a new library is not created.

WHAT NEXT

If you wish to create a new library, check that a library with the same name does exist already. In case you wish to create another library with the same name, remove the old library from dc_shell using the **free** command. The new library created with the -newlib option will replace the old library in memory.

PWR-180 (warning) There is no %s cell in the target library, assuming 0 power for these cells

DESCRIPTION

If your design contains cells of this type, you need to have the associated cells in the target library. Otherwise, we cannot correctly estimate the power of these cells. We will assume 0 for these types of cells.

WHAT NEXT

Need to respecify target_library to include library which contains these types of cells.

PWR-181 (warning) 'hookup_power_gating_ports' command failed to connect any ports of the design.

DESCRIPTION

The command 'hookup_power_gating_ports' failed because either there is no port to be stitched or all the power gating pins were already stitched.

WHAT NEXT

Check whether there is power_gating_pin attributes on the retention registers. Verify that those pins were not driven by non constant logics.

PWR-182 (warning) Pin '%s' of cell '%s' was already driven by pin or port '%s' with incompatible power_gating_pin/power_gating_style attributes.

DESCRIPTION

This happens in 'hookup_power_gating_ports' command when a pin with power_gating_pin/power_gating_style attribute was driven by a port/cell without the attribute or with different values of the attribute. The pin will be skiped in 'hookup_power_gating_ports' command.

WHAT NEXT

Check the power_gating_pin/power_gating_style attributes on the pin and port and make sure the attributes are the same.

PWR-183 (warning) Pin '%s' of hierarchical cell '%s' was driving

%d pin(s) with incompatible power_gating_pin attribute.

DESCRIPTION

This happens in 'hookup_power_gating_ports' command when a hierarchical pin with power_gating_pin attribute driving pins without the attribute or with different values of the attribute. The 'hookup_power_gating_ports' command will still hookup the hierarchical pin to the higher level of hierarchy.

WHAT NEXT

Check the power_gating_pin attributes on the pins and make sure these are the intended behavior;

PWR-184 (warning) There are multiple ports with the same 'power_gating_pin/power_gating_style' attribute in design '%s'. Port '%s' will be used to hook up the power gating pins in the design.

DESCRIPTION

This happens in 'hookup_power_gating_ports' command when a design/sub-design has multiple ports with the same power_gating_pin/power_gating_style attributes. In this situation, only one port is used to hook up all the power gating pins inside the design.

WHAT NEXT

Check the design to make sure only one port has one type of power gating pin.

PWR-185 (warning) Port/pin '%s' of design/cell '%s' was driving %s pins with incompatible 'power_gating_pin' attribute.

DESCRIPTION

This happens in 'hookup_power_gating_ports' command when a port/pin of the design/cell with power_gating_pin attribute was driving pins without the attribute or with different values of the attribute. The 'hookup_power_gating_ports' command will

still use this port to hook up the power gating pins in the design.

WHAT NEXT

Check the `power_gating_pin` attributes on the port/pins and make sure these are what you want.

PWR-186 (error) Port/pin '%s' of design/cell '%s' was driving pin '%s' of retention register or hierarchical cell '%s' with incompatible '`power_gating_pin/power_gating_style`' attributes.

DESCRIPTION

This happens in '`hookup_power_gating_ports`' command when a port/pin of the design/cell with `power_gating_pin/power_gating_style` attribute driving a pin of the retention register or the hierarchical cell without the attributes or with different values of the attributes. The '`hookup_power_gating_ports`' command will not use this port to hook up the power gating pins in the design.

WHAT NEXT

Check the `power_gating_pin/power_gating_style` attributes on the port/pins and correct the attributes.

PWR-187 (error) Design '%s' was not uniquified. Command failed.

DESCRIPTION

Command `hookup_power_gating_ports` requires the design to be uniquified.

WHAT NEXT

Uniquify the design before using `hookup_power_gating_ports` command.

PWR-188 (error) Can't find any object for

'set_power_gating_signal' command.

DESCRIPTION

Can not find objects (pins or ports) in the design from the object specified in 'set_power_gating_signal' command.

WHAT NEXT

Check the argument of 'set_power_gating_signal' command and try again.

PWR-189 (warning) Can not set power gating signal on pin/port '%s' because
the object has already had a different types of power gating signal.

DESCRIPTION

This happens when 'set_power_gating_signal' command tries to set the signal on the pin/port which has already had a different type of signal.

WHAT NEXT

Check the arguments of 'set_power_gating_signal' command and try again.

PWR-190 (error) The library cell %s specified for use as an integrated clock gating does not exist in the libraries specified.

DESCRIPTION

The library cell specified for use as an integrated clock gating cell does not exist in the libraries specified. This may be because either (a) you specified a wrong library or (b) you specified a wrong cell in the set_clock_gating_style command.

WHAT NEXT

Check your target libraries and the set_clock_gating_style command.

PWR-191 (error) The library cell required for use as an integrated clock gating does not exist in the libraries specified. The required attribute is %s.

DESCRIPTION

The library cell with the appropriate attribute required for use as an integrated clock gating cell does not exist in the libraries specified. This may be because either (a) you specified a wrong library , or (b) you specified a wrong cell in the set_clock_gating_style command.

WHAT NEXT

Check your target libraries and the set_clock_gating_style command.

PWR-192 (error) The library cell %s specified for use as an integrated clock gating does not have the correct value for the clock_gating_integrated_cell attribute. The attribute required is %s.

DESCRIPTION

The library cell specified for use as an integrated clock gating cell does not have the correct value for the clock_gating_integrated_cell attribute. This may be because either (a) you specified a wrong library, or (b) you specified a wrong cell in the set_clock_gating_style command or (c) the functionality of the specified cell does not match the functionality required by the set_clock_gating_style command.

WHAT NEXT

Check your target libraries and the set_clock_gating_style command.

PWR-193 (error) The library cell %s specified for use as an integrated clock gating does not have the clock_gating_integrated_cell attribute. The value required for

this attribute is %s.

DESCRIPTION

The library cell specified for use as an integrated clock gating cell does not have the `clock_gating_integrated_cell` attribute. This may be because either (a) you specified a wrong library, or (b) you specified a wrong cell in the `set_clock_gating_style` command or (c) you did not specify the `clock_gating_integrated_cell` on the specified cell.

WHAT NEXT

Check your target libraries and the `set_clock_gating_style` command.

PWR-194 (error) Invalid option for the `set_clock_gating_style` command. If you specify the "integrated" option for the `-positive_edge_logic` or `-negative_edge_logic` options, you cannot specify any inverters/buffers before or after it.

DESCRIPTION

If you specify the "integrated" option for the `-positive_edge_logic` or `-negative_edge_logic` options, you cannot specify any inverters/buffers before or after it.

WHAT NEXT

Re-enter the `set_clock_gating_style` command.

PWR-195 (warning) The setup and hold values are ignored for the integrated cell. For these cells the setup and hold must be specified on the library.

DESCRIPTION

If you specify the "integrated" option for the `-positive_edge_logic` or `-negative_edge_logic` options, an integrated clock gating cell from the library will be used. In this case, any values specified for the `-setup` and `-hold` options will be ignored for the integrated styles and used only for the non-integrated cells. If you have specified "integrated" for only one of the `-positive_edge_logic` or `-`

`negative_edge_logic` options, the setup and hold values will be used for the non-integrated clock gating style only. If you have specified "integrated" for both the `-positive_edge_logic` and `-negative_edge_logic` options, then the setup and hold values will be ignored completely.

WHAT NEXT

This is only a warning, you should be aware of what will happen.

PWR-196 (Error) The value of the "`clock_gating_integrated_cell`" attribute (%s) is not a valid value. Please correct this.

DESCRIPTION

The value of the "`clock_gating_integrated_cell`" attribute (%s) is not valid. Check the value of this attribute on both the library cell and the clock gating design cell.

WHAT NEXT

You need to check the value of this attribute on both the library cell and the clock gating design cell and make sure you have a correct attribute.

PWR-197 (error) Could not find the exact pin matches with the integrated clock gating cell %s.

DESCRIPTION

Could not get the exact pin matches to connect the integrated cell in place of the current clock gating circuit.

WHAT NEXT

Check the pin connections on the library cell and make sure that they are correct.

PWR-198 (error) Could not find design port %s on the clock

gating design %s.

DESCRIPTION

The ports of a clock gating design added by Power Compiler have specific names. One of the ports required on the design could not be found.

WHAT NEXT

Make sure the this port exists on the clock gating design.

PWR-199 (error) Could not find the %s pin with the correct attribute on the specified integrated clock gating cell %s.

DESCRIPTION

Could not find the pin with the required attribute in the integrated clock gating cell specified.

WHAT NEXT

Check the attributes on the pins on the integrated clock gating library cell and make sure that they are correct.

PWR-200 (warning) The design has existing user-annotated switching activity data; not all such data is overwritten by the SAIF file.

DESCRIPTION

The design has user-annotated switching activity data on some nets, ports and/or pins. It is detected that the SAIF file does not overwrite all such data.

WHAT NEXT

This is a warning. If it is expected that the current design is not annotated with any switching activity information before this command, then use the **reset_switching_activity** command to clean up all user-annotated switching activity, and read the SAIF file again.

SEE ALSO

`reset_switching_activity` (2)

PWR-201 (error) Can't find the %s file (%s).

DESCRIPTION

The specified file was not found in the search path. The filename might be misspelt or the file might not exist in the search_path.

WHAT NEXT

Check to see if the file exists and the search_path variable is set properly.

PWR-202 (error) Currently, BC does not support the integrated clock gating cell.

DESCRIPTION

User set clock gating style to use integrated cell. However, BC does not support the integrated clock gating cell.

WHAT NEXT

Reset the clock gating style using the command `set_clock_gating_style` to non integrated clock gating cell.

PWR-203 (warning) Clock %s related to max_toggle_rate object %s no longer exists.

DESCRIPTION

This warning occurs when `max_toggle_rate` information for the net/pin is specified with the `-clock` option of the `max_toggle_rate` command and the given clock no longer exists in the design.

WHAT NEXT

This is a warning. The related clock is ignored.

PWR-204 (warning) There are conflicting `set_max_toggle_rate` commands on object %s.

DESCRIPTION

This error occurs when there are two (or more) `set_max_toggle_rate` commands on different nets or pins within the same physical connection specifying different values for toggle rates and static probability.

WHAT NEXT

Remove the unnecessary `set_max_toggle_rate` commands for the reported net or pin.

PWR-205 (information) The derived `max_toggle_rate` value (%f) for the

clock net '%s' conflicts with the value annotated with the `set_switching_activity` command (%f). Using the %f value.

DESCRIPTION

During electromigration analysis, `max_toggle_rate` information is derived for clock nets from clock waveforms that were set by `create_clock`. This informational message indicates that the derived value conflicts with the value that was explicitly annotated on the net by `set_max_toggle_rate`.

The tool will usually override the derived value with your annotated switching information.

WHAT NEXT

If this behavior is acceptable, you need not do anything. However, if you want the derived clock information used, reset the annotated `max_toggle_rate` information by executing `set_max_toggle_rate` with no options.

PWR-210 (warning) The clock gating design has more than one cell with clock-gating setup or hold attributes. Only one of the setup and one of the hold attributes will be transferred to the integrated

cell.

DESCRIPTION

The clock gating design has more than one cell with clock-gating setup or hold attributes. Only one of the setup and one of the hold attributes will be transferred to the integrated cell.

WHAT NEXT

This is a warning. It's best to make sure that only one of the cells in the clock gating design had the setup and hold attributes, to make sure that the correct one is being copied. Please remove one of them using the "remove_clock_gating_check" command.

PWR-211 (error) Object '%s' is not a net or cell.

DESCRIPTION

You receive this message if you have specified an object other than *net* or *cell* for **report_saif -only**. You must specify either *net* or *cell*; no other objects are accepted.

WHAT NEXT

Re-execute the **report_saif** command and specify either *net* or *cell* with the **-only** option.

SEE ALSO

report_saif(2).

PWR-212 (error) -type option accepts only rtl or gate name.

DESCRIPTION

You receive this message if you specify something other than *rtl* or *gate* as the argument of the **-type** option of the **report_saif** command. You must use either *rtl* or *gate*.

WHAT NEXT

Identify the level of the *current_design* (that is, *rtl* or *gate-level*) and re-execute

report_saif using the appropriate argument (*rtl* or *gate*) for the **-type** option.

SEE ALSO

report_saif(2).

PWR-213 (warning) The **report_saif** command was called without specifying either **-type gate** or **-type rtl**. Using the default (*gate*).

DESCRIPTION

You receive this message if you issue the **report_saif** command without specifying the **-type** option with the argument *rtl* or *gate*. This message informs you that the default, *gate*, will be used.

WHAT NEXT

If *gate* is the correct level type for your design, no action on your part is required, but for clarity you might want to re-execute **report_saif** using **-type gate**. However, if *rtl*, and not *gate*, is the correct level type for your design, re-execute **report_saif** using **-type rtl**.

SEE ALSO

report_saif(2).

PWR-214 (error) **-input_list** option expects **-input** .

DESCRIPTION

The **-input_list** option of the **merge_saif** command expects **-input** .

WHAT NEXT

Correct the **-input_list** option and run the command again.

PWR-215 (error) -input_list option expects -weight .

DESCRIPTION

The `-input_list` option of the `merge_saif` command expects `-weight` .

WHAT NEXT

Correct the `-input_list` option and run the command again.

PWR-216 (error) Error in read_saif process.

DESCRIPTION

The `merge_saif` command cannot read saif file.

WHAT NEXT

Check the saif file, correct the errors and run the command again.

PWR-217 (Error) Empty list in input_list option.

DESCRIPTION

Empty list in `input_list` option for `merge_saif` command.

WHAT NEXT

Correct the `-input_list` option and run the command again.

PWR-218 (Error) Weight value must be between 0 and 100.

DESCRIPTION

In `merge_saif` command, `input_list` option accepts only weight value between 0 and 100.

WHAT NEXT

Correct the *-input_list* option and run the command again.

PWR-219 (Error) The number of saif files is different of the number of weights in *input_list*.

DESCRIPTION

In *merge_saif* command, The number of saif files must be equal to the number of weights in *input_list* option.

WHAT NEXT

Correct the *-input_list* option and run the command again.

PWR-220 (Error) The sum of weights must be 100.

DESCRIPTION

In *input_list* option, the sum of weights must be 100.

WHAT NEXT

Correct the *-input_list* option and run the command again.

PWR-221 (error) The *-only* option cannot be used with *-gated* - *ungated* or the *-gating_element* options.

DESCRIPTION

The *report_clock_gating* command can either produce a design specific report using the *-gated*, *-ungated* and *-gating_element* options; or it can produce a report about specific cells via the *-only* option.

WHAT NEXT

Use either the instance-specific *-only* option or the design specific *-gated*, *-ungated* or the *-gating elements* options.

PWR-222 (information) Producing default clock-gating report.

DESCRIPTION

You receive this message if you issue the `report_clock_gating` command without options. In that case, `report_clock_gating` displays a default report, as the message states.

WHAT NEXT

This is an informational message only; if you are satisfied with the default report, no action is required on your part. Otherwise, reissue the `report_clock_gating` command with any of the available options.

SEE ALSO

`report_clock_gating` (2).

PWR-224 (Information) -simple_merge option is not set, default is -cps_propagation.

DESCRIPTION

You receive this informational message when you do not specify an option for the `merge_saif` command. By default, the option is set to `-cps_propagation`.

WHAT NEXT

If you are satisfied with the default option set for the `merge_saif` command, no action is required on your part. If you are not satisfied with the default setting, set the desired option for the command.

PWR-225 (Error) SDPD is not supported in this release.

DESCRIPTION

In `merge_saif` command, SDPD is not supported in this release.

WHAT NEXT

Please use non-SDPD switching activity and try this command again.

PWR-226 (Error) SAIF files must have the same time unit.

DESCRIPTION

In merge_saif command, SAIF files must have the same time unit.

WHAT NEXT

Please regenerate your saif files with the same time unit and try this command again.

PWR-227 (information) The library cell '%s' in the library '%s' is not characterized for %s power.

DESCRIPTION

The given library cell is not characterized for leakage power, internal power or both. A leakage and/or internal power value of 0 is assumed for this cell; Since this power value may not be accurate, power optimizations may not use this cell effectively and power analysis of designs containing instances of this cell may not be accurate.

WHAT NEXT

This is an information message. Please contact your library vendor if you believe that this library cell needs the missing leakage and/or internal power characterization.

PWR-228 (information) The design contains cells, other than constants and black boxes, that are not characterized for %s power.

DESCRIPTION

This information message is issued when power calculations are performed on the current design and it contains instances of library cells that are not characterized for leakage power, internal power or both. The missing leakage and/or internal power values in the characterization are assumed to be 0.

WHAT NEXT

This is an information message. Please contact your library vendor if you believe that power characterization is needed for your design.

PWR-229 (information) The cells in your design are not characterized for %s power.

DESCRIPTION

This information message is issued when power calculations are performed on the current design and none of the cells are characterized for leakage power, internal power or both. In such cases, the missing leakage and/or internal power is assumed to be 0.

WHAT NEXT

This is an information message. Please contact your library vendor if you believe that power characterization is needed for your design.

PWR-231 (error) No clock-gated register specified as an argument to the group_clock_gated_registers command

DESCRIPTION

The argument to the -registers option of the group_clock_gated_registers command should contain a list of clock-gated registers.

WHAT NEXT

Check that all the members of the argument to the -registers option are valid clock-gated registers. Use the report_clock_gating command to find a list of clock-gated registers.

PWR-232 (error) %s is not a clock-gated register.

DESCRIPTION

The argument to the -registers option of the group_clock_gated_registers command should contain a list of clock-gated registers. All registers should be clock-gated.

WHAT NEXT

Check that all the members of the argument to the -registers option are valid clock-gated registers. Use the report_clock_gating command to find a list of clock-gated registers.

PWR-233 (error) Clock-gated registers do not belong to the same design instance.

DESCRIPTION

The argument to the -registers option of the group_clock_gated_registers command should contain a list of clock-gated registers which are in the same level of hierarchy. Clock-gated registers under different hierarchies cannot be grouped together.

WHAT NEXT

Check that all the members of the argument to the -registers option are clock-gated registers under the same level of hierarchy. Use the report_clock_gating command to find a list of clock-gated registers.

PWR-234 (error) Cannot use both -default and -exclusive options together.

DESCRIPTION

The -default and -exclusive options are mutually exclusive. Use -default to remove the cells from a user-defined group. Use -exclusive to create a new group which will have its own separate clock-gating cell. The clock-gating cell used to gate these registers will not gate any other registers

WHAT NEXT

Either use the -default option or the -exclusive option for the group_clock_gated_registers command. Use the report_clock_gating command to find a list of clock-gated registers.

PWR-235 (warning) Cannot annotate the cell '%s' with the

switching activity for the SAIF condition '%s'.

DESCRIPTION

The given state condition is not valid for annotating state-dependent static probabilities on the given cell. This usually occurs when the gate-level SAIF file is read on a different design than the one used to generate the SAIF file. For example, the design has been modified using an implementation step (like compile -inc). Alternatively the design is linked with a different library than the one used when generating the backward SAIF file. If the SAIF file is generated using a simulation flow, the link library may be different from the one used to generate the library forward SAIF.

WHAT NEXT

Check that the backward SAIF file being read is intended for the current design.

PWR-236 (warning) Cannot annotate the pin '%s' with the switching activity for the SAIF condition '%s'.

DESCRIPTION

The given state condition is not valid for annotating state-dependent toggle rates on the given pin. This usually occurs when the gate-level SAIF file is read on a different design than the one used to generate the SAIF file. For example, the design has been modified using an implementation step (like compile -inc). Alternatively the design is linked with a different library than the one used when generating the backward SAIF file. If the SAIF file is generated using a simulation flow, the link library may be different from the one used to generate the library forward SAIF.

WHAT NEXT

Check that the backward SAIF file being read is intended for the current design.

PWR-237 (warning) Cannot annotate the pin '%s' with the switching activity for the SAIF path source '%s'.

DESCRIPTION

The given path source is not valid for annotating path-dependent toggle rates on the given pin. This usually occurs when the gate-level SAIF file is read on a different design than the one used to generate the SAIF file. For example, the design has

been modified using an implementation step (like compile -inc). Alternatively the design is linked with a different library than the one used when generating the backward SAIF file. If the SAIF file is generated using a simulation flow, the link library may be different from the one used to generate the library forward SAIF.

WHAT NEXT

Check that the backward SAIF file being read is intended for the current design.

PWR-238 (warning) Cannot annotate the pin '%s' with the switching activity for the SAIF condition '%s' and path source '%S'.

DESCRIPTION

The given state condition and path source are not valid for annotating state-dependent and path-dependent toggle rates on the given pin. This usually occurs when the gate-level SAIF file is read on a different design than the one used to generate the SAIF file. For example, the design has been modified using an implementation step (like compile -inc). Alternatively the design is linked with a different library than the one used when generating the backward SAIF file. If the SAIF file is generated using a simulation flow, the link library may be different from the one used to generate the library forward SAIF.

WHAT NEXT

Check that the backward SAIF file being read is intended for the current design.

PWR-239 (warning) Removing invalid SDPD switching activity from cell '%s'.

DESCRIPTION

The state-dependent static probabilities annotated on the given cell and/or the state-dependent and/or path-dependent toggle rates annotated on the pins of the given cell are invalid and are being removed so that power can be calculated. For this particular cell, Power Compiler will estimate the required SDPD switching activities instead of using the annotated ones. The reason that the SDPD switching activity is invalid is likely to be that the design is linked with a technology library that has different states/paths in its power characterization than the one used when the SDPD activity was annotated.

WHAT NEXT

This is a warning message; check that the intended link library is specified.

PWR-240 (error) Neither static_probability nor toggle_rate specified.

DESCRIPTION

Either the static_probability or the toggle rate must be specified, if either the period or the clock is specified. If none of these four options are specified, the command will reset switching activity on the objects specified.

WHAT NEXT

If you want to annotate activity, you must enter a valid value for at least one of these: -static_probability or -toggle_rate. If you want to reset activity, make sure that you have none of the following options specified: -static_probability, -toggle_rate, -clock, -period.

PWR-241 (error) Invalid value %s for the -select option.

DESCRIPTION

The valid values for the -select option are "regs" "ports" or "all". Please check the man pages to find out the meaning of each of these. The value specified is not valid.

WHAT NEXT

Please specify a valid value for the -select option.

PWR-242 (error) Invalid value %s for the -type option.

DESCRIPTION

The valid values for the -type option are "datapath" or "control". Please check the man pages to find out the meaning of each of these. The value specified is not valid.

WHAT NEXT

Please specify a valid value for the `-type` option.

PWR-243 (information) Resetting switching activity for the specified objects.

DESCRIPTION

Since none of the following options: `-static_probability`, `-toggle_rate`, `-clock`, and `-period`, were specified switching activity will be reset to the default values on the objects specified.

WHAT NEXT

If you want to annotate activity, you must enter a valid value for at least one of these: `-static_probability` or `-toggle_rate`; and should also specify a value for `-period` or `-clock`.

PWR-250 (error) Specification of cell internal power must be for a pin.

DESCRIPTION

You receive this message if you issue the `set_cell_internal_power` command without specifying at least one pin name as an argument, or if a name you specified is not the name of a pin in your design. The `pin_names` argument is required for `set_cell_internal_power`, and names supplied for this argument must represent pins in your design.

WHAT NEXT

Verify the correct spelling of names of pins in your design for which you want to set the cell internal power, and re-issue `set_cell_internal_power` with correct pin names.

SEE ALSO

`set_cell_internal_power(2)`.

PWR-251 (error) Command %s not supported in pe_shell.

DESCRIPTION

This command is not supported in pe_shell. In order to use it you must use the more powerful dc_shell.

WHAT NEXT

Use *dc_shell*.

PWR-252 (warning) RTL-Power-Analysis license must already by checked out for this command to run, and you should be in pe_shell.

DESCRIPTION

RTL-Power-Analysis license must already by checked out for this command to run.

WHAT NEXT

Please use pe_shell, not dc_shell. Also, make sure you have the RTL-Power-Analysis license.

PWR-253 (warning) RTL-Power-Analysis license not available.

DESCRIPTION

RTL-Power-Analysis license not available.

WHAT NEXT

Please set up RTL-Power-Analysis license and run *pe_shell* again.

PWR-254 (Error) Error detected while reading design.

DESCRIPTION

You receive this message from **create_power_model** to inform you that it has stopped

executing because an error was detected while reading the design. This message is issued in addition to a similar message issued earlier.

WHAT NEXT

You would have received at least one other error message prior to this one. Examine the messages, identify the message that relates to reading the design, and use the information in that message to help you correct the error. Then reexecute `create_power_model`.

SEE ALSO

`create_power_model` (2).

PWR-255 (Error) Error detected while reading constraints.

DESCRIPTION

You receive this message from `create_power_model` to inform you that it has stopped executing because an error was detected while reading constraints. This message is issued in addition to a similar message issued earlier.

WHAT NEXT

You would have received at least one other error message prior to this one. Examine the messages, identify the message that relates to reading constraints, and use the information in that message to help you identify and correct the error. Then reexecute `create_power_model`.

SEE ALSO

`create_power_model` (2).

PWR-256 (Error) Error detected while creating models.

DESCRIPTION

You receive this message from `create_power_model` to inform you that it has stopped executing because an error was detected while creating models. This message is issued in addition to a similar message issued earlier. The error could possibly be caused by an incorrect setting of the `link_library` or `target_library` variables.

WHAT NEXT

You would have received at least one other error message prior to this one. Examine the messages, identify the message that relates to reading the design, and use the information in that message to help you identify and correct the error. Also, verify that the **link_library** and **target_library** variables are set correctly. Then reexecute **create_power_model**.

SEE ALSO

create_power_model (2); **link_library** (3), **target_library** (3).

PWR-257 (Error) Error detected while reading switching activity.

DESCRIPTION

You receive this message from **estimate_power** to inform you that it has stopped executing because an error was detected while reading the switching activity file. This message is usually issued in addition to a similar message issued earlier; if no earlier message is issued, the problem might be with an incorrect SAIF instance name.

WHAT NEXT

You might have received at least one other error message prior to this one. Examine the messages, identify the message that relates to reading the switching activity file, and use the information in that message to help you identify and correct the error. If you did not receive any other error messages and you used the **-saif** option, verify that the **-saif** *instance_name* argument is correct.

SEE ALSO

estimate_power (2).

PWR-258 (Error) Error detected while reporting RTL power estimation.

DESCRIPTION

You receive this message from **estimate_power** to inform you that it has stopped executing because an error was detected while reporting the RTL power estimation. This message is issued in addition to a similar message issued earlier.

WHAT NEXT

You would have received at least one other error message prior to this one. Examine the messages, identify the message that relates to reporting RTL power estimation, and use the information in that message to help you identify and correct the error.

SEE ALSO

`estimate_power` (2).

PWR-259 (Error) link_library not set or empty.

DESCRIPTION

You receive this message from `create_power_model` or `estimate_power` if the `link_library` variable is not set, or if a library it points to is empty. Before executing these commands, you must set the `link_library`, `synthetic_library`, and `target_library` variables.

WHAT NEXT

Set the `link_library` variable to a valid list of designs and libraries to be used during linking. Then reissue the `create_power_model` or `estimate_power` command.

SEE ALSO

`create_power_model` (2), `estimate_power` (2); `link_library` (3), `synthetic_library` (3), `target_library` (3).

PWR-260 (Error) target_library not set or empty.

DESCRIPTION

You receive this message from the `create_power_model` or `estimate_power` command if the `target_library` variable is not set, or if a library it points to is empty. Before executing these commands, you must set the `link_library`, `synthetic_library`, and `target_library` variables.

WHAT NEXT

Set the `target_library` variable to a valid list of technology libraries of components to be used when compiling your design. Then reissue the `create_power_model` or `estimate_power` command.

SEE ALSO

`create_power_model` (2), `estimate_power` (2); `link_library` (3), `synthetic_library` (3),
`target_library` (3).

PWR-261 (Error) The option "-format" is required.

DESCRIPTION

You receive this message if you issue the `create_power_model` or `estimate_power` command without the `-format` option. The `-format` option is required.

WHAT NEXT

Reissue the command and specify either `-format vhdl` or `-format verilog`.

`create_power_model` (2), `estimate_power` (2).

PWR-262 (Error) HDL designs required to read in.

DESCRIPTION

You receive this message if you issue the `create_power_model` or `estimate_power` command without the `-hdl_files` option; or if the list contains a file that is not a Verilog or VHDL file. The `-hdl_files` option is required, and only Verilog and VHDL are valid formats.

WHAT NEXT

Reissue the command and specify `-hdl_files` with a list of files that are either all Verilog or all VHDL.

SEE ALSO

`create_power_model` (2), `estimate_power` (2).

PWR-263 (Error) The option "-top_design" is required.

DESCRIPTION

You receive this message if you issue the `create_power_model` or `estimate_power` command without the `-top_design` option. The `-top_design` option is required.

WHAT NEXT

Reissue the command and specify **-top_design** with the name of your top-level design.

SEE ALSO

`create_power_model` (2), `estimate_power` (2).

PWR-264 (Error) Too many arguments for the -saif option.

DESCRIPTION

You receive this message if you issue the `estimate_power` command with the **-saif** option and enter more than two arguments for **-saif**. This option requires two arguments, as follows:

-saif {*saif_file_name instance_name*}

where *instance_name* is the name of the instance in the SAIF file.

WHAT NEXT

Reissue the `estimate_power` command and use only the *saif_file_name* and *instance_name* arguments for the **-saif** option.

SEE ALSO

`estimate_power` (2).

PWR-266 (Error) Cannot find saif file (%s).

DESCRIPTION

You receive this message if you issue the `estimate_power` command with the **-saif** option and the named SAIF file cannot be found. The file might not be in your search path; or, the error could be caused by a spelling error or typo.

WHAT NEXT

Check the SAIF filename and verify that the file exists, that its name is spelled correctly, and that it is in your search path. Then reissue the `estimate_power` command with the correct SAIF filename.

```
estimate_power (2).
```

PWR-267 (Error) Activity file not found.

DESCRIPTION

You receive this message if you issue the **estimate_power** command with the **-activity_file** option and the named activity file could not be found. The file might not be in your search path; or, the error could be caused by a spelling error or typo.

WHAT NEXT

Check the activity filename and verify that the file exists, that its name is spelled correctly, and that it is in your search path. Then reissue the **estimate_power** command with the correct activity filename.

```
estimate_power (2).
```

PWR-268 (Error) -saif and -activity_file options are mutually exclusive.

DESCRIPTION

You receive this message if you issue the **estimate_power** command with both the **-saif** and **-activity_file** options. You must use one of these options, but you cannot use both.

WHAT NEXT

Reissue the **estimate_power** command with either the **-saif** or **-activity_file** option, but not both.

SEE ALSO

```
estimate_power (2).
```

PWR-269 (Error) The -saif option requires two arguments

(saif_file_name and instance_name).

DESCRIPTION

You receive this message if you issue the **estimate_power** command with the **-saif** option and do not enter two arguments for **-saif**. This option requires two arguments, as follows:

-saif {saif_file_name instance_name}

where *instance_name* is the name of the instance in the SAIF file.

WHAT NEXT

Reissue the **estimate_power** command and use both the *saif_file_name* and *instance_name* arguments for the **-saif** option.

SEE ALSO

estimate_power (2).

PWR-270 (Error) You must use either the **-saif** or **-activity_file** option.

DESCRIPTION

You receive this message if you issue the **estimate_power** command without either the **-saif** and **-activity_file** options. You must use one of these options, and you cannot use both.

WHAT NEXT

Reissue the **estimate_power** command with either the **-saif** or **-activity_file** option, but not both.

SEE ALSO

estimate_power (2).

PWR-271 (Error) Invalid argument for the **-transform** option.

Currently, the only allowed argument is `gate_clock`.

DESCRIPTION

You receive this message if you issue the `create_power_model` or `estimate_power` command with the `-transform` option, and have used an argument for `-transform` other than `gate_clock`. Currently, `gate_clock` is the only allowed argument for `-transform`.

WHAT NEXT

Reissue the command and use the `gate_clock` argument with the `-transform` option.

SEE ALSO

`create_power_model` (2), `estimate_power` (2).

PWR-272 (Error) synthetic_library not set or empty.

DESCRIPTION

You receive this message from `create_power_model` or `estimate_power` if the `synthetic_library` variable is not set, or if a library it points to is empty. Before executing these commands, you must set the `link_library`, `synthetic_library`, and `target_library` variables.

WHAT NEXT

Set the `synthetic_library` variable to a valid list of designs and synthetic libraries to be used during linking. Then reissue the `create_power_model` or `estimate_power` command.

SEE ALSO

`create_power_model` (2), `estimate_power` (2); `link_library` (3), `synthetic_library` (3), `target_library` (3).

PWR-273 (information) Fixing SDPD switching activity annotation.

DESCRIPTION

This message is issued when user-annotated state-dependent and/or path-dependent

(SDPD) switching activity is being modified by the SDPD fixing step. The SDPD fixing step is enabled by the **power_fix_sdpd_annotation** variable; please check the man page of **power_fix_sdpd_annotation** for more information on this step.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

power_fix_sdpd_annotation (3), **power_fix_sdpd_annotation_verbose** (3),
power_sdpd_message_tolerance (3).

PWR-274 (warning) Negative annotated static probability on state '%s' of cell '%s' is set to 0.

DESCRIPTION

Negative state-dependent static probability values have been annotated on the specified cell. Such static probability annotations are invalid and are being removed before the switching activity can be used.

WHAT NEXT

Power Compiler will not use the negative static probability values; the script used to annotate the static probability values should be modified to avoid annotating negative static probabilities.

PWR-275 (information) Unannotated static probability for false state '%s' of cell '%s' is automatically set to 0.

DESCRIPTION

The specified cell is partially annotated with state-dependent static probability values. Power Compiler is setting the static probability value of unannotated false states to 0.0. False states are states that always evaluate to 0 and include the default state in cells where the other states cover all possible states of the cell.

This message is issued by the SDPD fixing step which can be controlled by the variables **power_fix_sdpd_annotation**, **power_fix_sdpd_annotation_verbose** and **power_sdpd_message_tolerance**.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),
`power_sdpd_message_tolerance` (3).

PWR-276 (information) Non-zero static probability annotation for false state '%s' of cell '%s' is automatically set to 0.

DESCRIPTION

The specified cell has false states annotated with a non-zero state-dependent static probability values. Power Compiler is setting the static probability of false states to 0.0. False states are states that always evaluate to 0 and include the default state in cells where the other states cover all possible states of the cell.

This message is issued by the SDPD fixing step which can be controlled by the variables `power_fix_sdpd_annotation`, `power_fix_sdpd_annotation_verbose` and `power_sdpd_message_tolerance`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),
`power_sdpd_message_tolerance` (3).

PWR-277 (information) The user annotated state dependent static probabilities on cell '%s' are being scaled so they add up to 1.

DESCRIPTION

The user annotated state-dependent static probability values on the specified cell do not add to 1.0. Power Compiler is scaling the static probability values so that they add up to 1.0.

This message is issued by the SDPD fixing step which can be controlled by the

variables `power_fix_sdpd_annotation`, `power_fix_sdpd_annotation_verbose` and `power_sdpd_message_tolerance`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),
`power_sdpd_message_tolerance` (3).

PWR-278 (information) The annotated state dependent static probabilities on cell '%s' add up to more than 1.0; Annotated static probabilities are being scaled down and the unannotated states are automatically annotated with 0.

DESCRIPTION

The specified cell is partially annotated with state-dependent static probability values. The sum of the annotated state-dependent static probabilities adds up to 1.0 or more. The annotated static probability values are being scaled down so that they add up to 1.0. The unannotated states are automatically annotated with a static probability value of 0.0.

This message is issued by the SDPD fixing step which can be controlled by the variables `power_fix_sdpd_annotation`, `power_fix_sdpd_annotation_verbose` and `power_sdpd_message_tolerance`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),
`power_sdpd_message_tolerance` (3).

PWR-279 (warning) Negative annotated %s toggle rate on the

%s of pin '**%s**' is set to 0.

DESCRIPTION

Negative state-dependent and/or path-dependent toggle rate values have been annotated on the specified pin. Such toggle rate annotations are invalid and are being removed before the switching activity can be used.

WHAT NEXT

Power Compiler will not use the negative toggle rate values; the script used to annotate the switching activity should be modified to avoid annotating negative toggle rates.

PWR-280 (warning) %s is not a buffer cell and will be ignored.

DESCRIPTION

The specified cell is not a buffer cell and for the purpose of clock tree power estimation it will be ignored.

WHAT NEXT

This is a warning; the command will resume normally with the default behaviour of finding an appropriate buffer in the link library.

PWR-281 (warning) %s buffer cell does not exist.

DESCRIPTION

The specified cell name has not been found in any link library and it will be ignored.

WHAT NEXT

This is a warning; the command will resume normally with the default behaviour of finding an appropriate buffer in the link library.

PWR-282 (warning) The link library does not contain a buffer.

DESCRIPTION

There is no buffer in the link library and clock tree power estimation will be aborted.

WHAT NEXT

Provide a link library in the link path with a buffer in it.

PWR-283 (warning) The specified clock-tree buffer fanout (%d) is invalid.

DESCRIPTION

You receive this warning because, during execution of the `report_power` command, Power Compiler found that the clock-tree buffer fanout you specified in the environment variable `clocktree_buffer_fanout` is invalid. Power Compiler will ignore the clock-tree buffer and will use the default value instead.

WHAT NEXT

If you do not want the compiler to select a fanout value (the selection is buffer-dependent), assign to the variable `clocktree_buffer_fanout` a value that is 2 or more. Then rerun the `report_power` command.

SEE ALSO

`report_power` (2); `clocktree_buffer_fanout` (3).

PWR-290 (error) Object '%s' is not an operator.

DESCRIPTION

You receive this message if you issue the `set_operand_isolation_cell` command and specify as part of the `object_list` an object that is not an operator. You can specify only operator cells for this command. This error could possibly be caused by a spelling error or typo.

WHAT NEXT

Check the items in the *object_list* and verify that all are operator cells and that the spelling is correct. Then reissue the **set_operand_isolation_cell** command with the correct *object_list*.

SEE ALSO

set_operand_isolation_cell (2).

PWR-291 (warning) Invalid isolation style specified. Using the default AND-based isolation style.

DESCRIPTION

You receive this message if you issue the **set_operand_isolation_style** command with an invalid value for the **-logic** *logic_style* option. Allowed values are *AND* (the default) and *OR*. This message informs you that the default (*AND*) is being used.

WHAT NEXT

If it is acceptable to you that the *logic_style* of *AND* is used, no action is required on your part. Otherwise, reissue the **set_operand_isolation_style** command with the option **-logic_style OR**.

SEE ALSO

set_operand_isolation_style (2).

PWR-292 (warning) Removing isolation logic for operator %s.

DESCRIPTION

You receive this message if, after delay optimization, PowerCompiler finds that the isolation logic for the specified operator causes a timing violation that exceeds the current timing threshold value. In that case, PowerCompiler removes the isolation logic from the operator, as stated in the message.

The default timing threshold value is 0; you use the **set_operand_isolation_slack** command to set a different timing threshold that overrides the default. If the delay optimization takes place after initial mapping, you can also adjust the **-weight** option to relax the slack constraint for removal of isolation logic.

WHAT NEXT

This is an informational message only; no action is required on your part.

If you did not want this isolation logic to be removed, you can go back to the version of the design before the first compile, reset the timing threshold to a much higher value, and recompile.

SEE ALSO

`compile` (2), `set_operand_isolation_slack` (2).

PWR-301 (Warning) The isolation cells required for operand isolation are not available in the target library; no operand isolation can be performed.

DESCRIPTION

This warning is issued when the target library does not contain the required cells to perform operand isolation. Depending on the isolation style, a two-input AND or OR gate must be available. When the isolation style is set to adaptive (the default), both a two-input AND and a two-input OR gate must be available.

WHAT NEXT

Check that the target library contains the required combinational cells. Make sure the usage of the cell was not disable with the `set_dont_use` command. If no two-input AND and/or OR gates are available, operand isolation cannot be applied.

SEE ALSO

`set_dont_use` (2), `set_operand_isolation_style` (2), `do_operand_isolation` (3).

PWR-302 (error) At least one, and only one, of the options `-all`, `-min_bitwidth`, `-gated_registers` or `-gating_cells` must be used with the `remove_clock_gating` command.

DESCRIPTION

The `remove_clock_gating` command requires that you use one (but only one) of the four options `-all`, `-min_bitwidth`, `-gated_registers`, or `-gating_cells`.

WHAT NEXT

To remove all the clock-gating cells in the current level of hierarchy, use the **-all option**. To remove only register that belong to banks smaller than a certain minimum size, use the **-min_bitwidth** option. Along with the **-all** and **-min_bitwidth** options, you can also use the **-no_hier** option to limit removal of clock-gating cells to the current level. To remove selected individual clock gating cells or registers in lower levels of the design hierarchy, give their complete path names from the current level of hierarchy as arguments to the **-gated_registers** option or the **-gating_cells** option of the **remove_clock_gating** command.

SEE ALSO

remove_clock_gating (2).

PWR-303 (error) Clock-gating cannot be removed from cell %s because the cell has the **size_only** attribute assigned to it.

DESCRIPTION

You receive this error message because the **remove_clock_gating** command is trying to mark for ungating a register that has the **size_only** attribute assigned to it. Removal of clock-gating requires remapping of the register, and the **size_only** attribute cannot be honored. Hence, this cell is not being marked for removal of clock-gating.

WHAT NEXT

If you want to remove clock-gating from the cell, use the **reset_attribute** command to remove the **size_only** attribute. Then reissue the **remove_clock_gating** command. This ensures that **compile -incremental** (and **physopt** and **physopt -incremental**) will remove clock-gating from this cell.

SEE ALSO

remove_clock_gating (2), **reset_attribute** (2).

PWR-304 (error) Clock-gating cannot be removed from cell %s because the **dont_touch** attribute is assigned to the cell.

DESCRIPTION

You receive this error message because the **remove_clock_gating** command is trying to mark for ungating a register that has the **dont_touch** attribute assigned to it.

Removal of clock-gating requires remapping of the register, and the **dont_touch** attribute cannot be honored. Hence, this cell is not being marked for removal of clock-gating.

WHAT NEXT

If you want to remove clock-gating from the cell, use the **remove_attribute** command to remove the **dont_touch** attribute. Then reissue the **remove_clock_gating** command. This ensures that **compile -incremental** (and **physopt** and **physopt -incremental**) will remove clock-gating from this cell.

SEE ALSO

remove_clock_gating (2), **remove_attribute** (2).

PWR-305 (warning) Cell %s has a timing exception that might be lost.

DESCRIPTION

You receive this warning to inform you that the **remove_clock_gating** command provides a directive to **compile -incremental** (and **physopt** and **physopt -incremental**) to remove clock-gating from a cell that has a timing exception. One of these commands set the exception: **set_max_delay**, **set_min_delay**, **set_multicycle_path** or **set_false_path**. This exception might be lost during the remapping of the cell during **compile -incremental**.

WHAT NEXT

After the **compile -incremental** command removes clock-gating from the cell, run the **report_timing** command to verify that the exception is being honored. If the exception is lost, reapply the timing exception by reissuing **set_max_delay**, **set_min_delay**, **set_multicycle_path**, or **set_false_path**. Reissue **compile -incremental** to ensure that the exception the command specifies is being honored.

SEE ALSO

remove_clock_gating (2), **report_timing** (2), **set_false_path** (2), **set_max_delay** (2), **set_min_delay** (2), **set_multicycle_path** (2).

PWR-306 (error) Cell %s has a timing exception and cannot be

ungated.

DESCRIPTION

You receive this error message to inform you that the `remove_clock_gating` command does not provide a directive to `compile -incremental` (and `physopt` and `physopt -incremental`) to remove clock-gating from a cell that has a timing exception. One of the following commands set the exception: `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`.

WHAT NEXT

To remove clock-gating from the cell, use the `reset_path` command to remove the timing exception.

SEE ALSO

`remove_clock_gating` (2), `report_timing` (2), `reset_path` (2), `set_false_path` (2),
`set_max_delay` (2), `set_min_delay` (2), `set_multicycle_path` (2).

PWR-307 (warning) The current design is a hierarchical design; consider using the `-hier` option.

DESCRIPTION

You see this warning because you issued the `remove_clock_gating` command with the `-all` option on a hierarchical design but did not use the `-hier` option. The `-all` option did not find clock-gating logic at the current level of hierarchy and will not mark any clock-gating logic for removal. If you intended to invoke both the `-all` and the `-hier` options, specify the `-hier` option at this time, in addition to the specifying the `-all` option.

WHAT NEXT

To remove clock-gating logic from all the hierarchies in the design, use the `remove_clock_gating` command with both the `-hier` option and the `-all` option.

SEE ALSO

`remove_clock_gating` (2), `report_clock_gating` (2).

PWR-308 (Information) No clock-gating cell found; no clock-

gating logic will be removed.

DESCRIPTION

You receive this message if you issue the **remove_clock_gating** command with only the **-all** option. The result is that **remove_clock_gating** did not find clock-gating logic at the current level of hierarchy and did not mark any clock-gating logic for removal.

WHAT NEXT

To remove clock-gating logic from all the hierarchies in the design, use the **remove_clock_gating** command with both the **-hier** option and the **-all** option.

SEE ALSO

remove_clock_gating (2), **report_clock_gating** (2).

PWR-309 (error) Clock Gating cell %s will be removed and cannot be used for rewiring.

DESCRIPTION

You receive this message because you used an invalid cell as an argument to the **-gating_cell** option of the **rewire_clock_gating** command. The cell is invalid because it is already marked for removal by the **remove_clock_gating** command. A cell that is marked for removal cannot be used to rewire other gated registers.

WHAT NEXT

If you do not want **compile -incremental** (or **physopt** and **physopt -incremental**) to remove the cell, use the **-undo** option with the **remove_clock_gating** command.

SEE ALSO

compile (2), **remove_clock_gating** (2), **rewire_clock_gating** (2).

PWR-310 (error) Clock-gated cell %s will be ungated and cannot

be rewired.

DESCRIPTION

You receive this message because you used an invalid cell as the value of the **-gating_cell** option of the **rewire_clock_gating** command. The cell is invalid because it is already marked for ungating by the **remove_clock_gating** command. A gated cell that is marked for removal of clock-gating cannot be rewired.

WHAT NEXT

If you do not want **compile -incremental** (or **physopt** and **physopt -incremental**) to remove clock-gating from the gated cell, use the **-undo** option with the **remove_clock_gating** command. Then reissue the **rewire_clock_gating** command.

SEE ALSO

compile (2), **physopt** (2), **remove_clock_gating** (2), **rewire_clock_gating** (2).

PWR-311 (error) Clock-gated cell %s is not gated by a gating cell that is logically equivalent to %s.

DESCRIPTION

You receive this error message because you specified a clock-gating cell to gate the named cell (which could be a register, clock gating cell or module) that is not logically equivalent to the current clock-gating cell gating the cell.

WHAT NEXT

Find a clock-gating cell that is logically equivalent to the one currently gating the cell, and use it as an argument to the **-gating_cell** option of the **rewire_clock_gating** command. To find logically equivalent cells, use the **report_clock_gating** command with the **-verbose** option. To create more than one logically equivalent clock-gating cell during **insert_clock_gating** use the **-max_fanout** option of the **set_clock_gating_style** command.

SEE ALSO

insert_clock_gating (2), **report_clock_gating** (2), **rewire_clock_gating** (2),
set_clock_gating_style (2).

PWR-312 (error) Clock-gating cell %s does not have clock-

gating information and cannot be used for rewiring.

DESCRIPTION

You receive this message because you specified an invalid clock-gating cell to gate the named register, clock gate or module. The cell is invalid because it does not have enough information.

WHAT NEXT

Power Compiler saves information related to clock-gating in the Synopsys database (.db) format file created for the design. If this information is lost, Power Compiler is unable to recognize the clock-gating cell. Ensure that the design remains in the .db format throughout your design flow.

SEE ALSO

`elaborate` (2), `report_clock_gating` (2), `rewire_clock_gating` (2),
`set_clock_gating_style` (2).

PWR-313 (warning) Cell %s is already gated by clock-gating cell %S.

DESCRIPTION

You see this warning to let you know that the option arguments of the `rewire_clock_gating` command specified for this cell are partially incorrect. For instance, the clock-gating cell you specified already gates the named cell (register, clock-gate or module). Other correct arguments to the `rewire_clock_gating` command might be honored anyway. But if not, the `rewire_clock_gating` command will not save any directive for `compile -incremental` to change the structure of the design. If the `-gated_registers` option of the `remove_clock_gating` command has more than one argument, one of the arguments might trigger the warning although the other arguments are valid.

WHAT NEXT

Use a different logically equivalent clock-gating cell to rewire the clock-gating cell. To find other logically equivalent clock-gating cells, use the `report_clock_gating` command with the `-verbose` option. To ensure that `insert_clock_gating` limits the fanout of a single clock-gating cell and creates more than one logically equivalent clock-gating cell, use the `-max_fanout` option of the `set_clock_gating_style` command.

SEE ALSO

`elaborate` (2), `report_clock_gating` (2), `rewire_clock_gating` (2),
`set_clock_gating_style` (2).

PWR-314 (warning) Clock-gating cannot be removed from design %s because it has a `dont_touch` attribute.

DESCRIPTION

You see this warning message because the design from which you are trying to remove clock-gating with the `remove_clock_gating` command is marked with the `dont_touch` attribute.

WHAT NEXT

To remove clock-gating from the design, remove the `dont_touch` attribute using the `reset_attribute` command. Then reissue the `remove_clock_gating` command. This ensures that `compile -incremental` (or `physopt` and `physopt -incremental`) will remove clock-gating from this cell.

SEE ALSO

`remove_clock_gating` (2), `reset_attribute` (2).

PWR-315 (error) The cell %s is not a hierarchical clock-gating cell and cannot be removed.

DESCRIPTION

You receive this error message because you specified a nonhierarchical clock-gating cell as an argument of the `-gating_cell` option of the `remove_clock_gating` command. Nonhierarchical cells cannot be removed.

WHAT NEXT

Make sure the specified cell is a hierarchical clock-gating cell. To find clock-gating cells in the design, use the `report_clock_gating` command. Do not ungroup the hierarchical clock-gating cells during the compile flow.

SEE ALSO

`remove_clock_gating` (2), `report_clock_gating` (2), `ungroup` (2).

PWR-316 (warning) The library cell %s is not up-to-date and, hence, the register cannot be ungated.

DESCRIPTION

You see this warning message because the cell in your library that corresponds to the specified clock-gated register is not up-to-date, and the register mapped to this library cell cannot be ungated.

The library vendor might be using an older version of Library Compiler to read the library. The library may also be using the obsolete state group instead of the ff group or latch group to describe the sequential functionality of the cell.

WHAT NEXT

If you have the .lib source file for your technology library, check to make sure that the sequential cells are using the ff group or latch group and not the obsolete state group.

If you do not have access to the .lib source file, contact the library vendor to verify that the vendor is using the latest version of Library Compiler to read the .lib file and that the .lib file uses the ff group or latch group (and not the obsolete state group) to describe the sequential functionality of the cell.

For more information about Library Compiler and the ff group and latch group, see the Library Compiler documentation suite.

SEE ALSO

`read_lib` (2), `write_lib` (2).

PWR-317 (warning) Clock-gated cell %s does not have a rewiring directive to undo.

DESCRIPTION

You see this warning message because you gave an invalid cell as the `-undo` option of the `rewire_clock_gating` command. The cell you specified does not have a rewiring directive on it.

WHAT NEXT

Check to make sure you are using the name of the correct cell in this instance. To check on information and names of cells related to clock-gating in your design, use the `report_clock_gating` command.

SEE ALSO

`report_clock_gating` (2), `rewire_clock_gating` (2).

PWR-318 (error) At least one cell or pin must be in the `-gated_objects` list.

DESCRIPTION

You see this error message because the list you specified as the `-gated_objects` option of the `rewire_clock_gating` command did not include a clock-gated cell (register, clock-gate or module). The `rewire_clock_gating` command requires that you specify at least one clock-gated cell or pin in the list you use as the argument to the `-gated_objects` option.

WHAT NEXT

Check to make sure you are using the name of the correct cell or pin in this instance. To check on information and names of cells related to clock-gating in your design, use the `report_clock_gating` command.

SEE ALSO

`report_clock_gating` (2), `rewire_clock_gating` (2).

PWR-319 (error) Only one of the options `-gating_cell` or `-undo` can be used.

DESCRIPTION

You receive this error message because you have specified a cell as an argument to the `rewire_clock_gating` command that has more than one of the allowed options defined. The `rewire_clock_gating` command requires that you define only one option, either `-gating_cell` or `-undo`.

WHAT NEXT

Check to make sure you are using the name of the correct cell in this instance. To check information and names of the cells related to clock-gating in your design, use the `report_clock_gating` command. To undo the effect of an earlier `rewire_clock_gating` command, use the `-undo` option. To rewire clock-gated registers in your design, use the `-gating_cell` option.

SEE ALSO

`report_clock_gating (2)`, `rewire_clock_gating (2)`.

PWR-320 (error) Only one clock-gating cell can be specified for the -gating_cell option

DESCRIPTION

You receive this error message because you have specified more than one cell as the argument of the `-gating_cell` option of the `rewire_clock_gating` command. The `-gating_cell` option takes only one cell as its value.

WHAT NEXT

Check to make sure you are using the name of the correct cell in this instance. To check information and names of cells related to clock-gating in your design, use the `report_clock_gating` command. Then make sure to use only one clock-gating cell as an argument of the `-gating_cell` option.

SEE ALSO

`report_clock_gating (2)`, `rewire_clock_gating (2)`.

PWR-321 (warning) The rewire_clock_gating cell command did not find a valid clock-gated cell to rewire.

DESCRIPTION

You see this warning message because the `rewire_clock_gating` command did not find any cell to rewire. This might be because the clock-gating cell you specified in the `-gating_cell` option already gates all the cells or pins you named in the `-gated_objects` option.

WHAT NEXT

Check to make sure you are using the name of the correct cell in this instance. To check information and names of cells related to clock-gating in your design, use the `report_clock_gating` command.

SEE ALSO

`report_clock_gating (2)`, `rewire_clock_gating (2)`.

PWR-322 (error) Clock-gating cell %s is a target cell for the rewire_clock_gating command.

DESCRIPTION

The named cell is not a valid option of the `remove_clock_gating` command because it is a target clock-gating cell for the `rewire_clock_gating` command.

WHAT NEXT

If a cell is a target clock-gating cell for the `rewire_clock_gating` command, it cannot be marked for removal. If you want to use the `compile` command with the `-incremental` option (or `physopt` and `physopt -incremental`) to remove the cell, use the `-undo` option of the `rewire_clock_gating` command with the `-gated_registers` option. Include as the argument to the `-gated_objects` option all the cells and pins that are marked to be moved to the new clock-gating cell. Then reissue the `remove_clock_gating` command.

SEE ALSO

`compile` (2), `remove_clock_gating` (2), `rewire_clock_gating` (2).

PWR-323 (error) The cell %s is marked for rewiring and cannot be ungated.

DESCRIPTION

You receive this error message because you specified as an option to the `remove_clock_gating` command a cell that is marked for rewiring by the `rewire_clock_gating` command.

WHAT NEXT

A cell that is marked for rewiring cannot be marked for removal. If you want to use the `compile` command with the `-incremental` option (or `physopt` and `physopt -incremental`) to remove the cell, use the `-undo` option of the `rewire_clock_gating` command. Use the cells and pins you specified as an argument for the `-gated_objects` option. Then reissue the `remove_clock_gating` command.

SEE ALSO

`compile` (2), `remove_clock_gating` (2), `rewire_clock_gating` (2).

PWR-324 (error) The cell %s is not a clock-gated flip-flop.

DESCRIPTION

You receive this message because you issued the `remove_clock_gating` command, but specified a non-clock-gated register as an argument. The `remove_clock_gating` command will not mark a non-clock-gated register for removal. Nor can you undo the effect of a previous `remove_clock_gating` command if you used the `-undo` option.

WHAT NEXT

Reissue the `remove_clock_gating` command with the appropriate arguments. If you want to remove a clock-gating cell, use the `-gating_cells` option. Check that the cells you specify are hierarchical clock-gating cells. If you want to remove clock-gating on specific registers, use the `-gated_registers` option of the `remove_clock_gating` command. Check that the cells you specify are clock-gated registers and have not been ungated already. Use the `report_clock_gating` command to get information about the clock-gated logic in the design. If you want to undo the effect of a previous `remove_clock_gating` command, use the `-undo` option.

SEE ALSO

`remove_clock_gating` (2), `report_clock_gating` (2).

PWR-325 (error) Clock-gating cell %s cannot be removed because it has a dont_touch attribute.

DESCRIPTION

You receive this error message because you specified for removal by the `remove_clock_gating` command a cell that has the `dont_touch` attribute defined on it. This cell is not being marked for removal of clock-gating.

WHAT NEXT

To remove clock-gating from the cell, remove the `dont_touch` attribute from the cell using the `reset_attribute` command. Then reissue the `remove_clock_gating` command. This ensures that `compile -incremental` (and `physopt` and `physopt -incremental`) will remove the clock-gating cell.

SEE ALSO

`remove_clock_gating` (2), `reset_attribute` (2).

PWR-326 (warning) Pin %s has a timing exception that might be lost.

DESCRIPTION

The `remove_clock_gating` command provides a directive to `compile -incremental` (and `physopt` and `physopt -incremental`) to remove clock-gating from a cell whose pin has a timing exception. One of the following commands set this timing exception: `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`. This exception might be lost during the remapping of the cell during `compile -incremental`.

WHAT NEXT

After `compile -incremental` removes clock-gating from the cell, run the `report_timing` command to check that the original timing exception is being honored. If the constraint is lost, reapply the timing exception by reissuing `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`. To ensure that the constraint specified by the command is being honored, reissue `compile -incremental`.

SEE ALSO

`remove_clock_gating` (2), `report_timing` (2), `set_false_path` (2), `set_max_delay` (2),
`set_min_delay` (2), `set_multicycle_path` (2).

PWR-327 (error) Pin %s has a timing exception and the cell cannot be removed.

DESCRIPTION

You receive this error message because you have specified to the `remove_clock_gating` command a clock-gating cell whose pin has a timing exception on it. The `remove_clock_gating` command does not provide a directive for `compile -incremental` (and `physopt` and `physopt -incremental`) to remove such a clock-gating cell. This timing exception was set by one of the following commands: `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`.

WHAT NEXT

To remove clock-gating from the cell, use the `reset_path` command to remove the timing exception from the pin.

SEE ALSO

`remove_clock_gating` (2), `report_timing` (2), `reset_path` (2), `set_false_path` (2),
`set_max_delay` (2), `set_min_delay` (2), `set_multicycle_path` (2).

PWR-328 (warning) A pin of cell %s has a timing exception that might be lost.

DESCRIPTION

The `remove_clock_gating` command provides a directive to `compile -incremental` (and `physopt` and `physopt -incremental`) to remove clock-gating from a cell whose pin has a timing exception. One of the following commands set this timing exception: `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`. This exception might be lost when remapping of the cell occurs during `compile -incremental`.

WHAT NEXT

After `compile -incremental` removes clock-gating from the cell, run the `report_timing` command to check that the original timing exception is being honored. If the constraint is lost, reapply the timing exception by reissuing `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`. Then reissue `compile -incremental` to ensure that the constraint specified by the command is being honored.

SEE ALSO

`remove_clock_gating` (2), `report_timing` (2), `set_false_path` (2), `set_max_delay` (2), `set_min_delay` (2), `set_multicycle_path` (2).

PWR-329 (error) A pin of cell %s has a timing exception and the cell cannot be removed.

DESCRIPTION

You receive this error message because you have specified to the `remove_clock_gating` command a clock-gating cell whose pin has a timing exception on it. The `remove_clock_gating` command does not provide a directive for `compile -incremental` (and `physopt` and `physopt -incremental`) to remove such a clock-gating cell. This timing exception was set by one of the following commands: `set_max_delay`, `set_min_delay`, `set_multicycle_path`, or `set_false_path`.

WHAT NEXT

To remove clock-gating from the cell, use the `reset_path` command to remove the timing exception from the pin. Then reissue `compile -incremental`.

SEE ALSO

```
remove_clock_gating (2), report_timing (2), reset_path (2), set_false_path (2),  
set_max_delay (2), set_min_delay (2), set_multicycle_path (2).
```

PWR-330 (error) Clock-gated cell %s does not have clock-gating information and cannot be used for rewiring.

DESCRIPTION

You receive this error message because you specified a clock-gating cell to gate the named cell (which could be a register, clock-gate or module) and the cell does not have enough information.

WHAT NEXT

Power Compiler saves information related to clock-gating in the Synopsys database format (.db) file created for the design. If this information is lost, Power Compiler is unable to recognize the clock-gating cell. Ensure that the design remains in the .db format throughout your design flow.

SEE ALSO

```
elaborate (2), report_clock_gating (2), rewire_clock_gating (2),  
set_clock_gating_style (2).
```

PWR-331 (error) You must use the -control_point option with the -control_signal option.

DESCRIPTION

You receive this error message because you have used the **set_clock_gating_style** command with incomplete specification for the test control circuitry. If you specify the **-control_signal** option to the **set_clock_gating_style** command, you must also use the **-control_point** option to specify where in the circuitry to insert the control point. If you use the default value **none**, no test control logic is inserted.

WHAT NEXT

Use the **-control_point** option of the **set_clock_gating_style** command if the **-control_signal** option is specified. Use the **before_latch** or **after_latch** argument of the **-control_point** option if you want to insert a test control point.

SEE ALSO

`set_clock_gating_style` (2).

PWR-332 (Warning) Unable to rewire cell %s; clock-gating cells might not be equivalent.

DESCRIPTION

The `rewire_clock_gating` command could not be honored during `compile` because the target clock-gating cell is not equivalent to the original clock-gating cell.

WHAT NEXT

Verify that the target clock-gating cell is logically equivalent to the original clock-gating cell. Make sure that you have not changed the name of the clock-gating cells or ungrouped the design after using the `rewire_clock_gating` command. To find logically equivalent cells, use the `report_clock_gating` command.

SEE ALSO

`report_clock_gating` (2), `rewire_clock_gating` (2).

PWR-333 (warning) Unable to find target clock-gating cell for rewiring cell %s.

DESCRIPTION

You receive this warning to let you know that the `rewire_clock_gating` command could not be honored during `compile` because Power Compiler could not find the target clock-gating cell.

WHAT NEXT

Make sure you have not changed the name of the clock-gating cells or ungrouped the design after using the `rewire_clock_gating` command. To find logically equivalent cells, use the `report_clock_gating` command.

SEE ALSO

`report_clock_gating` (2), `rewire_clock_gating` (2).

PWR-334 (error) Use at least one of the options, **-include_instances**, **-exclude_instances**, or **-undo** with the **set_clock_gating_registers** command.

DESCRIPTION

You receive this error message because the **set_clock_gating_registers** did not mark the registers to be included or excluded from clock-gating. Use at least one of these three options: **-include_instances**, **-exclude_instances**, or **-undo**. The arguments to the options should be registers in the current design.

WHAT NEXT

Use the appropriate set of options for the command. Make sure you are using the correct name of the registers you want to include or exclude for clock-gating. To find cells in the design, use the **find** command.

SEE ALSO

find (2), **insert_clock_gating** (2), **set_clock_gating_registers** (2).

PWR-335 (error) The cell %s is used in more than one of these options: **-include_instances**, **-exclude_instances**, or **-undo**.

DESCRIPTION

You receive this error message because you used the same cell as an argument to more than one option of the **set_clock_gating_registers** or **set_replace_clock_gates** command. Each option must have a different cell as its argument. The command therefore did not mark the signals that are to be included or excluded from clock-gating.

WHAT NEXT

Use an individual cell as an argument to only one of these options: **-include_instance**, **-exclude_instances**, or **-undo**.

SEE ALSO

report_clock_gating (2), **set_clock_gating_registers** (2). **set_replace_clock_gates** (2).

PWR-336 (error) An argument, %s, to the %s command is not a register that can be clock-gated by the insert_clock_gating command.

DESCRIPTION

You receive this error message to let you know that the **set_clock_gating_registers** command did not mark the registers that need to be included or excluded from clock-gating. One of the arguments was not a SEQGEN object that can be clock-gated.

WHAT NEXT

Make sure you are using the correct name for the registers you want to include or exclude for clock-gating. Use the **find** command to find cells in the design. Use the **report_cell** command to find information about individual cells.

SEE ALSO

set_clock_gating_style (2), **insert_clock_gating** (2), **report_cell**(2), **find** (2).

PWR-337 (error) Cannot use -undo option on register %s because the register's clock-gating cell is marked for removal.

DESCRIPTION

You receive this message if you issue the **remove_clock_gating** command with the **-undo** option for a register whose clock-gating cell is already marked for removal. An earlier invocation of the **remove_clock_gating** command, with either the **-gating_cell** option or the **-all** option, marked the cell for removal.

WHAT NEXT

Reissue the **remove_clock_gating** command with the appropriate arguments. If you do not want **compile -incremental** to remove clock-gating from the register, make sure that the clock-gating cell gating the register is not marked for removal. Use the **-undo** option of the **remove_clock_gating** command on the clock-gating.

If you want to selectively ungate a few registers, first unmark the clock-gating cell using the **remove_clock_gating** command with the **-undo** option. Then use the **remove_clock_gating** command with the **-gated_registers** option to mark the registers you want ungated.

SEE ALSO

`remove_clock_gating` (2), `report_clock_gating` (2).

PWR-338 (warning) Skipping cell %s because its clock-gating cell will be removed.

DESCRIPTION

You receive this message if you issue the `remove_clock_gating` command, with the `-gated_registers` option, but the cell's clock-gating cell is already marked for removal. The `compile` command with the `-incremental` option will remove the clock-gating on this cell because the gating cell itself is being removed.

WHAT NEXT

Check the spelling and confirm that you specified the correct cell. If you want to remove a clock-gating cell, use the `remove_clock_gating` command with the `-gating_cells` option. Verify that the cells you specify are hierarchical clock-gating cells.

If you want to remove clock-gating on a specific register, use the `-gated_registers` option. Verify that the cell you specify is a clock-gated register and has not been un gated already.

Use the `report_clock_gating` command to get information about the clock-gated logic in the design. To undo the effect of a previous `remove_clock_gating` command, use `remove_clock_gating -undo`.

SEE ALSO

`compile` (2), `remove_clock_gating` (2), `report_clock_gating` (2).

PWR-339 (error) Cell %s is causing a split in the clock-gating circuitry; group not possible.

DESCRIPTION

You receive this message if you issue the `group` command, and the selected cells to be grouped leads to the partition of clock-gating circuitry and the gated registers. All clock-gated registers being gated by a particular clock-gating cell should remain in the same or lower levels of hierarchy as the gating cell. This means that it is allowed to group clock-gated registers without its clock-gating cell, but it is not allowed to group the clock-gating cell without its gated objects (registers, modules and clock-gating cells).

WHAT NEXT

Check the spelling and confirm that you specified the correct cell. To find the cells that are gated by a particular gating cell, use the **report_clock_gating** command. Do not supply options that lead to a partition of clock-gating cells and the gated register. To explicitly exclude cells from the design being created, use the **-except** option of the **group** command.

SEE ALSO

group (2), **report_clock_gating** (2).

PWR-340 (warning) Cell %s will not be rewired.

DESCRIPTION

You receive this message if you issue the **group** command, and the selected cells contain a clock-gated cell (a register or clock-gating cell) marked for rewiring. The rewiring directive is lost if you use the **group** command on the design.

WHAT NEXT

Check the spelling and confirm that you specified the correct cell. To find the cells that are gated by a particular gating cell, use the **report_clock_gating** command. Then use the **rewire_clock_gating** command again to mark cells for rewiring. Make sure that the target clock-gating cell and the gated cell are in the same design.

SEE ALSO

group (2), **report_clock_gating** (2), **rewire_clock_gating** (2).

PWR-341 (warning) The cell %s is an ungated flip-flop.

DESCRIPTION

You receive this message if you issue the **remove_clock_gating** command, and one of the flip-flops to be ungated is already not gated.

WHAT NEXT

Reissue the **remove_clock_gating** command with the appropriate arguments. To remove a clock-gating cell, use the **-gating_cells** option of the **remove_clock_gating** command. Check that the cells you specify are hierarchical clock-gating cells.

To remove clock-gating on a specific register, use the **-gated_registers** option of the **remove_clock_gating** command. Check that the cell you specify is a clock-gated register and has not been ungated already.

To get information about the clock-gated logic in the design, use the **report_clock_gating** command.

To undo the effect of a previous **remove_clock_gating** command, use the **-undo** option.

SEE ALSO

remove_clock_gating (2), **report_clock_gating** (2).

PWR-350 (error) Power-Optimization license needed by command %s is not available.

DESCRIPTION

This command requires the Power-Optimization license. Either your site does not have the license or all of the available licenses are in use.

WHAT NEXT

You can use the environment variable **power_keep_license_after_power_commands** to keep holding the Power-Optimization license after using a Power Compiler command. This ensures that other users do not snatch the license from your session. Contact your Synopsys representative to obtain more licenses if your site does not have enough.

SEE ALSO

dc_shell (1), **dp_shell** (1), **synopsys_users** (1); **get_license** (2), **license_users** (2); **power_keep_license_after_power_commands** (3).

PWR-351 (warning) Clock-gating-related optimizations require the Power-Optimization license, which is not available; optimizations related to clock-gating will be skipped.

DESCRIPTION

You see this warning because you have used a command that requires you to have a Power-Optimization license. The **compile** command and related optimization commands require the Power-Optimization license to perform clock-gating-related optimizations. Either your site does not have the license or all of the available

licenses are in use.

WHAT NEXT

You can use the environment variable **power_keep_license_after_power_commands** to keep holding the Power-Optimization license after using a Power Compiler command. This ensures that other users do not snatch the license from your session. Contact your Synopsys representative to obtain more licenses if your site does not have enough.

SEE ALSO

`dc_shell` (1), `dp_shell` (1), `synopsys_users` (1); `get_license` (2), `license_users` (2);
`power_keep_license_after_power_commands` (3).

PWR-352 (error) Module Compiler license is not available; insert_clock_gating not possible.

DESCRIPTION

You receive this error message because your site is not licensed for Module Compiler or all the licenses are in use. The **insert_clock_gating** command requires the Module Compiler license if you are inserting clock-gating in a Module Compiler generated netlist with the **-mc** option.

WHAT NEXT

To ensure that other users do not snatch the license from your session, use the **get_license** command to check out the Module Compiler license. If your site does not have enough licenses, contact your Synopsys representative to obtain more.

SEE ALSO

`dc_shell` (1), `synopsys_users` (1). `get_license` (2), `license_users` (2).

PWR-353 (Error) Cannot continue because Power-Compiler license is not available and the design has clock-gating.

DESCRIPTION

You see this warning because you have used a command that requires you to have a Power-Compiler license. The **compile** command and related optimization commands require the Power-Optimization license to perform clock-gating-related optimizations. Either your site does not have the license or all of the available

licenses are in use.

WHAT NEXT

You can use the environment variable `power_keep_license_after_power_commands` to keep holding the Power-Optimization license after using a Power Compiler command. This ensures that other users do not snatch the license from your session. Contact your Synopsys representative to obtain more licenses if your site does not have enough.

SEE ALSO

`dc_shell` (1), `dp_shell` (1), `synopsys_users` (1); `get_license` (2), `license_users` (2);
`power_keep_license_after_power_commands` (3).

PWR-354 (error) Clock-gated register %s is not linked to a technology library cell and cannot be ungated.

DESCRIPTION

`remove_clock_gating` will not put a directive for the `compile -incremental` (and the `physopt` and `physopt -incremental`) command to remove a clock-gating cell which is not linked to a technology library cell or is a generic cell.

WHAT NEXT

If you want the clock-gating to be removed from the cell, make sure that the design is linked and all cells have an associated technology library cell. Also make sure that the design is mapped to a technology. Use the `report_cell` command to find the details of the cell. Use the `link` command if the design is already mapped.

SEE ALSO

`remove_clock_gating` (2), `report_cell`(2), `link` (2).

PWR-355 (error) The clock-gating cell %s and gated object %s are not in the same level of hierarchy.

DESCRIPTION

`rewire_clock_gating` will not put a directive to rewire the gated cell for the `compile -incremental` command because the target clock-gating cell is not in the same level of hierarchy as the gated cell.

WHAT NEXT

If you want the clock-gating cell to be changed, pick a logically equivalent clock-gating cell in the same level of hierarchy as the gated cell.

SEE ALSO

`rewire_clock_gating(2)`, `report_clock_gating(2)`.

PWR-356 (warning) '-transform gate_clock' is not supported in Flexible Analysis Flow, option ignored.

DESCRIPTION

If the design is read in through 'analyze' and 'elaborate' steps or through a 'read' step, 'create_power_model' can not do clock gating.

WHAT NEXT

In Flexible Analysis flow, use 'insert_clock_gating' and then `create_power_model` command to create the power model incorporating clock gating. If in the interactive mode, use '`create_power_model -hdl_files <> -top_design <> -transform gate_clock`' to do clock gating in the power model.

SEE ALSO

`elaborate(2)`

PWR-357 (error) pe_shell does not support tcl_mode

DESCRIPTION

`pe_shell` currently does not support `tcl_mode`

WHAT NEXT

Invoke `pe_shell` with out the `-tcl_mode` argument.

PWR-358 (error) Bad option combination between 'hier_level'

and ‘this_level_only’.

DESCRIPTION

‘hier_level’ and ‘this_level_only’ are mutually exclusive options. Only one of them can be used.

WHAT NEXT

Invoke ‘report_activity’ with either ‘hier_level’ OR ‘this_level_only’ option.

PWR-359 (error) Bad option combination between ‘all’ and ‘only’.

DESCRIPTION

‘all’ and ‘only’ are mutually exclusive options. Only one of them can be used.

WHAT NEXT

Invoke ‘report_activity’ with either ‘all’ OR ‘only’ option.

PWR-360 (error) The number assigned to hier_level option must be positive.

DESCRIPTION

hier_level option takes only positive integer arguments.

WHAT NEXT

Invoke ‘report_activity’ with ‘-hier_level <positive number>’ option.

PWR-361 (error) Only ‘ports’ and ‘registers’ are accepted with -

all option.

DESCRIPTION

'-all' options takes only a list of 'ports', 'registers' or both.

WHAT NEXT

Invoke 'report_activity' with '-all ports' OR '-all registers' OR '-all {ports registers}'.

PWR-362 (error) No switching activity has been annotated.

DESCRIPTION

The read_saif command could not annotate any switching activity. This is usually due to an invalid instance name specified with the -instance argument.

WHAT NEXT

Check that the -instance argument is valid; the instance specified by the -instance argument must be present in the backward SAIF file storing the switching activity.

PWR-363 (error) Only low or high is accepted for -effort.

DESCRIPTION

The valid choices for -effort option is either 'low' or 'high'.

WHAT NEXT

Reinvoke the command with either '-effort low' or '-effort high'.

PWR-364 (error) The <em drc switch> argument of set_electromigration_drc must be either 'on' or 'off'.

DESCRIPTION

The valid choices for the <em drc switch> argument of the set_electromigration_drc

command are either 'on' or 'off'.

WHAT NEXT

Reinvoke the command with either 'on' or 'off' as its <em drc switch> argument.

PWR-365 (error) The clock gating cell '%s' has an unknown pin.

DESCRIPTION

The clock gating cell has an unknown pin which can not be processed.

WHAT NEXT

Look for any steps which might have changed the clock gating cell since elaborate or last compile. Avoid any steps that would change the attributes or manipulate the clock gating cells and re-compile.

PWR-366 (error) Cannot specify '-path_dep', '-rise_ratio', or '-period' argument without '-toggle_rate'.

DESCRIPTION

The '-path_dep', '-rise_ratio' and '-period' arguments require a toggle rate value given with the '-toggle_rate' argument.

WHAT NEXT

Reinvoke the command with a valid '-toggle_rate' argument.

PWR-367 (error) Cannot specify '-state_dep' without either '-toggle_rate' or '-static_probability'.

DESCRIPTION

The '-state_dep' argument requires a toggle rate value given with the '-toggle_rate' argument or a static probability value given with the '-static_probability' argument.

WHAT NEXT

Reinvoke the command with a valid '-toggle_rate' or '-static_probability' argument.

PWR-368 (error) The '-toggle_rate' argument has to be numeric.

DESCRIPTION

The argument specified with '-toggle_rate' must be a decimal number.

WHAT NEXT

Reinvoke the command with a valid numeric '-toggle_rate' argument.

PWR-369 (error) The '-period' argument has to be numeric.

DESCRIPTION

The argument specified with '-period' must be a decimal number.

WHAT NEXT

Reinvoke the command with a valid numeric '-period' argument.

PWR-370 (error) The '-rise_ratio' value must be between 0 and 1.

DESCRIPTION

The value of the rise_ratio argument represent the ratio of rise toggles with respect to the total toggles and must be a decimal number greater or equal to 0.0 and less or equal to 1.0.

WHAT NEXT

Reinvoke the command with a value value for the '-rise_ratio' argument.

PWR-371 (error) Invalid type of switching activity for an object of

type %s.

DESCRIPTION

This error occurs when the arguments of the `set_switching_activity` command are not applicable to the object being annotated. Examples of such invalid switching activities are: any state and path dependent switching activity on design ports and nets; path dependent toggle counts on input pins, state dependent static probability on pins, any toggle count on cells, and non-state dependent static probability on cells.

WHAT NEXT

Check the type of the switching activity given in the arguments and the type of objects being annotated, and then re-apply the `set_switching_activity` command.

PWR-372 (error) The -khrate value must be non-negative.

DESCRIPTION

The value of the `-khrate` argument represents the de-rating factor of glitches and must be a non-negative real number.

WHAT NEXT

Re-invoke the command with a non-negative value of the `-khrate` argument.

PWR-373 (error) Empty/bad object list.

DESCRIPTION

The command was invoked with an empty list of objects, or with objects of the wrong type.

WHAT NEXT

Check the object types that are valid for this command, and re-invoke it with a valid object list.

PWR-374 (error) The %s argument cannot be used with %s.

DESCRIPTION

The command was invoked with a number of arguments that are mutually exclusive.

WHAT NEXT

Re-invoke the command with a valid list of arguments.

PWR-375 (error) The %s argument cannot be used without %s.

DESCRIPTION

The command was invoked with an argument that is meaningless or illegal unless used in conjunction with some other particular arguments.

WHAT NEXT

Re-invoke the command with a valid list of arguments.

PWR-376 (error) Bad arguments.

DESCRIPTION

The command was invoked with an illegal list of arguments.

WHAT NEXT

Re-invoke the command with a valid list of arguments.

PWR-377 (error) The %s value must be non-negative.

DESCRIPTION

The command argument needs a numeric value that is greater or equal to 0.

WHAT NEXT

Re-invoke the command with a non-negative value for this argument.

PWR-378 (warning) Unknown pins on clock gating cell '%s'. The clock gate will not be removed or rewired.

DESCRIPTION

There are unknown pins on the clock gating hierarchy. Only clock, enable, test control, test observation and gated clock output pins are allowed. Since the cell might contain additional functionality it will not be removed or rewired.

WHAT NEXT

Detect the step that inserted additional pins on the clock gating hierarchy and fix it. Run the rewire or remove clock gating command after that.

PWR-379 (warning) Using scan_enable with latch free clock gating may cause DRC violations during test insertion

DESCRIPTION

When using latch free clock gating with scan_enable, the glitches or edges in scan_enable can propagate to the clock pin of the register. Since scan_enable is not constrained during parallel input vector setup, there is a potential risk of scan_enable switching and hence causing an unwanted clock edge at the register clock pin. The test insertion or test DRC tool might issue violations like, clock pin not controllable or capture violations in this case.

WHAT NEXT

If you can ensure that there will be no unwanted glitching at scan_enable, you can safely ignore this warning. Otherwise reconsider using test_mode control signal or using a latch based clock gating style

PWR-380 (warning) Required pins missing on clock gating cell

'%s'. The clock gate will not be removed or rewired.

DESCRIPTION

Any of the mandatory pins (EN, CLK, ENCLK) of the clock gating hierarchy is missing. This could happen because of two reasons. The pins got removed by some other tools. OR the pins as such exist, but some of their attributes got removed.

WHAT NEXT

Detect the step that edited the clock gating hierarchy and fix it. Run the rewire or remove clock gating command after that.

PWR-381 (error) Use the 'uniquify' command to fix multiply instantiated designs.

DESCRIPTION

Hookup_testports command needs the design to be uniquified in XG mode.

If you don't want some instances to be modified please set_dont_touch those instances.

WHAT NEXT

You can resolve the multiply instantiated designs into separate designs using uniquify. If this is not acceptable, you can set_dont_touch on instances which should not be modified. Run hookup_testports after this.

PWR-382 (error) No objects are specified; a list of objects or -select is required.

DESCRIPTION

This command needs acts on a number of objects which can be specified explicitly as a list of objects, or implicitly using the -select argument.

WHAT NEXT

Re-invoke the command with a list of object in its argument, or use the -select option.

PWR-383 (error) Both an object list and -select are given as arguments.

DESCRIPTION

The command is invoked with a list of objects in its arguments together with the -select option. This command works on a number of objects that can be specified explicitly as a list of objects in its arguments, or implicitly using the -select option. The two options are mutually exclusively.

WHAT NEXT

Check the command arguments and reinvoke the command excluding the -select option or the list of objects in its arguments.

PWR-384 (error) -hier and/or -instance options given without -select.

DESCRIPTION

The -hier and -instance options can only be used with the -select option.

WHAT NEXT

Check the command line arguments and reinvoke the command with the -select option, or without the -hier/-instance options.

PWR-385 (error) %s is %s; it is not a valid instance.

DESCRIPTION

An invalid instance is given as an argument to this command. Only non-leaf cells are valid instances.

WHAT NEXT

Reinvoke the command with valid instances.

PWR-386 (error) State/Path dependent switching activity given

with -select.

DESCRIPTION

State Dependent (-state_dep option) and Path Dependent (-path option) switching activity can only be used when the design objects being annotated are specified explicitly as a list of objects. State/Path dependent switching activity cannot be used with the -select option.

WHAT NEXT

Reinvoke the command without the -select option.

PWR-387 (error) Unrecognized select type: %s.

DESCRIPTION

An invalid argument is given to the -select option. The following selection types can be used with the -select option: regs, tris, inputs, outputs, inout, ports, nets.

WHAT NEXT

Reinvoke the command with a valid list of selection types given to the -select argument.

PWR-388 (error) Empty type list given to -select.

DESCRIPTION

The -select option needs a non-empty list of selection types.

WHAT NEXT

Reinvoke the command with a non-empty list of selection types.

PWR-390 (warning) -max_fanout

DESCRIPTION

reserved

WHAT NEXT

reserved

PWR-391 (warning) Clock gating style has non-default -max_fanout.

DESCRIPTION

reserved

WHAT NEXT

reserved

PWR-392 (warning) Clock gate replacement requires at least one designated clock port; no replacement is performed on design %s.

DESCRIPTION

Before clock gate replacement can be performed, the clock ports must be identified with the **create_clock** command.

WHAT NEXT

Define the clock ports with the **create_clock** command.

SEE ALSO

replace_clock_gates (2), **create_clock** (2).

PWR-393 (warning) Cell %s is not replaced by a clock gate since it is not on a clock tree.

DESCRIPTION

Clock gate replacement only considers cells that are on the clock tree. The cell that was included with the `set_replace_clock_gates` command does not appear on the clock tree, hence it was not considered for clock gate replacement. Perhaps the wrong port was defined as the clock port, or there are multiple clock ports, and some of them were not properly defined with the `create_clock` command.

WHAT NEXT

Do not include this cell for clock gate replacement, or define the missing clock port with the `create_clock` command.

SEE ALSO

`insert_clock_gating` (2), `set_replace_clock_gates` (2), `create_clock` (2).

PWR-394 (warning) Cell %s is not replaced by a clock gate since it depends on multiple clock signals.

DESCRIPTION

Clock gate replacement will only replace the combinational cell when it can find a matching clock-gating cell. The specified combinational cell has multiple clock inputs. Since the Power Compiler clock gates only have one clock input, there is no opportunity for clock gate replacement. Perhaps the other path is not really a clock input -- in that case the driving port should not be defined as a clock port.

WHAT NEXT

Remove the clock for the port that is not a clock port with the `remove_clock` command, or exclude the combinational cell with the `set_replace_clock_gates` command.

PWR-395 (warning) The arc from %s to %s of cell %s is not unate; no clock gate replacement is performed upstream of the

cell output.

DESCRIPTION

Clock gate replacement will only replace the combinational cell with a clock gate when it can find a matching clock-gating cell. Only cells with AND/NOR or OR/NAND functionality can be replaced. The specified cell has a non-unate arc from the clock input to its output, hence it cannot be replaced by a Power Compiler clock gate.

WHAT NEXT

Reconsider the RTL implementation. If the functionality of this manually inserted clock gate is intended, exclude the cell with the **set_replace_clock_gates** command.

PWR-396 (warning) No compatible clock gating structure available to replace manually inserted clock gate %s; no clock gate replacement is performed for this cell.

DESCRIPTION

Clock gate replacement will only replace the combinational cell with a clock gate when it can find a matching clock-gating cell. Only cells with AND/NOR or OR/NAND functionality can be replaced

WHAT NEXT

Exclude the cell with the **set_replace_clock_gates** command.

PWR-397 (warning) Cell %s is a module which cannot be un gated; clock gate %s will not be removed.

DESCRIPTION

Module-level clock gates, i.e., clock gates which are driving modules cannot be removed, because the module cannot be un gated at the top level of hierarchy in the design. If the module contains registers, it can be ungrouped to bring the registers to the top level. If the module is a black-box cell, it cannot be further ungrouped; in that case removal of the clock gating cell is not possible.

WHAT NEXT

Ungroup the module with the **ungroup** command.

PWR-398 (error) Cell %s is a module which cannot be ungated; clock gate %s will not be removed.

DESCRIPTION

Module-level clock gates, i.e., clock gates which are driving modules cannot be removed, because the module cannot be ungated at the top level of hierarchy in the design. If the module contains registers, it can be ungrouped to bring the registers to the top level. If the module is a black-box cell, it cannot be further ungrouped; in that case removal of the clock gating cell is not possible.

WHAT NEXT

Ungroup the module with the **ungroup** command.

PWR-399 (warning) Cell %s drives both rising and falling edge registers; no clock gate replacement is performed upstream of the cell output.

DESCRIPTION

Clock gate replacement can only be performed if the fanout of the cell consists strictly of registers with the same edge sensitivity.

WHAT NEXT

Split the positive and negative edge registers in two groups, and use two different gated clock signals driven by two different clock-gating cells.

PWR-400 (warning) Cell %s drives a module output; no clock gate replacement is performed upstream of the cell output.

DESCRIPTION

Clock gate replacement can only be performed if the fanout of the cell consists

strictly of registers with the same edge sensitivity. Because the clock signal is also fed to an output port, it is not possible to determine what the edge type will be in the fanout of this output port. Hence, no replacement is performed.

WHAT NEXT

Split the output port from the internal signals by using two different gated clock signals driven by two different clock-gating cells.

PWR-401 (warning) Cannot determine active edge of register %s; no clock gate replacement is performed upstream of this cell.

DESCRIPTION

Clock gate replacement can only be performed if the fanout of the cell consists strictly of registers with the same edge sensitivity. For this sequential cell the edge type cannot be determined. Hence, no replacement is performed.

WHAT NEXT

If the edge type is known, specify it with the `set_replace_clock_gates` command.

PWR-402 (warning) Cell %s cannot be replaced by a clock gate.

DESCRIPTION

Clock gate replacement will only replace the combinational cell with a clock gate when it can find a matching clock-gating cell. Only combinational cells with a single output and at least two inputs are considered. Buffers and inverters are never considered for clock gate replacement, unless they are explicitly included with the `set_replace_clock_gates` command.

WHAT NEXT

Do not include this cell with the `set_replace_clock_gates` command.

PWR-403 (warning) Cannot determine active edge at output of

cell %s; no clock gate replacement is performed for this cell.

DESCRIPTION

Clock gate replacement can only be performed if the fanout of the cell consists strictly of registers or modules with the same edge sensitivity. For this manually inserted clock gate the edge type of the cells in the fanout cannot be determined. Hence, no replacement is performed.

WHAT NEXT

In case there are black box modules in the fanout, specify the edge type for those modules with the `set_replace_clock_gates` command. In case of mixed edge type, exclude the cell with the `set_replace_clock_gates -exclude` command. If there is an output in the fanout for which the edge type can be ignored, force clock gate replacement by including the cell with the `set_replace_clock_gates -include` command.

PWR-404 (warning) Pin %s of clock gate %s is not a clock input; no clock gate replacement is performed upstream of this pin.

DESCRIPTION

Clock gate replacement allows Power Compiler clock gating cells on the clock path, but the clock net should drive the clock input of these cells. When this is not the case, the edge type of the fanout of this cell cannot be determined, hence no replacement can be performed. Most likely, this warning occurred because the wrong port was assigned as the clock port.

WHAT NEXT

Remove the clock for the port that is not a clock port with the `remove_clock command`, or exclude the combinational cell with the `set_replace_clock_gates` command.

PWR-405 (warning) Cell %s is too complex to be replaced by a clock gate; no clock gate replacement is performed for this cell.

DESCRIPTION

Clock gate replacement will only replace the combinational cell with a clock gate when it can find a matching clock-gating cell. Only cells with AND/NOR or OR/NAND functionality can be replaced. The specified cell has a mix of AND and OR behavior, hence it cannot be replaced by a Power Compiler clock gate.

WHAT NEXT

Reconsider the RTL implementation. If the functionality of the manually inserted clock gate is intended, exclude the cell with the `set_replace_clock_gates` command.

SEE ALSO

`insert_clock_gating` (2), `set_replace_clock_gates` (2).

PWR-406 (warning) Clock gate replacement for cell %s demands a latch-%s clock gating style; no replacement is performed for this cell.

DESCRIPTION

Clock gate replacement will only replace the combinational cell with a clock gate when it can find a matching clock-gating cell. Only cells with AND/NOR or OR/NAND functionality can be replaced. The combination of the clock-gating style and the edge type does not match the functionality of the manually inserted clock gate, hence it cannot be replaced by a Power Compiler clock gate.

WHAT NEXT

Change the clock gating style from latch-based to latch-free or visa-versa to match the functionality of the cell.

SEE ALSO

`replace_clock_gates` (2), `set_clock_gating_style` (2).

PWR-407 (warning) Combinational loop detected at cell %s; no clock gate replacement is performed upstream of this cell.

DESCRIPTION

If a combinational loop exists on the clock path, the edge type of the registers in the fanout is undefined, hence no clock gate replacement can be performed. This warning usually indicates that something is wrong with the RTL description, since combinational loops on the clock path are almost never intentional.

WHAT NEXT

Revise the RTL description.

PWR-408 (error) The port %s is used in more than one of these options: -rising_edge_clock, -falling_edge_clock, or -undo.

DESCRIPTION

The same port of a design cannot have different edge types. If an instance pin is specified, the corresponding design port is used instead, since the edge type property is design specific. It is not allowed to specify the same port more than ones in the options of the **set_replace_clock_gates** command.

WHAT NEXT

Specify the port only once. If pins of multiple instances of the same design are specified, and the pins correspond to the same port, specify only one of the instance pins.

PWR-409 (warning) Instance '%s' of design '%s' is not clock gated because other instances of the same design are excluded from clock gating.

DESCRIPTION

If a design is not uniquified, and some instances of a subdesign are excluded from clock gating with the **set_dont_touch command**, all other instances are automatically excluded as well.

WHAT NEXT

Uniquify the conflicting instances before executing **insert_clock_gating -global**, or remove the set_dont_touch directive for the multiply-instantiated subdesigns.

PWR-410 (warning) Given -clock argument '%s' does not exist.

DESCRIPTION

The string argument of the -clock option of **set_switching_activity** needs to be an

existing clock. The -clock option of set_switching_activity associates a clock with the annotated object. When specified, toggle rates annotated to design objects will be divided by the period of the associated clock (also called the related clock) when power values are calculated.

WHAT NEXT

Check that the specified -clock option is correct, re-issue the set_switching_activity with the correct clock name if it is not. Otherwise, create a clock with the name of the -clock argument before calculating power numbers.

PWR-411 (warning) Both -clock and -period arguments are specified.

DESCRIPTION

A set_switching_activity command has been specified with both the -clock and -period arguments, which is probably a user error. The -period argument specifies the time period relative to which the given -toggle_rate is applied. Basically, the value of the -toggle_rate argument is divided by the value of the -period argument at the time of the annotation. For instance, the following two commands:

```
set_switching_activity [get_net n1] -toggle_rate 2.0 -period 100.0
set_switching_activity [get_net n1] -toggle_rate 0.02
```

are equivalent since both annotate a toggle rate of 0.02 to the net n1.

The -clock argument specifies a related clock for the annotated object. When an object has a related clock, the annotated toggle rate is divided by the clock period during power calculations. For example,

```
create_clock clk -period 100.0 set_switching_activity [get_net n1] -toggle_rate 2.0
-clock clk
```

annotates the toggle rate of 2.0 to the net n1. When power values are calculated (assuming that the period of clk remains changed) a toggle rate of 0.02 is used for the net n1. The user can change the clock period of clk and get different effective toggle rates for the net n1, without re-annotating the switching activity of the net n1.

When both the -period and -clock options are specified, the toggle rate value is first divided by the value of the -period argument during the time of annotation, and then divided again by the period of the clock given by the -clock option during power calculation. This is often not the intended behaviour.

WHAT NEXT

Check the arguments of the set_switching_activity command, and make sure that giving both the -period and -clock arguments to the set_switching_activity command is

intended. You can avoid getting this warning by specifying two set_switching_activity commands:

```
set_switching_activity -toggle_rate <tr> -period <p> ... set_switching_activity -clock <clk>
```

which has the same effect as the single command:

```
set_switching_activity -toggle_rate <tr> -period <p> -clock <clk> ...
```

PWR-412 (warning) The clock '%s' associated with the %s '%s' does not exist or has no period.

DESCRIPTION

The design object (net, pin, or port) given in the warning message has a clock associated with it that does not exist or has no period. A clock can be associated to a design object by using the -clock option of the set_switching_activity command. The associated, or related, clock period is used to calculate the effective toggle rate of the object used in power calculations. The effective toggle rate is the annotated toggle rate divided by the period of the related clock. When a related clock is not specified, the annotated toggle rate relative to the library time unit is used. In this case, the related clock does not exists in the current design or has no period; for power calculations, the related clock period is assumed to be 1.0.

WHAT NEXT

Create the required clock and re-issue the command giving the warning message.

PWR-413 (warning) The variable '%s' is obsolete; use '%s' instead.

DESCRIPTION

The variables for specifying the default switching activity values for unannotated primary inputs and black-box outputs are: **power_default_toggle_rate** and **power_default_static_probability**.

The variable you are using is obsolete and its value is ignored.

WHAT NEXT

Modify your scripts to use the **power_default_toggle_rate** and **power_default_static_probability** variables.

PWR-414 (warning) Design has unannotated primary inputs.

DESCRIPTION

A number of primary input ports of your design are not user annotated with switching activity. Default switching activity values are used for these ports. This may result in inaccurate power numbers.

WHAT NEXT

Check the switching activity annotation of your primary inputs. You can use the command:

```
report_saif -missing
```

to check which ports are not user annotated. Annotate the switching activities of these ports using the `set_switching_activity` or `read_saif` commands. You can set the value of the variable `power_sa_propagation_verbose` to `true` before propagating the switching activity to get a warning message for each unannotated black-box output. You can also force a verbose re-propagation of the switching activity information by calling `propagate_switching_activity -verbose`.

PWR-415 (warning) Design has unannotated sequential cell outputs.

DESCRIPTION

Some sequential cell outputs are not user annotated with switching activity. The switching activity propagation mechanism of Power Compiler will be used to derive these values. Propagated switching activity of sequential cells may be less accurate than the propagated activity of combination cells.

WHAT NEXT

Although the unannotated switching activity values of the sequential cell outputs will be derived by Power Compiler, more accurate power numbers can be achieved if these are user annotated with accurate switching activities. You can use:

```
report_saif -type rtl -flat -missing
```

to check how many sequential cells are not user annotated.

PWR-416 (warning) The unannotated %s '%s' %s a black-box

output.

DESCRIPTION

The given net or pin is not user annotated with switching activity values. Default switching activity values based on the variables:

`power_default_toggle_rate power_default_static_probability`

will be used since the functionality of the driving cell cannot be determined. The cell driving the net is either a black-box or has unknown functionality.

This may have an impact on the accuracy of the calculated power values.

Note that this warning message is only issued when the switching activity propagation mechanism is called in verbose mode. The boolean variable `power_sa_propagation_verbose` specifies the default propagation verbose level.

WHAT NEXT

You can use the `report_cell` command on the driving cell to check the type of cell. Use the `set_switching_activity` or `read_saif` command to annotate the switching activity of the specified net.

PWR-417 (warning) The net '%s' is only annotated with a static probability value. A default toggle rate value of %f is used.

DESCRIPTION

This warning message occurs when the net has static probability annotation but no toggle rate annotation, no related clock is associated with the net, and a default toggle rate value has to be annotated. Default switching activity values have to be annotated when they are not user annotated and Power Compiler cannot estimate the missing switching activity. This occurs on nets connected to primary inputs and black-box outputs.

The default toggle rate value is derived from the two variables: `power_default_toggle_rate` and `power_default_toggle_rate_type`.

If the value of the `power_default_toggle_rate_type` is `fastest_clock` then the default toggle rate value is derived by multiplying the value of the `power_default_toggle_rate` with the frequency of the fastest clock in the design. If no clock is defined in the current design, then a frequency value of 1.0 is used.

If the value of the `power_default_toggle_rate_type` is `absolute` then the value of the `power_default_toggle_rate` variable is used as the default toggle rate value.

WHAT NEXT

If possible annotate both the toggle rate and static probability values for this net.

PWR-418 (warning) The net '%s' is only annotated with a static probability value and the related clock '%s'. A default toggle rate value of %f is used.

DESCRIPTION

This warning message occurs when the net has static probability annotation but no toggle rate annotation, a related clock is associated with the net, and a default toggle rate value has to be annotated. Default switching activity values have to be annotated when they are not user annotated and Power Compiler cannot estimate the missing switching activity. This occurs on nets connected to primary inputs and black-box outputs.

The default toggle rate value is derived from the two variables:
`power_default_toggle_rate` and `power_default_toggle_rate_type`.

If the value of the `power_default_toggle_rate_type` is `fastest_clock` then the default toggle rate value is derived by multiplying the value of the `power_default_toggle_rate` with the frequency of the related clock.

If the value of the `power_default_toggle_rate_type` is `absolute` then the value of the `power_default_toggle_rate` variable is used as the default toggle rate value.

WHAT NEXT

If possible annotate both the toggle rate and static probability values for this net.

PWR-419 (warning) The net '%s' is annotated with a toggle rate but no static probability. A default static probability value of %f is used.

DESCRIPTION

This warning message occurs when the net has toggle rate annotation but no static probability annotation. Power Compiler needs both toggle rate and static probability values on a net in order to use its switching activity during propagation. If a static probability value is missing, a default value is assumed and the annotated toggle rate and the default static probability value are used during propagation. In

such cases, the default static probability value is assumed to be 0.0 if the annotated toggle rate is 0.0, otherwise the value given by the `power_default_static_probability` variable is used.

WHAT NEXT

If possible annotate both the static probability and toggle rate values for this net.

PWR-420 (warning) The partially annotated net '%s' has an estimated %s value of %f.

DESCRIPTION

Only the static probability value of the given net is user annotated. The unannotated toggle rate value is derived using the switching activity propagation mechanism of Power Compiler. The user annotated static probability value is not overwritten with the propagated value, but it is not used to derive the missing user annotation.

Both the static probability and toggle rate values are required in order for the switching activity of a particular net is used during propagation. If the static probability is missing a default value is assumed, but a default value cannot be assumed for such missing toggle rates, so the annotated static probability value cannot be used during propagation.

It is desirable that both the toggle rate and static probability values of design objects are user annotated. Partial annotation may result in inaccurate power calculations.

WHAT NEXT

If possible, annotate both the toggle rate and static probability of the given object.

PWR-421 (warning) Invalid switching activity annotation on constant net(s) is being ignored.

DESCRIPTION

The design contains logic 0 or 1 nets, or cell pins driven by such nets, that have been annotated with invalid switching activity. Basically, for constants the annotated toggle rate value must be 0. The static probability for logic 1 objects must 1.0 and that of logic 0 must be 0.0.

Since the user annotation is clearly invalid, it is ignored and the correct switching activity values will be used for power calculation purposes.

WHAT NEXT

This is a warning message. The invalid user annotation is being ignored during power calculation.

PWR-422 (warning) The partially annotated net '%s' has a derived %s value of %f.

DESCRIPTION

Only one of the toggle rate and static probability values of the given net is user annotated. The unannotated value has been derived by Power Compiler and may be used by the switching activity propagation mechanism to estimate the switching activity of other unannotated design objects.

WHAT NEXT

If possible, annotate both the toggle rate and static probability of the given object.

PWR-423 (warning) The value of the variable '%s' is invalid; the default value of %s will be used instead.

DESCRIPTION

The following variables:

```
float power_default_static_probability float power_default_toggle_rate
```

are used to derive default switching activity values of primary inputs and black box outputs that have not been annotated by the user. Valid values for these are:

The value of power_default_static_probability should be a floating number between 0.0 and 1.0 both inclusive. The value of power_default_static_probability should be a floating number greater or equal to 0.0.

When an invalid value for these variables is specified, then the default value of 0.5 will be used for deriving default switching activity values.

Also, if the value of power_default_static_probability is 1.0 or 0.0, then the value of power_default_toggle_rate should be 0.0. If the value of power_default_toggle_rate is not 0.0, then Power Compiler will issue this warning

message and use the value 0.0 for default toggle rates. If the value of power_default_toggle_rate is 0.0, then the value of power_default_static_probability should be 0.0 and 1.0. If the value of power_default_toggle_rate is neither 1.0 nor 0.0, then this warning message will be issued, and a default value of 0.0 will be used.

WHAT NEXT

Set the values of power_default_static_probability and power_default_toggle_rate to valid value.

SEE ALSO

`power_default_static_probability` (3), `power_default_toggle_rate` (3).

PWR-424 (warning) Main library '%s' does not specify the following unit%s required for power: '%s'.

DESCRIPTION

The following units are required for power calculations: Voltage, Capacitance, Time, and Leakage Power units. If some of these units are not defined in your technology library then the power reports may be unitless.

The main library is determined as follows: During reporting the main library is the first library in the link path that contains a cell that is used in the design. During optimization the main library is the first target library specified.

WHAT NEXT

Use a library that defines the units required for power. Specify this as the main library by making it the first library in your link and/or target library path list. You will need to remove the `local_link_library` attribute from the current design if this specifies a main library that does not contain power units. You can also use the `set_local_link_library` command to change the local link libraries after reading a compiled .db design file.

PWR-425 (error) The cell '%s' is a leaf cell.

DESCRIPTION

A leaf cell is specified where a hierachical cell is expected.

WHAT NEXT

Please specify a hierarchical cell. You can use the report_cell command to check whether a cell is hierarchical.

PWR-426 (error) The command '%s' is only available in XG mode.

DESCRIPTION

The specified command is only available in XG mode.

WHAT NEXT

Please use XG mode to run this command.

PWR-427 (warning) Cannot determine the time units, using 1 ns.

DESCRIPTION

This warning message is displayed during write_saif when the time units cannot be obtained from the main synthesis library. This usually happens when the technology library is not yet loaded, or when the first element in your link/target library list does not have a defined time unit. For instance, if the first element of your link library is a synthetic library, then it probably does not specify a time unit. In such cases, Power Compiler will assume that the intended synthesis time units are 1 ns.

WHAT NEXT

You can use a technology library that defines a time unit as the first element of your link and target libraries.

PWR-428 (warning) Design has unannotated black-box outputs.

DESCRIPTION

The design contains a number of black-box cells whose outputs are not user annotated with switching activity information. Since switching activity cannot be propagated for design nets connected to black-box outputs, default values are used for these nets. This may result in inaccurate power numbers.

WHAT NEXT

Check the switching activity annotation of the nets connected to black-box outputs. You can set the value of the variable **power_sa_propagation_verbose** to true before propagating the switching activity to get a warning message for each unannotated black-box output. You can also force a verbose re-propagation of the switching activity information by calling **propagate_switching_activity -verbose**.

PWR-429 (warning) The unannotated net '%s' is driven by a primary input port.

DESCRIPTION

The given net is driven by a primary input port and is not user annotated with switching activity values. Default switching activity values based on the variables:

`power_default_toggle_rate power_default_static_probability`

will be used since the unannotated switching activity cannot be estimated using the propagation mechanism.

This may have an impact on the accuracy of the calculated power values.

Note that this warning message is only issued when the switching activity propagation mechanism is called in verbose mode. The boolean variable **power_sa_propagation_verbose** specifies the default propagation verbose level.

WHAT NEXT

Use the **set_switching_activity** or **read_saif** command to annotate the switching activity of the specified net.

PWR-430 (warning) The cell %s is not a hierarchical clock-gating cell and cannot be removed.

DESCRIPTION

You receive this error message because you issued the **remove_clock_gating** command with the **-all** option on a design that has a nonhierarchical clock-gating cell. Such cells cannot be removed.

WHAT NEXT

The other (hierarchical) clock gates will still be marked for removal with the **remove_clock_gating** command. Do not ungroup the hierarchical clock-gating cells

during the compile flow.

SEE ALSO

`remove_clock_gating` (2), `report_clock_gating` (2), `ungroup` (2).

PWR-431 (error) Use at least one of the options - `-rising_edge_clock`, `-falling_edge_clock`, or `-undo` with the `set_module_clock_edges` command.

DESCRIPTION

The `set_module_clock_edges` requires at least one of the options above.

WHAT NEXT

Specify at least one of the options.

PWR-432 (error) Use at least one of the options - `-include_instances`, `-exclude_instances`, or `-undo` with the `set_module_clock_gates` command.

DESCRIPTION

You receive this error message because the `set_module_clock_gates` did not mark the cells to be included or excluded from clock-gate replacement. Use at least one of these three options: `-include_instances`, `-exclude_instances`, or `-undo`. The arguments to the options should be cells in the current design intended as manually inserted clock gates.

WHAT NEXT

Use the appropriate set of options for the command. Make sure you are using the correct name of the cells you want to include or exclude for clock-gate replacement. To find cells in the design, use the `find` command.

SEE ALSO

`find` (2), `insert_clock_gating` (2), `set_module_clock_gates` (2).

PWR-433 (error) Clock gate %s is marked for rewiring and cannot be ungated; its driving clock gate %s will not be removed.

DESCRIPTION

You receive this error message because you specified as an option to the `remove_clock_gating` command a cell that is marked for rewiring by the `rewire_clock_gating` command.

WHAT NEXT

A cell that is marked for rewiring cannot be marked for removal. If you want to use the `compile` command with the `-incremental` option (or `physopt` and `physopt -incremental`) to remove the cell, use the `-undo` option of the `rewire_clock_gating` command. Use the cell you specified as an argument for the `-gated_objects` option. Then reissue the `remove_clock_gating` command.

SEE ALSO

`compile` (2), `remove_clock_gating` (2), `rewire_clock_gating` (2).

PWR-434 (error) Clock gate %s is marked for rewiring and cannot be removed.

DESCRIPTION

You receive this error message because you specified as an option to the `remove_clock_gating` command a clock-gating cell that is marked for rewiring by the `rewire_clock_gating` command.

WHAT NEXT

A clock gating cell that is marked for rewiring cannot be removed. If you want to use the `compile` command with the `-incremental` option (or `physopt` and `physopt -incremental`) to remove the cell, use the `-undo` option of the `rewire_clock_gating` command. Use the cell you specified as an argument for the `-gated_objects` option. Then reissue the `remove_clock_gating` command.

SEE ALSO

`compile` (2), `remove_clock_gating` (2), `rewire_clock_gating` (2).

PWR-435 (error) Use at least one of the options `-gating_cell` or `-undo` with the `rewire_clock_gating` command.

DESCRIPTION

The `rewire_clock_gating` command requires at least one of the options above.

WHAT NEXT

Specify at least one of the options.

PWR-436 (warning) `max_fanout` ignored when `power_cts_driven_placement` set to true.

DESCRIPTION

In the CTS driven clock gate placement flow, there is no need to specify `max_fanout` constraint. Power Compiler resets the `max_fanout` to the default number of 2048 in this case to maximize power savings.

WHAT NEXT

No action required. To avoid the warning, remove `-max_fanout` option of `set_clock_gating_style` command.

PWR-437 (error) Port %s is an output; edge specification with the `set_replace_clock_gates` command can only be applied to input ports.

DESCRIPTION

The pins or ports in the object lists of the `-rising_edge_clock` or `-falling_edge_clock` options for the `set_replace_clock_gates` command have to be input ports.

WHAT NEXT

Do not attempt to specify the clock edge type for output ports.

PWR-438 (error) -proximity can not be used with any other options except -verbose

DESCRIPTION

-proximity option can not be combined with any other option except -verbose.

WHAT NEXT

Reissue `rewire_clock_gating` command with correct options.

PWR-439 (error) Enable path to clock gating cell '%s' is unconstrained.

DESCRIPTION

Enable path to the above clock gate does not have any timing constraints. Since `merge_clock_gates` can not honor the `-min_slack` option in this case, no merging will be done.

WHAT NEXT

Most probable cause for this is, the design does not have any clocks. Run `create_clock` with a valid `-period` option and then reissue `merge_clock_gates -min_slack <value>` command. Also explore other reasons why enable path is not constrained. For unconditional merging of clock gates, use `merge_clock_gates` without `-min_slack` option.

PWR-440 (warning) Not clock-gating register %s due to structural limitations.

DESCRIPTION

You receive this warning message when certain registers are not clock-gated due to structural limitations. This situation can occur during hierarchical clock-gating (issued with `insert_clock_gating -global`) on multiple-instantiated designs. Because of differences instantiations of the design, not all instances of the design can be treated the same. Because of this limitation, it can occur that registers are excluded from clock-gating.

WHAT NEXT

Uniquify the conflicting instances before executing `insert_clock_gating -global`.

SEE ALSO

`insert_clock_gating` (2), `set_clock_gating_style` (2).

PWR-441 (Error) The latch specified (%s) for %s edge logic does not have the required functionality

DESCRIPTION

The specified latch can not be used in the clock gating circuitry since it does not have the required functionality.

Power Compiler uses a transparent low latch for positive edge triggered registers and transparent high latch for negative edge triggered logic.

WHAT NEXT

Specify another latch which sticks to the above requirement

PWR-442 (warning) Cannot determine active edge for module input pin %s; no clock gate replacement is performed upstream of this module.

DESCRIPTION

Clock gate replacement can only be performed if the edge type of the cells in the fanout can be determined. For registers the edge type can be determined automatically, but for black box modules the edge type must be specified explicitly with the `set_replace_clock_gates` command.

WHAT NEXT

Set the edge type with the `set_replace_clock_gates` command.

PWR-443 (information) Unannotated %s toggle rate for false %s

of pin '%s' is automatically set to 0.

DESCRIPTION

The specified pin is partially annotated with state-dependent and/or path-dependent (SDPD) toggle rate values. Power Compiler is automatically setting the SDPD toggle rate value of unannotated false states/arcs to 0.0. False states are states that always evaluate to 0 and include the default state in pins where the other states cover all possible states of the cell. False arcs are invalid paths from an input to an output.

This message is issued by the SDPD fixing step which can be controlled by the variable `power_fix_sdpd_annotation`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3).

PWR-444 (information) Non-zero %s toggle rate annotation on false %s of pin '%s' is automatically set to 0.

DESCRIPTION

The specified pin is annotated with non-zero state-dependent and/or path-dependent (SDPD) toggle rate values on false states/arcs. Power Compiler is automatically setting the SDPD toggle rate value of false states/arcs to 0.0. False states are states that always evaluate to 0 and include the default state in pins where the other states cover all possible states of the cell. False arcs are invalid paths from an input to an output.

This message is issued by the SDPD fixing step which can be controlled by the variables `power_fix_sdpd_annotation`, `power_fix_sdpd_annotation_verbose` and `power_sdpd_message_tolerance`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),

```
power_sdpd_message_tolerance (3).
```

PWR-445 (information) The user annotated SDPD %s toggle rates on pin '%s' are being scaled so they add up to half of the pin toggle rate.

DESCRIPTION

The user annotated rise/fall state-dependent and/or path-dependent (SDPD) toggle rate values on the specified pin do not add to half of the non-SDPD toggle rate on the pin (i.e. the toggle rate of the net connected to the pin). Power Compiler is scaling the SDPD toggle rate values so that they add up to half of the pin toggle rate.

This message is issued by the SDPD fixing step which can be controlled by the variables **power_fix_sdpd_annotation**, **power_fix_sdpd_annotation_verbose** and **power_sdpd_message_tolerance**.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

```
power_fix_sdpd_annotation (3), power_fix_sdpd_annotation_verbose (3),  
power_sdpd_message_tolerance (3).
```

PWR-446 (information) The annotated SDPD %s toggle rates on pin '%s' add up to more than half the pin toggle rate; Annotated toggle rates are being scaled down and the unannotated toggle rates are automatically annotated with 0.

DESCRIPTION

The specified pin is partially annotated with state-dependent and/or path-dependent (SDPD) toggle rates. The user annotated rise/fall (SDPD) toggle rate values add to more than half of the non-SDPD toggle rate on the pin (i.e. the toggle rate of the net connected to the pin). Power Compiler is scaling the user annotated SDPD toggle rate values so that they add up to half of the pin toggle rate. Also, the non-annotated SDPD toggle rate values for this pin are set to 0.

This message is issued by the SDPD fixing step which can be controlled by the

variables `power_fix_sdpd_annotation`, `power_fix_sdpd_annotation_verbose` and `power_sdpd_message_tolerance`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),
`power_sdpd_message_tolerance` (3).

PWR-447 (information) Scaling the unannotated SDPD toggle rates for pin '%s' since the totals of the rise and fall SDPD toggle rates are different.

DESCRIPTION

The sums of the rise and fall state-dependent and/or path-dependent (SDPD) toggle rates on this pin differ. Power Compiler is scaling the user annotated SDPD toggle rate values so that the rise and fall sums become the same.

This message is issued by the SDPD fixing step which can be controlled by the variables `power_fix_sdpd_annotation`, `power_fix_sdpd_annotation_verbose` and `power_sdpd_message_tolerance`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3), `power_fix_sdpd_annotation_verbose` (3),
`power_sdpd_message_tolerance` (3).

PWR-448 (information) The toggle rate on pin '%s' is automatically set to the total of the annotated SDPD pin toggle

rates.

DESCRIPTION

The specified pin is annotated with state-dependent and/or path-dependent (SDPD) toggle rates, but not with a non-SDPD toggle rate value (i.e. a toggle rate on the net connected to the pin). Power Compiler is setting the non-SDPD toggle rate for this pin to be equal to the sum of the SDPD toggle rates.

This message is issued by the SDPD fixing step which can be controlled by the variable `power_fix_sdpd_annotation`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3).

PWR-449 (information) The toggle rate on pin '%s' is automatically set to twice the total of the annotated SDPD %s pin toggle rates.

DESCRIPTION

The specified pin is annotated with state-dependent and/or path-dependent (SDPD) toggle rates, but not with a non-SDPD toggle rate value (i.e. a toggle rate on the net connected to the pin). Power Compiler is setting the non-SDPD toggle rate for this pin to be equal to twice of the sum of the rise/fall SDPD toggle rates.

This message is issued by the SDPD fixing step which can be controlled by the variable `power_fix_sdpd_annotation`.

WHAT NEXT

This is an information message; no user action is required.

SEE ALSO

`power_fix_sdpd_annotation` (3).

PWR-450 (warning) The value of the variable '%s' is invalid; the default value of %s will be used instead.

DESCRIPTION

The value of the following variable:

```
string power_sa_propagation_effort
```

specifies the default propagation effort used when propagating switching activity. This value is used when a command option specifying the propagation effort is not used. For instance, the **-analysis_effort** option of the **report_power** command, and the **-effort** option of the **propagate_switching_activity** command, specify the propagation effort. The valid values for this variable are: *low*, *medium* and *high*. If an invalid value is set to this variable, a default value is assumed.

WHAT NEXT

Set the value of the `power_sa_propagation_effort` variable to a valid one.

SEE ALSO

```
power_sa_propagation_effort (3).
```

PWR-451 (warning) The -exclude_boundary_nets flag is obsolete.

DESCRIPTION

The **-exclude_boundary_nets** flag of the **report_power** command is obsolete, and it is being ignored by the command. The **report_power** command now excludes the net switching power of primary input nets by default, since this switching power is not consumed by the current design, but rather by the external designs driving the input ports.

The switching power of nets driven by an input or inout port is included only if the net is also driven by a cell in the current design. You can include the switching power of all input and inout ports by using the **-include_input_nets** flag of the **report_power** command

WHAT NEXT

The **-exclude_boundary_nets** is being ignored. You can call **report_power** without this flag.

PWR-452 (warning) There are %d objects not found during annotation.

DESCRIPTION

A number of objects in the SAIF file cannot be found in the current design; the switching activity information for this object is not annotated.

WHAT NEXT

Check the arguments of the (**read_saif** or **merge_saif**) command used to read the SAIF file. You can use the **-verbose** flag of the command to get warning messages for each unannotated object.

PWR-453 (warning) There are %d state/path dependent mismatches during annotation.

DESCRIPTION

A number of objects in the SAIF file have state/path dependent information that does not match with the state/path dependent information in the technology library characterization. This can occur when the backward SAIF file was generated using a forward library/gate-level SAIF file for a different library than the one used for linking the current design. It is also possible that the netlist used during simulation is different from the current design.

WHAT NEXT

Check that the designs and technology library used during simulation match the current design and link library.

PWR-454 (information) Inferring related clocks.

DESCRIPTION

This message specifies that Power Compiler will infer the related clocks on design object that need related clock inference. These objects have a **related_clock** attribute with value **"*"**. Power Compiler will infer a valid related clock on these objects and sets the **related_clock** attribute to the name of the inferred related clock.

WHAT NEXT

This is an information message. You can use the `report_attribute` and `check_attribute` commands to check that the `related_clock` attribute on the objects needing related clock inference has changed to a valid clock name.

PWR-455 (warning) Cannot infer related clocks: Unable to check out a Power Compiler license.

DESCRIPTION

Power Compiler is trying to infer related clocks, but a Power Compiler license is not available for check-out and the related clock inference process is aborted. The mechanism to infer related clock is requested when a command needs power switching activity information and the design has objects (ports, nets or pins) with the `related_clock` attribute set to the value `"*"`.

WHAT NEXT

Make sure that a Power Compiler license is available. In general, only Power Compiler commands need power switching activity information. If you get this warning message from a non-Power Compiler command, note that you can disable the related clock inference mechanism by removing the `related_clock` attributes from the design ports, nets and pins using the `remove_attribute` command.

PWR-456 (information) The clock '%s' is inferred as a related clock for the %s '%s'.

DESCRIPTION

Power Compiler has inferred a related clock on the specified object. The name of the inferred related clock is given in the information message. This message is displayed if the variable `power_sa_propagation_verbose` is set to `true`, or if the related clocks are inferred during a call to a verbose execution of the `propagate_switching_activity` command.

WHAT NEXT

This is an information message, no user action is required.

PWR-457 (information) The %s '%s' does not have an inferred

related clock.

DESCRIPTION

The user requested an inferred related clock on the specified object and Power Compiler inferred that the object does not have a related clock. This can happen for a number of cases, depending on the switches used to control the mechanism used to infer related clocks (the variables `power_rclock_inputs_use_clocks_fanout`, `power_rclock_use_asynch_inputs`, `power_rclock_unrelated_use_fastest`). For instance, if the user requests that the inferred related clock on input nets does not depend on the inferred related clocks in the nets transitive fanout (the variable `ffBpower_rclock_inputs_use_clocks_fanout`) then non-clock input nets will not have an inferred related clock.

This information message is only issued when the mechanism to infer related clocks is used with the verbose option, for example, when the `power_sa_propagation_verbose` variable is set to `true`, or when the issues the `propagate_switching_activity` command with the `-verbose` flag.

When the mechanism inferring related clocks determines that an object with the / fBrelated_clock/fP attribute set to "*" does not have a related clock, then the / fBrelated_clock/fP attribute is removed.

WHAT NEXT

This is an information message, no user action is required.

SEE ALSO

`propagate_switching_activity` (2), `power_rclock_inputs_use_clocks_fanout` (3),
`power_rclock_use_asynch_inputs` (3), `power_rclock_unrelated_use_fastest` (3).
`power_sa_propagation_verbose` (3).

PWR-458 (information) Writing '%s SAIF information to file '%s'.

DESCRIPTION

Power Compiler is generating a Switching Activity Interchange Format (SAIF) file. The following commands can generate SAIF files: `rtl2saif`, `lib2saif`, `merge_saif`, `write_saif`.

WHAT NEXT

This is an information message.

PWR-459 (error) The `regs_on_clocks` select type of the `-select` option of the `set_switching_activity` command has to be followed by a list of valid clock names.

DESCRIPTION

The `regs_on_clocks` select type of the `-select` option of the `set_switching_activity` command is used to select design registers that are clocked by a given list of clocks. The list of clocks is given as an argument of the `fBregs_on_clocks` inside the select list of the `-select` option. The following are examples of valid uses of the `regs_on_clocks` select type:

```
dc_shell-xg-t> set_switching_activity -select {regs_on_clock clk} ...
```

applies the `set_switching_activity` command on the outputs of the registers clocked by the clock clk.

```
dc_shell-xg-t> set_switching_activity -select {regs_on_clock {clk1 clk2} inputs} ...
```

applies the `set_switching_activity` command on the outputs of the registers clocked by the clock clk1 or clk2, and all the design inputs.

Note that the select type `regs` can be used to select all the register outputs.

WHAT NEXT

Specify a list of clock names after the `regs_on_clock` select type.

PWR-460 (error) Not all objects are of the same type.

DESCRIPTION

The objects specified for the `report_power_calculation` command must all be of the same type. Only pins, cells or nets are allowed, and you cannot mix objects of multiple types.

WHAT NEXT

Issue the `report_power_calculation` command multiple times, each time with objects of one specific type.

SEE ALSO

`report_power_calculation` (2).

PWR-461 (error) Options -rise and -fall are specified together.

DESCRIPTION

The **-rise** and **-fall** options cannot be used together for the **report_power_calculation** command.

WHAT NEXT

Use either **-rise** or **-fall**, or omit the edge specification altogether.

SEE ALSO

[report_power_calculation \(2\)](#).

PWR-462 (error) The -verbose option can only be used with objects of type cell or pin.

DESCRIPTION

This error occurs when the **report_power_calculation** command is used with the **-verbose** option for objects of type net. The **-verbose** option can only be used with objects of type cell or pin.

WHAT NEXT

Do not specify the **-verbose** option when applying **report_power_calculation** to nets.

SEE ALSO

[report_power_calculation \(2\)](#).

PWR-463 (error) Object '%s' is not a pin; options -rise or -fall cannot be specified.

DESCRIPTION

The **-rise** and **-fall** options cannot be used for objects of type cell or net. The **report_power_calculation** command only allows an edge specification for objects of type pin.

WHAT NEXT

Omit the edge specification for objects of type cell or net. Or, if you want to report the internal power calculation, specify a pin instead of a cell or net.

SEE ALSO

`report_power_calculation (2)`.

PWR-464 (error) Cell '%s' is not a leaf cell.

DESCRIPTION

The `report_power_calculation` command can only be issued for objects that are associated with leaf cells. This excludes reporting for hierarchical cells or pins of such cells.

WHAT NEXT

Issue the `report_power_calculation` command for a leaf cell or a pin that belongs to a leaf cell.

SEE ALSO

`report_power_calculation (2)`.

PWR-465 (error) Object '%s' is not a pin; a path condition cannot be specified.

DESCRIPTION

The `-path_source` option of the `report_power_calculation` command can only be used to narrow down the report of internal power calculation specific to a single pin. Therefore, this option can only be specified with objects of type pin.

WHAT NEXT

Omit the path source. Or, if you want to report the internal power calculation, specify a pin instead of a cell or net.

SEE ALSO

`report_power_calculation (2)`.

PWR-466 (error) Object '%s' is not a pin or cell; a state condition cannot be specified.

DESCRIPTION

The **-state_condition** option of the **report_power_calculation** command can only be used to narrow down the report of state dependent power calculation. This applies to both internal power calculation (pin specific) and leakage power calculation (cell specific). Therefore, this option can only be used with objects of type cell or pin.

WHAT NEXT

Omit the state condition if you want to report the calculation of switching power. If you want to report internal or leakage power calculation, specify a pin or a cell instead of a net.

SEE ALSO

`report_power_calculation (2)`.

PWR-467 (error) No internal power modeling available for library cell '%S'.

DESCRIPTION

The **report_power_calculation** command was applied to a pin that belongs to a leaf cell without internal power modeling. There is no internal power calculation for such a cell, and as a result the report cannot be generated.

WHAT NEXT

Use `report_power -cell -verbose -only` to find out more details about the power calculation specific to this cell.

SEE ALSO

`report_power_calculation (2)`, `report_power (2)`.

PWR-468 (error) Library cell '%s' does not have power

information for state condition "%s

DESCRIPTION

The `report_power_calculation` command was issued with the `-state_condition` option to narrow down the report. However, there is no power information available in the library characterization for the specified cell or pin.

WHAT NEXT

The possible state conditions are printed together with this error. Select one of the possible states. Alternatively, the option `-state_condition all` can be specified, in which case the power will be reported for all possible states.

SEE ALSO

`report_power_calculation (2)`.

PWR-469 (error) Library cell '%s' does not have a pin named '%S'.

DESCRIPTION

The `report_power_calculation` command was issued with the `-path_source` option to narrow down the report to a specific path source. However, the object for which the internal power calculation is to be reported belongs to a cell that does not have a pin by that name.

WHAT NEXT

The possible path sources are printed together with this error. Select one of the possible path sources. Alternatively, the option `-path_source all` can be specified, in which case the internal power will be reported for all possible path sources.

SEE ALSO

`report_power_calculation (2)`.

PWR-470 (error) There are no matching internal power tables or

polynomials.

DESCRIPTION

The **report_power_calculation** command was issued with a state condition and/or a path source to narrow down the internal power calculation report. However, there are no matching internal power tables or polynomials that match these constraints.

WHAT NEXT

The possible state and path combinations are printed together with this error. Select one of the possible combinations, or relax the constraint by omitting the path source and/or the state condition. When the option **-verbose** is specified the internal power will be reported for all matching states and path sources.

SEE ALSO

report_power_calculation (2).

PWR-471 (error) There is more than one matching internal power table or polynomial.

DESCRIPTION

The **report_power_calculation** command was issued with state and path constraints that are too relaxed. There is more than one matching internal power table or polynomial. By default, the **report_power_calculation** command will only report the power calculation for a single matching state / path combination.

WHAT NEXT

Specify the **-verbose** option, which is equivalent to **-state_condition all - path_source all** to allow reporting of internal power calculation for all matching state / path combinations.

SEE ALSO

report_power_calculation (2).

PWR-472 (error) There are no matching leakage power values

or polynomials.

DESCRIPTION

The **report_power_calculation** command was issued with a state condition to narrow down the leakage power calculation report. However, there are no matching leakage power values or polynomials that match these constraints.

WHAT NEXT

The possible state conditions are printed together with this error. Select one of the possible states, or relax the constraint by omitting the state condition.

SEE ALSO

report_power_calculation (2).

PWR-473 (error) There is more than one matching leakage power value or polynomial.

DESCRIPTION

The **report_power_calculation** command was issued without a state condition. Because there are multiple matching leakage power values or polynomials, no report is generated. By default the **report_power_calculation** command will only report the power calculation for a single matching state.

WHAT NEXT

Use the **-state_condition all** option to report leakage power for all matching states. Alternatively, the **-verbose** option can be used, but this will result in the reporting of internal power calculation for all corresponding pins in addition to the leakage power calculation report.

SEE ALSO

report_power_calculation (2).

PWR-474 (error) Library cell power information is protected.

DESCRIPTION

This error is seen during **report_power_calculation** if the technology library associated with a cell leakage power table or pin internal power table has not been loaded with the **read_lib** command or if the technology library does not have the library feature **report_power_calculation** enabled.

WHAT NEXT

Load the ASCII version of the library with the **read_lib** command or modify the library source to add the library feature **report_power_calculation**.

PWR-475 (error) Design contains no clocks or clock sources

DESCRIPTION

identify_clock_gating could not find any clocks or clock sources in the design

WHAT NEXT

Run **create_clock <port_name>** for all clocks of the design and reissue **identify_clock_gating** command.

PWR-476 (error) Pin '%s' of library cell '%s' has average rise/fall internal power modeling; options -rise or -fall cannot be specified.

DESCRIPTION

This error occurs because the **report_power_calculation** command was applied to a pin for which the internal power is not characterized with separate rise and fall power modeling, but nevertheless a specific edge was specified with the **-rise** or **-fall** options.

WHAT NEXT

Omit the edge specification.

PWR-477 (information) Removing redundant clock gate '%s'.

DESCRIPTION

You receive this message when a redundant clock gate is removed during **compile -incremental** or **physopt -incremental**. A clock gate is considered redundant when it is always enabled. This is the case when the enable net is tied to logic one.

The automatic removal of redundant clock gates can be disabled by setting the variable **power_remove_redundant_clock_gates** to *false* (the variable is set to *true* by default).

WHAT NEXT

This is an informational message only; if you want to prevent the redundant clock gates to be removed, set the variable **power_remove_redundant_clock_gates** to *false*.

SEE ALSO

power_remove_redundant_clock_gates (3).

PWR-478 (error) The options -global and -no_hier are mutually exclusive for the insert_clock_gating command.

DESCRIPTION

When the **-no_hier** option is specified for the **insert_clock_gating** command, clock gating is restricted to the top level of the hierarchy. This conflicts with the **-global** option, which enables hierarchical clock gating.

WHAT NEXT

Leave out one of the two options when issuing the **insert_clock_gating** command.

PWR-479 (Error) Clock gate module naming style has multiple occurrences of '%d' identifier.

DESCRIPTION

The clock gate module naming style specified using **power_cg_module_naming_style** has multiple occurrences of '%d'. **power_cg_module_naming_style** can only contain utmost one occurrence of '%d'.

WHAT NEXT

Change `power_cg_module_naming_style` variable to contain only one or no occurrence of '%d' identifiers and re-invoke `insert_clock_gating` command.

PWR-480 (Error) Clock gate module naming style contains an unknown format identifier '%s'.

DESCRIPTION

The clock gate module naming style specified using `power_cg_module_naming_style` variable contains an unknown format identifier. The supported format identifiers are,

```
target_library names (when using discrete clock  
gating)
```

WHAT NEXT

Change `power_cg_module_naming_style` variable to contain only legal format identifiers and re-invoke `insert_clock_gating`.

PWR-481 (Error) Clock gate cell naming style has multiple occurrences of '%d' identifier.

DESCRIPTION

The clock gate cell naming style specified using `power_cg_cell_naming_style` has multiple occurrences of '%d'. `power_cg_cell_naming_style` can only contain utmost one occurrence of '%d'.

WHAT NEXT

Change `power_cg_cell_naming_style` variable to contain only one or no occurrence of '%d' identifiers and re-invoke `insert_clock_gating`.

PWR-482 (Error) Clock gate cell naming style contains an

unknown format identifier '%s'.

DESCRIPTION

The clock gate cell naming style specified using **power_cg_cell_naming_style** variable contains an unknown format identifier. The supported format identifiers are,

WHAT NEXT

Change **power_cg_cell_naming_style** variable to contain only legal format identifiers and re-invoke **insert_clock_gating**.

PWR-483 (Error) Gated clock net naming style has multiple occurrences of '%%d' identifier.

DESCRIPTION

The gated clock net naming style specified using **power_cg_gated_clock_net_naming_style** has multiple occurrences of '%d'. **power_cg_module_naming_style** can only contain utmost one occurrence of '%d'.

WHAT NEXT

Change **power_cg_gated_clock_net_naming_style** variable to contain only one or no occurrence of '%d' identifiers and re-invoke **insert_clock_gating**.

PWR-484 (Error) Gated clock net naming style contains an unknown format identifier '%s'.

DESCRIPTION

The gated clock net naming style specified using **power_cg_gated_clock_net_naming_style** variable contains an unknown format identifier. The supported format identifiers are,

WHAT NEXT

Change **power_cg_gated_clock_net_naming_style** variable to contain only legal format identifiers and re-invoke **insert_clock_gating**.

PWR-485 (Error) The "integrated" argument of the `set_clock_gating_style` command contains an unknown integrated clock gating cell type %s.

DESCRIPTION

Invalid integrated clock gating cell type in the "integrated" argument for the `set_clock_gating_style` command. Valid integrated clock gating cell types are, 1. `active_low_enable` 2. `invert_gclk`

WHAT NEXT

Re-enter the `set_clock_gating_style` command.

PWR-486 (Error) Latch specification should be the first in the `gate_list` specified for %s.

DESCRIPTION

When you specify a `gate_list` for positive or negative edge logic, latch style (if any) should be the first in the list. Another option is to specify the latch style using `-sequential` option.

WHAT NEXT

Re-issue the `set_clock_gating_style` command with latch style moved to the first position in the gate list.

PWR-487 (information) Clock object is not specified, all clock nets of the design are considered.

DESCRIPTION

If no clock object is specified in `report_clock_tree_power` command, Power Compiler will perform `report_clock_tree_power` on all clock objects found in the design.

WHAT NEXT

reserved

PWR-488 (error) Power Compiler could not find any clock objects in the design, report_clock_tree_power command cannot be executed.

DESCRIPTION

reserved

WHAT NEXT

Please make sure that `create_clock` command is executed before `report_clock_tree_power` command.

PWR-489 (warning) clock net %s has no driver pin

DESCRIPTION

clock net does not have a driver pin (DC_DRIVER). `report_clock_tree_power` command cannot perform netlist traversal.

WHAT NEXT

Please double check the clock net that you specified, or check the netlist correctness.

PWR-490 (Warning) %d out of %d pins of the clock gating cell '%s' could not be identified.

DESCRIPTION

The functionality of one or more pins of a clock gate could not be identified. This will cause the clock gate to be not identified correctly.

If this error happens for an ICG cell, probably the ICG library has problems.

For discrete clock gates, the identification uses a mixture of functionality, connectivity and names. Make sure the Power Compiler assigned circuitry and the port names are not changed.

If this is a manually inserted clock gate, try to use a configuration and port names similar to what Power Compiler uses.

WHAT NEXT

Check the ICG cell library for pin attributes or check the names of clock gate pins and reissue **identify_clock_gating** command.

PWR-491 (Warning) No clock period specified; characterization may be inaccurate.

DESCRIPTION

This warning is specific to activity based clock gating. This is currently a beta feature of Power Compiler.

WHAT NEXT

Contact your Power Compiler representative if you would like more information on this feature, or if you want to participate in the beta testing program.

PWR-492 (error) Option '%s' for command '%s' is only available in XG mode.

DESCRIPTION

The specified option for this command is only available in XG mode.

WHAT NEXT

Please use XG mode to run this command option.

PWR-493 (error) The specified clock period must be positive.

DESCRIPTION

reserved

WHAT NEXT

reserved

PWR-494 (error) The specified number of equivalent inverters cannot be negative.

DESCRIPTION

reserved

WHAT NEXT

reserved

PWR-495 (error) The '%s' command cannot be performed if no clock gating style has been set.

DESCRIPTION

You need to set the clock gating style using the command `set_clock_gating_style` before this particular command can be performed. The command is terminated.

WHAT NEXT

Specify the clock gating style.

PWR-496 (error) Command '%s' can only be executed when activity based clock gating is enabled.

DESCRIPTION

You need to enable activity based clock gating by specifying the `-activity_based` option with the `set_clock_gating_style` command. The command is terminated.

WHAT NEXT

Enable activity based clock gating.

PWR-497 (error) Can't find consistent 'power_gating_pin' attributes for pin '%s'

on retention registers in the technology library.

DESCRIPTION

set_power_gating_signal command has an option *-library_pin* to specify a common pin name which is one of the control pins of the retention registers in the library. If *-type* is also specified for the command, the common pin name is for the retention registers of a certain type, otherwise, it's for all the retention registers in the library. It's required that the same *power_gating_pin* attribute should be specified on the control pins with same name for retention registers in the library. Power Compiler will stitch the control pins of retention registers in the design with **hookup_power_gating_ports** command based on the value of the related attribute. The error occurs when there are different values of *power_gating_pin* attributes on the pin with this name for the retention registers in the library.

WHAT NEXT

Check *-library_pin* option of the **set_power_gating_signal** command and the '*power_gating_pin*' attribute of retention registers in the libraries and make sure they match.

PWR-498 (warning) Can't find pin '%s' on retention register '%s'.

DESCRIPTION

set_power_gating_signal command has an option *-library_pin* to specify a common pin name which is one of the control pins of the retention registers in the library. If *-type* is also specified for the command, the common pin name is for the retention registers of a certain type, otherwise, it's for all the retention registers in the library. The warning occurs when no pin with this name can be found for the retention register.

WHAT NEXT

Check the retention register in the library.

PWR-499 (warning) Can't find 'power_gating_pin' attribute on pin '%s' of retention register '%s' in the library.

DESCRIPTION

set_power_gating_signal command has an option *-library_pin* to specify a common pin

name which is one of the control pins of the retention registers in the library. If `-type` is also specified for the command, the common pin name is for the retention registers of a certain type, otherwise, it's for all the retention registers in the library. It's required that the same `power_gating_pin` attribute should be specified on the control pins with same name for the retention registers in the library. Power Compiler will stitch the control pins of retention registers in the design with **`hookup_power_gating_ports`** command based on the values of the attribute. The warning occurs when no such an attribute can be found for the pin of this retention register.

WHAT NEXT

Check the retention register in the library.

PWR-500 (warning) Clock gating with elaborate `-gate_clock` is obsolete; instead use the `insert_clock_gating` command.

DESCRIPTION

The `insert_clock_gating` command provides additional features compared to the `elaborate -gate_clock` command. In addition to the regular clock gating also performed by `elaborate -gate_clock`, the `insert_clock_gating` command attempts to find even more clock gating opportunities by combing different register banks that share common enable conditions. Furthermore, it can create multi-stage clock gating designs by factoring common enable conditions from the inserted clock gates. This can further reduce the power dissipation.

WHAT NEXT

Use the `insert_clock_gating` command to introduce clock gating in your design.

SEE ALSO

`set_clock_gating_style` (2), `insert_clock_gating` (2).

PWR-501 (warning) The low effort leakage power optimization algorithm cannot run in `on_route` mode.

DESCRIPTION

This warning occurs during `physoptP command, if set_max_leakage_power -effort low` has been set and the `-on_route` flag has been used in invoking `physopt`. The warning indicates that the leakage power optimization algorithm will not be run, although `physopt` will continue to run.

WHAT NEXT

This is a warning. Either use `physoptP` with `high effort leakage power optimization algorithm (the default)`, or use the command without the `-on_route` flag.

PWR-502 (error) The toggle rate cannot be negative.

DESCRIPTION

A negative toggle rate was specified. The toggle rate should be zero (no activity) or positive (a certain activity).

WHAT NEXT

Reissue the command with a non-negative value for the toggle rate.

PWR-503 (warning) Clock gating could not be performed because of issues with the target library.

DESCRIPTION

Clock gating relies on the current target library. If the target library cannot be loaded, clock gating cannot be performed.

WHAT NEXT

Verify the `target_library` and the `search_path` variables and ensure that all libraries are existent and available from the search path.

PWR-504 (warning) There are no library cells with the specified power gating style '%s' and the operating condition. Regular flip flop(s) will be mapped instead.

DESCRIPTION

This error occurs when the library(s) does not have any power gating cell of the specified operating condition with the power gating style set by `set_power_gating_style` command. `compile` cannot map the cells to the library cell with expected power gating style, instead, it will map to the appropriate regular flip flops.

WHAT NEXT

Update the library(s) to include library cells with the specified power gating style and operating condition.

PWR-505 (error) Unknown power gating style '%s'.

DESCRIPTION

This error occurs when the user specify the power gating style with **set_power_gating_style** or **set_power_gating_signal** command but the style does not match the "power_gating_cell" attribute of any cells in the target libraries.

WHAT NEXT

Check -type option of the **set_power_gating_style** or **set_power_gating_signal** command and the 'power_gating_cell' attribute in the libraries and make sure they match.

PWR-506 (error) Can't find hdl block '%s'.

DESCRIPTION

This error occurs when hdl block name specified by -hdl_block option of **set_power_gating_style** command can not be found in the design.

WHAT NEXT

Check -hdl_block option of the **set_power_gating_style** command and make sure the hdl block name is correct.

PWR-507 (error) Can't find any hdl block matching name or name pattern '%s' in 'set_power_gating_style' command.

DESCRIPTION

This error occurs when the command can't find any hdl block matching the name or name pattern specified by the -hdl_block option of the **set_power_gating_style** command.

WHAT NEXT

Check -hdl_block option of the **set_power_gating_style** command and make sure the hdl block name is correct.

PWR-508 (error) The power gating style '%s' of cell '%s' conflicts with the power gating style '%s' of the example library cell '%s' in the 'set_register_type' command.

DESCRIPTION

This error occurs when both *set_power_gating_style* and *set_register_type -exact* are used. If the power gating style of the example flip flop is different from the power gating style set by *set_power_gating_style* command, *compile* can not resolve the conflicts between them.

WHAT NEXT

Check the *set_power_gating_style* and *set_register_type* commands and correct the inconsistencies.

PWR-509 (warning) The expected power gating style '%s' of cell '%s' conflicts with the power gating style '%s' of library cell '%s' implementing this cell.

DESCRIPTION

This error occurs when the library cell implementing the cell has different power gating style from the one set by *set_power_gating_style* command. For this cell, *compile* does not map it to the library cell with expected power gating style successfully.

WHAT NEXT

Check the *set_power_gating_style* command and the warning and error messages during *compile* and correct the setting.

PWR-510 (error) *power_cg_equivalence_check_effort* variable has an unsupported value '%s'.

DESCRIPTION

Commands like *identify_clock_gates* try to detect which clock gates are equivalent in a design. Two clock gates are equivalent if they both have equivalent enable and clock signals. The effort used in this detection process can be controlled by the variable, *power_cg_equivalence_check_effort*.

This error occurs when the variable *power_cg_equivalence_check_effort* has an invalid value. Valid values for this variable are low, medium and high.

WHAT NEXT

Set *power_cg_equivalence_check_effort* variable to a valid value and rerun the command.

PWR-511 (error) '%s' is not a recognized characterization type.

DESCRIPTION

This warning is specific to activity based clock gating. This is currently a beta feature of Power Compiler.

WHAT NEXT

Contact your Power Compiler representative if you would like more information on this feature, or if you want to participate in the beta testing program.

PWR-512 (error) '%s' is not a recognized edge type.

DESCRIPTION

This warning is specific to activity based clock gating. This is currently a beta feature of Power Compiler.

WHAT NEXT

Contact your Power Compiler representative if you would like more information on this feature, or if you want to participate in the beta testing program.

PWR-513 (error) The set_clock_gating_characterization command expects exactly 8 parameter values.

DESCRIPTION

This warning is specific to activity based clock gating. This is currently a beta feature of Power Compiler.

WHAT NEXT

Contact your Power Compiler representative if you would like more information on this feature, or if you want to participate in the beta testing program.

PWR-514 (error) The characterization clock period must be explicitly specified with the set_clock_gating_characterization command.

DESCRIPTION

This warning is specific to activity based clock gating. This is currently a beta feature of Power Compiler.

WHAT NEXT

Contact your Power Compiler representative if you would like more information on this feature, or if you want to participate in the beta testing program.

PWR-515 (error) Object '%s' is not an operator or hierarchical instance.

DESCRIPTION

You receive this message if you issue the `set_operand_isolation_cell` command and specify as part of the `object_list` an object that is not an operator or (hierarchical) cell instance. You can specify only operator cells or cell instances for this command. This error could possibly be caused by a spelling error or typo.

WHAT NEXT

Check the items in the `object_list` and verify that all are operator cells or cell

instances and that the spelling is correct. Then reissue the **set_operand_isolation_cell** command with the correct *object_list*.

SEE ALSO

set_operand_isolation_cell (2).

PWR-516 (error) Object '%s' is of the wrong type.

DESCRIPTION

The specified object is a library cell or design. You can get this error when issuing the **set_operand_isolation_cell** or the **set_operand_isolation_scope** command. The former does not allow designs as arguments. The latter does, but the design must have a proper hierarchy; i.e. it cannot be a black box. In either case library cells are not allowed.

WHAT NEXT

Check the items in the *object_list* and verify that all objects are of the right type and that the spelling is correct. Then reissue the **set_operand_isolation_cell** or **set_operand_isolation_scope** command with the correct *object_list*.

SEE ALSO

set_operand_isolation_scope (2), **set_operand_isolation_cell** (2).

PWR-517 (warning) No operand isolation applied to hierarchical cell '%s' because it contains sequential arcs.

DESCRIPTION

This warning is issued when operand isolation was requested for a hierarchical cell, but the directive could not be honored. This is because the hierarchical cell instance contains sequential arcs, and operand isolation can only be applied to fully combinational hierarchical instances.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. It may be an indication that the user directive for operand isolation was meant for another object. In that case, set the directive correctly and rerun the script.

SEE ALSO

`set_operand_isolation_style (2)`, `set_operand_isolation_cell (2)`,
`do_operand_isolation (3)`.

PWR-518 (warning) No operand isolation applied to hierarchical cell '%s' because isolation of hierarchical cells is disabled.

DESCRIPTION

This warning is issued when operand isolation was requested for a hierarchical combinational cell, but the directive could not be honored. This is because operand isolation of hierarchical cell instances is disabled. Only operators can be isolated with the current settings.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. It may be an indication that the user directive for operand isolation was meant for another object. In that case, set the directive correctly and rerun the script.

SEE ALSO

`set_operand_isolation_style (2)`, `set_operand_isolation_cell (2)`,
`do_operand_isolation (3)`.

PWR-519 (warning) No operand isolation applied to cell '%s' because no opportunity for isolation was found.

DESCRIPTION

This warning is issued when operand isolation was requested for an operator or hierarchical combinational cell, but the directive could not be honored. This is because no state could be identified for which the output of the operator or hierarchical cell is unused.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. It may be an indication that the user directive for operand isolation was meant for another object. In that case, set the directive correctly and rerun the script.

SEE ALSO

`set_operand_isolation_style` (2), `set_operand_isolation_cell` (2),
`do_operand_isolation` (3).

PWR-520 (warning) No operand isolation applied to cell '%s' because all inputs are driven by constant nets.

DESCRIPTION

This warning is issued when operand isolation was requested for an operator or hierarchical combinational cell, but the directive could not be honored. For optimal results, nets that are driven by a constant are never isolated. In this particular case, all inputs for the operator or hierarchical combinational cell are driven by constants, so none of the input nets are isolated.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. It may be an indication that the user directive for operand isolation was meant for another object. In that case, set the directive correctly and rerun the script.

SEE ALSO

`set_operand_isolation_style` (2), `set_operand_isolation_cell` (2),
`do_operand_isolation` (3).

PWR-521 (warning) No operand isolation applied to cell '%s'.

DESCRIPTION

This warning is issued when operand isolation was requested for an operator or hierarchical combinational cell, but the directive could not be honored. The outputs of the operator or hierarchical combinational cell are never used. Since this object is redundant, it is not efficient to apply operand isolation to it. Instead, it should be removed altogether.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. It may be an indication that the user directive for operand isolation was meant for another object. In that case, set the directive correctly and rerun the script.

SEE ALSO

`set_operand_isolation_style` (2), `set_operand_isolation_cell` (2),
`do_operand_isolation` (3).

PWR-522 (error) A non-empty collection of objects was specified together with one of the options '`-isolated_objects`', '`-unisolated_objects`' or '`-all_objects`'.

DESCRIPTION

When the `report_operand_isolation` command is used on a collection of specific objects, the report will be generated for those objects only. Reporting on all isolated, unisolated or simply all isolated objects is not allowed when a collection of objects is specified.

WHAT NEXT

Issue the `report_operand_isolation` command without the `-isolated_objects`, `-unisolated_objects` or `-all_objects`, or issue the command without a collection of specific objects.

SEE ALSO

`report_operand_isolation` (2).

PWR-523 (error) The '`-verbose`' option is used without either a collection of objects or one of the options '`-isolated_objects`' or '`-all_objects`'.

DESCRIPTION

The `report_operand_isolation` command can be issued with the `-verbose` option to get more detailed reporting for the isolated objects. To report isolated objects either the `-isolated_objects` or `-all_objects` options should be used, or a collection of specific objects should be specified.

This error is generated when the `report_operand_isolation` command is issued with the `-verbose` option, but reporting of isolated objects is not requested.

WHAT NEXT

If no reporting of isolated objects is requested, omit the **-verbose** option. If you are interested in details related to the isolated objects, specify the specific objects (operators or hierarchical combinational cells) or use the command with **-isolated_objects** or **-all_objects** in addition to **-verbose**.

SEE ALSO

`report_operand_isolation (2)`.

PWR-524 (error) The options '**-instances**' and '**-no_hier**' are mutually exclusive for the `report_operand_isolation` command.

DESCRIPTION

The `report_operand_isolation` command with **-instances** option produces a breakdown per instance of the summary of isolated and unisolated operators and hierarchical cells. This is only meaningful when multiple instances are considered for reporting.

The **-no_hier** option limits reporting to just the top level. Since the number of instances is limited to one, the **-instances** option cannot be used in combination with the **-no_hier** option.

WHAT NEXT

Omit either the **-no_hier** or the **-instances** option.

SEE ALSO

`report_operand_isolation (2)`.

PWR-525 (error) Object '%s' is neither an operator nor a hierarchical combinational cell.

DESCRIPTION

The `report_operand_isolation` command can be applied to a collection of specific objects. Each object should be either an operator or a hierarchical combinational cell. If an object does not meet these criteria (a leaf cell, black box or hierarchical cell that contains sequential arcs), this error is issued.

WHAT NEXT

Remove the objects that are not operators or hierarchical combinational cells from the collection and re-issue the **report_operand_isolation** command. Alternatively, the **-isolated_objects**, **-unisolated_objects** or **-all_objects** options can be used to apply the report to all (un-)isolated objects.

SEE ALSO

report_operand_isolation (2).

PWR-526 (error) Object '%s' is not within the current instance.

DESCRIPTION

The **report_operand_isolation** command can be applied to a collection of specific objects. If the current_instance is set to anything else than the top level of the design, the objects in the collection should all be within the scope of the current instance. Otherwise this error is generated.

WHAT NEXT

Remove the objects that are not within the scope of the current instance and re-issue the **report_operand_isolation** command. Alternatively, the **-isolated_objects**, **-unisolated_objects** or **-all_objects** options can be used to apply the report to all (un-)isolated objects within the current instance.

SEE ALSO

report_operand_isolation (2).

PWR-527 (error) Specified libcell '%s/%s' is marked pwr_dont_use.

DESCRIPTION

The specified for ICG library cell has pwr_dont_use attribute. Power Compiler can not use this lib cell for ICGC mapping.

WHAT NEXT

Remove the **set_dont_use -power** command (if any) from the script. Specify a different ICG libcell or remove the **pwr_cg_dont_use** attribute on the libcell.

PWR-528 (warning) Specified lib_cell '%s' is marked power_dont_use.

DESCRIPTION

One or more of the libraries does have the specified library cell, but it is marked *power_dont_use*.

WHAT NEXT

Specify a different ICG library cell or remove the *power_cg_dont_use* attribute on the libcell.

PWR-530 (error) There is no clock with name '%s' in the current design.

DESCRIPTION

The argument specified to the **regs_on_clocks** select type has to be the name of an existing clock. There is no clock in the current design with the specified clock name.

WHAT NEXT

Specify a valid clock name as argument to the **regs_on_clocks** select type; or apply the **set_switching_activity** command after creating the specified clock.

PWR-531 (warning) The value '%s' of the variable 'power_default_toggle_rate_type' is invalid. The default value of '%s' is used instead.

DESCRIPTION

The value of the variable **power_default_toggle_rate_type** can be either "**fastest_clock**" or "**absolute**". This variable determines how the **default_toggle_rate** variable is used in determining the default toggle rates on unannotated primary input ports and black-box output pins. More information on these variables is available on the man page of **power_default_toggle_rate_type**.

WHAT NEXT

Set the value of the variable `power_default_toggle_rate_type` to "`fastest_clock`" or "`absolute`".

SEE ALSO

`power_default_toggle_rate_type` (3), `power_default_toggle_rate` (3),
`power_default_static_probability` (3).

PWR-532 (warning) The library cell '%s' contains an internal power table with the obsolete attribute '%s'.

DESCRIPTION

The internal power characterization of the specified cell contains an attribute that is obsolete or not supported. The power table with this attribute is ignored and will not be used for power calculations.

WHAT NEXT

Use a library with up-to-date power characterization.

PWR-533 (warning) The library cell '%s' contains an internal power table with an invalid or inconsistent value for the attribute '%s'.

DESCRIPTION

The internal power characterization of the specified cell is invalid and contains an unexpected value for the given attribute. The attribute value may be invalid, or it conflicts with the attribute values of the other power tables.

The invalid power table will not be used in power calculations.

WHAT NEXT

Use a library with valid internal power characterization. This warning message usually occurs when an obsolete or invalid library is compiled with an old version of Library Compiler that did not check for certain characterization errors. Check and fix the internal power characterization of the specified cell and recompile the library, preferably with a Library Compiler version having the same version number as that of the Power Compiler version being used.

PWR-534 (warning) The library cell '%s' contains invalid or inconsistent internal power characterization.

DESCRIPTION

The internal power characterization of the specified cell is invalid and not all internal power tables can be used for power calculation.

WHAT NEXT

Use a library with valid internal power characterization. This warning message usually occurs when an obsolete or invalid library is compiled with an old version of Library Compiler that did not check for certain characterization errors. Check and fix the internal power characterization of the specified cell and recompile the library, preferably with a Library Compiler version having the same version number as that of the Power Compiler version being used.

PWR-535 (information) Removing power SDPD switching activity information for multi-mode flow.

DESCRIPTION

User annotated state-dependent and/or path-dependet (SDPD) switching activity information is being removed because of multi-mode. Currently, user annotated SDPD switching activity cannot be used during multi-mode power optimization. Non-SDPD user annotated switching activity is used, and is user can annotate different non-SDPD information for each layer. SDPD switching activity is estimated on the fly from non-SDPD information for each layer during power calculations.

WHAT NEXT

This is an information message.

PWR-536 (information) The library cell '%s' in the library '%s' is not characterized for internal power.

DESCRIPTION

The given library cell is not characterized for internal power. The dynamic power of a cell consists of the internal power. An internal power of 0 is assumed for this cell; Since this internal power value may not be accurate, power optimizations may not use this cell effectively and power analysis of designs containing instances of

this cell may not be accurate.

WHAT NEXT

This is an information message. Please contact your library vendor if you believe that this library cell needs internal power characterization.

PWR-537 (warning) The library cell '%s' contains multiple leakage power tables for the same condition.

DESCRIPTION

The given library cell contains more than one leakage power table for the same condition ("when" condition, or a combination of "when" and "power_level" conditions). In such cases, only one power table for each condition is used during power calculations.

An example when this warning message occurs is if the library cell characterization contains more than one leakage power table with a when condition logically equivalent to "0". Note that such tables do not contribute to the leakage power of instances of the library cell, so they are usually not included intentionally in the cell characterization; therefore this warning message may suggest that there is an error in the cell characterization. Another example is that the cell contains leakage power characterization with invalid state conditions that are all assumed to be default condition.

WHAT NEXT

Power calculations will proceed but will only use one of the multiple tables for the same condition. Check that the leakage power characterization of the particular library cell is valid.

PWR-538 (information) %d path sources specified in '%s'. The specified toggle rate will be shared between each path source.

DESCRIPTION

Multiple path sources are specified with the same `set_switching_activity` command calls. The toggle rate given in the command will be shared equally between each path source.

WHAT NEXT

This is an information message. You can specify different path dependent toggle

rates for each path source using separate calls to the **set_switching_activity** command.

PWR-539 (information) The state condition '%s' matches %d power tables. The specified toggle rate is shared between all matches.

DESCRIPTION

The specified state condition matches more than one table, and the toggle rate given in the **set_switching_activity** will be shared equally between each match. You can use the **report_power** command with the **-cell -verbose -only** cell arguments to see all the state and path dependent conditions for the specified cell.

WHAT NEXT

This is an information message. You can specify different state/path dependent toggle rates for each state and path condition using separate calls to the **set_switching_activity** command using both the **-state_dep** and **-path_dep** arguments.

PWR-540 (information) No operand isolation was performed because no opportunity for isolation was encountered.

DESCRIPTION

This warning is issued when operand isolation was enabled during mapping, but no operand isolation was performed. This could be because there are no operators or hierarchical combinational cells that are used conditionally.

When there are such operators or hierarchical combinational cells, the isolation of these cells is only performed when a user directive has been specified for this object (user-driven mode) or when the switching activity indicates that it is favorable for dynamic power optimization to apply operand isolation.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. For user-driven operand isolation, specify user directives with the **set_operand_isolation_cell** command. For automatic isolation, make sure switching activity has been annotated before mapping to ensure best results.

SEE ALSO

`set_operand_isolation_style (2)`, `set_operand_isolation_cell (2)`,
`do_operand_isolation (3)`.

PWR-541 (warning) No operand isolation applied to operator '%S' because it contains sequential arcs.

DESCRIPTION

This warning is issued when operand isolation was requested for an operator, but the directive could not be honored. This is because the operator contains sequential arcs, and operand isolation can only be applied to fully combinational operators.

WHAT NEXT

Since this is only an informational warning, it can safely be ignored. It may be an indication that the user directive for operand isolation was meant for another object. In that case, set the directive correctly and rerun the script.

SEE ALSO

`set_operand_isolation_style (2)`, `set_operand_isolation_cell (2)`,
`do_operand_isolation (3)`.

PWR-542 (warning) The command '%S' is obsolete; use '%s' instead.

DESCRIPTION

To enable further enhancements it is sometimes required to abandon certain flows in favor of new, more advanced flows.

This command will be obsoleted soon. To ensure proper operation, change your script to use the suggested alternative command instead.

WHAT NEXT

Use the suggested alternative command instead.

PWR-543 (Error) Unscanning a scan replaced register failed.

Clock gating removal abandoned.

DESCRIPTION

Clock gating removal involves unscanning and rescanning the register if it is scan replaced. If the unscan step fails, clock gating removal will not be performed.

WHAT NEXT

Look for the reasons why unscan failed and fix the problem. Then re-issue **compile -incr**.

PWR-544 (error) Object '%s' is not a design or hierarchical instance.

DESCRIPTION

You receive this message if you issue the **set_operand_isolation_scope** command and specify as part of the *object_list* an object that is not a design or hierarchical instance. You can specify only designs or hierarchical instances for this command. This error could possibly be caused by a spelling error or typo.

WHAT NEXT

Check the items in the *object_list* and verify that all are designs or cell instances and that the spelling is correct. Then reissue the **set_operand_isolation_scope** command with the correct *object_list*.

SEE ALSO

set_operand_isolation_scope (2).

PWR-545 (Information) Added %d gates during splitting

DESCRIPTION

WHAT NEXT

PWR-546 (error) At least one of the options -from or -to must be

specified.

DESCRIPTION

The **remove_operand_isolation** command requires a set of path specified as a collection of start points (specified with the **-from** option) and/or a collection of end points (specified with the **-to** option).

WHAT NEXT

Issue the **remove_operand_isolation** command with the **-from** or **-to** options.

PWR-547 (Warning) For best performance, use the default minimum bitwidth of 1 when activity based clock gating is enabled.

DESCRIPTION

This warning is specific to activity based clock gating. This is currently a beta feature of Power Compiler.

WHAT NEXT

Contact your Power Compiler representative if you would like more information on this feature, or if you want to participate in the beta testing program.

PWR-548 (warning) Pin %s of cell %s is bidirectional; no clock gate replacement is performed on this branch.

DESCRIPTION

Clock gate replacement can only be performed on unidirectional clock trees. If a net on the clock tree is bidirectional. i.e. if there is a pin present on the clock tree that can act as both input and output, no replacement can be performed.

WHAT NEXT

There should be no need for bidirectional pins in the clock tree. Determine the proper pin direction, and define the clock ports as either module inputs or outputs.

PWR-549 (warning) Clock loop detected.

DESCRIPTION

identify_clock_gating detected a clock loop. *identify_clock_gating* will break the loop while doing clock tracing. Potentially some clock gates may be left unidentified because of this.

WHAT NEXT

Check if the design is linked properly with *link* command. Unlinked or wrong cells in the clock path may be interpreted as buffers by *identify_clock_gating*. Check if the design has any clock loops. Fix the problem and rerun *identify_clock_gating*.

PWR-550 (Information) No clock gate found for %s clock.

DESCRIPTION

Since clock has no gates, there is nothing to work on.

WHAT NEXT

No action is necessary.

PWR-551 (error) Physical design is not created for design '%s'.

DESCRIPTION

The physical design is not created for the design. Power map features requires the physical design to be created.

WHAT NEXT

Check the script to see whether physical design is created when using the power map features.

PWR-552 (Information) Merging clock gates before splitting...

DESCRIPTION

Performing merge of clock gates before splitting.

WHAT NEXT

No action is necessary.

PWR-553 (Information) Performing clock gate analysis for %s clock...

DESCRIPTION

The tool performs clock gate analysis and splitting if necessary.

WHAT NEXT

No action is necessary.

PWR-554 (Information) Estimated clock latency is %f ns.

DESCRIPTION

Estimation mode came up with reported clock latency.

WHAT NEXT

No action is necessary.

PWR-555 (Information) Estimating delay for %s clock...

DESCRIPTION

Tool estimates clock latency to perform splitting.

WHAT NEXT

No action is necessary.

PWR-556 (Information) Fixing enable %s net...

DESCRIPTION

Tool fixes DRC in the enable net.

WHAT NEXT

No action is necessary.

PWR-560 (warning) The path source '%s' is not valid for the pin '%s'; the toggle rate portion for this path source is not annotated.

DESCRIPTION

This warning message occurs when multiple path sources have been specified and some or all of the path sources are not valid for the given cell. When multiple path sources are specified, the path dependent toggle rate given with the **set_switching_activity** command will be shared equally with all path sources. The toggle rate associated with an invalid path source will not be annotated, and therefore will not be used in power calculations. When specifying path dependent toggle rates the path source should match one of the internal power path sources given in the library cell characterization. To see the valid path sources and state conditions for this pin you can use the **report_power** command with the **-cell -verbose -only** cell arguments, where the specified cell contains the pin being annotated.

WHAT NEXT

To annotate switching activity on all specified path sources reissue the **set_switching_activity** command with a valid path source or sources.

PWR-561 (error) The path source %s '%s' %s not valid for the pin %s.

DESCRIPTION

The specified path source or sources are not valid and the toggle rate information

is not annotated. When specifying path dependent toggle rates the path source should match one of the internal power path sources given in the library cell characterization. To see the valid path sources and state conditions for this pin you can use the **report_power** command with the **-cell -verbose -only** cell arguments, where the specified cell contains the pin being annotated.

WHAT NEXT

Reissue the **set_switching_activity** command with a valid path source.

PWR-562 (error) The state '%s' is not valid for state dependent static probability specifications for the cell '%s'.

DESCRIPTION

The specified state condition is not valid and the static probability information is not annotated. When specifying state dependent static probabilities the state condition should match one of the leakage power state conditions given in the library cell characterization. To see the valid state conditions for this cell you can use the **report_power** command with the **-cell -verbose -only** cell arguments.

WHAT NEXT

Reissue the **set_switching_activity** command with a valid state condition.

PWR-563 (error) The state '%s' is not valid for state dependent toggle rate specifications for the pin '%s'.

DESCRIPTION

The specified state condition is not valid and the toggle rate information is not annotated. When specifying state dependent toggle rates the state condition should match one of the internal power state conditions given in the library cell characterization. To see the valid path sources and state conditions for this pin you can use the **report_power** command with the **-cell -verbose -only** cell arguments, where the specified cell contains the pin being annotated.

WHAT NEXT

Reissue the **set_switching_activity** command with a valid state condition.

PWR-564 (error) The state '%s' and path source%s '%s' are not valid for state dependent and path dependent toggle rate specifications for the pin '%s'.

DESCRIPTION

The specified state condition and path source(s) are not valid and the toggle rate information is not annotated. When specifying state dependent and path dependent toggle rates, the state condition and path sources should match one of the internal power state condition and path source combination given in the library cell characterization. To see the valid path sources and state conditions for this pin you can use the **report_power** command with the **-cell -verbose -only** cell arguments, where the specified cell contains the pin being annotated.

WHAT NEXT

Reissue the **set_switching_activity** command with a valid state condition and path source.

PWR-565 (error) The "-rise_ratio" argument cannot be specified without "-state_dep" or "-path_dep".

DESCRIPTION

Different rise/fall values can be used for state and path dependent (SDPD) toggle rates on cell pins, however non-SDPD toggle rates on nets, ports and pins are shared equally between rise and fall transitions, so a rise ratio of 0.5 is the only meaningful value. The **-rise_ratio** argument of the **set_switching_activity** command can be used to specify different rise/fall SDPD toggle rates and therefore can only be used with the **-state_dep** and **-path_dep** arguments which specify the state and path dependent conditions respectively.

WHAT NEXT

The **-rise_ratio** argument cannot be specified when setting non-SDPD toggle rates. To specify SDPD toggle rates use the **-state_dep** and/or **-path_dep** arguments.

PWR-566 (information) The path source '%s' matches %d power tables. The specified toggle rate is shared between all

matches.

DESCRIPTION

The specified path source matches more than one table, and the toggle rate given in the **set_switching_activity** will be shared equally between each match. You can use the **report_power** command with the **-cell -verbose -only** cell arguments to see all the state and path dependent conditions for the specified cell.

WHAT NEXT

This is an information message. You can specify different state/path dependent toggle rates for each state and path condition using separate calls to the **set_switching_activity** command using both the **-state_dep** and **-path_dep** arguments.

PWR-567 (warning) Ignoring invalid user-annotated SD static probability on cell '%s'.

DESCRIPTION

State-dependent static probability annotation on the specified cell is invalid and will not be used for power calculations. A likely reason for this problem is that the current link library and the link library used when the SD static probability was annotated have different states in their leakage power characterization for the specified cell.

WHAT NEXT

Check that the SD static probability values annotated on the given cell (with **set_switching_activity** or **read_saif**) are valid; also check that the link library used when annotating the SD static probabilities is the same as the current one or that it has the same states in the leakage power characterization.

PWR-568 (warning) Ignoring invalid user-annotated SDPD toggle rate on pin '%s'.

DESCRIPTION

State-dependent and/or path-dependent toggle rate annotation on the specified pin is invalid and will not be used for power calculations. A likely reason for this problem is that the current link library and the link library used when the SDPD toggle rate was annotated have different state/path conditions in their internal power characterization for the specified pin.

WHAT NEXT

Check that the SDPD toggle rate values annotated on the given pin (with set_switching_activity or read_saif) are valid; also check that the link library used when annotating the SDPD toggle rates is the same as the current one, or that it has the same state/path conditions in the internal power characterization.

PWR-569 (warning) Ignoring invalid user-annotated SDPD switching activity on cell '%s'.

DESCRIPTION

State-dependent and/or path-dependent toggle rate annotation and/or state-dependent static probabilities on the specified cell or its pins are invalid and will not be used for power calculations. A likely reason for this problem is that the current link library and the link library used when the SDPD switching activity was annotated have different state/path conditions in their internal power characterization and/or different state conditions in their leakage power characterization.

WHAT NEXT

Check that the SDPD switching activity values annotated on the given cell (with set_switching_activity or read_saif) are valid; also check that the link library used when annotating the SDPD switching activity is the same as the current one, or that it has the same SDPD conditions in the internal and leakage power characterization.

PWR-570 (warning) Cell %s is not a buffer or inverter and hence cannot be ungated; clock gate %s will not be removed.

DESCRIPTION

Clock gates which are driving combinational cells other than buffers or inverters cannot be ungated. Such combinational cells are considered manual inserted clock gating cells that are not recognized as Power Compiler clock gates.

WHAT NEXT

Replace the manual inserted clock gate with a Power Compiler clock gate by issuing the `replace_clock_gates` command.

PWR-571 (error) Cell %s is not a buffer or inverter and hence cannot be ungated; clock gate %s will not be removed.

DESCRIPTION

Clock gates which are driving combinational cells other than buffers or inverters cannot be ungated. Such combinational cells are considered manual inserted clock gating cells that are not recognized as Power Compiler clock gates.

WHAT NEXT

Replace the manual inserted clock gate with a Power Compiler clock gate by issuing the `replace_clock_gates` command.

PWR-572 (warning) Option -module_level is obsolete. Use the replace_clock_gates command instead.

DESCRIPTION

It is not recommended to perform replacement of manual inserted clock gates simultaneously with clock gate insertion. To replace existing clock gates with Power Compiler clock gates, use the `replace_clock_gates` command instead.

WHAT NEXT

Replace the manual inserted clock gate with a Power Compiler clock gate by issuing the `replace_clock_gates` command.

SEE ALSO

`insert_clock_gating` (2), `replace_clock_gates` (2).

PWR-573 (warning) Use of option -no_register_based is deprecated.

DESCRIPTION

It is not recommended to perform replacement of manual inserted clock gates simultaneously with clock gate insertion. To replace existing clock gates with Power Compiler clock gates, use the `replace_clock_gates` command instead. With the availability of this command there is no need for the `-no_register_based` option for

the `insert_clock_gating` command.

WHAT NEXT

Do not use the `-no_register_based` option with the `insert_clock_gating` command. If you do not want register-based clock gating, do not issue the `insert_clock_gating` command altogether.

SEE ALSO

`insert_clock_gating` (2), `replace_clock_gates` (2).

PWR-574 (information) For a multi-voltage design, library %s specified in the `set_clock_gating_style` command will be ignored. The library cell matching the correct operating condition will be used.

DESCRIPTION

The user specifies the clock gating cell of a specific library in `set_clock_gating_style` command. In a multi-voltage design, this library will be ignored by the linker inside `compile`. Instead, it will select the clock gating cell with the appropriate operating condition.

WHAT NEXT

In a multi-voltage design, the user do not need to specify the library name of the clock gating cell in the `set_clock_gating_style` command.

PWR-575 (warning) The library %s specified in the `set_clock_gating_style` will be ignored during clock gate mapping since the design is a multi-voltage design.

DESCRIPTION

The user specifies the clock gating cell of a specific library in `set_clock_gating_style` command. In a multi-voltage design, this library will be ignored by the linker inside `compile`. Instead, it will select the clock gating cell with the appropriate operating condition.

WHAT NEXT

In a multi-voltage design, the user do not need to specify the library name of the clock gating cell in the **set_clock_gating_style** command.

PWR-580 (Error) Could not make connection to pin '%s' because cell '%s' is marked dont_touch.

DESCRIPTION

hookup_testports had to create pins at intermediate levels of hierarchy to hooking up the specified pin to the *hookup_pin* specified. But one of the cells in the hierarchy was marked *dont_touch* and hence the connection could not be made.

WHAT NEXT

Remove the *dont_touch* on the specified cell and rerun **hookup_testports** if that is possible. **hookup_testports** has completed the rest of the connections. The user can choose to fix the failed connection with netlist editing commands also.

PWR-581 (warning) Clock-gating cell %s is a target cell for the rewire_clock_gating command.

DESCRIPTION

The **remove_clock_gating -all** command cannot mark clock gating cells for removal that are a target clock-gating cell for the **rewire_clock_gating** command.

WHAT NEXT

If a cell is a target clock-gating cell for the **rewire_clock_gating** command, it cannot be marked for removal. If you want to use the **compile** command with the **-incremental** option (or **physopt** and **physopt -incremental**) to remove the cell, use the **-undo** option of the **rewire_clock_gating** command with the **-gated_registers** option. Include as the argument to the **-gated_objects** option all the cells and pins that are marked to be moved to the new clock-gating cell. Then reissue the **remove_clock_gating** command.

SEE ALSO

compile (2), **remove_clock_gating** (2), **rewire_clock_gating** (2).

PWR-582 (error) The cell %s is marked dont_touch and cannot be removed.

DESCRIPTION

You receive this error message because you specified a clock-gating cell that is marked dont_touch as an argument of the **-gating_cell** option of the **remove_clock_gating** command. Cells that are marked dont_touch cannot be removed.

WHAT NEXT

Make sure the specified cell is not marked dont_touch. If the clock gating cell is marked dont_touch, use the **set_dont_touch** command to explicitly set the dont_touch attribute to false or the **remove_attribute** command to remove the dont_touch attribute.

SEE ALSO

remove_clock_gating (2), **report_clock_gating** (2), **set_dont_touch** (2),
remove_attribute (2).

PWR-583 (warning) The cell %s is marked dont_touch and cannot be removed.

DESCRIPTION

You receive this error message because you issued the **remove_clock_gating** command with the **-all** option on a design that has a clock-gating cell that is marked dont_touch. Such cannot be removed.

WHAT NEXT

Make sure the specified cell is not marked dont_touch. If the clock gating cell is marked dont_touch, use the **set_dont_touch** command to explicitly set the dont_touch attribute to false or the **remove_attribute** command to remove the dont_touch attribute.

SEE ALSO

remove_clock_gating (2), **report_clock_gating** (2), **set_dont_touch** (2),
remove_attribute (2).

PWR-584 (warning) Clock gate %s is marked for rewiring and cannot be removed.

DESCRIPTION

The **remove_clock_gating -all** command cannot mark clock gating cells for removal that are marked for rewiring by the **rewire_clock_gating** command.

WHAT NEXT

A clock gating cell that is marked for rewiring cannot be removed. If you want to use the **compile** command with the **-incremental** option (or **physopt** and **physopt -incremental**) to remove the cell, use the **-undo** option of the **rewire_clock_gating** command. Use the cell you specified as an argument for the **-gated_objects** option. Then reissue the **remove_clock_gating** command.

SEE ALSO

compile (2), **remove_clock_gating** (2), **rewire_clock_gating** (2).

PWR-585 (error) Either the option -all or one of the options -min_bitwidth, -gated_registers or -gating_cells must be used with the remove_clock_gating command.

DESCRIPTION

The **remove_clock_gating** command requires that you use either **-all** or one or a combination of the options **-min_bitwidth**, **-gated_registers**, or **-gating_cells**.

WHAT NEXT

To remove all the clock-gating cells in the current level of hierarchy, use the **-all option**. To remove only register that belong to banks smaller than a certain minimum size, use the **-min_bitwidth** option. Along with the **-all** and **-min_bitwidth** options, you can also use the **-no_hier** option to limit removal of clock-gating cells to the current level. To remove selected individual clock gating cells or registers in lower levels of the design hierarchy, give their complete path names from the current level of hierarchy as arguments to the **-gated_registers** option or the **-gating_cells** option of the **remove_clock_gating** command.

SEE ALSO

remove_clock_gating (2).

PWR-590 (Information) Datapath cell '%s' is gated with %s gating style.

DESCRIPTION

Power Compiler found that, datapath gating for the cell reduces dynamic power consumption and hence successfully gated the cell with the displayed style.

WHAT NEXT

No action is necessary.

PWR-591 (warning) Datapath cell '%s' is not considered for gating.

DESCRIPTION

This warning is issued when datapath gating engine encounters a DesignWare module cell with no dedicated pin to hookup gating control signal. If datapath gating is supported for any DesignWare module, low power DesignWare library (dw_lp.foundation.sldb) will have another similar module with an extra pin to which gating control signal can be connected. When datapath gating is enabled, this gating compatible DesignWare module is used for an operator instead of normal module.

All of most commonly used DesignWare modules have their gating compatible modules. This warning is issued for those module cells which do not have their gating compatible module.

WHAT NEXT

Check if dw_lp.foundation.sldb is included in the synthetic_library list. If it is already included, it is most likely that gating compatible module is not supported for the reported datapath cell. This warning can then be safely ignored.

SEE ALSO

`set_datapath_gating_options` (2), `power_enable_datapath_gating` (3).

PWR-592 (Information) Datapath cell '%s' is not gated because

no opportunity for gating was found.

DESCRIPTION

This warning is issued when no state could be identified for which the output of the datapath cell is unused.

WHAT NEXT

No action is necessary.

SEE ALSO

`set_datapath_gating_options` (2), `power_enable_datapath_gating` (3).

PWR-593 (Information) Datapath cell '%s' is not gated because gating did not prove useful.

DESCRIPTION

This warning is issued when the datapath cell is not gated since there is no power gain seen after gating the cell.

WHAT NEXT

No action is necessary.

SEE ALSO

`set_datapath_gating_options` (2), `power_enable_datapath_gating` (3).

PWR-600 (error) No valid command argument is specified with `saif_map`.

DESCRIPTION

The `saif_map` command is called without an argument that specifies an action. The `saif_map` command requires one of the following arguments that specify an action: `-start`, `-end`, `-reset`, `-report`, `-get_name`, `-set_name`, `-add_name`, `-remove_name`, `-clear_name`, `-get_object_names`, `-create_map`, `-write_map`, `-read_map`, `-verbose` and `-non_verbose`.

WHAT NEXT

Use one of the above arguments with **saif_map** in order to specify the action required.

PWR-601 (error) The **saif_map** arguments '%s' and '%s' specify different commands and cannot be used together.

DESCRIPTION

The **saif_map** command is called with multiple arguments that specify different actions. The following **saif_map** commands specify different actions and cannot be used together: **-start**, **-end**, **-reset**, **-report**, **-get_name**, **-set_name**, **-add_name**, **-remove_name**, **-clear_name**, **-get_object_names**, **-create_map**, **-write_map** and **-read_map**.

WHAT NEXT

Use only one of the above arguments when calling the **saif_map** command.

PWR-602 (information) The SAIF name-mapping information database is %s.

DESCRIPTION

An information message that explains whether the SAIF name mapping database is currently active or inactive. The SAIF name mapping mechanism can be activated using the **saif_map -start** command and deactivated using the **saif_map -end** command. The features of the SAIF name mapping mechanism are only available when the name mapping database is active.

WHAT NEXT

This is an information message.

SEE ALSO

saif_map (2).

PWR-603 (information) The verbose mode of the SAIF name-

mapping mechanism is %s.

DESCRIPTION

Specifies whether the SAIF name mapping mechanism is current in verbose mode or not. The name mapping mechanism can be put in verbose mode using the **saif_map -verbose** command. The name mapping mechanism can be put in non-verbose mode using the **saif_map -non_verbose** command.

WHAT NEXT

This is an information message.

PWR-604 (error) The SAIF name-mapping mechanism is not active.

DESCRIPTION

The required operation needs the SAIF name-mapping mechanism to be active. You can activate the name-mapping mechanism by invoking **saif_map -start**.

WHAT NEXT

Activate the name-mapping mechanism with **saif_map -start** and repeat the command.

PWR-605 (error) The '-create_map' argument is specified without the '%s' argument.

DESCRIPTION

The **saif_map** argument **-create_map** needs the following two arguments: **-input filename** and **-source_instance instance_name**. The **-input** specifies the SAIF file that will be used for creating the SAIF Names information in the name mapping database. The **-source_instance** argument specifies the instance name of the current design as used in the SAIF file (that is, as the instance name in the simulation testbench).

WHAT NEXT

Use both the **-input** and **-source_instance** arguments with the **saif_map** command argument **-create_map**.

PWR-606 (error) When used with the '%s' argument, the `saif_map` command also requires a single design object as an argument.

DESCRIPTION

The action specified with the `saif_map` command argument also requires a single design object (port, cell, net or pin) to be used by the `saif_mapfP command`.

WHAT NEXT

Specify the missing argument with the `saif_map` command.

PWR-607 (error) The `saif_map` arguments '%s' and '%s' are mutually exclusive.

DESCRIPTION

The two `saif_map` arguments specify contradictory actions and are therefore mutually exclusive.

WHAT NEXT

Specify `saif_map` with only one of the mutually exclusive arguments.

PWR-608 (error) The `saif_map` argument '%s' is currently unavailable.

DESCRIPTION

The specified argument is still under construction.

WHAT NEXT

Avoid using the specified argument for now.

PWR-609 (error) Cannot recognize the `saif_map` column or sort

type '%s'.

DESCRIPTION

The value of the **saif_map** arguments **-columns** and/or **-sort** is invalid. The valid value of these arguments is a list of SAIF name mapping report column names; The valid column names are: **type** (the type of object, that is, port, cell, net or pin), **object_names** (the name of the design object), **saif_names** (the SAIF Name of the design object), **orig_names** (the Orig Name of the design object), **extended_orig_names** (the Orig Name of the design object in extended syntax), and **attributes** or **flags** (the name mapping flags on the design object).

WHAT NEXT

Use valid values for the **saif_map** command arguments **-columns** and **-sort**.

PWR-610 (error) The **saif_map** column or sort type '%s' is used multiple times.

DESCRIPTION

The value of the **saif_map** argument **-columns** or **-sort** is invalid because a column name is used multiple times. Valid values of these arguments are lists of column names without repetitions.

WHAT NEXT

Use a valid value for the **saif_map** arguments **-columns** and **-sort**.

PWR-611 (error) Cannot recognize the -type argument '%s' for the command **saif_map** '%s'.

DESCRIPTION

The **saif_map** command argument **-type** is invalid. Valid values for the **-type** argument depend on the other arguments of the **saif_map** command.

If the **-set_name**, **-get_name** or **-get_object_names** arguments are used, then the valid values of the **-type** argument are: **saif_names**, **orig_names** and **extended_orig_names**.

If the **-clear_name** argument is used, then the valid values of the **-type** argument are: **saif_names**, **orig_names**, **extended_orig_names** and **all_names**.

If the **-write_map** argument is used, then the valid values of the **-type** argument are: **name_map** and **ptpx**.

WHAT NEXT

Use a valid value for the **saif_map** argument **-type**.

PWR-612 (error) Cannot use the **-type** argument with the **saif_map** command '%s'.

DESCRIPTION

The **saif_map** argument **-type** cannot be used with the specified argument. The action arguments that can be used with the **-type** argument are: **-set_name**, **-get_name**, **-get_object_names**, **-clear_name**, and **-write_map**.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-613 (error) Cannot use the **-inverted** flag with the **saif_map** command '%s'.

DESCRIPTION

The **saif_map** command flag **-inverted** cannot be used with the specified action argument. The **-inverted** can be used with the **-set_name** and **-add_name** action arguments.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-614 (error) Cannot specify the **saif_map** '%s' argument together with a list of objects.

DESCRIPTION

A number of **saif_map** arguments (such as **-clear_name**) also require a list of objects

that can be specified explicitly as a list of objects or implicitly using the optional arguments **-instances**, **-hierarchical**, **-no_hierarchical**. It is not possible to specify the objects both explicitly and implicitly, so it is not possible to use the **-instances**, **-hierarchical**, **-no_hierarchical** arguments together with a list of options.

WHAT NEXT

Specify the required objects either explicitly or implicitly.

PWR-615 (error) Cannot use the -instances argument with the saif_map command argument '%s'.

DESCRIPTION

The **saif_map** argument **-instances** can only be used when the **saif_map** operation requires a list of objects that can be specified implicitly. The command arguments that can use an implicitly specified list of objects are: **-report**, **-clear_name** and **-get_object_names**.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-616 (error) Cannot use the '%s' flag with the saif_map command '%S'.

DESCRIPTION

The **saif_map** optional flags **-hierarchical** and **-no_hierarchical** can only be used when the **saif_map** operation requires a list of objects that can be specified implicitly. The command arguments that can use an implicitly specified list of objects are: **-report**, **-clear_name** and **-get_object_names**.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-617 (error) Cannot use the '%s' argument with the

saif_map command '%s'.

DESCRIPTION

The **saif_map** arguments **-columns**, **-sort**, **-rtl_summary** and **-missing_rtl** can only be used when using the **saif_map** command argument **-report** to report the SAIF name mapping information on the current design.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-618 (error) The **saif_map -columns** argument must have at least one of: **saif_names**, **orig_names**, **extended_orig_names**.

DESCRIPTION

A column type that specifies the SAIF Names or an Orig Names of the design objects is missing from the **-column** argument of the **saif_map** command.

WHAT NEXT

Specify at least one of **saif_names**, **orig_names**, **extended_orig_names** when using the **-column** argument.

PWR-619 (error) Cannot use the '%s' argument with the **saif_map** command '%s'.

DESCRIPTION

The **saif_map** command arguments **-input_name**, **-source_instance** and **-target_instance** can only be used when creating the name mapping information from a SAIF file using the **-create_map** argument.

WHAT NEXT

Use valid arguments when using the **saif_map** command.

PWR-620 (information) Reporting correlated power.

DESCRIPTION

Power Prediction mode is on. The reported power numbers include predicted power.

WHAT NEXT

This is an information message. No action required.

PWR-621 (error) Can't report power unless Power Prediction mode is on.

DESCRIPTION

In Topographical mode, power is reported only when Power Prediction mode is on.

WHAT NEXT

Run `set_power_prediction` followed by `compile_ultra` or `compile_ultra -incremental` before running the power reporting command.

PWR-622 (error) Use at least one option with the '%s' command.

DESCRIPTION

This command requires at least one option. Run the command with the `-help` option to see a list of all available options.

WHAT NEXT

Re-issue the command with at least one of the available options.

PWR-623 (error) Can't find correlated power.

DESCRIPTION

The last compile of the design was run without Power Prediction.

WHAT NEXT

Run `set_power_prediction` followed by `compile_ultra` or `compile_ultra -incremental` before running the power reporting command.

PWR-624 (warning) Skipping Clock Tree Power Estimation in PDB based run.

DESCRIPTION

Power Correlation is not supported when using PDB libraries.

WHAT NEXT

Rerun `compile_ultra` using MilkyWay libraries after setting `use_pdb_lib_format` to `false`.

PWR-625 (error) Clock Tree Estimation failed.

DESCRIPTION

The clock tree estimation step failed.

WHAT NEXT

Please contact support.

PWR-626 (Error) Power Prediction mode can not be set since the design has cells that can not be uniquified.

DESCRIPTION

Power Prediction can not be turned on if the design has hierarchical cells which can not be uniquified. This happens if there are multiply instantiated cells with `dont_touch` attribute or there are multiply instantiated cells inside a `dont_touched` cell.

WHAT NEXT

Use `uniquify -force` before turning on Power prediction.

PWR-627 (Error) Power constraint can not be set without enabling power prediction.

DESCRIPTION

In DC-Topographical mode, power constraints can not be set if power prediction mode could not be set.

WHAT NEXT

Check previous error messages to see why setting power prediction mode failed.

PWR-628 (Error) Power-driven clock gating during compile can not be enabled without enabling power prediction.

DESCRIPTION

In DC-Topographical mode, power-driven clock gating during compile can not be enabled if power prediction mode could not be set.

WHAT NEXT

Check previous error messages to see why setting power prediction mode failed.

PWR-630 (error) Cannot use the -hsep argument with the saif_map command '%s'.

DESCRIPTION

The **saif_map** command argument **-hsep** specifies the hierarchical separator when displaying or parsing SAIF Names and Orig Name. The **saif_map** command arguments that can take the **-hsep** argument are: **-get_name**, **-set_name**, **-add_name**, **-remove_name**, **-clear_name**, **-get_object_names**, and **-report**.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-631 (error) Invalid -hsep argument value: '%s'.

DESCRIPTION

An invalid value for the **saif_map** command argument **-hsep** is used. The valid values for the **-hsep** argument are: "/" (default value), "." and " ".

WHAT NEXT

Use a valid argument value.

PWR-632 (error) Cannot use a list of objects as arguments to the saif_map command '%s'.

DESCRIPTION

A list of objects is specified as arguments to the **saif_map** command together with a command argument that does not require a list of objects. The **saif_map** command arguments that can use a list of objects are: **set_name**, **get_name**, **add_name**, **clear_name**, **remove_name**, and **report**.

WHAT NEXT

Use valid argument with the **saif_map** command.

PWR-633 (error) The read_saif flags '%s' and '%s' are mutually exclusive.

DESCRIPTION

The **read_saif** flags **-map_names**, **-auto_map_names**, and **-rtl_direct** specify different actions are pairwise mutually exclusive. Also, the **read_saif** flags **-map_names**, **-auto_map_names**, and **-names_file** are pairwise mutually exclusive.

WHAT NEXT

Use at most one of the mutually exclusive flags with the **read_saif** command.

PWR-634 (error) Unable to create name mapping for SAIF file;

The switching activity information in the SAIF file will not be annotated.

DESCRIPTION

The **read_saif** command is specified with the **-auto_map_names** to create SAIF name mapping information and use it to read the SAIF file, but the name mapping information could not be created.

WHAT NEXT

Fix the problem that causing the name mapping creating to fail. You can use the **saif_map** with the **-create_map** argument to just create the name mapping information and help you debug the problem.

SEE ALSO

[saif_map \(2\)](#).

PWR-635 (information) Writing SAIF name mapping information to file '%s'.

DESCRIPTION

Power Compiler is generating a SAIF name mapping file for the current design.

WHAT NEXT

This is an information message. The SAIF name mapping file can be read back in future using the **saif_map** command with the **-read_map** argument.

PWR-636 (information) Writing SAIF name mapping information into the PT-PX name mapping file '%s'.

DESCRIPTION

Power Compiler is generating a name mapping file to be read by PT-PX. The generated name mapping file contains PT-PX **set_rtl_to_gate_name** commands and cannot be read into Power Compiler.

WHAT NEXT

This is an information message.

PWR-637 (information) Reading SAIF name-mapping information from file '%s'.

DESCRIPTION

Power Compiler is reading the SAIF name-mapping information from the specified file.

WHAT NEXT

This is an information message.

PWR-638 (warning) Unable to process line %d of SAIF name mapping file '%s' starting with: '%s'.

DESCRIPTION

An error occurred while processing the SAIF name-mapping file. The specified line in the SAIF name-mapping file is not in a format that is expected by the **saif_map** command. It is likely that the SAIF name-mapping file used to store the SAIF name-mapping information is invalid.

WHAT NEXT

Use a valid SAIF name mapping file generated by the **saif_map** command argument **-write_map** when reading SAIF name-mapping information.

PWR-639 (error) Cannot process the SAIF name-mapping file: '%s'.

DESCRIPTION

Too many errors occurred while processing the SAIF name-mapping file and the read operation has been aborted. No SAIF name-mapping information has been read properly. The provided file is not in a format that can be understood by the **saif_map** command argument **-read_map**.

WHAT NEXT

Use a valid SAIF name mapping file generated by the **saif_map** command argument - **write_map** when reading SAIF name-mapping information.

PWR-640 (information) Annotating original name information on design object for SAIF name matching.

DESCRIPTION

SAIF name matching information is being stored on design objects. This information represents the original names of the design objects and can be used later for matching SAIF names in RTL backward SAIF files with design objects.

WHAT NEXT

This is an information message.

SEE ALSO

saif_map (2).

PWR-641 (warning) Unable to find the %s '%s' in the current design when reading line %d of SAIF name mapping file '%s'.

DESCRIPTION

A design object specified in the SAIF name mapping file cannot be found. It is likely that the specified SAIF name mapping file is not intended for the current design.

WHAT NEXT

Make sure that the SAIF name mapping file being read is intended for the current design.

PWR-642 (warning) The rtl2saif command will be obsoleted in future versions; use flows involving the saif_map command to

read RTL SAIF files.

DESCRIPTION

You are using the **rtl2saif** command to generate a forward RTL SAIF file, but flows involving the forward RTL SAIF file will be made obsolete in future. To generate and read backward RTL SAIF files, do not use forward RTL SAIF files and use the **saif_map** command and the **-auto_map_names** and/or **-map_names** arguments of **read_saif**. The following is a sample script template for reading RTL SAIF files:

```
saif_map -start  
read... rtl_source  
link  
read_saif -auto_map_names -input rtl.saif -instance tb/u1
```

where the **rtl.saif** is a backward RTL SAIF file generated without using a forward RTL SAIF file. To properly generate a backward RTL SAIF file without using a forward SAIF file, the following guidelines should be followed:-

- When using the **vcd2saif** utility, the **-rtl** argument should not used.
- When using the direct SAIF generation of Synopsys VCS and VCS/MX, or the Synopsys SAIF generation PLI/FLI utilities, the gate/net monitoring policy should be set to **rtl_on** and an RTL SAIF file should not be read. To set the monitoring policy, use the PLI task **set_gate_level_monitoring** or the FLI task **set_net_monitoring_policy**.

WHAT NEXT

This is a warning message; for best performance use the **saif_map** flow for reading RTL backward SAIF files.

SEE ALSO

[saif_map\(2\)](#)
[read_saif\(2\)](#)

PWR-643 (information) The variable "power_preserve_rtl_hier_names" is set to "true"; This variable is not required when using the **saif_map** command and will be obsoleted in future releases.

DESCRIPTION

The **power_preserve_rtl_hier_names** is not required when using flows involving the **saif_map** command to read RTL SAIF files. The **power_preserve_rtl_hier_names** variable

is only required if using the **rtl2saif** command and/or the **-rtl_direct** option of **read_saif**; however, note that such flows will be unsupported in future versions of the tool.

WHAT NEXT

This is an information message; you do not need to set the **power_preserve_rtl_hier_names** variable if your flow does not involve the **rtl2saif** command or the **-rtl_direct** flag.

PWR-644 (warning) The **-rtl_direct** flag will be made obsolete; use flows involving the **-map_names** and/or **-auto_map_names** flags and the **saif_map** command to read RTL SAIF files.

DESCRIPTION

You are using the **-rtl_direct** flag to read a SAIF file, but this flag will be made obsolete in future. To generate and read backward RTL SAIF files, it is suggested to use the **saif_map** command and the **-auto_map_names** and/or **-map_names** arguments of **read_saif**. The following is a sample script template for reading RTL SAIF files:

```
saif_map -start  
read... rtl_source  
link  
read_saif -auto_map_names -input rtl.saif -instance tb/u1
```

where the **rtl.saif** is a backward RTL SAIF file generated without using a forward RTL SAIF file. To properly generate a backward RTL SAIF file without using a forward SAIF file, the following guidelines should be followed:-

- When using the **vcd2saif** utility, the **-rtl** argument should not used.
- When using the direct SAIF generation of Synopsys VCS and VCS/MX, or the Synopsys SAIF generation PLI/FLI utilities, the gate/net monitoring policy should be set to **rtl_on** and an RTL SAIF file should not be read. To set the monitoring policy, use the PLI task **set_gate_level_monitoring** or the FLI task **set_net_monitoring_policy**.

WHAT NEXT

This is a warning message; for best performance use the **saif_map** flow for reading RTL backward SAIF files.

saif_map (2)

```
read_saif(2)
```

PWR-645 (error) Cannot use the saif_map arguments '%s' and '%S' together.

DESCRIPTION

A number of mutually exclusive arguments are used with the **saif_map** command argument **-report**.

The **-rtl_summary** flag cannot be used with the **-columns**, **-sort**, or **-hsep** arguments. The **-rtl_summary** flag specifies that a summary report on synthesis invariants is to be reported, while the **-columns**, **-sort** and **-hsep** arguments are used to control the full (non-summary) report.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-646 (error) Cannot use the '%s' flag with the saif_map command '%s'.

DESCRIPTION

The **-nosplit** flag can only be used with the **saif_map** command argument **-report**.

WHAT NEXT

Use valid arguments with the **saif_map** command.

PWR-647 (error) The '%s' flag can only be specified with the '%s' flag.

DESCRIPTION

The **-missing_rtl** flag can only be specified with both the **-report** and **-rtl_summary** flags of the **saif_map** command to include a list of synthesis invariant objects with no SAIF names when displaying a summary SAIF mapping report on synthesis invariant objects.

WHAT NEXT

Use valid arguments with the `saif_map` command.

PWR-648 (information) The clock '%s' does not have a period.

DESCRIPTION

The given clock does not have a period and will not be used in related clock inference or other power calculation steps.

WHAT NEXT

This is an information message; if the given clock is expected to have a period then check that it was created properly.

PWR-649 (warning) The clock '%s' associated with the %s '%s' does not have a period.

DESCRIPTION

The design object (net, pin, or port) given in the warning message has a clock associated with it that does not have a period. A clock can be associated to a design object by using the `-clock` option of the `set_switching_activity` command. The associated, or related, clock period is used to calculate the effective toggle rate of the object used in power calculations. The effective toggle rate is the annotated toggle rate divided by the period of the related clock. When a related clock is not specified, the annotated toggle rate relative to the library time unit is used. In this case, the related clock does not exist in the current design, and for power calculations, the related clock period is assumed to be 1.0.

The related clock is also used during the related clock inference mechanism. If a related clock has no period then it cannot be used to infer the related clock of other design objects.

WHAT NEXT

Check that the given clock was created properly, or use a different related clock on the specified object.

PWR-650 (warning) A minimum bit-width constraint has been

set; power-driven clock gating may yield inferior results.

DESCRIPTION

To obtain optimal results it is advised not to set a minimum bit-width constraint when performing power-driven clock gating. This allows the optimization algorithm to optimally clock gate the design based on the switching activity and dynamic power of the register banks.

WHAT NEXT

Do not explicitly specify a minimum bit-width constraint by not setting the `-minimum_bitwidth` option with the `set_clock_gating_style` command.

PWR-651 (warning) A GICG style is set; clock gate insertion will not be performed.

DESCRIPTION

Clock gating is not supported with generic integrated clock gating (GICG) styles.

WHAT NEXT

Specify a discrete or standard integrated clock gating (ICG) style with the `set_clock_gating_style` command.

PWR-652 (warning) The '`-exact_map`' option may not be honored for registers that are involved in clock gating optimization.

DESCRIPTION

Both the `-gate_clock` and `-exact_map` options were specified with `compile` or `compile_ultra`. Since registers can be remapped during both removal and insertion of clock gating, it may not always be possible to honor the `-exact_map` option for those registers that are involved with clock gating optimization.

WHAT NEXT

If honoring the `exact_map` option has the highest priority, do not use the `-gate_clock` option with `compile` or `compile_ultra`. Instead, use the

`insert_clock_gating` command to introduce clock gates in the design at the RT-level.

PWR-660 (warning) Multiple threshold voltage groups were not detected from the library. Leakage power optimization will treat

the design as single threshold voltage.

DESCRIPTION

Multiple threshold voltage groups are identified by setting the *threshold_voltage_group* attribute on library cells or *default_threshold_voltage_group* on libraries. The threshold voltage group information helps **compile** to better optimize the leakage power of the design. These message indicate that no such attribute were set or the libraries only has one threshold voltage group.

WHAT NEXT

Check whether the design has single threshold voltage group or the threshold voltage group attributes are set.

PWR-661 (warning) A latch-based clock-gating style was chosen but
no latches are in the technology library.

DESCRIPTION

The default clock-gating style or user defined clock-gating style use "latch" without a specific library as the *-sequential_cell* option but the technology library has no latch.

WHAT NEXT

Change the clock gating style to a latch-free style or add latches to the technology library.

PWR-662 (warning) Register '%s' (%s) will not be translated to the retention specification.

DESCRIPTION

The named register could not be translated into a retention cell provided in the *target_library*. The most likely reason is that no library cell exists in the *target_library* that matches the asynchronous or clock-phase requirements of the register in the input netlist (e.g. RTL), while still satisfying the specified retention style or retention library cells (via *set_power_gating_style*, or *map_retention_cell*).

Another possible reasons are: (1) there is dont_touch flag on the cell, or, (2) you are running compile -incr or compile_ultra -incr, which does not re-target cells from non-retention to retention.

WHAT NEXT

Investigate the reason for not getting the desired mapping.

If it is because of library cells not meeting the asynchronous requirements, add a correctly-modeled retention cells to the target_library, or modify the RTL to change the asynchronous requirements.

If it is because of clock-phase, add a correctly-modeled retention cells to the target_library, or modify the RTL to change the clock-phase.

If you want to re-target a pre-mapped non-retention cell to a retention cell, you will need to run full compile_ultra.

PWR-680 (warning) merge_clock_gates will be obsolete in dc_shell in the next release.

DESCRIPTION

The command **merge_clock_gates** will be obsoleted in dc_shell in the next major release.

WHAT NEXT

Do not use **-max_fanout** option of **set_clock_gating_style** command to get maximally merged clock gate configuration. Also the command may still be available in icc_shell.

PWR-700 (error) Cannot specify the -reset flag with the percentage value argument.

DESCRIPTION

The **-reset** flag of the **set_max_lvth_percentage** command specifies that the current max %lvth constraints will be removed and cannot be used with arguments that specify new max %lvth constraints.

WHAT NEXT

Use a valid set of arguments with the **set_max_lvth_percentage** command. To remove the current constraints use the **-reset** flag with no other arguments. To set new constraints specify the max %lvth percentage value as an argument to the command together with the list of vth groups to be considered as low vth using the **-lvth_groups** argument.

PWR-701 (error) Cannot specify the -reset flag with the -lvth_groups argument.

DESCRIPTION

The **-reset** flag of the **set_max_lvth_percentage** command specifies that the current max %lvth constraints will be removed and cannot be used with arguments that specify new max %lvth constraints.

WHAT NEXT

Use a valid set of arguments with the **set_max_lvth_percentage** command. To remove the current constraints use the **-reset** flag with no other arguments. To set new constraints specify the max %lvth percentage value as an argument to the command together with the list of vth groups to be considered as low vth using the **-lvth_groups** argument.

PWR-702 (error) Cannot specify the value argument without the -lvth_groups argument.

DESCRIPTION

The **set_max_lvth_percentage** argument can be used to set the max %lvt constraint by specifying the value of the constraint as a floating point value argument to the command and by specifying the list of vth groups to be considered as low vth using the **-lvth_groups** argument.

WHAT NEXT

Use a valid set of arguments with the **set_max_lvth_percentage** command. To set new constraints specify the max %lvth percentage value as an argument to the command together with the list of vth groups to be considered as low vth using the **-lvth_groups** argument.

PWR-703 (error) Cannot specify the -lvth_groups argument without a percentage value argument.

DESCRIPTION

The **set_max_lvth_percentage** argument can be used to set the max %lvt constraint by specifying the value of the constraint as a floating point value argument to the command and by specifying the list of vth groups to be considered as low vth using the **-lvth_groups** argument.

WHAT NEXT

Use a valid set of arguments with the **set_max_lvth_percentage** command. To set new constraints specify the max %lvth percentage value as an argument to the command together with the list of vth groups to be considered as low vth using the **-lvth_groups** argument.

PWR-704 (error) The -lvth_groups argument '%s' is not a valid vth group name.

DESCRIPTION

The **set_max_lvth_percentage** command is specified with an invalid **-lvth_groups** argument. The **-lvth_groups** argument is a list of strings specifying vth groups. Valid vth groups are non-empty strings and may contain alphanumeric characters and the underscore ("_") character.

WHAT NEXT

Specify a valid **-lvth_groups** argument to the **set_max_lvth_percentage** command.

PWR-705 (warning) Unable to parse the max_lvth information.

DESCRIPTION

The representation of the max %lvth information is not valid, and any max %lvth constraints will be ignored. This happens if the attributes representing the max %lvth constraint have been set incorrectly directly using the **set_attribute** command. The max %lvth information can be set correctly using the **set_max_lvth_percentage** command.

WHAT NEXT

Use the **fBset_max_lvth_percentage -reset** command to clear the current max %lvth constraint; then re-issue the **set_max_lvth_percentage** with valid arguments to set the max %lvth constraints if these are required.

PWR-720 (error) report_power is disabled since the design has ILMs.

DESCRIPTION

Power reporting is not permitted currently in designs with ILMs.

WHAT NEXT

You can report power after linking in the original netlists for the ILM blocks.

PWR-721 (warning) Not setting Power Prediction mode, because the design has ILMs

DESCRIPTION

Power prediction mode is not turned on since the design has ILM blocks. But the power constraint specified will be used during optimization.

WHAT NEXT

Link in the original netlist for the ILM blocks if you want to turn on Power Prediction.

PWR-722 (error) Power Prediction mode can not be set,

because the design has ILMs

DESCRIPTION

Power Prediction mode can not be turned on currently on designs with ILMs

WHAT NEXT

Link in the original netlist for the ILM blocks before turning on Power Prediction.

PWR-723 (error) %s can not be used, because the design has multiple scenarios.

DESCRIPTION

%s is not supported in a design with multiple scenarios.

WHAT NEXT

Remove %s from the multi-scenario design.

PWR-724 (error) %s can not be used, because the design has multiple scenarios. Please reset power_driven_clock_gating to false.

DESCRIPTION

%s %s is not supported in a design with multiple scenarios.

WHAT NEXT

Do not set %s to true in a multi-scenario design.

PWR-725 (Warning) Could not find correlated power.

DESCRIPTION

The last compile of the design was run without Power Prediction.

WHAT NEXT

To report correlated power, run `set_power_prediction` followed by `compile_ultra` or `compile_ultra -incremental` before running the power reporting command.

PWR-726 (Warning) Power Prediction mode can not be set since the design has cells that can not be uniquified.

DESCRIPTION

Power Prediction can not be turned on if the design has hierarchical cells which can not be uniquified. This happens if there are multiply instantiated cells with *dont_touch* attribute or there are multiply instantiated cells inside a *dont_touched* cell.

WHAT NEXT

Use `uniquify -force` before turning on Power prediction.

PWR-727 (Warning) Can not report correlated power unless power prediction mode is set.

DESCRIPTION

If power prediction is not set, correlated power will not be reported.

WHAT NEXT

To report correlated power, run `set_power_prediction` before running the power reporting command.

PWR-728 (Information) set_clock_gating_registers directives on technology mapped registers are honored only in compile - gate_clock flow.

DESCRIPTION

`insert_clock_gating` flow does not honor any `set_clock_gating_registers` directives on technology mapped registers.

WHAT NEXT

If you are using `insert_clock_gating` command to insert clock gates, apply the clock gating directives and invoke `insert_clock_gating` before the registers are mapped. There is no restriction when this command is used with `compile -gate_clock [-incr]` or `compile_ultra -gate_clock [-incr]`.

PWR-729 (warning) Clock gating with `insert_clock_gating` is obsolete and will be removed on some future release; instead use the `compile -gate_clock` command.

DESCRIPTION

The `compile -gate_clock` command provides additional features compared to the `insert_clock_gating` command. In addition to the regular clock gating also performed by `insert_clock_gating`, the `compile -gate_clock` command attempts to find even more clock gating opportunities by combing different register banks that share common enable conditions. Furthermore, it can create multi-stage clock gating designs by factoring common enable conditions from the inserted clock gates. This can further reduce the power dissipation.

WHAT NEXT

Use the `compile -gate_clock` command to introduce clock gating in your design.

SEE ALSO

`set_clock_gating_style` (2), `compile` (2).

PWR-730 (Information) Performing clock-gating on design %s.

DESCRIPTION

The tool is inserting clock gating on design %s. All gateable registers in this design based on the selected clock gating style will get gated.

Every clock gate inserted by this will be located on the same level of hierarchy as the registers. If you want clock gates to be shared between levels of hierarchy, set the variable `compile_clock_gating_through_hierarchy` to `true`

WHAT NEXT

This is an information message and no action is required. If you did not intend to insert clock gating on your design, remove `-gate_clock` from your `compile` or

`compile_ultra` options.

PWR-731 (Information) Performing global clock-gating on design %s.

DESCRIPTION

The tool is inserting clock gating on design %s. All gateable registers in this design based on the selected clock gating style will get gated.

Every clock gate inserted by this will be shared between different levels of hierarchy. If you want clock gates to be on the same level of hierarchy as the registers, set the variable `compile_clock_gating_through_hierarchy` to `false`

WHAT NEXT

This is an information message and no action is required. If you did not intend to insert clock gating on your design, remove `-gate_clock` from your `compile` or `compile_ultra` options.

PWR-732 (Information) Performing power driven clock-gating.

DESCRIPTION

Registers will get clock gated only if they fulfil the restrictions set with the current selected clock gating style and if clock gate insertion reduces the overall power consumption of the design.

WHAT NEXT

This is an information message and no action is required. If you did not intend to use power driven clock gating, set the `power_driven_clock_gating` variable to false.

PWR-733 (Error) value '%s' for option '-fanout_latency' is not valid.

DESCRIPTION

Syntax of argument given to option `-fanout_latency` for `set_clock_gate_latency` command is not valid.

The expected value is a comma separated list with the format
{n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a compatible value for the argument.

PWR-734 (Error) '%s' is not a floating point number.

DESCRIPTION

The substring of argument given to option -fanout_latency for set_clock_gate_latency command, which specifies the clock latency to be applied, is not a floating point number.

The expected value for this argument is a comma separated list with the format {n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a compatible value for the argument.

PWR-735 (Error) '%s' is not a positive integer number.

DESCRIPTION

A substring of argument given to option -fanout_latency for set_clock_gate_latency command, which specifies an upper or lower limit for a fanout range is not a positive integer number.

The expected value for this argument is a comma separated list with the format {n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a compatible value for the argument.

PWR-736 (Error) wrong fanout range specified: %d-%d.

DESCRIPTION

A substring of argument given to option -fanout_latency for set_clock_gate_latency command, which specifies a fanout range is not valid because the lower limit is higher than the upper limit.

The expected value for this argument is a comma separated list with the format {n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a compatible value for the argument.

PWR-737 (Warning) A fanout of 0 is invalid, value will be ignored.

DESCRIPTION

A substring of argument given to option -fanout_latency for set_clock_gate_latency command, which specifies the lower limit for a fanout range is the integer number 0. This value is ignored so the considered fanout range will start from 1.

The expected value for this argument is a comma separated list with the format {n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a fanout range starting from 1.

PWR-738 (Warning) Lower limit of first fanout range was extended to 1.

DESCRIPTION

A substring of argument given to option -fanout_latency for set_clock_gate_latency command, which specifies the lower limit for the first fanout range is an integer number higher than 1.

Since the specified fanout values must cover the complete range from 1 to 'inf', the lower limit for this first fanout range is extended to start from 1.

The expected value for this argument is a comma separated list with the format {n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a fanout range starting from 1.

PWR-739 (Warning) Upper limit of last fanout range was extended to 'inf'.

DESCRIPTION

A substring of argument given to option -fanout_latency for set_clock_gate_latency command, which specifies the upper limit for the last fanout range is not the string 'inf'.

Since the specified fanout values must cover the complete range from 1 to 'inf', the upper limit for this last fanout range is extended to finish at 'inf'.

The expected value for this argument is a comma separated list with the format {n1-m1 lat1, n2-m2 lat2, n3-m3 lat3, ...} where:

- ni and mi are positive integer numbers representing respectively lower and upper limits for fanout ranges. The first fanout range must start from 1 and the last one must finish with the string 'inf'. The ranges should not overlap each other.
- lati are floating point numbers representing a clock latency to be applied to each range.

WHAT NEXT

Supply a fanout range finishing at 'inf'.

PWR-740 (Warning) Fanout range %d-%d has no clock latency

information, value %.2f will be applied to it.

DESCRIPTION

No clock latency was specified for the listed fanout range. The tool will select for it the lowest latency value from the adjacent fanout ranges.

WHAT NEXT

Supply clock latency information for the complete fanout range going from 1 to 'inf'.

PWR-741 (Warning) One or more specified fanout ranges are overlapping.

DESCRIPTION

One or more fanout ranges specified as part of argument given to option - fanout_latency for set_clock_gate_latency command are overlapping.

The tool will select the lowest specified clock latency for those ranges with more than one value provided.

WHAT NEXT

Supply clock latency information for non overlapping fanout ranges.

PWR-742 (Warning) Clock latency of %.2f specified for fanout range %d-%d is lower than value %.2f specified for range %d-%s.

DESCRIPTION

The specified clock latency values are not decreasing with respect to fanout ranges. This may produce inconsistent clock latency settings and as a result a wrong timing analysis.

WHAT NEXT

Make sure that clock latency values are decreasing with respect to fanout ranges.

PWR-743 (Warning) Only one clock latency specification is meaningful for stage 0, value %.2f will be used.

DESCRIPTION

Argument given to option -fanout_latency for set_clock_gate_latency command specifies different fanout ranges, while value given for option -stage is 0.

Since the fanout range for "stage 0" is meaningless, the expected syntax for that argument in this case is {1-inf lat} where lat is a floating point number representing the clock latency to be applied to each gated register.

The tool will select the lowest specified clock latency value.

WHAT NEXT

Supply a compatible value for the argument.

PWR-744 (Warning) In clock gating latency settings specified for clock '%s', the max value for stage %d (%.2f) is higher than the min value for stage %d (%.2f)

DESCRIPTION

The specified clock latency values are not decreasing with respect to clock gating stages. This may produce inconsistent clock latency settings and as a result a wrong timing analysis.

WHAT NEXT

Make sure that clock latency values are decreasing with respect to clock gating stages.

PWR-745 (Warning) Clock latency settings are not available for clock gating stage %d with respect to clock %s.

DESCRIPTION

The tool has found one or more clock gating cells with a stage for which there is no clock latency specified by using set_clock_gate_latency command. The clock latency for these clock gating cells will be based on timer propagated values from the

previous stage.

WHAT NEXT

Make sure the supplied clock latency settings are the desired ones.

PWR-746 (Warning) Inconsistent clock latency specification found. Assuming value %f for cell %s.

DESCRIPTION

The tool has found an inconsistent clock latency specified on a clock gating cell in a clock path, for which, some clock latency settings have been provided by `set_clock_gate_latency` command.

The tool assumes the smaller value for clock latency annotation on clock gating cells, so that it is ensured that clock latencies are monotonically increasing values in the path going from the clock source to the gated registers.

WHAT NEXT

Make sure the supplied clock latency settings are the desired ones.

PWR-747 (Error) No clocks found on current design.

DESCRIPTION

It is not possible to specify clock latency values with `set_clock_gate_latency` command because there is no clock object defined for current design.

WHAT NEXT

Use `create_clock` command to apply clock constraints for current design.

PWR-748 (Error) No clocks found on current design.

DESCRIPTION

It is not possible to execute `reset_clock_gate_latency` command because there is no clock object defined for current design.

WHAT NEXT

Use `create_clock` command to apply clock constraints for current design.

PWR-749 (Error) No clock latency settings supplied for clock gating cells.

DESCRIPTION

`apply_clock_gate_latency` command has been executed with no previous call to `set_clock_gate_latency` command.

WHAT NEXT

Use `set_clock_gate_latency` command to provide some clock latency settings for clock gating cells.

PWR-750 (Warning) No clocks found on current design.

DESCRIPTION

Report generated by `report_clock_gating -structure` command is clock based. If no clock is defined for current design, only the summary report is printed.

WHAT NEXT

Use `create_clock` command to apply clock constraints for current design.

PWR-751 (Warning) Could not ungate register '%s'.

DESCRIPTION

Remove clock gating or clock gate clean up step could not remove the clock gating for the register mentioned.

WHAT NEXT

Please contact support.

PWR-752 (Error) Power unit not found in library. Power calculation will be aborted in create_ilm.

DESCRIPTION

Neither leakage power unit nor dynamic power unit is found in the library or the environment variable. The user encounters this error message because power units are needed to perform power calculation during create_ilm command.

WHAT NEXT

If user does not want power calculation performed in create_ilm command, user can disable it by issuing the following variable before create_ilm. **set
ilm_enable_power_calculation FALSE** Otherwise, use a library that defines the units required for power.

PWR-753 (warning) Can not ungate register '%s' because it is scan stitched.

DESCRIPTION

A scan stitched register or a register where the scan related pins are used for functional logic can not be ungated.

WHAT NEXT

Invoke **remove_clock_gating** (or the optimization step that tried to ungate the register) before doing **insert_dft**.

PWR-754 (Error) Can not remove clock gating on a scan stitched design.

DESCRIPTION

Clock gating removal has to be performed before stitching the scan chains.

WHAT NEXT

Invoke **remove_clock_gating** before doing **insert_dft**.

PWR-755 (Warning) Skipping clock tree estimation because one or more irregular rows were found for site array.

DESCRIPTION

Clock Tree Estimation requires a regular site array, so that the width and the spacing between the sites are equal.

WHAT NEXT

Correct the site array definition and rerun **compile_ultra** command with power prediction turned on.

PWR-756 (warning) Design contains no clocks or clock sources.

DESCRIPTION

This warning message occurs because the tool cannot find any clocks or clock sources in the design when running the **identify_clock_gating** command. Identification of clock gates is not possible.

WHAT NEXT

This is only a warning message. No action is necessary.

However, if the result is not what you intended, you can run the **create_clock command with the port_name parameter** for all clocks in the design and recompile your design.

SEE ALSO

`create_clock(2)`
`identify_clock_gating(2)`

PWR-757 (information) Performing clock gating circuitry identification in design '%s'.

DESCRIPTION

This information message informs you that the tool is identifying clock gating logic on the specified design. All clock gates inserted by the tool in another run will be identified.

WHAT NEXT

This is an information only message. No action is required.

PWR-758 (Warning) Library cell %s is not present for the operating condition P=%f, V=%f, T=%f.

DESCRIPTION

This warning message occurs when the tool encounters a missing library cell. Library cells must be available for all of the operating conditions that are used by the active scenarios during compile. Power optimization cannot work correctly when a library cell is missing.

WHAT NEXT

Use the `set_check_library_options` command with the `-mcmm` option, followed by the `check_library` command to determine the library cells that are not available in all (P,V,T)s. Either use consistent libraries or set DONT_USE on the cells that are not available for all active operating conditions.

SEE ALSO

`check_library(2)`
`list_libs(2)`
`set_check_library_options(2)`

PWR-759 (Warning) %d library-cells are not available for one of the leakage scenarios.

DESCRIPTION

This is a summary message of PWR-758. Library cells should be available for all the operating conditions that are used by the active scenarios during compile. Power optimization can not work correctly because library cell are missing for one or more leakage operating conditions.

WHAT NEXT

Use `set_check_library_options -mcmm` followed by the `check_library` command to determine the library cells thar are not available in all the (P,V,T)s. Either use consistent libraries OR set DONT_USE on the cells that are not available for all the active operating conditions.

SEE ALSO

`set_check_library_options (2)`, `check_library (2)`, `list_libs (2)`.

PWR-760 (Warning) Specified clock gate '%s' is not a valid Power Compiler clock gate.

DESCRIPTION

Power Compiler does not support this type of clock gating. The cell wont be identified as a clock gate.

WHAT NEXT

Run the command on a valid Power Compiler clock gate.

PWR-761 (Information) Correlated power is not available.

DESCRIPTION

Power Prediction is not supported for multi scenario designs.

PWR-800 (warning) Use of %s is not recommended. This feature will be obsolete in a future release. Check the man page for more information

DESCRIPTION

Use of %s is not recommended. This feature will be obsolete in a future release. Check the man page for more information

WHAT NEXT

Update your command usage as indicated in the man page.

PWR-1000 (warning) The value 'low' for option '-leakage_effort'

is not supported with multiple scenarios.

DESCRIPTION

The message indicates that '-leakage_effort' with value 'low', in set_power_options command, is not supported with multiple scenarios(modes or corners). Users are recommended to use leakage_effort high with multiple scenarios.

Although it may still work with '-leakage_effort' set to 'low', it will use current scenario for timing and leakage power calculations. To avoid excessive setup time degradation during leakage optimization set the current scenario to the worst setup scenario when using low effort.

WHAT NEXT

Change to high effort leakage optimization by setting '-leakage_effort' to 'high'.

PWR-2000 (Information) Message %s has reached maximum printing limit of %d.

DESCRIPTION

Some messages have limits on number of times they are printed. This is done to maintain readability of logs. The suppression by itself does not fix any problems.

WHAT NEXT

Read the man page for the suppressed message and resolve the issue.

QTB

QTB-001 (error) There is no QTM model that is currently being defined - Please run `create_qtm_model` first.

DESCRIPTION

You received this message when you run any other QTM command before running `create_qtm_model` command. The QTM model creation is initiated by `create_qtm_model` command and finished by `save_qtm_model` command.

WHAT NEXT

Please start the QTM model creation by calling `create_qtm_model` command.

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`,

QTB-002 (warning) QTM model with name '%s' already exists. Removing old QTM model.

DESCRIPTION

You received this message when you run `create_qtm_model` command twice with the same QTM model name. The existing QTM model is being removed and is being replaced by new QTM model.

WHAT NEXT

Please give a different name to the newly created QTM model by calling `create_qtm_model` command.

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`,

QTB-003 (error) No Input Pin on cell '%s'.

DESCRIPTION

You received this message when you run `create_qtm_load_type` command with `-lib_cell` option but no `-input_pin_name` option. The QTM model creation is unable to find any input pin on the given library cell.

WHAT NEXT

Please change the library cell given in `-lib_cell` option by calling `create_qtm_load_type` command again.

SEE ALSO

`create_qtm_load_type(2)`, `set_qtm_port_load(2)`

QTB-004 (error) No global timing found for %s command.

DESCRIPTION

You received this message when you run `create_qtm_global_parameter` command with `-lib_cell` option. The QTM model creation is unable to find any timing arc in the given library cell.

WHAT NEXT

Please change the library cell given in `-lib_cell` option by calling `create_qtm_global_parameter` command again.

SEE ALSO

`create_qtm_global_parameter(2)`, `create_qtm_delay_arc(2)`,
`create_qtm_constraint_arc(2)`

QTB-005 (error) Pin Name '%s' not found.

DESCRIPTION

You received this message when you run `create_qtm_load_type` command with `-lib_cell` option and `-input_pin_name` option. This message may also be printed by `create_qtm_drive_type` and `create_qtm_path_type` commands, if they are run with `pin` option. The QTM model creation is unable to find any pin with given name on the

given library cell.

WHAT NEXT

Please correct the library pin name given in *-input_pin_name* option by calling *create_qtm_load_type* command again.

SEE ALSO

create_qtm_load_type(2), **set_qtm_port_load(2)**

QTB-006 (error) Drive Type '%s' not found.

DESCRIPTION

You received this message when you run *set_qtm_port_drive* command with *-type* option. The QTM model creation is unable to find any *create_qtm_drive_type* command with matching drive type.

WHAT NEXT

Please change the drive type given in *-type* option by calling *set_qtm_port_drive* command again.

SEE ALSO

create_qtm_drive_type(2), **set_qtm_port_drive(2)**

QTB-007 (error) Load Cell '%s' not found.

DESCRIPTION

You received this message when you run *create_qtm_load_type* command with *-lib_cell* option. The QTM model creation is unable to find any library cell with the given library name.

WHAT NEXT

Please change the library cell given in *-lib_cell* option by calling *create_qtm_load_type* command again.

SEE ALSO

`create_qtm_load_type(2)`, `set_qtm_port_load(2)`

QTB-008 (error) Load Type '%s' not found.

DESCRIPTION

You received this message when you run `set_qtm_port_load` command with `-type` option. The QTM model creation is unable to find any `create_qtm_load_type` with matching load type.

WHAT NEXT

Please change the type given in `-type` option by calling `set_qtm_port_load` command.

SEE ALSO

`create_qtm_load_type(2)`, `set_qtm_port_load(2)`

QTB-009 (error) Load value is invalid for lib pin '%s'.

DESCRIPTION

You received this message when you run `set_qtm_port_load` command with `-lib_cell` option. The QTM model creation is able to find the library pin on the library cell. But, there is no valid capacitance value at the library pin.

WHAT NEXT

Please change the library pin given in `-input_pin` option by calling `set_qtm_port_load` command.

SEE ALSO

`create_qtm_load_type(2)`, `set_qtm_port_load(2)`

QTB-010 (error) No Drive Type specified when Value not

specified.

DESCRIPTION

You received this message when you run *set_qtm_port_drive* command with no *-type* option and no *-value* option. You must specify either of those two options.

WHAT NEXT

Please correct the *set_qtm_port_drive* command.

SEE ALSO

`create_qtm_drive_type(2)`, `set_qtm_port_drive(2)`

QTB-011 (error) No Load Type specified with Load Factor.

DESCRIPTION

You received this message when you run *set_qtm_port_load* command with *-factor* option but no *-type* option. The QTM model creation expects both of these options to be used together.

WHAT NEXT

Please add the *-type* option by calling *set_qtm_port_load* command.

SEE ALSO

`set_qtm_port_load(2)`

QTB-012 (error) No delay type or value specified in *create_qtm_constraint_arc* command.

DESCRIPTION

You received this message when you run *create_qtm_constraint_arc* command with no *-type* option and no *-value* option. You must specify either of these two options in *create_qtm_constraint_arc* command.

WHAT NEXT

Please specify `-type` or `-value` option to `create_qtm_load_type` command.

SEE ALSO

`create_qtm_constraint_arc(2)`

QTB-013 (error) No global '%s' parameter defined for %s command.

DESCRIPTION

You received this message when you run `create_qtm_delay_arc` or `create_qtm_constraint_arc` command without running the corresponding `set_qtm_global_parameter` command.

The sequential delay arc requires the global parameter "clk_to_output". The setup constraint arc requires the global parameter "setup". The hold constraint arc requires the global parameter "hold".

WHAT NEXT

Please specify the global parameter calling `set_qtm_global_parameter` command again.

SEE ALSO

`create_qtm_delay_arc(2)`, `create_qtm_constraint_arc(2)`, `set_qtm_global_parameter(2)`

QTB-014 (error) Path Type '%s' not found.

DESCRIPTION

You received this message when you run `create_qtm_constraint_arc` or `create_qtm_delay_arc` command with `-type` option. The QTM model creation is unable to find any `create_qtm_path_type` with matching path type.

WHAT NEXT

Please change the path type given in `-type` option of `create_qtm_constraint_arc` or `create_qtm_delay_arc` command. Or, please create the path type using `create_qtm_path_type` command.

SEE ALSO

`create_qtm_constraint_arc(2)`, `create_qtm_delay_arc(2)`, `create_qtm_path_type(2)`

QTB-015 (error) Failed in DB model creation for:

DESCRIPTION

You received this message when the QTM model creation is unable to create in-memory .db timing model for any QTM command. This message is followed by failing QTM command on next line. The QTM model creation has stopped abnormally.

Usually, this message will be preceded by a different message, showing the actual error message.

WHAT NEXT

Please check the error message(s) before this error to analyze the cause of this failure. Please update the QTM model appropriately.

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`

QTB-016 (error) Internal Error '%s'.

DESCRIPTION

You have received an internal debug message during ICC QTM Flow. Please report this error message along with the testcase to Synopsys.

WHAT NEXT

Please contact Synopsys for more information about this error message.

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`

QTB-017 (warning) No support for 2D table of '%d' and '%d'.

DESCRIPTION

You received this message when you run *create_qtm_constraint_arc* or *create_qtm_type_arc* command with *-type* option. The QTM model gets the delay arc from the library cell and puts that arc on the QTM model arc.

The message suggests that you are using a non-standard delay lookup table for the delay arc in the library cell.

WHAT NEXT

Please check the timing model of the library cell given in *-lib_cell* option of *create_qtm_load_type* or *create_qtm_path_type* or *create_qtm_drive_type* command.

SEE ALSO

create_qtm_load_type(2), *create_qtm_path_type(2)*, *create_qtm_delay_arc(2)*,
create_qtm_constraint_arc(2)

QTB-018 (warning) Unable to get the library pin '%s' for library cell '%s'.

DESCRIPTION

You received this message when you run *create_qtm_constraint_arc* or *create_qtm_delay_arc* or *create_qtm_port_drive* command with *-lib_cell* option. The QTM model creation is unable to find any library cell pin by name on the given library cell.

WHAT NEXT

Please change the library cell or library cell given in *create_qtm_drive_type* or *create_qtm_path_type* command.

SEE ALSO

create_qtm_constraint_arc(2), *create_qtm_delay_arc(2)* *create_qtm_path_type(2)*,
create_qtm_drive_type(2)

QTB-019 (error) Arc to pin or related drive pin of port '%s' has

not been created in DB Design for `create_qtm_delay_arc` command.

DESCRIPTION

You received this message when you run `create_qtm_delay_arc` command. The QTM model creation is unable to find `create_qtm_port` command for the QTM port referred in `-to` option of `create_qtm_delay_arc` command.

WHAT NEXT

Please run `create_qtm_delay_arc` command before calling `create_qtm_delay_arc` command.

SEE ALSO

`create_qtm_delay_arc(2)`, `create_qtm_port(2)`

QTB-020 (error) Design Port '%s' has not been created in before calling %s command.

DESCRIPTION

You received this message if you don't create a QTM model port, before referring to that port in a later QTM model.

WHAT NEXT

Please call `create_qtm_port` command to create the QTM model port, before calling a command which refers to that QTM model port.

SEE ALSO

`create_qtm_port(2)`, `create_qtm_insertion_delay(2)`, `set_qtm_port_drive(2)`,
`create_qtm_generated_clock(2)`

QTB-021 (error) Either From Pin '%s' or To Pin '%s' has not

been created in DB Design for %s command.

DESCRIPTION

You received this message when you run `create_qtm_delay_arc` or `create_qtm_constraint_arc` command with `-from` and `-to` option. The QTM model creation is unable find the ports referred in `-from` or `-to` option to be created by `create_qtm_port` command.

WHAT NEXT

Please create the missing port calling `create_qtm_port` command.

SEE ALSO

`create_qtm_delay_arc(2)`, `create_qtm_constraint_arc(2)`, `create_qtm_port(2)`

QTB-022 (error) No setup or hold flag specified in create_qtm_constraint_arc command

DESCRIPTION

You received this message when you run `create_qtm_constraint_arc` command with no `-setup` option and no `-hold` option. You must specify either of those two options.

WHAT NEXT

Please add `-setup` or `-hold` option to `create_qtm_constraint_arc` command.

SEE ALSO

`create_qtm_constraint_arc(2)`

QTB-023 (error) Unable to convert db lib->dc lib.

DESCRIPTION

You received this message when you run `save_qtm_model` command. The QTM model creation generates in-memory .db timing model for the QTM model. It then converts this .db timing model to a dc library. You are seeing this error message because there was an error during conversion to dc library.

WHAT NEXT

Please check any preceding error messages and rectify the reported problem(s).

SEE ALSO

`save_qtm_model(2)`, `create_qtm_model(2)`

QTB-024 (warning) No QTM Models in Memory to Create DB Design. Please check the flow of QTM commands.

DESCRIPTION

You received this message when you run `save_qtm_model` command with no QTM models in memory.

WHAT NEXT

Please note that QTM model creation is started by `create_qtm_model` and finished by `save_qtm_model` command. Please check any preceding error messages and rectify the reported problem(s).

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`

QTB-025 (warning) Unable to get the library cell '%s' for path type '%s'.

DESCRIPTION

You received this message when you run `create_qtm_path_type` command with `-lib_cell` option. The QTM model creation is unable to find any library cell with the given library cell name.

WHAT NEXT

Please change the library cell name given in `-lib_cell` option by calling `create_qtm_path_type` command.

SEE ALSO

`create_qtm_path_type(2)`

QTB-026 (warning) Unable to set %s on Internal Pin Name '%s'.

DESCRIPTION

You received this message when you run `create_qtm_insertion_delay` or `create_qtm_port_load` command with port option referring to an internal QTM port. These commands are not expected to work on internal ports.

WHAT NEXT

Please change the port name in `port_list` option of `create_qtm_insertion_delay` or `create_qtm_port_load` command.

SEE ALSO

`create_qtm_port_load(2)`, `create_qtm_insertion_delay(2)`, `create_qtm_port(2)`

QTB-027 (warning) write_qtm_model has no in-memory db timing model to write to on-disk .db file.

DESCRIPTION

You received this message when you run `write_qtm_model` command with no in-memory db timing model. The QTM model creation is started by `create_qtm_model` and finished by `save_qtm_model`. The in-memory db timing model is created by `save_qtm_model`. The `write_qtm_model` command is expected to be called after `save_qtm_model` command.

WHAT NEXT

Please run `save_qtm_model` command before calling `write_qtm_model` command.

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`, `write_qtm_model(2)`

QTB-028 (warning) %s command is not supported right now.

This command will be supported in later release.

DESCRIPTION

You received this message when you run `delete_qtm_constraint_arc` or `delete_qtm_delay_arc` or `get_qtm_ports` command. These QTM commands are not currently supported. These commands will be supported in later IC Compiler release.

WHAT NEXT

Please don't use these unsupported QTM commands.

SEE ALSO

`create_qtm_model(2)`, `save_qtm_model(2)`

QTB-029 (error) Unable to open QTM model file %s during write_qtm_model.

DESCRIPTION

You received this message when `write_qtm_model` command is unable open the text file to write out the QTM model.

WHAT NEXT

Please check the permissions of the directory given in `-out_dir` option. Please create this directory before calling `write_qtm_model` command.

SEE ALSO

`write_qtm_model(2)`

QTB-030 (error) The option '%s' cannot be used in conjunction with '%S'.

DESCRIPTION

You received this message when you run mutually exclusive options of a QTM command. Only one of these options is expected to be used at one time.

WHAT NEXT

Please use only one of the two options for the QTM command.

SEE ALSO

`set_qtm_global_parameter(2)`, `set_qtm_port_load(2)`, `set_qtm_port_drive(2)`,
`set_qtm_delay_arc(2)`

QTB-031 (error) To use option '%s', the option '%s' has to be used.

DESCRIPTION

You received this message when you run a QTM command with mutually dependent options. These two options must always be used together.

WHAT NEXT

Please change the QTM command to call both options for the QTM command.

SEE ALSO

`set_qtm_global_parameter(2)`, `set_qtm_port_load(2)`, `create_qtm_delay_arc(2)`

QTB-032 (warning) The port '%s' has already been created in the model. Replacing the original port with the new port.

DESCRIPTION

You received this message when you run `create_qtm_port` command twice with the same port name. The new port definition will replace the original port definition.

WHAT NEXT

Please check if the duplicate port name creation is expected behavior or not.

SEE ALSO

`create_qtm_port(2)`

QTB-033 (error) "Must specify one of '%s', or '%s' options.

DESCRIPTION

You received this message when you run a QTM command, which requires one of the two options.

WHAT NEXT

Please call this QTM command with one of the two options.

SEE ALSO

`set_qtm_port_drive(2)`, `set_qtm_port_load(2)`, `set_qtm_global_parameter(2)`

QTB-034 (error) Must specify one of '%s', '%s' or '%s' options.

DESCRIPTION

You received this message when you run a QTM command, which requires one of the three options.

WHAT NEXT

Please call this QTM command with one of the three options.

SEE ALSO

`create_qtm_delay_arc(2)`

QTB-035 (error) Parameter '%s' cannot be a negative number.

DESCRIPTION

You received this message when you run `create_qtm_delay_arc` or `set_qtm_technology` or `create_qtm_load_type` or `set_qtm_port_load` or `set_qtm_port_drive` command with one of the options that is not expected to take a negative number.

WHAT NEXT

Please call the QTM command with a positive number.

SEE ALSO

`create_qtm_delay_arc(2)`, `set_qtm_technology(2)`, `create_qtm_load_type(2)`,
`set_qtm_port_load(2)`, `set_qtm_port_drive(2)`

QTB-036 (error) Unable to create internal clock '%s' on QTM model '%s' by create_qtm_clock command.

DESCRIPTION

You received this message when you run `create_qtm_clock` command with a clock name, that is the same name as the port name on the existing black box corresponding to the QTM model. This `create_qtm_clock` command is being ignored.

You cannot create a new internal clock port with the same name as existing port on the QTM model.

WHAT NEXT

Please call the `create_qtm_clock` command with a different clock name.

SEE ALSO

`create_qtm_clock(2)`

QTB-037 (error) -process, -voltage, and -temperature must be specified with -operating_condition.

DESCRIPTION

You received this message when you run `set_qtm_technology` command with one or more following options but not all: `-operating_condition`, `-process`, `-voltage`, `-temperature`.

These four options must be specified together.

WHAT NEXT

Please call the `set_qtm_technology` command with all four options mentioned above.

SEE ALSO

QTM

QTM-1 (error) Cannot create the QTM model '%s' before saving the existing one.

DESCRIPTION

You have tried to create a new QTM model before saving the current QTM model.

WHAT NEXT

Save the current QTM model using `save_qtm_model` and then create a new QTM model.

QTM-2 (error) There is no QTM model that is currently being defined.

DESCRIPTION

You are using a QTM command without actually creating a QTM model.

WHAT NEXT

Use `create_qtm_model` to create a new QTM model. All QTM commands have to be between a `create_qtm_model` and `save_qtm_model` command.

QTM-3 (error) Unable to load the library '%s'

DESCRIPTION

QTM is unable to load the library you have specified. Perhaps you have not read in the library.

WHAT NEXT

Please make sure that the library is read in using the `read_db` command. QTM will not be able to auto load the library even if the library is in the search path.

QTM-4 (warning) Technology library '%s' has been already loaded

DESCRIPTION

You have already defined the technology library. The existing technology library will be replaced with the new one.

WHAT NEXT

If you do not intend to overwrite the existing technology library please reload the existing technology library

QTM-5 (warning) The parameter '%s' has already been set to '%f', overriding with the new value.

DESCRIPTION

The global parameter has already been set, the existing value will be overridden with the new value.

WHAT NEXT

If you do not want to override the existing value of the global parameter, please set it back to the old value.

QTM-6 (warning) The parameter '%s' has already been set to '%s'; overriding with the new value.

DESCRIPTION

The global parameter has already been set, the existing one is overridden with the new value.

WHAT NEXT

If you do not want the overridden value, please replace it with the existing value.

QTM-7 (error) The option '%s' cannot be used in conjunction with '%S'

DESCRIPTION

The two options cannot be used together. Please use either one of them.

WHAT NEXT

Please use either one of the two options.

QTM-8 (error) To use option '%s', you must also use the option '%S'.

DESCRIPTION

The two options have to be used together, you cannot use one of them alone.

WHAT NEXT

Use the two options together.

QTM-9 (error) To use option '%s', a library should have been specified, but no library has been specified for this model

DESCRIPTION

You are attempting to use a lib_cell, but you have not set the technology library.

WHAT NEXT

Please set the technology library with **set_qtm_technology** with the -library option to set the technology library.

QTM-10 (warning) The path type '%s' has already been defined,

redefining the path type with the new one.

DESCRIPTION

The path type has already been defined. The existing path type definition will be replaced by the new path type definition.

WHAT NEXT

If you do not want the existing path type definition to be replaced by the new one, give unique names to the two different path types.

QTM-11 (error) The library cell '%s' is not present in the technology library you have specified.

DESCRIPTION

The specified lib_cell is not present in the technology library.

WHAT NEXT

Please provide the correct lib_cell name.

QTM-12 (error) The '%s' pin '%s' you have specified, is not present in the cell '%s'.

DESCRIPTION

The input/output pin name specified is not present in the lib_cell.

WHAT NEXT

Please provide the correct input/output pin name for the lib_cell you are using.

QTM-13 (warning) Fanout count not specified for the path type

'%s';
using the default fanout of %d.

DESCRIPTION

You have not specified the fanout count for the path type definition. The tool uses a default count of 1.

WHAT NEXT

If you do not want to use the default fanout count (of 1), please provide the fanout count using the -fanout option.

QTM-14 (warning) The drive type '%s' has already been defined; redefining the drive type with the new one.

DESCRIPTION

The drive type has already been defined. The existing drive type definition will be replaced by the new drive type definition.

WHAT NEXT

If you do not want the existing drive type definition to be replaced by the new one, give unique names to the two different drive types.

QTM-15 (warning) The load type '%s' has already been defined; redefining the load type with the new one.

DESCRIPTION

The load type has already been defined. The existing load type definition will be replaced by the new load type definition.

WHAT NEXT

If you do not want the existing load type definition to be replaced by the new one, give unique names to the two different load types.

QTM-16 (warning) The port '%s' has already been created in the model.

Replacing the original port with the new port.

DESCRIPTION

A QTM port with the same name already exists; the original port will be replaced with the new port.

WHAT NEXT

If you want the original port direction, recreate the port.

QTM-17 (error) Must specify one of '%s', or '%s' options

DESCRIPTION

Must use either one of the two options in the command.

WHAT NEXT

Please use one of the two options in the command.

QTM-18 (error) The '%s' QTM parameter '%s' used has not been defined

DESCRIPTION

The QTM parameter you are using has not been defined. Please define the QTM parameters before using them. For e.g., if you are using a path type A in defining a timing arc, please define the path type A before using it in the timing arc.

WHAT NEXT

Please define the QTM parameters (path type, drive type, load type) before using them.

QTM-19 (error) The port '%s' used in the arc is not defined

DESCRIPTION

The port referred in the arc has not been defined.

WHAT NEXT

Please define the ports before using them in the timing arcs.

QTM-20 (error) The '%s' port for a '%s' arc must be a '%s' port , but port '%s' is of type '%s'.

DESCRIPTION

The port type for the type of arc you are defining is not of the correct type.

For a setup arc, the from port must be of type clock and the to port must be of type input/inout.

For an edge delay arc, the from port must be of type clock and the to port must be of type output/inout.

For a combinational delay arc, the from port must be of type input/inout and the to port must be of type output/inout.

WHAT NEXT

Create the arc between valid type of ports as explained above.

QTM-21 (error) The port '%s' is not a bus, but you have implied a bus structure.

DESCRIPTION

You have implied a bus structure for the port, but the port is not a bus.

WHAT NEXT

If the port is intended to be a bus, define the port to be of bus type, else use the port in a non bussed fashion.

QTM-22 (error) The bus index specified %d:%d for the bus '%s', is out of the bus array bounds %d:%d.

DESCRIPTION

The indicies used for the bus is not within the array bounds of the bus.

WHAT NEXT

Please check the array bounds of the bus and use the indicies with the array bounds.

QTM-23 (error) The arc that is an edge arc (launch) has more than one port (%d) as the from port.

DESCRIPTION

An edge delay arc can originate from a single port. In the edge delay arc you have defined, there is more than one 'from' port.

WHAT NEXT

If you want to define more than one edge delay arc to the same port, define different timing arcs, do not combine them in one.

QTM-24 (error) The global '%s' parameter has not been defined, you cannot define a '%s' arc

DESCRIPTION

Before defining setup/hold/edge delay timing arcs, the corresponding global parameter have to be defined.

Before defining setup arcs, define the global parameter, global setup time using **set_qtm_global_parameter** with -setup option.

Before defining hold arcs, define the global parameter, global hold time using **set_qtm_global_parameter** with -hold option.

Before defining edge delay arcs, define the global parameter, global clock to output time using **set_qtm_global_parameter** with -clk_to_output option.

WHAT NEXT

Define the corresponding global parameter before defining the setup/hold/edge delay arcs.

QTM-25 (error) Cannot get clock pin for the cell '%s'.

DESCRIPTION

The cell does not have a clock pin. If you are defining global setup/hold/clk_to_output time using a lib_cell, the lib_cell should have the corresponding arc types, which means that the cell must have a clock pin too.

WHAT NEXT

Please use a lib_cell that has an arc corresponding to the global parameter you are defining.

QTM-26 (error) Cannot find a '%s' arc in the cell '%s' from the clock pin '%s'.

DESCRIPTION

If you are defining global parameter (setup/hold/clk_to_output) using lib_cell, the lib_cell must have corresponding arc. Further, if you specify the clock pin, there must be a corresponding arc from the clock pin.

WHAT NEXT

Please provide a lib_cell and a clock pin which has a timing arc corresponding to the global parameter you are defining. For example, If you are defining global setup time, the lib_cell must have a setup arc with regard to the clock pin. If you are defining global hold time, the lib_cell must have a hold arc with regard to the clock pin. If you are defining global clk_to_output time, the lib_cell must have a clk_to_output arc originating from the clock pin.

QTM-27 (error) Cannot find the pin '%s' in the cell '%s'

DESCRIPTION

Cannot find the pin specified in the lib_cell.

WHAT NEXT

Please check the pin name and give a valid pin name in present in the lib_cell.

QTM-28 (error) Pin '%s' is not of type '%s'

DESCRIPTION

The pin is not of the type desired.

WHAT NEXT

Provide a pin in the lib_cell which is of the type desired.

QTM-29 (error) Could not find arc of type '%s' coming %s the pin %s.

DESCRIPTION

QTM expects a timing arc to come into/go out of the specified pin. It did not find an arc of the corresponding type at the pin.

WHAT NEXT

Please specify a pin in the lib_cell to satisfy the above requirement.

QTM-30 (error) Could not find arc from clock '%s' to the output pin '%s'.

DESCRIPTION

The lib_cell does not have an edge delay arc from the clock pin to the output pin.

WHAT NEXT

Choose the clock pin and output pin such that there is an edge delay arc from the clock pin to the output pin.

QTM-31 (error) The port '%s' is not defined in the QTM model.

DESCRIPTION

The port you are referring to has not been defined in the QTM model.

WHAT NEXT

Please define the port before referring to the port.

QTM-32 (error) The port '%s' for which the drive is defined is neither an output port nor an inout port.

DESCRIPTION

Drive can be defined only on the output/inout ports.

WHAT NEXT

Please define drives only for output ports.

QTM-33 (error) The drive type '%s' used is not defined

DESCRIPTION

The drive type you have referenced has not been defined.

WHAT NEXT

Please define the drive type before referring to the drive type.

QTM-34 (error) The port '%s' for which the load is defined is not

an input port, a clock port, or an inout port.

DESCRIPTION

A load can be defined only on input/clock/inout ports, and not on output ports.

WHAT NEXT

Define the loads only on input/clock/inout ports.

QTM-35 (error) The load type '%s' used is not defined.

DESCRIPTION

The load type referenced has not been defined.

WHAT NEXT

Please define the load type first before referring to it.

QTM-36 (error) There is no pin '%s' of type %s in the cell '%s'.

DESCRIPTION

The input or output pin specified is not present.

WHAT NEXT

The pin you specified is not present or the direction of the pin might not be right.

QTM-37 (error) No arc exists from '%s' to '%s' in the lib_cell %s.

DESCRIPTION

Could not find a combinational arc between the two specified pins.

WHAT NEXT

Please specify the pins between which there is a combinational arc.

QTM-38 (information) Path Type: %s, Cell: %s, Input Pin: %s,
Output Pin: %s
Delay : %f.

DESCRIPTION

This is an informational message that provides the details of the path type defined.

WHAT NEXT

This is not an error message.

QTM-39 (information) Load Type: %s, Cell: %s, Pin: %s.

DESCRIPTION

This is an informational message which provides the details of the load type defined.

WHAT NEXT

This is an information message.

QTM-40 (information) Drive Type: %s, Cell: %s, Input Pin: %s,
Output Pin: %s .

DESCRIPTION

This is an informational message which prints the details of the drive type defined.

WHAT NEXT

This is an informational message.

QTM-41 (information) Parameter: %s, Cell: %s, Clock Pin: %s,
Input

Pin: %s, Constraint Value : %f.

DESCRIPTION

This informational message prints out the details of the global parameter defined.

WHAT NEXT

This is an informational message.

**QTM-42 (information) Parameter: clk_to_output, Cell: %s, Clock Pin: %s, Output Pin: %s
Delay Value : %f**

DESCRIPTION

This informational message prints the details of the clk_to_output parameter defined.

WHAT NEXT

This is an informational message.

QTM-43 (error) Parameter '%s' cannot be a negative number

DESCRIPTION

The parameter cannot have a negative value

WHAT NEXT

You have entered a negative for a parameter which is invalid. Please enter a value greater than 0 for the parameter

QTM-44 (error) Port '%s' not defined to be a clock

DESCRIPTION

For a constraint/clk_to_output arc, the from port must be a clock.

WHAT NEXT

Create the constraint/clk_to_output arc starting from a clock port.

QTM-45 (error) Port '%s' not of the type input/inout.

DESCRIPTION

The 'to' port of a constraint arc must be of the type input/inout. Any other port direction is illegal.

WHAT NEXT

Create the constraint arc ending in an input/inout port.

QTM-46 (error) Port '%s' not of the type output/inout.

DESCRIPTION

The 'to' port of a delay arc must be of the type output/inout.

WHAT NEXT

Create the delay arc ending in an output/inout port.

QTM-47 (error) Port '%s' not of the type input/inout.

DESCRIPTION

The 'from' port of a delay arc must be of the type input/inout.

WHAT NEXT

Create the delay arc starting from an input/inout port.

QTM-48 (warning) The port '%s' has invalid name.

DESCRIPTION

A QTM port with an invalid name is being created. Examples, are " ", "/".

WHAT NEXT

Check the name of the port that you are creating. If the ports are defined in a list, check the list.

QTM-49 (warning) Wire Load Model '%s' does not exist in the library.

Using 0 capacitance.

DESCRIPTION

The Wire Load Model specified must exist in the technology library.

WHAT NEXT

Specify a valid Wire Load Model name.

QTM-50 (error) Input transitions have already been defined for drive type '%s'.

DESCRIPTION

The drive type you have referenced has been defined with rise and/or fall input transitions. You cannot specify the transition again for the port.

WHAT NEXT

Please define another drive type without transition specification before referring to it for this port.

QTM-51 (error) %s.

DESCRIPTION

This is a general error message due to some unexpected command options, and/or settings in creating the QTM.

WHAT NEXT

Please correct the indicated error and try again.

QTM-52 (error) Attribute '%s' for object class '%s' %s type '%s'.

DESCRIPTION

This is an error message indicating the specified attribute for the indicated QTM object class has already been defined to the given type, or it is an application reserved attribute of the specified type.

WHAT NEXT

Please correct the indicated error and try again.

QTM-53 (information) Defining new attribute '%s' of type '%s' for object class '%s'.

DESCRIPTION

This is an informational message indicating the specified attribute for the QTM object class has been successfully defined.

WHAT NEXT

No user action necessary.

QTM-54 (error) %s '%s' has not been defined.

DESCRIPTION

This is a general error message indicating the specified object has not been defined in the QTM, therefore it cannot be referred to in other commands.

WHAT NEXT

Please correct the indicated error and try again.

QTM-55 (error) No attribute named '%s' is defined for object class '%s'.

DESCRIPTION

This is an error message indicated the named attribute for the specified object class has not been defined yet.

WHAT NEXT

Please define the attribute for the QTM object class before set it on objects.

QTM-56 (error) Attribute named '%s' for object class '%s' is not defined as type '%s'.

DESCRIPTION

This is an error message indicated the named attribute for the specified object class has not been defined yet.

WHAT NEXT

Please define the attribute for the QTM object class before set it on objects.

QTM-57 (warning) Attribute '%s' is not defined for %s%s.

DESCRIPTION

This is a warning message indicating that the named attribute for the specified object/class has not been defined yet.

WHAT NEXT

Please define the attribute for the QTM object class before set or remove it on objects.

QTM-58 (information) Attribute '%s' has already been set on%s%s'

and is now replaced with the new value.

DESCRIPTION

This is an informational message indicating that the named attribute for the specified object/class has not been re-defined, so the value is updated.

WHAT NEXT

No user action is necessary.

QTM-59 (error) The specified value '%s' does not match the defined data type '%s'.

DESCRIPTION

This is an error message indicating the given attribute value does not match the type defined for the attribute.

WHAT NEXT

Please correct the indicated error and try again.

QTM-60 (information) Attribute '%s' successfully removed for '%S'.

DESCRIPTION

This is an informational message indicating the specified attribute for the QTM object has been successfully removed.

WHAT NEXT

No user action necessary.

QTM-61 (error) Cannot find a proper timing arc in the specified lib cell to define the drive.

DESCRIPTION

This is an error message indicating that PrimeTime cannot find a proper delay arc in the specified cell to be used in defining the drive. There are 2 possible reasons for this: 1. the absense of a proper delay arc to be used as a driving arc. 2. there are ambiguities in deciding a specific arc that can be used to define the drive.

WHAT NEXT

If the error is caused by absense of proper timing arcs in the lib cell, please choose another lib cell with arcs providing the intended driving characteristics. If the error is caused by ambiguity, please use options such as -input_pin and -output_pin to tell PrimeTime exactly which timing arc should be used to define the drive.

QTM-62 (warning) Defining '%s' attribute on %s disables %s, %S.

DESCRIPTION

This is a general warning message. It may not be an error requiring corrective action, but it provides important information for your reference.

For example, the 'function' attribute for lib_pin, even though QTM allows 'function' attribute be defined for ports, but it treats the boolean logic expressions as string literals, does not perform any syntax check, and only writes QTM with such attributes to .lib format, the correctness of the attributes therefore

only enforced when compiled by LibraryCompiler.

WHAT NEXT

Please note and confirm the indicated reason/action and make any changes if necessary.

QTM-63 (error) Attribute '%s' for object class '%s' can not be defined for %s '%s', %s.

DESCRIPTION

This is an error message indicated the named attribute for the specified object class is not applicable to the named object.

WHAT NEXT

Please correct the definition of the attribute for the indicated QTM object and try again.

RAIL

RAIL-900 (error) %s

DESCRIPTION

Basic input error checking.

WHAT NEXT

Please re-check the command inputs and use '-help' option to verify if the input is correct.

RB

RB-1 (fatal) Rulebase name '%s' is already taken.

DESCRIPTION

This message indicates an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-2 (error) Rulebase divide by zero error.

DESCRIPTION

This message indicates an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-3 (error) Cannot insert atom '%s' in rulebase.

DESCRIPTION

This message indicates an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-4 (warning) Could not load rulebase utilities.

DESCRIPTION

This message indicates an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-5 (error) Could not open file '%s'.

DESCRIPTION

This message indicates an error in the installation of the Design Compiler (a missing rulebase file 'optimize.r') or an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-6 (fatal) Binary table format error.

DESCRIPTION

This message indicates that the rulebase file has been corrupted. The rulebase file is located in the installation directory *bin-'arch'/syn/auxx* and is named *optimize.r*. Make sure that this file is identical to the version shipped on your release tape. The Unix utility *diff* pinpoints any differences.

WHAT_NEXT

If the *optimize.r* file does not match the one on your tape, reinstall the file from the tape. If the *optimize.r* file appears to be identical, contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-7 (error) Cannot insert rule '%s' in rulebase.

DESCRIPTION

This message indicates an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-8 (error) Cannot insert class '%s' in rulebase.

DESCRIPTION

This message indicates an internal Synopsys error.

WHAT_NEXT

Contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RB-9 (fatal) Stream I/O error on '%s'.

DESCRIPTION

This message indicates that the rulebase file has been corrupted. The rulebase file is located in the installation directory *bin-'arch'/'syn/auxx* and is named *optimize.r*. Make sure that this file is identical to the version shipped on your release tape. The Unix utility *diff* pinpoints any differences.

WHAT_NEXT

If the *optimize.r* file does not match the one on your tape, reinstall the file from the tape. If the *optimize.r* file appears to be identical, contact your Synopsys application engineer or the Synopsys hotline staff. Document beforehand the test case that produced the error to assist Synopsys personnel in analyzing your problem.

RCCALC

RCCALC-004 (warning) Failed to compute C-effective for the timing arc

(%S) %S/%S-->%S (%S %S)

%S

%S

DESCRIPTION

This message warns you that the cell delay calculation failed to compute the effective capacitance of the detailed RC network driven by a specific timing arc, so a lumped capacitance is being used to compute the cell delay. To ensure conservative results, the total capacitance of the RC network is used in max analysis mode, and zero capacitance in min analysis mode.

Reasons for this failure fall into three classes: library-related, parasitics-related, and design-related. Each is discussed in text that follows, along with possible solutions.

Library-Related Problems

One of the following messages is appended to this warning to explain the library-related reason for the C_effective failure:

1. "because the library data indicates a non-positive drive resistance"

This message is appended if the cell delay and/or output transition time does not increase with increasing output load capacitance. This condition can be caused by extrapolating too far outside the library table, or by problems in the table itself.

Solution: Check the timing arc on a lumped load using the **set_load** and **report_delay_calculation** commands; you might have to annotate delays and transition times until the library data can be fixed by the library vendor. Typically, extrapolations disappear when buffer trees are applied to large fanout networks.

2. "because the library data is inconsistent with a linear-driver model"

This message is appended if the parameters of the linear-driver model cannot be determined for this timing arc and/or RC network. Usually the trip-point variables have not been set correctly, or the library data is artificial. If generic_cmos library models are being used, ensure that the later slew trip-point is the same as the delay trip-point.

Solution: Double-check the settings of the RC delay-calculation thresholds using attributes or the **report_driver_model** command; if the library does not set these you will have to set the shell variables (c.f. DES-021). The attributes have the same

names as the shell variables and are annotated on the design. If the thresholds are correct, then there is a problem with the library data. If you have access to the library source, ensure that any generic_cmos library models present are used correctly (the later slew trip-point must be the same as the delay trip-point). If nonlinear delay models (a.k.a. tables) are used, confirm that the data was derived from transistor simulation with sufficient accuracy; sometimes libraries are characterized with insufficient accuracy or the data has been manually manipulated in some way. If you do not have access to the library source, then you can try as a temporary measure (i.e. until the library can be fixed) to relax DesignTime's effective-capacitance error tolerance; increase the value of the hidden shell variable **rc_ceff_delay_min_diff_ps** from its default value of 0.25 to 0.5 or greater. Please note that relaxing this error tolerance will help avoid falling-back to lumped RC delay-calculation in RCCALC-004 cases, but it will also adversely impact accuracy for those delay-calculations without RCCALC-004 messages.

Parasitics-Related Problems

One of the following messages is appended to this warning to explain the parasitics-related reason for the C_effective failure:

1. "because C_total is less than or equal to zero"

This message is appended if the total capacitance of the RC network is not positive, so that there is no way to determine an effective capacitance.

Solution: Check the network using **report_net -connections -verbose** and correct the parasitics file if necessary.

2. "because the RC network has an invalid reduced-order model"

This message is appended usually if the annotated connectivity does not match the logical connectivity; for example, if there is an unconnected pin in the design.

Solution: Look for earlier **link_design** (LNK) warnings pertaining to the problematic net. In rarer situations, there might be a non-positive resistive and/or capacitive path to ground. Check the network with **report_net -connections -verbose** and correct the parasitics file if necessary.

3. "because the RC network has an invalid pole-residue model"

This message is appended if the network has poles and residues that do not generate a converging waveform. Usually this is caused by problems in the network definition has problems.

Solution: Check the network with **report_net -connections -verbose** and correct the parasitics file if necessary. This reason applies only to pi-models (for example, RSPF and RNETs in SPEF).

Design-Related Problems

The following message is appended to this warning to explain the design-related reason for the C_effective failure:

"because the from_pin is unconnected"

This message is appended if a driving arc on a multi-driven network has an unconnected from_pin. In this case, there is no way of knowing the behavior of that arc relative to the other driving arcs of the network; this will prevent RC cell delay calculation from being performed.

Solution: Connect the from_pin or use commands **set_case_analysis** or **set_disable_timing** to fully qualify the unconnected arc.

TIMING ARC NOTATION

The timing arc is displayed by the warning message with the following six parts:

(1) 2/3-->4 (5 6)

In the above, "1" denotes the library cell name, "2" denotes the cell instance name, "3" denotes the from-pin, "4" denotes the to-pin, "5" denotes the sense direction (rising or falling), and "6" denotes the sense type and unateness.

```

RCCALC-005 (warning) Failed to compute the RC network delay

from the pin '%s'
to the pin '%s'
in the network '%s'.

DESCRIPTION

The RC network delay for the specified timing arc could not be computed. Common reasons for this are as follows:

1. Unsupported multi-drive scenarios

Support for RC networks with multiple strong drivers is currently limited to the case where all drivers are wired in parallel. Thus, if a from-pin on a driver connected to a network does not connect to a from-pin on all other drivers, DesignTime cannot perform RC delay calculation.

Solution: Directly annotate the delays and slews.

2. Networks without timing arcs

You can define networks that have only driver pins or only load pins. If no pins are bidirectional, DesignTime cannot perform RC delay calculation. You receive this warning message if you attempt to report from or to one of these pins.

3. Extremely under-driven networks

Networks that are extremely large for their drivers might not converge to one or more RC delay calculation thresholds. This sometimes occurs before layout for nets (for example, clock trees) when buffer insertion has not yet been performed.

Solution: Either adjust the RC threshold variables or directly annotate the delays and slews.

4. Incompatible voltage-swing

If the driver and load assume different voltage-swing, it is possible that the load waveform trip-point voltages are not sufficiently covered by the driver voltage-swing.

Solution: Verify whether the voltage-swing differences are valid. If so, different library trip-points must be used to ensure sufficient coverage. If the voltage-swing differences are invalid, then the design must be fixed. Another common cause of this problem is using a library without a default operating condition; when this occurs one can either fix the library or use the **set_operating_conditions** command on the affected cells.

WHAT NEXT

Check the network against the above situations and follow the suggested solutions.

RCCALC-009 (warning) The drive-resistance for the timing arc
(%S) %S/%S-->%S (%S %S)
is much less than the network impedance to ground;
DesignTime has adjusted

the drive-resistance to improve accuracy.

DESCRIPTION

DesignTime builds a driver model from library data in order to perform RC delay calculation. The driver model consists of a voltage ramp in series with a resistor; the resistor helps smooth out the voltage ramp so that the resulting driver waveform has similar curvature to that of an actual transistor driver. When the drive resistor is much less than the impedance of the network to ground, the smoothing effect is reduced, causing RC delay calculation to be potentially inaccurate. This condition can occur when a very strong driver is connected to a very resistive network. This condition does not arise out of a problem with library data.

When this condition occurs, DesignTime adjusts the drive resistance to improve accuracy; however, note that even with this adjustment the resulting accuracy might be insufficient. By default, extra pessimism is sought in min analysis mode by not using slew-degradation.

If you wish to turn-on slew degradation in min analysis mode, set the value of the shell variable **rc_degrade_min_slew_when_rd_less_than_rnet** to true.

Also by default, DesignTime will issue the RCCALC-009 message only for the subset of these conditions where net-delays are greater than driver transition times. This is because these net-delays have depended upon the portion of the driver waveform most affected by drive-resistance, namely that near and beyond the later slew trip-point.

If you wish to see the RCCALC-009 message whenever DesignTime overrides the drive-resistance (i.e. without the just-mentioned filtering), set the value of the shell variable **rc_filter_rd_less_than_rnet** to false.

With some designs you may get flooded with RCCALC-009 messages. This can occur for two reasons.

The first is that DesignTime uses a threshold parameter to determine when to override the drive-resistance, and the default value assumes well-distributed RC extraction (i.e. that very resistive nets are extracted with many RC segments). As a rule of thumb, there should not be more than 100 ohms per segment. If you are using too few RC segments, and you do not wish to increase the extraction resolution, then you can either (a) qualify DesignTime's accuracy in RCCALC-009 mode and suppress the messages with the **suppress_message** command, or (b) change the value of the shell variable **rc_rd_less_than_rnet_threshold** to optimize accuracy for your desired extraction methodology.

The second reason for getting flooded with RCCALC-009 messages is that there may just be a lot of very strong drivers connected to very resistive nets in the design. If this is so, then you can either (a) qualify DesignTime's accuracy in RCCALC-009 mode and suppress the messages, or (b) annotate delays and slews on the arcs of concern. Another, albeit seldomly possible solution is to use weaker/smaller drivers.

You can shut-off the RCCALC-009 feature completely by setting the shell variable **rc_adjust_rd_when_less_than_rnet** to false.

WHAT NEXT

Simulate the indicated timing arc with the network load to determine whether the accuracy of the DesignTime result is sufficient. Typically the number of these conditions in a design is very small, and the resulting delay calculations are overly pessimistic. You can back-annotate the simulator results with SDF, or use a weaker driver and/or less resistive network in the design.

TIMING ARC NOTATION

The timing arc is displayed by the warning message with the following six parts:

(1) 2/3-->4 (5 6)

In the above, "1" denotes the library cell name, "2" denotes the cell instance name, "3" denotes the from-pin, "4" denotes the to-pin, "5" denotes the sense direction (rising or falling), and "6" denotes the sense type and unateness.

RCCALC-010 (warning) RC network is incomplete - load %s does not have dc_node.

DESCRIPTION

This message warns you that the accurate delay calculation cannot be done because the RC network is not complete. The specified load does not have RC node. WLM will be used for net delay calculation.

Solution: The RC network should be completed to perform delay calculation based on RC network.

SEE ALSO

RCCALC-011 (warning) RC network is incomplete - driver %s does not have dc_node.

DESCRIPTION

This message warns you that the accurate delay calculation cannot be done because the RC network is not complete. The specified driver does not have RC node. WLM will be used for net delay calculation.

Solution: The RC network should be completed to perform delay calculation based on RC network.

SEE ALSO

RCCALC-012 (warning) RC network is incomplete - net %s is unconnected.

DESCRIPTION

This message warns you that the accurate delay calculation cannot be done because the RC network is not complete. An RC network for the specified net cannot be presented by a single contiguous graph. WLM will be used for net delay calculation.

Solution: The RC network should be completed to perform delay calculation based on RC network.

SEE ALSO

RCCALC-013 (information) Reached RCCALC-004 limit - remainder will be suppressed

DESCRIPTION

This message informs the user that the limit for RCCALC-004 messages is reached.

RCEX

RCEX-001 (error) The default conversion factor was not specified in the physical library (.pdb) file.

DESCRIPTION

This error occurs because you did not specify the conversion factor in the The conversion factor converts placement units to and from microns. Without it, the tool is not able to interpret the cell information in the library.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) file with the conversion factor present. Use **lef2plib** command to the convert the LEF file to a .plib file. Use the **read_lib** command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the **write_lib** command to create the physical library database.

SEE ALSO

RCEX-003 (error) The layer width for '%s' is either missing or illegal in the physical (.pdb) file.

DESCRIPTION

This error occurs because your physical library does not contain layer width information that is a mandatory parameter needed for RC computation and extraction and of crucial importance in determining route capacitances.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) file with the layer width information present. Use the `lef2plib` command to convert the LEF file to a .plib file. Use the `read_lib` command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the `write_lib` command to create the physical library database.

SEE ALSO

`lef2plib(1)`
`read_lib(2)`
`write_lib(2)`

RCEX-004 (error) The layer resistance for '%s' was not found in the physical (PDB) file.

DESCRIPTION

You receive this error message because your physical library does not contain layer resistance information, a mandatory parameter needed for RC computation and extraction that is crucial in determining route resistance.

WHAT NEXT

Please ask your library vendor to provide you with a LEF library file with the layer resistance information present. You can then convert the LEF to PLIB using the `lef2plib` command. Convert the PLIB file to a PDB by reading it into Physical Compiler or Design Compiler using the `read_lib` command. Once the library is read in,

issue the **write_lib** command to create the PDB.

SEE ALSO

lef2plib (1); **read_lib** (2), **write_lib** (2).

RCEX-005 (error) The preferred layer direction for '%s' was not found in the physical (.pdb) file.

DESCRIPTION

This error occurs because your physical library does not contain the preferred direction parameter. This information is crucial for RC computation and extraction and to help calculate resistive and capacitive components for routes.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) file with the layer preferred direction information present. Use the **lef2plib** command to convert the LEF file to a .plib file. Use the **read_lib** command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the **write_lib** command to create the physical library database.

SEE ALSO

lef2plib(1)

RCEX-007 (info) The distance unit in Capacitance and Resistance is %s micron.

DESCRIPTION

You receive this message because it provides information on the type of units in use. The unit used for capacitance is library capacitance units per micron. The unit used for resistance is library resistance units per micron.

WHAT NEXT

No action is necessary. The result is informative.

RCEX-008 (information) Using derived R and C coefficients.

DESCRIPTION

You receive this message to inform you that the capacitance and resistance values used for the horizontal and vertical routing layers are derived from the physical library.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-009 (info) %s is scaled by %5.2f

DESCRIPTION

You receive this message because it provides information on the type of scaling in use. They are the scale factors specified in Milkyway technology file.

WHAT NEXT

No action is necessary. The result is informative.

SEE ALSO

`set_delay_estimation_options (2)`, `set_extraction_options (2)`

RCEX-010 (error) All nets are unrouted or skipped. Extraction cannot be done.

DESCRIPTION

You receive this message because your design does not have any routes defined, therefore, extraction cannot proceed. The problem is with the input database you read in. If you have routes in the input database, most likely an error occurred that prevented them from being read in.

WHAT NEXT

Use the `write_pdef` command to confirm that routes are present. If routes are present, look into error messages from the `extract_rc` command or the `read_pdef` command.

SEE ALSO

`extract_rc (2)`, `read_pdef (2)`, `write_pdef (2)`.

RCEX-011 (information) %s : %.2g %.2g

DESCRIPTION

This message displays the library-derived min and max values for one of the RC coefficients used to calculate net capacitance and resistance. These coefficients include resistance and capacitance for each metal layer, average resistance and capacitance across all horizontal and vertical layers, and via resistance.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-012 (information) %s used : %.2g %.2g

DESCRIPTION

You receive this message to inform you of the value for the vertical or horizontal, capacitance or resistance coefficient used for delay estimation. Delay estimation is used in placement and routing estimation. The numbers displayed are the max and min values.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-013 (information) Using region-based R and C coefficients.

DESCRIPTION

You receive this message to inform you that the value is derived from the region for vertical and horizontal, capacitance and resistance coefficients used for delay calculation during placement and routing estimation.

If you explicitly specify the RC coefficients using `set_delay_estimation_options`, you will not see this message. Similarly, if you use 1D parameters, and specify weight for every metal layer, you will not see this message either.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-014 (information) %d region specific RC values are found.

DESCRIPTION

You receive this message to inform you the number of region specific RC values in the design.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-015 (information) The RC model used is %s.

DESCRIPTION

This message advises you of the RC model that the tool will use to compute the unit RC.

The valid RC models and their descriptions are shown below, starting with the highest priority and ending with the lowest priority.

- User - The model is based on user-specified RC parameters.
- TLUPplus - The model is based on TLUPplus parameters.
- TLU - The model is based on TLU parameters in Milkyway.
- Library extractor based - The model is based on extraction parameters.
- 2.5D - The model is based on 2.5D parameters and the user-specified routing wire model.
- Library 2.5D - The model is based on 2.5D parameters.
- Library 1D - The model is based on 1D parameters

WHAT NEXT

This is only an informational message. No action is required.

RCEX-15(n)

RCEX-017 (information) Use %s layer weight : %g %g

DESCRIPTION

This message informs you which layer weight and value is used. The numbers displayed are the max and min values.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-018 (warning) Inconsistent library data found for layer %s.

DESCRIPTION

This warning occurs because the library data for the specified layer is inconsistent. For example, you receive this message if the pitch is less than the width plus the spacing. The tool will continue to execute, assuming that the real pitch is the width plus the spacing. This will not impact congestion computation.

WHAT_NEXT

Check the library data for possible problems. Fix the library resistance and capacitance inconsistency problem, and regenerate the physical library.

RCEX-019 (information) Layer %s is ignored for resistance and capacitance computation.

DESCRIPTION

This message advises you that the tool will exclude this layer from resistance and capacitance computation. You can use the `set_ignored_layers` command to request the excluding of specific layers.

WHAT NEXT

This is only an informational message. No action is required.

SEE ALSO

`set_ignored_layers(2)`
RCEX-011(n)

RCEX-020 (Warning) Net '%s' is exceeding threshold (over %d pins) and will be skipped.

DESCRIPTION

This net has a very large number of pins so it will not be extracted. This net was probably not meant to be detail routed. There will be no parasitics and no back-annotated delay computed for this net. Timing analysis will use the wire load model with the high fanout threshold assumptions. The current default for the max number of pins is 1000. You can use command `set_extraction_options` to adjust it.

WHAT NEXT

Buffer this net and detail route it to be able to extract it.

SEE ALSO

`extract_rc (2)`, `set_extraction_options (2)`.

RCEX-021 (warning) Net '%s' is ideal and will be skipped.

DESCRIPTION

This warning message occurs when the specified ideal net is not considered for extraction. The ideal net is not extracted or considered when extracting the capacitance for any other nets. The `extract_ideal_nets` variable can be used to override this behavior.

WHAT NEXT

This is only a warning message.

If you want the extractor to process the ideal nets, set the `extract_ideal_nets` variable to `true` and run the command again. By default, the variable is set to `false`.

SEE ALSO

`extract_rc(2)`
`extract_ideal_nets(3)`

RCEX-022 (information) Using pre-route resistance and capacitance estimation during extraction.

DESCRIPTION

This message advises you that the tool performs extraction based on a pre-route estimation method for resistance and capacitance computation, instead of actually extracting the resistance and capacitance values.

The tool needs specific information to perform extraction, such as the process parameters. If any of the required parameters are missing, the tool cannot successfully extract resistance and capacitance, so it uses a pre-route estimation method to compute the resistance and capacitance values.

See the user manual for required parameters to perform extraction. See the **RCEX-015** error message for the pre-route estimation model used.

WHAT NEXT

This is only an informational message. No action is required.

SEE ALSO

`extract_rc(2)`
`RCEX-011(n)`
`RCEX-015(n)`

RCEX-023 (information) %s parasitic extraction.

DESCRIPTION

This message advises you that the tool is performing parasitic extraction.

WHAT NEXT

This is only an informational message. No action is required.

SEE ALSO

`extract_rc(2)`

RCEX-024 (warning) Incorrect TLU+ tech file '%s' specified.

DESCRIPTION

This warning occurs because the specified TLUPlus technology file is missing, cannot be opened, or is not in the correct format. As a result, the tool does not use TLUPlus to perform resistance and capacitance computation. Instead, the tool uses another resistance and capacitance computation method available in the physical library. See the **RCEX-015** error message for the computation method used.

WHAT NEXT

Ensure that the path to the TLUPlus technology file is correctly specified and that the file permission is correctly set. See the user manual for information on how to prepare a TLUPlus technology file.

SEE ALSO

`extract_rc(2)`
RCEX-015 (n)

RCEX-025 (warning) Incorrect ITF TLUPlus technology files specified: %s.

DESCRIPTION

This warning message occurs because the specified Interconnect Technology Format (ITF) TLUPlus files are incorrect. The tool cannot use the specified files for the reason shown in the message.

The ITF TLUPlus technology files are output from the **grdgenxo** command (for the maximum or the minimum operating condition) and from the mapping file that maps the Synopsys physical library format (.plib layer name to the ITF mask layer name. As a result, the tool does not use TLUPlus to perform resistance and capacitance computation.

WHAT NEXT

Examine the ITF TLUPlus technology file and mapping file. Common mistakes include missing resistance values in ITF, missing via definitions in ITF, and incorrect layer names in the mapping file.

It is a good practice to ensure that the path to the ITF TLUPlus technology files is

correctly specified and verify that the file permission is correctly set.

See the user manual for details about preparing ITF TLUPplus technology files.

SEE ALSO

`extract_rc(2)`
`RCEX-015(n)`

RCEX-026 (warning) Incorrect mapping file '%s' specified. %s.

DESCRIPTION

This warning message occurs because the specified mapping file does not contain the information necessary to perform layer mapping due to the reason shown in the message. As a result, the tool does not use table lookup plus (TLUplus) to perform resistance and capacitance computation. Instead, the tool uses other resistance and capacitance computation methods available in the technology library. See the **RCEX-015** error message for the computation method used.

The mapping file is necessary to map the technology library layer names to Interconnect Technology Format (ITF) layer names. It should at least contain the `conducting_layers` and `via_layers` sections. The `conducting_layers` section maps a `routing_layer` in the technology library to a conductor layer in ITF. The `via_layers` section maps a contact layer in the technology library to a via layer in ITF.

For example, given that you have the following information in your physical library:

```
routing_layer ( "METALL1" ) {  
    ...  
}  
contact_layer ( "VIA1" );
```

and given that you have the following information in your ITF file:

```
CONDUCTOR metall1 {THICKNESS=0.53 WMIN=0.23 SMIN=0.23  
    RPSQ=0.078 CAPACITIVE_ONLYETCH=0}  
VIA via1 { FROM=metall1 TO=metal2 AREA=0.0169 RPV=1.6 }
```

Your mapping file should look like the following:

```
conducting_layers  
    METAL1 metall1  
via_layers  
    VIA1 via1
```

WHAT NEXT

Correct the reported error, and examine the mapping file to see whether it correctly maps the technology library layer names to ITF layer names.

See the user manual for information about preparing a correct mapping file.

SEE ALSO

`extract_rc(2)`
`set_tlu_plus_files(2)`
RCEX-015(n)

RCEX-027 (warning) Design is not global routed, use detail route extraction.

DESCRIPTION

This warning message occurs when global route is not performed for the design, so global route extraction cannot be done. Instead, detail route extraction is performed for this design.

WHAT NEXT

This is only a warning message.

If the result is not what you intended and you want global route extraction, rererun global route for this design.

SEE ALSO

`extract_rc(2)`
RCEX-015(n)

RCEX-028 (warning) Poly layer %s is defined as routable layer.

DESCRIPTION

This warning message occurs when a poly layer in your physical library is also defined as a routable layer. Since poly layers usually have higher resistance value, defining poly layers as routable could skew your average resistance computation.

WHAT NEXT

If the result is not what you intended and you dont want poly layers to be defined as routable layer, please make the correction to your physical library. Otherwise, you can discard this warning message.

SEE ALSO

`extract-rc (2)`

RCEX-029 (information) Running post route extraction in a separate process.

DESCRIPTION

This information message advises you that the post route extraction will run in a separate process. This is only valid with post route extraction using TLU or TLUPplus.

WHAT_NEXT

This is an information message only. No action is required.

SEE ALSO

`physopt_enable_tlu_plus_process(3)`

RCEX-030 (error) Initialization of the %s RC model failed.

DESCRIPTION

This error occurs because the tool fails to initialize the specified resistance and capacitance model.

The tool supports many RC models and each one requires specific parameters to be properly initialized. If none of the required parameters are present for an RC model, the tool ignores the initialization of the RC model and moves on to initialize the next available RC model. However, if some of the required parameters exist, the tool considers the RC model to be the desired one. This error message is the result of failing to initialize this RC model.

The following list shows each RC model and the condition that, once satisfied, causes the tool to consider it to be the RC model:

- User - Resistance and capacitance for horizontal and vertical directions

- TLUPlus - Specifies the **set_tlu_plus_files** or **create_mw_design** command with TLUPlus
- TLU - Milkyway is with TLU
- Library extractor based - Any extraction parameter, such as oxide thickness/permittivity.
- 2.5D - Any 2.5D parameter (such as plate_cap), and a user-specified routing wire model
- Library 2.5D - Any 2.5D parameter (such as plate_cap)
- Library 1D - area_per_sq or res_per_sq

For example, if you use TLUPlus you can use the **set_tlu_plus_files** command to specify a TLUPlus technology file from the output of the **grdgenxo** command and a mapping file that maps the layer names between the physical library and the Interconnect Technology File (ITF). If you do not specify these files, the tool ignores TLUPlus and attempts to initialize other RC models.

However, if you use the **set_tlu_plus_files** command, the tool considers the TLUPlus RC model to be your desired RC model. This error message is the result of failing to initialize TLUPlus due to errors such as specifying an incorrect mapping file.

WHAT NEXT

Determine whether the RC model is your desired RC model. If not, remove all references to it in your physical library and/or script. The tool then ignores this RC model and initializes another available RC model.

If this is your desired RC model, check the error messages associated with the initialization of this RC model. Make appropriate changes to your physical library and/or script, and execute the command again.

RCEX-048 (warning) Failed to load resistance from TLUPlus.

The tool is continuing with resistance from the physical library.

DESCRIPTION

This warning occurs because of an error in loading the resistance portion of the TLUPplus file specified by the **set_tlu_plus_files** command. The tool is unable to load resistance information from TLUPplus. Instead, the tool uses resistance information from your physical library. This includes resistance for metal layers and resistance for vias.

The tool still uses the capacitance portion of TLUPplus.

WHAT NEXT

This is only a warning message. You can eliminate this warning message by using a newer version of the **grdgenxo** command to regenerate TLUPplus.

SEE ALSO

[grdgenxo\(1\)](#)
[set_tlu_plus_files\(2\)](#)

RCEX-049 (Warning) TLU+ only supports one operating condition for process scaling.

DESCRIPTION

TLU+ (table lookup plus) mode supports only one operating condition for process scaling. If you specify different process scaling values for both minimum and maximum operating conditions, the lower (minimum) of the two conditions is applied to both operating conditions.

In the following example, 0.3 is used as the process scaling for both the minimum and maximum operating conditions during TLU+ based extraction.

```
set_extraction_options -max_process_scale 0.4 -min_process_scale 0.3
```

WHAT NEXT

Use the same process scaling value for both the minimum and maximum operating conditions. Model the difference in the minimum and maximum operating conditions using different extraction parameters.

SEE ALSO

[set_extraction_options \(2\)](#).

RCEX-050 (information) The process parameters are scaled by %g %g.

DESCRIPTION

You receive this information to let you know that the process parameters defined in your physical library will be scaled. The two numbers displayed are the process scaling factors for the max and min operating conditions. You can use **set_extraction_options** command to specify the scaling factors, or you can specify the scaling factors in your physical library. The command line scaling factors have higher priority than the values in your physical library.

WHAT NEXT

This is an informational message only.

SEE ALSO

set_extraction_options (2), **report_extraction_options** (2), **RCEX-015**

RCEX-051 (warning) The field oxide thickness was not found in the physical (.pdb) file. The tool is using '%f' for the field oxide thickness.

DESCRIPTION

This warning occurs because your physical library does not contain field oxide thickness information, which is needed for extraction to help calculate capacitive components for routes. If the field oxide thickness is not present in the Synopsys physical database format (.pdb) file, then the value for the TSMC 0.18 micron technology is used.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) library file with the field oxide thickness information present. Then use the **lef2plib** command to convert the LEF file to a .plib file, or use the **extract2plib** command to convert the extraction process file. Use the **read_lib** command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the **write_lib** command to create the physical library database.

SEE ALSO

extract2plib(1)

```
lef2plib(1)
read_lib(2)
write_lib(2)
```

RCEX-052 (warning) The field oxide permitivity was not found in the physical (.pdb) file. The tool is using '%f' for the field oxide permitivity.

DESCRIPTION

This warning occurs because your physical library does not contain field oxide permitivity information that is required for extraction to help calculate capacitive components for routes. If the field oxide permitivity information is not present in the (.pdb) file, the value for the TSMC 0.18 micron technology is used.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) library file with the field oxide permitivity present. Then use the **lef2plib** command to convert the LEF file to a .plib file, or use the **extract2plib** command to convert the extraction process file. Use the **read_lib** command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the **write_lib** command to create the physical library database.

SEE ALSO

```

lef2plib(1)
read_lib(2)
write_lib(2)
```

RCEX-053 (warning) No layer spacing was found for '%s' in the physical (.pdb) file. The tool is using '%d micron' for the layer spacing.

DESCRIPTION

This warning occurs because your physical library does not contain layer spacing information that is required for extraction to help calculate resistive and capacitive components for routes. The layer spacing to be used is the minimum of the normal spacing and the width-based spacing for the layer. If you did not define either of these measurements, the spacing for the TSMC 0.18 micron technology is used.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) library file with the layer spacing present. Then use the **lef2plib** command to convert the LEF file to a .plib file, or use the **extract2plib** command to convert the extraction process file. Use the **read_lib** command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the **write_lib** command to create the physical library database.

SEE ALSO

```
extract2plib(1)
lef2plib(1)
read_lib(2)
write_lib(2)
```

RCEX-054 (warning) No layer thickness was found for '%s' in the physical (.pdb) file. The tool is using '%f micron' for the layer thickness.

DESCRIPTION

This warning occurs because your physical library does not contain layer thickness information that is required for extraction to help calculate capacitive components for routes. If you did not define this measurement, then the layer thickness for the TSMC 0.18 micron technology is used.

WHAT NEXT

Ask your library vendor to provide you with a Library Exchange Format (LEF) library file with the layer thickness present. Then use the **lef2plib** command to convert the LEF file to a .plib file, or use the **extract2plib** command to convert the extraction process file. Use the **read_lib** command to convert the .plib file to a .pdb file and read it into the tool. Once the library is read in, use the **write_lib** command to create the physical library database.

SEE ALSO

```

RCEX-059 (warning) The die area is undefined for this design.

DESCRIPTION

You receive this warning because you have not defined the die area, which is used to optimize internal data structures used during extraction. If you do not define the die area, it is inferred by the routing and placement of cells in the design. The tool visits each route and cell and chooses the die area that covers all.

WHAT NEXT

Edit the PDEF file and add the correct die area for the design.

SEE ALSO

read (2).

RCEX-060 (warning) Net '%s' is not fully connected and will be estimated.

DESCRIPTION

You receive this warning because two route segments you specified are not connected and the compiler will estimate RC of the net.

Accurate extraction engine is only performed on completely routed nets. Resistances and capacitances for partially routed nets will be estimated as virtual routed. RC results of all nets will be output.

WHAT NEXT

Disconnection is reported for all DRC-open nets. Please refer to DRC for definition of open net.

RCEX-061 (error) Process parameter '%s' is required for extraction.

DESCRIPTION

This error occurs because you are not using the TLUPlus-based RC model, and your physical library does not contain the named process parameter that is required for extraction.

WHAT NEXT

This is only an informational message. No action is required.

It is recommended that you use TLUPlus based RC extraction. You can use the **set_tlu_plus_files** command to specify the necessary TLUPlus tables.

SEE ALSO

`report_tlu_plus_files(2)`
`set_tlu_plus_files(2)`

RCEX-062 (Error) Missing/Illegal Process parameter '%s' for layer '%s'.

DESCRIPTION

You receive this message because you are not using the TLUplus based RC model, and your physical library either does not contain or has illegal value for the named process parameter, which is required for RC computation and extraction.

WHAT NEXT

It is recommended to use TLUplus based RC extraction. Please use **set_tlu_plus_files** to specify the necessary TLUplus tables.

SEE ALSO

`set_tlu_plus_files (2); report_tlu_plus_files (2);`

RCEX-063 (Warning) Zero width special segment ('%d' '%d') ('%d' '%d') ignored for layer '%s'.

DESCRIPTION

You receive this message because your physical data contains special segments whose widths are zero.

WHAT NEXT

Check your PDEF to make sure that the route widths are greater than zero.

RCEX-064 (error) Cannot read ECO parasitic files without full parasitic.

DESCRIPTION

This error message occurs when using the **read_parasitics -eco** command to read in ECO parasitic files with a design that is not with full parasitic. The design must have full parasitic with the **read_parasitics** command before you can use **read_parasitics -eco** to read ECO parasitic files.

WHAT NEXT

Run **read_parasitics** to read in the full parasitic for the design, and then run the **read_parasitics -eco** command.

SEE ALSO

```
read_parasitics(2)
write_parasitics(2)
extract_rc(2)
```

RCEX-065 (error) Cannot read ECO parasitic files with different format.

DESCRIPTION

This error message occurs when using the **read_parasitics -eco** command to read in ECO parasitic files with different parasitic format comparing to the full parasitic.

Note that **IC Compiler** only supports ECO SPEF or ECO SBPF.

WHAT NEXT

You must use the same format with ECO parasitic files. If your full parasitic is read in with SPEF, the ECO parasitic files must be SPEF; if your full parasitic is read in with SBPF, the ECO parasitic files must be SBPF as well.

SEE ALSO

```
read_parasitics(2)
write_parasitics(2)
extract_rc(2)
```

RCEX-066 (warning) %s is ignored during ECO parasitic reading.

DESCRIPTION

The given option is ignored during ECO parasitic reading, thus, specifying that has no effect. The same option (or lack of) used during full parasitic reading is used during ECO parasitic reading as well.

WHAT NEXT

Change the options when reading full parasitic files.

SEE ALSO

```
read_parasitics(2)
write_parasitics(2)
extract_rc(2)
```

RCEX-067 (information) Poly pin geometries are detected.

DESCRIPTION

You receive this information message because we detect some pins have geometries on the POLY layer.

By default, we respect POLY pin geometry and POLY contact, but does not check POLY wires. If you have POLY wires, you need to define the POLY layer as a routable layer, otherwise, a net with POLY wires might be considered as disconnected.

WHAT NEXT

This is an information message only. However, if you have POLY wires, it is recommended that you define POLY layer as routable layer to avoid the disconnection problem.

SEE ALSO

`extract_rc(2)`

RCEX-068 (information) Poly contacts are used in signal routing.

DESCRIPTION

You receive this information message because we detect some poly contacts are used in signal routing.

By default, we respect POLY pin geometry and POLY contact, but does not check POLY wires. If you have POLY wires, you need to define the POLY layer as a routable layer, otherwise, a net with POLY wires might be considered as disconnected.

WHAT NEXT

This is an information message only. However, if you have POLY wires, it is recommended that you define POLY layer as routable layer to avoid the disconnection problem.

SEE ALSO

`extract_rc(2)`

RCEX-069 (warning) Poly wires are used in signal routing.

DESCRIPTION

You receive this warning message because we detect some poly wires are used in signal routing.

By default, we respect POLY pin geometry and POLY contact, but does not consider POLY wires. If you have POLY wires, you need to define the POLY layer as a routable layer, otherwise, a net with POLY wires might be considered as disconnected.

WHAT NEXT

It is recommended that you define POLY layer as routable layer to avoid the disconnection problem.

SEE ALSO

`extract_rc(2)`

RCEX-070 (error) File '%s' does not exist or it is unreadable.

DESCRIPTION

This error message occurs when using the `-max_tluplus`, `-min_tluplus`, `-tf2itf_map` or `-tech2itf_map` option to the `set_tlu_plus_files` command and specifying a file name that does not exist or cannot be read.

WHAT NEXT

Verify that the file exists and that the permissions are set correctly, and then run the command again.

SEE ALSO

`set_tlu_plus_files(2)`

RCEX-071 (information) No layer mapping file is specified. Assume layer names are the same between the technology library and the ITF.

DESCRIPTION

This message advises you that you are using the `set_tlu_plus_files` command without specifying the `-tech2itf_map` option (switch).

The tool requires a layer mapping file to map the layer names from technology library to the Interconnect Technology File (ITF). If the switch is omitted, the tool assumes that the layer maps are the same between your technology library and the ITF.

For example, if in the physical library, you have the following:

```
routing_layer ( "METAL1" ) {
```

```
...
}
contact_layer ( "VIA1" );
...
```

and in the ITF, you have the following:

```
CONDUCTOR metal1 {THICKNESS=0.53 WMIN=0.23 SMIN=0.23
    RPSQ=0.078 CAPACITIVE_ONLYETCH=0}
...
VIA via1 { FROM=metal1      TO=metal2 AREA=0.0169 RPV=1.6 }
```

provide a mapping as follows:

```
conducting_layers
METAL1 metal1
...
via_layers
VIA1 via1
...
```

However, if the ITF contains the following information, you are not required to specify the layer mapping file because the layer names are the same between the technology library and ITF:

```
CONDUCTOR METAL1 {THICKNESS=0.53 WMIN=0.23 SMIN=0.23
    RPSQ=0.078 CAPACITIVE_ONLYETCH=0}
...
VIA VIA1 { FROM=METAL1      TO=METAL2 AREA=0.0169 RPV=1.6 }
```

WHAT NEXT

This is only an informational message. No action is required.

If the layer names are the same between the technology library and the ITF, you can ignore this message.

Otherwise, you can provide a layer mapping file by using the **set_tlu_plus_files** command specifying the **-tech2itf_map** option. See the user guide for the syntax of the extraction parameters.

SEE ALSO

[set_tlu_plus_files\(2\)](#)

RCEX-072 (warning) The parasitic file does not contain location

information.

DESCRIPTION

You receive this warning message because the parasitic file that you are reading does not have location information.

A location consists of three components: x coordinate, y coordinate, and metal layer information. Each node in the parasitic rc tree should have a location defined. This includes terminal nodes that are connected to a pin, or internal sub nodes in the rc tree.

```
|-----| | gate o=====o sub node |-----| || terminal || || |-----|
o=====o gate | |-----|
```

If you don't have location specified for a node in your parasitic file, we will use an estimation to determine where is the location for the node.

WHAT NEXT

If you are only running timing analysis with the parasitic file, you can ignore the warning since locations are not required for timing analysis.

However, if you want to run **on_route** with the given parasitic file, you need to specify the location information since that decides the initial location for the new cells.

Consult the user manual for the program that creates the parasitic file on how to add location information.

SEE ALSO

```
read_parasitics(2)
extract_rc(2)
```

RCEX-073 (warning) Some parasitic nodes have no location.

DESCRIPTION

You receive this warning message because some of the parasitic nodes in the parasitic file that you are reading do not have location.

A location consists of three components: x coordinate, y coordinate, and metal layer information. Each node in the parasitic rc tree should have a location defined. This includes terminal nodes that are connected to a pin, or internal sub nodes in the rc tree.

```
|-----| | gate o=====o sub node |-----| || terminal || || |-----|
o=====o gate | |-----|
```

If you don't have location specified for a node in your parasitic file, we will use an estimation to determine where is the location for the node.

WHAT NEXT

If you are only running timing analysis with the parasitic file, you can ignore the warning since locations are not required for timing analysis.

However, if you want to run **on_route** with the given parasitic file, you need to specify the location information since that decides the initial location for the new cells.

Consult the user manual for the program that creates the parasitic file on how to add location information.

SEE ALSO

```
read_parasitics(2)  
extract_rc(2)
```

RCEX-074 (warning) All parasitic nodes have location at (0, 0).

DESCRIPTION

You receive this warning message because all parasitic nodes in the parasitic file that you are reading have location at (0, 0). Even though (0, 0) could be a legal value for location, having all nodes at (0, 0) is not legal.

WHAT NEXT

If you are only running timing analysis with the parasitic file, you can ignore the warning since locations are not required for timing analysis.

However, if you want to run **on_route** with the given parasitic file, you need to specify the location information since that decides the initial location for the new cells.

Consult the user manual for the program that creates the parasitic file on how to add location information.

SEE ALSO

```
read_parasitics(2)  
extract_rc(2)
```

RCEX-075 (warning) Some parasitic nodes have location

outside block boundray.

DESCRIPTION

You receive this warning message because some of the parasitic nodes in the parasitic file that you are reading have location outside the block boundary.

WHAT NEXT

If you are only running timing analysis with the parasitic file, you can ignore the warning since locations are not required for timing analysis.

However, if you want to run **on_route** with the given parasitic file, you need to specify the location information since that decides the initial location for the new cells.

Consult the user manual for the program that creates the parasitic file on how to add location information.

RCEX-085 (error) Variable physopt_enable_virtual_shield is no longer supported, please use set_extraction_options -

virtual_shield_extraction true|false.

DESCRIPTION

This error message tells you that variable `physopt_enable_virtual_shield` is no longer supported since Y-2006.06-SP2 release. Virtual shield extraction has since been controlled using `set_extraction_options -virtual_shield_extraction true/false`. The default setting is `true`.

WHAT NEXT

Use `set_extraction_options -virtual_shield_extraction true` to enable virtual shield extraction. Use `set_extraction_options -virtual_shield_extraction false` to disable virtual shield extraction.

SEE ALSO

`extract_rc(2)`
`set_extraction_options(2)`

RCEX-086 (information) Using the HALF_NODE_SCALE_FACTOR in TLUPlus for process scale.

DESCRIPTION

This information tells you that half node scale factor is defined in TLUplus (`HALF_NODE_SCALE_FACTOR`). ICC will use this scale factor for process scaling. It will overwrite the scaling factors defined in `set_extraction_options` command or in your physical library.

Since in TLUplus model, only one process scale factor is supported, it is expected that all TLUplus files have the same half node scale factor defined. If not, a warning message will be issued and the smallest scale factor found will be used for process scaling.

WHAT NEXT

This is an informational message only.

SEE ALSO

`set_extraction_options(2); report_extraction_options(2), RCEX-015`

RCEX-087 (Warning) Process_scale in set_extraction_options and HALF_NODE_SCALE_FACTOR in TLUPlus cannot be used at the same time.

DESCRIPTION

This warning tells you that **HALF_NODE_SCALE_FACTOR** is defined in TLUPlus. At the same time, there is **max_process_scale** or **min_process_scale** defined in **set_extraction_options**. In ICC, they cannot be used together. ICC will use **HALF_NODE_SCALE_FACTOR** for process scaling. It will ignore the scaling factors defined in **set_extraction_options** command.

WHAT NEXT

Please choose one for process scaling. You can remove **process_scale** in **set_extraction_options** command. Or you can remove **HALF_NODE_SCALE_FACTOR** from TLUPlus.

SEE ALSO

set_extraction_options (2); **report_extraction_options** (2), **RCEX-015**

RCEX-088 (error) User specified TLUPlus signature file does not match current extraction context.

DESCRIPTION

This error tells you that the TLUPlus signature file specified by **-tlup_file** in **read_parasitics -format compact** command does not match that derived from the current extraction context. This means that your compact parasitic files may have been generated in a different extraction context, for example, with different tluplus files or different operation conditions, or different scenario settings, etc. Therefore, they cannot be used in this extraction session. A TLUPlus signature file records essential extraction context information used to create the associated compact parasitic files.

WHAT NEXT

You need to restore the same extraction context in order to use the specified compact parasitic files using **read_parasitics -format compact** command.

SEE ALSO

read_parasitics (2).

RCEX-090 (information) Doing incremental extraction.

DESCRIPTION

You receive this message to inform you that incremental extraction is triggered in rc-extraction.

This is an informational message only. No action is required on your part.

RCEX-091 (information) Incremental extraction not triggered due to too many changes.

DESCRIPTION

You receive this message to inform you that incremental extraction is not triggered in rc-extraction.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-092 (information) Incremental extraction does not work with non-detail-routed extraction.

DESCRIPTION

You receive this message to inform you that incremental extraction will not be triggered in rc-extraction.

WHAT NEXT

This is an informational message only. No action is required on your part.

RCEX-140 (information) Extractor based RC computation is

enabled.

DESCRIPTION

This message advises you that the tool performs automatic computation for capacitance that is based on the extraction parameters.

This feature does not support min/max RC computation. You must use scaling factors to model the minimum condition. You can specify scaling factors by using the **set_delay_estimation_options** command.

To turn off this feature, use: the **set physopt_enable_extractor_rc** variable set to FALSE.

The tool will do this only if all of the following conditions are true:

- User RC is not used.
- TLU+ RC model is not used.
- Optional extraction parameters are present in the physical library.

The tool must have the following extraction parameters in order to perform automatic computation:

- field oxide thickness
- field oxide permitivity
- layer thickness for all routable layers
- layer oxide thickness for all routable layers
- layer oxide permitivity for all routable layers
- layer lateral oxide thickness for all routable layers
- layer lateral oxide permitivity for all routable layers

See the user guide for extraction parameter syntax.

WHAT NEXT

SEE ALSO

`set_delay_estimation_options(2)`

RCEX-141 (n)
RCEX-143 (n)

RCEX-141 (information) TLUPlus based RC computation is enabled.

DESCRIPTION

This information message occurs when the tool will perform automatic computation for capacitance based on the TLUPlus model.

This message only appears when both of the following are true:

- User RC is not used.
- The TLUPlus technology file is available.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

RCEX-144 (n)

RCEX-142 (information) TLU based RC computation is enabled.

DESCRIPTION

This information message occurs when the tool will perform automatic computation for capacitance based on the TLU model.

This message only appears when all of the following are true:

- User RC is not used.
- TLUPlus is not used.
- The TLU technology file is available.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

RCEX-145 (n)

RCEX-143 (information) Extractor-based RC computation is disabled.

DESCRIPTION

This message advises you that the tool does not perform automatic computation for capacitance that is based on extraction parameters although you might have specified them in the physical library.

You will not see this message if your physical library does not contain any extraction parameters.

Extraction parameters used by the tool are the following:

- field oxide thickness
- field oxide permitivity
- layer thickness for all routable layers
- layer oxide thickness for all routable layers
- layer oxide permitivity for all routable layers
- layer lateral oxide thickness for all routable layers
- layer lateral oxide permitivity for all routable layers

See the user guide for extraction parameter syntax.

WHAT NEXT

This is only an informational message. No action is required.

SEE ALSO

RCEX-140 (n)

RCEX-144 (information) TLUPlus based RC computation is disabled.

DESCRIPTION

This information message occurs when the tool will not perform automatic computation for capacitance based on the TLUPlus model.

The most common reasons for failure include:

- Cannot open file for reading: *search_path* is not used to search for TLUPlus files; use the absolute path instead.
- Incorrect mapping file: it should map the .plib layer name to the ITF layer name.
- Error while generating TLUPlus model from ITF technology files: use the latest **grdgenxo** utility to create the technology file.

WHAT NEXT

This is an informational message only. No action is required.

Refer to RCEX-141 for conditions under which this feature is enabled.

SEE ALSO

RCEX-141(n)

RCEX-145 (information) TLU based RC computation is disabled.

DESCRIPTION

This information message occurs when the tool will not perform automatic computation for capacitance based on the TLU model.

The most common reasons for failure include the following:

- Cannot open file for reading: *search_path* is not used to search for TLU files; use absolute path instead
- Incorrect technology file

WHAT NEXT

This is an informational message only. No action is required.

Refer to RCEX-142 for the conditions under which this feature is enabled.

SEE ALSO

RCEX-142 (n)

RCEX-201 (information) All the nets in the design are routed. Extraction of all the nets has been performed.

DESCRIPTION

All the nets have been extracted with RC values.

WHAT NEXT

report_timing report_nets

RCEX-202 (information) The mixed mode parasitic extraction has been performed.

DESCRIPTION

Some nets are routed and some nets are not. Extraction will be performed on the fully connected nets. For partially routed or unrouted nets, estimation will be performed.

WHAT NEXT

report_timing report_nets

RCEX-203 (information) None of the nets in the design are routed. Estimation of all the nets will be performed.

DESCRIPTION

All the nets in the design will be estimated since they are not fully connected for partially connected.

WHAT NEXT

report_timing report_nets

RCEX-204 (information) File r/w error, %s.

DESCRIPTION

A File can't be created in directory or A file can't be found for reading.

WHAT NEXT

check if the directory is full or write_protected

RCEX-205 (error) Extraction failed.

DESCRIPTION

Extraction failed, it may be caused by many reasons 1. case setup error 2. disk is full or write protected. 3. other run time error

WHAT NEXT

check log message to find error happened before RCEX-205

RCEX-206 (information) maxIntraCapDistRatio is set to %d.

DESCRIPTION

maxIntraCapDistRatio is used to control how far RC-engine will search neighbors. It affects both R and C value.

WHAT NEXT

User can dump technology file(tf) and set maxIntraCapDistRatio in tf. Then re-load tf to make it work.

SEE ALSO

set_mw_technology_file(2)

RCEX-207 (error) No TLU+ is found. Please set TLU+ and rerun.

DESCRIPTION

Extraction failed because TLU+ is not found.

WHAT NEXT

Set TLU+ and rerun.

RDB

RDB-1 (warning) Ignore old spacing rule attribute. Please regenerate db by reading pdef.

DESCRIPTION

This warning is issued when detect the old spacing rule attribute from the pdef. The spacing rule will be ignore.

WHAT_NEXT

Please regenerate db by reading pdef again.

REGDUP

REGDUP-1 (warning) No Register duplication will be done, as the register max fanout load is set below 1.0

DESCRIPTION

Register duplication is based on fanout load on output pin. And it's value can't be less than 1.0

WHAT NEXT

Set register max fanout load above 1.0

REGDUP-2 (warning) Register duplication can't be done, as no Registers found to have fanout greater than value set on current_design or register appropriately.

DESCRIPTION

Register duplication happens only if there are registers having higher fanout load than the maximum fanout load set.

WHAT NEXT

REGDUP-3 (information) Duplicating register %s with fanout load of %.2f

DESCRIPTION

WHAT NEXT

REGDUP-4 (information) Register %s is driving %s, can't

duplicate.

DESCRIPTION

Register duplication does special architecture specific checks, which determine if a register needs to be duplicated or. This is done even after qualifying with respect to fanout count.

WHAT NEXT

RGEN

RGEN-1 (fatal) Topology error in target net near '%s'.

DESCRIPTION

RMDB-92 (error) Routing via not translated .

DESCRIPTION

WHAT NEXT

RMDB-93 (error) Via '%s' not translated .

DESCRIPTION

WHAT NEXT

RMDB-94 (Info) SDC information is not read by read_mdb.

DESCRIPTION

The SDC information is not read from the Milkyway database by read_mdb command. The designer has to explicitly read the SDC data from the Milkyway database.

WHAT NEXT

read_sdc(2)

RMDB-95 (error) Directory not writable '%s' .

DESCRIPTION

WHAT NEXT

RMDB-96 (warning) SDC file exists at '%s'.

DESCRIPTION

WHAT NEXT

RMDB-97 (warning) Could not reset incremental SDC flag in Milkyway.

DESCRIPTION

This warning message informs you that although the incremental Synopsys Design Constraints (SDC) may be written out, the flag for incremental SDC in Milkyway cannot not be reset.

Upon further use of this Milkyway database, it may appear that there is no

incremental SDC written out.

WHAT NEXT

This is a warning message only. No action is required on your part.

SEE ALSO

`read_mdb` (2).

RMDB-98 (error) Incremental SDC could not be found.

DESCRIPTION

This error message appears when there is an error in finding incremental Synopsys Design Constraints (SDC) in the Milkyway design database.

WHAT NEXT

Determine if the incremental SDC can be written out using Astro, and annotate that SDC to the design in the tool by sourcing that SDC.

SEE ALSO

`read_mdb` (2).

RMDB-99 (error) The specified cell '%s' doesn't exists in design library '%s'.

DESCRIPTION

WHAT NEXT

RMDB-100 (warning) Failed to set the min/max layer for net '%s'

DESCRIPTION

WHAT NEXT

RMDB-101 (error) Unable to create net %s.

DESCRIPTION

Read_mdb failed to create a net. Probably the hierarchy information in CEL view is incorrect.

WHAT NEXT

Please run astRepairHierPreservation in Astro and rerun read_mdb command.

RMDB-103 (error) Port instance %s of cell inst %s not connected to hier net. Please run astRepairHierPreservation in Astro to fix.

DESCRIPTION

WHAT NEXT

RMDB-104 (error) Port instance %s of cell inst %s not connected to hier net. Please run astRepairHierPreservation in

Astro to fix.

DESCRIPTION

WHAT NEXT

RMDB-105 (error) Found new hierarchy %s in MW..

DESCRIPTION

Read_mdb unable to update the milkyway library because of the inconsistencies between the LOGIC view and CEL view.

WHAT NEXT

Fix the MDB and rerun read_mdb command.

There also exists a work-around. You can set variable "mw_create_netlist_from_CEL" to true so that the inconsistent LOGIC view will be ignored. Do not forget to explicitly load the SDC after read_mdb.

RMDB-106 (error) Failed to open the main library '%s'.

DESCRIPTION

Read_mdb cannot open the given MDB library.

WHAT NEXT

Double check the library name and path are correct and you have write permission.

RMDB-107 (error) Failed to open cell '%s' in view '%s' .

DESCRIPTION

Read_mdb unable to open the given cell for write.

WHAT NEXT

Make sure you have write permission to the cell. Also check the mw_reference_library variable to make sure that all the libraries are added correctly.

RMDB-108 (warning) Please update Hierarchy in Astro before running read_mdb.

DESCRIPTION

You get this error because Milkyway does not have a flag set which shows that the hierarchy perservation is not updated.

WHAT NEXT

Run astRepairHierPreservation in Astro before you save the cell and then run read_mdb.

RMDB-109 (error) Failed to close cell .

DESCRIPTION

Read_mdb unable to close the cell that opened earlier. This should be an internal error.

WHAT NEXT

Please check Synopsys for solutions.

RMDB-110 (error) Failed to open cell '%s' in view '%s' .

DESCRIPTION

WHAT NEXT

RMDB-111 (error) Failed to close cell .

DESCRIPTION

WHAT NEXT

RMDB-112 (error) Failed to get the Instances in the design .

DESCRIPTION

Read_mdb failed to get the instance from milkyway library.

WHAT NEXT

Make sure your milkyway library is correct and rerun read_mdb.

RMDB-113 (warning) No cell boundary defined for the design.

DESCRIPTION

Read_mdb could not get the boundary definition from the MDB.

WHAT NEXT

Make sure the boundary is defined before run read_mdb.

RMDB-114 (error) No sites found in the design .

DESCRIPTION

Read_mdb could not find the sites defined for current design.

WHAT NEXT

Make sure the site is defined before run read_mdb.

RMDB-115 (error) Failed to get the site row basearray.

DESCRIPTION

Read_mdb unable to get the site row base array. This usually means that the MDB library was not correctly prepared.

WHAT NEXT

Make sure the MDB library is correct before call read_mdb.

RMDB-116 (error) Failed to get the site for design.

DESCRIPTION

Read_mdb unable to get the site data from the library. This usually means that the MDB library was not correctly prepared.

WHAT NEXT

Make sure the MDB library is correct before call read_mdb.

RMDB-117 (error) Failed to set the site '%s' in the db .

DESCRIPTION

WHAT NEXT

RMDB-118 (warning) No tracks in the design.

DESCRIPTION

Read_mdb unable to get the track. This usually means that the MDB library was not correctly prepared.

WHAT NEXT

Make sure the MDB library is correct before call read_mdb.

RMDB-119 (error) Failed to set the track '%s' .

DESCRIPTION

read_mdb could not set the track. This could happened if running out of memory.

WHAT NEXT

Rerun the command with more memory.

RMDB-120 (warning) Maximum number of pins exceeded the equivalent pin class.

DESCRIPTION

The equivalent pin class number exceeded the predefined maximum number in MDB. This mostly happened because of some internal error.

WHAT NEXT

Make sure your MDB library is correct before call read_mdb. As a workaround, you can

also try to manually reduce the pin number.

RMDB-121 (warning) Maximum number of pins exceeded the equivalent pin class of 1000.

DESCRIPTION

Read_mdb limits the number of equivalent pin class to 1000. If the actual number is more than this, the pin information could not be saved into the db.

WHAT NEXT

Reduce the equivalent pin class number and rerun read_mdb.

RMDB-122 (warning) Pin '%s' not connected to any Net.

DESCRIPTION

The given pin is not connected to any net in the MDB library.

WHAT NEXT

RMDB-123 (error) Failed to set the rule '%s'.

DESCRIPTION

WHAT NEXT

RMDB-124 (warning) Poly shaped blockages are not supported.

DESCRIPTION

DB library does not support poly-shaped blockages. Read_mdb will drop these blockages if any.

WHAT NEXT

RMDB-125 (warning) No group associated with the region .

DESCRIPTION

WHAT NEXT

RMDB-126 (warning) No cells found in the group.

DESCRIPTION

WHAT NEXT

RMDB-127 (warning) No group associated with the region .

DESCRIPTION

WHAT NEXT

RMDB-128 (warning) No cells found in the group.

DESCRIPTION

WHAT NEXT

RMDB-129 (warning) Failed to set the min/max layer for net '%s'

DESCRIPTION

Read_mdb unable to set the min/max layer for the given net. This could happen if read_mdb cannot get the specified layer.

WHAT NEXT

Make sure the MDB library is correct before call read_mdb.

RMDB-130 (error) No nets in the design .

DESCRIPTION

Read_mdb could not find any nets defined in current design. No route information will be updated.

WHAT NEXT

Make sure the MDB library is correct before call read_mdb.

RMDB-131 (error) Failed to get the Net '%s'.

DESCRIPTION

Read_mdb could not find the specified net in the design.

WHAT NEXT

RMDB-132 (error) Failed to get the Net '%s'.

DESCRIPTION

WHAT NEXT

RMDB-133 (error) Unable to create net %s.

DESCRIPTION

read_mdb failed to create a new net. Probably the hierarchy information in CEL view is incorrect.

WHAT NEXT

Please run astRepairHierPreservation in Astro.

RMDB-134 (info) Sourcing SDC from file %s.

DESCRIPTION

WHAT NEXT

RMDB-135 (error) Linking the design failed .

DESCRIPTION

read_mdb failed to link the design internally. No physical information could be transferred from the MDB library.

WHAT NEXT

Make sure to provide all the necessary libraries. Also check the link command for necessary steps.

RMDB-136 (error) Polygon with odd points!. Dropping last co-ordinate.

DESCRIPTION

WHAT NEXT

RMDB-137 (warning) Round type wire extensions are not supported.

DESCRIPTION

Round type wire extensions are not supported by DB library. Read_mdb will not be able to keep this extension info.

WHAT NEXT

RMDB-138 (info) Incremental SDC is at %s.

DESCRIPTION

An incremental Synopsys Design Constraints file is written in your current working directory with the name shown. You need to manually source this file to annotate this SDC to the design. If the switch -update_sdc is provided to read_mdb, the SDC will be automatically sourced. Incremental SDC are SDC constraints that were created during an Astro session and are additional to the existing SDC constraints that describe the constraints of the design.

WHAT NEXT

Source the incremental SDC which is shown, if you want the incremental SDC annotated on your design. If you have specified the switch -update_sdc to read_mdb, no action is required by you on this message.

RMDB-140 (error) Internal error in initializing the milkyway host.

DESCRIPTION

WHAT NEXT

RMDB-141 (Warning) Failed to open cell '%s' in view '%s'.

DESCRIPTION

The specified cell doesn't exist on the specified milkyway libraries.

WHAT NEXT

1. Check the mw_reference_library variable to make sure that all the libraries are added correctly.

RMDB-142 (information) The LOGIC view does not exist. The

tool is creating it in the memory database from a CEL view.

DESCRIPTION

This message advises you that the LOGIC view for the specified cell does not exist in the library. The tool uses the netlist by default and the Synopsys Design Constraints (SDC) information is not translated. The reason for this action is because this library was created by using a directory from another tool.

WHAT NEXT

This is only an informational message. No action is required.

However, if the result is not what you intended, you can explicitly read the SDC information from the other tool into the tool that is generating the message. You can run the **change_names** command to ensure that your data is consistent with the SDC that is output from the system.

RMDB-143 (error) dixi2ax_mwUnInit called without Initializing.

DESCRIPTION

WHAT NEXT

RMDB-144 (warning) Failed to read the GCEL grid from milkway design library.

DESCRIPTION

WHAT NEXT

RMDB-145 (warning) Failed to create placement obstruction for

the design.

DESCRIPTION

Read_mdb unable to create the placement obstruction for current design.

WHAT NEXT

Make sure the MDB library is correct before call read_mdb.

RMDB-146 (warning) Failed to attach the TLu+ file for design '%S'.

DESCRIPTION

read_mdb unable to attach the TLu+ file to the design library.

WHAT NEXT

Please manually set the environment variable "tlu_plus_library" with correct value.

RMDB-147 (error) Non-rectangular edge for polygon.

DESCRIPTION

WHAT NEXT

RMDB-148 (warning) Less than 4 points: ignoring POLYGON definition.

DESCRIPTION

WHAT NEXT

RMDB-149 (information) Unable to get direction for port,

assuming INPUT.

DESCRIPTION

read_mdb failed to get the port direction, so just assume it is INPUT.

WHAT NEXT

SEE ALSO

RMDB-150 (information) Unable to get direction for ref port.

DESCRIPTION

read_mdb failed to get the port direction from MDB. Set the direction to UNKNOWN in DB.

WHAT NEXT

SEE ALSO

RMDB-151 (warning) Failed to get port type.

DESCRIPTION

read_mdb failed to get the port type from MDB.

WHAT NEXT

Check if the port type exists in the MDB and rerun read_mdb.

SEE ALSO

RMDB-152 (warning) Failed to get hierarchical net name.

DESCRIPTION

`read_mdb` unable to get the hierarchical net name from Milkyway library. This could be an internal error.

WHAT NEXT

Please try `astRepairHierPreservation` in Astro.

SEE ALSO

RMDB-153 (warning) More than one base array found.

DESCRIPTION

`Read_mdb` got more than one base array for the given design from MDB library.

WHAT NEXT

SEE ALSO

RMDB-154 (warning) Core area may not be set correctly.

DESCRIPTION

`read_mdb` failed to get the core area for the given design.

WHAT NEXT

Check the mdb library and rerun `read_mdb`.

SEE ALSO

RMDB-155 (warning) Failed to create routing obstruction.

DESCRIPTION

WHAT NEXT

RMDB-156 (information) Updating netlist from Milkyway database.

DESCRIPTION

This information message occurs when the tool is updating a netlist from the Milkyway database.

This message does not occur if the Milkyway database was initially created using a Jupiter or Astro flow.

WHAT NEXT

This is only an information message. No action is required.

RMDB-157 (information) Processing master '%s'.

DESCRIPTION

This information message occurs when the `read_mdb` command is processing the specified design master.

WHAT NEXT

This is only an information message. No action is required.

SEE ALSO

`read_mdb(2)`

RMDB-158 (error) Failed to get cell name.

DESCRIPTION

WHAT NEXT

RMDB-159 (error) Failed to initiate an iterator through ports in the cell.

DESCRIPTION

WHAT NEXT

RMDB-160 (error) Failed to initiate an iterator through cell instances in the cell.

DESCRIPTION

WHAT NEXT

RMDB-161 (error) Failed to initiate an iterator through port instances in the cell.

DESCRIPTION

WHAT NEXT

RMDB-162 (error) Voltage area %s contains no hierarchical

objects.

DESCRIPTION

read_mdb could not find any hierarchical cell belong to the given voltage area. This usually means that the voltage attribute was not correctly set for the cells. read_mdb does not recognize the voltage attribute set only to the leaf cells.

WHAT NEXT

Update the voltage area attribute for the hierarchical cells and do read_mdb again.

RMDB-163 (warning) Exclusive plan group '%s' is translated to non-exclusive bounds in the tool.

DESCRIPTION

This warning occurs because the tool does not support exclusive plan groups. These plan groups are treated as non-exclusive plan groups (bounds) for reading and writing purposes. Any subsequent writing would transfer the exclusive plan groups to non-exclusive bounds in this tool.

The hardness level of the bound is determined by the rigidity on the plan group. The tool considers anything other than rigidity of 10 to be soft bounds.

WHAT NEXT

You can create non-exclusive plan groups for a smooth flow between JXT/Astro. You can also convert all of the exclusive plan groups to voltage areas before doing any reading.

RMDB-164 (info) Successfully read SDC file attached to CEL view.

DESCRIPTION

JupiterXT and Astro can attach the SDC file to the CEL view. Read_mdb will read the attachment and invoke 'read_sdc' to import the SDC constraints. This message indicates this operation has completed successfully.

WHAT NEXT

ROPT

ROPT-001 (error) Qor does not converge. Exitting.

DESCRIPTION

You receive this error message because the design does not converge during route_opt. The tool is expecting better result after optimization but it got worse and stop continue to optimize.

WHAT NEXT

Please check if there is any issue in the following areas: constraints, congestion, routing, and utilization.

SEE ALSO

`route_opt` (2), `set_route_opt_strategy` (2),

ROPT-002 (warning) The design has too many route violation.

DESCRIPTION

You receive this warning message because the tool sees many route violations in the design. When the design has many route violation, the search and repair step takes a lot longer and will have impact overall runtime of route_opt. When the tool detects too many route violations, the tool will run only one loop of search and repair for the following steps regardless of the original search and repair loop settings to reduce runtime impact. Also, it is recommended that route violation should be taken care of before proceed further.

WHAT NEXT

Please check the source of route violation. If you want to ignore route violation checking, please refer `set_route_opt_strategy`.

SEE ALSO

`route_opt` (2), `set_route_opt_strategy` (2),

ROPT-003 (error) To run xtalk_reduction, please enable SI.

DESCRIPTION

You receive this error message because xtalk_reduction is enabled but SI flow is not enabled. The xtalk_reduction is effective on delta delay, switching noise and static noise. To run xtalk_reduction, at least one of SI effects such as delta delay, switching noise and static noise has to be used. To enable SI effect, please use "set_si_options".

WHAT NEXT

Please set any one of SI effects through "set_si_options".

SEE ALSO

`route_opt` (2), `set_si_options` (2),

ROPT-004 (error) To specify -only_ options, please set -incr option.

DESCRIPTION

All only options in route_opt, -only_hold_time and -only_wire_size, are supported only in incremental run. To enable -only settings, -incremental has to be set.

WHAT NEXT

Please set -incremental option in route_opt command.

SEE ALSO

`route_opt` (2),

ROPT-005 (information) Discontinue %s due to too many changes occurred.

DESCRIPTION

You receive this message because the tool sees too many changes were made in one optimization stage. When the tool made too many changes, there will be potential

convergence problems and to prevent the convergence problem, the tool stops optimization and move on to the detail placement and ECO route. To turn off this feature, please set routeopt_disable_cpulimit to true.

WHAT NEXT

Please check the number of violations in the design. If there are too many violations from different constraints, it is recommended to fix violations before running route_opt using psynopt.

SEE ALSO

`route_opt` (2), `set_route_opt_strategy` (2), `psynopt` (2), `routeopt_disable_cpulimit`(3)

ROPT-006 (information) max_design_rules cost has higher priority than the max delay cost.

DESCRIPTION

You receive this message because the tool is fixing design rule violation with max_design_rule cost as the highest priority. With this setup, the tool will fix design rule violation even it degrades timing.

WHAT NEXT

To disable this setup, please set routeopt_drc_over_timing to false.

SEE ALSO

`route_opt` (2), `set_route_opt_strategy` (2), `psynopt` (2), `routeopt_drc_over_timing`(3)

ROPT-007 (Error) -power_mode is an obsolete option, use -power

DESCRIPTION

-power_mode option is obsolete. To enable leakage optimization inside route_opt, please use -power option instead.

WHAT NEXT

Please set -power option in route_opt command.

SEE ALSO

route_opt (2) ~

ROPT-008 (error) Invalid specification for %s switch.

DESCRIPTION

The current specification for that switch is not valid one.

WHAT NEXT

Please use one of valid specification for the switch. To find out the valid specifications, please refer man page of **route_opt**.

SEE ALSO

route_opt (2)

ROPT-009 (Error) More than one -only_ options are specified.

DESCRIPTION

To enable any -only_ options in **route_opt**, single -only_ option should be specified. **route_opt** can't support multiple -only_ options.

WHAT NEXT

Please set only one -only_ option.

SEE ALSO

route_opt (2)

ROPT-010 (Error) Invalid option with -initial_route_only.

DESCRIPTION

The specified options is not valid with -initial_route_only.

WHAT NEXT

Please check man page for `-initial_route_only` to see which options are supported with `-initial_route_only`.

SEE ALSO

`route_opt` (2)

ROPT-011 (Error) -route_mode is obsoleted.

DESCRIPTION

Starting from 2007.03-SP2, the option `-route_mode` is no longer used in `set_route_opt_strategy`. All route settings come from `set_route_options` and `set_si_options`. If nothing is specified, `route_opt` will perform timing driven global route and crosstalk prevention track assign.

WHAT NEXT

Please check ROPT-013 and ROPT-014 for what settings are used for global route timing driven and track assign xtalk prevention inside `route_opt`.

SEE ALSO

`route_opt` (2), `set_route_options` (2), `set_si_options` (2)

ROPT-012 (Warning) Setting high density limit will cause convergence issue.

DESCRIPTION

You receive this message because you set the density limit for `route_opt` too high. There will be potential convergence problems due to large displacements.

WHAT NEXT

Please make sure the setting is intended one.

SEE ALSO

`route_opt` (2)

ROPT-013 (Information) Running global route with timing driven mode %d (%s).

DESCRIPTION

This message informs you that global route is running timing driven mode or not inside route_opt. By default, route_opt is running timing driven global route. To change the setting of global route timing driven, please use set_route_option. When the message is saying "user_define", that means the setting is coming from set_route_option.

WHAT NEXT

This is an informational message only. No action is required on your part.

RPGP

RPGP-001 (error) Compression does not work with alignment type '%s'

DESCRIPTION

This error message occurs when the **create_rp_group** command detects that you specified compress with incompatible alignment type.

WHAT NEXT

Choose either a different alignment type or compress so that they are compatible. After making any changes, rerun the command.

SEE ALSO

[create_rp_group\(2\)](#)

RPGP-002 (error) Alignment type '%s' requires that you also provide a -pin_align_name.

DESCRIPTION

This error message occurs when the **create_rp_group** command detects that you specified an alignment type that requires the additional specification of a pin alignment name.

WHAT NEXT

Choose either a different alignment type that does not require a pin alignment name or provide a pin alignment name. After making any changes, rerun the command.

SEE ALSO

[create_rp_group\(2\)](#)

RPGP-003 (warning) Spurious -pin_align_name '%s' provided

for alignment type '%s'.

DESCRIPTION

This warning message occurs when the **create_rp_group** command detects that you specified an alignment type that does not require the specification of a pin alignment name, so the given pin alignment name will be ignored.

WHAT NEXT

This is only a warning message. No action is required. You can eliminate this warning message by following the instructions below.

Choose either a different alignment type that requires a pin alignment name or do not provide a pin alignment name. After making any changes, rerun the command.

SEE ALSO

[create_rp_group\(2\)](#)

RPGP-004 (error) Duplicate instantiation: the instance %s is already being used to instantiate the group %s inside the group %s.

DESCRIPTION

This error message occurs when you instantiate a group twice using the same instance while using the **add_to_rp_group** command. A group may only be instantiated once per instance.

WHAT NEXT

Choose a different instance of the same design to instantiate it multiple times and then run the command again.

SEE ALSO

[add_to_rp_group\(2\)](#)

RPGP-005 (error) Non-positive keepout width: %d.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you specified a keepout width that is non-positive.

WHAT NEXT

Choose a positive keepout width or do not provide a keepout width. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-006 (error) Non-positive keepout height: %d.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you specified a keepout height that is not positive.

WHAT NEXT

Choose a positive keepout height or do not provide a keepout height. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-007 (information) No groups were removed.

DESCRIPTION

This information message occurs when the **remove_rp_group** command detects that no groups were removed. You specified the **-all** option, but no groups are loaded into memory yet, so there are no groups to remove.

WHAT NEXT

To suppress this informational message from being emitted, add the **-quiet** flag to the **write_rp_group** command.

SEE ALSO

`add_to_rp_group(2)`
`create_rp_group(2)`
`read_milkyway(2)`
`remove_rp_group(2)`
`write_milkyway(2)`
`write_rp_group(2)`

RPGP-008 (error) Keepout option%s specified for '%s' add.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you specified an option that is only used for keepouts but the **add_to_rp_group** argument is not **-keepout**.

WHAT NEXT

Either remove the keepout options or change the **add_to_rp_group** argument to **-keepout**. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-009 (error) Circular: attempt to include group '%s' within '%s' creates a circle.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects an attempt to create a hierarchical inclusion that would result in a chain of inclusions, such that a group would include itself by the transitive closure of inclusions.

WHAT NEXT

Eliminate any cycles in your hierarchy inclusion. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-010 (error) Relative Placement (RP) command %s requires that a physical design is loaded, but none is in memory.

DESCRIPTION

This error message occurs when the Relative Placement (RP) command you tried to evaluate detects that no physical design is loaded. A physical design must be loaded in memory in order to evaluate any RP commands.

WHAT NEXT

Load a physical design into memory and rerun the command.

SEE ALSO

`add_to_rp_group(2)`
`create_rp_group(2)`
`read_milkyway(2)`
`remove_rp_group(2)`
`write_milkyway(2)`
`write_rp_group(2)`

RPGP-011 (error) Hierarchical instantiation option%s specified for '%s' add.

DESCRIPTION

This error message occurs when the `add_to_rp_group` command detects that you specified an option that is only used for hierarchical instantiations, but the `add_to_rp_group` argument is not `-hierarchy`.

WHAT NEXT

Either remove the hierarchical instantiation options or change the `add_to_rp_group` argument to `-hierarchy`. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-012 (error) The -hierarchical or -leaf option%s specified for '%s' add.

DESCRIPTION

This error message occurs when the `add_to_rp_group` command detects that you specified an option that is only used for the `-hierarchy` or `-leaf` argument, and the `-keepout` argument was used.

WHAT NEXT

Either remove the options or change the `add_to_rp_group` argument to `-hierarchy` or `-leaf`. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-013 (error) A group named %s already exists in design %S.

DESCRIPTION

This error message occurs when `create_rp_group`, `extract_rp_group` or `order_rp_groups` command detects that you tried to create a new group using a name that is already being used for another group in the same design.

WHAT NEXT

Choose a new unique name for the group within the given design, and rerun the command.

SEE ALSO

`create_rp_group(2)`
`extract_rp_group(2)`
`order_rp_groups(2)`

RPGP-014 (error) Add at row %d is out of range for RP group

%s that has only %d rows.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you tried to add an item to a Relative Placement (RP) group in a row that is out of range of the rows for that group. If the object being added is a cell in multiple rows then some specified rows are out of range.

WHAT NEXT

Choose a new row that is within the rows of the RP group, or modify the RP group to have more rows using the **set_rp_group_options** command. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`
`set_rp_group_options(2)`

RPGP-015 (error) Add at column %d is out of range for RP group %s that has only %d columns.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you tried to add an item to a Relative Placement (RP) group in a column that is out of range of the columns for that group. If the object being added is a cell in multiple columns then some specified columns are out of range.

WHAT NEXT

Choose a new column that is within the columns of the RP group, or modify the RP group to have more columns using the **set_rp_group_options** command. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`
`set_rp_group_options(2)`

RPGP-016 (error) Cannot find cell '%s' in design '%s' as %s for

group '%s'.

DESCRIPTION

This error message occurs when the **add_to_rp_group**, **remove_from_rp_group** or **extract_rp_group** command detects that you passed in a cell name that could not be located in the design of the group.

WHAT NEXT

Check the spelling of the cell name and confirm that the cell you are providing is in the same design as the Relative Placement (RP) group to which you are trying to add/remove it. After making any changes, rerun the command.

SEE ALSO

[add_to_rp_group\(2\)](#)
[remove_from_rp_group\(2\)](#)

RPGP-017 (error) Duplicate hierarchical inclusion of group '%s'.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you tried to include a group that is already included elsewhere. A group may only be included once.

WHAT NEXT

Either remove the other inclusion, skip this one, or switch to hierarchy instantiation. After making any changes, rerun the command.

SEE ALSO

[add_to_rp_group\(2\)](#)

RPGP-018 (information) No groups were written.

DESCRIPTION

This information message occurs when the **write_rp_group** command detects that no groups were written. You specified the **-all** option but since no groups are loaded into memory yet, no groups can be written.

WHAT NEXT

This is only an informational message. You can eliminate this message by following the instructions below.

To prevent message from being emitted, add the **-quiet** flag to the **write_rp_group** command.

SEE ALSO

`add_to_rp_group(2)`
`create_rp_group(2)`
`read_milkyway(2)`
`remove_rp_group(2)`
`write_milkyway(2)`
`write_rp_group(2)`

RPGP-019 (error) Unable to add '%s' to column %d and row %d of group '%s' because that location is already occupied.

DESCRIPTION

This error message occurs when the **add_to_rp_group** command detects that you tried to add an item to a column and row position that is already occupied by another item. Each lattice position of a Relative Placement (RP) group can only contain one item.

WHAT NEXT

Either remove the item already located at the given lattice position before inserting another item at that location, or choose another location that is empty. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-020 (warning) Hierarchical RP group '%s' has an offset value that will be ignored.

DESCRIPTION

This warning message occurs because while processing a hierarchical Relative Placement (RP) group, an **-x_offset** or **-y_offset** value was present. However, offset values are not yet implemented for hierarchical RP, so the value is ignored. Offset

values can be provided when creating RP groups with the **create_rp_group** command.

WHAT NEXT

RP group offsets are not supported for hierarchical RP. This is only a warning message. You can eliminate this warning message by following the instructions below.

In the future, do not provide offset values for any RP groups that are hierarchical when creating them.

SEE ALSO

`create_rp_group(2)`

RPGP-021 (error) Cannot find cell '%s' in design '%s'.

DESCRIPTION

This error message occurs when the **all_rp_references** command detects that you passed in a cell name that could not be located in the given design.

WHAT NEXT

Check the spelling of the cell name and confirm that the cell you looking up is in the same design as the design given. Note that if **-design** is not supplied, the design in which the cell is looked up defaults to the `current_design`. After making any changes, rerun the command.

SEE ALSO

`all_rp_references(2)`
`current_design(2)`

RPGP-022 (warning) Ignored spurious -design argument.

DESCRIPTION

This warning message occurs when the **all_rp_references** command detects that you passed in a **-design** argument when no `cell_list` argument was supplied.

The **-design** argument is used to determine the context within which the `cell_list` argument is interpreted. Without any `cell_list` argument the **-design** argument does not have any meaning and is ignored.

WHAT NEXT

Either omit the **-design** argument or provide a *cell_list* argument to make this warning go away.

SEE ALSO

all_rp_references(2)

RPGP-023 (error) RP in Milkyway requires manual schema evolution.

DESCRIPTION

This error message occurs when the **read_milkyway** command detects that the database you are reading contains old format Relative Placement (RP) data. All old format Relative Placement (RP) data gets removed, so if you need to recover the RP data then do manual schema evolution or source RP information again.

WHAT NEXT

To do manual schema evolution, locate the old version of physical compiler that was used to create the Milkyway database you are now failing to read. Load that database using that old version and dump out all the RP annotations with **write_rp_groupfp -all -output filename**. Next, remove all the RP annotations with **remove_rp_groupfp -all**. With the RP now stored as a **TCL script in filename** and removed from memory, write back out a new Milkyway database with **write_milkywayfp**.

Go back to the new version of physical compiler where you first got this error and load in the newly created Milkyway database you just created with all the RP information stripped. Once it is loaded, execute the script stored in *filename* to reannotate your RP. Lastly, write back out the Milkyway again with **write_milkywayfp to create your manual schema evolved database**.

Now you can resume your prior work by replacing the old Milkyway database with the new schema evolved one you just created.

SEE ALSO

read_milkyway(2)
remove_rp_group(2)
write_milkyway(2)
write_rp_group(2)

RPGP-024 (error) Relative Placement (RP) %s failed.

DESCRIPTION

This error message occurs when an unexpected error condition arises while manipulating RP in a Milkyway CEL view.

WHAT NEXT

You may continue to work, however, any RP stored in your Milkyway CEL view should be considered corrupt and not used. You should report this problem to Synopsys with a testcase to reproduce it.

You can try to work around the limitation by a method similar to the manual schema evolution described in RPGP-023. This is done by dumping your RP as TCL commands via the **write_rp_groupfp command**, and then deleting all the RP via the **remove_rp_groupfp command**, and then writing out your Milkyway database without any RP. Finally, start a new session of this tool, load the Milkyway database you just created which has no RP, and reannotate the RP using the **TCL commands you created earlier with the write_rp_groupfp command**.

SEE ALSO

`read_milkyway(2)`
`remove_rp_group(2)`
`write_milkyway(2)`
`write_rp_group(2)`

RPGP-025 (error) Cannot find '%s' '%s' in rp group '%s'.

DESCRIPTION

This error message occurs when the **remove_from_rp_group** command detects that you passed in an item (cell,keepout,hierarchical or instance) name that could not be located in the rp group you provided.

WHAT NEXT

Check the spelling of the item name and confirm that the item belongs to the rp group you have provided. After making any changes, rerun the command.

SEE ALSO

`remove_from_rp_group(2)`

RPGP-026 (warning) Could not get legal location for placing cell '%s' in RP group '%s'.

DESCRIPTION

This is not a failure but a warning indicating that the location for the RP cell is reserved; Coarse placement will continue and will find next non-reserved location. If legal location can not be found then RP group placement may fail.

WHAT NEXT

See the placement results and use the command **check_rp_groups** for finding any RP constraint violations.

SEE ALSO

`check_rp_groups(2)`

RPGP-027 (warning) Possible placement failure of relative placement group '%s'.

DESCRIPTION

No enough area for the entire relative placement group to be placed together because of overlapping with fixed cells or placement obstruction. Note that the search region for the relative placement group in the core area is based on the value that you specify to the `-move_effort` option. The relative placement cells will be placed around blockages if possible. The relative placement group constraints might not be respected.

WHAT NEXT

Bring up the ICC GUI and check the placement results. Use the command **check_rp_groups** for finding any relative placement constraint violations. You might need to modify `-move_effort` for the relative placement group.

SEE ALSO

`check_rp_groups(2)`
`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-028 (warning): The height '%f' of the RP group '%s' is

more than the height '%f' of the core area.

DESCRIPTION

You receive this warning message because the RP group does not fit in the current core area. This might be due to overestimating the size of the RP group for the current core area.

WHAT NEXT

Redo the floorplan to increase the core area, or use Module Compiler shrink the RP group.

SEE ALSO

`check_rp_groups` (2).

RPGP-029 (warning) The width '%f' of RP group '%s' is more than the width '%f' of the core area.

DESCRIPTION

You receive this message because the RP group might be overlapped with other cells in the current core area. This is might be due to over-estimating the RP group for the current core area.

WHAT NEXT

If placement fails, redo the floorplan to increase the core area, or use Module Compiler to shrink the RP group.

RPGP-030 (warning) RP Group '%s' needed to move beyond specified movement limit to respect RP.

DESCRIPTION

The RP group can not be placed within the specified movement limit. RP Group will not be moved beyond specified limits so could result in violation of RP constraints.

WHAT NEXT

See the placement results and use the command **check_rp_groups** for finding any RP constraint violations. If RP placement fails then increase the movement limits, which can be set using the variables **physopt_rp_allow_x_move** and **physopt_rp_allow_y_move**.

SEE ALSO

`check_rp_groups(2)`

RPGP-031 (warning) POSSIBLE RP ALIGNMENT FAILURE: Failure in finding legal locations for maintaining RP Constraints of cluster '%s'.

DESCRIPTION

If the location of cell(s) is not legal and is overlapped with blockages, other cells etc then the RP constraints may be violated.

WHAT NEXT

See the placement results and use the command **check_rp_groups** for finding any RP constraint violations. If RP placement fails then increase the floorplan area.

SEE ALSO

`check_rp_groups(2)`

RPGP-032 (warning) Could not set user-specified orientations for cell '%s'.

DESCRIPTION

The user specified orientations can not be set because none of them are allowed at the legal location of the cell.

WHAT NEXT

Add more orientations to the list, so that one of them will be legal. If you add more orientations for one cell, consider adding similar orientations for the other cells in the same column to maximize the possibility of getting straight routes.

SEE ALSO

`check_rp_groups(2)`

RPGP-033 (warning) Possible failure of relative placement within the voltage region. Could not place the relative placement group '%s' within the voltage region.

DESCRIPTION

This warning occurs because of no area that is free of placement obstruction or fixed cells to place the entire relative placement group together in the voltage region. The relative placement cells are placed inside the voltage area if possible. The relative placement group constraints might not be respected.

WHAT NEXT

Bring up the GUI and check the placement results. You can use the `check_rp_groups` command to find any relative placement constraint violations. You might need to increase the size of voltage area if the relative placement group size is bigger than the size of voltage area. You might also need to use the `modify` command with the `-move_effort` option for the relative placement group.

SEE ALSO

`check_rp_groups(2)`
`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-034 (warning) All cells of the relative placement group '%s' do not belong to the same voltage region. This group is ignored during placement.

DESCRIPTION

This warning occurs because all of the cells of the relative placement group do not belong to the same voltage region. The voltage region has a higher priority than the relative placement group. During placement, this relative placement group is ignored, but voltage regions are honored.

WHAT NEXT

You can recreate the relative placement group with all the cells in one voltage

region.

SEE ALSO

`check_rp_groups(2)`
`create_rp_group(2)`

RPGP-035 (warning) Relative Placement leaf cell data may have been lost.

DESCRIPTION

The relative placement leaf cell data has been corrupted during placement optimizations. The reason may be because you may not have used the recommended RP flow, `set_dont_touch` or `set_size_only` on all RP cells, before doing placement. If RPGP-024 is concurrently issued with RPGP-035 then RPGP-024 may be ignored.

WHAT NEXT

Please use `set_dont_touch` or `set_size_only` on all RP cells before running placement.

SEE ALSO

`create_rp_group(2)`
`add_to_rp_group(2)`

RPGP-036 (warning) The x offset specified for the RP group '%s' has not been satisfied. The movement from the specified location is '%f'.

DESCRIPTION

This warning message occurs because while processing a Relative Placement (RP) group, an `x_offset` was present, and the RP group could not be placed at the requested location.

WHAT NEXT

This is only a warning message. The movement may not be significant. If it is significant then it may be caused by obstructions/blockages around that area. In such a case please specify appropriate x and y offsets.

SEE ALSO

```
create_rp_group(2)
set_rp_group_options(2)
remove_rp_group_options(2)
report_rp_group_options(2)
```

RPGP-037 (warning) The y offset specified for the RP group '%s' has not been satisfied. The movement from the specified location is '%f'.

DESCRIPTION

This warning message occurs because while processing a Relative Placement (RP) group, an **y_offset** was present, and the RP group could not be placed at the requested location.

WHAT NEXT

This is only a warning message. The movement may not be significant. If it is significant then it may be caused by obstructions/blockages around that area. In such a case please specify appropriate x and y offsets.

SEE ALSO

```
create_rp_group(2)
set_rp_group_options(2)
remove_rp_group_options(2)
report_rp_group_options(2)
```

RPGP-038 (warning) The alignment has not been respected for RP group '%s'.

DESCRIPTION

This warning occurs when the alignment specified for an RP group or any of its hierarchical RP groups has not been met. The warning indicates failure of column alignment of non-compressed RP groups or row alignment of compressed RP groups.

WHAT NEXT

You may open up the GUI and check the alignment of the RP groups. The specified alignment may not be met after placement because of overlap with fixed placement objects.

SEE ALSO

```
check_rp_groups(2)
create_rp_group(2)
set_rp_group_options(2)
set_attribute(2)
```

RPGP-039 (warning) The utilization has not been respected for the RP group '%s'.

DESCRIPTION

This warning occurs because the actual utilization is lower than the specified utilization. The default utilization is 1.0. The utilization has not been respected such that column alignment could be maintained for relative placement (RP) columns; this can occur when tap cell arrays or other fixed physical cells or blockages are present.

WHAT NEXT

Bring up the concerned relative placement group in the GUI to analyze the exact reason for the utilization constraint violation.

SEE ALSO

```
check_rp_groups(2)
create_rp_group(2)
set_rp_group_options(2)
```

RPGP-040 (warning) Relative placement group '%s' contains too many objects and cannot be created.

DESCRIPTION

You received this message because the relative placement group you are trying to create contains too many objects. The relative placement group was not created.

WHAT NEXT

You can continue to work, however this relative placement group was not created in the database and subsequent add_to_rp_group commands for this group will fail. A single flat relative placement group must contain less than 4194299 objects for efficient handling of relative placement during placement. To create a larger relative placement group, you can use hierarchical relative placement groups.

SEE ALSO

`create_rp_group(2)`
`add_to_rp_group(2)`

RPGP-041 (warning) The relative placement constraints cannot be honored for relative placement group %s, because all cells of relative placement group does not belong to same move bound.

DESCRIPTION

You received this message because all cells of the relative placement group does not belong to the same move bound. The move bounds have higher priority than the relative placement group. During placement, the relative placement group is ignored, but the move bounds are honored.

WHAT NEXT

If you use both relative placement groups and move bounds, make sure that all cells of a relative placement group are in the same move bound.

SEE ALSO

`create_rp_group(2)`
`add_to_rp_group(2)`
`create_bounds(2)`

RPGP-042 (warning) Possible placement failure of relative placement keepout '%s'.

DESCRIPTION

You received this message because the specified hard keepout would have been overlapped with tap cell if placed at the intended location.

WHAT NEXT

You can continue to work, however this particular rp keepout will not be placed. If you want keepouts of rp group to be overlapped with tap cell, please set "-allow_keepout_over_tapcell true" for that rp group using command "set_rp_group_options" and re-run the command again.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-043 (information) The `size_only` value for `cts_option` attribute of relative placement group is only applicable to `clock_opt`, not to '`%s`'. '`%s`' will use `fixed_placement` for each relative placement group, which has `size_only` value specified for `cts_option`.

DESCRIPTION

The commands `compile_clock_tree` and `optimize_clock_tree` does not support `size_only` value for `cts_option` and these commands use `fixed_placement` value for each relative placement group, which has `size_only` value specified for `cts_option`.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-044 (warning) The given name '`%s`' is ambiguous and `%d` cells matched that name.

DESCRIPTION

The given cell name matches with more than one cell, so no object is being added into the relative placement group.

WHAT NEXT

To add a leaf or instance in relative placement group please specify a name which can be uniquely determined. You may specify the full hierarchical name of the object to be added.

SEE ALSO

`add_to_rp_group(2)`
`write_rp_groups(2)`

RPGP-045 (warning) Can't find specified relative placement group(s) in design '%s'.

DESCRIPTION

None of the specified relative placement group is found in the design.

WHAT NEXT

Please provide the correct relative placement group name. You may use "get_rp_groups" command to see relative placement groups that are present in the design.

SEE ALSO

`get_rp_groups(2)`
`write_rp_groups(2)`

RPGP-046 (warning) Orientation on hierarchical inclusions and instantiations is not supported, and will be ignored during placement.

DESCRIPTION

Orientation on hierarchical inclusions and instantiations is not supported. The option will be ignored.

SEE ALSO

`report_rp_group_options(2)`
`report_attribute(2)`
`write_rp_groups(2)`

RPGP-047 (error) The value '%s' for option '-allow_keepout_over_tapcell' is not valid.

DESCRIPTION

The value for option "-allow_keepout_over_tapcell" can either be true or false.

WHAT NEXT

Please provide the correct value for the option.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-048 (information) There are no relative placement groups in design '%s'

DESCRIPTION

There are no relative placement groups in the design.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-049 (Error) Keepout '%s' already exists in '%s' relative placement group.

DESCRIPTION

The keepout already exists in the relative placement group. So this keepout will not be added into the relative placement group.

WHAT NEXT

You may add the keepout with different name in the relative placement group.

SEE ALSO

`get_rp_group_keepouts(2)`
`write_rp_groups(2)`

RPGP-050 (Information) The ignore option of the relative placement group '%s' is being removed because it is not a top

level group anymore.

DESCRIPTION

The ignore option is supported for top level relative placement group only. The ignore option of the relative placement group is being removed, because it is being added as hierarchical relative placement group in another relative placement group, and can not be ignored anymore.

WHAT NEXT

If you want to ignore the relative placement group then do not add it as a hierarchical relative placement group.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-051 (error) The `-cts_option` option should have a value of `fixed_placement` or `size_only`.

DESCRIPTION

This error occurs because the `-cts_option` option has been given a value other than `fixed_placement` or `size_only` in the `create_rp_group` or `set_rp_group_options` command.

WHAT NEXT

You can continue to work, but the command that is responsible for producing the error is not implemented. Alternatively, the you can rerun the same command using the `fixed_placement` or `size_only` value for the `-cts_option` option.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-052 (error) The `-route_opt_option` option should have a

value of `fixed_placement` or `in_place_size_only`.

DESCRIPTION

This error occurs because the `-route_opt_option` option has a value other than `fixed_placement` or `in_place_size_only` in the `create_rp_group` or `set_rp_group_options` command.

WHAT NEXT

You can continue to work, but the command that is producing the error is not implemented. Alternatively, the you can rerun the same command using the `fixed_placement` or `in_place_size_only` value for the `-route_opt_option` option.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-053 (error) The `-psynopt_option` option should have a value of `fixed_placement` or `size_only`.

DESCRIPTION

This error occurs because the `-psynopt_option` option has a value other than `fixed_placement` or `size_only` in the `create_rp_group` or `set_rp_group_options` command.

WHAT NEXT

You can continue to work, but the command that is producing the error is not implemented. Alternatively, the you can rerun the same command using the `fixed_placement` or `size_only` value for the `-psynopt_option` option.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`

RPGP-054 (error) The functionality for multiple RP locations for a cell is not currently supported. The tool is skipping add of '%s'

into '%s' since it is already in relative placement group '%s'.

DESCRIPTION

This error occurs because you attempted to include a leaf cell in two different relative placement (RP) groups.

WHAT NEXT

You can continue to work, although the attempted addition of a leaf cell to the RP group has not occurred.

SEE ALSO

`add_to_rp_group(2)`

RPGP-055 (Error) Relative Placement (RP) group '%s' is corrupted and is being removed.

DESCRIPTION

This error occurs when the tool removes a relative placement group because its data has been corrupted. The corrupted relative placement group along with its hierarchical groups has been removed.

WHAT NEXT

The user may continue working, although the relative placement group, for which this error was thrown, has been removed. Alternatively, the user may recreate the affected relative placement group, and then continue working.

SEE ALSO

`write_rp_groups(2)`
`get_rp_groups(2)`

RPGP-056 (error) Cannot have "::" in the name specified for a relative placement group.

DESCRIPTION

This error occurs because the tool prepends the design name to the given relative

placement (RP) group name and stores it in the following format:

```
design_name::group_name
```

Hence, the RP group name you specify should not include ">::".

WHAT NEXT

The RP group has not been created. Remove the ">::" and rerun the command to create the RP group.

SEE ALSO

```
create_rp_group(2)
extract_rp_group(2)
order_rp_groups(2)
```

RPGP-057 (error) No valid leaf cells are found in the list of cells for extract_rp_group.

DESCRIPTION

This error occurs because no leaf cells are found in the list of cells for the **extract_rp_group** command. The **extract_rp_group** command filters out macros, hierarchical cells, cells belonging to other RP groups, and unplaced cells if you specify the **-coordinates** or **-physical** option.

WHAT NEXT

Ensure that the *coordinates_list* or *objects_list* value lists cells that are not macros or hierarchical and which do not belong to any other RP group. If you use the **extract_rp_group** command with the **-coordinates** or **-physical** option, the tool considers only cells that are placed.

SEE ALSO

```
add_to_rp_group(2)
extract_rp_group(2)
```

RPGP-058 (error) The number of RP cells is more than the grid

size (rows*columns) you provided for `extract_rp_group`.

DESCRIPTION

This error occurs because the number of relative placement (RP) cells in the list you specified by the `-coordinates` or `-objects` option of `extract_rp_group` command is more than the grid size provided.

WHAT NEXT

The RP group is not created. Ensure that the number of cells you specify matches the grid size (rows*columns) and that the cells are not hierarchical cells and do not belong to another existing RP group.

SEE ALSO

`extract_rp_group(2)`

RPGP-059 (information) '%s' coordinate specified as -coordinates option for `extract_rp_group` is outside the core. Moving it inside the core.

DESCRIPTION

This message advises you if any of the coordinates specified in the `-coordinates` option of the `extract_rp_group` command falls outside the core area.

WHAT NEXT

This is only an informational message. No action is required. The specified relative placement (RP) group is created by using the modified coordinates. If this is not the intended result, you can rerun the command specifying the correct values for `-coordinates` option.

SEE ALSO

`add_to_rp_group(2)`
`extract_rp_group(2)`

RPGP-060 (error) The region provided in the `-coordinates`

option of extract_rp_group is incorrect.

DESCRIPTION

This error occurs because, for the values specified by the **-coordinates** option or the **extract_rp_group** command, the lower-left x-coordinate is greater than the upper-right x-coordinate or the lower-left y-coordinate is greater than the upper-right y-coordinate.

WHAT NEXT

The specified relative placement (RP) group is not created. Rerun the command using the correct values for the xy-coordinates.

SEE ALSO

`add_to_rp_group(2)`
`extract_rp_group(2)`

RPGP-061 (Warning) The number of RP cells is less than the grid size (rows*columns) provided by the user for extract_rp_group

DESCRIPTION

This warning occurs when the number of RP cells in the list provided via **-coordinates** or **-objects_list** by the user is less than the grid size provided.

WHAT NEXT

The specified relative placement group will be created, but the grid would not be fully occupied by relative placement cells.

SEE ALSO

`extract_rp_group`

RPGP-062 (warning) Compress does not work with alignment

type '%s'

DESCRIPTION

This error message occurs when the tool detects that you specified compress with incompatible alignment type.

WHAT NEXT

You can continue, however compress will be ignored and alignment type will be respected. If you don't want that, choose either a different alignment type or compress so that they are compatible. After making any changes, rerun the command.

SEE ALSO

`create_rp_group(2)`
`set_rp_group_options(2)`
`remove_rp_group_options(2)`

RPGP-063 (warning) Compress does not work with alignment type '%s'

DESCRIPTION

This error message occurs when the tool detects that you are trying to override the alignment type of an element of a relative placement group with an alignment type which is incompatible with compress. compress is set for parent relative placement group.

WHAT NEXT

You can continue, however alignment type of the element will not be overridden. If you don't want that, choose either a different alignment type or compress so that they are compatible. After making any changes, rerun the command.

SEE ALSO

`add_to_rp_group(2)`
`set_rp_group_options(2)`
`remove_rp_group_options(2)`

RPGP-064 (error) bit stack placement is not supported for

hierarchical relative placement group.

DESCRIPTION

This error message occurs when the tool detects that you are trying do bit stack placement for hierarchical relative placement group which is not supported.

WHAT NEXT

Please set physopt_use_bit_stacked_placement to FALSE and re run the command.

SEE ALSO

`add_to_rp_group(2)`
`remove_from_rp_group(2)`

RPGP-065 (error) Keepout '%s' will not be placed.

DESCRIPTION

The relative placement group which need to be compressed does not support keepout for which width or height is not provided.

WHAT NEXT

Please provide height and width of the keepout or remove this keepout from relative placement group or remove the compress flag from the relative placement group which contains that keepout.

SEE ALSO

`add_to_rp_group(2)`
`remove_from_rp_group(2)`
`remove_rp_group_options(2)`

RPGP-066 (warning) The size_only flow is used for relative placement group '%s', because fixed_placement flow is not supported during place_opt.

DESCRIPTION

This warning occurs because the '`-psynopt_option`' value specified for a relative

placement group is `fixed_placement`, so it will be ignored during `place_opt`. Instead, `place_opt` performs `size_only` for cells in the relative placement groups.

WHAT NEXT

You can continue working. However the `size_only` is used as the '`-psynopt_option`', instead of `fixed_placement` during `place_opt`.

SEE ALSO

`create_rp_group(2)`
`remove_rp_group_options(2)`
`set_rp_group_options(2)`

RPGP-067 (error) Hard macros cannot be added to a relative placement group. Skipping addition of hard macro '%s' to relative placement group '%s'.

DESCRIPTION

This error occurs when '`add_to_rp_group`' or '`extract_rp_group`' attempts to add a hard macro to a relative placement group. Only non-macro cells can be added as leaf cells of relative placement groups.

WHAT NEXT

You may continue to work. The addition of hard macro cells to the relative placement group will be skipped.

SEE ALSO

`add_to_rp_group(2)`
`extract_rp_group(2)`

RPGP-068 (warning) `physopt_use_bit_stacked_placement` variable is obsolete. Please use `-compress` switch of `create_rp_group` or `set_rp_group_options` command instead.

DESCRIPTION

You receive this warning message because you used a variable that is obsolete. Use `-compress` option of command `create_rp_group` or `set_rp_group_options` as described in

their corresponding man pages.

WHAT NEXT

Remove the obsolete variable, and use new switch of `create_rp_group` or `set_rp_groups_options`.

SEE ALSO

`create_rp_group(2)` `set_rp_groups_options(2)` `remove_rp_group_options(2)`

RPGP-069 (warning) The Relative Placement group '%s' has multiple instances and will not be removed.

DESCRIPTION

The command `remove_rp_groups` when called with `-hier` option will not remove any Relative Placement groups instantiated down the hierarchy of the Relative Placement groups specified, unless all its instantiations have been removed.

WHAT NEXT

You may call `remove_rp_groups` command for the Relative Placement group that is not removed, to remove it from the design.

SEE ALSO

`remove_rp_groups(2)` `write_rp_groups(2)`

RPGP-070 (Error) Multiple locations are not supported for '%s'.

DESCRIPTION

The options `num_rows` and `num_columns` of command `add_to_rp_group` can be used to add a cell in multiple locations of relative placement group. Multiple locations are not supported for non-leaf objects.

WHAT NEXT

Please add the object without options `num_rows` and `num_cols`.

SEE ALSO

`add_to_rp_group(2)`

RPGP-071 (Error) The alignment bottom-right and bottom-pin are not supported for multiple column cell.

DESCRIPTION

A RP cell is allowed in multiple columns of a relative placement group. Only bottom-left alignment is supported for such kind of cells. This error gets issued when bottom-right or bottom-pin alignment is being set on multiple column cell or on the relative placement group which contains multiple column cell.

WHAT NEXT

Please add the multiple column cell to the relative placement group with bottom-left alignment, using option `-alignment` of command `add_to_rp_group`.

SEE ALSO

`add_to_rp_group(2)`

RPGP-072 (Error) The multiple location cell is not supported with compress mode.

DESCRIPTION

The options `-num_rows` and `-num_columns` of command `add_to_rp_group` can be used to add a cell in multiple locations of relative placement group. The compress mode is not allowed for the relative placement group that contains multiple location cell.

WHAT NEXT

Please either remove compress mode from RP group using `remove_rp_group_options` command or try to add cell again with no multiple locations.

SEE ALSO

`create_rp_group(2)`
`add_to_rp_group(2)`
`set_rp_group_options(2)`
`remove_rp_group_options(2)`

RPGP-074 (error) Width or height for space keepout %s need to be specified.

DESCRIPTION

This error message occurs when the `add_to_rp_group` command detects that either you have not specified width or height (or both) for a space keepout or the corresponding values are not greater than zero.

WHAT NEXT

Choose appropriate value for keepout height and width and rerun the command.

SEE ALSO

`add_to_rp_group(2)`

RPGP-075 (information) The bottom-pin alignment is being ignored for multiple location cell '%s'.

DESCRIPTION

A RP cell is allowed in multiple columns of a relative placement group. Only bottom-left alignment is supported for such kind of cells.

WHAT NEXT

Please add the multiple column cell to the relative placement group with bottom-left alignment, using option `-alignment` of command `add_to_rp_group`.

SEE ALSO

`add_to_rp_group(2)`

RPGP-076 (information) No pin named "%s" exists in cell "%s" in RP group "%s". Pin alignment will be ignored for this cell.

DESCRIPTION

The pin align name specified for the given leaf cell, either set on the RP group or set on the leaf cell, does not exist. Hence the pin alignment will not be honored

for this cell.

WHAT NEXT

Please check the pin align name specified for the leaf cell and the RP group. You may specify the pin align name for the leaf cell via the set_attribute command or you can specify the pin align name of the RP group by using -pin_align_name option in the set_rp_group_options command.

SEE ALSO

set_attribute(2)
set_rp_group_optionns(2)

RPGP-077 (information) The list specified for check_rp_groups contains a hierarchical RP group "%s" which will be ignored.

DESCRIPTION

check_rp_groups checks and reports failures on only top-level relative placement groups, not on hierarchical RP groups.

WHAT NEXT

Please use check_rp_groups for the parent RP group of a hierarchical RP group to find out the failures.

SEE ALSO

check_rp_groups(2)
write_rp_groups(2)

RPGP-078 (information) There are no RP group failures in the specified RP groups.

DESCRIPTION

This message occurs when the check_rp_groups command finds no RP failure on top-level RP groups in the specified list. Notice that errors on hierarchical RP groups will also be reported on the top-level group.

WHAT NEXT

SEE ALSO

`check_rp_groups(2)`

RPT

RPT-1 (warning) Reports may be inaccurate and/or incomplete due to interrupt.

DESCRIPTION

WHAT NEXT

RPT-2 (warning) %d unresolved references are not included in this report.

DESCRIPTION

WHAT NEXT

RPT-3 (warning) No timing information for '%s'.

DESCRIPTION

WHAT NEXT

RPT-4 (information) Reported the %d requested paths; other

paths have identical delays.

DESCRIPTION

WHAT NEXT

RPT-5 (error) Illegal -%s list.

DESCRIPTION

WHAT NEXT

RPT-6 (error) No match for %s '%s'.

DESCRIPTION

WHAT NEXT

RPT-7 (information) This design contains unmapped logic.

DESCRIPTION

WHAT NEXT

RPT-8 (information) This design contains black box (unknown) components.

DESCRIPTION

This informative message is printed during report when the current design contains black box components. The purpose of the message is to remind users that the contents of black box components are not reported.

WHAT NEXT

RPT-9 (information) This design contains at least one timing loop at pin: '%s'.

DESCRIPTION

WHAT NEXT

RPT-10 (warning) Design '%s' has no schematic.

DESCRIPTION

WHAT NEXT

RPT-11 (error) This design has no %ss.

DESCRIPTION

WHAT NEXT

RPT-12 (warning) This design has no %s.

DESCRIPTION

WHAT NEXT

RPT-13 (warning) The replace_fpga command has been run on portions of this design. Since replace_fpga replaces fpga resources by gates the

report you are about to see may not accurately convey table lookup usage information. It is better to use `report_fpga` BEFORE `replace_fpga`.

DESCRIPTION

This error may be seen during `report_fpga`, if the `replace_fpga` command was used to replace programmable cells by gates in the design, before running the report. Since the programmable cells are no longer present in the design, their resource usage cannot be reported, and the resulting report will not be correct. As a methodology, it is best to run `report_fpga` BEFORE running `replace_fpga`.

WHAT NEXT

Use the `report_fpga` prior to using the `replace_fpga` command.

RPT-14 (error) A %s report can not be generated for %s designs.

DESCRIPTION

The named report command is not valid for the specified type of designs.

WHAT NEXT

Check the documentation for that specific report command to verify what types of designs it can accept. Also make sure that your design has been linked to the correct library.

RPT-15 (error) Conflicting inputs for the options '%s'.

DESCRIPTION

Some input option combinations are not legal.
For example, `report_cache -larger 5 -smaller 5` is not allowed.

WHAT NEXT

RPT-16 (warning) Corrupt or unreadable pathname.

The problem is at the pathname '%s',
one of the components of the pathname, or one level below the
pathname.

Aborting processing for this pathname.

DESCRIPTION

A file or directory is nonexistent, unreadable, or has the wrong format.

WHAT NEXT

Remove the entire directory structure that contains the corrupted cache. Examine for corrupted format the pathname, its components, and the files one level below. Use the UNIX **ls -l** command. Examine filename formats of similar files. Frequently the *cache_read* or *cache_write* variable lists directory X as a cache directory, but the directory X/synopsys_cache_v*.* does not exist.

RPT-17 (warning) Missing synthetic library information for the
cache entry

'%s'.

This report will use parameter names like 'unknown_param_1'.

DESCRIPTION

There is no information about this cache entry from the files listed in the *synthetic_library* variable. Frequently, an entry will be written into the cache when

a specific .sldb file is included in *synthetic_library*.
But later, when the cache is searched, that file is not
included so the number of parameters is unknown.

WHAT NEXT

Use *report_lib* to examine the contents of .sldb files.

Place the .sldb file that contains the cache entry into
the *synthetic_library* variable.

RPT-18 (error) Syntax error in -parameters input option at or near '%S'.

DESCRIPTION

Error occurred while parsing or interpreting the user's input option for -parameters.

WHAT NEXT

See man page for the command.

RPT-19 (warning) Inconsistent number of parameters for the cache entry

'%S'.

This report will use parameter names like 'unknown_param_1', if there are parameters.

DESCRIPTION

There is an inconsistency between the number of parameters found in the cache directory and the number of parameters defined for the module in the synthetic library (.sldb file). The corresponding synthetic library may not be defined in the *synthetic_library* variable, or the cache directory structure could be corrupted.

WHAT NEXT

Check that the module's .sldb file is listed in the *synthetic_library* variable. Use **report_synlib** to examine the parameters defined by the .sldb files. To see if this pathname differs from other pathnames, look at the cache directory structure.

RPT-20 (information) This design has been annotated with physical cluster hierarchy.

DESCRIPTION

The **read_clusters** command has been used to annotate onto this design physical cluster hierarchy information. Physical cluster hierarchy is used to direct the **reoptimize_design** command to optimize only those cells located in the same physical region on the chip. This leads to more predictable wiring delay estimates.

WHAT NEXT

RPT-21 (error) The report_clusters command cannot be specified for the design '%s', which has no physical cluster hierarchy.

DESCRIPTION

No physical cluster hierarchy has been associated with the design. The **report_clusters** command makes sense only when physical cluster hierarchy information is present on a design.

You can use the **read_clusters** command to annotate physical cluster hierarchy information onto a design. Physical cluster hierarchy is used to direct the **reoptimize_design** command to optimize only those cells located in the same physical region on the chip. This leads to more predictable wiring delay estimates.

WHAT NEXT

RPT-22 (error) The design '%s' has no cluster named '%s'.

DESCRIPTION

No physical cluster of the name given is associated with the current design.

WHAT NEXT

Use the **report_clusters** command to list all the valid names, and reissue the command.

RPT-23 (error) The -cells option can be supplied only if a -cluster is specified.

DESCRIPTION

Only the cells contained within a cluster may be listed with the report_clusters command.

WHAT NEXT

RPT-24 (warning) Problems encountered with removing the file or directory '%s'.

DESCRIPTION

The attempt to remove the file or directory failed.

WHAT NEXT

Look at the protection modes of the file and its directory.

RPT-25 (error) Clock '%s' cannot be used for all_registers because it has no period.

DESCRIPTION

The **all_registers -clock** *clock_name* command only works when the specified clock has a valid period. This is because the timing verifier needs to know the periodic waveform of a clock object.

WHAT NEXT

Use **create_clock -period** *period_value* **-waveform** *waveform_spec* *object_list* to describe the clock properly, then reissue the **all_registers** command.

RPT-26 (error) Unable to find clock '%s'.

DESCRIPTION

The timing verifier was unable to find the specified clock.

WHAT NEXT

Use **report_clock** to see if the clock is described correctly. Use

report_transitive_fanout -clock_tree to list the transitive fanout of the clock sources.

RPT-27 (warning) Some clocks have no period defined. These clocks will not be considered for timing.

DESCRIPTION

Some of the clocks in the design do not have a period defined. To affect timing of the design, a period is required for the clock.

WHAT NEXT

To set a period on a clock, use **create_clock -period** or **max_period**. The period value must be zero or greater.

RPT-30 (error) Cannot find wire load '%s' in design '%s'.

DESCRIPTION

The **report_wire_load** command could not be executed because the wire-load model defined could not be found on the design or in the libraries linked to the design.

WHAT NEXT

Use **report_wire_load** to list the wire-load models on the design and its clusters. Use **list link_library** to list the link library, and use **report_lib** to list the wire-load models in a library.

RPT-31 (warning) There is no porosity information in library '%s'.

DESCRIPTION

The **report_routability** command reports the "porosity" of the current design. The named library does not contain porosity information. Porosity is a measure of the number of channels available for routing over the cells in the design. Some technologies, such as FPGA, do not have porosity information in their libraries. Standard cells and gate-array technology libraries do contain porosity information.

WHAT NEXT

If you have Library Compiler, add the porosity information for each cell. If you don't have Library Compiler, contact the owners of the library and ask them to include porosity information in their next library release.

RPT-32 (warning) There is no porosity information in link libraries.

DESCRIPTION

The **report_routability** command cannot report the "porosity" of the design because the libraries on the link path do not contain porosity information. Porosity is a measure of how many channels are available for routing over the cells in the design. Some technologies, such as FPGA, do not have porosity information in their libraries. Standard cells and gate-array technology libraries do contain porosity information.

WHAT NEXT

If you have Library Compiler, add the porosity information for each cell in the libraries on the link path. If you don't have Library Compiler, contact the owners of the link libraries and ask them to include porosity information in their next library release.

RPT-33 (error) Could not find the specified %s pin.

DESCRIPTION

This error will be seen during **report_delay_calculation** if the specified pin can not be found in the current design.

WHAT NEXT

Check the current design to see if the pin name was entered correctly.

RPT-34 (error) Library cell delay information is protected.

DESCRIPTION

This error is seen during **report_delay_calculation** if the technology library associated with a cell delay arc has not been loaded with the **read_lib** command or if

the technology library does not have the library feature report_delay_calculation enabled.

WHAT NEXT

Load the ASCII version of the library with the read_lib command or modify the library source to add the library feature report_delay_calculation.

RPT-35 (error) There is no cell or net delay arc between pins '%s' and '%s'.

The pins must be on the same net or the same cell.

DESCRIPTION

This error will be seen during **report_delay_calculation** if there is not delay arc (either a net arc or a cell arc) between the 'from' and 'to' pins given to this command. The specified pins should be driver and load pins on the same net to see a net delay arc calculation, and should be input and output pins of a cell to see the details of a cell delay arc calculation.

WHAT NEXT

Check the pin names against those in the design to see if they were specified correctly.

RPT-36 (error) There is no library associated with the cell attached to the 'to' pin.

DESCRIPTION

This error will be seen during **report_delay_calculation** if pins on a non-leaf cell are specified for cell delay arc. Cell delay data is only available for leaf cells from a technology library.

WHAT NEXT

Move down the design hierarchy to a leaf cell.

RPT-37 (error) Must specify exactly one '%s' pin for this

command.

DESCRIPTION

This error will be seen during `report_delay_calculation` if more than one pin is specified via either the -from or -to options.

WHAT NEXT

Try again, specifying exactly one pin for both the -from, and -to options.

RPT-38 (error) Timing arc type '%s' is not supported for this command.

DESCRIPTION

This error will be seen during `report_delay_calculation` if delay information is requested for an unsupported arc type. Supported arc types include: . See the Library Compiler manual for details about arc types.

WHAT NEXT

RPT-40 (warning) The '-insts' option is available only with a TestManager license.

It will be ignored.

DESCRIPTION

The '-insts' option on 'report_test -faults' and 'report_test -coverage' is not available without a TestManager license.

WHAT NEXT

RPT-41 (warning) The faults annotated on the design are being

ignored.

DESCRIPTION

The design has fault information annotated on it. This is probably because the 'atpg_keep_faults_data' variable was set when writing out the design. This variable is not supported with the TestManager and the faults on the design will be ignored.

WHAT NEXT

The 'restore_test' command provides a much more powerful and flexible mechanism to save fault information.

RPT-42 (warning) Constraint generation interrupted. Constraint file may be incomplete or inaccurate.

DESCRIPTION

Constraint generation was interrupted by Ctrl-C from the keyboard. Constraints will still be written out but the generated file may be incomplete or inaccurate.

WHAT NEXT

The safest course of action is to re-run write_constraints without interruption. However, if the constraint file is manually validated and appears correct, you can probably use it.

RPT-45 (warning) The value for '%s' must be between '%s' and '%S'.

Using default value of '%s' instead.

DESCRIPTION

The value specified is out of range. A default value was used instead.

WHAT NEXT

Enter the command again with a number in the range if the default was inappropriate.

RPT-46 (warning) Command specific default precision will be used while performing report.

DESCRIPTION

The variable `report_default_significant_digits` is set to a value -1. This causes command specific default precision to be used while reporting, on the listed report commands.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`report_cell` (2), `report_constraint` (2), `report_clock_gating_check` (2), `report_net` (2), `report_path_budget` (2), `report_port` (2), `report_qor` (2), `report_timing` (2), `write_constraints` (2), `write_sdf` (2).

RPT-50 (error) Could not report timing and area information for the cache model due to missing %s.

DESCRIPTION

You receive this error message because you specified the `-statistics` option of the `report_cache` command. But missing from the search path are one or more synthetic libraries specified in the synthetic library list or one or more target libraries specified in the synlib target library list of the cached models.

WHAT NEXT

Verify that all specified synthetic libraries and target libraries are available in the search path.

SEE ALSO

`report_cache` (2).

RPT-51 (Information) `report_cache -statistics` implies that only

cached models will be reported.

DESCRIPTION

You receive this informational message because you have specified the **-statistics** option with the **report_cache** command. This means that only cached models will be reported.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

report_cache (2).

RPT-52 (error) Could not find module '%s' or implementation '%s' in the synthetic libraries.

DESCRIPTION

You receive this error message because you executed the **report_cache** command with the **-statistics** option, and the module or implementation of the cached model is not in the synthetic libraries.

WHAT NEXT

Add to the synthetic library list the synthetic library used at the creation of the cache model.

SEE ALSO

report_cache (2).

RPT-53 (error) Could not read the cache entry '%s'.

DESCRIPTION

You receive this error message when you execute the **report_cache** command and the cache entry is either not readable or corrupted.

WHAT NEXT

Verify that the entry is available.

SEE ALSO

`report_cache (2)`.

RPT-54 (Error) -voltage and/or -temperature options are supported only in multi-voltage mode.

DESCRIPTION

Voltage and temperature options can be used only when design is multi voltage. Multi voltage design contains blocks specified with different operating conditions.

WHAT NEXT

RPT-77 (error) Cell '%s' is invalid for scan. %s.

DESCRIPTION

The error shows an issue with scan-replacement or scan-insertion.

WHAT NEXT

You need to check the specification and configuration settings and see if something is wrong.

RPT-78 (Information) There are '%d' more cells with the same error.

DESCRIPTION

The error shows an issue with scan-replacement. This accompanies RPT-77 message.

WHAT NEXT

You need to check the RPT-77 message shown before this to see the actual error.

RPT-79 (warning) Cell '%s' is not valid for scan. %s.

DESCRIPTION

The warning shows an issue with scan-replacement or scan-insertion. This may not be critical for scan-insertion.

WHAT NEXT

You need to check the specification and configuration settings and see if something is wrong.

RPT-80 (Information) All the '%d' sequential cells are valid for scan.

DESCRIPTION

The message shows that all sequential cells are valid after scan-replacement or scan-insertion.

WHAT NEXT

RPT-81 (Warning) Relative Scope of the object "%s" not reported as the object lies in a higher logical scope.

DESCRIPTION

This message warns that one of the objects whose relative scope is being reported is above the current logical level of hierarchy.

WHAT NEXT

RPT-90 (error) The options -bucket_range and -bucket_number are mutually exclusive.

DESCRIPTION

Both options -bucket_range and -bucket_numbers were used in the report_histogram

command.

WHAT NEXT

Please use either the **-bucket_range** or the **-bucket_number** option. The **-bucket_range** option allows you to specify the slack range for one bucket (in library units). The **-bucket_number** option allows you to specify how many buckets should be used in the histogram.

RPT-91 (error) The value of the -bucket_number option should be at least 1.

DESCRIPTION

The option **-bucket_number** was used with an argument smaller or equal to 0.

WHAT NEXT

Please use a positive, non-zero number for the option **-bucket_number**. This option defines how many buckets will be used in the histogram.

RPT-92 (error) %s is not an active scenario.

DESCRIPTION

The option **-scenario** was used and one of the scenarios given was not recognized as an active scenario.

WHAT NEXT

Please check that all the scenario names used are valid scenario names. Please use the command **set_active_scenarios** to activate any scenarios used that are currently inactive.

RPT-93 (error) options define empty range.

DESCRIPTION

The options **-range_maximum** and **-range_minimum** were used and their values define an empty range.

WHAT NEXT

Please check that the value given for the option **-range_maximum** is larger than the value given for the option **-range_minimum**.

RPT-101 (error) Can not find PatternExec with name '%s'.

DESCRIPTION

The error occurs when you run the command **report_fault** but the pattern exec name you specified does not exist in the CTL model.

WHAT NEXT

You need to check the CTL model and specify the correct pattern exec name. The pattern exec name should NOT be quoted.

RPT-102 (warning) Can not find the corresponding core instance for pattern "%s".

DESCRIPTION

In the top level CTL model, each pattern should be correspondent to one core instance. You receive this error message when the corresponding core instance can not be found.

WHAT NEXT

You need to check the CTL model to see if the pattern block was named correctly.

RPT-103 (warning) Can not find top level pattern instance for design '%s'.

DESCRIPTION

You receive this error message when you execute command **report_fault** to report fault coverage for the design, but the CTL model of this design does not contain the top level pattern instance. For core designs, the top level pattern instance is used to test the core. For top level deisgn, the top level pattern instance is used to test the UDL logic at top level.

WHAT NEXT

You need to check the CTL model to see if the top level pattern instance is there and the domain references for top level pattern instance are consistent with those defined in the environment block.

RPT-104 (warning) No pattern info found for pattern '%s'. The fault coverage report may be inaccurate.

DESCRIPTION

You receive this error message when you execute command `report_fault` to report overall fault coverage for the design, but the pattern referred does not have associative pattern infomation. So, the overall fault coverage report may be inaccurate.

WHAT NEXT

You need to read in the corresponding patinfo file for pattern.

SEE ALSO

`read_pattern_info (2)`.

RPT-105 (error) The CTL model does not include valid patinfo.

DESCRIPTION

You receive this error message when you execute command `report_fault` to report overall fault coverage for the design, but the CTL model for the design does not have patinfo or the patinfo included is invalid.

WHAT NEXT

You need to check the CTL model for those patinfo block to see if they are there and valid.

RT

RT-001 (error) Cannot find Astro executable file, Astro router failed.

DESCRIPTION

WHAT NEXT

Please make sure that "Astro" command is in your search path.

RT-002 (error) write_mdb failed.

DESCRIPTION

When each time 'route' command is called, internally we will call 'write_mdb' and 'read_mdb' command. Astro router will not run if 'write_mdb' failed.

WHAT NEXT

Please check messages from 'write_mdb' and fix the problems first before calling 'route' command.

RT-003 (error) read_mdb failed.

DESCRIPTION

When each time 'route' command is called, internally we will call 'write_mdb' and 'read_mdb' command. After Astro finishes, we call 'read_mdb' command. This message tells you that 'read_mdb' failed and routing data did not get read back.

WHAT NEXT

Please check messages from 'read_mdb' and fix the problems first before calling 'route' command.

RT-004 (error) Astro router failed, please check file '%s' for error

messages.

DESCRIPTION

Astro router failed and routing data did not get read back.

WHAT NEXT

Please check the log file for Astro running results.

RT-005 (error) Incorrect option combination.

DESCRIPTION

The options you specified for 'route' command are wrong combinations.

WHAT NEXT

Check 'route' command syntax.

RT-006 (error) Failed to save CEL "%s".

DESCRIPTION

This error message indicates that the design CEL could not be saved into the Milkyway library. The reasons for this could be one of the following.

- No write permission for the Library/CEL.
- No disk space is available.

WHAT NEXT

Please check that the Milkyway design library and CEL are writeable and that there is sufficient disk space available.

RT-007 (error) Unknown parameter %s found.

DESCRIPTION

The parameter you specified is not defined for the command.

WHAT NEXT

Check the command syntax.

RT-008 (error) %s is obsolescent, please use %s.

DESCRIPTION

The command is no more used, please use the new one.

WHAT NEXT

Update script with the new key word.

RT-011 (error) Can not use -effort_level option.

DESCRIPTION

WHAT NEXT

Check 'route' command syntax.

RT-012 (error) Wrong effort level specified.

DESCRIPTION

-effort_level allows you to specify "fast", "medium" or "slow". You specified a effort name other than these three names.

WHAT NEXT

Use the right effort level name and rerun this command again.

RT-013 (error) Cannot use -groute_timing_effort option.

DESCRIPTION

When you use the **route** command **-groute_timing_effort** option, you must specify an effort level of low, medium or high, and include the **-global**, **-eco_global**, or **-signal** option.

WHAT NEXT

Check the **route** command syntax for the correct use of the option.

SEE ALSO

route (2).

RT-014 (error) Wrong timing effort level specified.

DESCRIPTION

The **route** command allows you to specify the timing effort level as low, medium or high with the **-groute_timing_effort** and the **-track_assign_timing_effort** options. Only low, medium and high are accepted level names.

WHAT NEXT

Correct the timing effort level name and run the command again.

SEE ALSO

route (2).

RT-015 (error) Wrong crosstalk effort level specified.

DESCRIPTION

-xtalk_effort allows you to specify "low", "medium" or "high". You specified a crosstalk effort name other than these three names.

WHAT NEXT

Use the right crosstalk effort level name and rerun this command again.

RT-016 (error) File '%s' does not exist or it is unreadable.

DESCRIPTION

When using the **-scheme_rail**, **-scheme** or **-post_scheme** option of the **route** command, specify a file name that exists and that is readable.

WHAT NEXT

Check that the file exists and that the correct access permission is set.

SEE ALSO

route (2).

RT-017 (error) Option -track must be combined with -global or -eco_global option.

DESCRIPTION

WHAT NEXT

Check 'route' command syntax.

RT-018 (error) Invalid value specified for '%s' option.

DESCRIPTION

WHAT NEXT

Check 'set_astro_routing_options' command syntax.

RT-019 (error) Cannot use -track_assign_timing_effort option.

DESCRIPTION

When you use the **route** command **-track_assign_timing_effort** option, you must also specify the **-track** or **-signal** option.

WHAT NEXT

Check the **route** command syntax for the correct use of the option.

SEE ALSO

route (2).

RT-020 (error) insert_metal_filler expects a list with option "%s".

DESCRIPTION

You should provide a list of layer name and number for this option.

WHAT NEXT

Check "insert_metal_filler" command syntax.

RT-021 (error) Failed to get %s from %s. %s

DESCRIPTION

This error message is for command signoff_metal_fill. The command failed to get necessary information from your inputs. The reason might be:

1. There is no GRAPHICS/GRAFICS_NETLIST/WRITE_MILKYWAY command in your runset.
2. There is no layer assignment in your GRAPHICS/GRAFICS_NETLIST/WRITE_MILKYWAY command.
3. The layer assignment in your runset is not consistent with MW database or the map file.

WHAT NEXT

Please

1. Add GRAPHICS/GRAFICS_NETLIST/WRITE_MILKYWAY command in your runset.
2. Make sure the GRAPHICS command in your input runset is not commented out. Then, parse your runset by running "evp -O parsed_fill_runset.ev original_fill_runset.ev", and then re-run signoff_metal_fill with the runset "parsed_fill_runset.ev".
3. Make sure the layer numbers in your runset are consistent with those in MW database, or specify a map file.

Please refer to the man page of the command for more information.

RT-022 (error) %s has not been specified.

DESCRIPTION

The command failed since you did not specify necessary inputs. You may specify the inputs by the options of this command, or via another command prior to executing this command.

WHAT NEXT

Specify necessary inputs and then execute this command again. Please refer to the man page of the command for more information.

RT-023 (error) The number of density rules of layer '%s' in technology file exceeds the maximum number %d.

DESCRIPTION

The number of density rules of the specified layer in the technology file exceeds the maximum number of density rules.

WHAT NEXT

Please use "write_mw_lib LIB_NAME -technology -output TECH.tf", and then open TECH.tf to check and fix the setting of DensityRule. Then, use "set_mw_technology_file LIB_NAME -technology TECH.tf" to replace the technology file as the correct one.

RT-031 (error) Maximum layer name must be on the top of minimum layer name.

DESCRIPTION

This error message occurs when running the **set_net_routing_layer_constraints** command with the **-min_layer_name** and **-max_layer_name** options incorrectly specified.

Specify the **-max_layer_name** with a higher layer than **-min_layer_name** as shown in the following example:

```
-min_layer_name = m1 (first routing layer)  
-max_layer_name = m3 (third routing layer)
```

The error message occurs if you reversed the values in the example above.

WHAT NEXT

Correct the values specified for the **-min_layer_name** and the **-max_layer_name**, and then run the command again.

SEE ALSO

`set_net_routing_layer_constraints (2)`.

RT-032 (error) Specified via '%s' does not exist in physical library.

DESCRIPTION

You receive this message because you are trying to use a via that does not exist in physical library.

WHAT NEXT

RT-033 (error) Specified via '%s' is not a default via.

DESCRIPTION

You receive this message because you are trying to use a via which is a non-default via in physical library.

WHAT NEXT

RT-034 (error) Syntax error in '%s' option.

DESCRIPTION

You receive this message because you used a wrong command option syntax.

WHAT NEXT

Check the command syntax from the man page and use correct syntax.

RT-035 (error) Taper level must be equal or larger than 0.

DESCRIPTION

You receive this message because you used a taper level smaller than 0.

WHAT NEXT

Check the command syntax from the man page and use correct value.

RT-036 (error) Layer '%s' does not exist in design.

DESCRIPTION

You receive this message because you used a layer that does not exist in design.

WHAT NEXT

Check the layers from the design and use the right routing layer name.

RT-037 (error) Specified via '%s' does not exist in reference routing rule '%s'.

DESCRIPTION

You receive this message because you are trying to use a via that does not exist in the reference routing rule.

WHAT NEXT

RT-038 (error) There are two vias (%s and %s) corresponding

to same layer level in one routing rule, it's not allowed.

DESCRIPTION

You receive this message because you are trying define two vias that corresponding to same layer level. For example: two vias for M1 and M2. In one routing rule, it is not allowed. syntax.

WHAT NEXT

RT-039 (info) Creating routing rule (%s) failed.

DESCRIPTION

Creating routing rule failed. Please check the -via_cuts list, if there are more than one vias for same layer level, that is the reason. For example: there are two vias for metal1 and metal2.

WHAT NEXT

RT-040 (error) %s option is incorrect.

DESCRIPTION

Creating routing rule failed. Please check the option list. You can use m1 to m15 to represent metal layers; however, ap cannot represent ap layer; only m1 to m15 are legal expressions

WHAT NEXT

RT-041 (error) Please specify target nets!

DESCRIPTION

Routing cannot be done without target nets.

WHAT NEXT

RT-042 (error) Please specify one net only!

DESCRIPTION

Neighbor sweeping can have one target net only.

WHAT NEXT

RT-043 (error) The number of CPUs should be greater than or equal to 1.

DESCRIPTION

You receive this message because you used number of CPUs smaller than 1.

WHAT NEXT

Check the command syntax from the man page and use correct value.

RT-044 (error) Invalid bounding box specified.

DESCRIPTION

You receive this message because the coordinates of a bounding box are not given in order from the lower-left corner to the upper-right corner.

WHAT NEXT

Place the lower-left corner coordinates before the upper-right corner coordinates, and ensure that it forms a valid bounding box.

RT-045 (warn) The options '%s' and '%s' are mutually exclusive.

'%s' option will be ignored.

DESCRIPTION

This warning message occurs when you use two options which are mutually exclusive.

WHAT NEXT

Please refer to the man page for the command for more information.

RT-046 (error) Illegal error cell name.

DESCRIPTION

You receive this message because the specified error cell name is illegal.

WHAT NEXT

Please check the command syntax from the man page and use correct error cell name.

RT-047 (info) Create error cell %s ...

DESCRIPTION

This information message notifies you that a new error cell will be created if it does not exist in physical library.

WHAT NEXT

This is an informational message only. No action is required on your part.

RT-048 (info) No DRC error is reported!

DESCRIPTION

This information message notifies you that there is no DRC violation after running this command.

WHAT NEXT

This is an informational message only. No action is required on your part.

RT-049 (error) Cannot find %s from user path.

DESCRIPTION

You receive this message because the executable is missing.

WHAT NEXT

Please run this command after setting environment of the executable.

RT-050 (error) Failed in executing %s.

DESCRIPTION

Command has failed.

WHAT NEXT

Please check the log file and correct any errors reported.

RT-051 (info) Use machine '%s' to run Astro.

DESCRIPTION

WHAT NEXT

RT-052 (info) The placement is illegal, but we will continue to run Astro router.

DESCRIPTION

Since the placement is illegal, you may end up with DRC violations after running Astro router.

WHAT NEXT

Run 'legalize_placement' before calling 'route' command.

RT-053 (info) Running Astro rail router ...

DESCRIPTION

WHAT NEXT

RT-054 (info) Running Astro clock detail router ...

DESCRIPTION

WHAT NEXT

RT-055 (info) Running Astro global router ...

DESCRIPTION

WHAT NEXT

RT-056 (info) Running Astro incremental global router ...

DESCRIPTION

WHAT NEXT

RT-057 (info) Running Astro track assignment ...

DESCRIPTION

WHAT NEXT

RT-058 (info) Running Astro detail router ...

DESCRIPTION

WHAT NEXT

RT-059 (info) Astro router finished successfully, please check file '%s' for detail Astro running results.

DESCRIPTION

WHAT NEXT

RT-060 (info) Running Astro router with customer scheme file.

DESCRIPTION

This information message notifies you that the customer Astro router is using the customer scheme script and the only other option you can use is the **-overwrite** option.

WHAT NEXT

This is an informational message only. No action is required on your part.

You can refer to the **route** command syntax for the correct use of the option.

SEE ALSO

route (2).

RT-061 (warn) The width of m%d (%d)is defaultwidth %d.

DESCRIPTION

Please make sure if you want to apply default width on stack-via creating. You can use `set_route_flip_chip_options` to set the width of stack-vias.

WHAT NEXT

RT-062 (warning) Port at [%f,%f..%f,%f], layer(%s), is completely blocked by fixed obstructions (net %s)

DESCRIPTION

This message is produced by the check_routeability command when it detects that a pin is completely blocked by fixed obstructions. Since the fixed obstructions cannot be changed during routing, it will be impossible for the router to connect the port without causing at least one DRC violation.

WHAT NEXT

The pin and/or some fixed obstruction must be moved. Examine the port in the GUI and determine how to correct the problem by modifying the floorplan, placement, clock tree routing, etc.

SEE ALSO

`check_routeability(2)`

RT-063 (warning) The design cannot be cleanly routed because it has %d completely blocked ports

DESCRIPTION

This message is produced by the check_routeability command when there are one or more blocked ports. For each of the blocked ports summarized by this message, check_routeability also produced an RT-062 message.

WHAT NEXT

Find the RT-062 messages that precede this message in the log. Those messages give more detailed information about each of the ports that are blocked.

SEE ALSO

`check_routeability(2)`

RT-064 (warning) The design has already been assigned layer

constraints and we will overwrite the constraints.

DESCRIPTION

WHAT NEXT

RT-065 (warning) Net '%s' has already been assigned '%s' routing rule and we will overwrite the constraints.

DESCRIPTION

WHAT NEXT

RT-070 (warning) There is no via landing solution in Port (%s,%s)

DESCRIPTION

All pins of the port may have design-rule (min-spacing, min-width) violations or may be blocked in all directions.

WHAT NEXT

Please open the layout and check if the FRAME view is ok. Please check via-regions, blockages and pins of the port to see if the blockage blocks all routable places or other geometry issues. Please check the layout of top design to see if there is any object blocking the pin. (Ex. P/G straps...) Please check if standard cells overlap.

RT-080 (info) %s

DESCRIPTION

As described in the message.

WHAT NEXT

This is for your information.

RT-101 (warning) Option -scheme_rail will be ignored because -rail is specified.

DESCRIPTION

WHAT NEXT

RT-102 (warning) Can not use machine '%s' to run Astro.

DESCRIPTION

When you run Astro on a remote machine, you must make sure that the machine is accessible.

WHAT NEXT

We will use the current machine to run Astro. If you really want to run Astro on the remote machine, please specify the correct name and make sure that you can access the remote machine.

RT-103 (warning) All other options will be ignored since -default is specified.

DESCRIPTION

You get this message because when you specify options for Astro routing, -default is used, so all of the other options will be ignored.

WHAT NEXT

You need to reset those old options (if you have any) if you want to use those options to be kept.

RT-104 (warning) Net '%s' has already been assigned layer

constraints and we will overwrite the constraints.

DESCRIPTION

WHAT NEXT

RT-105 (warning) You are changing GCELL size, you may have potential problems if you want to run ECO global routing.

DESCRIPTION

WHAT NEXT

RT-106 (warning) You have specified init_scheme file in set_routing_options, and it will be overwritten by the same option in 'route' command.

DESCRIPTION

WHAT NEXT

RT-107 (warning) File '%s' you specified in set_routing_options

does not exist or it is unreadable.

DESCRIPTION

WHAT NEXT

RT-110 (error) Net '%s' can not be found.

DESCRIPTION

WHAT NEXT

RT-111 (warn) set_route_type did not find any object to set route type.

DESCRIPTION

Just to let you know that set_route_type did not set route type for any object.

WHAT NEXT

Check "set_route_type" command syntax.

RT-112 (warn) Specified reference rule name does not exist.

DESCRIPTION

The specified reference rule name does not exist. Using default reference rule.

WHAT NEXT

Verify that the reference rule name has been defined.

RT-113 (warn) Net pattern did not match any nets.

DESCRIPTION

The net pattern specified did not match with any nets.

WHAT NEXT

Verify that the net pattern specified is correct.

RT-114 (warn) %s

DESCRIPTION

An unexpected failure has occurred.

WHAT NEXT

Please notify your AC.

RT-115 (warn) %s

DESCRIPTION

Basic input error checking.

WHAT NEXT

Please recheck the command inputs and use the -help option to verify the input is correct.

RT-116 (warn) %s

DESCRIPTION

Command has failed.

WHAT NEXT

Please check the log file and correct any errors reported.

RT-117 (error) Invalid route type specified.

DESCRIPTION

You receive this message because you used an invalid route type. The valid values for route types are user_enter, signal_route_detail, clk.

WHAT NEXT

Check the command syntax from the man page and use correct value.

RT-118 (error) Cannot get current working directory.

DESCRIPTION

You receive this message because the current working directory cannot be found.

WHAT NEXT

Check whether current working directory exists and permission of the directory.

RT-131 (error) Some setting(s) in technology file is(are) not correct.

DESCRIPTION

Incorrect setting in technology file can lead to catastrophic result and must be fixed. The possible reasons include: Some non-zero values are set to be zero. For example, the pitch, minSpacing and minWidth of each layer should never be zero. Some values are set to unreasonably large or small. For example, the minSpacing of certain layer is set to 10000 nm.

WHAT NEXT

Please use "write_mw_lib LIB_NAME -technology -output TECH.tf". Then open TECH.tf and correct the incorrect setting. Then use "set_mw_technology_file LIB_NAME - technology TECH.tf" to replace the technology file as the correct one.

RT-151 (warn) The P/G nets of the diode instances are not connected.

DESCRIPTION

There are opens in the P/G nets

WHAT NEXT

Please use "connect_pg_nets" command to connect P/G nets.

RT-152 (warn) geNewDRC only supports maxNumMinEdge = 1, skip minEdgeLength checking.

DESCRIPTION

minEdgeLength checking will be skipped since maxNumMinEdge is not 1.

WHAT NEXT

As matter of fact, you should use verify_drc.

RT-153 (error) Antenna checking is not turned on.

DESCRIPTION

Antenna checking is not turned on. There will be no antenna checking.

WHAT NEXT

Please use "set_parameter doAntennaConx value" command or specify -signal_route_options.

RT-154 (error) Cannot find Hercules antenna report in database.

DESCRIPTION

The Hercules antenna report is missing.

WHAT NEXT

Please run antenna check with Hercules before using -antenna_check_engine Hercules option.

RT-155 (error) Unknown antenna_check_engine "%s".

DESCRIPTION

wrong antenna_check_engine is specified.

WHAT NEXT

Please check the antenna_check_engine option, it should be Internal or Hercules.

RT-156 (error) Failed to find spare diodes.

DESCRIPTION

no spare diodes in design.

WHAT NEXT

Please insert spare diode before using connect_spare_diode.

RT-157 (error) Failed to complete routing of spare diodes.

DESCRIPTION

eco routing failed.

WHAT NEXT

Please check the error message issued during eco route.

RT-158 (error) No cell is opened.

DESCRIPTION

No cell is opened.

WHAT NEXT

Please check cell name.

RT-159 (error) Unknown internal_check_option "%s".

DESCRIPTION

wrong internal_check_option is specified.

WHAT NEXT

Please check the internal_check_option option, it should be all or top_layer_only.

RT-160 (error) Unknown antenna violation file format "%s".

DESCRIPTION

wrong file format is specified.

WHAT NEXT

Please check the format option, it should be Hercules.

RT-161 (error) Fail to get library Id.

DESCRIPTION

WHAT NEXT

RT-162 (error) Fail to delete the previous antenna report.

DESCRIPTION

WHAT NEXT

RT-163 (error) Fail to copy the new antenna report.

DESCRIPTION

WHAT NEXT

RT-164 (error) Fail to store the new antenna report.

DESCRIPTION

WHAT NEXT

RT-165 (error) Cannot create diode cell instance "%s".

DESCRIPTION

WHAT NEXT

RT-166 (error) Cannot get diode port instance ID of [%s,%s].

DESCRIPTION

WHAT NEXT

RT-167 (warn) Cannot freeze diode (%s) for ECO.

DESCRIPTION

WHAT NEXT

RT-168 (error) Cannot connect net (%s) and port (%s) in diode (%s).

DESCRIPTION

WHAT NEXT

RT-169 (error) Cannot update ECO file.

DESCRIPTION

WHAT NEXT

RT-170 (warn) Cannot set diode port [%s,%s] max route layer to (%s).

DESCRIPTION

WHAT NEXT

RT-171 (warn) Fail to attach diode instance cell to hier cell

instance.

DESCRIPTION

WHAT NEXT

RT-172 (warn) No antenna violation is found.

DESCRIPTION

WHAT NEXT

RT-201 (error) Internal error in global routing stage.

DESCRIPTION

This is an internal error.

WHAT NEXT

Contact your Synopsys CAE immediately.

RT-202 (error) Failed to find required node:Net %s

DESCRIPTION

Global router cannot find the required node of specified net.

WHAT NEXT

RT-203 (error) No more pins of net %s to route.

DESCRIPTION

Internal error in global routing stage.

WHAT NEXT

RT-204 (error) Internal error in global routing stage. Failed in %s

DESCRIPTION

This is an internal error in global routing stage.

WHAT NEXT

Contact your Synopsys CAE immediately.

RT-205 (error) Pin (%d %d) (%d %d) not on minGrid.

DESCRIPTION

Check tech file to see if this pin location is really not on minGrid.

WHAT NEXT

Check the input to Global route and find why the location is not on minGrid. It could be a bad input or a bug in the previous program.

RT-301 (info) MustJoin Pin (%s,%s,%d) = %d

DESCRIPTION

This is an informational message about MustJoin Pin.

WHAT NEXT

RT-302 (error) It is not recommended to use classic router commands after Zroute commands.

DESCRIPTION

Routing was done with Zroute on the current design. Now an attempt is made to run

commands of classic router. This is not recommended because the DRC analysis and routing graph interpretations are different between the two routers.

WHAT NEXT

Continue to run all the routing commands in Zroute. If the intention to use the classic router for the flow, delete all the existing routes and start the flow with classic router.

RT-303 (WARNING) %s

DESCRIPTION

Router will continue to route. However there will be more tracks than defined by pitch of the layer. This may cause CPU, memory or QOR impact.

WHAT NEXT

Please fix the track definition if it is not intention for the design.

RT-401 (warn) Total number of fully blocked pins = %4d

DESCRIPTION

check_routeability has detected pins which are most likely inaccessible.

WHAT NEXT

Use error_browser to examine the blocked pins. If necessary, modified the design to enable access to these pins.

RT-402 (warn) %d pin have design-rule errors

DESCRIPTION

check_routeability has detected pins with design-rule violations and/or shorts.

WHAT NEXT

Use error_browser to examine the detected violations. If necessary, modified the design to enable access to these pins.

RT-403 (warn) Fat-merge at (%.2f %.2f, %.2f %.2f, %s) skipped. It has %d thin slices, out of %d rectangles

DESCRIPTION

Fat-merge has detected a geometry which has too many thin slices. The merging process of this geometry is disabled, to save cpu time.

Fat-merge is a process which merges items in order to identify fat geometries.

Shapes with many thin slices may be generated by fracturing diagonal items, sometimes found at chip corners. A thin slice is a rectangle with width smaller than minWidth for its layer. "too many" means more than the number specified by ignoreFatMergeIfThinSlices (default is 80) and more than twice the number of non-thin rectangles in the same shape.

WHAT NEXT

Use gui to identify the skipped shape. If it may affect routing or verify_route results, you may set higher number for ignoreFatMergeIfThinSlices. For example, use:
`set_app_var droute_ignoreFatMergeIfThinSlices 120`

Or set 0 to disable this Fat-merge skipping: `set_app_var droute_ignoreFatMergeIfThinSlices 0`

RT66

RT66-001 (error) Cannot detect current design name.

DESCRIPTION

You receive this message because no design has been loaded into the system.

WHAT NEXT

Load a design, and ensure that the **current_design** variable is defined.

SEE ALSO

current_design (3).

RT66-003 (error) Inconsistent database.

DESCRIPTION

You receive this message because an internal error has occurred in the design database.

WHAT NEXT

Attempt to reload the design database from the file.

RT66-004 (error) No physical library loaded.

DESCRIPTION

You receive this message because no library containing a physical description of the design has been loaded.

WHAT NEXT

Load the physical library.

RT66-005 (error) Cannot find library %s.

DESCRIPTION

You receive this message because the specified library cannot be found.

WHAT NEXT

Examine the library name and the **search_path** variable.

SEE ALSO

search_path (3).

RT66-006 (error) Cannot detect value of %s.

DESCRIPTION

You receive this message because the specified value is not defined.

WHAT NEXT

Define the value, and then start routing again.

RT66-007 (error) Preferred direction for routing layer '%s' is not defined.

DESCRIPTION

You receive this message because the preferred routing direction for the layer is not defined.

WHAT NEXT

Define the direction, and then start routing again.

RT66-008 (error) Class of site '%s' is not defined.

DESCRIPTION

You receive this message because the class (CORE or I/O) of the site is not defined.

WHAT NEXT

Define the site class, and then start routing again.

RT66-009 (error) Size of site '%s' is not defined.

DESCRIPTION

You receive this message because either the horizontal or vertical size of the site is not defined.

WHAT NEXT

Define the site size, and then start routing again.

RT66-010 (warning) Height and/or width of die area are undefined

DESCRIPTION

This message indicates that width and/or height of die area are not defined. Route66 requires these parameters.

WHAT NEXT

Define die width and die height and run route66 again.

RT66-011 (error) A shape object of unknown type detected.

DESCRIPTION

This message indicates an internal error in the design database.

RT66-012 (error) Routing segment of invalid direction is detected.

DESCRIPTION

You receive this message because an internal error has occurred in the design database.

RT66-013 (error) Invalid specification of '%s' detected.

DESCRIPTION

You receive this message because there is an internal error in the design database.

RT66-014 (error) Internal error.

DESCRIPTION

You receive this message because an internal error has occurred in the design database.

RT66-015 (error) Size of component '%s' is not defined.

DESCRIPTION

You receive this message because either the horizontal or vertical size of the component is not defined.

WHAT NEXT

Define the component size, and then start routing again.

RT66-016 (error) Offset of component '%s' is not defined.

DESCRIPTION

You receive this message because the offset of the component is not defined.

WHAT NEXT

Define the component offset, and then start routing again.

RT66-019 (error) Default routing width of layer '%s' is not defined.

DESCRIPTION

You receive this message because the default routing width of the layer is not defined.

WHAT NEXT

Define default routing width for the layer, and then start routing again.

RT66-020 (warning) Placement grid is not defined in horizontal direction.

DESCRIPTION

You receive this message because no site array is defined in the core area. If the design contains core components, the site array must be defined in the core area.

WHAT NEXT

Examine the design data.

RT66-021 (warning) Placement grid is not defined in vertical direction.

DESCRIPTION

You receive this message because no site array is defined in the core area. If the design contains core components, the site array must be defined in the core area.

WHAT NEXT

Examine the design data.

RT66-022 (error) Routing grid is not defined.

DESCRIPTION

You receive this message because the routing grid is not defined for the design.

WHAT NEXT

Define the routing grid, and then start routing again.

RT66-023 (error) Undefined reference: '%s' '%s'.

DESCRIPTION

You receive this message because a reference to a nonexistent object is detected.

WHAT NEXT

Check the data consistency.

RT66-024 (warning) Via '%s' has only one routing layer defined.

RT66-025 (warning) Via '%s' has more than two routing layers defined.

DESCRIPTION

WHAT NEXT

RT66-030 (error) Component '%s' is not defined in physical library.

DESCRIPTION

You receive this message because a component used in the netlist is not defined in the physical library.

WHAT NEXT

This message may appear in case of hierarchical presentation of the design. In this case, flatten the design using the **ungroup** command with the **-all** and **-flatten** options and the start router.

RT66-050 (error) Cannot open '%s' file.

RT66-051 (error) Cannot create '%s' directory.

RT66-053 (error) Cannot read from '%s' file.

RT66-055 (error) Cannot detect host name of current machine.

RT66-056 (error) Cannot open '%s' or '%s' file.

RT66-057 (error) The design is hierarchical. %s

DESCRIPTION

You receive this message because design is hierarchical.

WHAT NEXT

use command **ungroup -all -flatten -force** to remove all levels of hierarchy.

SEE ALSO

RT66-058 (error) The design database is incompletely completed. Cannot

open '%s' file.

DESCRIPTION

You receive this message because design database is incompletely. Some important files are missing.

WHAT NEXT

Please check the database.

SEE ALSO

RT66-059 (error) The directory '%s' is not existing or no read permission.

DESCRIPTION

You receive this message because the directory is not accessible. are missing.

WHAT NEXT

Please check if directory exist and permission of the directory.

SEE ALSO

RT66-060 (error) The directory '%s' is locked with process ID %d. %s

DESCRIPTION

You receive this message because the directory is locked.

WHAT NEXT

You can kill the process according the ID from the error message. Then the directory will be unlocked.

SEE ALSO

RT66-070 (error) Cannot find '%s' net.

RT66-071 (error) Error in routing '%s' control file is detected.

RT66-072 (error) Error in routing database file is detected.

DESCRIPTION

You receive this message because an internal error has occurred in the routing database.

RT66-101 (warning)

DESCRIPTION

This message may indicate an inconsistency in routing data.

RT66-102 (error)

DESCRIPTION

This message indicates an inconsistency in routing data.

RT66-103 (error)

DESCRIPTION

This message indicates that the flow cannot continue because of critical error.

RT66-104 (error) "Invalid index value %d in array with %d elements

"

DESCRIPTION

This message means some unexpected (for RtC) situation in the database.

When you see this message, please file a STAR and provide the data to let R&D reproduce and analyze the problem. R&D are working on creating a separate clear message for each of these situations.

RT66-105 (error) "Condition violated: %s, file %s, line %d

"

DESCRIPTION

This message means some unexpected situation in the soft.

When you see this message, please file a STAR and provide the data to let R&D reproduce and analyze the problem. R&D are working on creating a separate clear message for each of these situations.

RT66-106 (error) "Component '%s' is connected to net '%s' but undefined in list of components

"

DESCRIPTION

RTC

RTC-001 (error) Cannot detect current design name.

DESCRIPTION

You receive this message because no design has been loaded into the system.

WHAT NEXT

Load a design, and ensure that the `current_design` variable is defined.

SEE ALSO

`current_design` (3).

RTC-002 (error) File .rhosts does not exist in your home directory.

DESCRIPTION

Detail router requires file `.rhosts` to exist in user's home directory. This file must contain hostname of machines where router may run. Symbol '+' in the `.rhosts` file indicates that router may run on any machine.

WHAT NEXT

Create the `.rhosts` file with the hostname in it in your home directory, and start the router again.

SEE ALSO

`route` (2).

RTC-003 (error) Inconsistent database.

DESCRIPTION

You receive this message because an internal error has occurred in the design database.

WHAT NEXT

Attempt to reload the design database from the file.

RTC-004 (error) No physical library loaded.

DESCRIPTION

You receive this message because no library containing a physical description of the design has been loaded.

WHAT NEXT

Load the physical library.

RTC-005 (error) Cannot find library %s.

DESCRIPTION

You receive this message because the specified library cannot be found.

WHAT NEXT

Examine the library name and the **search_path** variable.

SEE ALSO

search_path (3).

RTC-006 (error) Cannot detect value of %s.

DESCRIPTION

You receive this message because the specified value is not defined.

WHAT NEXT

Define the value, and then start routing again.

RTC-007 (error) Preferred direction for routing layer '%s' is not defined.

DESCRIPTION

You receive this message because the preferred routing direction for the layer is not defined.

WHAT NEXT

Define the direction, and then start routing again.

RTC-008 (error) Class of site '%s' is not defined.

DESCRIPTION

You receive this message because the class (CORE or I/O) of the site is not defined.

WHAT NEXT

Define the site class, and then start routing again.

RTC-009 (error) Size of site '%s' is not defined.

DESCRIPTION

You receive this message because either the horizontal or vertical size of the site is not defined.

WHAT NEXT

Define the site size, and then start routing again.

RTC-010 (warning) Height and/or width of die area are undefined

DESCRIPTION

This message indicates that width and/or height of die area are not defined. Route66

requires these parameters.

WHAT NEXT

Define die width and die height and run route66 again.

RTC-011 (error) A shape object of unknown type detected.

DESCRIPTION

This message indicates an internal error in the design database.

RTC-012 (error) Routing segment of invalid direction is detected.

DESCRIPTION

You receive this message because an internal error has occurred in the design database.

RTC-013 (error) Invalid specification of '%s' detected.

DESCRIPTION

You receive this message because there is an internal error in the design database.

RTC-014 (error) Internal error.

DESCRIPTION

You receive this message because an internal error has occurred in the design database.

RTC-015 (error) Size of component '%s' is not defined.

DESCRIPTION

You receive this message because either the horizontal or vertical size of the component is not defined.

WHAT NEXT

Define the component size, and then start routing again.

RTC-016 (error) Offset of component '%s' is not defined.

DESCRIPTION

You receive this message because the offset of the component is not defined.

WHAT NEXT

Define the component offset, and then start routing again.

RTC-019 (error) Default routing width of layer '%s' is not defined.

DESCRIPTION

You receive this message because the default routing width of the layer is not defined.

WHAT NEXT

Define default routing width for the layer, and then start routing again.

RTC-020 (warning) Placement grid is not defined in horizontal direction.

DESCRIPTION

You receive this message because no site array is defined in the core area. If the design contains core components, the site array must be defined in the core area.

WHAT NEXT

Examine the design data.

RTC-021 (warning) Placement grid is not defined in vertical direction.

DESCRIPTION

You receive this message because no site array is defined in the core area. If the design contains core components, the site array must be defined in the core area.

WHAT NEXT

Examine the design data.

RTC-022 (error) Routing grid is not defined.

DESCRIPTION

You receive this message because the routing grid is not defined for the design.

WHAT NEXT

Define the routing grid, and then start routing again.

RTC-023 (error) Undefined reference: '%s' '%s'.

DESCRIPTION

You receive this message because a reference to a nonexistent object is detected.

WHAT NEXT

Check the data consistency.

RTC-024 (warning) Via '%s' has only one routing layer defined.

RTC-025 (warning) Via '%s' has more than two routing layers defined.

DESCRIPTION

WHAT NEXT

RTC-030 (error) Component '%s' is not defined in physical library.

DESCRIPTION

You receive this message because a component used in the netlist is not defined in the physical library.

WHAT NEXT

This message may appear in case of hierarchical presentation of the design. In this case, flatten the design using the **ungroup** command with the **-all** and **-flatten** options and the start router.

RTC-050 (error) Cannot open '%s' file.

RTC-051 (error) Cannot create '%s' directory.

RTC-053 (error) Cannot read from '%s' file.

RTC-055 (error) Cannot detect host name of current machine.

RTC-056 (error) The tool cannot open the %s or %s file.

DESCRIPTION

This error occurs because the tool failed to open the temporary files specified in the message. This is a program error in the tool.

WHAT NEXT

Contact the Synopsys Customer Support Center by doing one of the following:

- Send an e-mail message to support_center@synopsys.com.
- From the Web, go to <http://solvnet.synopsys.com> and click the "Enter a Call" link.

RTC-057 (error) The %s design is hierarchical.

DESCRIPTION

You receive this message because the specified design is hierarchical.

WHAT NEXT

Use the **ungroup** command with the **-all**, **-flatten**, and **-force** options to remove all levels of the hierarchy.

SEE ALSO

ungroup (2).

RTC-058 (error) The design database is incomplete. The program cannot open the %s file.

DESCRIPTION

You receive this message because the design database is incomplete. Some important, necessary files are missing.

WHAT NEXT

Please examine the database for completeness.

RTC-059 (error) The %s directory does not exist or has no read permission.

DESCRIPTION

You receive this message because the specified directory is missing entirely or is not accessible, possibly due to not having read permission.

WHAT NEXT

Determine that directory actually exists and examine the permissions on it to ensure that read permission is set.

RTC-060 (error) The %s directory is locked with process ID %d.

DESCRIPTION

You receive this message because the specified directory is locked.

WHAT NEXT

You can unlock the directory by using the process ID specified in the message to kill the process.

RTC-070 (error) Cannot find '%s' net.

RTC-071 (error) Error in routing '%s' control file is detected.

RTC-072 (error) Error in routing database file is detected.

DESCRIPTION

You receive this message because an internal error has occurred in the routing database.

RTC-101 (warning) A routing data inconsistency might exist.

DESCRIPTION

You receive this message because an inconsistency in routing data might exist.

RTC-102 (error) A routing data inconsistency exists.

DESCRIPTION

You receive this message because an inconsistency in routing data exists.

RTC-103 (error) A critical error has occurred, so the flow cannot continue.

DESCRIPTION

You receive this message because the flow cannot continue due to the occurrence of a critical error.

RTC-104 (error) The %d invalid index value has occurred in an

array with %d elements.

DESCRIPTION

You receive this message because an unexpected database situation has occurred for Route Compiler.

WHAT NEXT

File a Synopsys Technical Action Request (STAR), and provide the data necessary for Synopsys to reproduce and analyze the problem. Synopsys is in the process of creating a separate, clear message for each situation that might result in this error.

RTC-105 (error) Internal fatal error: unexpected database violation.

DESCRIPTION

You receive this message because an unexpected database situation has occurred in the Route Compiler software.

WHAT NEXT

File a Synopsys Technical Action Request (STAR), and provide the data necessary for Synopsys to reproduce and analyze the problem. Synopsys is in the process of creating a separate, clear message for each situation that might result in this error.

RTC-106 (error) Cell '%s' is undefined in list of cells, but defined in netlist as connected to net '%s'.

DESCRIPTION

You receive this message because the specified component is connected to the specified net, but is undefined in the list of components. To be recognized by a net, a component must be defined in the list of components for that net.

RTC-107 (warning) Nondefault routing rule %s does not define

width for layer '%s'.

DESCRIPTION

Nondefault routing rule does not define wire width for specified layer. For the router it means that routing of nets assigned to this rule is prohibited on this layer. If there is a pre-routed segment of this rule on this layer, it will have the default width.

RTC-108 (warning) There is no minimal-area rule compliant via defined within the routing rule '%s' for layer '%s'.

DESCRIPTION

RTC-109 (warning) Logical pin '%s' of component '%s' does not have physical port.

DESCRIPTION

RTC-110 (warning) Via %s is not Route66-compatible (asymmetrical):

Layer %s: outline box: X: %d,%d; Y: %d,%d.

DESCRIPTION

RTC-111 (warning) Via %s is not Route66-compatible (non-concentric pads).

DESCRIPTION

RTC-112 (information) Connectivity to net '%s' from pin '%s' of

cell '%s' defined twice.

DESCRIPTION

RTC-113 (error) Extensions part of "design.lib

DESCRIPTION

RTC-114 (warning) P/G-route: undefined fragment type %s.

DESCRIPTION

RTC-115 (information) Pin '%s' of cell '%s' is defined connected to net '%s' in netlist: ignore wildcard connectivety to net '%s'.

DESCRIPTION

RTC-116 (error) Pin '%s' is undefined in reference '%s', but defined in netlist for cell '%s'.

DESCRIPTION

RTC-117 (information) Wildcard connection: net '%s', cells '%s', pin '%s'.

DESCRIPTION

RTC-118 (error) Undefined via id='%d' encountered in db: via

ignored.

DESCRIPTION

RTC-119 (error) Component '%s' not placed (has reference '%s' of type %s).

DESCRIPTION

RTC-120 (warning) Reference '%s' has no pins.

DESCRIPTION

RTC-121 (warning) Spacing for UP & UP vias on layer '%s' has different definition (%d and %d): will use maximum value.

DESCRIPTION

RTC-122 (warning) Undefined routing grid. New grid will be created..

DESCRIPTION

RTC-123 (warning) Routing grid and/or port coordinates are out of die area; adjusting die size.

DESCRIPTION

RTC-124 (error) Number of %s routing tracks is %d: exceed

maximum value %d.

DESCRIPTION

RTC-125 (error) Global segment of net '%s' (routing rule '%s') is detected on layer '%s' that is not allowed by routing rule.

DESCRIPTION

RTC-126 (warning) Routing grid defines for invalid layer '%s'.

DESCRIPTION

RTC-127 (warning) Undefined routing grid for routing layer '%s'.

DESCRIPTION

RTC-128 (warning) Wire rule '%s' does not exist. Net '%s' which is assigned to this rule will have default rule applied.

DESCRIPTION

RTC-129 (warning) Regular (non-special) routing for net '%s' contains generated via '%s'; putting the via into special routing.

DESCRIPTION

RTC-130 (error) The routing database in directory '%s' is out-of-

date with the version of the software being used.

DESCRIPTION

RTC-131 (error) You try to use old version of soft (%d) to work with routing data base created by soft version (%d). Please, upgrade soft version.

DESCRIPTION

RTC-132 (error) Undefined layer reference in same_net spacing definition '%s'.

DESCRIPTION

RTC-133 (error) Undefined layer '%s' referred in samenet spacing definition.

DESCRIPTION

RTC-134 (error) Samenet definition for different routing layers is

incorrect.

DESCRIPTION

RTC-135 (error) Undefined spacing for routing layer '%s'.

DESCRIPTION

RTC-136 (warning) No %s found matching '%s' in set_fat_contact_options %s.

DESCRIPTION

RTC-137 (warning) No pin of reference '%s' found matching '%s' in set_fat_contact_options %s.

DESCRIPTION

RTC-138 (error) Via '%s' has no corresponding wire/via codes in routing data base: ignored.

DESCRIPTION

RTC-139 (error) Net %s: via %s has no corresponding type in

net group: ignored.

DESCRIPTION

RTC-140 (warning) Via %s: defines on %d routing layers.

DESCRIPTION

RTC-141 (warning) Via %s: defined on non nearest routing layers.

DESCRIPTION

RTC-142 (warning) Via %s: defines on %d cut layers.

DESCRIPTION

RTC-143 (warning) Wire code for TURN VIA '%s': duplicate

definition.

DESCRIPTION

RTC-144 (warning) Via %s has one routing layer and cut layers.

DESCRIPTION

RTC-145 (warning) Via %s: no objects on routing layers defined.

DESCRIPTION

RTC-146 (warning) Via %s: has no any objects.

DESCRIPTION

RTC-147 (warning) Site '%s' of reference '%s' has no definition in any library.

DESCRIPTION

RTC-148 (warning) Undefined taperrule for net %s.

DESCRIPTION

RTC-149 (error) Nondefault wire rule '%s' is not defined in

physycal library: ignoring routing object.

DESCRIPTION

RTC-150 (warning) Layer %s: undefined ID number in DB.

DESCRIPTION

RTC-151 (warning) Masterslice layer %s is defined after cut layer %s.

DESCRIPTION

RTC-152 (warning) Masterslice layer %s is defined after routing layer %s.

DESCRIPTION

RTC-153 (warning) No metal or masterslice layer was defined before cut layer %s.

DESCRIPTION

RTC-154 (warning) No cut layer was defined before routing layer %s.

DESCRIPTION

RTC-155 (warning) Routing group %s includes %d via codes

between layers %s and %s: will leave only 8.

DESCRIPTION

RTC-156 (warning) Routing group '%s': missing via-code between routing layers '%s' and '%s'.

DESCRIPTION

RTC-157 (error) Invalid layers definition.

DESCRIPTION

RTC-158 (information) Additional number of joined pins - %d.

DESCRIPTION

RTC-159 (information) Additional number of joined nets - %d.

DESCRIPTION

RTC-160 (warning) Maximum number of pins for regular net is %d.

DESCRIPTION

RTC-161 (warning) Net '%s' has pairwise isolation with itself.

Isolation ignored.

DESCRIPTION

RTC-162 (warning) Incorrect %s net name '%s'.

DESCRIPTION

Power or ground net name is setting in tcl-variable **physopt_route66_ground** or **physopt_route66_power**. Net with this name is present in database but has different type.

WHAT NEXT

Type of net will be changed from current to 'power' or 'ground'. Check correct definition tcl-variables and power/ground nets in database.

RTC-310 (error) Cannot find reference rule %s.

DESCRIPTION

You receive this message because the routing rule specified in the -reference_rule_name option is not defined among either library-specific or design-specific routing rules.

WHAT NEXT

Correct the reference rule name or use the -default_reference_rule option

SEE ALSO

[report_routing_rules](#) (2).

RTC-311 (error) Layer %s is not defined in physical library.

DESCRIPTION

You receive this message because the layer specified for the routing rule is not defined in physical library.

WHAT NEXT

Correct layer name

SEE ALSO

`report_lib` (2) `report_routing_rules` (2).

RTC-312 (error) Cannot set %s for non-routing layer %s.

DESCRIPTION

You receive this message because either wire width or minimum routing spacing was specified for a non-routing layer.

WHAT NEXT

Correct the option

SEE ALSO

`report_lib` (2) `report_routing_rules` (2).

RTC-313 (error) Incorrect syntax: %s.

DESCRIPTION

You receive this message because of a syntax violation.

WHAT NEXT

Re-enter the command following syntax rules

SEE ALSO

`define_routing_rule` (2) `report_lib` (2) `report_routing_rules` (2).

RTC-314 (error) Routing rule %s already exists.

DESCRIPTION

You receive this message the rule being defined already exists.

WHAT NEXT

Change the rule name or remove existing rule.

SEE ALSO

`remove_routing_rules` (2) `report_lib` (2) `report_routing_rules` (2).

RTC-315 (warning) Physical library distance unit (1/%dum) is smaller than the design distance unit (1/%fum). The 'width' and 'spacing' attributes that are not specified explicitly may lose precision.

DESCRIPTION

You receive this message because the physical library distance unit is smaller than smaller than the design distance unit. As a result the distance attributes that are not explicitly specified may lose their precision.

WHAT NEXT

Specify all the spacings and widths for the new rule explicitly or use a design-specific reference rule.

SEE ALSO

`remove_routing_rules` (2) `report_lib` (2) `report_routing_rules` (2).

RTC-316 (error) Number of cuts cannot be set for non-contact

layer %s.

DESCRIPTION

You receive this message because number of cuts was specified for a non-contact layer.

WHAT NEXT

Correct the option

SEE ALSO

`report_lib (2) report_routing_rules (2)`.

RTC-317 (error) Same-net spacing is not defined for contact layer %s; cannot generate via.

DESCRIPTION

You receive this message because neither reference wire rule nor physical library defines same-net spacing for the specified layer. This value is required to generate multi-cut vias.

WHAT NEXT

Add the required data to physical library.

SEE ALSO

`report_lib (2) report_routing_rules (2)`.

RTC-318 (error) There is no default_via_generate_rule defined for contact layer %s; cannot generate via.

DESCRIPTION

You receive this message because physical library does not contain default_via_generate_rule for the specified layer. This rule is required to generate multi-cut vias.

WHAT NEXT

Add the required data to physical library.

SEE ALSO

`report_lib` (2) `report_routing_rules` (2).

RTC-319 (error) The value of %s is wrong; cannot generate vias.

DESCRIPTION

The space of cut_to_cut is incorrect, please check you physical library.

WHAT NEXT

Add the required data to physical library.

SEE ALSO

`report_lib` (2) `report_routing_rules` (2).

RTC-350 (warning) Cannot find nondefault rule %s.

DESCRIPTION

You receive this message because the nodefault routing rule specified in the -rule option is not defined among either library-specific or design-specific routing rules.

WHAT NEXT

Correct the rule name

SEE ALSO

`report_routing_rules` (2).

RTC-351 (warning) Cannot find layer %s in the reference rule.

DESCRIPTION

You receive this message because the layer specified in -widths option or the -spacings option can not be found in the reference rule specified in the -reference_rule option.

WHAT NEXT

The layer will be ignored in the new nondefault routing rule. If you don't want to see this message, use layers that exist in the reference rule when specifying -widths or the -spacings option.

SEE ALSO

`report_routing_rules` (2).

RTC-411 (error) Layer %s is not a routing layer in physical library.

DESCRIPTION

You receive this message because the layer specified for the routing rule is not a routing layer in physical library.

WHAT NEXT

Correct layer name

SEE ALSO

`report_lib` (2) `report_shielding_options` (2).

RTC-412 (error) Incorrect syntax: %s.

DESCRIPTION

You receive this message because of a syntax violation.

WHAT NEXT

Re-enter the command following syntax rules

SEE ALSO

`set_shielding_options` (2) `report_lib` (2) `report_shielding_options` (2).

RTC-450 (error) Turn via '%s': missing or incorrect definition in db.

DESCRIPTION

Router can't find the turn via's definition in db.

WHAT NEXT

Please check your db, and add definition for the turn via.

SEE ALSO

RTC-470 (error) Missing layer '%s' definition.

DESCRIPTION

Can't found layer's definition from pdb, when RC generated via '%s'.

WHAT NEXT

Please check your pdb, and add layer definition.

RTC-501 (warning) No genereated vias to fix '%s' rule.

DESCRIPTION

There are violations of the rule, but there are no generated vias to fix them. It may happens in case if via rules are not defined or defined incorrectly.

WHAT NEXT

Check correctness of the via rule definition inside of corresponded fat contact rule '%s'.

SEE ALSO

`set_fat_contact_options(2)`, RTC-503

RTC-502 (warning) Unknown detection method '%s' - cut_inside is used.

DESCRIPTION

The warning means that incorrect string was used to define fat contact detection method. There are three keywords: `cut_inside`, `cut_cross`, `cut_around`, which are allowed either in 'method' attribute of PLIB `fat_contact_settings` section or in -method option of `set_fat_contact_options` command.

WHAT NEXT

Make sure that 'method' of both PLIB and `set_fat_contact_options` contains correct value.

SEE ALSO

`set_fat_contact_options(2)`

RTC-503 (warning) %s in rule '%s'.

DESCRIPTION

The warning happens in case of wrong definition of fat via generation parameters inside of PLIB `fat_contact_rule` section. If you see the warning it means fat vias will not be generated for that '%s' rule. There are the following first strings:

"Incorrect bottom layer" - bottom layer of the via is the top metal of the design.

"Min threshold is more than max threshold" - minimum threshold can't be more or equal to maximum one.

"Size of cuts is less or equal to 0" - size of cut should be more than 0.

"Up enclosure is less than 0", "Down enclosure is less than 0",

"Up end-of-line is less than 0", "Down end-of-line is less than 0" - enclosure and end-of-line parameters should be 0 or more.

"Number of cuts is less than 1 or more than 4" - number of cuts should be more or equal to 1 and less or equal to 4

WHAT NEXT

Make sure that via generation parameters are correct.

SEE ALSO

`set_fat_contact_options(2)`, RTC-501

RTDC

RTDC-3 (warning) The sequential cell '%s' drives the clock in this design. The cell will not be moved by retiming.

DESCRIPTION

If a sequential cell drives the clock pin(s) of one or more other sequential cells, this sequential cell cannot be moved by retiming.

WHAT NEXT

No action is necessary. If the cell in question should not be driving clock pins check the original netlist.

RTDC-4 (error) The cell '%s' drives the clock in this design. Only buffer and inverter cells are allowed on the clock network.

DESCRIPTION

The use of non-buffer and non-inverter cells in the clock network may introduce different clock domains into the design.

WHAT NEXT

Exclude the clock generation logic from the design to be retimed.

RTDC-5 (warning) No clock net driving clock pin of cell '%s'.

DESCRIPTION

The clock pin of the cell is either not connected to a net or there is no clock source if the net connected to the clock pin is traced back across unate and inverting cells. Retiming cannot retime such cells. They will be treated like dont-touched registers.

WHAT NEXT

You should check whether it is your intention to have such a cell in your design or whether there are any non-unate gating cells in the clock network driving this cell. You might need to change the design if you want to move these registers or get the best possible results from retiming.

RTDC-6 (error) Retiming cannot be performed with this clocking scheme.

DESCRIPTION

This error should only occur in combination with one or more other errors that have been reported earlier. These can be a flip-flop drives a clock net (RTDC-3), both normal and fake master slave sequential cells exist (RTDC-106), or a clock pin of a flip-flop is not connected to any net at all (RTDC-5).

WHAT NEXT

Look through the dc_shell log and find one of the previous error messages and fix the cause for this problem.

RTDC-7 (error) The following cell(s) contain sequential elements

and have the dont_touch attribute set. Cannot retime.

DESCRIPTION

The modelling capabilities of the retiming package do not allow this.

WHAT NEXT

Remove the dont_touch attribute from the cell.

RTDC-8 (error) Sequential cell '%s' is neither a flip-flop nor

a latch. Cannot retime.

DESCRIPTION

The cell is a sequential cell, which is not an edge triggered flip-flop Nor is it a latch. The retiming commands do not work on designs that contain such cells.

WHAT NEXT

Exclude the cell from the design. This can be done by putting it into its own hierarchical module. Then retime only the other hierarchical modules.

RTDC-9 (error) More than one clock signal has been detected. Multiple clock signals not allowed for retiming. The different clocks have sources in '%s' and '%s'.

DESCRIPTION

Retiming only works on designs where all registers and latches are driven by the same clock. Gated clocks that are derived from the same based clock are allowed.

WHAT NEXT

Try to retime only for one clock signal at a time. This could be achieved by the following steps: Group all the registers in the design that are driven by one clock or by gated clocks derived from the same base clock into a hierarchical cell of their own. Then set the current design to the design for this new hierarchical cell. Constrain the new design. Retime the new design. Proceed in the same way for all other clocks in the original design.

RTDC-10 (warning) No movable flip-flops in design. Nothing to retime.

DESCRIPTION

There must at least be one movable flip-flop in the design. Otherwise retiming cannot perform any optimization. Flip-flops can become not movable for the following reasons, which are indicated by other warning messages: A dont_touch attribute has been set on them. They are the endpoint of a point to point exception such as false or multicycle path. There is not enough information available about its functionality. Some retiming commands also do not move flip-flops with asynchronous reset. 'balance_registers' does this in general, while 'optimize_registers' allows

to control this with command line options.

WHAT NEXT

Find out what makes the flip-flops in your design not movable by looking at other warning messages. You can also use the `check_design` and `verbose` options of `optimize_registers`. Then take the appropriate measures to make some or all of the cells movable.

RTDC-12 (warning) No designs have the `balance_registers`, `optimize_registers` or `pipeline_design` attribute set. Nothing to retime.

DESCRIPTION

The `optimize_registers`, `balance_register`, `pipeline_design`, `set_optimize_registers` and `set_balance_registers` commands put attributes on designs or subdesigns to be retimed. The inner retiming algorithm looked for these attributes and did not find any.

WHAT NEXT

Use one of the commands on an existing design.

RTDC-13 (error) Retiming interrupted.

DESCRIPTION

The Control-c key or another key for interruption was hit during retiming and the retiming was stopped.

WHAT NEXT

Start the retiming command again and do not interrupt it.

RTDC-14 (warning) Retiming failed. No registers have been

moved.

DESCRIPTION

The retiming failed. A previous error message should give you a detailed reason for the failure.

WHAT NEXT

Find the previous error message by looking for the string RTDC in your dc_shell log file. Fix the problem as described in the documentation for that error message.

RTDC-15 (warning) Design contains registers that will be retimed.

Cannot verify.

DESCRIPTION

The current design contains a part that has the balance_registers, optimize_registers or pipeline_design attribute set. The system moves registers of this part to minimize/optimize the maximum register-to-register delay. Because of the movement, the pre- and post-compiled designs cannot be verified.

WHAT NEXT

If you want to retime a design, you cannot verify it, so remove the -verify option from the compile command. However, if you do not want to retime the design, remove the balance_registers, optimize_registers or pipeline_design attribute from the design, using the remove_attribute command.

RTDC-16 (error) The design contains generic combinational logic. Cannot retime.

DESCRIPTION

The current design contains generic logic. Since this logic does not have any delay associated with it, it cannot be retimed.

WHAT NEXT

Compile the design so that it is completely mapped and then issue the retiming command again.

RTDC-17 (error) Design contains unmapped DesignWare parts. Cannot retime.

DESCRIPTION

The current design contains an unmapped DesignWare part. Since there are no gates associated with this part, the register cannot be moved with respect to the parts delay.

WHAT NEXT

If you want to retime this design, but do not want the registers pushed into the DesignWare part, perform a `dont_touch` on that part. If you do want the registers to be pushed into the DesignWare part, then it must be mapped by performing a compile.

RTDC-19 (warning) Clock period after accounting for worst case set-up and median clock to Q/QN delay is non-positive. Original clock period is %.2f, estimated clock period is %.2f. Using a zero target clock period.

DESCRIPTION

By default, the clock period that retiming tries to achieve is computed in the following way: The desired clock period, which you specified either through the `create_clock` command or the `-period` option is corrected by subtracting the setup time of the preferred flip-flop or latch and the median clock-to-Q delay of the design. In this case, the resulting number is negative. Retiming will try to achieve a clock period that is as small as possible. Note that for latch retiming we operate with a clock period that is half the nominal clock period.

WHAT NEXT

If you wanted the smallest possible clock period, you need not change anything. Otherwise you should check whether the clock period that is specified by the `create_clock` command for your design or by the `-period` option of your retiming command is a realistic value and correct it if necessary. Then start retiming again.

RTDC-20 (error) Negative clock cycle specified with -period option.

DESCRIPTION

The value for the desired clock period that was provided with the -period option is negative. Even with retiming a negative clock period cannot be achieved for any design.

WHAT NEXT

Check the command line for your retiming command and correct the value provided for the -period option. The smallest possible value is 0.

RTDC-21 (warning) No clock connected to flip-flops. Using clock period of zero.

DESCRIPTION

The retiming command could not find a clock port while tracing back from the clock pins of the sequential cells in the design. Some sequential cells in the design have a clock pin that is not connected to any clock port. A clock period of zero will be used for retiming these sequential cells.

WHAT NEXT

If you want to retime with a clock period other than zero, modify the design so that all flip-flop clock pins are connected to the clock port and create a clock at the clock port.

RTDC-22 (warning) No clock period specified with clock %s.

DESCRIPTION

The retiming command could find a clock port of the design while tracing back from the clock pins of the flip-flops, but this clock port had no period assigned to it. There was also no desired clock period given by using the -period option of the retiming command.

WHAT NEXT

Please specify the clock period using the `create_clock` command with the period option or the -period option of `optimize_registers` or `pipeline_design`.

RTDC-23 (warning) No clock found on '%s'.
Trying flip-flops in the design.

DESCRIPTION

The retiming command can trace back from the clock pins of the flip-flops to a clock port, but this clock port does not have clock attribute set on it.

WHAT NEXT

Set a clock attribute on your clock port by using the `create_clock` command.

RTDC-24 (error) Retiming is not supported for Xilinx 4000 designs.

DESCRIPTION

The design has been created with the Xilinx 4000 technology. Retiming cannot be performed for this technology.

WHAT NEXT

Use a different technology.

RTDC-25 (error) The target library does not contain an inverter.

DESCRIPTION

An inverter is required for retiming to handle registers with inverted outputs and to connect registers after retiming.

WHAT NEXT

Please add an inverter to the library (e.g. be removing `dont_use` commands).

RTDC-26 (warning) The flip-flop '%s' selected by '`set_register_type`' is unacceptable for retiming because no setup time is available for this flip-flop.
Attempting to search the target library for a D flip-flop with reasonable setup.

DESCRIPTION

This warning message occurs when a preferred flip-flop is selected using the `set_register_type` command. The selected flip-flop does not have a setup time specified in the library. The `set_register_type` specification is ignored and a preferred flip-flop is chosen from the library.

WHAT NEXT

This is a warning message only. No action is required on your part. However, it is good practice to choose a different flip-flop from the target library.

SEE ALSO

`balance_registers` (2), `optimize_registers` (2), `set_register_type` (2).

RTDC-27 (error) No good flip-flop found in library. Cannot model the design.

DESCRIPTION

Retiming selects a preferred flip-flop from the flip-flops in the technology library to perform clock correction using its setup time and the median clock-to-Q delay computed with this flip-flop. The selection is performed by using different criteria. In this case no suitable preferred flip-flop could be found. One potential reason for this might be that you forbid the use of flip-flops in the library with the `dont_use` command.

WHAT NEXT

Use the `-check_design` option of the retiming command to determine which flip-flops are candidates and why they are not selected. Check the `dont_use` commands in your script and correct them if too many flip-flops are excluded. Then retime again.

RTDC-29 (error) A combinational loop was found in design. Retiming cannot operate on such designs.

DESCRIPTION

A loop consisting only of combinational cells has been found in the design. There is no register in this loop. Retiming of a design with such a loop is not possible.

WHAT NEXT

Change your design to not contain such a loop or exclude the loop from the part of the design that has to be retimed.

RTDC-30 (error) The design has master-slave sequential elements as well as flip-flops. All sequential elements must be of the same kind.

DESCRIPTION

The design contains both single clock flip-flops and master-slave flip-flops. Retiming does not support a design that has both flip-flop types.

WHAT NEXT

Partition the design so that one subdesign has only single clock flip-flops and the other subdesign has only master-slave flip-flops. Then retime the two designs separately.

SEE ALSO

`balance_registers` (2), `optimize_registers` (2).

RTDC-31 (warning) The master clock has period %.2f, the slave

has period %.2f. Choosing master clock period as target for area optimization.

DESCRIPTION

The design has a master-slave clock system. The retiming analysis of the clock networks and clock ports found that the master and slave clock have different clock period values defined. Retiming will use the value specified for the master clock as the target value for optimization.

WHAT NEXT

If the value for the master clock is indeed your target clock period, there is no need to change anything. Otherwise be sure to set the correct clock period for the master clock port using the `create_clock` command.

RTDC-32 (warning) Cell '%s' has no timing information. Treating it like an external module.

DESCRIPTION

This warning indicates that the retiming command found a cell that contains no timing information. Because the retiming algorithm relies on having timing information for every cell, the cell is being modeled as if it is external to the `current_design`; that is, no registers may move across it.

WHAT NEXT

No further action is indicated.

RTDC-33 (warning) Must have BOA-BRT license to handle cells without timing information.

DESCRIPTION

This warning indicates that `balance_registers` found a module that contains no timing information. Because the retiming algorithm relies on having the timing information for every cell, it cannot handle the `current_design`.

WHAT NEXT

Use the `externalize_cell` command to externalize the cells that do not have timing information. Then re-execute `balance_registers`.

RTDC-34 (warning) The following registers are considered to be 'fixed' during retiming. They are end-points of timing exceptions such as '`set_false_path`'.

DESCRIPTION

Some registers in the `current_design` are start- or endpoints for timing exceptions defined by one of the following commands: `set_multicycle_path`, `set_max_delay`, `set_min_delay`, `set_false_path`. To avoid a violation of the timing requirements, these registers will not be moved and no other registers will be moved across them.

WHAT NEXT

Use `report_timing_requirements` to get a list of start- and end-points of the timing exceptions mentioned above.

SEE ALSO

```
current_design (2); set_multicycle_path (2); set_max_delay (2); set_min_delay (2);
set_false_path (2); report_timing_requirements (2).
```

RTDC-35 (error) Designs with flip-flops driving a reset pin cannot be retimed.

DESCRIPTION

The current functionality for retiming of flip-flops with asynchronous resets does not allow resets that are not controlled by primary inputs of the design. A flip-flop has been detected where a reset pin is driven by the output of another flip-flop.

WHAT NEXT

Exclude the flip-flop that has a reset pin that is not driven by a primary input from retiming. You can do this by either putting the `dont_touch` attribute on the flip-flop or by excluding it from the part of the design that is to be retimed.

RTDC-36 (error) Designs using gated resets cannot be retimed.

DESCRIPTION

The current functionality for retiming of flip-flops with asynchronous resets does not allow resets that are not controlled by primary inputs of the design. A flip-flop has been detected where a reset pin is not connected (either directly or through buffers and inverters) by a reset port of the design.

WHAT NEXT

Exclude the flip-flop that has a reset pin that is not driven by a primary input from retiming. You can do this by either putting the dont_touch attribute on the flip-flop or by excluding it from the part of the design that is to be retimed.

RTDC-37 (error) Cannot retime a design with several driving pins for the asynchronous set or clear. One pin found is '%s', another one is '%s'.

DESCRIPTION

The not dont_touched asynchronous set or clear registers in the design are either connected to one net with more than one driving pin or to multiple reset nets driven by different pins.

WHAT NEXT

Replace the multiple driver net in the reset logic by a net consisting of simple adder and inverter cells driven by an external port or (in case of multiple reset nets) put a dont_touch attribute on all cells on one reset net while retiming those on the other one.

RTDC-38 (error) Cannot retime flip-flops with asynchronous set and clear at the same time.

DESCRIPTION

The design contains flip-flops that have the asynchronous clear pin connected as well as flip-flops that have the asynchronous set pin connected.

WHAT NEXT

Retime one group of flip-flops at a time by dont_touching the other group.

RTDC-40 (error) Flip-flop with two asynchronous pins connected. Cannot retime.

DESCRIPTION

A flip-flop has been detected that has two of its asynchronous pins connected. The current version of retiming cannot move this flip-flop.

WHAT NEXT

Exclude the flip-flop that has two reset pins connected from being retimed. You can do this by either putting the dont_touch attribute on the flip-flop or by excluding it from the part of the design that is to be retimed.

RTDC-41 (error) The following cell(s) have at least one pin, which is bidirectional (inout) or for which the direction cannot be inferred (for example because the the cell itself is an unresolved reference). Cannot retime.

DESCRIPTION

Bidirectional pins or pins for which the direction cannot be inferred are introduced by certain types of black boxes or unresolved references in the design. The retiming methodology does not allow to optimize designs with such pins.

WHAT NEXT

Replace the (black box) cell with a cell having only directed (in or out) pins or provide a reference to the cell giving the pin directions.

RTDC-42 (warning) Port '%s' has negative %s %s delay set. Retiming will operate as if the delay is zero.

DESCRIPTION

This warning indicates that the retiming command found an input or output of the design that has a negative delay set by **set_input_delay** or **set_output_delay** commands. The retiming algorithm does not support this and will work with an input delay of zero (0.0) for this port.

WHAT NEXT

Check your design constraints and try to set a correct non-negative I/O delay for all ports. Use these delays already for logic synthesis.

RTDC-43 (warning) The input port '%s' has input %s delay that is smaller than the clock-to-Q delay used by the retiming algorithm. For optimal results, make sure to set an input delay that is realistic. This can be done by using the 'set_input_delay' or 'characterize' commands.

DESCRIPTION

This warning indicates that the retiming command found an input port of the design that has a delay set by **set_input_delay** that is less than the clock-to-Q delay used by retiming. **optimize_registers** uses the median clock-to-Q delay. **balance_registers** uses the maximum clock-to-Q delay found in the design. The retiming algorithm might provide non-optimal timing and area results.

WHAT NEXT

Check your design constraints and try to find a correct and sufficiently high input delay characterization for all ports. At least a typical clock to Q delay must be used at all input ports in any realistic environment for your design. Use those delays already used for logic synthesis.

RTDC-44 (warning) The output port '%s' has output %s delay that is smaller than the estimated average setup time used by the retiming algorithm. For optimal results make sure to set an

output

delay that is realistic. This can be done by using the 'set_output_delay' or 'characterize' commands.

DESCRIPTION

This warning indicates that the retiming command found an output port of the design that has a delay set by **set_output_delay** which is less than the setup time used by retiming. The retiming algorithm may provide results (timing and area), which are worse than you expect.

WHAT NEXT

Check your design constraints and try to find a correct and sufficiently high output delay characterization for all ports. At least a typical flip-flop setup time must be used at each output port in any realistic environment for your design. Use these delays already for logic synthesis.

RTDC-45 (error) The clock tree is configured such that cell '%s' and cell '%s' are sensitive to opposite edges of the clock applied to the clock port of the design. Cannot retime.

DESCRIPTION

The number of inverters on the path from the external clock port to the clock pin of one of the two sequential cells is even, while the number on the path to the other cell is odd. Thus the cells are driven by opposite edges of the external clock. This is not allowed for retiming.

WHAT NEXT

Check whether your clock tree is build correctly and whether you really need these differently triggered flip-flops in your design.

RTDC-46 (error) The clock tree feeds cell '%s' which is non sequential and does not feed any sequential cells. Cannot

remove the clock tree.

DESCRIPTION

The cell in question was not encountered when backtracing the clock tree from the sequential elements, but is connected to the clock tree. Therefore removing the clock tree may change the functionality of the circuit.

WHAT NEXT

Check whether your clock tree is build correctly and whether you really need this cell connected to the clock tree.

RTDC-47 (warning) There are buffer or inverter cells in the clock tree. The clock tree has to be recreated after retiming.

DESCRIPTION

Since retiming moves flip-flops in the design and changes their numbers. The clock tree needs to be rebuild after retiming.

WHAT NEXT

Continue with retiming and recreate the clock tree.

RTDC-48 (error) A master-slave flip-flop has been chosen as the preferred flip-flop for a normal flip-flop type design. Cannot retime.

DESCRIPTION

For normal (single-phase) clock designs a corresponding flip-flop must be chosen from the library.

WHAT NEXT

If you want to have a normal (single-phase) clock design either chose a corresponding flip-flop from your library using 'set_register_type' or use a target library containing single-phase clock flip-flops. If you want to have a master-slave

design compile the existing design for master-slave first use a slave clock port and then the 'set_signal_type' command.

RTDC-49 (error) A single-phase clock flip-flop has been chosen as the preferred flip-flop for a master-slave type design. Cannot retime.

DESCRIPTION

For master-slave type designs a corresponding flip-flop must be chosen from the library.

WHAT NEXT

If you want to have a master-slave clock design either chose a corresponding flip-flop from your library using 'set_register_type' or use a target library containing master-slave flip-flops. If you want to have a single-phase design compile the existing design for master-slave first removing the slave clock port and the 'set_signal_type' command.

RTDC-50 (error) Cell '%s' has too many pins. Cannot retime.

DESCRIPTION

The number of pins per cell is limited for memory efficiency during retiming.

WHAT NEXT

If the cell is a hierarchical cell that you have dont_touched try removing the dont_touch attribute from this cell, so that the lower level cells (with less pins) form the basic elements for retiming. If the cell is a leaf cell (an instance of a technology library cell) with a large number of pins try to resynthesize the design after putting a dont_use attribute on the library cell. Another solution would be to regroup the design and externalize the inflicting cell.

RTDC-51 (Warning) The clock tree feeds cell '%s' which is non

sequential and does not feed any sequential cells.

DESCRIPTION

The cell in question was not encountered when backtracing the clock network from the sequential elements, but is connected to the clock network. Maybe you intended to have a gated clock?

WHAT NEXT

Check whether your clock tree is build correctly and whether you really need this cell connected to the clock tree.

RTDC-52 (error) The following cell(s) are tristate cells.

Cannot retime.

DESCRIPTION

For retiming the design may no contain tristate cells, because moving registers across tristate cells may cause bus systems not to work properly.

WHAT NEXT

Extract the part of your design containing the tristate cells and the bus and retime only the remaining design.

RTDC-53 (error) The design '%s' is not purely combinational. It cannot be pipelined.

DESCRIPTION

The `pipeline_design` command only handles purely combinational designs.

WHAT NEXT

Extract a combinational part for retiming from your design.

RTDC-54 (error) The target library does not contain any edge triggered

flip-flops.

DESCRIPTION

The `pipeline_design` command needs edge triggered flip-flops for retiming.

WHAT NEXT

Select a different library.

RTDC-55 (error) The target library does not contain a simple D flip-flop without additional logic.

DESCRIPTION

The `pipeline_design` command needs this simple flip-flop to construct the initial circuit prior to retiming.

WHAT NEXT

Select a different library.

RTDC-56 (error) Could not find the port '%s' in the design.

DESCRIPTION

The control and clock ports must already exist in the design, before `pipeline_design` is applied.

WHAT NEXT

Add a port with this name.

RTDC-57 (warning) The value provided by the '-period' option for
optimize_registers will now be corrected by the setup time and

clock-to-Q delay of the preferred flip-flop.

DESCRIPTION

The default behavior was changed to prevent a common mistake that led to worse results than expected.

WHAT NEXT

To obtain the old default behavior, use the '`-no_clock_correction`' option.

RTDC-58 (error) A loop without registers on the net was detected in the design taking into account hierarchical cells with the `dont_touch` attribute set to true. I.e. these cells are viewed as a single cell. Retiming cannot operate on such designs, although the netlist on the leaf cell level does not contain combinational feedback loops.

DESCRIPTION

The loop was created by putting a `dont_touch` attribute on a hierarchical cell.

WHAT NEXT

Remove the `dont_touch` attribute from the cell(s) in the loop causing the problem. It may be possible to put the `dont_touch` attribute on lower level cells in the hierarchy instead.

RTDC-59 (warning) The '`optimize_registers`' attribute or the '`pipeline_design`' attribute has been set on a design but no license for this feature is authorized. The retiming will be performed using the '`balance_registers`' functionality.

DESCRIPTION

The 'optimize_registers' and 'pipeline_design' attributes require a special license during compile. In this case there is no key for this key in the license file. Instead the 'balance_registers' functionality is used, which performs no register count optimization.

WHAT NEXT

You can purchase a license key to allow retiming with optimize_registers and pipeline_design functionality from Synopsys.

RTDC-60 (warning) The design contains the following cells which have no influence on the design's function but cannot be removed (e.g. because a dont_touch attribute has been set on them). Retiming will ignore these cells in order to achieve good results:

DESCRIPTION

Even if a cell is unconnected at all output ports or feeds only cells that are unconnected at all output ports it cannot be removed if there is an attribute forbidding this. Retiming will disconnect these cells from the rest of the circuit and will not further regard them.

WHAT NEXT

Since these cells are of no importance. They should be removed. It will happen automatically if any dont_touch attributes on them or on the nets they are connected to are removed.

RTDC-61 (warning) The design contains the following cells from the GTECH library. The results of retiming may not be

valid:

DESCRIPTION

The GTECH library contains generic cells without timing. Retiming results obtained using these cells, may become useless once the GTECH cells are mapped.

WHAT NEXT

Map the entire design using the compile command before retiming.

RTDC-62 (warning) The design contains the following multibit registers, which can be moved by retiming. For retiming they will be decomposed into single bit registers. To avoid this put a 'dont_touch' attribute on these cells.

DESCRIPTION

To be able to retime movable registers have to be single bit.

WHAT NEXT

Put the dont_touch attribute on these cells or (if you want them to be retimed) try to group the single bit registers after retiming to compile to multibit registers.

RTDC-63 (warning) The flip-flop '%s' selected by 'set_register_type' is unacceptable for retiming because it cannot be used to represent all necessary flip-flop functions. Attempting to search the target library for a suitable D flip-flop.

DESCRIPTION

It must be possible to represent any generic flip-flop of the correct reset type (synchronous / asynchronous) with the preferred flip-flop. If the library description of a flip-flop does not allow this.

WHAT NEXT

Accept the flip-flop selected automatically or select a different one using 'set_register_type'.

RTDC-64 (warning) The flip-flop '%s' selected by 'set_register_type' is unacceptable for retiming because it is not a scan flip-flop. Since this is a scan replaced design, the flip flop will only be used for retiming calculations. Another flip-flop may be used for replacement.

DESCRIPTION

A 'test_ready' design must contain scan flip-flops. Therefore scan flip-flops have to be inserted after retiming.

WHAT NEXT

Accept the flip-flop selected automatically or select a different one using 'set_register_type'.

RTDC-65 (error) The current (sub)-design is scan routed. Retiming would invalidate the scan routing.

DESCRIPTION

Scan routing depends on the a register distribution.
Retiming will change this distribution.

WHAT NEXT

Create scan routing and scan logic after retiming.

RTDC-66 (error) The current (sub)-design has scan logic. Retiming would invalidate the scan

logic.

DESCRIPTION

Scan logic depends on the register distribution.
Retiming will change this distribution.

WHAT NEXT

Create scan routing and scan logic after retiming.

RTDC-67 (warning) A timing arc with a negative delay was found. Will use a delay of zero during retiming.

DESCRIPTION

Retiming does only work on netlists with non-negative delay cells.

WHAT NEXT

No action is necessary. However, you should check the correctness of your cell library the accuracy of retiming and synthesis may be compromised.

RTDC-68 (warning) There is not enough information available about the functionality of the library cell of flip-flop cell %S.
It cannot be retimed. It will be treated as a fixed flip-flop.

DESCRIPTION

In order to retime a sequential cell certain information on its functionality such as reset, clear, or load enable pins must be available. If this information is not, or not completely available in the technology library, no retiming that ensures the correct functionality of the circuit can be performed. The particular cell will remain in place. The quality of results might or might not deteriorate.

WHAT NEXT

Let the retiming run complete and check whether the results are acceptable. If they are not acceptable, try to compile the circuit again starting from the HDL source code while forbidding the use of the library cell. You can accomplish this with the **dont_use** command. Then retime again.

RTDC-69 (warning) The flip-flop cell %s has either the force_00 or the force_11 input connected, or it has both the force_01 and the force_10 connected to a non-constant net. This type of cell cannot be supported by retiming. Therefore it will not be moved.

DESCRIPTION

It is required that the Q and QN output of a flip-flop cell always have complementary values. This cell does not fulfill this requirement.

WHAT NEXT

Let the retiming run complete and check whether the results are acceptable. If they are not acceptable, try to synthesize the circuit again not using cells with this reset capability.

RTDC-70 (warning) The flip-flop cell %s is a multibit cell. For retiming the cell's synchronous set, clear or load enable capabilities will not be utilized.

DESCRIPTION

If the decompose option has not been utilized and the decompose attribute has not been set on the sequential cell, **optimize_registers** will try to make use of synchronous set, clear, or load_enable inputs for better results, or for single bit flip-flops if these exist. For multibit cells this does not happen.

WHAT NEXT

If the multibit registers doesn't have synchronous set, synchronous clear, or synchronous load enable, there is no deterioration in the quality of result. However, if it does and you suspect retiming results could be better, try recompiling your original design without the use of multibit registers and retime again.

RTDC-71 (warning) The flip-flop cell %s is connected at both the asynchronous preset pin and the asynchronous clear pin.

The

library cell for this cell has identical reset values for the Q and the QN output in case both the preset and the clear are active simultaneously. If this situation can occur in the circuit the retimed circuit may have a behavior differing from that of the original circuit.

DESCRIPTION

The retiming commands rely on the fact that the Q and QN outputs of flip-flops have always opposing values to disconnect one of them and drive its net by the inverted output of the other. Some library cells such as the one in this case allow to connect two asynchronous initialization signals to the cell. To allow proper initialization the library cell's specification must include the values for the Q and the QN pin in case both preset and clear are active at the same time. In this case the basic assumption for the retiming command's transformation is violated.

WHAT NEXT

If you are sure that preset and clear for the cell are never active at the same time, there is no need for any action. Otherwise there are two possibilities to deal with this situation. The first one is to put a dont_touch attribute on the cell. In this case it will not be retimed and there is no problem. If this first solution decreases the quality of results of retiming, you can apply the second solution: Synthesize your circuit again and forbid the use of the particular library cell by using the 'dont_use' command. Then retime again.

RTDC-72 (error) The target technology library does neither contain

a two input AND nor a two input NAND gate. One of these is

**necessary to
connect flip-flops with two reset inputs correctly after retiming.**

DESCRIPTION

Under certain circumstances it is necessary to construct a new reset signal from two other reset signals after retiming in order to create correct reset behavior for flip-flops with two resets of the same type (synchronous/asynchronous) connected. In this case either a two input AND gate or a two input NAND gate and an inverter were searched but not found.

WHAT NEXT

Check whether the use of these cells has been forbidden by the dont_use command. If yes, remove the dont_use commands and rerun your script. If the library indeed does not contain such cells, try to modify your design such that it does not use flip-flops that have two resets of the same type connected simultaneously.

**RTDC-73 (error) The target technology library does neither
contain
a two input OR nor a two input NOR gate. One of these is
necessary to
connect flip-flops with two reset inputs correctly after retiming.**

DESCRIPTION

Under certain circumstances it is necessary to construct a new reset signal from two other reset signals after retiming in order to create correct reset behavior for flip-flops with two resets of the same type (synchronous/asynchronous) connected. In this case either a two input OR gate or a two input NOR gate and an inverter were searched but not found.

WHAT NEXT

Check whether the use of these cells has been forbidden by the dont_use command. If yes, remove the dont_use commands and rerun your script. If the library indeed does not contain such cells, try to modify your design such that it does not use flip-flops that have two resets of the same type connected simultaneously.

RTDC-74 (error) The retiming graph that has been constructed

for the design to be retimed does not contain any nodes.

DESCRIPTION

Retiming optimizations are executed on graphs. In this case the graph does not contain any nodes. The reason for this could be that all cells in the current design are considered unused. This in turn could be caused by the fact that none of the output pins is really a function of the inputs or the internal registers.

WHAT NEXT

Check the netlist of the design to be retimed. Especially check whether at least one output port is really driven by an internal gate or an input port.

RTDC-77 (error) The cell %s has has an illegal value of the transform_for_retim ing attribute.

DESCRIPTION

Only the values multiclass (0), dont_retime (1) or decompose (2) are legal for the transform_for_retim ing attribute.

WHAT NEXT

Decide which value you want for this cell. Then set it using the set_transform_for_retim ing command.

RTDC-78 (error) The cell %s has has an illegal value of the state_for_retim ing attribute.

DESCRIPTION

Only the values preserve (0) or dont_care (1) are legal for the state_for_retim ing attribute.

WHAT NEXT

Decide which attribute value you want for this cell. Then set it using the set_state_for_retim ing command.

RTDC-79 (warning) The cell %s has the dont_touch or dont_retime and the dont_care attribute set.

Using preserve instead.

DESCRIPTION

If a sequential cell has the dont_touch or the dont_retime attribute set the state represented by it is automatically preserved. The dont_care attribute does not make any sense for retiming.

WHAT NEXT

No action is necessary. The correction has been performed automatically. If you want to avoid this message in the future, remove the dont_care_for_retimming attribute from the cell.

RTDC-80 (warning) The cell %s has the decompose and the dont_care attribute set. Using decompose and preserve instead.

DESCRIPTION

If a sequential cell has the decompose attribute set the state represented by it is automatically preserved. The dont_care attribute does not make any sense for retiming.

WHAT NEXT

No action is necessary. The correction has been performed automatically. If you want to avoid this message in the future, remove the dont_care_for_retimming attribute from the cell.

RTDC-81 (error) The clock system is too complicated for retiming.

DESCRIPTION

The retiming algorithms cannot only handle a subset of designs with multiple clocks involving multiple periods, phases and clock gating. The current design is too

complicated.

WHAT NEXT

Read the retiming user manual for a description of the allowed clocking schemes. Try to partition your design into smaller parts that have only a single clock for all registers.

RTDC-82 (warning) The backward justification during retiming failed.

DESCRIPTION

In order to be able to move registers including their reset connections retiming needs to compute the equivalent initial state of the circuit after retiming. In this case the computation of the equivalent state for registers moved backward has failed. This is most likely caused by runtime or capacity limits.

WHAT NEXT

If the design has synchronous reset and you decompose all or part of the registers using the `-sync_trans` option of the retiming command or the `set_transform_for_retimming` command the computation of the initial states for the registers is no longer necessary. If there are registers in the design that need to have an initial state upon reset but the particular value is of no relevance applying the `-sync_state`, `-async_state` options and the `set_state_for_retimming` commands will help. Further on it may help to remove the `dont_touch` attribute from complex cells such as multipliers or adders in the design, if these exist.

If these suggestions are not applicable, then the following might help:

Try to recode the RTL description for the design such that the registers are initially located at the primary inputs instead of the primary outputs. That would assure that registers are only moved forward and the initial state computation for forward moves is much easier than that for backward moves.

RTDC-83 (error) The forward justification during retiming failed.

DESCRIPTION

In order to be able to move registers including their reset connections retiming needs to compute the equivalent initial state of the circuit after retiming. In this case the computation of the equivalent state for registers moved forward has failed. This is most likely caused by runtime or capacity limits.

WHAT NEXT

It may help to remove any dont_touch attribute from complex cells such as multipliers or adders in the design, if these exist. If the design has synchronous reset and you decompose all or part of the registers using the -sync_trans option of the retiming command or the set_transform_for_retimining command the computation of the initial states for the registers is no longer necessary. If there are registers in the design that need to have an initial state upon reset but the particular value is of no relevance applying the -sync_state, -async_state options and the set_state_for_retimining commands will help.

RTDC-84 (warning) The cell %s has at least one asynchronous pin connected and the decompose transform attribute is set for it. The any synchronous functionality of this cell will be handled by decomposing. Asynchronous clear or set will be handled using multiclass functionality.

DESCRIPTION

Asynchronous functionality of sequential cells cannot be decomposed. Therefore only the synchronous functionality of the cell will be decomposed.

WHAT NEXT

No action is necessary. If you want the cell to be not moved or moved using the multiclass algorithm entirely, use the set_transform_for_retimining command.

RTDC-85 (warning) The cell %s has at least one asynchronous pin connected and the decompose transform attribute is set for it. Since the default transformation for asynchronous cells is dont_touch, this cell will not be moved.

DESCRIPTION

Asynchronous functionality of sequential cells cannot be decomposed. Because it is requested that asynchronous cells are not moved This cell will not be moved.

WHAT NEXT

No action is necessary. If you want the cell to be moved using the multiclass algorithm use the `set_transform_for_retimming` command.

RTDC-86 (warning) One or more cells in the design to be retimed have the retiming state attribute set to `dont_care`. The behavior of the retimed circuit may differ from that of the original circuit.

DESCRIPTION

The `dont_care` attribute allows retiming to achieve better quality of results or use less CPU time of optimization. However, the initial state of the retimed circuit not equivalent to that of the original circuit. This may be acceptable for registers on data paths. In general it is not acceptable for registers in control parts (finite state machines) of the circuit.

WHAT NEXT

No action is necessary. If you want the cell not to use the `dont_care` attributes for some or all cells use the `set_state_for_retimming` command or the `-sync_state` or `-async_state` attributes of the `optimize_registers` command.

RTDC-87 (warning) Net %s has the `synch_set_reset` attribute set. The following sequential cells in the net's fanout may be moved away from the net during retiming.

DESCRIPTION

A `synch_set_reset` attribute on a net may indicate that the sequential cells in the fanout of this net should be connected to the net by as few logic levels as possible. The register movement during retiming may change this.

WHAT NEXT

If it is not important to you that registers are kept close to the net in question, no action is necessary. However, if you want to have the synchronous set or clear moved with the registers during retiming, use the following steps. 1. Analyze and elaborate the design from the HDL description using the HDL attribute `sync_set_reset` or the `dc_shell` variable `hdlin_ff_always_sync_set_reset = true`. 2. Put a `dont_touch` attribute on all the sequential cells in the elaborated design. 3. Compile the

combinational logic in the design. 4. Remove the dont_touch attribute from the sequential cells. 5. Run optimize_registers with the -sync_trans multiclass option.

RTDC-88 (warning) The optimize_registers or the pipeline_design attribute has been set on a design but the BOA-BRT license is not available.

DESCRIPTION

Retiming during compile requires a BOA-BRT license for the optimize_registers and pipeline_design attributes. In this case there is a key for the BOA-BRT license in the license file, but all BOA-BRT licenses are currently in use.

WHAT NEXT

The setting of the variable 'compile_retimming_license_behavior' determines whether, the execution of compile stops ("stop"), or waits for a license to become available ("wait"), or use the balance_registers functionality instead ("next") if the DC-Expert license is available. It has to be set before the start of compile. Another solution is to obtain the necessary license before the start of compile using the get_license command.

RTDC-89 (warning) A retiming attribute (optimize_registers, balance_registers, pipeline_design) has been set on a design but the DC-Expert license has not been authorized. Retiming cannot be performed.

DESCRIPTION

Retiming during compile requires a DC-Expert license for the balance_registers attribute and also for the optimize_registers and pipeline_design attributes, if the BOA-BRT license is not available. In this case no key for the DC-Expert license exists in the license file.

WHAT NEXT

You can purchase a license key for DC-Expert from Synopsys.

RTDC-90 (warning) A retiming attribute (optimize_registers,

`balance_registers, pipeline_design)` has been set on a design but the DC-Expert license is not available.

DESCRIPTION

Retiming during compile requires a DC-Expert license for the `balance_registers` attribute and also for the `optimize_registers` and `pipeline_design` attributes, if the BOA-BRT license is not available. In this case there is a key for the DC-Expert license in the license file, but all DC-Expert licenses are currently in use.

WHAT NEXT

The setting of the variable '`compile_retimig_license_behavior`' determines whether, the execution of compile stops ("stop"), or waits for a license to become available ("wait"). It has to be set before the start of compile. Another solution is to obtain the necessary license before the start of compile using the `get_license` command.

RTDC-91 (warning) The design contains combinational cells that are not from the target library.

DESCRIPTION

The current design contains combinational cells that are not in the target library. This can happen for three reasons:

- The cell is not yet mapped.
- A `dont_use` attribute has been put on the library cell after the first compile but before retiming.
- One or more of the library cells in the netlist are marked as `dont_use` in the library itself. This can happen, if the netlist was created by a software not respecting library defined `dont_use` attributes.

WHAT NEXT

Set all the `dont_use` attributes for on target library cells before the first compile. Make sure any `dont_touch` attributes on generic combinational cells are removed before the first compile. If your library description has internally `dont_use` attributes on various cells you have two options: Either make sure the tool creating the netlist is respecting these attributes or run an incremental compile on the netlist in Design Compiler before retiming.

RTDC-92 (warning) A timing arc with a negative delay was found found on cell %s (%s) from pin %s to pin %s.
Using zero delay instead.

DESCRIPTION

Retiming does only work on netlists with non-negative delay cells.

WHAT NEXT

No action is necessary. However, it would be best to check your technology library for correctness. If you want to avoid these warnings do not use the negative delay library cell by putting a dont_use attribute on it before compiling your design for the first time.

RTDC-93 (warning) A latch cell %s is found in retiming procedure.
It will be treated as a fixed flip-flop.

DESCRIPTION

Retiming can not work on latches. A latch will not be moved, which might affect the quality of retiming.

WHAT NEXT

No action is necessary. However, it would be best to check what is the functionality of the latch. Try to avoid using a latch in data path.

RTDC-94 (error) The clock signal of cell %s can not be reached from any clock port(s) via combinational logic.

DESCRIPTION

All the sequential cells in the retiming circuit must be controlled by any clock signal defined by the user.

WHAT NEXT

Please check the clock pin of the cell and make sure it is connected to a clock port defined by using `create_clock` command. Or you can exclude the cell from the design. This can be done by putting it into its own hierarchical module. Then retime only the other hierarchical modules.

SEE ALSO

`create_clock`.

RTDC-95 (error) The clock gating cell %s is controlled by more than one clock signal or by the rising and falling edge of the same clock. The clock signals are from cells %s and %s.

DESCRIPTION

The input signals of the clock gating cells can contain only one clock signal.

WHAT NEXT

Please check the clock nets connected to the gating cell and remove the extra clock signal(s).

RTDC-96 (error) The clock signal from %s is used as both master and slave clock.

DESCRIPTION

A clock signal can be used only as either master clock or slave clock of the sequential cell in the circuit. Using a clock signal as both make it impossible for the retiming tool to calculate the timing constraints of the circuit.

WHAT NEXT

Please check all the master-slave registers in the circuit and make sure that the master pins and slave pins are connected correctly.

RTDC-97 (warning) The output pin %s of the gating cell %s is

not unate with respect to the clock signal input %s.

DESCRIPTION

The output of a clock gating cell has to be unate to its clock input. Otherwise the clock might and might not be inverted when it passes through the gating cell, depending on the other control signals of the gating cell. Therefore it is impossible for the retiming tool to calculate the timing constraints. Any registers driven by this output pin of the clock gating cell will not be moved.

WHAT NEXT

If no register is driven by the particular pin of the clock gating cell no action is necessary. Otherwise correct your clock gating logic.

RTDC-98 (error) One of the following two registers is sensitive to the rising edge of their common base clock the other to the falling edge:

%s

%s

DESCRIPTION

There can be two causes of this problem. The first is that the number of inverters on the path from the clock driving pin to the clock pin of certain sequential cell is even, while the number on the path to the clock pin of some other sequential cell is odd. The other is that the library cells used for the registers are sensitive to different edges of the clock. Thus there are cells driven by opposite edges of the clock. This is not allowed for retiming.

WHAT NEXT

Check whether your clock tree is build correctly and whether you really need these differently triggered flip-flops in your design.

RTDC-99 (error) The master clock from %s and slave clock from

%s used to control cell %s are not matched.

DESCRIPTION

The master clock and slave clock form a pair to control the master-slave sequential cells. Neither a master clock nor a slave clock can be paired multiple times with different clock signals. Either the master clock or the slave clock has already been used with a third clock signal, therefore they are not allowed to be used together.

WHAT NEXT

Check whether your clock tree is built correctly and check whether the master and slave clock pins of all the sequential cells are connected correctly.

RTDC-100 (warning) The clock signal generated from %s is connected to the non-clock pin of the sequential cell %s. The sequential cell will not be moved.

DESCRIPTION

The clock signal is connected to a non-clock pin of a sequential cell, such as the next-state input, or reset, or load-enable.

WHAT NEXT

If this is intended, no action is necessary. Otherwise please correct your circuit or your 'create_clock' commands.

RTDC-101 (error) The output of the gating cell %s has 2 or more outputs. Cannot retime.

DESCRIPTION

In this version of the retiming package, the complexity of the gating cell is limited. Only cells with one output pin are allowed

WHAT NEXT

Please check whether the gating cell is correctly designed. Try to partition the gating cell into many blocks with only one output pin each.

RTDC-102 (warning) There is at least one clock which is not connected to any sequential cells directly.

DESCRIPTION

A clock signal, which does not directly control any sequential cell, exists. However it might be used to control one or more sequential cells through clock gating cell or simply pass through the circuit block.

WHAT NEXT

No action is necessary. However, it would be best to check when the clock tree is designed correctly.

RTDC-103 (warning) A black box cell %s is found on the clock tree.

DESCRIPTION

A black box cell is found on the clock tree. The clock tree analysis can not go into the cell. A black box cell can affect the quality of retiming because no sequential cells can be move across it.

WHAT NEXT

No action is necessary. However, it would be best to check whether the black box cell is designed correctly. Try to avoid black box cell in the circuit because it might affect the quality of retiming.

RTDC-104 (error) Two cells %s and %s drive clock net.

DESCRIPTION

A clock cell can not be driven by more than one cell. Cannot retime.

WHAT NEXT

Redesign the clock tree so that each clock net is driven by only one cell.

RTDC-105 (error) No clock is found.

DESCRIPTION

No clock port is defined by the user and no port is found to connect to any existing sequential cells.

WHAT NEXT

Please check the design of the clock tree and make sure that the clock pins of all the sequential cells are connected correctly and the clock source is connected to a port. In the pipeline design, a clock port has to be defined.

RTDC-106 (error) The both normal master slave sequential cells and fake master slave sequential cells exist. Cannot retiming.

DESCRIPTION

A normal master slave sequential cell is controlled by two clock nets, i.e. a master clock and a slave clock. While a fake master slave sequential cell is controlled by only one master clock. Its slave pin is connected to a net with constant value. Retiming can handle a single clocking scheme, therefore these two types of cells can not co-exist.

WHAT NEXT

Please replace one type of sequential cells by the other.

RTDC-107 (information) The design contains the following cells in the master clock tree. Retiming will not try to improve timing for paths along these cells:

DESCRIPTION

Cells that have a master clock net connected to a non-clock input pin are not taken into account in the retiming timing analysis.

WHAT NEXT

No action is necessary.

RTDC-108 (information) The design contains the following cells in the slave clock tree. Retiming will not try to improve timing for paths along these cells:

DESCRIPTION

Cells that have a slave clock net connected to a non-clock input pin are not taken into account in the retiming timing analysis.

WHAT NEXT

No action is necessary.

RTDC-109 (error) Retiming with gated clocks is not supported with the balance_registers command.

DESCRIPTION

The design contains gated clocks. The balance_registers command is not allowed on such design.

WHAT NEXT

Use optimize_registers.

RTDC-110 (warning) Sequential cell %s is driven by an output of hierarchy cell %s which is being retimed. The registers in the hierarchy cell have a different clock than the sequential cell. The delay may not be correctly

optimized by retiming.

DESCRIPTION

Only part of the design is retimed. There are registers outside the part of the design being retimed and there is a combinational path from internal registers to these external registers. The registers at the endpoints of this path are driven by different clocks. The delay may not be correctly optimized by retiming.

WHAT NEXT

You can either use a bottom up compile strategy or change your design so that the retimed registers are only connected to registers driven by the same clocks.

RTDC-111 (warning) Sequential cell %s drives an input of hierarchy cell %s which is being retimed. The registers in the hierarchy cell have a different clock than the sequential cell. The delay may not be correctly optimized by retiming.

DESCRIPTION

Only part of the design is retimed. There are registers outside the part of the design being retimed and there is a combinational path from external registers to these internal registers. The registers at the endpoints of this path are driven by different clocks. The delay may not be correctly optimized by retiming.

WHAT NEXT

You can either use a bottom up compile strategy or change your design so that the retimed registers are only connected to registers driven by the same clocks.

RTDC-112 (warning) The design contains cells that have been used by Power Compiler's clock gating. After retiming Power Compiler

clock gating commands will no longer work:

DESCRIPTION

Retiming cannot maintain the relations between clock gating cells and the registers gated by them. Therefore Power Compiler commands such as 'report_clock_gating' will no longer work correctly after retiming. The design is still functionally correct.

WHAT NEXT

No action is necessary.

RTDC-113 (error) The design the following nets that have multiple drivers.

DESCRIPTION

Retiming cannot operate on designs with nets with multiple drivers.

WHAT NEXT

Replace the multiple driver nets by cells calculating the desired logic function of the drivers.

RTDC-114 (error) The flip-flop %s selected with set_register_type or set_register_type_for_retimng cannot be used.

DESCRIPTION

A preferred flip-flop for retiming was specified with the set_register_type command but it cannot be used. Possible reasons are that no flip-flop with this name exists in the library or a dont_use attribute has been put on the flip-flop.

WHAT NEXT

Check whether a flip-flop of this name exists. If yes, remove the dont_use attribute from it.

RTDC-115 (warning) The following cells only drive asynchronous pins of sequential cells which have no timing constraint. Therefore retiming will not optimize delay through them:

DESCRIPTION

This warning message occurs when any paths to asynchronous cells of sequential cells do not have timing constraints. Therefore, retiming does not include cells on these paths that only drive such pins into the retiming optimization.

WHAT NEXT

This is a warning message only. No action is required on your part.

SEE ALSO

`balance_registers`, (2), `optimize_registers` (2).

RTDC-116 (error) The clock name '%s' which you selected is not among the clocks of the design. Possible clock names are:

'%S'

DESCRIPTION

If the user specifies the name of a single clock to retime, this name must be a name of one of the clocks that have been created on the design.

WHAT NEXT

Choose one of the legal clock names given in the error message or do not specify a clock name at all.

RTDC-117 (warning) A clock period has been specified at the command line. However, more than one clock in the

design will be retimed. The clock period will be ignored.

DESCRIPTION

If there are multiple clocks being retimed it does not make sense to specify a single clock period.

WHAT NEXT

You can just ignore this warning. Or you can limit the retiming to one clock using the 'clock' option.

RTDC-118 (warning) No movable %s for %s edge of base clock(s): '%s'.

DESCRIPTION

There must at least be one movable sequential cell (register or latch) for a particular edge of a base clock to be able to perform retiming. Sequential cells can become not movable for the following reasons, which are indicated by other warning messages: A dont_touch attribute has been set on them. They are the endpoint of a point to point exception such as false or multicycle path. There is not enough information available about its functionality. Depending on the options you used for the retiming command sequential cells without asynchronous set/clear or sequential cells with asynchronous set/clear may not be retimed either.

WHAT NEXT

This is just a warning. If you do not need to have any sequential cells triggered by this edge of the base clock retimed, no further action is necessary. Otherwise, find out what makes the sequential cells in your design not movable by looking at other warning messages. You can also use the check_design and verbose options of optimize_registers. Then take the appropriate measures to make some or all of the cells movable.

RTDC-119 (warning) Clock '%s' has its source in the movable sequential cell '%s'. The cell will not be moved.

DESCRIPTION

If a register with is the source of a clock is moved the clock would be lost.

Therefore it will not be moved.

WHAT NEXT

Check whether the clock should really come from this cell. If not correct your constraints. Otherwise no action is needed.

RTDC-120 (warning) No information can be found about the function of cell %s.

Registers might not be moved across this cell because retiming cannot compute the equivalent reset state.

DESCRIPTION

The cell has no description of its function in the library. To improve delay or area retiming would like to move registers with set or clear signal across this cell. However, it cannot do so because it is not possible to compute the equivalent reset state. Therefore a retiming solution will be attempted that does not move any registers with set or clear functionality across this cell.

WHAT NEXT

No action is necessary. However, if you want registers to move across the cell you can do one of the following things:

Provide functionality of the cell in the library.

Use the decompose option for the registers that should move across the cell, if they have synchronous but no asynchronous set or clear.

Use the dont_care option on the registers in question or all registers, if the correct reset state is not important to you.

RTDC-121 (warning) The following registers are triggered by both the rising and the falling edge of the clock. They will not be moved during retiming.

DESCRIPTION

Instances of flip-flops which have setup or hold times, or clock-to-Q delays defined

for both the rising and the falling edge of the clock cannot be retimed.

WHAT NEXT

If you have to retime these registers implement them as single edge triggered flip-flops.

RTDC-122 (warning) The pin %s of the clock tree cell %s drives pins that are not part of the clock network.

DESCRIPTION

Retiming cannot handle cells that are both for the propagation of the clock signals and for operations on data signals accurately. Retiming results may not be the best possible.

WHAT NEXT

Try to change the circuit such that clock-tree and non-clock-tree functionality are never combined in the same cell.

RTDC-123 (warning) The design %s will not be retimed because the Formality-friendly flow is active.

DESCRIPTION

Retiming is suppressed in most cases during Design Compiler synthesis if the Formality-friendly flow is in effect. Only pipelined DesignWare multipliers are still retimed.

WHAT NEXT

If you want to have retime despite of the Formality-friendly flow set the dc_shell variable "optimize_reg_skip_retimings_for_formal_verification" to "false".

RTDC-124 (warning) Formal verification with the original design

will fail after the pipeline_design command.

DESCRIPTION

The pipeline_design command inserts additional registers into the circuit. The behavior of the modified circuit is no longer equivalent to that of the original circuit. Equivalence checking with the original design will fail.

WHAT NEXT

If you want to retime pipelined data path and be able to verify the design afterward with a formal verification tool, insert the registers into the original design and use the optimize_registers command.

RTDC-125 (warning) The Formality-friendly flow is active but retiming has been enabled.

DESCRIPTION

The Formality-friendly flow is active but retiming has been enabled. Retiming might make formal verification inconclusive.

WHAT NEXT

If you do not want to retime set the dc_shell variable "optimize_reg_skip_retimings_for_formal_verification" to "true".

RTDC-126 (warning) The design contains a min-delay path or an exception for hold time violations. Retiming results may be worse than expected.

DESCRIPTION

During retiming sequential cells that are start- or end-points of timing exceptions are not moved. If these timing exceptions are only addressing minimum delays or hold-time violations it might be worth while to remove them during retiming and reapply them after retiming to have them fixed during and incremental compile.

WHAT NEXT

If you think retiming results may be influenced negatively try removing these

exceptions during retiming.

RTDC-127 (Error) The design cannot be pipelined because the design contains the following cells with bidirectional pins.

DESCRIPTION

The pipeline_design cannot work on designs that contain bidirectional ports or cells with bidirectional pins.

WHAT NEXT

Remove the bidirectional ports and cells with bidirectional pins from the design or insert registers yourself and use the optimize_registers command.

RTDC-128 (Warning) The following clock-gating latches will not be moved during retiming.

DESCRIPTION

Clock-gating latches are latches that drive clock-gating cells to avoid glitches in gated-clock signals. These latches will not be moved during retiming.

WHAT NEXT

There is no need for any action.

RTDC-129 (Error) Did not find two-phase latch system for clock %S.

DESCRIPTION

When retiming latches using the **-latch** option of the **optimize_registers** command the latches have to be clocked by a two-phase clock system. I.e. every other latch must be transparent at a time when the intermediate latches are not transparent and vice versa. This can be achieved by several different clocking systems. E.g. a clock can drive the latches for one phase while an inverted version of the same clock drives the latches for the other phase. Or the same clock drives the latches for both phases but the latches for one of the phase are transparent when the clock is high, while those for the other phase are transparent when the clock is low. Or you have

to separate clocks one driving the latches for phase one and the other (with a waveform shifted by half a clock period compared to the first) driving the latches for the other phase.

WHAT NEXT

Check your design's clock network and check whether you have specified the correct clock for latch retiming.

SEE ALSO

`optimize_registers` (2).

RTDC-130 (Warning) The following latches are out of phase.
They will not be moved during retiming.

DESCRIPTION

When retiming latches using the `-latch` option of the `optimize_registers` command the latches have to be clocked by a two-phase clock system. I.e. every other latch must be transparent at a time when the intermediate latches are not transparent and vice versa. The latches reported here have at least one neighbor which has the same phase as they. Therefore they will not be moved during retiming.

WHAT NEXT

Check your design's clock network to see whether you might have connected some of your latches to the wrong phase of the clock. If you did so on purpose no further action is necessary. If not, correct the design.

SEE ALSO

`optimize_registers` (2).

RTDC-131 (warning) Reset state justification was terminated early to reduce runtime.

DESCRIPTION

In order to be able to move registers including their reset connections, retiming needs to compute the equivalent initial state of the circuit after retiming. In this case the computation of the equivalent state for registers moved backward has failed. This is most likely caused by runtime or capacity limits.

Please switch to medium effort. However, using medium effort could lead to very long runtime.

WHAT NEXT

If you are not satisfied with the delay and area results, you may want to use medium justification effort in the `optimize_registers` or `set_optimize_registers` command. Please be aware that the medium effort level may greatly increase runtime, while an improvement in QoR is not guaranteed.

RTDC-132 (warning) Reset state justification was terminated early to reduce runtime.

DESCRIPTION

In order to be able to move registers including their reset connections, retiming needs to compute the equivalent initial state of the circuit after retiming. In this case the computation of the equivalent state for registers moved backward has failed. This is most likely caused by runtime or capacity limits.

Please recode the RTL such that registers are located at the primary inputs. Having registers at the primary inputs is suggested because forward justification of registers doesn't take a long time. You could even use high justification effort. However, using high effort could lead to very long runtime.

WHAT NEXT

Please recode the RTL to have registers at the primary inputs. You could even try using high justification effort in the `optimize_registers` or `set_optimize_registers` command, if you are not satisfied with the delay and area results. Please be aware that the high effort level may greatly increase runtime, while an improvement in QoR is not guaranteed.

RTDC-133 (warning) QoR may not be optimal with medium justification effort.

DESCRIPTION

The QoR obtained with medium justification effort may not be optimal. Please recode the RTL such that registers are located at the primary inputs. Having registers at the primary inputs is suggested because forward justification of registers doesn't take a long time. You could even use high justification effort. However, using high effort could lead to very long runtime.

WHAT NEXT

Please recode the RTL to have registers at the primary inputs. You could even try using high justification effort in the optimize_registers or set_optimize_registers command, if you are not satisfied with the delay and area results. Please be aware that the high effort level may greatly increase runtime, while an improvement in QoR is not guaranteed.

RTDC-134 (warning) Using high justification effort could lead to very long runtime.

DESCRIPTION

Using high justification effort could lead to very long runtime. You could avoid this problem by recoding the RTL to have registers at the primary inputs. Having registers at the primary inputs is suggested because forward justification of registers doesn't take a long time.

WHAT NEXT

If justification doesn't complete within a finite amount of time, please recode the RTL to have registers at the primary inputs. You could even try using medium justification effort in the optimize_registers or set_optimize_registers command to reduce runtime.

RTDC-135 (warning) Retiming is likely to run for an extended period of time due to the large design size.

DESCRIPTION

Global retiming is the most effective on pipelined datapath designs, which are usually not very large. Retiming a large non-pipeline design can incur very long run time, and in some cases, it may never finish. Viable alternatives include retiming smaller sub-designs or using adaptive retiming instead.

WHAT NEXT

Continue with retiming.

RTLE

RTLE-000 (error) Internal error.

DESCRIPTION

Some unspecified internal error occurred. This is a bug.

WHAT NEXT

Please file a bug report.

RTLE-001 (warning) Cannot open input file '%s'.

DESCRIPTION

The listed file cannot be opened for input. Either it does not exist, or you don't have read permission.

WHAT NEXT

Ensure that the listed file is the desired file, that it exists, and that it is readable.

RTLE-002 (warning) Cannot access output directory '%s'.

DESCRIPTION

The listed directory cannot be used for output. Either it is a file, or it is a directory for which you don't have write permission, or it cannot be created.

WHAT NEXT

Ensure that the listed directory is the desired directory. If it exists, it must be writable. If it does not exist, its parent must be writable.

RTLE-003 (information) Writing edited '%s' to '%s'.

DESCRIPTION

This is a simple information message stating that the edited version of the specified source file is written out at the specified location. As a result of writing out this file, it is removed from memory. It is no longer available for further editing.

WHAT NEXT

No action required.

RTLE-004 (information) Writing edited '%s' as an sed script to %s.

DESCRIPTION

This is a simple information message stating that the edited version of the specified source file is written out as an sed script at the specified location. As a result of writing out this file, it is removed from memory. It is no longer available for further editing.

WHAT NEXT

The sed script can be played back on the original file to obtain the edited version as 'sed -e <orig_file>'.

RTLE-005 (warning) There are no files to write.

DESCRIPTION

A write command was issued, but there are no files to write.

WHAT NEXT

Ensure that the desired file was previously read in, but not already written out. Note that files are removed from active memory when they are written to disk.

RTLE-006 (warning) File '%s' is not currently loaded in the

editor; it cannot be written out.

DESCRIPTION

A write command was issued, but the specified file is not currently loaded in the editor.

WHAT NEXT

Ensure that the desired file was previously read in, but not already written out. Note that files are removed from active memory when they are written to disk.

RTLE-010 (warning) Syntax errors while reading file '%s'.

DESCRIPTION

Some syntax errors occurred while reading the specified file. The file is not completely read into memory. The units in which the errors occurred are missing. This will affect the editing commands pertaining to these units.

WHAT NEXT

From the strict point of view of this session, only the syntax errors affecting editing commands need be addressed. Look at the following messages to see what further commands are affected, if any. Look at the previous messages to understand the details of the syntax error.

RTLE-011 (warning) Overwriting unit '%s'.

DESCRIPTION

The last read file redefines the specified unit. The previous definition is discarded.

WHAT NEXT

Decide for yourself if this is desirable or not.

RTLE-012 (warning) Cannot find unit '%s'.

DESCRIPTION

The specified unit is not currently loaded in memory.

WHAT NEXT

Verify that the specified unit is the desired unit. Ensure that the file defining this unit was read.

RTLE-013 (warning) Cannot find %s '%s' in unit '%s'.

DESCRIPTION

The specified object cannot be found in this unit.

WHAT NEXT

Verify that the specified object is the desired object, of the desired type. Correlate with source code.

RTLE-014 (warning) %s '%s' already exists in unit '%s'.

DESCRIPTION

The specified object already exists. It cannot be created.

WHAT NEXT

Verify that the specified object is the desired object, of the desired type. Correlate with source code.

RTLE-015 (information) Module '%s' is not loaded.

DESCRIPTION

The specified module or entity is not currently loaded in memory. For the operation requiring it, it will be treated as a black box. In particular, the actual existence of such a module is assumed, not verified. The specifics of its interface--name and

direction of ports--is not known. As a result, there is no guarantee that the edited design will properly link.

WHAT NEXT

If full validation is required, the module should be read in. Otherwise, if script is known to be correct, no action is required.

RTLE-016 (information) Reading file '%s'.

DESCRIPTION

This is a simple information message stating that the specified file is read into the editor.

WHAT NEXT

No action required.

RTLE-017 (information) Copying unit '%s' to '%s'.

DESCRIPTION

This is a simple information message stating that the specified unit is duplicated. This enables different editing commands to be applied on the two copies, depending on the context.

WHAT NEXT

No action required.

RTLE-018 (information) Renaming unit '%s' to '%s'.

DESCRIPTION

This is a simple information message stating that the specified unit is renamed.

WHAT NEXT

No action required.

RTLE-019 (warning) Unit '%s' already exists; it cannot be %s over.

DESCRIPTION

The specified unit already exists. The copy or rename command has no effect. In particular, the existing unit is not modified.

WHAT NEXT

Check the script.

RTLE-020 (Warning) Output directory '%s' cannot be created.

DESCRIPTION

The specified directory does not currently exist but it cannot be created. Look at the following messages to see what recovery action was taken.

WHAT NEXT

Validate that the specified path is legal, and that its parent is writable. Ensure that there is some free space on the disk.

RTLE-021 (Information) Output directory '%s' is used.

DESCRIPTION

This simple information message states that a directory different than the one specified by the user is used. See the previous message to get some indication of why the original directory was not used.

WHAT NEXT

No action required.

RTLE-022 (Warning) '%s' exists, but it is not a writable directory.

DESCRIPTION

The specified pathname refers to an existing object on the file system, but it cannot be used as an output directory. Either it is not a directory, or it is not writable. Look at the following messages to see what recovery action was taken.

WHAT NEXT

Modify the directory specification or clean-up.

RTLE-023 (Error) No valid output directory.

DESCRIPTION

The write command fails as it cannot compute a valid output directory from the user specification.

WHAT NEXT

Ensure that the editor has access to a writable directory and that this directory is correctly specified.

RTLOUT

RTLOUT-1 (warning) The designware operation '%s' is not one of the predefined designware operations. As a result, a call to a function with the same name of the operator will be written out, and the contents of that function will need to be provided.

DESCRIPTION

The leveled netlister currently does not understand all possible designware operators. For those operators that it doesn't understand, a function call will be written out with no body for the function. The user will then need to provide the contents of that function in order to simulate.

WHAT NEXT

There are two possible choices. First, the command **replace_synthetic** can be used to implement all synthetic parts. This is the most convenient solution, but it has the disadvantage of being slow, and writing out a slower and less comprehensible hdl netlist.

The second alternative is to supply the definition of the function. If VHDL is being written out, then the function can be encapsulated in a package, and that package can be included using the variable **vhdout_use_packages**. For verilog, this can be done using a file that is included using the variable **verilogout_include_files**.

NAME RTLOUT-2 (warning)

The DesignWare operator '%s' has a port '%s' for which HDL type information could not be extracted. This port will be declared as a vector of bits (for example, std_logic_vector in VHDL), in the generated RTL code. This can result in errors during subsequent analysis of the HDL code.

DESCRIPTION

You receive this warning when Behavioral Compiler cannot determine the HDL type of a parameter to a subprogram call in the RT-level HDL description it is generating. This lack of type information can cause subsequent analysis of this HDL description to fail.

When Behavioral Compiler encounters a subprogram in the input behavioral HDL that is preserved as a level of hierarchy by the **map_to_operator** or the **preserve_function** pragmas, Behavioral Compiler gathers and stores information about the types of each of the parameters of the subprogram call.

Later, when RT-level HDL is output, the synthetic operator to which this subprogram call was mapped (or the subdesign formed by preserving the subprogram) is replaced by a call to a subprogram representing the combinational simulation model for the operator (or subdesign). The user must supply a package containing this combinational simulation model.

The behavioral subprogram can be used as the combinational simulation model only if the parameter list of the subprogram containing the combinational simulation model is identical to that of the original behavioral subprogram. Thus, Behavioral Compiler must ensure that the types of the parameters at the RT-level are the same as those of the parameters in the original behavioral subprogram declaration. This prevents "type mismatch" errors when the RT-level HDL code is analyzed prior to simulation.

This warning message means that Behavioral Compiler was unable to find the necessary typing information for a port of a subprogram call and cannot guarantee that the original behavioral subprogram body can be used as the combinational simulation model.

WHAT NEXT

Identify the reason why Behavioral Compiler was unable to find the typing information. There are two possibilities, as follows:

1. You might have constrained a previously declared unconstrained range in the parameter declarations of the subprogram, as in the following example:

```
procedure my_proc (
    I1 : in integer range 0 to 7;
    ...
);
```

The recommended methodology is to create a named subtype for this constrained range in the original behavioral description, and re-synthesize; for example,

```
subtype my_integer_type is integer range 0 to 7;
procedure my_proc (
    I1 : in my_integer_type;
    ...
);
```

2. The design from which the leveled RT-level HDL code is being generated might not contain the necessary information; this can happen if you write out a design generated using an earlier version of Behavioral Compiler.

In this case, you can ignore the warning messages. The generated RT-level HDL should work correctly with combinational simulation models that worked with the earlier version of Behavioral Compiler.

NAME RTLOUT-3 (information) Synthesizable RTLOUT is being written.

DESCRIPTION

Behavioral Compiler generates an HDL (Verilog or VHDL) output using write command. This message informs that the HDL output is being generated. You must have invoke write command with -rtl_script option to get this message. Synthesizable hdl output is a description of a scheduled design from Behavioral Compiler, and this output can be an input to many Synopsys RTL-level tools like Design Compiler, FPGA Compiler II, or Formality. Especially for Design Compiler, BC also generates a script file which contains a set of design constraints which are necessary for a consistent synthesis.

WHAT NEXT

Please look at the man page for write command. Synthesizable RTLOUT is generated only when -rtl_script option is given. The file format (-format), hierarchy (-hierarchy) and output (-output) options must also be given.

NAME RTLOUT-4 (error) Only non-levelized (structural) %s shall be generated with -rtl_script option.

DESCRIPTION

Synthesizable RTLOUT is a description which contains both functional and structural RTL-level description. Though, most of the part is structural. So it cannot generate a leveled RTLOUT. Please change the variable setting of vhdlout_levelize or verilogout_levelize to false to generate a synthesizable RTLOUT. To see the current value of those variables, please use: list vhdlout_levelize (or verilogout_levelize). Even though the simulation speed is not as fast as the leveled output, the synthesizable RTLOUT is also simulatable. To run simulation with synthesizable RTLOUT, you must provide a simulation model for the components that are instantiated. For combinational logic gates, either the target library must have a simulation model or you may set vhdlout_equations (verilogout_equation) to true. With vhdlout_equations (or verilogout_equation) set to true, combinational logic is written as technology-independent Boolean equations. To determine the current value of this variable, use **list vhdlout_equations (or verilogout_equation)**. For a list of all **vhdl1o** variables and their current values, use the **list -variables vhdl1o** command.

WHAT NEXT

Please read manpages for vhdlout_levelize (verilogout_levelize) and vhdlout_equations (or verilogout_equation).

NAME RTLOUT-5 (error) Writing synthesizable RTLOUT was not successful.

DESCRIPTION

This message simply indicates that the execution of writing synthesizable RTLOUT was not successful. There may be several reasons to get this error. First, the current design must have been generated by a correct version of schedule (2000.0x version or newer) which is designed to provide an appropriate information for synthesizable RTLOUT generation. Or another reason may be the incorrect command line options. Also, when the input description has at least one RTL block (process) is specified with behavioral processes, synthesizable RTLOUT will not be generated. Further detailed messages are printed along with this message most of the time.

WHAT NEXT

Please read write (2) manpage for the detailed description of write command with -rtl_script option.

NAME RTLOUT-6 (error) Currently we do not allow a subdesign to be written for synthesizable RTLOUT. When we use ‘write -script_file’ command, please do not specify any design name.

DESCRIPTION

Currently only the implicit current design is written. To tell the name of the design to be written, use ‘list current_design’. The current_design to be written must be a top design. Even though you set the current_design to be a subdesign, write -rtl_script command will not write out the subdesign since it’s not a top design. All the subdesigns instantiated under the top design (current_design) are automatically written. The constraint file whose name is specified with -rtl_script option contains Design Compiler constraints and the file will contain the constraints for all the (and only the) designs that are to be written.

WHAT NEXT

Please read write (2) command manpage with option -script_file.

NAME RTLOUT-7 (information) %s is an alias for %s.

DESCRIPTION

In the scheduled design, all the register banks (bc registers) are uniquified, which implies that there is one-to-one correspondance between a design and an instantiation. Since many register banks may have the same bit width, reset values and reset characteristics, one design can be shared by multiple instantiations. This message informs which registers are sharing the same design, i.e. if A is an alias for B, only A design is written in synthesizable RTLOUT, then A is instantiated in replace of B.

WHAT NEXT

Please see write (2) command manpage to know more about synthesizable RTLOUT.

NAME RTLOUT-8 (error) Design %s didn't link properly.

DESCRIPTION

It's actually the same error as LINK-5. This warning is issued when a suitable design can not be found to link a cell reference to. This will result in any cells using that reference being left as "black boxes". Generally this will happen because of one of two reasons: (1) either a design with the same name as the reference does not exist in the database, link libraries and the directories specified by the search_path, or, (2) the design exists but there are port mismatches between the reference and the design. In the second case an additional error message indicating the exact nature of the mismatch would be given.

WHAT NEXT

More information is available at LINK-5 manpage.

RTLOUT-9 (error) Unable to process design for writing synthesizable RTL output.

DESCRIPTION

You receive this error message because Behavioral Compiler is unable to process the design for writing out synthesizable RTL output.

This error can happen in a variety of circumstances:

1. Your design contains an RTL process.

2. Your design is missing implementation directives. This happens if you are trying to write synthesizable RTL output for a design scheduled with a version of Behavioral Compiler earlier than 2000.05.

3. Behavioral Compiler failed to implement the components used by your design.

WHAT NEXT

Typically, this message is preceded by another message regarding the specific error that caused Behavioral Compiler to fail processing. Refer to the manual page (manpage) for the specific error message issued.

SEE ALSO

`write` (2), `write_rtl` (2).

NAME RTLOUT-10 (error) Option `-rules_name` should only be used to generate a synthesizable RTLOUT. Hence, `-rtl_script` must be given at the same time.

DESCRIPTION

This message is issued when `write -rules_name` is called without `-rtl_script` option. `-rules_name` is used for users to add more renaming rules in addition to the default renaming rules. will generate a synthesizable HDL out which can be synthesized by Design Compiler.

WHAT NEXT

Please read `write`.2.

NAME RTLOUT-11 (information) User-specified rename rules

shall be applied.

DESCRIPTION

There is a set of default renamings applied when we write an HDL (VHDL and Verilog). This set of rules is language specific. Since synthesizable RTLOUT generates both an HDL file and a constraint.scr file, the naming should be consistent. Therefore, we apply the same set of renaming rules for the object names in the constraint.scr file. In addition to this, an additional set of renaming rules may be defined by the user. This can be done by specifying `-rules_name` option in `write` command. This informs that a user has defined a certain renaming rules which shall be applied to

the script file that write -rtl_script command generates.

WHAT NEXT

Please read write -rtl_script <script_file> -rules_name <rules_name> manpage.

NAME RTLOUT-12 (error) Applying user-specified rule %s was not successful.

DESCRIPTION

This message says that the user defined rename rule was not successfully applied. One obvious reason to get this error will be the named rule is not existent for some reason. When we applied a user defined rule, we show the renamed objects verbosely.

WHAT NEXT

NAME RTLOUT-13 (information) Default rename rules are applied to pass design constraints from Behavioral Compiler to Design Compiler.

DESCRIPTION

When we write out an HDL output, a set of renaming rules is applied to the HDL output. In synthesizable RTLOUT, a constraint.scr file is also generated. When we write out a constraint script file, we have to apply the same set of renaming rules in order to maintain consistency between the script and the generated HDL file. Since the renaming is applied unconditionally, we do not provide an option not to apply the default renaming rules. So it's not possible to disable the application of default renaming rules. When there is a set of user-defined renaming rules, the user-defined renaming rules will be applied first, and the default renaming rules will be the last one to be applied. A brief summary of renaming for each design is printed. Basically, the default renaming consists of renaming to remove illegal characters. The users are not encourage to check why a certain renaming is done because some renaming is forced to be done just to match the names between an HDL output and a constraint.scr file.

WHAT NEXT

Please look at change_names and define_name_rules to apply a user-specified rename rule. Also see write command manpage, especially, -rtl_script and -rules_name option to apply additional user defined rules for synthesizable HDLOUT and its corresponding constraint.script file.

NAME RTLOUT-14 (error) Application of default renaming rules was not successful.

DESCRIPTION

This is an error flag which says that the default renaming rule is not successful. This is very unlikely to happen though. This just checks the status of the command.

WHAT NEXT

This may be issued when the behavior of change_names or define_name_fuleschanges.

NAME RTLOUT-15 (error) Option -rtl_script should only be used for a BC design which has been manipulated for synthesizable RTLOUT.

DESCRIPTION

The write command with -rtl_script will generate a synthesizable HDL out which can be synthesized by Design Compiler. This message is issued when write -rtl_script is called with a design which is not generated (scheduled) by Behavioral Compiler.

WHAT NEXT

Please read write command manpage with -rtl_script option.

NAME RTLOUT-16 (error) Currently, write -rtl_script command should be used to write only the entire design hierarchy. Please use -hierarchy option with -script_file option.

DESCRIPTION

Only the entire design is written for synthesizable RTLOUT. Currently no design_list should be given when you invoke write -rtl_script commmand. The current_design should be set to the top design. We may support to write out a synthesizable sub-design in the future. Also a script file will be created and the created script file will constrain compile constraints for all the designs under the top design.

WHAT NEXT

Please understand 'current_design' command and design hierarchy. The design to be written as a synthesizable rtlout must be a top-design.

NAME RTLOUT-17 (error) You may not use %s option with -rtl_script option.

DESCRIPTION

This message is printed when there is an incompatible option specified with -rtl_script option. Since we only support a limited form of write command, the option -rtl_script is not compatible with several options of write command. Here is a summary on how to use write command for synthesizable RTLOUT.

The option -rtl_script followed by a file name (constraint.scr file) must be given. Option -hierarchy, -output and -format must be given as well. The file name specified with -output option is the name of an HDL while which contains the synthesizable RTLOUT. The format name must be either Verilog or VHDL. No other format is allowed. -rules_name option may or may not be given depending on the existence of user-defined renaming rules. The following options must not be used with -rtl_script option: -name_files, -library, -modified and -no_implicit. Also the design_list must not be given, and the 'current_design' should be set to the top design.

WHAT NEXT

See manpage for write (2) command.

NAME RTLOUT-18 (error) -rules_name option should be used with -rtl_script option.

DESCRIPTION

-rules_name option must be used only with -rtl_script option. It is used to specify a user-defined renaming rules in addition to the default renaming rules applied to object names in the design. The renaming rules are applied to the objects in the constraint file, not the real HDL files. When write command is writing an HDL file, there is a set of renaming rules applied to the names of the object unconditionally. They are mainly to remove illegal characters. To maintain the consistency between the names in the HDL file and those in the constraint.scr file, the default renaming rule of the synthesizable RTLOUT is applied. When user wants to apply additional renaming rules, then she/he can use -rules_name option. However, it is important to remember that the default renaming rule is the one which will be applied last to give the highest priority among the renaming rules.

WHAT NEXT

Please see the man page for define_name_rules, change_names, and write command.

NAME RTLOUT-19 (error) The design is not scheduled by Behavioral Compiler.

DESCRIPTION

The write command with -rtl_script option should be called only with the design which is scheduled by Behavioral Compiler. Otherwise, this error shall be issued. One important thing to remember is to use a new version of schedule command (2000.05 or newer) to generate the scheduled db. Otherwise, the write -rtl_script command will not recognize the scheduled db as an input for writing synthesizable RTLOUT. Also when the write -rtl_script is invoked, the current_design must be set to the top-level design. The preprocessing for synthesizable RTLOUT inside the schedule command is not computation or memory intensive. Therefore, the preprocessing step should not cause more computation time or memory requirement.

WHAT NEXT

Please see the manpage for write command, and also read manpage for schedule command.

NAME RTLOUT-20 (error) Missing implementation directives for design %s.

DESCRIPTION

Implementation directive should have been attached during scheduling. But when it's not existent this error is issued. This implementation directive will be used to instantiate a DesignWare component for each synthetic operator in the synthesizable RTLOUT. You have to use a new schedule executable which enables synthesizable RTLOUT (either 2000.05 version or newer). As long as you use an appropriate schedule command, it's very unlikely that you shall get this error.

An example of information when there is no problem is:

```
Information: Sharing and implementation directives for process 'P': (RTLOUT-22)
Instance 0: Processor 'DW02_mult' Implementation 'csa' Operations: mul_23, binding
'b4' mul_21, binding 'b4'
```

This message shows that two operations mult_21 and mult_23 will share a functional unit DW02_mult with the implementation 'csa'.

WHAT NEXT

Please see man page for schedule and write command.

RTLOUT-21 (error) Design %s contains RTL process %s, which is not supported while writing synthesizable RTL output.

DESCRIPTION

Behavioral Compiler does not support writing out synthesizable RTL output for a design that contains both behavioral and RTL processes.

WHAT NEXT

Do one of the following:

1. Separate the behavioral and RTL processes into different designs.
2. Use the `write_rtl` command with the `-ignore_rtl` argument to write out synthesizable RTL output. The RTL processes are removed from the design prior to writing synthesizable RTL output. You must manually insert the original RTL processes into the synthesizable RTL model prior to logic synthesis.

SEE ALSO

`write` (2), `write_rtl` (2).

NAME RTLOUT-22 (information) Sharing and implementation directives for process '%s':

DESCRIPTION

This informs directives for sharing and implementation module for each process in the design. To print this information, you have to set `bc_synt1_debug_mode` to TRUE.

An example of information with this message is:

```
Information: Sharing and implementation directives for process 'P': (RTLOUT-22)
Instance 0: Processor 'DW02_mult' Implementation 'csa' Operations: mul_23, binding
'b4' mul_21, binding 'b4'
```

This message shows that two operations `mult_21` and `mult_23` will share a functional unit `DW02_mult` with the implementation '`csa`'.

WHAT NEXT

NAME RTLOUT-23 (information) Sharing is prohibited on the process.

DESCRIPTION

A hidden flag is created to prohibit a sharing for a set of constructs which are not allowed to be shared. This message is only printed when `bc_synrtl_debug_mode` is true, and normally when this message is issued, generating synthesizable HDL out is not successful. One typical case is where there is a mixture of behavioral processes and RTL processes. For RTL processes, the hidden flag is set to prohibit sharing.

WHAT NEXT

NAME RTLOUT-24 (error) Output file name must be specified with -output option when you write a synthesizable RTLOUT.

DESCRIPTION

The write command line options are checked for synthesizable RTLOUT, and this message is issued when `-rtl_script` option is given without `-output` option. Unlike the original write command, the output file name must be provided when you write a synthesizable RTLOUT with `-rtl_script` option. When write command is called with argument `-script_file`, `-format` option must be given with vhdl or verilog, and `-hierarchy` option must be given too.

WHAT NEXT

Please see manpage for write command.

NAME RTLOUT-25 (information) %s name '%s' changed to '%s'

DESCRIPTION

This message is issued when the name changes by the renaming routines for synthesizable RTLOUT. While generating synthesizable RTLOUT, several types of objects are renamed to make the names consistent with the names in the synthesizable HDL file. The reason is depending on the format of the HDL file, there are different sets of renaming applied. These renamed names will be used to write the synthesizable HDL file. Therefore, we need to apply the same set of renaming to

match the name of the objects in the constraint.scr file. Port names and designs names with illegal characters are changed. Note that the renaming by synthesizable RTLOUT will be used to write constraints.scr file, and it will not affect the HDL file.

WHAT NEXT

Please see manpage for write command with -rtl_script option.

NAME RTLOUT-26 (error) The format should be either VHDL or Verilog for synthesizable HDLOUT.

DESCRIPTION

The synthesizable HDLOUT only writes out VHDL or Verilog RTL-level code. Where there is no -format option, the option is set to "db" format by default. Therefore, you should specify the format name either as VHDL or Verilog to generate a synthesizable RTLOUT. A different set of constraint.scr file shall be created depending on the output language format. This is because the hierarchical structure of the output file is different and also the names in the script file may have gone through a different renaming rule application.

WHAT NEXT

See manpage for write command with -rtl_script option.

NAME RTLOUT-27 (information) Register bank, %s's enable signal is masked by M port. In synthesizable HDLOUT, the register bank will be written in bit-level instead of word-level to indicate which bits are masked.

DESCRIPTION

M port is to selectively mask the enable signal so that we can update the contents of a register bank selectively. The enable signal is shared by all the bits in the register bank which makes impossible to update the contents partially. BC has made M port available to provide a way to do it. In the synthesizable RTLOUT, all register banks are written at a word-level by default. For those register banks with M port connected, they shall be written at bit-level to represent the masking of individual bits.

WHAT NEXT

Please see manpage for write command.

NAME RTLOUT-28 (information) %s %s is written in the rtlout.

DESCRIPTION

This message shows the value of bc_synrtl_write_preserved_functions or bc_synrtl_write_precompiled_designware is TRUE. If they are true, the design for preserved_function or precompiled designware is written in the synthesizable rtlout. If they are FALSE (by default), all such components have instantiations only and then you have to provide a db (design) file under the design library.

WHAT NEXT

Please see manpage for bc_synrtl_write_preserved_fucntions and bc_synrtl_write_precompiled_designware variable.

NAME RTLOUT-29 (information) %s %s is instantiated, and must be resolved via link.

DESCRIPTION

This message shows the value of bc_synrtl_write_preserved_functions or bc_synrtl_write_precompiled_designware is FALSE. If they are FALSE (by default), all such components have instantiations only and then you have to provide a db (design) file under the design library. If they are true, the design for preserved_function or precompiled designware is written in the synthesizable rtlout.

WHAT NEXT

Please see manpage for bc_synrtl_write_preserved_fucntions and bc_synrtl_write_precompiled_designware variable.

NAME RTLOUT-30 (information) Mapping to target_library %s.

DESCRIPTION

This message shows the value of bc_synrtl_map_to_gtech. By default the value is TRUE. When it's TRUE, the target library is set to be GTECH. And components are mapped to GTECH components. If you want to use a real target library, you have to

set the variable bc_synrtl_map_to_gtech to be false. To see the current value, please use list bc_synrtl_map_to_gtech.

WHAT NEXT

Please see manpage for bc_synrtl_map_to_gtech.

NAME RTLOUT-31 (information) Synthesizable RTLOUT will generate constraint.script in both dcsh and dctcl because bc_synrtl_write_dcsh_and_dctcl is on. The current dc_shell is running in %s mode. Therefore, the given file name is used to write in %s script, and %s is used to generate a %s script.

DESCRIPTION

Synthesizable RTLOUT generates a constraint.script file. The format is either dcsh or dctcl and is automatically selected according to the current running mode of the dc_shell. Under some circumstance, user may want to generate constraint.script file in both format. For example, user is running dc_shell in eqn mode, and wants to generate a constraint.script file in dctcl. In this case, they can set variable: bc_synrtl_write_dcsh_and_dctcl to true. Then two copies of the constraint script file will be generated, one is in dcsh and the other one is in dctcl. By default the value is false.

When a single script is generated, the name of the script file will be the same as the given as the argument, regardless of the format. When both are generated, the script in the same format as the current dc_shell mode will have the same name as the argument, and the other script will have a name which contains some suffix. The suffix will be "-t" for a tcl script, and "-eqn" for a dcshl script.

For example, when a dc_shell is running in normal (non-Tcl) mode, if the variable bc_synrtl_write_eqn_tcl_script is true, when write -rtl_script <file_name> is called, <file_name>-t is generated as the constraint script file in tcl format in addition to <file_name> as the constraint script file in eqn format.

WHAT NEXT

Please see manpage for bc_synrtl_write_dcsh_and_dctcl.

RTLOUT-32 (information) write_rtl has successfully generated

%s RTLOUT.

DESCRIPTION

You receive this informational message because the `write_rtl` command has successfully generated a synthesizable RTL model or a simulation RTL model.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`write_rtl` (2).

RTLOUT-33 (error) write_rtl has failed to generate %s RTLOUT.

DESCRIPTION

You receive this error message because the `write_rtl` command has failed while generating a synthesizable RTL model or a simulation RTL model.

WHAT NEXT

This error message is always preceded by other error messages that provide details about the failure. See the man pages for those error messages to determine how to recover from this error.

SEE ALSO

`write_rtl` (2).

NAME **RTLOUT-34** (information) By default, %s is set to TRUE when synthesizable RTLOUT is generated. Use -use_gates

option if you need to set the variable to FALSE.

DESCRIPTION

WHAT NEXT

NAME RTLOUT-35 (error) You must provide the %s option.

DESCRIPTION

WHAT NEXT

NAME RTLOUT-36 (error) Translation of tech-mapped gates into gtech gates is effective only when precompiled netlist or preserved function is written out. Please use -translate option with -precompiled_designware and/or -preserved_functions.

DESCRIPTION

WHAT NEXT

NAME RTLOUT-37 (warning) Functional model for DW components shall be written. Note that not all the DW instantiations can map to a functional operator.

DESCRIPTION

Here is a list of designware components that we can map to a functional model:
DW01_add, DW01_inc, DW01_dec, DW01_sub, DW01_incdec, DW01_addsub, DW02_mult,
DW02_divide, DW01_cmp2, DW01_cmp6.

WHAT NEXT

See man page for write_rtl command.

NAME RTLOUT-38 (error) Argument(s) which is not relevant to the %s RTLOUT is given.

DESCRIPTION

WHAT NEXT

NAME RTLOUT-39 (error) '-rtl_script' option is required to generate the synthesizable RTLOUT.

DESCRIPTION

WHAT NEXT

NAME RTLOUT-40 (error) '-syn' and '-sim' options are given at the same time. Either synthesizable or simulatable RTLOUT is generated using the write_rtl command.

DESCRIPTION

WHAT NEXT

RTLOUT-41 (information) Translating design %s from %s to GTECH succeeded.

DESCRIPTION

You receive this message because translation of the specified design from the target library to a Synopsys GTECH netlist representation succeeded. This is an intermediate step in the generation of a synthesizable RTL model.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`write_rtl (2)`.

RTLOUT-42 (error) Translating design %s from %s to GTECH failed.

DESCRIPTION

You receive this error message because certain components in the design for which the synthesizable RTL model is being generated contain target library components that cannot be translated into GTECH components. The generated synthesizable RTL model will contain instantiations of the target library components.

WHAT NEXT

Provide synthesis models of the target library components.

SEE ALSO

`write_rtl (2)`.

RTLOUT-43 (information) %s is written as a functional model.

DESCRIPTION

You receive this message because while writing a synthesizable RTL model, the specified component was written out functionally instead of being instantiated. For example, a DW01_add component would be written out at a "+" operator.

Replacing components with functional models wherever possible removes the dependence of the RTL model on any specific component library and allows RTL synthesis tools the freedom to select their own implementations for the operators.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`write_rtl (2)`.

RTLOUT-44 (warning) %s is being instantiated but has no model.

DESCRIPTION

You receive this warning message because Behavioral Compiler has detected a synthetic DesignWare component in the specified design for which there is no implementation or functional representation available. You must supply an implementation for the component prior to running RTL synthesis on the synthesizable RTL output. In the synthesizable RTL output, this component will be instantiated. The implementation for the component exists inside a synthetic library of DesignWare parts. Each component of a synthetic library has a VHDL or Verilog model that defines the component.

WHAT NEXT

If you are writing out a synthesizable RTL model in VHDL, you must include the package that contains this model. You can do this using the **-use_packages** argument of the **write_rtl** command. For example:

```
dc_shell> write_rtl -use_packages { dw01.dw01_components } -f vhdl -o my_synrtl.vhd
```

If you are writing out a synthesizable RTL model in Verilog, you must read in the Verilog model for the component into the relevant tool when using the synthesizable model in simulation or RTL synthesis.

SEE ALSO

write_rtl (2).

NAME RTLOUT-45 (error) The format should be either VHDL or Verilog for ‘write_rtl’ command.

DESCRIPTION

WHAT NEXT

RTLOUT-46 (information) For the preprocessing of synthesizable RTLOUT, target_library is temporarily set to { %s } from { %s }. The original target_library will be restored after the

preprocessing step.

DESCRIPTION

You receive this message because during the generation of a synthesizable RTL model, the target library is temporarily modified. The target library will be restored to its original value after preprocessing.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`write_rtl` (2).

RTLOUT-47 (information) Translating design %s from %s to GTECH succeeded.

DESCRIPTION

You receive this message because the translation of the specified design from the target library to a Synopsys GTECH netlist succeeded. This is an intermediate step in the generation of a synthesizable RTL model.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`write_rtl` (2).

RTLOUT-48 (error) Translating design %s from %s to GTECH failed.

DESCRIPTION

You receive this message because certain components in the design for which the synthesizable RTL model is being generated contain target library components that cannot be translated into GTECH components. The generated synthesizable RTL model

will contain instantiations of the target library components.

WHAT NEXT

To perform RTL synthesis on the synthesizable RTL model, provide synthesis models of the target library components.

SEE ALSO

`write_rtl` (2).

RTLOUT-49 (information) Mapping to target library %s.

DESCRIPTION

You receive this message because the synthesizable RTL model being generated will contain instantiations of components from the specified target library. To perform RTL synthesis using this model, you must provide synthesis models of the components from the target library.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`write_rtl` (2).

RTLOUT-50 (error) Only simulatable (levelized) %s output can be generated with the -format systemc option.

DESCRIPTION

You receive this message because

although the `write` command can generate RTL-level output in the SystemC language once a behavior-level design has been synthesized through the SystemC compiler, currently support exists only for a simulatable model of the RTL output. The `systemcout_levelize` variable must be set to `true` to generate this output. To see the current value of this variable, use `list systemcout_levelize`.

Note that the input behavior-level language must be SystemC. Use of any other HDL language (VHDL, VERILOG) as the input language may not result in a usable RTL-level output.

WHAT NEXT

See man page for the **systemcout_levelize** variable.

RTLOUT-51 (warning) The RTLOUT writer cannot determine if the input HDL was SystemC or finds that the input is in a language different from SystemC.

DESCRIPTION

You receive this message because the RTLOUT writer is writing out in the SystemC language but cannot determine that the input design was also written in SystemC. RTLOUT writer either could not determine the input format or found that the input format is in some other language (for example, VHDL or Verilog).

This may result in interface port type information not being available to the RTLOUT writer. The ports of the RTL module being written out may not match those of the input behavior, resulting in compilation mismatches with the testbench.

This may mean that any information about the types of various interfaces (input, output ports, and function calls) may not be available to the RTLOUT writer. The output then uses a default type. This may result in compilation mismatches with the testbench.

WHAT NEXT

Identify the reason why the RTLOUT writer finds a mismatch in the input language and the output format it is expected to write in. The two possibilities for this are as follows:

- The input language is some other HDL/ High Level language. Since this is not supported, the you must use this flow at your own risk.
- If the input language is SystemC, the SystemC Compiler was not used to synthesize the design.

RTLOUT-52 (error) Output format must be specified as VHDL, Verilog, or SystemC.

DESCRIPTION

You receive this error message because you have not specified a valid output format with the **write_rtl** command. The **write_rtl** command requires that you specify a valid

output format as an argument.

WHAT NEXT

Reexecute the `write_rtl` command and specify a valid output format.

SEE ALSO

`write_rtl` (2).

RTLOUT-53 (error) Output file name must be specified.

DESCRIPTION

You receive this error message because you did not specify an output file name with the `write_rtl` command. You must specify an output file name with this command.

WHAT NEXT

Reexecute the `write_rtl` command and specify an output file name.

SEE ALSO

`write_rtl` (2).

RTLOUT-54 (error) The %s argument is invalid when used with the %s output format.

DESCRIPTION

You receive this error message because, with the `write_rtl` command, the specified argument cannot be used with the specified output format.

WHAT NEXT

Reexecute the `write_rtl` command and specify a valid argument.

SEE ALSO

`write_rtl` (2).

RTLOUT-55 (error) Synthesizable SystemC RTL output is not currently available.

DESCRIPTION

You receive this error message because you have used the **write_rtl** command to write synthesizable RTL output with SystemC as the output format. This is not currently supported.

WHAT NEXT

Either use VHDL or Verilog as your output format for synthesizable RTL output, or specify the **-simulation** argument to write a simulation RTL model in SystemC.

SEE ALSO

write_rtl (2).

RTLOUT-56 (warning) The %s argument has no effect when the %s argument is used.

DESCRIPTION

You receive this warning message because you have executed the **write_rtl** command and have specified an argument that will be ignored in the presence of the second argument.

WHAT NEXT

Verify that you want the first argument to be ignored. Remove one of arguments to prevent this warning message from being generated.

SEE ALSO

write_rtl (2).

RTLOUT-57 (warning) The %s argument has no effect when

used without the %s argument.

DESCRIPTION

You receive this warning message because you have executed the **write_rtl** command with an argument that will be ignored unless you also include the second argument.

WHAT NEXT

If you do not want the specified argument to be ignored, reexecute the **write_rtl** command and specify both arguments.

SEE ALSO

write_rtl (2).

RTLOUT-58 (error) The -rtl_script argument must be specified when writing synthesizable RTL output.

DESCRIPTION

You receive this error message because you have executed the **write_rtl** command without the **-rtl_script** argument. You must specify this argument so that the **write_rtl** command has a place to write the constraints needed to guide synthesis of the synthesizable RTL model that is written out.

WHAT NEXT

Reexecute the **write_rtl** command and specify the **-rtl_script** argument.

SEE ALSO

write_rtl (2).

RTLOUT-59 (information) RTL synthesis constraints will be written to RTL synthesis script file %s.

DESCRIPTION

You receive this message because you have executed the **write_rtl** command but have not specified the **-rtl_script** argument. The necessary RTL synthesis constraints will

be written into a script file with the name specified in the information message.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`write_rtl` (2).

RTLOUT-60 (error) The simulation optimized RTL output option is not available for a design configured for behavioral synthesis targeting an FPGA.

DESCRIPTION

You receive this message because simulation optimized RTL output is not available on a design configured for behavioral synthesis targeting an FPGA. Use the default RTL output, which can also be simulated.

WHAT NEXT

Use the `write_rtl` command to generate a synthesizable, simulatable RTL model. Be careful not to use the `-simulation` option of `write_rtl`.

EXAMPLES

The following example shows how to use `write_rtl` to generate an appropriate RTL model.

```
dc_shell> write_rtl -format vhdl -output \
my_rtl_design.vhd
```

SEE ALSO

`set_fpga` (2), `write_rtl` (2).

SAIF

SAIF-1 (error) The SAIF file contains switching data for the design '%s';
this switching data cannot be annotated on the design '%s'.

DESCRIPTION

This message indicates that the design for which the switching data was written, as indicated by the DESIGN construct of the SAIF file, is not the **current_design**. The name in the DESIGN construct of the SAIF file must be the name of the **current_design**.

WHAT NEXT

Verify that the SAIF file was created for the **current_design**, and if so, edit the SAIF file so that the DESIGN construct contains the name of the **current_design**.

SAIF-2 (warning) The SAIFVERSION values we accept is '%s'.

DESCRIPTION

This message indicates that the current SAIF file was written using an unrecognized revision of the SAIF language. Revisions recognized by the current version of the **read_saif** command are listed in the message.

This message is a warning only; **read_saif** attempts to read the file. However, if syntactic or semantic errors occur, suspect version incompatibility.

WHAT NEXT

If the file is read successfully, you need to do nothing. However, if the file is not read successfully, verify that the SAIF file created is compatible with one of the versions indicated by this warning message.

SAIF-3 (error) The time unit in a SAIF file must be one of these:

s, ms, us, ns, ps, fs.

DESCRIPTION

The SAIF language syntax requires that the timing unit must be either s, ms, us, ns, ps, or fs. Check your SAIF file and make sure this is the case.

WHAT NEXT

This is an error.

SAIF-4 (error) The time_scale in a SAIF file must be one of these:

1, 10, 100.

DESCRIPTION

The SAIF language syntax requires that the time_scale must be either 1, 10, or 100. Check your SAIF file and make sure this is the case.

WHAT NEXT

This is an error.

SAIF-5 (error) %s at or near token '%s'.

DESCRIPTION

A lexical or syntactic error has occurred in processing this SAIF file.

WHAT NEXT

Look at the line and token indicated in the message, and fix the problem.

SAIF-6 (warning) The object '%s' does not belong to

the instance '%s'. The object is ignored.

DESCRIPTION

The -instance option specifies the design instance and its sub-design instances that will be annotated into DesignPower. Any other object is ignored by the read_saif command. This warning message means that the specific object does not belong to the design instance or any of its sub-design instances, and is therefore ignored.

WHAT NEXT

This is a warning.

SAIF-7 (warning) The -instance parameter, '%s' is a substring of the object '%s', but it is not a complete name. The object is ignored.

DESCRIPTION

The -instance option must specify a full path name. For example, "-instance TOP/TEST" is a valid option for an object name "TOP/TEST/design/cell/A", but "-instance TOP/TE" is not.

WHAT NEXT

Please check your read_saif command to make sure you have specified a correct -instance option.

SAIF-8 (warning) The object '%s' has been found without a containing module, after '%s' is stripped off. The object is ignored.

DESCRIPTION

It is most likely that you did not appropriately specify the -strip_module option. Check the option and make sure you did NOT strip off the instance name of the top design module where the SAIF file is applied.

WHAT NEXT

This is a warning.

SAIF-9 (error) The simulation duration time is less or equal to 0.

DESCRIPTION

The duration field specified in the SAIF file must be a positive value.

WHAT NEXT

This is an error.

SAIF-10 (error) The read_saif command can only read a backward-annotation SAIF file.

DESCRIPTION

The **read_saif** command only supports a backward-annotation SAIF file.

WHAT NEXT

This is an error. Check your SAIF file again and verify that it is a backward-annotation SAIF file.

SAIF-11 (error) This file has a version number greater than 2.0, but it does not contain the "DIRECTION ..." construct.

DESCRIPTION

The SAIF file with version 2.0 or greater must have the "DIRECTION ..." construct to specify if this is a forward or backward-annotation SAIF file.

WHAT NEXT

This is an error.

SAIF-12 (error) Unable to open file %s.

DESCRIPTION

The **read_saif** command can not open the SAIF file.

WHAT NEXT

Make sure the file exists.

SAIF-13 (warning) Cannot find the equivalent %s pin of the cell %s.

DESCRIPTION

The pin name "Q" or "Z" for a virtual instance in SAIF is a logical name. The **read_saif** command tried to find the equivalent pin in the actual library cell but failed. The likely cause is pin name in the SAIF file has been manually changed, or the library cell information is not available.

WHAT NEXT

This is a warning.

SAIF-14 (error) Path dependent switching activity has to be specified inside the state dependent switching activity.

DESCRIPTION

SAIF syntax does not allow both path dependent and state dependent switching activity appear at the same level. You have to embed path dependent switching activity inside state dependent switching activity.

WHAT NEXT

This is an error.

SAIF-15 (error) Only timing attribute information can be

specified inside the LEAKAGE construct.

DESCRIPTION

SAIF syntax does not allow toggle data appear inside the LEAKAGE construct. The LEAKAGE construct is used to capture state dependent static probability. Therefore, only timing attribute information can be specified here.

WHAT NEXT

This is an error.

SAIF-16 (warning) Can't find object '%s'.

DESCRIPTION

A specific object, net/pin/port, can not be found in the current design.

WHAT NEXT

This is a warning.

SCALING

SCALING-001 (Error) Tried to set library into multiple scaling library groups.

DESCRIPTION

In scaling mode, a particular library can be put in only one scaling library group. Otherwise, tool will not know which scaling library group should be used to perform scaling on the library cell.

WHAT NEXT

Check there is not overlap between any two scaling library group

SCALING-002 (Error) Arc mismatching error. The arc '%s' on cell '%s' does not exist on cell '%s'.

DESCRIPTION

In scaling mode, all cells, which are treated as the different versions of the same cell by the linker, will be link to a unique library cell. Therefore, in order to acquire the accurate timing with scaling, tool require all arcs should match exactly between cells when they are linked together. If arc mismatching exist between libraries, those mismatched arcs could be possibly ignored to accommodate scaling. The timing accuracy could be lost in such case.

WHAT NEXT

Fix the library to revise the mismatched arcs.

SCALING-003 (Warning) `set_min_library` command is obsolete in scaling mode, please use `set_scaling_lib_group -min` instead.

DESCRIPTION

In scaling mode, there is no need to use `set_min_library` any more. The command `set_scaling_lib_group -min` can serve all `set_min_library` command purpose and provide more flexibility.

WHAT NEXT

Replace set_min_library with set_scaling_lib_group -min

SCALING-004 (Warning) Duplicated arcs in one cell. The arc '%s' on cell '%s' is duplicated.

DESCRIPTION

In scaling mode, in order to do arc scaling within a scaling library group, all the corresponding arcs from the libraries in the group are found to fetch the needed data. In the case there are multiple exactly same arc in one library cell, the first incoming will be pickup as the scaling candidate and all other duplicated peers are ignored. If this arc is not the one desired, unexpected result will appear.

WHAT NEXT

Make sure the first arc is the desired arc to be used for scaling. Try to remove other duplicated arcs if they are unnecessary.

SCAN

SCAN-1 (error) Can't open init file '%s'.

DESCRIPTION

WHAT NEXT

SCAN-2 (error) Init file '%s' has improper format.

DESCRIPTION

WHAT NEXT

SCAN-3 (error) Invalid data format.

DESCRIPTION

WHAT NEXT

SCAN-4 (error) %s: Lexical Error on line %d at or near '%s'.

DESCRIPTION

WHAT NEXT

SCD

SCD-2 (error) Operations in resource '%s' can not be shared because they may execute in the same control step %s

DESCRIPTION

WHAT NEXT

SCD-4 (error) Operations in resource %s are part of a combinational feedback loop(%s).

DESCRIPTION

You receive this message if the **compile** command finds that a combinational feedback loop would occur in the final design as a result of manual resource sharing directives. Operations cannot be shared if doing so causes a combinational feedback loop.

WHAT NEXT

Review your manual resource sharing directives for the specified resources, and modify them so that they do not create a combinational feedback loop. For information about how sharing can create a combinational feedback loop, see the section on Data Flow Conflicts in either the *VHDL Compiler Reference Manual* or the *HDL Compiler for Verilog Reference Manual*.

SCD-7 (error) You must specify the module using 'map_to_module' if you want to set the implementation%s

DESCRIPTION

WHAT NEXT

SCD-9 (information) Additional cells were grouped along with

specified cells
because they must be in the same design as the grouped logic which they control.

DESCRIPTION

WHAT NEXT

SCD-10 (information) Some cells were not grouped because they must be in the same design as the logic which they control.

DESCRIPTION

WHAT NEXT

SCD-11 (information) Some cells were duplicated in both the original and grouped design because these cells control logic in both the original and grouped design.

DESCRIPTION

WHAT NEXT

SCD-12 (warning) Operation '%s' can not be included in a resource. It will not be implemented on '%s' %s

DESCRIPTION

WHAT NEXT

SCHD

SCHD-1 (error) %s '%s' in design '%s' has no symbol.

DESCRIPTION

WHAT NEXT

SCHD-2 (error) %s '%s' in design '%s' has no symbol library.

DESCRIPTION

WHAT NEXT

SCHD-3 (error) The symbol library of %s '%s' in design '%s' has no name.

DESCRIPTION

WHAT NEXT

SCHD-4 (warning) Symbols were generated because they were

not found in any library.

DESCRIPTION

WHAT NEXT

SCHD-5 (error) %s '%s' has no symbol.

DESCRIPTION

WHAT NEXT

SCHD-6 (error) Could not load bitmap file '%s'.

DESCRIPTION

WHAT NEXT

SCHD-7 (error) Could not find reference name for cell '%s' on the schematic.

Was this schematic created with an older version of Synopsys software?

DESCRIPTION

WHAT NEXT

SCHD-8 (error) '%s' is not a valid justification specification.

DESCRIPTION

WHAT NEXT

SCHV

SCHV-1 (error) Plot command is not available.

DESCRIPTION

WHAT NEXT

SCO

SCO-001 (error) Cannot open net components net ID:%d.

DESCRIPTION

You received this error message because scan chain optimization failed to access net data for buffering.

WHAT NEXT

Verify netlist.

SDC

SDC-1 (information) Setting sdc_version outside of an SDC file has no effect

DESCRIPTION

You set the **sdc_version** variable outside of the context of an SDC file. In that context, changing the variable has no effect.

WHAT NEXT

No action necessary.

SDC-2 (warning) SDC version in file (%s) does not match the version you requested

from **read_sdc** (%s). Some constraints and options may not function.

DESCRIPTION

The version indicated by the setting of the **sdc_version** variable in your SDC file does not match the version requested by the **read_sdc** command.

WHAT NEXT

Ensure that you select the correct version when issuing the **read_sdc** command.

SDC-3 (warning) Constraint '%s' is not supported by %s.

DESCRIPTION

Not all Synopsys Design Constraints are supported by all applications. The specified constraint is not supported by the current application, and it is ignored. For example, test constraints are not recognized by PrimeTime. One SDC-3 message is issued per instance of the constraint which is ignored. Then, after **read_sdc** completes, an SDC-4 summary message will tell you how many of each constraint was ignored.

WHAT NEXT

SDC-4 (information) Ignored %d unsupported '%s' constraint%s.

DESCRIPTION

This is a summary message indicating how many instances of a particular constraint were ignored by `read_sdc` because the constraint is unsupported.

WHAT NEXT

SDC-5 (error) Errors reading SDC file:

%S.

Use `error_info` for more info.

DESCRIPTION

This message is generated by `read_sdc` when an syntax error occurs during the read. The specific error is shown in the text of the message.

WHAT NEXT

You can use `error_info` to help trace the cause of the error. For example, it might show the file and line number of the syntax error.

SDFN

SDFN-1 (warning) The delay type variables must be: 'minimum' 'typical' or 'maximum'. '%s' is invalid, '%s' will be used by default.

DESCRIPTION

The delay type variable is invalid, it must be 'minimum', 'typical' or 'maximum'. Read the man pages of variables `sdfin_rise_net_delay_type`, `sdfin_fall_net_delay_type`, `sdfin_rise_cell_delay_type` and `sdfin_fall_cell_delay_type` for explanations on how these variables are used.

WHAT NEXT

The type specified is invalid, the default is to read the 'maximum' delay value from the timing fields in the SDF file.

SDFN-2 (warning) The library '%s' has no time unit specified, '%s' is assumed.

DESCRIPTION

The library has no time unit specified. By default the time unit is nanosecond and time scale is 1. The only valid library time unit for the sdf format are 0.001, 0.01, 0.1, 1, 10 and 100. The time unit is specified in the library with the attributes `time_scale` and `time_unit_name`. For example, a library with timing values in 10 picoseconds unit is specified with the attributes: `time_scale = 10` and `time_unit_name = ps` `read_timing` assumes the technology library time unit is 1ns. The time unit in the sdf file is specified with TIMESCALE construct.

WHAT NEXT

If this assumption is incorrect, modify the scale and time unit of the sdf timing file before reading it in Design Compiler.

SDFN-3 (warning) No library was found on the search path, time unit '%s'

is assumed.

DESCRIPTION

There was no library found on the search path.

WHAT NEXT

Verify the search path with **list search_path** and verify the link library is under the search path. The link library is specified with **link_library**. Use **link** to verify the design has necessary libraries on the search path. Read the timing file once again after fixing the link errors.

SDFN-4 (error) The SDF file contains delays for the design '%s', they cannot be annotated on design '%s'.

DESCRIPTION

The current design and the design the SDF file was written for are not the same. They must be the same. The DESIGN construct in the sdf file contains the name of the design the timing file was written for. This name should be the same as the **current_design**.

WHAT NEXT

Verify the sdf file was created for the current design, the DESIGN construct in the sdf file should contain the name of the current design. Check the usage of the **read_timing** command, you might need to use the **-path** option.

SDFN-6 (warning) Cell delay could not be annotated between pin '%s', and pin '%s' for the design '%s'.

DESCRIPTION

The sdf timing file contains an IOPATH construct, specifying a cell delay between the pins specified in this warning message. The delay could not be annotated on the current design, the reason should be explained from a previous error message. The timing values in the sdf file could be invalid. The sdf file could be invalid if it contained references of non leaf cell pins. Only top level ports and leaf cell pins must be in the sdf file. The sdf file might have been created for a different level of the design hierarchy. The design names might have been renamed since the sdf file

was created, if so regenerate a sdf file. The sdf file is case sensitive. Other delays in the sdf file have been annotated on the design.

WHAT NEXT

Check the sdf file was created for the current design, verify the use of **read_timing**, you might need to use the **-path** option. Make sure there was no renaming performed in the design, regenerate the sdf file if this was the case.

SDFN-7 (warning) Interconnect delay could not be annotated between pin '%s', and pin '%s' for the design '%s'.

DESCRIPTION

The sdf timing file contains an INTERCONNECT construct, specifying a net delay between the pins specified in this warning message. The delay could not be annotated on the current design, the reason should be explained from a previous error message. The timing values in the sdf file could be invalid. The sdf file could be invalid if it contained references of non leaf cell pins. Only top level ports and leaf cell pins must be in the sdf file. The sdf file might have been created for a different level of the design hierarchy. The design names might have been renamed since the sdf file was created, if so regenerate a sdf file. The sdf file is case sensitive. Other delays from the sdf file have been annotated on the design.

WHAT NEXT

Check the sdf file was created for the current design, verify the use of **read_timing**, you might need to use the **-path** option. Make sure there was no renaming performed in the design, regenerate the sdf file if this was the case.

SDFN-9 (warning) Instance '%s' could not be found.

DESCRIPTION

The sdf timing file contains an instance that could not be found in the design. The instance name is specified with the construct INSTANCE in the sdf file. The sdf file is invalid if it contains references to instances not in the current design. Note the sdf file is case sensitive. Also the design must be free of link errors before annotating delays with **read_timing**. The design names might have been renamed since the sdf file was created, if so regenerate a sdf file. Some delays might have been annotated on the design before the error occurred. **sdfin_top_instance_name** must be used if the SDF instance names contain the top level name of the design. Synopsys SDF reader assumes the top level name of the design is not included in the instance names.

WHAT NEXT

Verify the design does not have link errors, with the **link** command. Make sure there was no renaming performed in the design, regenerate the sdf file if this was the case. Check with **report_annotation_delay** if any delay have already been annotated. Use **remove_annotation_delay** to remove unwanted annotated delays. Set **sdfin_top_instance_name** to the top design name if SDF instance names contain the top level design name.

SDFN-10 (warning) Pin '%s'/'%s' could not be found.

DESCRIPTION

The sdf timing file contains a pin that could not be found in the design. The sdf file could be invalid if it contains references of non leaf cell pins. The sdf file might have been created for a different level of the design hierarchy. The design names might have been renamed since the sdf file was created, if so regenerate a sdf file. Note, the sdf file is case sensitive. Some delays might have been annotated on the design before the error occurred. **sdfin_top_instance_name** must be used if the SDF instance names contain the top level name of the design. Synopsys SDF reader assumes the top level name of the design is not included in the instance names.

WHAT NEXT

Check the sdf file was created for the current design, verify the use of **read_timing**, you might need to use the **-path** option. Make sure you have no link error, with the **link** command. Make sure there was no renaming performed in the design, regenerate the sdf file if this was the case. Set **sdfin_top_instance_name** to the top design name if SDF instance names contain the top level design name.

SDFN-11 (error) Port '%s' could not be found.

DESCRIPTION

The sdf timing file contains a port that could not be found in the design. The sdf file could be invalid if it contained references of non leaf cell pins. Only top level ports and leaf cell pins must be in the sdf file. The sdf file might have been created for a different level of the design hierarchy. The design names might have been renamed since the sdf file was created, if so regenerate a sdf file. Note, the sdf file is case sensitive. Some delays might have been annotated on the design before the error occurred. **sdfin_top_instance_name** must be used if the SDF instance names contain the top level name of the design. Synopsys SDF reader assumes the top level name of the design is not included in the instance names.

WHAT NEXT

Check the sdf file was created for the current design, verify the use of **read_timing**, you might need to use the **-path** option. Check with **link** that your design has no link error. Make sure there was no renaming performed in the design, regenerate the sdf file if this was the case. Check with **report_annotated_delay** if any delay have already been annotated. Use **remove_annotated_delay** to remove unwanted annotated delays. Set **sdfin_top_instance_name** to the top design name if SDF instance names contain the top level design name.

SDFN-12 (warning) Net delay could not be annotated on pin or port '%s' for design '%s'.

DESCRIPTION

The delay specified with PORT construct in the SDF file could not be annotated on the design. The reason should be explained from a previous error message. The sdf file could be invalid if it contained references of non leaf cell pins. Only top level ports and leaf cell pins must be in the sdf file. The sdf file might have been created for a different level of the design hierarchy. The design names might have been renamed since the sdf file was created, if so regenerate a sdf file. The sdf file is case sensitive. Other delays from the sdf file have been annotated on the design.

WHAT NEXT

Use the **link** command to check if the design has link errors. The design must be free of link errors before using **read_timing**. Check the sdf file was created for the current design, verify the use of **read_timing**, you might need to use the **-path** option. Make sure there was no renaming performed in the design, regenerate the sdf file if this was the case.

SDFN-13 (warning) The SDF file contains negative cell delays.

DESCRIPTION

Negative cell delays are supported within Design Compiler. It is very strange to back-annotate negative cell delays. You can use **report_annotated_delay -cell** to see the back-annotated cell delays.

WHAT NEXT

Use **report_annotated_delay -cell** to see which cells are annotated with negative delays. Verify with the person who wrote the SDF file if negative delays make sense.

SDFN-14 (warning) The SDF file contains negative net delays.

DESCRIPTION

Negative net delays are supported within Design Compiler. It is very strange to back-annotate negative net delays. You can use **report_annotated_delay -net** to see the back-annotated net delays.

WHAT NEXT

Use **report_annotated_delay -net** to see which nets are annotated with negative delays. Verify with the person who wrote the SDF file if negative delays make sense.

SDFN-15 (error) SDF version '%s' is not supported. Use version '%S'.

DESCRIPTION

The sdf file was written in a format not supported by Design Compiler. Design compiler read_timing reads only files written in SDF version 1.0, 1.1 and 2.1. In the SDF file, the SDFVERSION field indicates the SDF version. This field must contain a ratified OVI version like '1.0', or '1.1', or '2.1'. Note, Design Compiler does not support SDF version 2.0.

WHAT NEXT

Write from the layout tool a SDF in v1.0, v1.1 or v2.1 format. Reading other format version than 1.0, 1.1 or 2.1 might generate syntax errors.

SDFN-16 (information) Reading '%s' values for '%s'.

DESCRIPTION

The sdf file can contain minimum, typical, or maximum values for each delay. This message indicates if **read_timing** has back-annotated the minimum, typical or maximum value onto the design.

WHAT NEXT

If this setting is not correct, use the variables **sdfin_rise_cell_delay_type**, **sdfin_fall_cell_delay_type**, **sdfin_rise_net_delay_type**, **sdfin_fall_net_delay_type**.

SDFN-17 (warning) '%s' is read as an instance of '%s' but is linked to design '%s'.

DESCRIPTION

The sdf file contains delays for the specified instance. But this instance's reference in the SDF file is different from the instance's reference in the current design. The SDF file is invalid for the current design. This situation can happen if the design has been changed and an old SDF file is read onto the design.

WHAT NEXT

Use `remove_annotated_delay` to remove the back-annotated values. Then use `read_timing` again with a new SDF file.

SDFN-18 (error) Cell '%s' is not hierarchical.

DESCRIPTION

Currently, we only support hierarchical cell as possible instances when option '-instance' used in command `write_sdf`.

WHAT NEXT

SDF writing will stop after this message.

SDFN-19 (information) Multiple instances found, only instance %s be dumped into SDF file.

DESCRIPTION

This prompt message will be seen when option '-instance' feed with multiple instances collection.

WHAT NEXT

Change your own definition for '-instance' to make sure only unique instance will be selected.

SDFN-20 (error) '%s' is not a valid triplet name for max.

DESCRIPTION

The valid triplet names for the -max_triplet option are maximum, typical, or none.

WHAT NEXT

Change the triplet name in the read_timing command.

SDFN-21 (error) '%s' is not a valid triplet name for min.

DESCRIPTION

The valid triplet names for the -min_triplet option are minimum, typical, or none.

WHAT NEXT

Change the triplet name in the read_timing command.

SDFN-22 (error) If minimum triplet name is 'none', the maximum triplet

name cannot be 'none'.

DESCRIPTION

Both minimum triplet and maximum triplet names are set to 'none'. At least one of these names must be set to a value other than 'none'.

WHAT NEXT

Change the triplet name in the read_timing command.

SEC

SEC-0 (error) Software is not licensed for this machine.

DESCRIPTION

Could not find a valid matching key in the key file for this feature

WHAT NEXT

Check to see that the machine hostid, using the machine_id utility provided by Synopsys, matches the hostid in the key file for the feature.

SEC-1 (error) %s

DESCRIPTION

The key file with all of the license information cannot be opened.

WHAT NEXT

Check directory and file read permissions.

SEC-2 (error) Cannot open key file '%s' or a licensing environment parameter has not been set correctly.

DESCRIPTION

The keyfile cannot be read.

WHAT NEXT

Check the location of the keyfile to see if a keyfile is present and it is readable.

SEC-3 (error) Encryption file header is corrupt.

DESCRIPTION

WHAT NEXT

SEC-4 (error) Unknown encryption method.

DESCRIPTION

The application is trying to match the encryption with that in the keyfile. The encryption being used is not correct.

WHAT NEXT

Make sure that the executable is not corrupt or has not been changed.

SEC-5 (warning) License for '%s' expires within %2d days.

DESCRIPTION

The license for the listed feature is going to expire within 2 days.

WHAT NEXT

Contact your Synopsys support representative.

SEC-6 (warning) License for '%s' has expired.

DESCRIPTION

The license for the listed feature has expired.

WHAT NEXT

Please contact your Synopsys support representative.

SEC-10 (error) Software is not licensed for this machine.

DESCRIPTION

There was a problem matching the key file information to the machine you are trying to run the software on.

Possible causes are bad encryption code and the hostid specified in the license file does not match the node on which the software is running.

WHAT NEXT

Check to see if the hostid in the key file matches the machine hostid.

Check to make sure that the key certificate encryption code exactly matches the key file encryption code.

Contact your Synopsys support representative.

SEC-11 (error) Software is not yet enabled or has expired.

DESCRIPTION

The feature trying to be used does not have a valid license. Either the date may be wrong or the encryption may be wrong.

WHAT NEXT

Check the start date of the feature. It may not have been reached. Contact your Synopsys support representative.

SEC-12 (error) Can't communicate with the license server.

DESCRIPTION

The machine you are running the software on is having trouble communicating with the license server.

The attempt to connect to the vendor daemon on all SERVER nodes was unsuccessful.

WHAT NEXT

Check to make sure that the daemon name in the license file FEATURE line matches the

vendor daemon name.

Check to see that the ethernet device can be located.

Check network connections from node running software to server node(s).

Contact local System Administrator.

SEC-13 (error) The date/time difference between your host and the license server host is too great.

DESCRIPTION

The date/time difference between your host and the license server host cannot be greater than 4 hours.

WHAT NEXT

Contact local System Administrator to synch client/host times.

SEC-14 (error) Key file syntax error: %s.

DESCRIPTION

The start or expiration date is invalid.

WHAT NEXT

Check the dates in the license file.

Contact your Synopsys support representative.

SEC-15 (error) Key file '%s' has an unrecognized format.

DESCRIPTION

The keyfile is unreadable.

WHAT NEXT

Check the permissions on the file. It may also not be a text file.

SEC-16 (error) Can't read the '%s' file.

DESCRIPTION

The file /dev/kmem or /vmunix is not readable on this system.

WHAT NEXT

Contact your local System Administrator.

SEC-17 (error) Internal licensing error number %d: %s.

DESCRIPTION

A possible reason is a bad encryption handshake with the server. The client performs an encryption handshake operation with the daemon prior to any licensing operations. This handshake operation failed.

A possible reason is the feature database got corrupted in the daemon. The daemon's run-time feature data-structures have somehow become corrupted. This is an internal daemon error.

A possible reason is that there is no TCP/IP service "license." This happens if a SERVER line does not specify a TCP/IP port number, and the TCP service does not exist. There is no socket to talk to the server on.

WHAT NEXT

Make sure that there is a socket number in the SERVER line of the key file. Also check with your system administrator.

SEC-18 (error) Unknown internal licensing error number: %d.

DESCRIPTION

Unknown error has occurred.

WHAT NEXT

Check the status of the license server and the vendor daemon. Try bringing down the license server and bringing it back up again.

SEC-20 (error) This site is not authorized for license(s): %S

DESCRIPTION

This site is not licensed to use this product.

WHAT NEXT

Make sure that the required features are in the key file.

Use lmstat to make sure that the server has enabled the required features.

Contact your local Synopsys Support Center.

SEC-21 (error) Failed to checkout license for feature(s): %S

DESCRIPTION

The application failed to check out the licenses required to enable this product. It may be that all the licenses are in use or the site is not licensed to use this product.

WHAT NEXT

Make sure that the required features are in the key file.

Use lmstat to make sure that the server has enabled the required features and to find the current users of the features.

Contact your local Synopsys Support Center.

SEC-22 (information) %s feature '%s'.

DESCRIPTION

This is an informational message indicating the feature that has been queued, checked-out, or checked-in.

WHAT NEXT

If the feature has been queued for sometime, then you can find out the current users of this feature (by using the lmstat -A command) and request them to release it.

SEC-23 (information) Waiting for required feature(s). (%s)

DESCRIPTION

This is an informational message that is displayed periodically when the process is queued for required set of features. You can find out the current users of all the required features by using the lmstat -A command.

WHAT NEXT

Request the current users to release the licenses, if possible.

Let the process wait in queue for indicated period of time to acquire the license.

SEC-50 (error) All '%s' licenses are in use.

DESCRIPTION

The maximum number of licenses has been reached.

WHAT NEXT

Contact your Synopsys support representative to order more licenses.

SEC-51 (error) This site is not licensed for '%s'.

DESCRIPTION

A possible cause is that no such feature exists. The feature could not be found in the license file.

A possible problem is that the version is not supported at the server end. The version specified in the checkout request is greater than the highest version number the daemon supports.

A possible problem is that the server does not support this feature or the feature has expired or has not yet started (on the server node).

WHAT NEXT

Check to make sure that the license file supports this version.

SEC-52 (error) Requested more licenses for '%s' than supported in the key file.

DESCRIPTION

A checkout request was made for more licenses than are supported in the license key file.

WHAT NEXT

Make sure that you have enough licenses in the keyfile.

SEC-53 (error) The end-user license options EXCLUDE you from using '%s'.

DESCRIPTION

The user/host/display has been excluded from this feature by an end-user's daemon option file.

WHAT NEXT

Contact your local System Administrator to have your name removed from the EXCLUDE list in the options file.

SEC-54 (error) The end-user license options don't INCLUDE you for using '%s'.

DESCRIPTION

The user/host/display has NOT been included in this feature by an end-user's daemon option file.

WHAT NEXT

Contact your local System Administrator to include you in the options file.

SEC-55 (error) Can't remove your '%s' license. You must always have one or more of the following license(s): %s.

DESCRIPTION

A request was received to remove a license that is necessary for the application to be run. At least one of these licenses is required for the application to be running.

WHAT NEXT

Make sure that you are removing the right license.

SEC-80 (information) Attempting to reacquire license for '%s'; wait %d minutes.

DESCRIPTION

The node has lost communication with the license server and is attempting to reacquire a license. It will try to reestablish connection every minute for the first X minutes (default is 10, but it will use the number supplied with the -timeout option). It will retry for four days.

WHAT NEXT

Contact your local system administrator to check to see whether the license server or network is hung.

SEC-81 (information) Reacquired license for '%s' after %d minutes.

DESCRIPTION

The application lost the license due to some reason. It could be that the vendor daemon died or the license daemon died and it was brought back up again. The application tries to reconnect to the daemon a few times.

WHAT NEXT

Make sure that the license and vendor daemons are running.

SEC-82 (warning) License server is busy, retrying.

DESCRIPTION

The application server is "busy" trying to connect. The license server is busy establishing a quorum of server nodes so that licensing can start.

WHAT NEXT

Wait a few minutes. If the license daemon does not start up, bring it down and back up again. It could also be that one of the servers in the redundant server configuration is down.

SEC-83 (warning) Timeout value must be between %d and %d; using default of %d.

DESCRIPTION

The timeout value used is not correct.

WHAT NEXT

Use the correct timeout value.

SEC-84 (warning) Unable to obtain a license for '%s'. Obtained a license for '%s' instead.

'%s' contains these features:%s.

DESCRIPTION

Not all licenses for the application could be checked out.

WHAT NEXT

Check the keyfile and make sure that you have the licenses for all the features in the product.

SEC-85 (error) Communication with the license server failed; error number %d.

DESCRIPTION

Bad return from server. The port number returned from lmgrd is invalid. An attempted connection to a vendor daemon did not result in a correct acknowledgement from the daemon. The daemon did not send back a message within the timeout interval. A message from the daemon had an invalid checksum.

Cannot read from server. The process cannot read data from the daemon within the timeout interval. The connection was reset by the daemon (usually because the daemon exited) before the process attempted to read data.

Cannot write to server. The process could not write data to the daemon after the connection was established.

Feature checkin failed at daemon end. The checkin request did not receive proper reply from the vendor daemon (the license might still be considered in use).

WHAT NEXT

Make sure that the port number and the path to the daemon in the keyfile are correct. Either the daemon is down or the machine is not alive. Try checkin again or try removing the license for that feature.

SEC-86 (error) This site is not licensed for third party software; error number %d.

DESCRIPTION

A possible cause is that no such feature exists. The feature could not be found in

the license file.

A possible problem is that the server does not support this feature or the feature has expired or has not yet started (on the server node).

WHAT NEXT

Check to make sure that the license file supports this version.

SEC-87 (error) Unable to obtain license for '%s'. Feature is suppressed.

DESCRIPTION

The functionality cannot be invoked for this product package. Possible cause is the functionality is not supposed to be supported for this product package, eventhough the license key is available.

WHAT NEXT

If the functionality should be within the product package, contact your Synopsys support representative.

SEC-88 (warning) Unable to set precedence for key '%s'. Cyclic dependency detected.

DESCRIPTION

Cyclic dependency on the prerequisite licenses detected. Some features may not execute because of inability to obtain license. If you encounter this warning, please report it to your Synopsys support representative.

WHAT NEXT

Contact your Synopsys support representative.

SEC-89 (information) Unable to set precedence for key '%s'.

Precedence already exists.

DESCRIPTION

Order of prerequisite licenses has already existed. Re-setting the precedence is redundant, and does not cause any harm.

WHAT NEXT

Contact your Synopsys support representative to ensure that the redundant order setting is removed in the next product release.

SEC-100 (error) This can only be used with software that is network licensed.

DESCRIPTION

The application is licensed to run only with network licensing. You may be running the application by using a node locked license.

WHAT NEXT

Check the keyfile being used.

SEC-101 (information) No one is using any feature from the license server.

DESCRIPTION

No features from the keyfile are being used.

WHAT NEXT

Nothing needs to be done.

SEC-102 (error) Unable to get an optimize license.

DESCRIPTION

The license cannot be obtained.

WHAT NEXT

Check the keyfile for this feature. Check the location of the keyfile, default or SYNOPSIS_KEY_FILE.

SEC-103 (error) You must have a Design-Analyzer or one of the optimize licenses to use this feature.

DESCRIPTION

The keyfile must have a Design-Analyzer or an optimize license to use this application.

WHAT NEXT

Check to see if the keyfile has these features. Check whether the correct keyfile is being used.

SEC-104 (information) Checking out the license '%s'.

DESCRIPTION

This is a message from the daemon that the license for this feature is being checked out.

WHAT NEXT

Check whether you are using this feature. If so, nothing needs to be done.

SEC-105 (information) Checking in the license '%s'.

DESCRIPTION

This is a message from the daemon that the license for this feature is being released.

WHAT NEXT

Nothing need to be done.

SEC-106 (information) Checking out '%s' implies that '%s' is also available. Checking '%s' back in to avoid duplicate license checkout.

DESCRIPTION

The new license key, "DesignWare", is issued to replace the following old license keys: "DesignWare-Foundation", "SynLib-ALU", "SynLib-AdvMath", "SynLib-Control", "SynLib-FltTol", "SynLib-Seq". When the new key is checked out, no old key will be checked out. If any of the old keys are already checked out, they are checked back in to avoid having duplicate licenses checked out.

This is a message from the daemon that the license for the specified feature is being released, because it is not needed.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEL

SEL-001 (error) No such collection '%s'

DESCRIPTION

The collection which you specified does not exist.

WHAT NEXT

Verify that the collection is the one you want. It is possible that it existed, but was transient. Transient collections are automatically garbage-collected and cannot be relied upon across command boundaries. In order to make a collection persistent, set it to a variable, and then use it. For example:

```
set uPorts [get_ports U*]
command_for_ports $uPorts
```

SEL-002 (warning) Collection '%s' has inappropriate type (%s).

DESCRIPTION

The collection which you specified contains objects which are not acceptable for this command. Either the data type of the objects is incorrect, or the objects are out of context (for example, they are not in the current design).

WHAT NEXT

Check the command to determine the allowable object types for it, or specify objects that are in the correct context.

SEL-003 (warning) Nothing implicitly matched '%s'

DESCRIPTION

The pattern which you specified did not match any objects of the classes acceptable for this command.

WHAT NEXT

Check the pattern to see if it is what you expected.

SEL-004 (warning) No %s objects matched '%s'

DESCRIPTION

The pattern which you specified did not match any objects of the class acceptable for this command.

WHAT NEXT

Check the pattern to see if it is what you expected.

SEL-005 (error) Nothing matched for %s

DESCRIPTION

The pattern(s) which you specified did not match any objects.

WHAT NEXT

Check the values which you entered.

SEL-006 (error) More than one object matched for '%s'.

DESCRIPTION

The pattern(s) which you specified matched more than one object. This command option accepts only a single object.

WHAT NEXT

Check the values which you entered.

SEL-007 (error) Invalid index %d for collection %s

DESCRIPTION

During an iteration over a collection (with `foreach_in_collection`), an invalid index was generated.

WHAT NEXT

Contact your application consultant.

SEL-008 (warning) Collection/attribute class '%s' has not been defined

DESCRIPTION

The collection class which you specified does not exist. Classes of objects include designs, cells, etc.

WHAT NEXT

Verify that the class name is spelled correctly, or that the class of objects is applicable for this product.

SEL-009 (warning) Collection class '%s' cannot be %s

DESCRIPTION

The collection class which you specified cannot be used for the operation you attempted. Some collection classes cannot be queried, indexed, or copied, so they cannot be used as an argument to query_objects, index_collection, or copy_collection.

WHAT NEXT

Only use collections of this class as arguments to appropriate commands.

SEL-010 (warning) %s objects from '%s' were of the %s incorrect class.

DESCRIPTION

A heterogeneous collection was passed to another command. This collection contained some objects that were of a class which is not accepted by the command. The message will indicate whether some objects or no objects were accepted by the command.

WHAT NEXT

Some commands continue to operate when only a subset of the patterns match. Other commands only perform their action when all patterns match something. So, verify that the command was applied to the objects which were expected.

SEL-011 (warning) Some objects (%s) could not be queried.

DESCRIPTION

A heterogeneous collection was passed into query_objects. This collection contained some objects that were of a class which cannot be the target of a query.

WHAT NEXT

There is no adverse affect of this situation.

SEL-012 (information) Iteration for collection %s was terminated because the collection was modified or deleted.

DESCRIPTION

Commands in the body of a **foreach_in_collection** can affect the collection which is currently in iteration. Some commands can cause objects to be removed from the collection, and others can cause the collection to be deleted. When such events occur, the iterator is modified and in some cases will terminate. This message advises you of that event.

For example:

```
foreach_in_collection itr [get_cells *] { remove_design [current_design] }  
would cause the collection of cells to be deleted, and the iteration would be  
terminated.
```

WHAT NEXT

No action is required.

SEL-013 (error) Regular expression error: %s.

DESCRIPTION

While using a regular expression with a collection command, you entered an invalid regular expression. For example, use of the * (zero or more) or + (one or more) operators alone always yields the empty set; therefore, ".*" or ".+" would be appropriate. Other errors such as unmatched parens or invalid characters within square braces will also cause this error.

WHAT NEXT

Take action based on the error that occurred.

SEL-014 (error) At least one %s collection required for argument '%s'%s

DESCRIPTION

Some commands do not allow heterogeneous collections as arguments, whereas others allow them only in some contexts. Other commands require at least one collection as an argument. You entered a variation of a command which requires at least one collection (either homogeneous, or of either type) for the named argument.

WHAT NEXT

Consult the man page from the command which failed for further information.

SEL-015 (warning) Ignored all implicit elements in argument '%s'%s

DESCRIPTION

Many commands allow implicit searches for objects - an argument can be a list of collections or patterns which are searched for in a documented set of object classes. However, in some cases, it is not possible to determine any object classes in which to search for an implicit pattern. For example, attempting to add an implicit pattern to a heterogeneous collection with **add_to_collection** would cause this warning.

WHAT NEXT

Consult the man page from the command which failed for further information.

SEL-016 (error) Name patterns are not allowed in this argument context - the pattern %s will be skipped/ignored; use only collections in this argument context.

DESCRIPTION

Many commands allow implicit searches for objects - an argument can be a list of collections or name patterns which are searched for in a documented set of object classes. However, in some cases, when there is more than one object class to be searched, it is not allowed to include name patterns, and only collections should be included in such an argument.

WHAT NEXT

In the argument context in which this error happened, remove all name patterns from the offending argument, and make sure that only collections are included in the argument. You can typically use a "get" command to convert a name pattern to a collection.

SEQMERGE

SEQMERGE-1 (information) Merging duplicate register '%s' of '%s'.

DESCRIPTION

This information message pops up as you have enabled Register merging. Please note that **compile -verify** verification may fail as duplicate registers are removed.

You can do formalty verification by setting `verification_merge_duplicated_registers` variable to true.

```
fm_shell> set verification_merge_duplicated_registers true true
```

WHAT NEXT

You can disable Register merging using variable **fpga_enable_merge_register**.

SI

SI-007 (warning) Cannot calculate noise immunity for library pin %s
due to invalid CCS-noise information.

DESCRIPTION

You received this warning message because the indicated pin does not have valid CCS-noise information to calculate noise immunity.

You may have to set noise immunity on the pin manually by yourself. Otherwise, you may miss a violation if no slack value is available from the pin.

WHAT NEXT

Check if the characterization on this pin has been done properly.

SI-101 (error) Cannot find mask name for layer '%d'.

DESCRIPTION

SI command `report_signal_em` uses layer maskname to determine a constraint is setup for metal or via layers. If the maskname cannot be found, the constraint data in the design may be incomplete or corrupted.

WHAT NEXT

Check if the layer has been assigned a mask name.

SI-102 (error) Unable to retrieve signal EM's constant constraint object for layer '%s' from Milkyway database.

DESCRIPTION

SI command `report_signal_em` accesses Milkyway database to get EM constraints. This

error happens when the command cannot find the constant constraint data even though the constraint's model type is labeled as 'constant'.

WHAT NEXT

Check if the current constraint on this layer has been defined properly.

SI-103 (error) Unable to retrieve signal EM's table constraint object for layer '%s' from Milkyway database.

DESCRIPTION

SI command `report_signal_em` accesses Milkyway database to get EM constraints. This error happens when the command cannot find the constraint table data even though the constraint's model type is labeled as 'EM table'.

WHAT NEXT

Check if the current constraint on this layer has been defined properly.

SI-104 (error) Unknown signal EM model type for layer '%s'.

DESCRIPTION

SI command `report_signal_em` accesses Milkyway database to get EM constraints. This error happens when the command cannot recognize the type of model specified. We support 'constant' and 'table' type of constraint models.

WHAT NEXT

Check if the current constraint on this layer has been defined properly.

SI-105 (error) failed in the signal EM analysis of net '%s'.

DESCRIPTION

SI command `report_signal_em` has failed on the net. This is a general error message when the signal EM analysis has failed for a net for any reason. Watch for error messages preceding to this.

WHAT NEXT

SI-106 (error) net '%s' is skipped in signal EM analysis because it doesn't have an RC network.

DESCRIPTION

SI command `report_signal_em` has skipped the analysis on the net because the RC network of the net is not found, or the size is zero.

WHAT NEXT

Check if the net is extracted or annotated correctly.

SI-107 (warning) Variable routing rule table cannot be initialized.

DESCRIPTION

Variable routing rule table cannot be initialized correctly in signal EM analysis. This table will be used to merge existing variable routing rules with those generated from signal EM. If a design doesn't have existing variable routing rules stored in the database, the table cannot be initialized.

WHAT NEXT

SI-108 (warning) Variable routing rules cannot be merged for net '%s'.

DESCRIPTION

SI command `report_signal_em` has failed merging the new variable routing rule with an existing one in the database.

WHAT NEXT

Check if the width of the net is adjustable. Also check the mask names of the metal

and contact layers in the design. For metals, it should start with 'poly' or 'metal'. For vias, it should start with 'cont' or 'polyCont'. This warning can be ignored if you have made sure there is no existing routing rule for the net.

SI-109 (error) Variable routing rules cannot be printed out for net '%s'.

DESCRIPTION

SI command `report_signal_em` has failed printing the new variable routing rule.

WHAT NEXT

Check if for the specified output file name, the file is writable.

SI-110 (warning) Location missing for a resistive edge (%g) of net '%s'.

DESCRIPTION

SI command `report_signal_em` uses location information to access EM constraints. Without the location information, signal EM cannot calculate relative average, RMS, or peak values.

WHAT NEXT

Check if the parasitics is loaded with command `read_parasitics`. The command doesn't load location information with parasitics in .spf format. Either extract RC with ICC internal extracor, or load parasitics in .sbpf format.

SI-111 (warning) physical via cannot be found for a via resistance edge between layers '%s' and '%s'.

DESCRIPTION

SI command **report_signal_em** needs physical via to process signal EM constraints properly. With the warning message, signal EM cannot correctly calculate relative average, RMS, or peak values.

WHAT NEXT

Check if the parasitics is reduced. Signal EM cannot process reduced RC netlist.

SI-112 (error) min delta delay is not enabled.

DESCRIPTION

The command **report_delay_calculation** with options -crosstalk and -min requires that min delta delay is enabled.

WHAT NEXT

Enable min delta delay with command `set_si_options`.

SI-113 (error) no net timing arc from pin to pin for report_noise_calculation.

DESCRIPTION

The command **report_noise_calculation** requires that the net arc exists for the pair of pins.

WHAT NEXT

Check the names of both pins and existence of net arc.

SI-114 (warning) Skipping net '%s' because it has too many connections.

DESCRIPTION

The SI computation is not done since net exceeds high fanout threshold .

WHAT NEXT

Change high fanout threshold or perform buffer insertion for this net.

SI-115 (error) delta delay is not enabled.

DESCRIPTION

The command **report_delay_calculation** with option -crosstalk requires that delta delay is enabled.

WHAT NEXT

Enable delta delay with command **set_si_options**.

SI-116 (error) the number of worst pins is less than 1.

DESCRIPTION

In the command **report_noise** with option -nworst_pins , the number equal to 1 or greater than 1 is accepted.

WHAT NEXT

Change the number of worst pins.

SI-117 (warning) 'reselect_slack_less_than' option is ignored because 'timing_window' is not on

DESCRIPTION

-reselect_slack_less_than option is only effective if timing window is enabled.

WHAT NEXT

enable timing window in 'set_si_options' command.

SI-118 (information) Number of nets reselected for next iteration: %d.

DESCRIPTION

This information message advises you the number of nets that are reselected in the second timing and SI iteration. Normally the smaller the number is, the faster the second iteration will be. You can influence the reselection strategy using SI commands such as 'set_si_options'.

WHAT NEXT

This is an informational message only. No action is required.

SEE ALSO

`set_si_options(2)`

SI-119 (error) Pin '%s' is not found.

DESCRIPTION

The command `report_noise` cannot find the pin specified in the argument.

WHAT NEXT

Check the name of the pin and correct accordingly.

SI-120 (error) can't set '%s'.

DESCRIPTION

The variable has to be set larger than or equal to zero.

SI-121 (warning) can't perform signal EM analysis on dangling

net '%S'.

DESCRIPTION

This net doesn't have any load pins and doesn't need to be analyzed for EM.

SI-122 (warning) the following pins have no noise model specified in library.

DESCRIPTION

This warning message occurs when `check_noise` command finds pins without noise model specified in library. This may result in inaccurate results. It is very important that all pins in the design have correct noise information.

SEE ALSO

`check_noise` (2).

SI-130 (error) the option `-exclude_all` can not be used with other options.

DESCRIPTION

The commands `set_si_delay_analysis` and `remove_si_delay_analysis` with option `-exclude_all`, can not be used with other options.

WHAT NEXT

Remove other options.

SI-131 (warning) Reading the old effective aggressor model in hierarchical si.

DESCRIPTION

The old effective aggressor model is read in hierarchical si , which can affect the results.

WHAT NEXT

Re-generate the model with `create_ilm`.

SIF

SIF-1 (error) Parse error near symbol "%s

DESCRIPTION

WHAT NEXT

SIF-2 (error) Package "%s

DESCRIPTION

DESCRIPTION

WHAT NEXT

SIF-16 (error) Can't find attribute "%s" of "%s

DESCRIPTION

WHAT NEXT

SIF-17 (error) Port "%s

DESCRIPTION

WHAT NEXT

SIF-18 (error) Illegal character or symbol (%d) %s

DESCRIPTION

WHAT NEXT

SIF-19 (error) Attributes may not be nested %s

DESCRIPTION

WHAT NEXT

SIF-20 (error) Malformed attribute specification %s

DESCRIPTION

WHAT NEXT

SIF-21 (error) Varargs too big in '%s' %s

DESCRIPTION

WHAT NEXT

SIF-22 (warning) Built-in function %s does not exist (ignored).

DESCRIPTION

WHAT NEXT

SIF-23 (warning) Inout port '%s' drives a scan-in pin. This

VHDL design cannot support parallel-loading.

DESCRIPTION

Parallel-loading input vectors require that values be forced onto scan-in nets. The scan-in nets are replaced by global signals. If the scan-in net is driven by an in/out port, however, the scan-in net must be driven directly by the in/out port, and a global signal cannot be inserted.

WHAT NEXT

Replace the in/out port with an input port or an output port, but do not drive scan-in nets directly with in/out ports.

SIF-24 (error) No primary input bidirectional control signal specified. No vectors generated.

DESCRIPTION

This design contains at least one bidirectional signal. But it contains no primary input signal for controlling the direction of the bidirectional signals. LSI scan rules require such signals. The error is specific to writing LSI CTV vectors.

WHAT NEXT

Before invoking the `create_test_patterns` command, use the `set_signal_type`, `test_bidir_control`, or `test_bidir_control_inverted` command to define all primary inputs controlling bidirectional signals. Then, reinvoke the `create_test_patterns` command, and regenerate the vectors.

SIF-25 (warning) Scan cell "%s" is within a hierarchical design module and references a non-unique instance in the design. This VHDL design cannot support parallel loading.

DESCRIPTION

Parallel-loading input vectors require the forcing of values onto scan-in nets. Therefore, these scan-in nets must be unique. However, the `current_design` has a level of hierarchy and the scan cells are referencing the same component. The scan cell must reference either a leaf-level library cell or a unique component.

WHAT NEXT

The scan cells must be uniquified or flattened to reference a leaf-level library cell.

SIF-26 (error) Port "%s port BEFORE invoking create_test_patterns. No vectors generated.

DESCRIPTION

LSI CTV interface specific requirement. Bidirectional control ports need to be specified using the `set_signal_type` command with either a `test_bidir_control` attribute or with a `test_bidir_control_inverted` attribute BEFORE generating vectors. Use the `test_bidir_control` attribute for those bidirectional control ports that need to be set to logic 1 to drive all bidirectionals to input mode. Use the `test_bidir_control_inverted` attribute for those bidirectional control ports that need to be set to logic 0 to drive all bidirectionals to input mode.

WHAT NEXT

Specify bidirectional control ports in the aforementioned manner before invoking `create_test_patterns` command.

SIF-27 (error) Apparent inconsistency between vector data base and netlist data base. Could not find '%s' in vector data base.

DESCRIPTION

A potential inconsistency exists between the vector database and the scan design database.

It's possibly because a vector database file (.vdb file) has been used with an incompatible scan database file (.db file). Or perhaps it's because there are errors in custom test protocol.

An example of an inconsistency is when the `write_test` command is invoked using an older version of a .vdb file. This inconsistency might occur when a user rerouted or altered the scan chain and did not invoke `create_test_patterns` before issuing the `write_test` command.

WHAT NEXT

Invoke `write_test` with compatible vector and scan database files. Try to run `check_test` and `create_test_patterns` before invoking `write_test` to generate vectors. If custom test protocol is used, also make sure that no error message is produced

when reading in the custom test protocol.

SIF-28 (error) Trying to specify parallel load for a protocol that is incapable of supporting it.

DESCRIPTION

`Write_test` is incapable of formating parallel load vectors for custom test protocols.

WHAT NEXT

Reissue the `write_test` command without the `-parallel` option, or use an inferred or initialization protocol.

SIF-29 (warning) Maximum number of input timing definitions supported by the TSTL2 format exceeded. Subsequent specifications will be ignored.

DESCRIPTION

Toshiba/TSTL2 supports a maximum of six input timing definitions. Of these, you can allocate a maximum of four to clock waveforms. The number of clock waveforms defined for the current design exceeds the maximum value.

WHAT NEXT

Use the `report_test -port` command to report the clocks (and their waveforms) for the current design. Use the `create_test_clock` command (or modify your test protocol file) to define a maximum of four unique clock waveforms for the clocks in your design.

If you must change the clock waveforms, rerun `check_test` to verify that test design rule-checking passes and that the clock capture groups have not been modified due to the clock timing changes. If the clock capture groups have been modified, rerun `create_test_patterns` to avoid the possibility of bad vectors.

SIF-30 (warning) `write_test_max_cycles` value specified is too

small, value will be ignored

DESCRIPTION

The `write_test_max_cycles` value specified does not permit writing the next test pattern into a file, even at one pattern per file. To prevent infinite looping, `write_test` uses the default value of the `write_test_max_cycles` variable, which implies that the patterns will be written in a single file.

WHAT NEXT

Specify a value which is at least sufficient for a single pattern.

SIF-31 (warning) Cell '%s' does not have its set and observe pins specified

DESCRIPTION

You receive this message if `write_test` detects that the specified cell in your design does not have one or both of its set or observe pins specified. The LSI Logic interface requires each scan cell in the design to have set and observe pins specified.

When `write_test` detects unspecified set and observe pins, it assumes a default name of S2(A) for the set pin, and Q(Z) for the observe pin name.

WHAT NEXT

If the default names `write_test` has assumed for the set and observe pins of this cell are acceptable to you, no action is required on your part.

Otherwise, to change set and observe pin names, choose one of these alternatives:

1. Use the `set_attribute` command to specify the set and observe pin names for the specified cell, write out the .db file, and re-run `create_test_patterns` before re-running `write_test`.

For example, to specify the set and observe pin names for a FD1S scan cell in `lsi_10k.db` library to IN(A) and OUT(Z), use these commands:

```
dc_shell> set_attribute lsi_10k/FD1S set_pin "IN(A)" -type string
dc_shell> set_attribute lsi_10k/FD1S observe_pin "OUT(Z)" -type string
dc_shell> write lsi_10k.db -out scan_lsi_10k.db
```

2. Alternatively, you can change the set and observe pin names manually by editing the "PATTERN BPAT" and "SAVE" statements of the .SCL file.

SEE ALSO

`create_test_patterns(2), set_attribute (2), write_test (2).`

SIF-32 (warning) Scan chain '%s' does not have a scan %s port.

DESCRIPTION

This particular scan chain appears not to possess a scan input port or a scan output port.

WHAT NEXT

If this is not the expected configuration, you can use the `report_test -scan_path` and `report_test -port` commands to obtain more information about existing scan chains in the design. You may also want to check your (custom) test protocol as well as the outputs of `check_test` command.

SIF-33 (warning) Output net '%s' seems to be shorted to output net '%s', and they both drive the same scan data pin of scan cell '%s'.

DESCRIPTION

A scan data in port is driven by two nets that seems to be shorted together. This may cause simulation mismatches when simulating the parallel vectors produced.

WHAT NEXT

Perform `check_test` to identify shorted nets and remove them as needed.

SIF-34 (error) Can not find library needed by this design

DESCRIPTION

The link libraries needed to generate vectors for this design can not be found

WHAT NEXT

Check for errors in specifying the `link_library`. An example of this is a typo error

in issuing the command, e.g. issuing 'link_library = ...' instead of 'link_library = ...'

SIF-35 (error) %s , scan package for parallel-loading is not created.

DESCRIPTION

Scan package for parallel loading is not created due to the aforementioned error(s)

WHAT NEXT

Run check_test first to identify scan path and other potential error(s)

SIF-36 (error) Could not find data base reference for scan cell '%s' .

DESCRIPTION

Inconsistent or missing data base in conjunction with the used vector data base, vectors generated may be bad due to missing scan chain structural information

WHAT NEXT

Parallel vector generation and fault simulation needs design information, this design has to be the exact design used to generate the .vdb file used as the input to the write-test command.

SIF-37 (error) Could not get bit value for primary port '%s' in test program. This port is present in the current design.

DESCRIPTION

This message indicates that the test program does not match the design. It does not contain value(s) for the aforementioned primary port. The design has probably been changed since the test program was written.

WHAT NEXT

If you need to use this test program, you must change the design back to what it was when the test program was written out. Otherwise, the test program cannot be used and a new one will have to be generated.

SIF-38 (error) Clock port '%s' can not be found in test protocol. This port is present in the current design.

DESCRIPTION

This message indicates that the test protocol does not match the design. The clock port in the design can not be obtained from the protocol.

WHAT NEXT

Check if current test program contains the correct protocol by writing out protocol file. If not, generate a new test program.

SIF-39 (error) Scan chain number '%d' can not be found. Possible test protocol problem.

DESCRIPTION

The test protocol used may not match the design. The indicated scan chain can not be found in the list of scan chains obtained from the protocol.

WHAT NEXT

Check if current test program contains the correct protocol by writing out protocol file. If not, generate a new test program.

SIF-40 (error) The vector file '%s' created by TestSim has been corrupted.

DESCRIPTION

Write_test uses the vector file written by the 'fault_simulate' command. This file appears to have been corrupted.

WHAT NEXT

Rerun the fault_simulate command to regenerate the vector file.

SIF-41 (error) Can not find scan '%s' port of scan chain number '%d'. Possible test protocol problem.

DESCRIPTION

The test protocol used may not match the design. The named scan port can not be found in the specified scan chain obtained from the protocol.

WHAT NEXT

Check if current test program contains the correct protocol by writing out protocol file. If not, generate a new test program.

SIF-42 (error) Can not find data for scan port named '%s' in test protocol. Possible test protocol problem.

DESCRIPTION

The test protocol used may not match the design. The named scan port can not be found in the specified scan chain obtained from the protocol.

WHAT NEXT

Check if current test program contains the correct protocol by writing out protocol file. If not, generate a new test program.

SIF-43 (error) Can not find vector index '%d' for port '%s' in test protocol. Possible test protocol problem.

DESCRIPTION

The test protocol used may not match the design. The named scan port can not be found in the specified scan chain obtained from the protocol.

WHAT NEXT

Check if current test program contains the correct protocol by writing out protocol file. If not, generate a new test program.

SIF-44 (error) Using bidirectional port '%s' as clock is currently unsupported

DESCRIPTION

DFT Compiler does not currently support using a bidirectional port as clock port. The named port will not be used as a clock port.

WHAT NEXT

Do not use bidirectional ports as clock ports

SIF-45 (error) Scan chains in this design are not parallel loadable because not all scan cells are both controllable and observable.

DESCRIPTION

There is a scan cell in the current design which is either controllable only or observable only. As a result, write_test cannot reliably generate a parallel loadable test program.

WHAT NEXT

Use a serial format or fix the test design rule violations on the scan chains. See the results of the check_test command.

SIF-46 (warning) Bidirectional ports switch mode after/during some clock pulses. You may get mismatches when simulating these vectors.

DESCRIPTION

In the test protocol for LSI formats, bidirectional ports must switch mode before

the active edge of the clock. The bidirectional delay value is specified using the environment variable 'test_default_bidir_delay'. write_test reports this warning if the leading edge time of any clock pulse is less than the bidirectional delay value.

WHAT NEXT

If there are any bidirectional ports that switch mode after the active edge of the corresponding clock, change the value of the environment variable 'test_default_bidir_delay' and rerun check_test, create_test_patterns and write_test. Otherwise, you can ignore this message.

SIF-47 (error) Formatting of vectors in this format is not currently supported for designs with multibit cells.

DESCRIPTION

You receive this message if your design contains multibit cells and you have used the parallel Verilog, parallel VHDL, or LSI MDE vector format. DFT Compiler does not support these formats for multibit cells.

In parallel load formats, values are forced onto scan-in nets during the scan shift cycle. Multibit cells have internal scan chains, so scan-in nets of some bits are not accessible. Thus, DFT Compiler cannot support vectors in these formats.

WHAT NEXT

Please use serial vector formats instead.

SIF-48 (information) Design has multibit cells. Please make sure your WGL translator can correctly interpret the WGL output generated.

DESCRIPTION

You receive this message if your design contains multibit cells. This message is to remind you that in WGL files generated by DFT Compiler, the cell name corresponding to each bit is printed in the "scancell" statement. Thus, for a multibit cell, the cell name is printed once for each bit. Some WGL translators might incorrectly interpret the multiple appearances of the cell name.

WHAT NEXT

Work with the provider of your WGL translator to ensure that the WGL file is

translated correctly.

SIF-49 (warning) Some timing values are being rounded to integers. This may cause simulation mismatches.

DESCRIPTION

You receive this message if `write_test` finds a non-integer timing value in your design. If the variable `write_test_round_timing_values` is set to `true` (the default), `write_test` rounds all timing values to the nearest integer. This message informs you that some timing values in your design have been rounded to the nearest integer.

WHAT NEXT

If rounding timing values to integers does not cause simulation mismatches, no action is required on your part. However, if rounding timing values to integers **does** cause simulation mismatches, do one of the following:

1. If your test environment can accept noninteger timing, set the variable `write_test_round_timing_values` to `false`, and rerun `write_test`.
2. If your test environment cannot accept noninteger timing, reset the timing values using the environment variables `test_default_delay`, `test_default_bidir_delay`, and `test_output_strobe`; and the command `create_test_clock`. Rerun `check_test` and `create_test_patterns`, then rerun `write_test`.

SEE ALSO

`check_test` (2), `create_test_patterns` (2), `write_test` (2); `test_default_bidir_delay` (3), `test_default_delay` (3), `test_output_strobe` (3), `write_test_round_timing_values` (3).

SIF-50 (error) Multiple declaration of terminal '%s' in instance '%S'

DESCRIPTION

Multiple declarations of terminals of an instance are not allowed.

WHAT NEXT

Remove declarations of terminals such that there is only one declaration of the terminal.

SPEF

SPEF-1 (warning) Missing or unknown library unit.

DESCRIPTION

There is no library unit available or the library unit is invalid (valid library units are ps, ns, or us). As default unit, ns is assumed.

WHAT NEXT

Check the library unit for correctness if ns is not the unit you want to use.

SPEF-2 (information) Path delimiter = %s.

DESCRIPTION

In the SPEF file, this character is used to separate elements in the path of an hierarchical object.

SPEF-3 (information) Pin delimiter = %s.

DESCRIPTION

In the SPEF file, this character is used to separate the path name from the pin name.

SPEF-4 (warning) Missing or unknown capacitance library unit.

DESCRIPTION

There is no cpacitance library unit available or the library unit is invalid. As default unit, pF is assumed.

WHAT NEXT

Check the library unit for correctness if pF is not the unit you want to use.

SPEF-5 (warning) Missing or unknown resistance library unit.

DESCRIPTION

There is no resistance library unit available or the library unit is invalid. As default unit, kOhm is assumed.

WHAT NEXT

Check the library unit for correctness if kOhm is not the unit you want to use.

SPEF-6 (warning) Failed to lookup annotated delay between '%s' and '%s'.

DESCRIPTION

This error points to an inconsistency of the timing data structures. There is supposed to be a backannotated delay between the two pins, but the attempt to read the delay fails. Under normal conditions, this error should not occur.

WHAT NEXT

Try to remove all backannotated delays with **remove_annotated_delays** and execute **read_parasitics** again.

SPEF-7 (warning) Failed to lookup elmore node for '%s'.

DESCRIPTION

The backannotation algorithm assumes that there is already an elmore node for the specified pin, but it cannot be found. This error is usually caused by inconsistent SPEF files. I.e., this error can happen if there is a pin mentioned in the *RES section of the SPEF file, but it isn't mentioned in the *CAP section.

WHAT NEXT

Check your SPEF file and make sure that all pins occurring in the *RES section also occur in the *CAP section. Also make sure that all pins occurring in the *CAP section also occur in the *RES section.

SPEF-8 (warning) Uncomplete RC annotation between '%s' and '%S'.

DESCRIPTION

The backannotation algorithm has detected a gap in the RC tree. This is most likely caused by an SPEF file containing incomplete parasitic information. However, this error should only occur if 'automatic tree completion' is switched off. By default, incomplete RC trees are automatically expanded and all gaps resulting from incomplete parasitic information are automatically bridged.

WHAT NEXT

Check if the tree completion algorithm has been disabled and check your SPEF file for inconsistencies.

SPEF-9 (warning) Inconsistent backannotated data detected.

DESCRIPTION

The `read_parasitics` command computes a single delay value for each pin pair. In the backannotation phase, the max rise delay, max fall delay, min rise delay, and min fall delay are all set to this single value. This error message is printed if a pin is encountered that doesn't contain the same delay value for each delay type. This error message may occur if a different command than `read_parasitics` has been used to backannotate delays.

WHAT NEXT

Remove all backannotated data by executing `remove_annotated_delays` before executing `read_parasitics`.

SPEF-10 (information) Library unit = %f %S.

DESCRIPTION

This message shows the unit that has been found in the mail library. All values that are read in from an parasitics file will be scaled to match the unit given in the main library. If the library base unit is missing or unknown, a warning message is issued and default units are assumed. The default units are ns for delays, pF for capacitances, and Ohm for resistances.

SPEF-11 (information) Derived delay scale factor = %f.

DESCRIPTION

The delay scale factor expresses the main library unit in terms of 1ns. More precisely, the value to be backannotated is calculated by (delay in ns) * scale_factor = value to be backannotated.

SPEF-12 (information) Derived capacitance scale factor = %f.

DESCRIPTION

The scale factor expresses the main library unit for capacitances in terms of 1pF. More precisely, the value to be backannotated is calculated by (capacitance in pF) * scale_factor = value to be backannotated.

SPEF-13 (information) Derived resistance scale factor = %f.

DESCRIPTION

The scale factor expresses the main library unit for resistances in terms of 1 Ohm. More precisely, the value to be backannotated is calculated by (resistance in Ohm) * scale_factor = value to be backannotated.

SPEF-14 (warning) Pins '%s' and '%s' are not on the same net.

DESCRIPTION

This warning message indicates that the loaded SPEF file is inconsistent with the logical design in memory. The two involved pins belong to the same parasitic network given by the SPEF file, but do not belong to the same net in the logical design. In other words, the SPEF topology and the topology of the design in memory are out of sync. The warning message strongly indicates that the logical design has been changed after the SPEF file has been generated.

WHAT NEXT

Regenerate the SPEF data with the current logical design.

SPEF-15 (error) User specified path-prefix '%s' does not exist.

DESCRIPTION

This warning message indicates that the user-specified path (" -path" option) does not exist. The argument to the "-path" option must be a relative path from the current design to a hierarchical design for which the parasitics file has been created.

WHAT NEXT

Check the "-path" argument for typos. Check if the SPEF file and the current design in memory fit together.

SPEF-16 (error) User specified strip-path '%s' does not exist.

DESCRIPTION

This warning message indicates that the user-specified strip-path (" -strip_path" option) is incorrect. The argument to the "-strip_path" option must be a path prefix. When an SPEF file is read, this prefix is stripped off from the name of each read object. If the name of an object in the SPEF file does not start with the strip-path prefix, the name remains unchanged. This message is issued if no object in the SPEF file has a name starting with the specified prefix. This means that the strip path option had no effect.

WHAT NEXT

Check the "-strip_path" argument for typos. Check if the SPEF file and the current design in memory fit together.

SPEF-17 (error) No DC design in memory.

DESCRIPTION

There is no DC design in memory for the current design. This error occurs if there is no design currently loaded or if a design is loaded, but you haven't executed **read_parasitics** prior to this command.

WHAT NEXT

Make sure that a design has been loaded and you have backannotated parasitic information with the **read_parasitics** command.

SPEF-18 (warning) Cannot associate pins of net '%s' with pins of the current design.

DESCRIPTION

This warning message is printed if none of the pin-names read from the parasitics file can be associated with any pin of the current design. Usually, this is a strong indication that the parasitics file and the design in memory do not match.

WHAT NEXT

Take either of the following actions:

- Check if the design in memory and the specified parasitics file belong together.
- Check if the current design is set correctly.
- Check the value of parameter **-path** is applicable.
- Check the value of parameter **-strip_path** is applicable.

SEE ALSO

`read_parasitics` (2), `SPEF-15` (3), `SPEF-16` (3).

SPEF-19 (warning) Net '%s' contains an interconnection loop. The delays and transition times computed for this net may be inaccurate.

DESCRIPTION

This warning message is printed if the SPEF file contains an RC tree with interconnection loops for the specified net. Depending on the selected delay calculator, loops may be substituted internally by a corresponding spanning tree which can influence the accuracy of the computed delays and transition times.

This message is printed out only for the first net containing interconnection loops. Please refer to the SPEF-21 warning message for the total number of nets having interconnection loops.

WHAT NEXT

Take either of the following actions:

- Generate a parasitics file without interconnection loops.
- Select the Arnoldi delay calculator.

SEE ALSO

`read_parasitics (2)`.

SPEF-21 (warning) '%d' nets with interconnection loops have been read.

DESCRIPTION

This warning message indicates that the currently read SPEF file contains RC trees with interconnection loops for the specified number of nets. For these nets, the computed delay and transition times may be inaccurate, depending on the selected delay calculator. If the Elmore delay model is selected, loops are substituted internally by a corresponding spanning tree that can influence the accuracy of the computed delays and transition times.

WHAT NEXT

This is a warning message only. No action is required on your part. However, to recompute more accurate delay and transition times, you can take one of the following actions and then run the command again.

- Generate a parasitics file without interconnection loops
- Select the Arnoldi delay calculator.

SEE ALSO

`read_parasitics (2)`.

SPEF-23 (information) Output limit reached for message '%s'.

DESCRIPTION

This information message occurs when the number of printed messages for the specified message is exceeded. The number of printed messages is restricted for some warning and error messages, in order to prevent unlimited growth of the printed output or log files.

WHAT NEXT

This is an informational message only. No action is required on your part.

Further occurrences of this message are suppressed.

SEE ALSO

SPEF-22 (n).

SPEF-24 (information) Message '%s' occurred '%d' times.

DESCRIPTION

This information message occurs when the number of printed messages exceeds the number of messages allowed. The messages shows the total number of times the error or warning condition appears.

Some warning and error messages restrict the number of printed messages allowed in order to avoid unlimited growth of the printed output or log files.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

SPEF-21 (n).

SPFP

SPFP-001 (error) Cannot open file '%s'.

DESCRIPTION

The named parasitics file cannot be opened.

WHAT NEXT

Validate that the file name is correct.

SPFP-002 (error) Could not determine the format of parasitics file:

'%s'

DESCRIPTION

The named parasitics file was opened, but the format of the file (DSPF, RSPF, SPEF) could not be determined.

WHAT NEXT

Validate that the file is a properly formatted parasitics file in one of the supported formats.

SPFP-010 (error) %s syntax error: %s at line %d near '%s' in file '%s'

DESCRIPTION

A syntax error was found while reading the indicated type of parasitics file. A nearby line is given to help you isolate the problem.

WHAT NEXT

This message covers a wide variety of syntax errors. Review the line number reported in the message and determine if the writer of the parasitics file has introduced a syntax error.

SPFP-011 (error) Unknown %s construct '%s' at line %d in file '%s'

DESCRIPTION

An unexpected or unknown construct was found while reading a parasitics file of the indicated format. This will often be followed by a general syntax error, **PARA-010**.

WHAT NEXT

Review the line number reported in the message and determine if the writer of the parasitics file has introduced an unknown construct.

SPFP-012 (warning) Missing '*'|GROUND_NET' statement in SPF file '%s'

Using 'vss', 'VSS', 'gnd' and 'GND'

DESCRIPTION

The GROUND_NET statement is missing from the named DSPF or RSPF file.

WHAT NEXT

This is just a warning to indicate that default values will be used.

SPFP-013 (warning) name DELIMITER and hierarchy DIVIDER are the same!

Some objects may not be found, and performance may be affected.

DESCRIPTION

The hierarchy divider and pin delimiter in the named parasitics (SPEF, DSPF, RSPF) file are the same. This may not be completely supported. Some net or pin objects may not be found, and performance may be adversely affected.

WHAT NEXT

Modify your use of the application which generated the parasitics file and

regenerate it using different (or default) DELIMITER and DIVIDER. Synopsys strongly recommends that for the best performance, you should use different characters for the hierarchy delimiter and name delimiter.

SPFP-014 (warning) %s value %g exceeds user-defined threshold at line %d in file '%s'.

DESCRIPTION

You receive this message if the parasitics file contains a capacitance value (in picofarads) or a resistance value (in ohms) that exceeds user-defined thresholds, as specified by the **parasitics_cap_warning_threshold** and **parasitics_res_warning_threshold** variables. This warning is intended to assist you in detecting large, unexpected values generated by other applications. The specified value is still used by the application.

WHAT NEXT

This is a warning message only; no action on your part is required. However, you can change the thresholds by setting the **parasitics_cap_warning_threshold** and **parasitics_res_warning_threshold** variables to different values, or to 0.0 (the default) to suppress the generation of this message. For more information, see the manual pages of these variables.

SEE ALSO

parasitics_cap_warning_threshold (3), **parasitics_res_warning_threshold (3)**.

SPFP-100 (error) Expected %s keyword %s but found '%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax error where a specific keyword was expected (for example, *D_NET), but something else was found. The file name and line number are given so you can isolate the problem.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-101 (error) Invalid %s '%s'%s at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax or semantic error in a number of different constructs. The message will indicate the type of construct and what part of it is invalid. Some examples include:

- You specified a DIVIDER, DELIMITER, or BUS_DELIMITER which is outside of the allowed set of values for the construct
- Any of the header unit constructs has an invalid number or multiplier string.
- A port or D_NET connectivity entry has an invalid direction.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-102 (error) NAME_MAP syntax error at '%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax or semantic error in an entry in the NAME_MAP section of the file.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-103 (error) %s requires %d or more %s's

at line %d in file '%s'.

DESCRIPTION

Many sections of the SPEF file require one or more sub sections of a specific type. You receive this message if the SPEF file violates that semantic. Some examples include:

- The *CAP section of a D_NET, if specified, requires one or more capacitor elements.
- The *RES section of a D_NET, if specified, requires one or more resistor elements.
- The connectivity section of a D_NET requires one or more *P or *I sub sections.
- The *POWER_NETS and *GROUND_NETS sections, if specified, require one or more net names.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

**SPFP-104 (error) %s requires %s
at line %d in file '%s'.**

DESCRIPTION

Some sections of the SPEF file require a specific sequence of sub sections. You receive this message if the SPEF file violates that semantic. Generally, this message is reserved for some rarely used sections of the file, like *DEFINE.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-105 (error) Invalid node name '%s'

at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax or semantic error in a node name, which is used in several places in the *RES and *CAP sections. The specific node name which is in error is shown in the message. A node name is either a port name, an instance pin name (an instance name or name map id, followed by the pin delimiter, followed by a pin name or name map id), or an internal node name (a net name, followed by the pin delimiter, followed by a positive integer).

The SPEF specification details the various possible forms for a node name.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

**SPFP-106 (error) Strict SPEF syntax error: invalid %s %s
at line %d in file '%s'.**

DESCRIPTION

Historically, there are a number of SPEF writers which write illegal SPEF. For backward compatibility with existing questionable SPEF files, the parser allows a number of forms which are strictly illegal. If the parser is in *strict* mode, you will receive this error when one of these strict-SPEF rules is violated.

WHAT NEXT

The first thing to try is to turn off strict mode. Or, you can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

**SPFP-107 (error) Expected %s but found '%s'
at line %d in file '%s'.**

DESCRIPTION

You receive this message if the SPEF file has a construct in the wrong place or out of order. Some examples include:

- The *D_NET section expects a certain series of optional sub sections. A SPEF keyword which is not a valid *D_NET sub section was found where a *D_NET sub section was expected.
- The *S connectivity attribute has some optional thresholds which must be positive fractions (between 0 and 1). The value found is not a positive fraction.
- Several sections of the SPEF file require a positive integer, and that was not found.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-108 (error) Invalid value '%s' at line %d in file '%s'.

DESCRIPTION

Many sections of the SPEF file use values, or triplets of values. You receive this message if the SPEF file has a syntax error in a value. Values are used in the *L and *S connectivity attributes, total capacitance of a D_NET or R_NET, capacitances, resistances, poles and residues, and so on.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-109 (error) Syntax error in complex number: '%s %s%s%s%s%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax error in a complex number. Complex numbers are used in the specification of poles and residues. They can be specified as (r i), or as a triplet such as (r i):(r2 i2):(r3 i3). The message will

indicate the specific problem number.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-110 (error) Syntax error near '%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax error not covered by any of the other syntax error messages. The token in question, as well as the file name and line number, will be given in the message.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-111 (error) Undefined name map index *%d referenced at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file finds a syntactically correct name map reference, such as *2379, but no such entry was ever defined in the NAME_MAP section.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-112 (error) Non-terminated comment starting at line %d

of '%S'

DESCRIPTION

You receive this message if the SPEF file contains a multi-line comment, which begins with /*, but does not end. This message is intended to help you find the line where the non-terminated comment starts.

WHAT NEXT

You can try to correct this error manually by terminating or removing the comment. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-113 (error) Premature end-of-file reading '%S'.

DESCRIPTION

You receive this message if the SPEF file ends unexpectedly, for example, in the middle of parsing required header sections, or before any D_NET or R_NET sections were found. A missing double quote in the header section can cause this error.

WHAT NEXT

You might be able to correct this error manually if this is caused by missing header sub-sections, or by a missing closing quote in one of the header sub sections. But, generally, it will be difficult to isolate the problem in a large file.

SPFP-114 (information) Ignored unsupported %s section starting at line %d of '%S'

DESCRIPTION

You receive this informational message if the SPEF file contains a construct which is being ignored, such as D_PNET and R_PNET.

WHAT NEXT

No action is necessary.

SPFP-115 (error) BUS_DELIMITER cannot be the same as %s at line %d in '%s'.

DESCRIPTION

You receive this message if the BUS_DELIMITER is found to be the same as either the DIVIDER or the DELIMITER. SPEF does not allow this combination.

WHAT NEXT

The SPEF file will almost certainly need to be regenerated.

SPFP-116 (error) Semantic error near '%s': %s at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file reader has found a semantic error. The token in question, the specific problem, and the file name and line number will be given in the message.

WHAT NEXT

You can try to correct the error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the problem corrected.

SPFP-117 (error) SENSITIVITY syntax error at '%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has a syntax or semantic error in an entry in the SENSITIVITY section of the file.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-118 (error) Sensitivity factor syntax error at '%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has an invalid value for a sensitivity factor. A sensitivity factor is supposed to be a floating point number.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-119 (error) Invalid parameter ID '%d' value in sensitivity at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has an invalid value for a variation parameter ID in the sensitivity section. The variation parameters are defined in the *VARIATION_PARAMETERS section and are supposed to be within the values defined in this section. This error indicates that the current parameter ID is outside the valid range.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-120 (error) Invalid parameter types for process parameter '%s' at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has an invalid type of process variation parameter. The variation parameters are defined in the *VARIATION_PARAMETERS section and allowed values are 'D', 'N' or 'X' type of process variation parameters. This indication implies whether the parameter affects capacitance, resistance and inductance in numerator (for 'N'), denominator (for 'D') or does not affect resistance (for 'X').

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-121 (error) Syntax error at line %d in file '%s'. Cannot define process variations after temperature variations.

DESCRIPTION

You receive this message if the SPEF file has temperature variations followed by process variations. It is expected that the file contains process variation parameters followed by temperature variations. The variation parameters are defined in the *VARIATION_PARAMETERS section.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-122 (warning) Invalid sensitivity for capacitance at line %d in file '%s'.

DESCRIPTION

You receive this message if the SPEF file has sensitivities for ground or coupling capacitances with respect to temperature variations or 'N' parameters to inform you that these sensitivities are illegal.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-123 (error) Syntax error at line %d in file '%s'. Expected

to see keyword CRT2.

DESCRIPTION

You receive this message if the SPEF file has syntax errors in the definition of temperature variations. The variation parameters are defined in the *VARIATION_PARAMETERS section.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPFP-124 (error) Illegal name map index *%d referenced at line '%d' in file '%s'.

DESCRIPTION

You receive this message if the SPEF file finds a syntactically illegal name map reference, such as *-1. Such lines will be ignored.

WHAT NEXT

You can try to correct the syntax error manually. However, since SPEF files are usually machine generated and extremely large, you will most likely need to work with the vendor of the application which wrote the file to get the syntax corrected.

SPG

SPG-001 (error) Core area not specified. Cannot run SPG without core area.

DESCRIPTION

This error message occurs because the core area is not specified for this design. The floorplan information is not automatically generated in SPG.

WHAT NEXT

To run this design in SPG mode, use the **extract_physical_constraints** command and ensure that the placement area is specified.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

SPG-002 (error) The port %s does not have a user-defined location.

DESCRIPTION

This error message occurs when the port does not have a user-specified location.

WHAT NEXT

To run this design in SPG mode, use the **extract_physical_constraints** command and ensure that the placement area is specified.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

SPG-003 (error) The %s %s does not have a user-defined

location.

DESCRIPTION

This error message occurs because the macro does not have a user-specified location. The **compile_ultra -spg** command does not generate macro locations for unplaced macros.

WHAT NEXT

To run this design in SPG mode, use the **extract_physical_constraints** command and ensure that the placement area is specified.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

SPG-004 (error) The cell %s is a black box. SPG flow does not allow black boxes.

DESCRIPTION

This error message occurs because the black box cells are not allowed in the SPG flow.

WHAT NEXT

To run this design in SPG mode, update the target libraries and the physical libraries to include the specified cell.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

SPG-005 (error) The ILM %s is a DCT ILM. The SPG flow does not allow DCT ILMs.

DESCRIPTION

This error message occurs because DCT ILMs are not allowed in the SPG flow. Only ICC

ILMs are allowed in the SPG flow.

WHAT NEXT

To run this design in SPG mode, create an ICC ILM for this ILM or replace the ILM with the complete model.

SEE ALSO

[extract_physical_constraints\(2\)](#)
[report_physical_constraints\(2\)](#)

SPG-006 (error) The ILM %s does not have a user-specified location.

DESCRIPTION

This error message occurs because the unplaced ILMs are not allowed in the SPG flow. You must provide a location for this ILM.

WHAT NEXT

To run this design in SPG mode, place the ILM.

SEE ALSO

[extract_physical_constraints\(2\)](#)
[report_physical_constraints\(2\)](#)

SPG-007 (error) The physical block %s is not allowed in the SPG flow.

DESCRIPTION

This error message occurs because the specified physical block is not allowed in the SPG flow.

WHAT NEXT

To run this design in SPG mode, remove the specified physical block.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

SPG-008 (Error) The design has run thru -spg, cannot update the physical constraints using %s command.

DESCRIPTION

You receive this error message because you are updating the physical constraints for the design, this information should be provided before the first `compile_ultra -spg`.

WHAT NEXT

Apply this constraint before the first `compile_ultra -spg`.

SEE ALSO

`extract_physical_constraints (2)`, `report_physical_constraints (2)`

SPG-009 (error) The design has run through -spg but cannot update the physical constraints.

DESCRIPTION

This error message occurs because you are updating the physical constraints for the design. This information must be provided before running the `compile_ultra -spg` command.

WHAT NEXT

Apply this constraint before running the `compile_ultra -spgfp` for the first time.

SEE ALSO

`extract_physical_constraints(2)`
`report_physical_constraints(2)`

SR

SR-1 (error) Can't find a module to implement operation '%s' in process %s.

DESCRIPTION

The **compile** command could not find a module to implement the specified operation. Either the module was not present in any of the synthetic libraries in the **synthetic_library** variable, or the module might be present but disabled with the **set_dont_use** command.

WHAT NEXT

First, examine the contents of the **synthetic_library** variable and ensure that the required module is present; extend the synthetic library if necessary. Next, check your **set_dont_use** statements, and remove any that prevent the required module from being used. Then reexecute the command.

SR-2 (error) Can't implement all operations of resource(s) '%s' on any available module in process %s.

DESCRIPTION

The **compile** command could not find a module to implement some operations in the specified resource. Either some modules were not present in any of the synthetic libraries in the **synthetic_library** variable, or the modules might be present but disabled with the **set_dont_use** command.

WHAT NEXT

First, examine the contents of the **synthetic_library** variable and ensure that the required modules are present; extend the synthetic library if necessary. Next, check your **set_dont_use** statements, and remove any that prevent the required modules from being used. Then reexecute the command.

SR-3 (error) Can't find implementation '%s' for module '%s'

%S

DESCRIPTION

The given implementation cannot be found in your synthetic libraries. Either the name is misspelled or the implementation is declared in a synthetic library which is not included in "synthetic_library". Another possibility is that the USE of the implementation in your design cannot be determined, and therefore the proper license was not checked out at the right time. Check the contained_operators/module/ implementations attribute for modules that use this part in the .sl file.

WHAT NEXT

SR-4 (error) Data class '%s' is not recognized.

DESCRIPTION

You receive this message if you use an illegal data class value in the synthetic library. Allowed values are *signed* and *unsigned*.

WHAT NEXT

Check your synthetic library source code, and ensure that you use either *signed* or *unsigned* as the data class value. Then reexecute the command.

SR-5 (error) Can't find the %s '%s' in synthetic_library. Resource sharing has been aborted %s

DESCRIPTION

The set of Synthetic libraries specified by the synthetic_library variable must contain the specified part.

WHAT NEXT

SR-7 (error) Cannot find instantiated synthetic module '%s'

in the libraries listed in 'synthetic_library'.

DESCRIPTION

The given synthetic module was identified because it was contained in a synthetic library listed in the *link_library* variable. You must also list the synthetic library in the *synthetic_library* variable to generate an implementation for the module.

WHAT NEXT

List the synthetic libraries from your *link_library* variable in your *synthetic_library* variable.

SR-8 (error) The %s is shorted to the %s.

Resource sharing does not support operations that are shorted together.

DESCRIPTION

This error is most likely caused by a bug in the user's source code. An example that would trigger this error is:

```
C <= A + B; C <= A - B;
```

Note that the signal must be driven in two separate blocks and/or concurrent statements.

WHAT NEXT

The most likely fix is to find the two outputs that are shorted together, and to remove the short. However, if the shorted outputs are really what the user wants, then the resource sharing code can be fooled by instantiating a buffer after one of the operations so that the operations don't appear to be shorted together.

SR-9 (warning) The operation '%s' has been deleted because it was not needed.

DESCRIPTION

In general, redundant operations are removed when elaborating the HDL design. However, some operations are not necessarily deleted then because it takes logic

synthesis to run to determine that the operations are redundant.

Consider the following VHDL fragment:

```
process ( in1, in2 )
  constant table : bit_vector( 3 downto 0 ) := "0000";
  variable tmp : integer range 0 to 3;
begin
  tmp := in1 + in2;
  out1 <= table( tmp );
end process;
```

The adder assigned to "tmp" is actually redundant since all values of the array "table" are the same. As a result, the value of "tmp" does not affect the output "out1" which will always be zero. During logic synthesis, the adder assigned to "tmp" will be deleted, and this warning will be issued.

WHAT NEXT

Check the deleted operation and make sure that it is okay for this operation to be deleted. If not, check to logic to see if you can determine why the operation is being deleted.

SR-10 (Information) Reporting of resource costs is no longer supported.

DESCRIPTION

This SII interpreter command has been discontinued.

WHAT NEXT

No action on your part is required; there is no workaround. Normally, customers do not see this message.

SR-11 (error) Net %s has multiple drivers. High Level Optimization does not support synthetic operators/modules

whose outputs drive the same net.

DESCRIPTION

This error is most likely caused by a bug in the user's source code. An example that would trigger this error is:

```
DW01_csa #(16) DW01_csa_1 (.a(a_1), .b(b_1), .c(c_1), .ci(1'b0), .carry(carry_1),  
.sum(sum_1), .co(co)); DW01_csa #(16) DW01_csa_2 (.a(a_2), .b(b_2), .c(c_2),  
.ci(1'b0), .carry(carry_2), .sum(sum_2), .co(co));
```

WHAT NEXT

The most likely fix is to find the multiple driver net and fix it.

SSH

SSH-1 (error) Unknown host '%s'.

DESCRIPTION

WHAT NEXT

SSH-2 (error) Can't execute program '%s'.

DESCRIPTION

WHAT NEXT

SSH-3 (error) File '%s': Permission Denied.

DESCRIPTION

WHAT NEXT

SSH-4 (error) Could not connect to %s subshell

DESCRIPTION

WHAT NEXT

SSH-5 (information) Abnormal Exit -- program %s function %s

host %s

DESCRIPTION

WHAT NEXT

SSH-6 (error) '%s' is not a valid feature name for '%s'.

DESCRIPTION

The given feature name cannot be checked out for the given tool. This can happen if the feature name doesn't exist or you are not authorized to use that feature.

WHAT NEXT

Choose another feature name. Check the reference manual of the tool in question for a list of valid feature names.

STIL

STIL-101 (error) %s

DESCRIPTION

This error is generated when you try to read a STIL file with syntax error. The syntax error happens at the next symbol.

WHAT NEXT

Fix the syntax error and read in the file again.

STIL-102 (error) %s block is not a top level STIL block.

DESCRIPTION

This error is generated when you try to read a STIL file without any top level STIL blocks. At least one top level STIL block (except STIL & Header) is required for a valid STIL file.

WHAT NEXT

modify the STIL file to make it valid.

STIL-103 (error) Can't read version %s of STIL.

DESCRIPTION

This error is generated when the STIL parser can not parse the STIL version mentioned. It is usually caused by reading in a ctldb file that was generated by early version of dft compiler.

WHAT NEXT

User have to regenerate the ctldb file with current version of dft compiler.

STIL-104 (information) Using CTL parser version %s on a

version %s model.

DESCRIPTION

The model's CTL version is no longer supported. This message informs you that the tool will attempt to read the model using a parser designed for a later version of CTL. Most constructs in newer versions are backwards compatible. In all likelihood, the read will be successful.

WHAT NEXT

Pay attention to the next messages. They will inform you whether the read was successful or not.

STIL-301 (error) Illegal STIL string: %s.

DESCRIPTION

This error is generated when the mentioned string in is illegal according to STIL syntax.

WHAT NEXT

Check with STIL syntax, modify the string to make it legal.

STIL-302 (error) Illegal STIL identifier: %s.

DESCRIPTION

This error is generated when the mentioned identifier is illegal according to STIL syntax.

WHAT NEXT

Check with STIL syntax and modify it to legal identifier.

STIL-303 (error) Cannot find PatternExec with name %s

DESCRIPTION

This error is generated when the PatternExec with the specified name is not found in the STIL file.

WHAT NEXT

Specify another PatternExec name or modify the existing PatternExec name in STIL file.

STIL-304 (error) Signal %s already defined.

DESCRIPTION

This error is generated when the concerned signal is previously defined in the STIL file. Redefinition of signal is not allowed in STIL file.

WHAT NEXT

Remove the one of the dual signal definitions.

STIL-305 (error) Variable %s redefined.

DESCRIPTION

This error is generated when the concerned variable is previously defined in the same domain. Redefinition of variable is not allowed in the same domain.

WHAT NEXT

Remove one of the dual variable definitions.

STIL-306 (error) Signals block redefined.

DESCRIPTION

This error is generated when the Signals block was redefined. Only one and anonymous Signals block is allowed in STIL syntax.

WHAT NEXT

Remove the duplicated definition of Signals block.

STIL-307 (error) Anonymous SignalGroups block redefined.

DESCRIPTION

This error is generated when the anonymous SignalGroups block was redefined. Only one anonymous SignalGroups block is allowed in STIL syntax.

WHAT NEXT

Remove the duplicated definition of the anonymous SignalGroups block.

STIL-308 (error) Named %s domain not allowed in this context.

DESCRIPTION

This error is generated when it is not allowed to defined a named domain in the current context. e.g. when you try to define a named SignalGroups domain in the CoreTypes block. Only an anonymous SignalGroups domain is allowed to be defined there.

WHAT NEXT

Modify the named domain to an anonymous (unnamed) domain.

STIL-309 (error) Cann't define SignalVariables in %s block.

DESCRIPTION

This error is generated when user try to define SignalVariables in the block mentioned. This definition is not supported currently.

WHAT NEXT

Remove the SignalVariable definition from the concerned block.

STIL-310 (error) Cann't define SignalVariableEnums in %s block.

DESCRIPTION

This error is generated when user try to define SignalVariableEnums in the block mentioned. This definition is not supported currently.

WHAT NEXT

Remove the SignalVariableEnum definition from the concerned block.

STIL-311 (error) ScanChain Length and number of scancells don't match in ScanChain %s.

DESCRIPTION

This error is generated when the specified scan chain length doesn't match the number of scan cells in the ScanChain mentioned.

WHAT NEXT

Check to make them consistent.

STIL-312 (error) Time expression format are supported.

DESCRIPTION

This error is generated when the format of time expression user specified is not supported now. Currently only numerical time expression format is supported.

WHAT NEXT

Modify the concerned time expression to numerical only format.

STIL-313 (error) The ScanInversion must be 0 or 1 in

ScanChain %s.

DESCRIPTION

This error is generated when the user specify the ScanInversion value as neither 0 nor 1. The ScanInversion value means the overall inversion from before the first scan cell to after the last scan cell.

WHAT NEXT

Correct the ScanInversion value to either 0 or 1.

STIL-314 (error) Anonymous ScanStructures block redefined.

DESCRIPTION

This error is generated when the anonymous ScanStructures block was redefined. Only one anonymous ScanStructures block is allowed in STIL syntax.

WHAT NEXT

Remove the duplicated definition of the anonymous ScanStructures block.

STIL-315 (error) %s Domain %s redefined.

DESCRIPTION

This error is generated when the Domain mentioned above is redefined. The Domain can be SignalGroups, ScanStructures, Timing, Procedures or MacroDefs. Each named domain can only be defined once.

WHAT NEXT

Remove the duplicated domain definition.

STIL-316 (error) Anonymous Variables block redefined.

DESCRIPTION

This error is generated when the anonymous Variables block was redefined. Only one

anonymous Variables block is allowed in STIL syntax.

WHAT NEXT

Remove the duplicated definition of the anonymous Variables block.

STIL-317 (error) Duplicated signal %s in the signal expression.

DESCRIPTION

This warning is generated when there exists duplicate signals in a signal expresion.

WHAT NEXT

Check each element in the signal expression, find out and remove the duplicates.

STIL-318 (error) Non-cyclized data is not supported.

DESCRIPTION

This error is generated when user includes non-cyclized data in a vector statement. Currently the STIL reader only support single cyclized data in a vector statement. For exact meaning of cyclized and non-cyclized data, please refer to STIL syntax.

WHAT NEXT

You may need to remove non-cyclized data and find alternative ways to express that.

STIL-319 (warning) Only constant expression is allowed in %s.

DESCRIPTION

This error is generated under given context, integer expression or sigvar expression can only contains constant variables or values, while non-constant variables were used in those expressions.

WHAT NEXT

Replace the non-constant variables with constant variables or values.

STIL-320 (error) %s domain %s does not exist.

DESCRIPTION

This error is generated when the specified STIL domain was not defined before. The STIL domain can be SignalGroups, ScanStructures, Timing, Procedures or MacroDefs.

WHAT NEXT

Please check if the domain is referred or defined correctly.

STIL-324 (error) Can't create PatternBurst %s.

DESCRIPTION

This error is generated when PatternBurst mentioned above can not be created during model construction. The most probable reason is that the PatternBurst with the same name has already been created before.

WHAT NEXT

Check if the duplicated PatternBurst has already been created.

STIL-326 (error) PatternExec block has multiple Timing statements.

DESCRIPTION

This error is generated when the PatternExec block has multiple Timing statements. Only one Timing statement is allowed according to STIL syntax.

WHAT NEXT

Remove the duplicated Timing statements in PatternExec block.

STIL-327 (error) PatternBurst %s does not exist.

DESCRIPTION

This error is generated when the PatternBurst mentioned in the PatternExec block was not defined before. It is required by the STIL syntax to define PatternBurst before referencing.

WHAT NEXT

Check if the PatternBurst was referred or defined correctly.

STIL-328 (error) PatternExec block has multiple PatternBurst statements.

DESCRIPTION

This error is generated when multiple PatternBurst statements are included in the PatternExec block. Currently only one PatternBurst statement is allowed in PatternExec block according to STIL syntax.

WHAT NEXT

Define a new PatternBurst block to include the multiple PatternBurst statements, and put the new defined PatternBurst in the PatternExec block.

STIL-329 (error) Can't create PatternExec %s.

DESCRIPTION

This error is generated when PatternExec mentioned above can not be created during model construction. The most probable reason is that the PatternExec with the same name has already been created before.

WHAT NEXT

Check if the duplicated PatternExec has already been created.

STIL-330 (error) Too many events in event list.

DESCRIPTION

This error is generated when you define a waveform character list, the number of events in the event list is more than the number of wfcs in the wfc list.

WHAT NEXT

Modify your wfc defintion to make them consistent.

STIL-331 (error) Waveform inheritance not supported.

DESCRIPTION

This error is generated when the user specify an InheritWaveform statement in WaveformTable definition. Currently, the waveform inheritance is not supported.

WHAT NEXT

Try alternative ways to reach the goal.

STIL-332 (warning) Unsupported construct in waveform definition.

DESCRIPTION

This warning is generated when the construct in the waveform definition is legal but not supported now. e.g. in the definition list of wfcs, currently we only support time-value pair definition. Other constructs are not recognized.

WHAT NEXT

Try alternative ways to reach the goal.

STIL-333 (error) Incomplete time-value pair in waveform

definition.

DESCRIPTION

This error is generated when there is an incomplete time-value pair in waveform definition. Currently we only support time-value pair as the definition of wfcs.

WHAT NEXT

Correct it or try alternative ways to reach the goal.

STIL-334 (error) Waveform inheritance not supported.

DESCRIPTION

WHAT NEXT

STIL-335 (error) WaveformTable inheritance not supported.

DESCRIPTION

This error is generated when the user specify an InheritWaveformTable statement in WaveformTable definition. Currently, the waveform table inheritance is not supported.

WHAT NEXT

Try alternative ways to reach the goal.

STIL-336 (error) SubWaveforms not supported.

DESCRIPTION

This error is generated when the user specify an SubWaveforms statement in WaveformTable definition. Currently, the SubWaveforms is not supported.

WHAT NEXT

Try alternative ways to reach the goal.

STIL-337 (error) WaveformTable %s redefined.

DESCRIPTION

This error is generated when user redefined a WaveformTable in the same Timing domain. The WaveformTable definition should be unique within one Timing domain.

WHAT NEXT

Remove the duplicated definition of WaveformTable.

STIL-339 (error) Single signal expected for %s.

DESCRIPTION

This error is generated when a signal bus is passed in when a single signal is expected. e.g. in the scan chain definition, the scan in and scan out are required to be a single signal.

WHAT NEXT

Modified the signal bus to a single signal.

STIL-340 (error) Signal or SignalGroup %s not defined.

DESCRIPTION

This error is generated when user tries to refer to an undefined signal or signal group. Signals and SignalGroups must be defined before being referenced.

WHAT NEXT

Define the signal or signal group before using it.

STIL-341 (error) ScanCell %s not defined.

DESCRIPTION

This error is generated when user tries to refer to an undefined scancell. ScanCells must be defined before being referenced. They are defined in the ScanStructures

blocks.

WHAT NEXT

Define the scancell before using it.

STIL-342 (error) Anonymous BistStructures block redefined.

DESCRIPTION

This error is generated when the anonymous BistStructures block was redefined. Only one anonymous BistStructures block is allowed in STIL syntax.

WHAT NEXT

Remove the duplicated definition of the anonymous BistStructures block.

STIL-345 (error) Ambigous parameter matching '%s' in call to '%S'.

DESCRIPTION

This error is issued when a parameter is multiple defined in a macro or procedure call.

WHAT NEXT

Modify the macro or procedure call and remove the multiple defined parameter.

SEE ALSO

`read_test_protocol(2).`

STIL-401 (warning) Domain name '%s' already exists in the test model. Overwriting the old one.

DESCRIPTION

This warning is issued when a domain name in a STIL file read by `read_test_protocol`

command already exists in the existing test model.

The old domain in the test model will be replaced by the new one.

WHAT NEXT

If you do not want to overwrite the old one, remove the '-overwrite' argument from the `read_test_protocol` command. This will ignore the new one and keep the old one.

SEE ALSO

`read_test_protocol(2)`.

STIL-402 (warning) Domain name '%s' already exists in the test model. Ignoring the new one.

DESCRIPTION

This warning is issued when a domain name in a STIL file read by `read_test_protocol` command already exists in the existing test model.

The old domain in the test model will be preserved, and the domain in the protocol file will be ignored.

WHAT NEXT

If you want to overwrite the old one, specify the '-overwrite' argument in the `read_test_protocol` command. This will replace the old one by the new one.

SEE ALSO

`read_test_protocol(2)`.

STIL-403 (warning) Overwriting the existing waveform table with new timing.

DESCRIPTION

This warning is issued when the existing waveform talbe is overwritten by a new waveform table defined in the test protocol read by `read_test_protocol` command.

WHAT NEXT

Check if the new waveform table is compatible with the timing in other test modes.

SEE ALSO

`read_test_protocol(2).`

STIL-404 (error) The timing of signal '%s' is different from the existing one.

DESCRIPTION

This error is issued when the waveform of the signal in the test protocol is different from the existing one.

The sequence of events in a waveform should be in canonical order, and the waveforms in the test protocol read and in the existing protocol (or model) should be equal.

DFTCompiler allows only one timing block and waveform table. You cannot read a test protocol that has different timing block from the one in other test protocols in different test modes.

You can replace the old timing with the new timing only if you have no protocol, or you have only one test protocol and replace it in the same test mode.

WHAT NEXT

Write out the existing test protocol, and compare the timing block against the timing block of the test protocol you want to read.

SEE ALSO

`read_test_protocol(2).`

STIL-406 (Error) Signal or SignalGroup %s used in test setup procedure is not defined.

DESCRIPTION

This error is generated when user tries to refer to an undefined signal or signal group in test setup. Signals and SignalGroups must be defined before being referenced. Make sure all referenced signals are within double quotes.

WHAT NEXT

Define the signal or signal group before using it.

SYMB

SYMB-1 (warning) The symbol attribute '%s' was lost during translation to db.

DESCRIPTION

This warning should never come out during production code. It is an internal warning.

WHAT NEXT

Call support and file a bug report.

SYMB-2 (error) Couldn't write to the file '%s'.

DESCRIPTION

This error should only come out if there is a file system error.

WHAT NEXT

Check the disks capacity ... the job may have run out of disk space while writing to the disk.

SYMB-3 (warning) Encountered an end of file before processing was finished in file '%s'.

DESCRIPTION

This should only happen when a ".syn" file has been corrupted or if there is a file in a design library that ends in a .syn suffix that was not generated by the dc_shell read or analyze commands.

WHAT NEXT

If the .syn file is corrupt, regenerate the .syn file by re-analyzing its source code. However, if the file was not generated by design_compiler, then the file

should be moved from the design library.

SYMB-4 (warning) Corrupted data file '%s' ... %s.

DESCRIPTION

The specified .syn file is corrupt. It should be regenerated by re-analyzing its source code.

WHAT NEXT

Regenerate the .syn file by re-analyzing its source code.

SYMB-5 (warning) The file '%s' is not a symb file.

DESCRIPTION

There is a file in a design library that has a .syn suffix, but it is not a .syn file.

WHAT NEXT

Remove (or move) the file.

SYMB-6 (warning) Can't read in this version of data file ... please regenerate the data file '%s' by re-analyzing its source.

DESCRIPTION

The file mentioned in the error message was created with a different version of the software.

WHAT NEXT

The file should be recreated by analyzing its source using the current analyzer.

SYMB-7 (warning) The value of the current time in the operating system is earlier than the time of the source file. The timestamp that will be used to save the .syn file will be the time of the source file.

DESCRIPTION

This error message indicates that the timestamp used to create the source file is "in the future" compared to what the current machine thinks the time is. This is probably due to the fact that the filesystem's time is ahead of the machine being run on.

WHAT NEXT

Get the UNIX system administrator to synch up the clocks on the network.

SYNDB

SYNDB-1 (error) Could not find parameter '%s' on module '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-2 (warning) Could not find design '%s' associated with module '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-3 (error) A port could not be found on the %s '%s' which matches the port '%s' on the %s '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-5 (error) A design named '%s' has already been associated with module '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-6 (error) The port '%s' on the module has a different

direction than the port '%s' on the design.

DESCRIPTION

WHAT NEXT

SYNDB-7 (error) A parameter could not be found on the %s '%s' which matches the parameter '%s' on the %s '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-8 (error) Could not compile the synthetic design '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-9 (error) Could not model the compiled synthetic design '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-10 (error) The parameter '%s' for the module '%s' hasn't been specified

on the reference '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-11 (error) Could not build the synthetic design '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-12 (warning) A reference has been made to the module '%s' which has had no designs specified which can implement it.

DESCRIPTION

WHAT NEXT

SYNDB-13 (error) Could not find the required attribute 'default_implementation' on the module '%s'

DESCRIPTION

WHAT NEXT

SYNDB-14 (warning) The attribute 'default_implementation' is required on the

synthetic library module '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-15 (error) Module '%s' has an implementation '%s' which has a syntax error in the contained implementation '%s'.

DESCRIPTION

WHAT NEXT

SYNDB-16 (error) In module '%s' implementation '%s', the contained operator '%s' cannot be found.

DESCRIPTION

Contained operators must be defined in one of the .sldb files in the 'synthetic_library' variable.

WHAT NEXT

SYNDB-17 (error) In module '%s' implementation '%s', the contained module '%s' cannot be found.

DESCRIPTION

Contained modules must be defined in one of the .sldb files in the 'synthetic_library' variable.

WHAT NEXT

SYNDB-18 (error) The synthetic library operator '%s' is referred to in the (linked) current design, but it cannot be found among the .sldb files.

DESCRIPTION

All synthetic library instantiations must be defined in one of the .sldb files from the 'synthetic_library' dc_shell variable.

WHAT NEXT

SYNDB-19 (error) The synthetic library module '%s' is referred to in the (linked) current design, but it cannot be found among the .sldb files.

DESCRIPTION

All synthetic library instantiations must be defined in one of the .sldb files from the 'synthetic_library' dc_shell variable. Moreover, the instantiation cannot have a dont_use applied to it.

WHAT NEXT

SYNDB-20 (error) Cannot find the synthetic library implementation '%s' of module '%s'.

DESCRIPTION The implementation is referred to in the current

design hierarchy through inferencing, instantiation, or a contained_implementation attribute in a .sldb file. But the implementation declaration could not be found among the files listed in the *synthetic_library* dc_shell variable. Alternatively, a license could not be obtained for this implementation, the implementation had a **dont_use** applied to it, or the implementation is not valid with the specified target library technology.

WHAT NEXT

The .sldb file that contains the offending implementation should be listed in the *synthetic_library* variable and the *link_library* variable. Use **report_synlib** to see the contents of a .sldb file. Licenses are automatically checked out, unless the *synlib_dont_get_license* variable prevents them from being checked out or all the licenses are currently in use.

Check the legality and technology attributes of the implementation within the synthetic library (if possible) to determine applicability.

SYNDB-21 (error) The stall pin attribute is illegal on module %s.

DESCRIPTION

The *stall pin* attribute is valid only for modules associated with behavioral synthesis sequential operators. A behavioral synthesis sequential operator has a *clocking_scheme* group defined for the module.

WHAT NEXT

Check the module to see if it has a *clocking_scheme* group.

SYNDB-22 (error) %s binding '%s' must be associated with a %s module '%s'.

DESCRIPTION

Combinational bindings are bindings without *state* groups. Sequential bindings have *state* groups. A combinational module is a module without a *clocking_scheme* group. A sequential module has a *clocking_scheme* group.

WHAT NEXT

Reexamine your binding and module definitions to insure that both are either combinational or sequential.

SYNDB-23 (error) Improper use_resource name '%s' in binding

'%s' of module '%s'.

DESCRIPTION

The `use_resource` names in bindings must be declared as resources in the sequential module.

WHAT NEXT

Add the resource declaration to the sequential module.

SYNDB-24 (error) Stable pin '%s' of binding '%s' of module '%s' has a changed value in the next state.

DESCRIPTION

A pin that has the `stable` attribute in one state must have the same binding in the next state, so that its value remains stable between the two states.

WHAT NEXT

Change the pin association in the next state, or remove the `stable` attribute.

SYNDB-25 (error) Unable to use implementation '%s' in module '%s'.

DESCRIPTION

This error occurs due to conflicting specified information. This implementation cannot be both a user selected implementation as well as an implicit `dont_use` implementation.

WHAT NEXT

Either change the value of the `set_dont_use` command or unselect implementation.

SYNDB-26 (warning) Implementation '%s' in module '%s' has a

"dont_use"
implementation as a result of "dont_use" lower level synthetic
part '%s'

DESCRIPTION

This implementation will not be considered during implementation selection phase

WHAT NEXT

Check the value of the set_dont_use command

SYNDB-27 (error) Referenced module '%s' has no
implementation.

DESCRIPTION

The specified module has no implementation as a result of all of its implementations
have become "dont_use" implementations.

WHAT NEXT

Change the value of the set_dont_use command to allow more implementations to be
selected.

SYNDB-28 (warning) Module '%s' has no implementation. This
module
will not be considered during resource sharing.

DESCRIPTION

This module will not be considered during implementation selection. This occurs when
all of its implementations have become implicit "dont_use" implementations.

WHAT NEXT

Change the value of the set_dont_use command.

SYNDB-30 (error) Cannot find valid synthetic library implementations for module '%s'.

DESCRIPTION

The module is referred to in the current design hierarchy. But no implementation declaration could be found among the files listed in the *synthetic_library dc_shell* variable. Alternatively, no implementations is valid for this module in current design hierarchy because: no license could be obtained for any available implementations or the implementations had a **dont_use** applied to them.

WHAT NEXT

The .sldb file that contains the offending implementations should be listed in the *synthetic_library* variable and the *link_library* variable. Use **report_synlib** to see the contents of a .sldb file. Licenses are automatically checked out, unless the *synlib_dont_get_license* variable prevents them from being checked out or all the licenses are currently in use.

SYNDB-31 (error) The check implementation reference group '%s' within module '%s' refers to an implementation, '%s', which is not found in the current set of synthetic libraries.

DESCRIPTION

The *check_implementation* group of the named module contains the *verify_use_implementation* attribute. The value of this attribute names an implementation within the same module to be used as the verification implementation. This error signifies that no implementation named by the *verify_use_implementation* attribute was found within any of the synthetic libraries specified by the *synthetic_library* variable.

WHAT NEXT

Ensure that the *synthetic_library* variable enumerates all required synthetic libraries. Examine the contents of each synthetic library with the **report_synlib** command to ensure that the named implementation exists and is spelled correctly.

If the set of libraries passes the **check_synlib** command, yet still fails, examine the implementation used for verification purposes for attributes specifying technology libraries, legality checks, and so on.

SYNDB-32 (error) The generator named '%s' does not exist within the '%s' library.

DESCRIPTION

A `uses_generator` attribute has specified the use of a generator which does not exist within the scope of the named library. This error typically results from an incorrectly written synthetic library.

WHAT NEXT

Verify that the spelling of the generator specified by the `uses_generator` attribute matches the appropriate generator within the synthetic library source file.

SYNDB-33 (error) Implementation '%s' of module '%s' is not a valid implementation for the design when 'synlib_enable_dpgen = false'.

DESCRIPTION

When `synlib_enable_dpgen = false`, it is illegal to set forced implementations to generated implementations.

WHAT NEXT

Set the forced implementations to DesignWare Foundation parts, or turn on `synlib_enable_dpgen` to use generated implementations.

SYNDB-34 (error) Cannot find valid synthetic library module for operator '%s'.

DESCRIPTION

The operator is inferred in the current design. But no synthetic module could be found to implement the operator. This would cause problem during resource sharing.

WHAT NEXT

Check synthetic libraries to make sure there are synthetic modules to implement each synthetic operator.

SYNDB-35 (error) The design has set_implementation on the obsolete implementation '%s' of module '%s'.

DESCRIPTION

The module is referred to in the current design hierarchy, and the set_implementation command was performed to specify an obsolete implementation on a cell in the design. The obsoleted implementation is no longer supported and has no replacement implementation. Cannot find valid synthetic library implementations for the module.

WHAT NEXT

Call command report_attribute -cell -hierarchy. Find the cell that has 'implementation' attribute and the value of the attribute is the obsoleted implementation. Use command 'remove_attribute' to remove the attribute.

SYNDB-36 (warning) Implementation '%s' of module '%s' is replaced by '%s'. The design has 'set_implementation' to the obsolete implementation.

DESCRIPTION

The module is referred to in the current design hierarchy, and set_implementation command was performed to specify an obsoleted implementation on a cell in the design. The obsoleted implementation is no longer supported and is replaced by the replacement implementation.

WHAT NEXT

The design compiler will automatically modify the implementation attribute on the cell to use the replacement implementation. If you do not want to use the replacement implementation, call command report_attribute -cell -hierarchy to find the cell that has attribute implementation and the value of the attribute is the obsoleted implementation. Use command remove_attribute to remove attribute implementation from the cell. Or use set_implementation command to choose another implementation.

SYNDB-37 (information) Implementation '%s' of module '%s' is

replaced by '%s'.

DESCRIPTION

The module is referred to in the current design hierarchy. The implementation is replaced by the replacement implementation.

The implementation that is been replaced is obsoleted and permanently replaced by the new implementation.

If a design is set_implementation to a MC architecture, the set_implementation will be morphed to use the architecture from the advanced generator.

WHAT NEXT

The design compiler will use the replacement implementation. The obsoleted implementation will no longer be used in the design.

SEE ALSO

`synlib_enable_dpgen(3)`

SYNDB-38 (information) Implementation '%s' of module '%s' is obsoleted.

DESCRIPTION

The module is referred to in the current design hierarchy. The implementation is obsoleted and will no longer be used.

WHAT NEXT

The design compiler will choose other implementations for the module. The obsoleted implementation will no longer be used in the design.

SYNDB-39 (error) Could not find the replacement implementation '%s' of obsoleted implementation '%s'. No valid

synthetic implementation for module '%s'.

DESCRIPTION

The module is referred to in the current design hierarchy. And set_implementation command was performed to specify an obsoleted implementation on a cell in the design. The obsoleted implementation is replaced by the replacement implementation. The attempt to find the replacement implementation among the files listed in the *synthetic_library dc_shell* variable has failed. Alternatively, the replacement implementation is not valid because: no license could be obtained for any available implementations or the implementations had a **dont_use** applied to them.

WHAT NEXT

The .sldb file that contains the offending implementations should be listed in the *synthetic_library* variable and the *link_library* variable. Use **report_synlib** to see the contents of a .sldb file. Licenses are automatically checked out, unless the *synlib_dont_get_license* variable prevents them from being checked out or all the licenses are currently in use.

Alternatively, remove the implementation attribute from the cell to allow automatic selection of implementations for the module. report_attribute -cell command can be used to find the cell that has the implementation attribute. Use command remove_attribute to remove the attribute from the cell.

SYNDB-40 (warning) The 'implementation' attribute on cell '%s' in design '%s' is changed from '%s' to '%s'.

DESCRIPTION

The module is referred to in the current design hierarchy, and set_implementation command was performed to specify an obsoleted implementation on the cell in the design. The obsoleted implementation is no longer supported and is replaced by the replacement implementation. The value of 'implementation' attribute on the cell is modified to use the replacement implementation.

WHAT NEXT

The replacement implementation will be chosen for the cell. If you do not want to use the replacement implementation, use remove_attribute command to remove the implementation attribute from the cell.

SYNDB-41 (warning) Syntax error in property '%s' set on %s.

DESCRIPTION

This warning message occurs when there is a syntax error in a property set on the module or implementation.

The format of the syntax is as follows:

```
<property_type>:<property_name>:<property_value>
```

Separate multiple property definitions with white spaces.

The supported property types are Boolean, string, and integer. For a Boolean property, the value can only be **true** or **false**.

WHAT NEXT

This is only a warning message. No action is required.

However, if the result is not what you expected, correct the syntax error in the synthetic library file and run the command again.

SYNDB-42 (warning) Property '%s' of type '%s' exists %s

DESCRIPTION

There are duplicated properties on the synthetic library module or implementation. The new property will be ignored.

WHAT NEXT

Remove the duplicated property name in synthetic library file.

SYNDB-43 (Error) DesignWare operator '%s' has interface change.

DESCRIPTION

The interface of the DesignWare operator has been changed since the design was elaborated. The DW operator can not be linked correctly. Please re-elaborate the rtl design use the latest Design Compiler.

WHAT NEXT

Re-elaborate the rtl design use the latest Design Compiler.

SYNDB-44 (warning) The implementation attribute ('%s, %s) on cell %s in design %s is removed.

DESCRIPTION

This warning message notifies you that the implementation attribute on the cell has been removed. The module is referred to in the current design hierarchy, and the **set_implementation** command was performed to specify a free implementation on a cell in the design. The generated implementation provides better QoR. Free implementations are no longer used in the compile flow where generated implementations are available.

WHAT NEXT

This is only a warning message and no action is required. However, to get better QoR, do not **set_implementation** to a free implementation. If you need to use the free implementation, do not add dw_foundation.sldb in your synthetic_library list, and do not use **compile_ultra** flow.

SEE ALSO

`set_implementation(2)`

SYNDB-45 (information) Implementation '%s' of module '%s' is replaced by '%s'.

DESCRIPTION

This information message advises you that the module is referred to in the current design hierarchy. The implementation is replaced by the replacement implementation in the **compile_ultra** flow. The replacement implementation provides better QoR.

WHAT NEXT

Design Compiler will use the replacement implementation.

SYNDB-46 (information) Implementation '%s' of module '%s' is

don't use as a result of don't use implementation '%s'.

DESCRIPTION

This information message advises you that you set *don't use* on the free implementation. This implies that the generated implementation that covers the same QoR range is also *don't use*.

WHAT NEXT

Design Compiler will not use the generated implementation.

SYNENC

SYNENC-1 (error) Syntax error in HDL source file "%s".

DESCRIPTION

"synenc" has encountered syntax errors. The specified source file is not legal VHDL or Verilog. This may be caused by non-standard statements or comments near the beginning of the file.

WHAT NEXT

If this error occurs, please use your VHDL or Verilog compiler to identify and correct any syntax problems in the source file.

SYNENC-2 (error) "%s" is not a plain file.

DESCRIPTION

The file system path specified did not reference a text file. It looks like a directory or other special file.

WHAT NEXT

Check the path to make sure it is a valid VHDL or Verilog source file.

SYNENC-3 (error) cannot open file '%s' for reading.

DESCRIPTION

The specified input file is not readable.

WHAT NEXT

Check the Unix permissions on the specified file.

SYNENC-4 (error) cannot open file '%s' for writing.

DESCRIPTION

The specified output file cannot be opened for writing. 'synenc' always writes encrypted source files to the user's current working directory and gives them the name "inputfilename.e". Either the file already exists and is write protected or the user doesn't have correct permissions to create a file in the current working directory.

WHAT NEXT

Delete old encrypted files. 'cd' to a directory for which you have write permissions.

SYNENC-5 (error) Error while reading source file for encryption.

DESCRIPTION

Some unexpected condition caused the read of the source file to fail. This could be caused by a network failure or some similar transient condition.

WHAT NEXT

Try to encrypt the file again.

SYNENC-6 (error) Internal encryptor error.

DESCRIPTION

WHAT NEXT

SYNENC-7 (information) Processed file '%s'.

DESCRIPTION

WHAT NEXT

SYNH

SYNH-1 (information) The synthetic implementation was read from a cache.

DESCRIPTION

There is an obsolete or invalid implementation contained in a synthetic library cache(s) specified by your cache_read variable.

WHAT NEXT

Remove the old, incorrect implementation from the cache.

SYNH-2 (information) Read implementation '%s' for synthetic design '%s'
from design library '%s'.

DESCRIPTION

The named synthetic implementation was extracted from the named library.

A faster way to retreive synthetic implementations is to store them in and retreive them from a synthetic cache. An installation program (install_synlib) puts simple synthetic parts in the system cache.

WHAT NEXT

Store synthetic implementations you use often in a synthetic cache. Refer to the DesignWare reference manual for more details.

SYNH-3 (information) Modeled %s(%s).
(Timing Model = %s Operating Conditions = %s)

DESCRIPTION

You receive this message because the named synthetic design was optimized to obtain representative timing and area numbers for the part. These numbers are used to model the part in subsequent optimizations.

Once a part is modeled, it can be stored in a synthetic cache. Thus, subsequent compiles will not have to recreate the model. Use the variable's **cache_read** and **cache_write** to set up your cache. You can also use the **create_cache** command to store parts in your cache.

WHAT NEXT

Store in a synthetic cache the synthetic implementations you often use. For more information, see to the *DesignWare Reference Manual*.

SEE ALSO

create_cache (2).

SYNH-4 (information) The synthetic model was read from a cache.

DESCRIPTION

There is an obsolete or invalid model in a synthetic library cache(s) specified by your `cache_read` variable.

WHAT NEXT

Remove the old, incorrect model from the cache.

SYNH-7 (error) Module '%s', implementation '%s' does not have a library attribute.

DESCRIPTION

When Design Compiler tries to build a synthetic module/implementation, it needs to know which design library the netlist is in. This information is an attribute of either the module (which provides a default for all implementations), or of the implementation itself.

WHAT NEXT

Modify the synthetic library source to add the library attribute to either the module or implementation. Also, if it has not already been done, store the source for the design's netlist in the library. For VHDL/verilog, use the **analyze** command; for db designs, use the **writelfP** command.

SYNH-8 (error) Can't link to module '%s' implementation '%s' in synthetic part '%s'.

DESCRIPTION

This error occurred when linking a synthetic part that contains another synthetic part (the subpart). One possible problem is that one part comes from one synthetic library while the subpart comes from another synthetic library, and both libraries are not in the synthetic_library variable. Another possible problem is that the subpart is not mentioned as a contained operator/module/implementation of the parent part, so the license for the subpart was not checked out and the subpart was not considered an authorized synthetic library part.

WHAT NEXT

Add the subpart's .sldb file to the synthetic_library variable. Ensure that the subpart is listed as a contained operator/module/implementation of the parent part in the parent part's

SYNH-9 (warning) Synthetic library implementation '%s' in module '%s' is an empty netlist.

DESCRIPTION

The given synthetic implementation either has no description for the netlist or the entire netlist has been optimized away. This may cause problems in your final netlist.

WHAT NEXT

You do not need to take any action regarding this message.

SYNH-10 (error) Port number %d of implementation '%s' of synthetic module '%s' should be '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the ports in your netlist or hdl description match your module declaration exactly, both in name and order.

SYNH-11 (error) Direction of port '%s' in implementation '%s' does not match the declared synthetic module '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the netlist or hdl description has the correct direction for the named port.

SYNH-12 (error) Width of port '%s' in implementation '%s' does not match the declared synthetic module '%s'.

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the netlist or hdl description has the correct width for the named port. The width must match for all possible parameter values.

SYNH-13 (error) Port '%s' in implementation '%s' is not declared in the synthetic module '%s'

DESCRIPTION

The netlist or hdl description of the named implementation does not match the module declaration in the synthetic library.

WHAT NEXT

Make sure that the netlist or hdl description has the same ports as the synthetic module.

SYNH-14 (error) Cannot find a valid implementation for module '%S'.

DESCRIPTION

This message indicates that the specified module does not have a valid implementation, possibly because of problems that occurred during linking of a synthetic part that contains another synthetic part (the subpart). Here are some possible reasons for the lack of a valid implementation:

1. The **legal** parameter of the implementations might have made them all illegal. If a module uses legality, there must be at least one legal implementation for all parameter value combinations.
2. The part and the subpart might come from different synthetic libraries, and both libraries might not be in the **synthetic_library** variable.
3. The subpart might not be mentioned as a contained operator/module/implementation of the parent part, so the license for the subpart might not have been checked out and thus was not considered an authorized synthetic library part.
4. All of the module's implementations might require licenses, and perhaps none of those licenses have been purchased at the site.

WHAT NEXT

1. Ensure that there is at least one legal implementation for all parameter value combinations. For more information, refer to the *DesignWare Developer's Guide*.
2. Add the subpart's **.sldb** file to the **synthetic_library** variable.
3. Ensure that the subpart is listed as a contained operator/module/implementation of the parent part in the parent part's **.sl** file.
4. Examine the key file to determine whether a license has been purchased for the module's implementations. If not, purchase the required licenses.

SYNH-15 (error) Missing connection for input pin '%s' for binding

'%s' in module '%s' for operation '%s'.

DESCRIPTION

Each binding must specify how to connect ALL inputs of a module.

WHAT NEXT

SYNH-16 (error) Design hierarchy is not allowed inside a synthetic library part. The module '%s' implementation '%s' has hierarchy in it.

DESCRIPTION

We support only hierarchy that is a technology library or a synthetic library module or operator.

WHAT NEXT

If the hierarchy is a technology library or a synthetic library, check the *synthetic_library* and *link_library* variables and the *set_local_link_library* directive.

SYNH-17 (error) Cannot find a legal implementation of any module to implement the operations bound to the resource '%s'.

DESCRIPTION

An attempt to build the netlist for the module failed. One possible cause is that the module has no implementations in the synthetic library. This can happen if no implementations are declared for the module in synthetic libraries or if all implementations have a *dont_use* on them.

WHAT NEXT

SYNH-18 (error) Cannot find a legal implementation of any

module
to implement the operator '%s'.

DESCRIPTION

While performing resource sharing, no legal implementation of ANY synthetic module was found which could implement the named operator. Check legality specifications in the synthetic libraries.

WHAT NEXT

SYNH-19 (warning) Module '%s' was not found in the files of synthetic_library.

Implementation of synthetic design '%s' (cell '%s') is not being reconsidered.

DESCRIPTION

Synthetic implementation selection is not being reconsidered because the synthetic module for this design can no longer be found. Either the synthetic library that contains the module is not listed in the *synthetic_library* variable, or the module has been marked *dont_use*.

WHAT NEXT

Add the appropriate synthetic library, or remove the **dont_use** attribute.

SYNH-20 (warning) set_implementation '%s' was not found in the files of synthetic_library. Implementation of synthetic design '%s' (cell '%s') is not being reconsidered.

DESCRIPTION

The **set_implementation** command on this cell cannot be performed because the synthetic implementation specified cannot be found. Either the synthetic library that contains the implementation is not listed in the *synthetic_library* variable, or the implementation has been marked *dont_use*.

WHAT NEXT

Correct your `set_implementation` command, add the appropriate synthetic library, or remove the `dont_use` attribute.

SYNH-21 (information) Modeled %s(%s).

DESCRIPTION

The named synthetic design was optimized to obtain representative timing and area numbers for the part. These numbers will be used to model the part in subsequent optimizations.

Once a part is modeled, it can be stored in a synthetic cache. This way, subsequent compiles will not have to recreate the model. Use the variables "cache_read" and "cache_write" to set up your cache. You can also use the "create_cache" command to store parts in your cache.

WHAT NEXT

Store synthetic implementations you use often in a synthetic cache. Refer to the DesignWare reference manual for more details.

SYNH-22 (warning) Current implementation '%s' of module '%s' was not found in the files of synthetic_library. Implementation selection of synthetic design '%s' (cell '%s') will take longer.

DESCRIPTION

Either the synthetic library that contains the implementation is not listed in the `synthetic_library` variable, or the implementation has been marked `dont_use`. When the current implementation cannot be found in the synthetic library, the implementation selection algorithm cannot use cached models to make design trade-offs. This makes it necessary to compile trial designs on-the-fly, and slows down the process.

WHAT NEXT

If you wish to increase your CPU performance you may choose to: add the appropriate synthetic library; remove the `dont_use` attribute; use `set_implementation` to change the implementation of the cell; use `set_implementation` to lock the implementation of the cell to its current value; or set `compile_implementation_selection` to false.

SYNH-30 (error) An incorrect range has been specified for parameter '%s'.

DESCRIPTION

The defined parameter range is invalid because the end value is equal or larger than the start value.

WHAT NEXT

Provide a correct range for the parameter.

SYNH-31 (error) The specified parameter set doesn't match the required parameter set for module %s.

DESCRIPTION

The specified parameters doesn't match the required parameters of the module.

WHAT NEXT

Provide a correct parameter set.

SYNH-32 (error) Failed to generate the module due to previous errors.

DESCRIPTION

The tools failed to create a netlist and cache it. The reason for failure is reported by other error messages. This inform the user that the requested module was not created.

WHAT NEXT

Fix the problem and try again.

SYNH-33 (warning) Cannot find any module with the given

name.

DESCRIPTION

The requested module cannot be found in the synthetic libraries pointed to by the cache_read and cache_write variables. It is very likely that the user mistyped the name of the module on the command line.

WHAT NEXT

Check the name of the module, and try again.

SYNH-34 (error) Cannot find any valid implementation for module '%s' to match the requested implementation name.

DESCRIPTION

The requested implementation cannot be found in the synthetic libraries pointed to by the cache_read and cache_write variables. It is very likely that the user mistyped the name of the implementation on the command line.

WHAT NEXT

Check the name of the implementation, and try again.

SYNH-35 (error) Too many parameters have been specified.

DESCRIPTION

The requested module requires less parameters than those specified by the user. This is most certainly a user error.

WHAT NEXT

Re-run the command with the correct number of parameters.

SYNH-36 (error) Too few parameters have been specified.

DESCRIPTION

The requested module requires more parameters than those specified by the user. This is most certainly a user error.

WHAT NEXT

Re-run the command with the correct number of parameters.

SYNH-37 (error) Parameter name mismatch. This module requires parameter '%s'.

The provided parameter name is '%s'.

DESCRIPTION

The requested module requires a parameter with a certain name. The parameter name provided by the user does not contain a reference to required parameter.

WHAT NEXT

Re-run the command with the correct parameter set.

SYNH-38 (warning) '%s' is not a valid wire load in the specified technology library.

DESCRIPTION

The requested wire-load model cannot be found in any of the technology libraries identified by the *target_library* variable.

WHAT NEXT

Check the name of the wire-load model, and make sure it is a valid wire-load model within the identified target technology libraries.

SYNH-39 (error) '%s' is not a valid operating condition in the

specified technology libraries.

DESCRIPTION

The requested operating condition cannot be found in any of the technology libraries identified by the `target_library` variable.

WHAT NEXT

Check the name of the operating condition, and make sure it is valid within the identified target technology libraries. To check the name of the operating condition, run the `report_lib` command.

SYNH-40 (warning) No known implementation matched '%s'.

DESCRIPTION

The requested implementation for the synthetic module is not valid. If the implementation name contained a wild-card character, there was no match.

WHAT NEXT

Check the implementation name, and make sure it is a valid implementation of the module.

SYNH-41 (error) The implementation '%s' is not legal for implementing the operations bound to resource '%s'.

DESCRIPTION

User used manual resource sharing directives to implement one or more operations on an implementation which is not legal for the operations. For example, the bit width might be outside the legal range.

WHAT NEXT

SYNH-42 (warning) IIS optimization was skipped because the appropriate license could not be checked out.

DESCRIPTION

Incremental Implementation Selection requires a HDL-Compiler or VHDL-Compiler license. The quality of results may be suboptimal.

WHAT NEXT

Explicitly grab a license (`get_license`) and make sure the variable `hdl_keep_licenses` is set true.

SYNH-43 (warning) Syntax error in the '`synthetic_library`' variable assignment.

Default value will be used.

DESCRIPTION

An error occurred during a parse of the value of the `synthetic_library` variable. The variable should be set to a list of `.sldb` files. For example: `synthetic_library = { dw01.sldb dw02.sldb }`. The default value `{}` will be used. Note that `standard.sldb` is automatically included in the `synthetic_library` value.

WHAT NEXT

Change the value of your `synthetic_library` variable.

SYNH-44 (warning) The synthetic library module '%s' implementation '%s' failed to link.

DESCRIPTION

This error occurred when linking a synthetic part. One possible problem is that the part has illegal hierarchy (for example, a level of hierarchy that is not a synlib part). Another possible problem is that there one synlib part contains another part (or technology cell) and both part's `.sldb` files are not in the `synthetic_library` variable. Another possible problem is that the subpart is not mentioned as a contained operator/module/implementation of the parent part, so the license for the subpart was not checked out and the subpart was not considered an authorized synthetic library part. Another possible problem is the `local_link_library` variable was not set correctly.

WHAT NEXT

Make sure the parts linked are synlib parts, technology cells, or GTECH cells. Add the subpart's .sldb file to the synthetic_library variable. Ensure that the subpart is listed as a contained operator/module/implementation of the parent part in the parent part's .sl file. Make sure the local_link_path is set correctly.

SYNH-45 (warning) Test logic has been inserted in '%s'.
Skipping incremental implementation selection for that design.

DESCRIPTION

Incremental implementation selection attempts to change the implementation of a DesignWare part during compile. This attempt is being skipped for the named design because test logic has already been inserted into the design. Changing the implementation at this point would invalidate the test connections.

WHAT NEXT

If constraints are not being met through the design and incremental implementation selection is desired. Swap out the design for the non-test equivalent, and do the compile again.

SYNH-46 (error) Could not find port '%s' in implementation '%s' of synthetic module '%s'.

DESCRIPTION

This message indicates that the named port could not be found in the definition for the implementation as given in the synthetic library.

WHAT NEXT

Verify the set of defined ports in the synthetic library for the implementation with the report_synlib command. See the DesignWare Developer Guide for further information on these topics.

SYNH-47 (warning) No stall value has been specified for processor input pin

%s for binding %s in module %s and operation %s.

DESCRIPTION

The binding in the synthetic library does not contain any specification of a stall value. This implies, that whenever no operation is performed on this module, you can not make any assumptions about the driving value of this pin. This can have serious effects on the behavior of your circuit e.g. if the input pin is the read_write_enable for a memory you will want it to default to read.

WHAT NEXT

Check carefully, whether you are relying on certain inputs being fed to the module when it is not actively executing an operation.

SYNH-48 (warning) The following module/implementation/parameters are invalid combinations, they were ignored: %s

DESCRIPTION

The parameters in the module/implementation/parameters combination were out of the module or implementation's legal range. They were silently skipped in 'create_catch' command.

WHAT NEXT

SYNH-49 (warning) No default operating condition found.

DESCRIPTION

There is no operating condition specified for the create_cache command. We are trying to get the default operating condition from the target library. But There is no default operating condition found in the target library. No operating condition is used when creating DW models.

WHAT NEXT

Please specify an operating condition to be used when creating DW model cache.

SYNH-50 (warning) Select operator cannot be built through the MGI.

DESCRIPTION

Currently the MGI does not facilitate the creation of select operators.

WHAT NEXT

Create select operators using a conventional synthetic library. See the DesignWare Developer's Manual for more information.

SYNH-51 (warning) The array naming style of the synlib part %s is different than the current bus_naming_style setting %s. Skipping Incremental Implementation Selection for the design.

DESCRIPTION

Incremental implementation selection attempts to change the implementation of a Synthetic part during compile. This attempt is being skipped for the named design because the array naming style of the design is different than the current global bus_naming_style setting, thus the port names will not match on busses.

WHAT NEXT

Check the bus_naming_style setting, make sure it is consistant with the synlib part's setting.

SYNH-52 (error) DC failed to elaborate netlist for '%s', implementation '%s'.

DESCRIPTION

DC(Presto) failed to retrieve the netlist of the synthetic part. Possible causes of the failure are: 1. The source files of the synthetic component or implementation are not analyzed by the current release of the DesignCompiler; 2. There are syntax errors in the source file of the synthetic component or implementation.

WHAT NEXT

If the synthetic component or implementation are user defined, please re-analyze the source files using the current DesignComplier release. If the synthetic component and implementation are Synopsys component and implementation, please contact Synopsys DesignWare support.

SYNL

SYNL-4 (information) Ignoring dont_touch on synthetic instance '%s' of '%s'.

DESCRIPTION

WHAT NEXT

SYNL-5 (error) Can't find parameter '%s' in specification "%s

DESCRIPTION

WHAT NEXT

SYNL-6 (error) Malformed parameter specification "%s

DESCRIPTION

WHAT NEXT

SYNL-7 (error) '%s' is an invalid or out-of-date synthetic library.

DESCRIPTION

There is a bad module-to-operator binding in this synthetic library. Or this synthetic library is out_of_date with respect to other synthetic libraries.

WHAT NEXT

Use the up to date synthetic library; Or remove the offended binding from the module in this synthetic library; Or remove this synthetic library from the synthetic library and the link library lists.

SYNL-8 (warning) Can't find operator '%s' for binding '%s' in module '%s'.
Binding ignored.

DESCRIPTION

WHAT NEXT

SYNL-9 (error) Can't find oper_pin '%s' for binding '%s' in module '%s'.

DESCRIPTION

There is a pin mis-match between the operator and the associated module. The attempt to bind the operator to the module failed.

WHAT NEXT

Check the oper_pin declaration in the binding of this module; Or update this synthetic library; Or remove the offended synthetic library from the synthetic library and the link library lists.

SYNL-10 (error) Direction of operator pin '%s' does not match direction
of module pin '%s' in binding '%s' of module '%s'.

DESCRIPTION

WHAT NEXT

SYNL-11 (error) Cannot find a module for '%s'.

Synthetic libraries disabled.

DESCRIPTION

WHAT NEXT

SYNL-12 (error) Can't find synthetic file '%s' in the synlib_search_path.

DESCRIPTION

WHAT NEXT

SYNL-13 (error) %s.

DESCRIPTION

This message may have several different outputs. Below is information on each one:

No formula or specified value for parameter '%s' in library specification for module '%s', implementation '%s'. The synthetic module or implementation requires the given parameter. When instantiating the module, the parameter was not specified.

Remember, synthetic library parameter names are case-sensitive. Keep in mind that the offending part instantiation might be nested inside another synthetic implementation.

WHAT NEXT

No formula or specified value for parameter '%s' in library specification for module '%s', implementation '%s'. Make sure you specify the required parameter. If you are using DesignWare developer, you can modify the module/implementation definition in your *.sl file so that the parameter is derived automatically (via a formula attribute).

SYNL-14 (error) Parameter '%s' does not evaluate to %s

%s.

DESCRIPTION

WHAT NEXT

SYNL-15 (error) Parameter '%s' not defined

%s.

DESCRIPTION

WHAT NEXT

SYNL-16 (error) All of the following regular licenses have been checked out:

%s.

The users of the licenses are listed in the following error message.

DESCRIPTION

The licenses for all implementations are checked out early in the **compile** command. If the license for one implementation cannot be obtained, the Design Compiler command is terminated because the missing implementation may affect compile results.

WHAT NEXT

Request that one of the users with a license release the license using the **remove_license** command.

SYNL-17 (error) Unknown input oper_pin '%s' specified as

permutable on operator '%s'.

DESCRIPTION

The specified input pin name in the permutable_inputs attribute is not on the operator.

WHAT NEXT

Changes this pin name to match with the pin name on the synthetic operator.

SYNL-18 (warning) Input oper_pin '%s' multiply specified as permutable.

DESCRIPTION

WHAT NEXT

SYNL-19 (warning) The limited license '%s' is being checked out to enable the

synthetic library part implementation '%s'.

Note: designs cannot be written out if they have synthetic library parts enabled with limited licenses.

DESCRIPTION

WHAT NEXT

SYNL-20 (error) The synthetic library part implementation '%s' should be

available for use during the compile command, but the implementation is not enabled because all of the following limited licenses have been checked out:

%s.

The users of the licenses are listed in the following error message.

DESCRIPTION

The licenses for all implementations are checked out early in the **compile** command. If the license for one implementation cannot be obtained, the Design Compiler command is terminated because the missing implementation may affect compile results.

WHAT NEXT

Request that one of the users with a license release the license using the **remove_license** command.

SYNL-21 (warning) The license '**%s**' is not legal and will be ignored
for the synthetic library part implementation '**%s**'.

DESCRIPTION

WHAT NEXT

SYNL-22 (warning) The write cache directory '**%s**' is not listed as one of the read cache directories.
Synthetic library parts written out to the cache cannot be read back from the cache.

DESCRIPTION

WHAT NEXT

SYNL-23 (error) Synthetic module '**%s**' cannot be linked

because port width(s) cannot be determined.

DESCRIPTION

The port width of the given instantiated module could not be determined. This has two probable causes. The first is that the parameters (generics) which you specified were named incorrectly and did not match the synthetic library part.

The second cause may be that you linked to a synthetic library part by accident, and you actually wanted a technology library part. You should check to make sure that the names in your synthetic library do not clash with the names in other libraries. (Be careful, VHDL references are case-insensitive, so you may be linking to a module called 'add' from a synthetic library when you wanted to link to cell 'ADD' from a technology library.)

WHAT NEXT

SYNL-24 (error) Synthetic library '%s'
is from an incompatible version of the software.

DESCRIPTION

You cannot use the given synthetic library with this version of the software. If you are worried about obtaining "standard.sldb", don't worry. An up-to-date standard.sldb always used, no matter how the synthetic_library variable is set. The correct default setting for synthetic_library is {}.

WHAT NEXT

SYNL-25 (error) Pin association '%s' does not correspond to a module pin in binding '%s' for module '%s'.

DESCRIPTION

WHAT NEXT

SYNL-26 (warning) Binding '%s' multiply defined for module '%s'.

Binding ignored.

DESCRIPTION

WHAT NEXT

SYNL-27 (warning) Priority for implementation '%s' of module '%s' is out of range. Using the default value '%d'.

DESCRIPTION

The priority formula for the given implementation evaluated to a value outside of the legal priority range.

WHAT NEXT

SYNL-28 (warning) Can't find operator pin '%s' for binding '%s' in module '%s'.

Binding ignored.

DESCRIPTION

The argument for the constraint or *unbound_oper_pin* groups must be an operator input pin name.

WHAT NEXT

SYNL-29 (error) Could not check out '%s' or '%s' license.
Cannot continue to process the libraries listed in the
'synthetic_library' variable.

Set "synlib_evaluation_mode = true" to evaluate parts.

DESCRIPTION

Processing synthetic libraries other than the baseline 'standard.sldb' requires a license. This error message is issued when you attempt to use a non-baseline synthetic library and the license cannot be obtained. Following this error, the current command will probably abort. Some commands (such as report) do not strictly need synthetic libraries and may continue to run.

This error will also be triggered if you add your own parts to standard.sldb (because the added non-baseline parts require a license). You should not add parts to standard.sldb.

WHAT NEXT

You either need to obtain a license or give up using non-baseline synthetic libraries. If you don't require synthetic libraries for the current command, simply set "synthetic_library = {}", and no license will be required.

In addition, you should routinely set "synthetic_library = {}" when you don't require synthetic libraries. This will prevent your process from checking out a license, and will leave licenses free for other's use.

SYNL-32 (warning) The synthetic library part implementation '%s' should be

**available for use during the compile command,
but the implementation is not enabled because all of the
following licenses have been checked out:
%s.**

Waiting for a license to become available.

Press <ctrl>-C to interrupt the command.

**The users of the licenses are listed in the following error
message.**

DESCRIPTION

The current design contains inferred or instantiated DesignWare parts for which licensed implementations are available. All of the licenses that enable the use of one or more of the licensed implementations are currently in use. The current

command will wait until a license becomes available.

WHAT NEXT

Request that one of the users with a license release the license using the **remove_license** command. Interrupt the command using <ctrl>-C.

SYNL-33 (error) Missing clock polarity for pipelined part '%s'.

DESCRIPTION

Clock port is specified on the encapsulated function reference but there is polarity specified.

WHAT NEXT

SYNL-34 (error) Missing polarity for asynchronous reset pin '%s' on pipelined part '%'.

DESCRIPTION

Asynchronous reset pin is specified on the encapsulated function but without the polarity.

WHAT NEXT

SYNL-35 (error) Missing polarity for synchronous reset pin '%s' on pipelined part '%'.

DESCRIPTION

Synchronous reset pin is specified on the encapsulated function but without the polarity.

WHAT NEXT

SYNL-36 (error) Missing polarity for pipeline stall pin '%s' on

pipelined part '%s'.

DESCRIPTION

Pipeline stall pin is specified on the encapsulated function but without the polarity.

WHAT NEXT

SYNL-37 (error) Invalid pipeline stages '%s' is detected on pipelined part'%s'.

DESCRIPTION

The number pipeline stages that is specified on the encapsulated function must be greater than 1.

WHAT NEXT

SYNL-38 (error) Missing pipeline stages for this pipelined part '%S'.

DESCRIPTION

The number of pipeline stages is not specified on the encapsulated pipelined function.

WHAT NEXT

Specify the pipeline stages using bc command, set_pipeline_design.

SYNL-39 (error) Data_class attribute on operator '%s' contains invalid value '%s'.

DESCRIPTION

The string value of the data_class attribute is not one of the "unsigned", "signed" strings.

WHAT NEXT

SYNL-40 (warning) Invalid string format '%s' for the
permutable_inputs
is detected on operator '%s'.

DESCRIPTION

The string value of the permutable_inputs attribute is not in the correct format.

WHAT NEXT

Change the value to conform to the "name1 name2 nam3..." format.

SYNL-41 (error) Unable to read netlist '%s' for function
reference '%s'.

DESCRIPTION

The specified netlist (through the "use_netlist" pragma) is not found (or has no
read permission) in the search path.

WHAT NEXT

Check the permission and/or the location of the specified netlist.

SYNL-42 (error) Unable to find design '%s' in the specified file
'%s'
for function reference '%s'.

DESCRIPTION

The specified design (through the "use_netlist" pragma) is not found in the netlist
db file.

WHAT NEXT

Make sure that the design in the specified netlist db has the same prefix as the

netlist db file.

SYNL-43 (error) Design '%' contains generic logic element '%s' which is not allowed in an encapsulated function.

DESCRIPTION

The external netlist that is referred to in the encapsulated function contains generic (unmapped) element. The current release does not support these types of components.

WHAT NEXT

Make sure that all cells in the netlist are mapped by compiling the design.

SYNL-44 (error) Design '%' contains synthetic component '%s' which is not allowed in an encapsulated function.

DESCRIPTION

The external netlist that is referred to in the encapsulated function contains unmapped synthetic component. The current release does not support these types of components.

WHAT NEXT

Make sure that all cells in the netlist are mapped by compiling the design.

SYNL-45 (error) Design '%' contains hierarchical component '%s' which is not allowed in an encapsulated function.

DESCRIPTION

The external netlist that is referred to in the encapsulated function contains hierarchical component. The current release does not support these types of

components.

WHAT NEXT

Make sure that all hierarchical cells in the netlist are flatten (ungrouped).

SYNL-46 (error) Unable to find function design '%s' for reference '%s' in '%s' root.

DESCRIPTION

The function design has either been deleted or renamed.

WHAT NEXT

If the function design is deleted, it must be recreated and relinked. If it is renamed to a different name, it must be renamed to match the design name and relinked.

SYNL-47 (error) Function '%s' does not have all required attributes of an encapsulated function. Therefore, this function will not be treated as a synthetic operator; It will remain to be just a hierarchical component.

DESCRIPTION

Some required attributes of the encapsulated function are missing. This function will remain to be just a hierarchical component.

WHAT NEXT

SYNL-48 (warning) Binding '%s' in module '%s' cannot be bound to

preserved function operator '%s'. Binding is ignored.

DESCRIPTION

The binding of a static module (that is defined in a synthetic library) specifies a preserved function operator as bound operator - which is illegal. This error is typically occurred when converting an existing function/subprogram from being a designware component to become a preserved function. This binding is ignored.

WHAT NEXT

Remove the offended binding from the library on the synthetic library and link library lists.

SYNL-49 (warning) External binding '%s' in library '%s' cannot be associated with preserved function module '%s'. Binding is ignored.

DESCRIPTION

This external binding is associated to a module that is reserved for a preserved function. This error is typically occurred when converting an existing function/subprogram from being a designware component to become a preserved function. This binding is ignored.

WHAT NEXT

Remove the offended binding from the library on the synthetic library and link library lists.

SYNL-52 (error) Unable to obtain DesignWare license to generate synthetic parts.

DESCRIPTION

You specified DesignWare synthetic library in your synthetic_library list. And the licensed DesignWare building blocks might be used by the design. A DesignWare Foundation license must be available to enable licensed DesignWare componentent in

the design.

WHAT NEXT

Use the variable synlib_wait_for_design_license to enable DC to wait for a Foundation license when they are all in use.

Remove synthetic libraries contain Foundation parts from your synthetic library line.

SYNL-54 (error) No technology library is specified for mce generator to build netlist. Terminate the process.

DESCRIPTION

MCE generator needs to have at least one technology library specified for synthesis. Normally the technology libraries are the ones in target_library list. But mce doesn't handle gtech library.

WHAT NEXT

Make sure target_library list is set and contains mce compatible technology libraries.

SYNL-55 (warning) Unable to obtain DesignWare-LP license to use the low power DesignWare implementation '%s'.

DESCRIPTION

You specified DesignWare low power synthetic library in your synthetic_library list. And the low power DesignWare implementations might be used by the design. However you do not have the DesignWare-LP license to use the low power DesignWare building blocks. A DesignWare-LP license must be available to enable licensed low power DesignWare implementations in the design. The low power implementations will not be considered during compile.

WHAT NEXT

In order to utilize the low power DesignWare implementations, please obtain the DesignWare-LP license.

SYNOPT

SYNOPT-1 (warning) Cache element %s could not be written.

DESCRIPTION

An error occurred while trying to write a cache element to the specified file. This is most likely due to file permissions problems, system's limitation on file name, or a full disk.

WHAT NEXT

Resolve the problem with the specified file/directory and try the failing command again.

SYNOPT-2 (warning) Port %s of synthetic library part %s has invalid direction.

DESCRIPTION

WHAT NEXT

SYNOPT-3 (warning) Synthetic library models may be inaccurate because wire load information is not available from the technology library (ie: did not find wire_load_from_area or default_wire_load statement in library).

User may want to remove from the cache the models created during this compile command.

DESCRIPTION

Models in the cache will not be as accurate as they could have been if wire load information had been available. For that reason it is a good idea not to keep them around.

WHAT NEXT

Remove the models and (ideally) investigate why there is no wire load data available from the technology library.

SYNOPT-4 (warning) Improper octal value for variable cache_file_chmod_octal or cache_dir_chmod_octal: %s

DESCRIPTION

The value specified for either cache_file_chmod_octal or cache_dir_chmod_octal was invalid. These values are used to set the directory and file permissions on directories and files created inside of a Synopsys cache. The values must be octal numbers and less than 0777 for file permissions and less than 01777 for directory permissions.

WHAT NEXT

Check the values of these two variables and update them so that they have valid values.

SYNOPT-5 (warning) Cannot chmod the cache file or directory %s

DESCRIPTION

After creating the specified directory, an attempt was made to chmod it to the permissions specified by the cache_dir_chmod_octal variable. The chmod system call failed.

WHAT NEXT

Fix the problem that prevented the chmod from succeeding if possible. Otherwise try creating the directory and setting the permissions manually.

SYNOPT-6 (warning) The synthetic library 'optimize' parameter value '%s' is not supported.

A parameter value of 'fastest' will be used.

DESCRIPTION

WHAT NEXT

SYNOPT-7 (warning) The value 'scaled_to_fastest' for the synthetic library 'optimize' parameter requires the 'scaled_to_fastest_scale' parameter to be set. A default value of 1.1 will be used.

DESCRIPTION

WHAT NEXT

SYNOPT-8 (information) Wrote %s as a cache element.

DESCRIPTION

Indicates that the specified design was written to the current Synopsys cache.

WHAT NEXT

No action is required as this is just an information message.

SYNOPT-9 (information) Read %s as a cache element.

DESCRIPTION

Indicates that the specified design was read from the current Synopsys cache.

WHAT NEXT

No action is required as this is just an information message.

SYNOPT-10 (warning) The cache_read directory %s is not readable.

DESCRIPTION

The cache_read variable is supposed to contain a set of directory names. These names indicate locations of Synopsys caches which are to be searched when a cached part is required. The specified directory name was found to be unreadable.

WHAT NEXT

Remove or correct the offending directory name in the cache_read variable. If the directory name is correct and the directory does exist, make sure the permissions are such that the directory can be read from.

SYNOPT-11 (warning) The cache_write directory %s is not writable.

So, no cache elements can be written.

DESCRIPTION

The cache_write variable is supposed to contain a directory name. The named directory is supposed to indicate the root of a Synopsys cache to which cached designs are to be written. The specified directory name was found to be unwritable.

WHAT NEXT

Correct the offending directory name in the cache_write variable. If the directory name is correct and the directory does exist, make sure the permissions are such that the directory can be written to.

SYNOPT-12 (warning) Cannot open file %s for writing. Check directory mode bits.

DESCRIPTION

The specified file can not be opened for write due to permission problems on the directory the file resides in.

WHAT NEXT

Check the permission bits on the directory and make sure that you have write permission.

SYNOPT-14 (warning) Synthetic library part '%s' does not have an 'optimize' parameter.

The optimize value 'fastest' will be used.

DESCRIPTION

WHAT NEXT

SYNOPT-15 (information) The cache entry '%s' is out of date with respect to its entry in the design library '%s' (module '%s', implementation '%s').
The cache entry has been removed.

DESCRIPTION

A cache entry is tagged with a timestamps from the design library entry it was created from.
If the design library is updated, then the cache entry may not be valid, so it is removed.

WHAT NEXT

SYNOPT-16 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed.
The entry should be removed because either it is corrupted or it is out of date.
An entry can be out of date with respect to either its entry in the design library '%s'

(module '%s', implementation '%s')
or its target library '%s'.

DESCRIPTION

A cache entry is tagged with a timestamps from the design library entry it was created from and a timestamp from the target library it was created from.

If either of these is updated, then the cache entry may not be valid, so it is removed.

Alternatively, if the cache entry is corrupted, it should be removed. The attempt to remove it failed.

If it is not removed manually, it may cause the compile command to take more time while it optimizes that synthetic library part.

WHAT NEXT

SYNOPT-17 (information) The cache entry '%s' is obsolete or has been corrupted, so it is being removed.

DESCRIPTION

The cache is a directory structure and the files in it have a predefined format. The entry listed above does not conform to the format.

WHAT NEXT

No action is necessary; the file has been removed.

SYNOPT-18 (information) The cache entry '%s' is out of date with respect to its target library '%s'. The cache entry has been removed.

DESCRIPTION

A cache entry is tagged with a timestamp from the target library it was created from.

If the target library is updated, then the cache entry may not be valid, so it is removed.

WHAT NEXT

SYNOPT-19 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed. The entry should be removed because either it is corrupted or it is out of date.

The entry is out of date with respect to its entry in the design library '%s' (module '%s', implementation '%s').

DESCRIPTION

A cache entry is tagged with timestamps from the design library entry it was created from.

If the design library is updated, then the cache entry may not be valid, so it is removed.

Alternatively, if the cache entry is corrupted, it should be removed. The attempt to remove it failed.

If it is not removed manually, it may cause the compile command to take more time while it optimizes that synthetic library part.

WHAT NEXT

SYNOPT-20 (warning) The cache entry '%s' should be removed, but the attempt to remove it has failed. The entry should be removed because either it is corrupted or it is out of date.

The entry is out of date with respect to its target library '%s'.

DESCRIPTION

A cache entry is tagged with a timestamp from the target library it was created from.

If the target library is updated, then the cache entry may not be valid, so it is removed.

Alternatively, if the cache entry is corrupted, it should be removed. The attempt to remove it failed. If it is not removed manually, it may cause the compile command to take more time while it optimizes that synthetic library part.

WHAT NEXT

SYNOPT-21 (warning) The cache_read variable should be a list variable,
but it was read as the string variable '%s'.

DESCRIPTION

There can be more than one directory to read from, so the cache_read variable is interpreted to be a list variable. But, the cache_read variable has been read as a string variable and will be converted to a one element list.

WHAT NEXT

The variable should be a list variable and its type should have been set by SYNOPSYS_ROOT + .synopsys_dc_setup. Check that this system file sets cache_read to a list variable.

SYNOPT-22 (information) The v3.3b cache element format has changed; removing cache entry
'%s'

DESCRIPTION

A new cache element will be built and cached.

WHAT NEXT

Nothing is required.

SYNOPT-23 (error) There are %d legal implementations for the sequential module '%s',
but the variable `synlib_sequential_module` is set to
'one_implementation_choice'.

DESCRIPTION

This message indicates that the variable `synlib_sequential_module` is set to `one_implementation_choice` on the specified sequential module, but in fact there is more than one legal implementation, as stated in the message. You must have only one implementation choice if you set `synlib_sequential_module` to `one_implementation_choice`. With `one_implementation_choice`, specific timing calculations can be skipped and the overall optimization can proceed significantly faster.

WHAT NEXT

Make the number of implementations agree with the value of `synlib_sequential_module`, in one of these two ways:

1. Ensure that there is only one legal implementation, using `set_implementation` or `set_dont_use`; or
2. Change the value of the variable `synlib_sequential_module` to another value. For information about other allowed values and their meanings, refer to the `synlib_sequential_module` manual page.

SYNOPT-24 (warning) The variable `synlib_sequential_module` is no longer supported.

DESCRIPTION

This message warns you that the variable `synlib_sequential_module` is longer supported. Setting the variable will have no effect on the compile flow.

WHAT NEXT

Remove the variable from the dc script.

SYNOPT-25 (warning) The dont_touch on the synthetic library implementation '%s' (module '%s') will be ignored.

DESCRIPTION

A dont_touch attribute on a top-level design is ignored. When a synthetic library implementation is modelled, it is treated as a top-level design. Later in the compile process, the implementation is a sub-design and the dont_touch will be adhered to. One consequence of this is that the model may be inaccurate.

WHAT NEXT

Remove the dont_touch on the design and apply the dont_touch to the cells in the implementation that the user wants to be dont_touched.

SYNOPT-26 (information) The time stamp of the cache entry '%s' does not match the time stamp of its target library '%s'.

DESCRIPTION

You receive this message because a cache entry is tagged with a time stamp from the target library it was created from. If the target library is updated, the cache entry will no longer be valid.

WHAT NEXT

This is an informational message. No action is required on your part.

SEE ALSO

`report_cache (2)`.

SYNOPT-27 (warning) The cache entry '%s' is corrupt or not readable and should be removed, but the attempt to remove it has failed.

DESCRIPTION

You receive this message because the cache entry is either not readable or has been

corrupted. Design Compiler (DC) could not read the cache element.

WHAT NEXT

Check the readability of the cache entry.

SYNOPT-28 (warning) Cell '%s' is not found in design, ignoring force hiis on this cell.

DESCRIPTION

You receive this message because an invalid cell name is specified in list synlib_hiis_force_on_cells. Force hierarchical incremental implementation selection will not be performed on invalid cells.

WHAT NEXT

Check to make sure all cells in synlib_hiis_force_on_cells list are valid.

SYNOPT-29 (information) The cache element for %s(%s) is not the optimal circuit. It is not used in the current design.

DESCRIPTION

Datapath optimization feature is enabled on the DesignWare RTL architectures in the current command. The cache element read in is not the optimal circuit. Discard this cache element and re-build the optimal circuit.

WHAT NEXT

No action is required as this is just an information message.

TDB

TDB-1 (error) Subrange direction does not match array declaration.

DESCRIPTION

WHAT NEXT

TEST

TEST-101 (error) No ports included in the BSR. A register consisting of a single shift-register stage must be provided.

DESCRIPTION

The JTAG Boundary Scan Register (BSR) associates a register with each I/O pad of a device. These registers can either 'capture' (observe) or 'apply' (control) values at the pads. The registers are serially chained together to form the BSR. Values are set and read serially through the BSR. Typically, all non-TAP (Test Access Port) ports are included in the BSR.

All non-TAP ports will be processed for inclusion in the BSR unless they have been explicitly excluded using the **set_jtag_port FALSE {port_list}** command.

Typically, excluding ports from the BSR is a *tolerable* violation of the IEEE 1149.1 standard that does not otherwise modify the structure of the JTAG logic. However, in the extreme case where either there are no ports to include in the BSR or *all* ports have been excluded from the BSR, Rule 10.2.1(i) of the standard applies. Rule 10.2.1(i) states that "In the event that no boundary-scan register cells are required for a component, a register consisting of a single shift-register stage shall be provided. NOTE- This situation will arise where a component only contains test logic as defined or permitted by this standard. Such a component could be described as being dedicated to testing; it will not contribute to the system function of an assembled board."

Designs that contain violations of the 1149.1 standard are referred to as non-compliant JTAG architectures. 1149.1 standard violations fall into two categories: *tolerable* and *intolerable*. We define *intolerable* violations as those that render the JTAG access protocol inoperable or which make the behavior of the JTAG logic unpredictable.

We define *tolerable* violations of the standard as those that neither render the JTAG access protocol inoperable nor make the behavior of the JTAG logic unpredictable, but which do violate some rule in the 1149.1 standard.

WHAT NEXT

Since the DFT Compiler JTAG synthesis capability does not currently support synthesis of the 'zero-length' BSR required by 10.2.1.(i), include at least one non-TAP port in the BSR. Use **set_jtag_port TRUE {port_list}** to establish such a condition.

To include all non-TAP ports in the BSR, execute **set_jtag_port TRUE find (port,"")** on the current_design.

TEST-102 (information) GLOBAL tracing enabled for these nets in design '%s':

DESCRIPTION

BACKGROUND INFORMATION

Using the **check_test** command, DFT Compiler design rule checking (DRC) is performed by doing a symbolic simulation of the test protocol for a design.

If the data applied at the scan in ports is successfully and predictably loaded into the scan chain, the cells are scan controllable. If data can be captured into the scan cells during the parallel capture cycle, and successfully and predictably unloaded, the cells are scan observable. When sequential cells are neither fully scannable (both scan controllable and scan observable) nor valid nonscan cells (for partial scan designs), fault coverage suffers.

DFT Compiler provides a net tracing capability which allows you to view the results of the symbolic simulation to help in the identification and correction of test protocol problems. DFT Compiler displays the logic values of the nets as information messages. All output from the design rule checker, including information messages, is linked to the design schematic. You can debug your protocol by selecting nets with certain values, then viewing the corresponding section in the schematic through the Design Analyzer.

Net tracing is enabled in either of two fashions. If **trace_nets** statements are added to vector or stream groups within a custom test protocol supplied by the designer, they enable tracing within a *local* scope limited to that vector or stream group. Alternatively, by specifying nets using the **trace_nets** command, nets can be traced within the *global* scope of the entire current test protocol. The **untrace_nets** command only acts on nets specified by the **trace_nets** command.

MANIFESTATION

This information message is generated to indicate that one or more nets specified by the **trace_nets** command will undergo *gobal* tracing during DRC of the currently active test protocol.

WHAT NEXT

If you do not want *global* net tracing for one or more of the nets listed (TEST-103), disable net tracing for them using the **untrace_nets** command.

TEST-103 (information) Output port '%s' is a user-specified three-state

enable signal requiring a BSR control cell.

DESCRIPTION

When the three-state elements driving three-state and bidirectional *outputs* are found in the core logic of the IC (i.e. not embedded in the pads themselves) DFT Compiler requires that these three-state elements be located at the top hierarchy of the core of the design so that Boundary Scan Register (BSR) cells can be placed on the **inside** of the three-state elements in order to control and observe the data and enable lines. In these cases, only a single three-state line exits the core logic.

However, in the cases where the three-state controller for output signals will be embedded in the three-state output or bidirectional input/output pad associated with these ports of a design two signals exit the core logic; a *data* line and an *enable* line. Unless, TC knows the distinction between these two types of exit lines, it will always assume that they are data lines and not insert the correct type of BSR cell on the enable lines. By specifying "enable" or "data" on a port the designer instructs TC on which type of BSR cell to place on these output ports. It is the responsibility of the designer to correctly connect these signals to the proper pads in a post-processing step of adding pads to the design.

This information message is produced when an output port has been specified by the designer to be the enable signal for a three-state output or bidirectional pad.

WHAT NEXT

The designer must exercise caution to connect the proper data and enable signals to the three-state and bidirectional pads of the design.

TEST-104 (information) Nets '%s' have been specified for LOCAL tracing during this vector or stream simulation.

DESCRIPTION

BACKGROUND INFORMATION

Using the **check_test** command, DFT Compiler design rule checking (DRC) is performed by doing a symbolic simulation of the test protocol for a design.

If the data applied at the scan in ports is successfully and predictably loaded into the scan chain, the cells are scan controllable. If data can be captured into the scan cells during the parallel capture cycle, and successfully and predictably unloaded, the cells are scan observable. When sequential cells are neither fully scannable (both scan controllable and scan observable) nor valid nonscan cells (for partial scan designs), fault coverage suffers.

DFT Compiler provides a net tracing capability which allows you to view the results of the symbolic simulation to help in the identification and correction of test

protocol problems. DFT Compiler displays the logic values of the nets as information messages. All output from the design rule checker, including information messages, is linked to the design schematic. You can debug your protocol by selecting nets with certain values, then viewing the corresponding section in the schematic through the Design Analyzer.

Net tracing is enabled in either of two fashions. If **trace_nets** statements are added to vector or stream groups within a custom test protocol supplied by the designer, they enable tracing within a *local* scope limited to that vector or stream group. Alternatively, by specifying nets using the **trace_nets** command, nets can be traced within the *global* scope of the entire current test protocol. The **untrace_nets** command only acts on nets specified by the **trace_nets** command.

MANIFESTATION

This information message is generated to indicate that, using a **trace_nets statement**, the specified nets have been marked for **LOCAL** tracing within the current vector or stream.

WHAT NEXT

This message is generated because in some cases simulation of the target vector or stream does not produce any activity on the specified net. In such cases, in the absense of additional tracing information, it is useful to know that the net was in fact explicitly targeted for local tracing.

**TEST-105 (information) Driven port '%s' characteristic '%s'
changed
to driving port '%s' characteristic '%s' due to BSR cell
optimization.**

DESCRIPTION

When DFT Compiler executes IEEE 1149.1 Standard mandated Boundary Scan Register optimizations, BSR cell optimization can push the BSR cell associated with an output (*Bdriven*) onto an input port (*Bdriving*). In these cases, it is possible that the BSR cell characteristics specified for the output port no longer coorespond with the BSR cell implementation serving that port if the characteristics specified for the input port and the output port BSR cells differed.

This information message is produced when such a difference has been encountered and reports those differences.

WHAT NEXT

If the characteristics of the optimized BSR register no longer meet your needs, set the BSR cell characteristics of the driving port to be those of the driven port.

TEST-106 (error) Critical missing connection(s) encountered while processing bidirectional port ‘%s’.

DESCRIPTION

DFT Compiler has encountered at least one missing connection while processing the designated bidirectional port. Bidirectional I/O ports must be connected to a net that both drives the port in output mode and is driven in input mode.

During boundary scan synthesis, three BSR cells must be associated with each bidirectional port: one with its input mode and two with its output mode.

This error message is generated when one or both of these net connections is missing. One possible cause is that the net could be connected to an unresolved reference. DFT Compiler has generated this error message and gracefully aborted JTAG synthesis.

WHAT NEXT

Run the dc_shell **link** command to get a list of unresolved references and fix the critical ones. Otherwise, verify that this port is indeed supposed to be bidirectional, and verify its connectivity.

TEST-107 (error) Port ‘%s’ can not be a TAP TDO. It is not an output port.

DESCRIPTION

The **insert_jtag** command lets you select TDO ports using **jtag_tdo signal_type** attributes. You must identify output ports as TDO ports.

You see this message when you select input or bidirectional ports as TDO ports. The **insert_jtag** command aborts.

WHAT NEXT

Use the **remove_attribute** command to remove the **signal_type** attribute from the offending port. Choose another design port.

TEST-108 (Warning) Internal failure: scan equivalence could not

create a pseudo-hierarchy for cell %s/%s.

DESCRIPTION

Scan equivalence generates this warning when it fails to create the pseudo-hierarchy it uses to constrain sequential-mapping based scan equivalence. This is an internal problem and should be handled gracefully, but should be reported to Synopsys R&D for further diagnosis.

WHAT NEXT

Study tool output for additional errors and warnings that involve the cell. Use `check_test` to establish whether `insert_scan` scan replaces the cell and includes it in a scan chain. File a Synopsys Technical Action Request, if at all possible.

TEST-109 (warning) Design '%s' has invalid scan chain information.

DESCRIPTION

This message tells you that `report_test -scan_path` produces invalid scan chain information for a design. Hierarchical scan insertion uses this information to infer that there are scan segments in the design. Invalid information confuses this process.

You can use `check_test` to restore the scan chain information. It is important that you do this before using `insert_scan` to attempt hierarchical scan operations.

WHAT NEXT

Run `check_test` on the design to restore scan chain information.

TEST-110 (warning) Cell %s of type %s is not a test cell.

DESCRIPTION

This message indicates that the cell in question is not defined as a test cell in the target library. A test cell must be declared with the keyword `test_cell()`.

WHAT NEXT

Check your library description.

TEST-111 (warning) Test cell %s of type %s is not consistent with the methodology.

DESCRIPTION

WHAT NEXT

TEST-112 (warning) Cell %s (%s) is unknown (black box).

DESCRIPTION

This message identifies a cell for which no functional model exists. DFT Compiler needs a functional model for every type of cell used in a design so it can generate test patterns and calculate fault coverage. DFT Compiler treats a cell without a functional model as a *black-box*, which means that faults on the pins of the cell and the surrounding circuitry are untestable. Depending on the number and location of such cells, the effect on overall fault coverage may or may not be significant.

WHAT NEXT

This message appears when a model exists for the cell in a Synopsys library file, but the model does not contain any functional information. Add the functional model with the **function** statement. For sequential cells, use the **state** group and related statements.

This message also appears when the cell is an unresolved reference, which means no description of the design referenced by the cell could be found when the design was linked. Use the **check_design** command to locate unresolved references.

To see whether the incorrect library was used when the design was linked, check the **link_library** variable. Check the **search_path** variable to see whether a library was omitted or not located.

If the message refers to a simple cell that was not included in any library, try developing a model and adding it to the library.

For complex cells, the functional model is more involved. For example, the cell may be a RAM, microprocessor core or some other type of embedded hierarchical block. In such situations, you may want to develop an abstract functional model for the cell in VHDL or Verilog. Read these models in so they can be used for test pattern generation. Although DFT Compiler cannot develop test patterns for the circuitry within the cell, the surrounding logic can be tested.

TEST-113 (information) Cell %s (%s) is generic.

DESCRIPTION

This message identifies a generic logic cell in the design. A generic logic cell represents an abstract logical function before it is mapped into a target technology library. Generic logic is generated after a functional description of a design is read in, and before the **compile** command synthesizes an implementation of the design from the target technology library.

If your design has generic logic cells, you can still use most of DFT Compiler, but your results will not be valid for the final (synthesized) design. For example, you can run the **check_test** command on designs with generic logic, and DFT Compiler will correctly identify scan design-rule violations.

You can also run the **create_test_patterns** command on designs with generic logic. However, since test pattern generation considers "stuck-at" faults on physical cell pins, the test patterns for the generic logic will be meaningless. If patterns are generated for designs that have generic logic, the faults considered will not correspond to the defects that may occur in the manufacture of the chip. Consequently, the generated patterns are not valid, and the reported fault coverage only approximates the possible fault coverage for the final design.

However, you cannot perform partial scan insertion using the **insert_test** command since generic cells have no scan equivalent and no area or timing information. This type of information is essential to make meaningful testability trade-off analysis.

Note: DFT Compiler reports only the first generic logic cell it finds.

WHAT NEXT

Use the **compile** command to map generic logic cells into cells from the selected technology library.

TEST-114 (warning) Type of wired net %s is unknown.

DESCRIPTION

The test design rule checker has encountered a wired (multiple-driver) net whose function is not understood. (That is the net is not a wired-AND, wired-OR or three-state net.) The values on such nets can not be predicted for the purposes of automatic test pattern generation. This means faults on the cells driving the net and driven by the net will not be testable. In addition the test design rule checker may generate further warnings as a consequence of being unable to understand the behavior of the net. For example any clock signals driven by the net will become unknown.

WHAT NEXT

You should always check messages of this form. They may be related to features of the original design description or the library in use. For example a missing library model may cause a cell to appear as a "black-box" which could give rise to problems if it was connected to a wired-net.

TEST-115 (warning) Three-state net %s is not properly driven.

DESCRIPTION

The value of a three-state node is unpredictable if that node is driven by a non-three-state driver. If there are multiple drivers, and one or more of them are not three-state drivers, bus contention or bus float can occur.

The DFT Compiler design rule checking (DRC) rigidly checks for this type of violation and generates this warning message when it encounters such a condition. You will also see an informational message immediately after this message to indicate where the problem lies.

If the problem is an incorrect design, you will see either a TEST-180 or TEST-182 message, which will indicate the problem cell or port.

However, you will also see the TEST-115 message in the following cases:

- When a RAM cell is driving a three-state bus. If the three-state driver is internal to the RAM cell, **dft_drc** will not recognize the function of the RAM cell and then issues the warning. You will see a TEST-199 message in this case.
- When the driver cell is a black box (not supported by DFT Compiler or has no reference in the working libraries) or was subject to another violation. Again you will see a TEST-199 message in these cases.
- When the **set_test_isolate** command is applied on a three-state driver's instance or output pin. Such a command is used to indicate to DFT Compiler that a cell or a pin has an unknown value during test. It has the effect of logically cutting the nets at a pin or around a cell. The test_isolated driver then behaves like an x-generator on the three-state net. In this case you will also see a TEST-198 message.

WHAT NEXT

Determine the cause for the existence of the non-three-state driver and eliminate it. See the appropriate man page for TEST-180, TEST-182, TEST-198, or TEST-199 for more detailed information.

When **dft_drc** finds a TEST-115 violation on a three-state net, in a scan-routed design, by default ATPG may not run because of the high risk of producing wrong patterns. However, in a pre-scan design ATPG will run, because it does not generate any patterns that can be saved and so there is no risk of you handing off bad patterns. However, be aware that your fault coverage can be extremely low if there are TEST-115 violations on a key bus in your design.

TEST-116 (warning) Asynchronous pins of cell %s (%s) are uncontrollable.

DESCRIPTION

When scan data is shifted in and out of the design-under-test, the asynchronous preset and clear pins of sequential cells must be held in an inactive state. The test design rule checker tries to derive a set of values to apply at the external ports of the design to ensure this condition is met. For the reported cell, no such values could be found to force the asynchronous preset and clear pins to inactive values. This problem usually occurs when the asynchronous preset or clear signal is generated from the state of other sequential devices, as with an asynchronously resetting counter.

WHAT NEXT

To maximize fault coverage, try to make all internal asynchronous preset and clear pins externally controllable. You can do this by introducing additional logic to disable internal preset and clear signals either throughout testing or just during scan shift.

TEST-117 (warning) Combinational feedback loop broken at pin %s of cell %s (%s).

DESCRIPTION

Test design rule checking has identified a combinational feedback loop in the design. Such loops introduce uncontrollable states, so faults in the region of the loop, and specifically faults at the cell pin specified in the message cannot be tested.

This violation usually has only a minor impact on overall fault coverage. However, in some cases the testability of other parts of the design is significantly reduced. For example, if the untestable loop circuitry controls the enables for a three-state bus, fault coverage suffers because the outputs on the bus are unpredictable. If the loop circuitry controls the asynchronous preset or clear inputs of a number of sequential cells, these inputs cannot be rendered inactive during test pattern generation, so the sequential cells are also untestable.

WHAT NEXT

Establish the impact of the combinational feedback loop on the total possible fault coverage for the design with the **create_test_patterns** command, which generates a fault coverage report. If the effect is significant, you can try to redesign the circuitry to remove the loop.

TEST-118 (warning) The design contains unreachable circuitry (closed loops).

DESCRIPTION

Test design rule checking has identified redundant gates that are not connected to other gates, or to the outputs of the design. Such circuitry typically forms a closed loop. Closed loops are untestable and result in reduced fault coverage for the overall design.

WHAT NEXT

Since redundant gates have no purpose, you may want to remove them from the design.

TEST-120 (warning) No scan equivalent exists for cell %s (%s).

DESCRIPTION

In the scan design technique, the state of internal sequential cells must be easily controllable and observable. DFT Compiler automatically replaces sequential cells with functionally equivalent cells that also perform a scan shift function. These cells are connected into chains through which their states can be controlled and observed.

This message identifies a cell for which no equivalent scan cell can be found in the library for the given scan style. Either the library does not contain scan cells, or it contains scan cells that do not functionally match the cell in question.

For a full-scan design, all cells of the type listed in the warning message are treated as *black boxes*. Therefore, faults on these cells and in the surrounding circuitry are not testable.

For a partial-scan design, the impact is less severe. Because the constraints you set for area, performance, and fault coverage determine which cells should be replaced with their scannable equivalents, DFT Compiler is limited to choosing only those cells for which a scannable equivalent exists. If other cells in the design can be scanned, this usually does not significantly affect overall fault coverage.

WHAT NEXT

If your design has many cells for which scan equivalents do not exist, you should modify the design so you can achieve high fault coverage, particularly for a full-scan design.

If your library has no scan cells, you may want to work with your ASIC vendor to add scan cells.

If your library has scan cells, but none functionally match the cells you are using, you can either try an alternative scan style or use different types of sequential cells.

You can use Design Compiler to translate the sequential cells in the design into different sequential cells, together with associated logic.

TEST-121 (warning) Cell %s (%s) can't be made scannable because it is dont_touched.

DESCRIPTION

If you set the `dont_touch` attribute on a cell in your design, that cell is not modified or replaced when you optimize the design with the `compile` command.

The `insert_scan` command also respects the `dont_touch` command during both scan replacement and design optimization. However, sequential cells that are both scan replaced and have a `dont_touch` attribute will be routed onto scan chains by `insert_scan`.

The `check_test` command issues this message (TEST-121) when it finds a nonscan replaced sequential element that has a `dont_touch` attribute.

WHAT NEXT

If you don't want `insert_scan` to scan replace or to optimize the sequential cell, no action is necessary.

If you don't want `insert_scan` to scan replace, but you want to optimize the sequential cell during the constraint violation fixing phase, remove the `dont_touch` attribute and use `set_scan_element false`.

If you want `insert_scan` to scan replace a particular sequential cell, but not to optimize the scan replacement, yet still allow global optimization, you need to use two passes of `insert_scan`. First remove the `dont_touch` attribute and run `insert_scan` with all user defined constraint violation fixing and compile design rule fixing disabled. Then, reapply the `dont_touch` attribute and run a second pass of `insert_scan` to fix user defined constraint violations and compile design rule violations *only*. The following script shows you how to do this.

```
remove_attribute inst1/dff1 dont_touch test_dont_fix_constraint_violations = true
check_test preview_scan insert_scan -ignore_compile_design_rules check_test

set_scan_configuration -replace false -route false
test_dont_fix_constraint_violations = false set_dont_touch inst1/dff1 check_test
preview_scan insert_scan check_test
```

An alternative approach is to run an incremental compile instead of the second pass of `insert_scan`. However, if your pre-scan design is constraint violation free, using `insert_scan` rather than `compile -incremental` to fix constraint violations introduced

by adding scan will run faster.

TEST-122 (warning) Cell %s (%s) is an unsupported complex latch.

DESCRIPTION

This message identifies a latch cell whose behavior is too complex to understand. Such a cell is treated as a *black box* for the purposes of test pattern generation. As a result, faults on the cell and the surrounding circuitry are untestable.

The scan design technique requires that the state of sequential cells (flip-flops and latches) can be controlled and observed. Therefore, the behavior of the cells must be readily understood. For example, clock pins and data pins must be identified. A *complex latch* is one with data, enable and asynchronous set or clear pins, whose behavior is not easily understood.

WHAT NEXT

If there are relatively few of these cells in the design, the impact on overall fault coverage is minor. If you can, place the latches in transparent mode for the purposes of testing.

If your design has many of these latches, you may need to modify the design. You could replace the complex latches with simple D-type latches and associated circuitry using Design Compiler. Design Compiler translates the complex latches into functionally equivalent simpler latches and combinational gates.

TEST-123 (information) Test design rule checking completed.

DESCRIPTION

The test design rule checking (DRC) command issues this message when it completes checking the current design against the test design rules of the scan test implementation, specified by the **set_scan_configuration** (-style and -methodology options) command.

WHAT NEXT

Read the Test Design Rule Violation Summary and the Sequential Cell Summary at the end of the test DRC report. If there are any violations, you need to understand the violations and their causes before you proceed. Either fix the violations or decide that you can accept the violation before you proceed. To understand the violations, read the two Summaries and the more detailed information generated by the test DRC command. If you need details of all the violations found by test DRC, rerun test DRC in verbose mode (-verbose option).

It is very important that you do not proceed to scan insertion or to ATPG without checking the violations reported by test DRC.

TEST-124 (warning) Violations occurred during test design rule checking.

DESCRIPTION

If the test design rule checking (DRC) information is out of date, **preview_scan** and **insert_scan** invoke the test design rule checking. The test DRC checks the current design against the test design rules of the scan test implementation specified by the **set_scan_configuration** (-style and -methodology options) command. When the test DRC completes, it issues this message if it found any violations. However, the **preview_scan** and **insert_scan** commands will continue to execute.

WHAT NEXT

It is very important that you do not proceed to scan insertion or to ATPG without checking the violations found by the test DRC.

If you did not run test DRC explicitly and the scan insertion or ATPG are unsatisfactory, run test DRC explicitly. Then read the Test Design Rule Violation Summary and the Sequential Cell Summary at the end of the test DRC report. If there are any violations, you need to understand the violations and their causes before you proceed. Either fix the violations or decide that you can accept the violation before you proceed. To understand the violations, read the two Summaries and the more detailed information generated by the test DRC command. If you need details of all the violations found by test DRC, rerun test DRC in verbose mode (-verbose option).

It is a much better practice to run test DRC explicitly and to read the violation reports before you run **preview_scan** or **insert_scan**. Because **preview_scan** and **insert_scan** only run test DRC if you have not run it explicitly, you do not save any time by not running test DRC explicitly.

TEST-125 (warning) Clock/enable pin %s of cell %s (%s) tied constant.

DESCRIPTION

During scan shift, the clock/enable pin is tied to a constant value.

WHAT NEXT

This may be due either to the clock/enable being held to a constant value or to the

clock/enable being gated by a `test_scan_enable` signal. If you find that the clock is not tied to a constant value, look at the `test_scan_enable` and `test_scan_enable_inverted` signals to see if they hold the clock/enable at a constant value during scan shift.

TEST-126 (warning) Cell %s (%s) is not scannable.

DESCRIPTION

In the scan design technique, the state of internal sequential cells must be easily controllable and observable. By default, DFT Compiler automatically replaces sequential cells with functionally equivalent cells that also perform a scan shift function. These cells are connected into chains through which their states can be controlled and observed.

You can also decide not to perform scan replacement if your design has already gone through this process. This control is available through `-replace` option of the `set_scan_configuration` command.

This message identifies a cell that is not scannable, that is, it cannot be part of any scan chain. This happens when you explicitly set `-replace` option of the `set_scan_configuration` to FALSE, and you have one of the following two situations:
i) the cell has not been scan replaced yet, or ii) the cell is scan replaced but with a different scan style than the one being used.

WHAT NEXT

You can ignore the message and leave the cell as a valid non-scan cell, not being part of any scan chain. You can also opt for scan replacement (set `replace` to TRUE) and rerun the `dft_drc` command.

TEST-130 (warning) Clock gating cell %s has unconnected test pin.

DESCRIPTION

The reported clock gating cell has an unconnected test pin. `dft_drc` will check to ensure that the register bank driven by this clock gating cell is not DRC violated and gets scan stitched. If the `set_dft_configuration -connect_clock_gating` is enabled (default behavior), `insert_dft` will connect the test pin to the appropriate ScanEnable or TestMode port. Test pins are not connected until `insert_dft` is run. If left unconnected (or `-connect_clock_gating` is disabled at the time of `insert_dft`), then Post-DFT DRC will report a violations for the register bank driven by this clock gating cell.

This message is issued irrespective of the `set_dft_configuration -`

connect_clock_gating feature being enabled or disabled.

WHAT NEXT

This message is primarily an information for user. If the `set_dft_configuration - connect_clock_gating` feature is enabled, then `insert_dft` will connect the appropriate test pin to the test signal. No further action is required from the user. However, if the user disables the feature, `insert_dft` will not make the connection and the cells being driven by the clock gating cell will not be put in the scan chain. The user can either enable the feature or choose to have these cells Auto-fixed thereby bypassing the Clock Gating cell. The cells will then be included on the scan chain.

SEE ALSO

`set_dft_configuration(2)`
`report_dft_configuration(2)`
`set_dft_signal(2)`

TEST-131 (warning) Data pin %s of cell %s (%s) is driven by a clock/enable signal.

DESCRIPTION

This message identifies a pin whose value is sensitive to the state of a clock signal. Faults on that pin, and in the logic in the immediate fanout of the pin and cell, are not testable. The message that follows this one lists the pins that comprise the clock network for the signal in question.

The scan design technique requires that *clock* signals must not drive, either directly or indirectly, the data pins of sequential cells or output ports of the design. This restriction ensures that automatic test pattern generation can correctly predict the test response values that are captured into sequential cells or observed at primary outputs. If these response values are sensitive to clock transitions (rising and falling edges), the captured or observed values cannot be reliably predicted.

WHAT NEXT

You should always check violations of this form to ensure that the violations are not design errors. In general, you should redesign the circuitry to avoid such violations.

This type of rule violation typically has only a local effect on fault coverage. Unless many pins are affected, the impact on overall fault coverage may not be significant.

TEST-132 (Warning) Sequential cell %s (%s) is a black box in combinational scan style

DESCRIPTION

In combinational scan style, clocks are not pulsed. Therefore, sequential cells cannot be used for testing. They are black-boxed.

WHAT NEXT

Even if no scan chain is present, either use a non-combinational scan style (multiplexed flip-flop, LSSD or clocked scan), or use a full scan methodology.

TEST-135 (information) Clock port %s captures data on both edges.

DESCRIPTION

This message indicates that for the identified clock ports, data is captured into sequential cells (flip-flops or latches) on both the rising and falling transitions of the clock signal. That is, there are either flip-flops sensitive to both edges or there are latches that become transparent on both levels of the clock.

This design practice is supported by DFT Compiler, but it can cause some testability problems so be careful using it. Specifically, any state changes caused by the first clock edge cannot affect the data captured on the second clock edge. If this problem occurs, DFT Compiler issues a warning of unreliable capture (TEST-478) or a warning that cells do not capture (TEST-310).

WHAT NEXT

If no warning messages are issued, and you intended to capture data on both edges, you can ignore this message. If you do get subsequent warning messages, you might want to review the use of both clock edges.

TEST-140 (warning) The clock signal to cell %s (%s) is illegally gated.

DESCRIPTION

During the parallel cycle of the scan-test sequence, the response of internal combinational logic to the applied test pattern is captured into the sequential

cells in the design. This is usually done by applying a system (normal operation) clock pulse.

To ensure that data is reliably captured, all clock gating conditions must remain stable while the clock pulse is applied. In this case, the gating condition for the clock of the identified cell is itself changed when the clock pulse is applied. That is, the gating condition depends on the state of cells that have the same clock as the identified cell.

The message following this one indicates an example of a path by which the gating condition is changed at the time the clock pulse is applied.

The impact of this rule violation is that the specified cell cannot be used to observe the combinational logic block driving it. This results in lower fault coverage at the cell, and in the driving logic network.

WHAT NEXT

If your design has many cells with illegally gated clock signals, you should ensure that your design has been correctly constructed. Problems of this type may also affect the reliable normal operation of your design, as gated clock pulses may be truncated, causing glitches.

If you must gate clocks, you may want to consider alternative implementations that would be more reliable. One option would be to delay the change in the clock gating condition during the time the clock is active (typically high). You can add a delay by inserting a latch that is transparent only when the clock signal is at an inactive level (typically low).

Another alternative is to change the sense of the clock pulse and the gating logic, so that changes in the gating condition only occur when the clock is returning to the inactive level (which is high, due to the sense change).

TEST-141 (warning) There is an illegal path to cell %s (%s).

DESCRIPTION

During the parallel cycle of the scan-test sequence, the response of internal combinational logic to the applied test pattern is captured into the sequential cells in the design. This is usually done by applying a system (normal operation) clock pulse.

To ensure that data is reliably captured, the values being captured must remain stable for a certain length of time. For latch-based designs in particular, the data being captured must remain stable throughout the time the latch is transparent (the duration of the clock pulse).

This message indicates that data values being captured into the specified cell change before they can be latched. This usually happens because the sequential cell which is the origin of the data is being clocked at the same time as the specified cell. For example, if there is a path between two transparent latches with a common

latch enable signal, data cannot be reliably passed between the two latches. In this case, the data would fall through the second latch.

The message following this one gives an example of a path where the data value being captured changes when the clock pulse is applied.

The impact of this rule violation is that the specified cell cannot be used to observe the combinational logic block driving it. This results in lower fault coverage at the cell, and in the driving logic network.

WHAT NEXT

If your design has many cells with illegal data paths, you should ensure that your design has been correctly constructed. Problems of this type may also affect the reliable normal operation of your design.

You can resolve this problem by ensuring that different clock signals are used for different sequential elements, or by replacing level-sensitive elements (latches) with edge-triggered elements (flip-flops).

TEST-142 (warning) Sequential cell %s (%s) has constant logic 1/0 state.

DESCRIPTION

The scan-test approach requires that the state of the sequential cells in the design can be set to different values to enable thorough testing of the design's combinational logic. (This applies to both full-scan and partial-scan designs, although with partial scan, an initialization sequence may be required.)

This message identifies a sequential cell whose state, for the purposes of testing, is held at a constant logic 1 or logic 0 value. This means that some faults associated with the cell and the surrounding combinational logic cannot be tested.

This situation arises for designs with on-chip test control logic that is set to a specific state to enable scan-testing. One example is a JTAG TAP controller.

WHAT NEXT

If you expect the cell to be at a constant state (such as when it is part of some on-chip test control logic), you can ignore this message. In this case, you should supplement the automatically-generated test patterns with functional patterns that exercise the test control logic.

If this message is unexpected, examine the circuitry surrounding the specified cell to determine why the cell's state is constant during scan-test. For example, check whether the data input pin is tied high or low.

TEST-143 (error) Dont_touch has been applied to three-state cell '%s'.
JTAG synthesis cannot proceed since Boundary Scan Register (BSR) cells
cannot be associated with this three-stated port.

DESCRIPTION

During JTAG synthesis, BSR cells are associated with ports of the design. Where ports are controlled by three-state cells, the BSR cells are connected before the inputs to these three-states. In some cases, complex three-state cells from the original design must be mapped into simpler logic constructs, in order to be compliant with the IEEE 1149.1 JTAG standard. If the dont_touch command has been executed on a three-state associated with a port to be included in the BSR, then the BSR cells cannot be attached to it and the synthesized JTAG would be non-compliant. This error message is generated when such a dont_touch three-state cell has been encountered.

WHAT NEXT

Remove the dont_touch attribute using the remove_attribute command.

TEST-144 (error) Encountered critical unresolved reference trying to process cell '%s'.

DESCRIPTION

DFT Compiler has come across an unresolved reference during its traversal of portions of the design. It makes the traversal to determine where to insert JTAG boundary scan register (BSR) cells. In particular, it must recognize any three-state devices associated with design I/O. Having come across an unresolved reference, DFT Compiler has generated this error message and terminated JTAG synthesis.

WHAT NEXT

Run the dc_shell link command to get a list of unresolved references. Fix the critical ones.

TEST-145 (Warning) Pad-mapped JTAG is not IEEE 1149.1

compliant for port '%s'.

Cell '%s' (library cell type '%s') has been inserted between the port pad

cell and the Boundary Scan Register (BSR) cell.

DESCRIPTION

You receive this message because Rule 10.1.1(a) of the IEEE 1149.1 JTAG Standard has been violated.

When JTAG synthesis is invoked with pad mapping, DFT Compiler attempts to add pads to all ports having the `port_is_pad` attribute set to `TRUE`. Based on area and performance constraints, DFT Compiler selects (from among the pads available in the target library) the optimal pad for each port.

In some cases, if the target library does not have an appropriate pad, DFT Compiler selects a combination of a different pad and some core logic. For example, if the target library contains only active-high-enable three-state output pads, but a given port is an active-low-enable three-state port, then pad-mapping selects the active-high-enable three-state pad but inverts the enable signal using an inverter in the core.

Rule 10.1.1(a) of the IEEE 1149.1 JTAG Standard specifies that "Boundary-scan register cells shall be connected between each digital system pin and the on-chip system logic to allow the state of the system pin and, where appropriate, the system logic connection to be controlled or observed or both." This rule is violated if pad-mapping has introduced logic between the pad and the BSR cell.

WHAT NEXT

Such a violation may result from one of the following situations:

- If the target library does not have a pad with the proper characteristics to map this port without introducing core logic, Test Compiler attempts to find another pad and introduce core logic. In such a case, you can either use a target library with the proper pad type or modify the offending design port characteristic so that pad-mapping can complete without the necessity of additional logic.
- If the pad-mapping algorithm has not selected a pad that could have been placed at this port without the necessity of additional core logic in the design, you can force pad-mapping to use the correct pad. (See the documentation on pad mapping by Design Compiler.)

TEST-146 (warning) testability configuration is not set.

DESCRIPTION

You receive this warning message because testability configuration must be set as follows to run TDVR (test data volume reduction) flow:

set_dft_configuration -testability

WHAT NEXT

No action is required on your part, if you do not intend to set testability configuration. However, if you want to set testability configuration, change your script to include **set_dft_configuration -testability**.

SEE ALSO

set_dft_configuration (2).

TEST-147 (warning) the required number of observe test points can not be met.

DESCRIPTION

You receive this warning message because several observe test points are defined too large and TetraMAX cannot meet this constraint. TetraMAX automatically defines an appropriate number of test points for the design.

WHAT NEXT

No action is required on your part if you want accept the observe test points number defined by TetraMAX. Change the user specifications to specify another number.

TEST-148 (warning) A new port will be created for "tpclk" clock.

DESCRIPTION

You receive this warning message because no clock is defined for the new observe scan flip-flops inserted in the design, so the tool creates the clock.

WHAT NEXT

No action is required on your part if you want to accept this change.

However, you can define a clock using the `set_dft_signal` command.

SEE ALSO

`set_dft_signal` (2).

TEST-149 (Error) The scan utility has to be enabled for the scan compression feature.

DESCRIPTION

You receive this error message because you enabled the scan compression and you disabled the scan utility.

WHAT NEXT

Enable the scan utility with the `-scan` option in `set_dft_configuration`.

SEE ALSO

`set_dft_configuration` (2), `set_scan_compression_configuration` (2).

TEST-150 (Error) The `-no_scan` option cannot be an option of `insert_dft` when scan compression is enabled.

DESCRIPTION

You receive this error message because you enabled the scan compression feature and you invoked `insert_dft -no_scan`.

WHAT NEXT

Remove the `-no_scan` option for `insert_dft` and reissue the command.

SEE ALSO

`insert_dft` (2), `set_dft_configuration` (2), `set_scan_compression_configuration` (2).

TEST-151 (Error) Scan compression and %s cannot be enabled

in the same flow.

DESCRIPTION

You receive this error message because you enabled the scan compression feature and the %s feature.

WHAT NEXT

Disable the %s feature with set_dft_configuration.

SEE ALSO

`insert_dft (2)`, `set_dft_configuration (2)`, `set_scan_compression_configuration (2)`.

TEST-152 (warning) Design has no scan-in port.

DESCRIPTION

DFT Compiler has not found any port with signal type `test_scan_in`. This situation can cause all the cells of the design to be "scan uncontrollable," if no custom test protocol is used. It also prevents the checking of scan-chain connectivity.

WHAT NEXT

Define the `test_scan_in` ports of the design.

TEST-153 (Error) The scan utility has to be enabled for the logic BIST feature.

DESCRIPTION

You receive this error message because you enabled the logic BIST feature and you disabled the scan utility with the command `set_dft_configuration -scan disable`

WHAT NEXT

Enable the scan utility with the `-scan disable` option in `set_dft_configuration` and reissue the command `preview_dft` or `insert_dft`.

SEE ALSO

```
insert_dft (2), preview_dft (2), set_dft_configuration (2), set_lbist_onfiguration (2).
```

TEST-160 (information) BSR cell port drive limit '%d' exceeded.
Another BSR cell will be added to drive signal '%s'.

DESCRIPTION

Simultaneous switching of multiple I/O ports can produce VCC and VSS glitches that could exceed the tolerance level of the IC. Such a danger can occur when JTAG is in test mode. The problem arises when the pins of a chip that does not normally support simultaneous switching or enabling of all outputs are controlled from the Boundary Scan Register (BSR), rather than from the on-chip system logic. For example, this situation arises when the EXTEST instruction is selected. It is possible that the tests supplied through the boundary-scan path will cause all outputs to change state and/or be active simultaneously. If precautions are not taken, the sum of the switching currents of all pins may produce VCC and VSS glitches that could exceed the tolerance level of the IC, and the core logic as well as the BSR cells and TAP would then be subject to interference. The power consumption could be increased beyond the capacity of the power pins for a prolonged period, perhaps resulting in incorrect operation of the chip.

Delays that only effect the signal path when the chip is in JTAG test mode can be added to prevent simultaneous switching of outputs when pins are driven from the BSR. The added delays should be small in comparison with the minimum period of TCK, but should be sufficient to ensure that the power-current demand arising from the change of state at one pin or group of pins does not overlap with that from another group producing the excessive power consumption.

However, if the process to optimize the number of BSR cells results in a single BSR cell (for example a bus three-state enable signal) driving too many enable signals there is no way to introduce delays between the signals controlled by that BSR cell and ground bounce may not be prevented.

As a safety precaution DFT Compiler places an default cap on the number of I/O ports that can be driven by a single BSR cell. This message signals that this limit has been reached and another BSR cell has been added to drive outputs driven by this signal.

A detailed discussion of the Ground-Bounce problems is presented in Chapter 15, 'Providing Boundary-Scan on Chips with Power or Output-Switching limitations' of 'The Test Access Port and Boundary-Scan Architecture' by Colin M. Maunders and Rodham E. Tulloss, IEEE Computer Society Press Tutorial, 1990.

WHAT NEXT

The environmental variable **test_jtag_bsr_cell_port_drive_limit** has been added to the .synopsys setup environment to provide the user with a mechanism to ensure that the

'ground bounce' problem does not occur for designs with JTAG synthesized by DFT Compiler.

test_jtag_bsr_cell_port_drive_limit puts a cap on the number of outputs that can be driven by a single BSR cell. For this design, the limit is shown by the value in the error message. The user can establish another positive non-zero limit, by changing the value of the variable in the .synopsys_dc.setup file.

It can be set in the global or local .synopsys file. Alternately, the ground bounce attribute can be set on a design by executing **set_attribute <design_name> jtag_bsr_cell_port_drive_limit <positive_integer> -type integer** before JTAG synthesis.

The value of the ground-bounce limit for a particular JTAG design can be determined by executing **report_test -jtag**.

TEST-163 (warning) User scan-chain %d has length %d which exceeds desired maximum.

DESCRIPTION

The **insert_test** command issues this message when you use its **-max_scan_chain_length** option to specify a maximum length that is less than the length of a scan chain you already defined. The **insert_test** command implements the scan chain that you defined but warns you that, in doing so, it has violated your specification for maximum scan chain length.

You can define scan chains with **set_scan_chain** or with **set_test_routing_order**. The **set_scan_chain** command specifies membership of the scan chain, but not the order of scan cells on the chain. Thus, the following commands give a **TEST-163** violation:

```
set_scan_chain 1 {"dff1", "dff2"} insert_test -max_scan_chain_length 1
```

The **set_test_routing_order** command specifies the order of scan cells on the chain. Thus, the following commands also give a **TEST-163** violation:

```
insert_test -no_route set_test_routing_order {"dff2", "dff1"} -scan_chain_index 1  
insert_test -no_insert -max_scan_chain_length 1
```

WHAT NEXT

If the scan chain you specified with **set_scan_chain** or **set_test_routing_order** is the scan chain you require, no action is necessary. However, if you need to reduce the length of the chain, correct the **set_scan_chain** or **set_test_routing_order** specification and rerun **insert_test**.

TEST-164 (warning) There are %d user scan-chains against

only %d requested.

DESCRIPTION

The **insert_test** command issues this message when you use its -scan_chains option to specify a number of scan chains that is less than the number of scan chains you previously defined. The **insert_test** command implements the scan chains you defined but warns you that, in doing so, it violated your specification for the number of scan chains. You can define scan chains with **set_scan_chain** or with **set_test_routing_order**.

The **set_scan_chain** command specifies membership of the scan chain, but not the order of scan cells on the chain. Therefore, the following commands give a **TEST-164** violation:

```
set_scan_chain 1 {"dff1", "dff2"} set_scan_chain 2 {"dff3", "dff4"} insert_test -  
scan_chains 1
```

The **set_test_routing_order** command specifies the order of scan cells on the chain. Thus, the following commands also give a **TEST-164** violation:

```
insert_test -no_route set_test_routing_order {"dff2", "dff1"} -scan_chain_index 1  
set_test_routing_order {"dff3", "dff4"} -scan_chain_index 2 insert_test -no_insert -  
scan_chains 1
```

WHAT NEXT

If the scan chains you specified with **set_scan_chain** or **set_test_routing_order** are the scan chains you require, no action is necessary. However, if you need to reduce the number of scan chains, correct the **set_scan_chain** or **set_test_routing_order** specifications and rerun **insert_test**.

TEST-165 (warning) There are too few scan-cells (%d) to build requested chains

DESCRIPTION

The **insert_test** command issues this message when you use its -scan_chains option to specify a number of scan chains that is more than the sum of the number of scan chains that you already defined and the number of scan cells that you have not yet allocated to scan chains. The message reports the number of scan cells that you have not yet allocated to scan chains.

The **insert_test** command implements the scan chains you defined but warns you that, in doing so, it was not able to implement the number of scan chains requested. You can define scan chains with **set_scan_chain** or with **set_test_routing_order**.

The **set_scan_chain** command specifies membership of the scan chain, but not the order

of scan cells on the chain. Therefore, for a design with only four scan cells {"dff1", "dff2", "dff3", "dff4"} the following commands give a **TEST-165** violation:

```
set_scan_chain 1 {"dff1", "dff2"} set_scan_chain 2 {"dff3", "dff4"} insert_test -scan_chains 3
```

The **set_test_routing_order** command specifies the order of scan cells on the chain. Therefore, the following commands also give a **TEST-165** violation for the same design:

```
insert_test -no_route set_test_routing_order {"dff2", "dff1"} -scan_chain_index 1  
set_test_routing_order {"dff3", "dff4"} -scan_chain_index 2 insert_test -no_insert -scan_chains 1
```

Finally, the following command gives you a **TEST-165** violation even though you defined no scan chains for the same design.

```
insert_test -scan_chains 5
```

WHAT NEXT

If the scan chains you specified with **set_scan_chain** or **set_test_routing_order** are the scan chains you require, no action is necessary. However, if you need to increase the number of scan chains, correct the **set_scan_chain** or **set_test_routing_order** specifications and rerun **insert_test**.

TEST-169 (warning) Normal mode clock pin %s of cell %s (%s) is uncontrollable.

DESCRIPTION

A normal mode clock pin is a clock pin that is active during normal operation of the design. Depending on the scan style, the clock pin might be active or inactive during scan shift. A typical example is an LSSD C Clock. In normal operation this captures data into the LSSD cell's master latch, but is held inactive during a scan shift while the A and B clocks are active. Another example is the clock pin of a multiplexed flip-flop scan cell, which is active in both normal operation and in scan shift.

The **check_test** command issues the **TEST-169** warning when it finds a normal mode clock pin that is in an unknown state when all clock ports of the design are held inactive.

The most frequent cause of this violation is invalid clock gating, where the value on the clock pin is determined by the value in another sequential element when the clock port is held inactive.

When **check_test** can identify the source of this violation it also issues a **TEST-281** to identify the network that causes the clock pin to be in an unknown state.

For prescan designs, it is important that you review this warning and correct it, otherwise the cell will not be scan replaced by **insert_scan** and so your fault coverage will be reduced.

WHAT NEXT

Review the accompanying **TEST-281** message to identify the source of the uncontrollable clock. If the source is a clock gating circuit, consider adding test-mode gating to ensure that the clock pin can be controlled from an external clock port for test purposes. For example, add a multiplexer to the clock gating circuit so when a `test_mode` port is held to logic 1 a clock port drives the clock pin. Now apply a `set_test_hold 1` command to the `test_mode` port and rerun `check_test`.

If you think that the clock gating is valid and should be accepted by `check_test`, review the sense of the clock signals inferred by `check_test`. (Check the **TEST-169** messages to see if DFT Compiler inferred a return-to-zero or a return-to-one clock.)

Consider a clock gating circuit that ANDs together an internal signal and a signal from a clock port, CLK. If CLK is inferred as a return to one clock, `check_test reports a TEST-169` violation because the clock gating's output is controlled by the internally generated signal when CLK is in its off-state of logic one. However, if you explicitly instruct Test Compiler to use a return-to-zero clock, no **TEST-169** violation is issued because the clock gating's output is at logic 0 when CLK is in its inactive state of logic zero. You can instruct DFT Compiler to use a return-to-zero clock with the `create_test_clock` command. For example,

```
create_test_clock CLK -period 100.0 -waveform {30.0 40.0}
```

TEST-170 (information) There are %d other pins with the same violation.

DESCRIPTION

When `check_test` runs in ordinary (nonverbose) mode it lists warnings only for the first pin that violates a rule, followed by the number of additional violations. The **TEST-170** messages shows the number of additional violations.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation).

If you want to see details of all the violations of a rule, run `check_test` in verbose mode. For example `check_test` might return the following messages:

```
Warning: Clock/enable pin CLK of cell a_out_reg[1] (DTN11) tied constant. (TEST-125)
Information: There are 3 other pins with the same violation. (TEST-170)
```

However, if you run **check_test -verbose**, you will see details of all four violations:

```
Warning: Clock/enable pin CLK of cell a_out_reg[1] (DTN11) tied constant. (TEST-125)
Information: Pins with this violation : a_out_reg[1]/CLK, a_out_reg[2]/CLK,
b_out_reg[0]/CLK, b_out_reg[1]/CLK. (TEST-284)
```

TEST-171 (information) There are %d other cells with the same violation.

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first cell that violates a rule, followed by the number of additional violations. The **TEST-170** messages show the number of additional violations.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might be additional information messages that provide more details about the first violation.)

If you want to see details of all the violations of a rule, run **check_test** in verbose mode. For example, **check_test** might produce the following messages:

```
Warning: No scan equivalent exists for cell a_out_reg[2] (FD1). (TEST-120)
Information: There are 2 other cells with the same violation. (TEST-171)
```

However, if you run **fbcheck_test -verbose**, you see details of all three violations:

```
Warning: No scan equivalent exists for cell a_out_reg[2] (FD1). (TEST-120)
Information: Cells with this violation : a_out_reg[0], a_out_reg[1], a_out_reg[2].
(TEST-283)
```

TEST-172 (information) There is one other pin with the same violation.

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first pin that violates a rule, followed by the number of additional violations. The **TEST-172** message shows that there is one additional violation.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation.)

If you want to see details of both the violations of a rule, run **check_test** in verbose mode. For example **check_test** might produce the following messages:

Warning: Clock/enable pin CLK of cell b_out_reg[0] (DTN11) tied constant. (TEST-125)
Information: There is one other pin with the same violation. (TEST-172)

However, if you run **check_test -verbose**, you will see details of both violations:

Warning: Clock/enable pin CLK of cell b_out_reg[0] (DTN11) tied constant. (TEST-125)
Information: Pins with this violation : b_out_reg[0]/CLK, b_out_reg[1]/CLK. (TEST-284)

TEST-173 (information) There is 1 other cell with the same violation.

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first cell that violates a rule, followed by the number of additional violations. The **TEST-170** message shows that there is one additional violation.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation).

If you want to see details of both the violations of a rule, run **check_test** in verbose mode. For example **check_test** might produce the following messages:

Warning: No scan equivalent exists for cell a_out_reg[2] (FD1). (TEST-120)
Information: There is 1 other cell with the same violation.

However, if you run **check_test -verbose**, you will see details of both violations:

Warning: No scan equivalent exists for cell a_out_reg[2] (FD1). (TEST-120)
Information: Cells with this violation : a_out_reg[1], a_out_reg[2]. (TEST-283)

TEST-174 (warning) %d scan-chains will be needed, against %d

requested.

DESCRIPTION

The **insert_test** command issues this message when you use its `-scan_chains` option to specify a number of scan chains that conflicts with one of the following:

- a) The number of clock domains in the design, when you have not used the `-multiple_clocks_chains` option and the scan style is multiplexed flip-flop
- b) The maximum scan chain length that you specified with the `-max_scan_chain_length` option
- c) Scan chains that you defined with `set_scan_chain` or `set_test_routing_order`
- d) A combination of the aforementioned.

For case a), if you do not specify that **insert_test** can mix elements clocked by different clocks on the same scan chain, **insert_test** will not mix clocks on the same scan chain. Therefore, if you specify fewer clocks than scan chains without specifying that clock mixing is allowed, **insert_test** is unable to satisfy both your requirements.

When **insert_test** issues the **TEST-174** warning, it gives precedence to your implicit specification not to mix clocks on the scan chain.

For example, you see the following message after the command **insert_test - scan_chains 1** for a design of two clock domains (clk1 and clk2):

Warning: 2 scan chains will be needed, against 1 requested. (TEST-174)

Then **insert_test** inserts two scan chains, one of elements clocked by clk1 and one of elements clocked by clk2.

For case b), if you specify a maximum scan chain length and a number of scan chains so that **insert_test** cannot honor both requirements, **insert_test** issues the **TEST-174** warning and gives precedence to the maximum scan chain length.

For example, you see the following message after the command **insert_test - scan_chains 1 -max_scan_chain_length 2000** for a design of 4000 scannable elements and a single clock domain:

Warning: 2 scan chains will be needed, against 1 requested. (TEST-174)

Then **insert_test** inserts two scan chains, each of length 2000.

For case c), if you specify more scan chains with `set_scan_chain` and `set_test_routing_order` than the number of scan chains you specify with the `-scan_chains` option and a number of scan chains, **insert_test** issues the **TEST-174P** warning and gives precedence to the scan chains that you specified with `set_scan_chain` or `set_test_routing_order`.

For example, after the commands:

```
set_scan_chain 1 {U1/DFF1} set_scan_chain 2 {U1/DFF2} insert_test -scan_chains 1
```

You see the following message:

```
Warning: 2 scan-chains will be needed, against 1 requested. (TEST-174)
```

and `insert_test` will build two scan chains.

WHAT NEXT

If the number of scan chains that `insert_test` inserted is acceptable to you, no action is necessary. However, if you need to reduce the number of scan chains, you need to correct your specification and rerun `insert_test`.

To determine the conflict in your specification it might be useful to run `check_test` and `report_test -scan_path` to examine the scan architecture that `insert_test` created. This should give you some insight into what was inconsistent in your specification.

TEST-175 (information) The loop contains: %s.

DESCRIPTION

This message provides additional information in support of other messages. For example, it may report the cell pins that comprise a combinational feedback loop.

WHAT NEXT

The message that appears before this message indicates the actual problem.

TEST-176 (information) Scan insertion did not build any scan chains.

DESCRIPTION

This message tells you that scan insertion did not build any scan chains.

WHAT NEXT

Study accompanying warning and error messages for the reasons why no scan chains were built.

TEST-179 (warning) Design has no scan-out port.

DESCRIPTION

DFT Compiler has not found any port with signal type **test_scan_out**. This situation can cause all the cells of the design to be "scan unobservable" if no custom test protocol is used. It also prevents checking the scan chain connectivity.

WHAT NEXT

Define the **test_scan_out** ports of the design.

TEST-180 (information) Because pin %s of cell %s (%s) is not a three-state driver.

DESCRIPTION

This message provides additional information in support of the TEST-115 (Three-state net %s is not properly driven) warning message.

The message indicates either

- a) A serious design problem where you have connected together a two-state driver and a three-state driver
- b) A link problem where no model can be found for the cell, and so is modeled by DFT Compiler as a black box. When a cell is modeled as a black box, DFT Compiler treats its outputs as two-state drivers that drive an unknown (or logic X) value.

WHAT NEXT

Use the information from the TEST-180 message and the TEST-115 messages to identify the two-state driver and the three-state net.

If you have a design violation, review your design to determine if the two-state driver should really be a three-state driver, or if you have connected its output to the wrong net. Correct your design and rerun **dft_drc**.

If there is a link problem, identify the missing information (link_library or search_path) and rerun **dft_drc**.

TEST-182 (information) Because input port %s is not a three-

state driver.

DESCRIPTION

This message provides additional information in support of the TEST-115 (Three-state net %s is not properly driven) warning message. The message indicates a serious design problem where you have connected together a port and three-state drivers.

WHAT NEXT

Use the information from the TEST-182 message and the TEST-115 messages to identify the input port and the three-state net. Review your design to determine if the port should really be connected to a three-state buffer, or if you have connected its output to the wrong net. Correct your design and rerun **dft_drc**.

TEST-186 (warning) Shift clock pin %s of cell %s (%s) is illegally gated.

DESCRIPTION

A shift clock pin is a clock pin that is active during scan shift while shifting data through the scan chain. Depending on the scan style a shift clock pin can be active or inactive during normal-mode operation.

The **check_test** command issues the TEST-169 warning for pre-scan designs when it finds a shift clock pin that is in an inactive state when all clock ports of the design are held inactive, but is in an unknown state when the clock port pulses. Since **check_test** only issues this message for pre-scan designs, you only see this violation message for clock pins that are active in both scan shift and normal-mode operations. Therefore, you only see this violation for the clock pin of multiplexed flip-flop scan cells or for the B clock of LSSD scan cells.

A shift clock pin that is in an unknown state when a shift clock pulses is a violation because it means that during scan shift the sequential element will not always receive a clock pulse in a scan shift cycle. Therefore, any scan chain that includes a cell with this violation will not shift reliably and so cannot be used to load and unload test data.

The most frequent cause of this violation is invalid clock gating, where the value on the clock pin is determined by the value in another sequential element when the clock port pulses. When **check_test** can identify the source of this violation it also issues a TEST-281 message to identify the network that causes the clock pin to be in an unknown state.

For pre-scan designs it is important that you review this warning and correct it; otherwise the cell will not be scan replaced by **insert_scan** and so your fault coverage will be reduced.

WHAT NEXT

For the multiplexed flip-flop scan style with a return to zero clock, this warning message indicates that you probably have an internal clock signal to a flip-flop generated by (N)ANDing the clock port with an internally generated signal from a sequential cell. When the clock port is in its inactive state (0), the internal clock signal is at a steady logic value: logic 1 for a NAND gate, logic 0 for an AND gate. However, when the clock port pulses the behavior of the internal clock signal depends upon the value of the internally generated signals.

For the multiplexed flip-flop scan style with a return to one clock, this warning message indicates that you have an internal clock signal to a flip-flop generated by (N)ORing the clock port with an internally generated signal. When the clock port is in its inactive state (1), the internal clock signal is at a steady logic value: logic 0 for a NOR gate, logic 1 for an OR gate. However, when the clock port pulses, the behavior of the internal clock signal depends upon the value of the internally generated signals.

Review the accompanying TEST-281 message to identify the source of the uncontrollable clock. If the source is a clock gating circuit, consider adding test-mode gating to ensure that the clock pin can be controlled from an external clock port for test purposes. For example, add a multiplexer to the clock gating circuit so that, when a test_mode port is held to logic 1, a clock port drives the clock pin. Now apply a **set_test_hold 1** command to the test_mode port and rerun **check_test**.

TEST-188 (warning) BSR cell optimization has pushed the cell associated with output port '%s' onto input port '%s'. The BSR cell for this input port has been specified as 'observe-only'.
This is not compliant with the IEEE 1149.1 JTAG standard.

DESCRIPTION

Using the **set_jtag_port_mode** command, this input port has been specified to be 'observe-only'. However since, BSR cell optimization has pushed the BSR cell associated with an output onto this input port, and all output port BSR cells must be controllable, the mode specification for this input is in fact non-compliant with the standard.

Unless the user requests a user-defined Boundary Scan Register (BSR) cell implementation using the **set_jtag_implementation** command, the Test Compiler selects 1149.1 compliant BSR cells from among the following 10 defined types:

Type Default Name BSR Cell Function

BSRINBOTHJTAG_BSRINBOTHset & observe data input cell

BSRINSETJTAG_BSRINSETset-only data input cell
BSRINOBSJTAG_BSRINOBSoberve-only data input cell
BSRINCLKBOTHJTAG_BSRINCLKBOTHset & observe clock input cell
BSRINCLKSETJTAG_BSRINCLKSETset-only clock input cell
BSRINCLKOBSJTAG_BSRINCLKOBSobserve-only clock input cell
BSROUTBOTHJTAG_BSROUTBOTHset & observe data output cell
BSROUTSETJTAG_BSROUTSETset-only data output cell
BSROUTOBSJTAG_BSROUTOBSobserve-only data output cell
BSRCTLJTAG_BSRCTLcontrol cell

IEEE 1149.1 Standard rule 10.1.1 specifies legal boundary scan register cell types. Several of the 10 types listed above are not compliant with the standard. Nonetheless, DFT Compiler supports them in order to allow designers the greatest possible flexibility when using Programmable JTAG.

10.1.1(b) "For a unidirectional system input pin (clock or nonclock), a boundary-scan register cell shall be connected between the system pin and the on-chip system logic to allow the state of the system pin to be observed and, optionally, for the state of the system logic to be controlled."

Thus, legal data and clock input BSR cell types for unidirectional system input pins are observe-only and both control and observe. BSRINSET and BSRINCLKSET are non-compliant types.

10.1.1(c) "For 2-state and open-collector system output pins, a boundary-scan register cell shall be provided to allow the state of the system pin to be controlled and the state of the on-chip system logic output to be observed."

Thus, the legal output BSR cell type for system 2-state and open-collector output pins is both control and observe. BSROUTSET and BSROUTOBS are non-compliant types.

10.1.1(d) "For 3-state system output pins, boundary-scan register cells shall be provided to allow both the data value and the output drive state (active or inactive) to be controlled and for the corresponding system logic outputs to be observed."

Thus, the legal output BSR cell type for system 3-state output pins is both control and observe. BSROUTSET and BSROUTOBS are non-compliant types.

10.1.1(e) "For a bidirectional system pin, boundary-scan register cells shall be provided to allow the value and direction of data at the system pin to be controlled or observed and, where appropriate, for the corresponding system logic inputs to be controlled."

This is somewhat ambiguous. DFT Compiler interprets this rule to indicate that as applied to bidirectional signals BSRINSET, BSROUTSET and BSROUTOBS are non-compliant types.

The types '**BSRxxxBOTH**' (control and observe) '**BSRxxxSET**' (control-only) and '**BSRxxxOBS**' (observe-only) differ. They correspond respectively to the three modes 'both', 'control' and 'observe' specified with the **set_jtag_port_mode** command. When this command is invoked for one or more ports of the design, BSR cells for those ports will have BSR cells of the specified type associated with them.

If the specified type will result in a non-compliant BSR cell being synthesized for a port, this warning message is issued.

WHAT NEXT

Determine whether non-compliant BSR cells can be tolerated in your design. If not, modify the port mode settings for the offending port and reinvode **insert_jtag**.

TEST-189 (error) Three-state cell '%s' (library cell '%s') with missing or erroneous enable pin.

DESCRIPTION

When determining where to insert boundary scan register (BSR) cells, Test Compiler processes any three-state drive cells associated with the I/O ports.

Where ports are controlled by three-state cells, the BSR cells are connected before the inputs to the three-states. In some cases, to be compliant with the IEEE 1149.1 JTAG standard, complex three-state cells from the original design must be mapped into simpler logic constructs.

This message is generated when DFT Compiler encounters a three-state cell whose enable signal is either missing or erroneously modeled.

The error message is also generated if the target cell is an unresolved reference or is in the design. One cause of an unresolved reference is the existence of generic logic in the design. Another cause for the error may be definition of the three-state cell as a black box.

In all cases JTAG synthesis of BSR cells for three-state controlled ports requires mapping the three-state controller to logic, which includes a simple generic logic gate comprised of single data, control, and output signals. One BSR cell is placed in front of both the control and data signal inputs. Thus, a black box definition of the three-state control cell is also erroneous.

WHAT NEXT

Verify the cell and check the library description of the offending cell for correctness. If the cell is an unresolved reference, resolve it. One way to discover errors in the library is to recompile it using the Library Compiler.

TEST-191 (error) Probable library error associated with cell '%s'.

No three-state enable signal associated with pin '%s'.

DESCRIPTION

This error message is generated when a three-state output signal does not have a three-state attach associated with it. The situation is probably caused by an incorrectly modeled library cell.

WHAT NEXT

Recompile the library using the Library Compiler, and correct any errors to this and other cells.

TEST-192 (error) Dangling port '%s' cannot be included in the JTAG Boundary Scan Register (BSR).

DESCRIPTION

DFT Compiler has encountered a top-level I/O port that is unconnected to any net, because of which DFT Compiler cannot determine the optimal configuration of the JTAG Boundary Scan Register (BSR) and has aborted JTAG synthesis. A 1149.1-compliant JTAG architecture requires that all ports of a design, except those comprising the JTAG Test Access Port (TAP), be included in the BSR. Optimal determination of the number of cells in the BSR requires that the connectivity of each port be traversed. It is possible to instruct DFT Compiler to synthesize a noncompliant BSR by explicitly excluding certain ports from the BSR.

WHAT NEXT

To distinguish *true* I/O ports of a design (which are to be included in the BSR) from *pseudo* ports (which are, in fact, internal signals that will be connected to other internal signals at a future date), the *true* ports are identified by executing **set_port_is_pad <list_of_true_IO_ports>** prior to invoking **insert_jtag**. If you want to proceed with JTAG synthesis and exclude a *true* "dangling" port from the BSR, specify the exclusion with the command **set_jtag_port FALSE <list_of_ports_to_be_excluded_from_the_BSR>**. If you want to include this dangling

port in the BSR, you must connect it correctly to the design. It is not necessary to create the TAP ports for the design prior to invoking JTAG synthesis; these ports are automatically created. Although DFT Compiler will identify pre-existing TAP ports (if they have been given the correct design attributes using `set_signal_type <signal_type> <port_name>`), it is simpler to rename automatically synthesized TAP ports after JTAG synthesis than to create them in advance. To identify pre-existing TAP ports, identify each TAP port with the correct `signal_type` from among `jtag_tdi`, `jtag_tck`, `jtag_tms`, `jtag_trst` and `jtag_tdo`.

TEST-193 (error) Default JTAG component '%s', of component type

'%s' not found in the JTAG component library associated with this design.

DESCRIPTION

DFT Compiler selects the various JTAG components (the TAP controller, Bypass, Instruction, and Identification registers, and the various types of Boundary Scan Register cells) from a JTAG component library.

In the absence of explicit instruction from the user (using the `set_jtag_implementation` command), DFT Compiler synthesizes JTAG using a set of `default` components from the jtag.db library. This error message is produced if the jtag.db library associated with the current design has been modified so that the default component specified has been removed. Under no circumstances should a default component be removed from the jtag.db since if the component is required for this JTAG architecture and the user has not specified an alternative implementation for this component, JTAG synthesis would fail. Absense of this default component causes `insert_jtagP` to **gracefully abort**.

WHAT NEXT

Rebuild the jtag.db to include all default components contained in the jtag.db library provided with DFT Compiler.

TEST-194 (error) -- Intolerable 1149.1 Violation --

Three-stated port '%s' is controlled by a feed-through input port '%s' that is excluded from the Boundary Scan Register.

DESCRIPTION

Designs that contain violations of the 1149.1 standard are referred to as non-compliant JTAG architectures. 1149.1 standard violations fall into two categories:

tolerable and *intolerable*. We define *intolerable* violations as those that render the JTAG access protocol inoperable or which make the behavior of the JTAG logic unpredictable.

We define *tolerable* violations of the standard as those that neither render the JTAG access protocol inoperable nor make the behavior of the JTAG logic unpredictable, but which do violate some rule in the 1149.1 standard.

In most cases exclusion of a non-TAP I/O port of a circuit from the Boundary Scan Register (BSR) is a violation of the standard and will result in reduced controllability and observability at the board and system levels, but is not an *intolerable* violation. However, in this case the exclusion of the feedthrough input port that drives the three-state control signal of an output port that is not excluded from the BSR is an *intolerable* violation of the IEEE 1149.1 standard because it renders that output port uncontrollable in 1149.1 test mode.

For this reason, it is not supported by DFT Compiler.

WHAT NEXT

Either exclude the associated output port(s) or include the feed-through input port in the Boundary Scan Register.

TEST-195 (information) JTAG pad synthesis will NOT include the following ports:

DESCRIPTION

The JTAG Boundary Scan Register (BSR) associates a register with each I/O pad of a device. These registers can either 'capture' (observe) or 'apply' (control) values at the pads. The registers are serially chained together to form the BSR. Values are set and read serially through the BSR. Typically, all non-TAP (Test Access Port) ports are included in the BSR.

Unless **insert_jtag** is invoked with the **-no_pads** option, Test Compiler will execute pad synthesis along with JTAG synthesis on all ports having the **port_is_pad** attribute set using **set_port_is_pad**. Ports not having this attribute set will be processed for inclusion in the BSR (provided they have not been excluded using **set_jtag_port FALSE {port_list}** command) but will not have pads synthesized for them.

This information message is issued when **insert_jtag** has been invoked without the **-no_pads** option, and the **port_is_pad** attribute has been set on some BSR or TAP ports, but other ports do not have the **port_is_pad** attribute set. In this case, JTAG synthesis will *only* include pad synthesis on the ports with the **port_is_pad** attribute set.

The list of BSR or TAP ports without the **port_is_pad** attribute set follows this message.

WHAT NEXT

If you require pad synthesis as a part of JTAG synthesis, set the **port_is_pad** attribute using the **set_port_is_pad** command on each port you want DFT Compiler to include in the BSR or existing TAP port. Do not assign the **port_is_pad** attribute to internal module ports.

One way to specify ports as pads is to execute **set_port_is_pad find (port,"*")** on the current_design.

If you do not want pad synthesis as a by-product of JTAG synthesis, execute **insert_jtag -no_pads**.

'BACKDOOR' PAD SYNTHESIS WITH JTAG

There is a 'backdoor' method for doing JTAG pad synthesis without using **set_port_is_pad** using **insert_jtag -no_pads**.

Using **set_jtag_implementation <component_type> <implementation> [list_of_ports]** where the **<implementation>** is in fact a pad cell, along with **insert_jtag -no_pads** will synthesize JTAG with pads, provided those pad cells have the satisfactory JTAG BSR logic in them. The following *WILL* synthesize JTAG with pads.

```
set_jtag_implementation BSRINBOTH some_inboth_pad_cell {list_of_input_ports}
set_jtag_implementation BSROUTBOTH some_outboth_pad_cell {list_of_output_ports}

insert_jtag -no_pads
```

TEST-196 (information) Port '%s' will not have a pad.

DESCRIPTION

The JTAG Boundary Scan Register (BSR) associates a register with each I/O pad of a device. These registers can either 'capture' (observe) or 'apply' (control) values at the pads. The registers are serially chained together to form the BSR. Values are set and read serially through the BSR. Typically, all non-TAP (Test Access Port) ports are included in the BSR.

Unless **insert_jtag** is invoked with the **-no_pads** option, Test Compiler will execute pad synthesis along with JTAG synthesis on all ports having the **port_is_pad** attribute set using **set_port_is_pad**. Ports not having this attribute set will be processed for inclusion in the BSR (provided they have not been excluded using **set_jtag_port FALSE {port_list}** command) but will not have pads synthesized for them.

This information message is issued when **insert_jtag** has been invoked without the **-no_pads** option, and the **port_is_pad** attribute has been set on some BSR or TAP ports, but other ports do not have the **port_is_pad** attribute set. In this case, JTAG synthesis will *only* include pad synthesis on the ports with the **port_is_pad** attribute set.

This BSR or TAP port does not have the **port_is_pad** attribute set.

WHAT NEXT

If you require pad synthesis as a part of JTAG synthesis for this port, set its' **port_is_pad** attribute using **set_port_is_pad {<port_name>}**.

One way to specify ports as pads for all ports is to execute **set_port_is_pad find (port,"*")** on the current_design.

If you do not want pad synthesis as a by-product of JTAG synthesis, execute **insert_jtag -no_pads**.

'BACKDOOR' PAD SYNTHESIS WITH JTAG

There is a 'backdoor' method for doing JTAG pad synthesis without using **set_port_is_pad** using **insert_jtag -no_pads**.

Using **set_jtag_implementation <component_type> <implementation> [list_of_ports]** where the **<implementation>** is in fact a pad cell, along with **insert_jtag -no_pads** will synthesize JTAG with pads, provided those pad cells have the satisfactory JTAG BSR logic in them. The following *WILL* synthesize JTAG with pads.

```
set_jtag_implementation BSRINBOTH some_inboth_pad_cell {list_of_input_ports}
set_jtag_implementation BSROUTBOTH some_outboth_pad_cell {list_of_output_ports}

insert_jtag -no_pads
```

TEST-197 (warning) Cell %s (%s) is not scan controllable because it has overlapping master/slave clocks.

DESCRIPTION

The waveforms on **scan clock A** and **scan clock B** are overlapping. The cell is not scan controllable.

When scan data is shifted in and out of the design-under-test, the overlapping scan clocks will cause the scan data to be corrupted.

WHAT NEXT

Make the waveforms of **scan clock A** and **scan clock B** non-overlapping.

TEST-198 (information) Because pin %s of cell %s (%s) has a

test_isolate attribute.

DESCRIPTION

This message provides additional information in support of the TEST-115 (Three-state net %s is not properly driven) warning message.

The design rule checker issues this message when it finds a pin with a set_test_isolate attribute driving a three-state net. Remember that a set_test_isolate inserts an X driver into the ATPG view of the circuit, and this X driver is a two-state driver. You see this message when you apply a set_test_isolate either directly to such a pin, or to the entire cell.

WHAT NEXT

Remove the set_test_isolate attribute with **remove_attribute**. However, if you applied the set_test_isolate attribute to a black box cell that drives a three-state net and which is in high impedance throughout scan testing, you still need to solve the problem of how to tell DFT Compiler that the output is a constant Z. The only way to do this is to write your own "wrapper" in Verilog or VHDL and to link the wrapper to this model instead of to the library cell.

For example, if you can guarantee that the cell will always be in high impedance during scan testing, you could write a model that sets the outputs of the cell to Z at all times. Be very careful with this option! If you write an incorrect model, or your assumptions on the cell's behavior are incorrect, bad patterns can easily result.

TEST-199 (information) Because driver %s is a three-state pin of black box cell %s (%s).

DESCRIPTION

You receive this message because it provides additional information in support of the TEST-115 warning message (Three-state net %s is not properly driven).

The design rule checker issues this message when a cell with a three-state pin is black boxed. Cells are black boxed when either of the following occurs:

- The library description of the cell's function missing or incomplete.
- The cell's functionality is not supported by DFT Compiler. The most common examples are RAMs.

WHAT NEXT

If the library cell can be modeled with Library Compiler and supported by DFT Compiler, you should contact your vendor/library developer to fix this cell. Otherwise, if you are sure that you can correctly model the functionality of the cell for test purposes, you can write your own wrapper in Verilog or VHDL and link the wrapper to this model instead of to the library cell.

For example, if you can guarantee that the cell is always in high impedance during scan testing, you can write a model that sets the outputs of the cell to Z at all times. Use caution with this option: If you write an incorrect model, or your assumptions on the cell's behavior are incorrect, it may result in bad patterns.

SEE ALSO

TEST-115 (n).

TEST-200 (information) Faults on unused cell outputs are not considered, for example pin %s of cell %s (%s).

DESCRIPTION

Cells that have output pins that are not connected to any other gates will not be added to the master fault list that **create_test_pattern** uses. Consequently **create_test_patterns** will not attempt to detect faults on these output pins. Unused cell output pins will not reduce your fault coverage.

WHAT NEXT

This message is purely an informational message; no action is required.

TEST-201 (information) Faults on unconnected ports are not considered, for example port %s.

DESCRIPTION

Faults on ports that are not connected to any gates will not be added to the master fault list that **create_test_pattern** uses. Consequently **create_test_patterns** will not attempt to detect faults on these output pins. Unused ports will not reduce your fault coverage.

WHAT NEXT

This message is purely an informational message; no action is required.

TEST-202 (information) Cell %s (%s) will not be scanned due to the set_scan_element command.

DESCRIPTION

The `check_test` command issues this message when it finds a sequential cell to which you applied `set_scan_element false`.

If the cell is mapped, but not yet scan replaced, this message tells you that when you run `insert_scan`, scan synthesis will NOT scan replace this cell.

If the cell is scan replaced, this message tells you that when you run `insert_scan`, the cell will be unscanned. That is, the cell is removed from a scan chain if the design is scan routed and remapped to a nonscan cell.

WHAT NEXT

If you want to make the cell a nonscan cell, no action is necessary. If you want to make (or keep) the cell a scan cell, correct the scan specification you created with `set_scan_element`. You need to ensure that that you apply a `set_scan_element true` to the cell.

TEST-203 (information) Faults on bidirectional (INOUT) pins are not considered, e.g. pin %s of cell %s (%s).

DESCRIPTION

Faults on bidirectional pins will not be added to the master fault list that `create_test_pattern` uses. Consequently `create_test_patterns` will not attempt to detect faults on these bidirectional pins. However, pins of gates that are connected to bidirectional pins will be added to the master fault list.

WHAT NEXT

This message is purely an informational message; no action is required.

TEST-204 (information) Latch cell %s (%s) assumed nonscan and using transparent latch model for testing.

DESCRIPTION

The `check_test` command issues this message to inform you that the specified level-

sensitive sequential element will be modeled using a transparent latch model during automatic test pattern generation (ATPG). The transparent latch model treats the latch as a buffer (data input to latch drives data output of latch) when the enable is in its active state. However, when the latch enable is in its inactive state, the latch output is treated as unknown (a logic X).

DFT Compiler models nonscan latches in four ways for ATPG:

- a) As black boxes
- b) As synchronization elements
- c) As transparent devices
- d) As sequential elements (in partial scan only)

By default, the **create_test_patterns** command treats all nonscan level-sensitive sequential elements in the design as black boxes during ATPG, except for elements that are recognized by **check_test** as synchronization elements.

However, you can choose to have ATPG use the transparent model by using the **set_scan_transparent true -existing** command. This command sets a **scan_latch_transparent** attribute on latch cells. (For details, see the **set_scan_transparent** man page.)

WHAT NEXT

This is an informational message; therefore, if you want to accept the use of the transparent latch model for the specified latch, no action is necessary. However, be advised that treating synchronization latches or scan-out lock-up latches as transparent causes more design rule violations and can significantly lower the fault coverage that ATPG can achieve.

If you do not want the transparent model to be used for the specified latch cell, set the **set_scan_transparent** attribute to *false* by executing **set_scan_transparent -false**, and re-run **check_test**. Alternatively, to remove individual **scan_latch_transparent** attributes, use the **remove_attribute** command.

SEE ALSO

check_test (2), **set_scan_transparent** (2).

TEST-206 (error) Required logic %d on pin %s/%s conflicts with required logic %d on pin %s/%s.

DESCRIPTION

The DFT Compiler **create_test_patterns** command issues this message when it detects contradictory requirements between two pins directly connected by a net.

When DFT Compiler issues this violation, it does not generate test vectors, since it is impossible for any vector to fulfill both requirements.

WHAT NEXT

Identify the unnecessary **set_test_require** and remove it using **remove_attribute**. Rerun **create_test_patterns**.

You can generate a report of the assertions that you specified (effects of **set_test_hold** and **set_test_require**) by entering

```
report_test -assertions
```

TEST-207 (error) Required logic %d on pin %s/%s conflicts with required logic %d on port %s.

DESCRIPTION

The DFT Compiler **create_test_patterns** command issues this message when it detects contradictory requirements between a pin and a port directly connected by a net. The required value on the port may have been specified using the **set_test_hold** command if the port is an input port, or using the **set_test_require** command.

When DFT Compiler issues this violation, it does not generate test vectors, since it is impossible for any vector to fulfill both requirements.

WHAT NEXT

Identify the unnecessary **set_test_require** or **set_test_hold** and remove it using **remove_attribute**. Rerun **create_test_patterns**.

You can generate a report of the assertions that you specified (effects of **set_test_hold** and **set_test_require**) by entering

```
report_test -assertions
```

TEST-208 (information) No tests generated - conflicting signal requirements in design. Use the 'report_test -atpg_conflicts' command for more information.

DESCRIPTION

DFT Compiler issues this message when it detects a condition that prevents valid test patterns from being generated.

Possible sources of conflicting signal requirements include:

- Three-state decoding logic that cannot be operated without creating float or

contention.

- Requirements that you defined with **set_test_require** and **set_test_hold** that create contention or float on a three-state net.
- Contradictory requirements that you defined with **set_test_hold** and **set_test_require** that cannot be satisfied. For example, requiring that the output of an AND gate is a logic 1 while also requiring that an input of the gate is at a logic 0.

WHAT NEXT

Generate a report that identifies the causes of the conflicts and lists the circuit elements involved. To generate a report of ATPG conflicts enter

```
report_test -atpg_conflicts
```

You might also find it useful to generate a report of the assertions (effects of **set_test_hold** and **set_test_require**) by entering

```
report_test -assertions
```

If the conflict is due to constraints that you defined, remove the condition that cannot be satisfied and rerun **create_test_patterns**.

If the conflict is due to the design of three-state decoding logic, you need to correct the logic; otherwise, if you can accept the float or contention, run **create_test_patterns** with **-check_contention false** or **-check_float false**. Be very careful with disabling contention checking; it might result in test vectors that can cause damage to your ASIC during manufacturing test.

TEST-210 (error) Generation of test vectors terminated abnormally.

DESCRIPTION

This message tells you that DFT Compiler could not recover from processing errors that occurred during test pattern creation.

WHAT NEXT

Study accompanying error messages and fix the problems reported.

TEST-211 (information) DFT insertion was not successful.

There were unrecoverable processing errors.

DESCRIPTION

This message tells you that DFT Compiler could not recover from processing errors that occurred during DFT insertion. DFT insertion has exited, without modifying your design.

WHAT NEXT

Study accompanying error messages and fix the problems reported.

TEST-212 (error) Checking of test design rules terminated abnormally.

DESCRIPTION

This message tells you that DFT Compiler could not recover from processing errors that occurred during test design rule checking.

WHAT NEXT

Study accompanying error messages and fix the problems reported.

TEST-213 (warning) Making scan cells non-scan to meet area constraints.

DESCRIPTION

DFT Compiler can make scan cells nonscan to meet area constraints. Use this capability when you need to back off scan in a small percentage of cells to meet critical area constraints.

Fault coverage results can degrade significantly if you apply unrealistic area constraints. For example, if you `set_max_area 0`, it only scans cells that have `true set_scan_element` attributes.

WHAT NEXT

Check design fault coverage. Relax area constraints to improve results.

TEST-214 (warning) Flip-flop-based clock gating is not supported. Cell %s is treated as an ordinary flip-flop and is not scan-replaced.

DESCRIPTION

You receive this message if your design uses flip-flop-based clock gating, which is not currently supported by DFT Compiler. This message is to warn you that Power Compiler sets the **dont_touch** attribute on the logic it inserts for clock gating; thus, flip-flops used for clock gating are not scan replaced, and are treated as non-scan cells.

WHAT NEXT

If the clock gating logic was not inserted by Power Compiler, set the **dont_touch** attribute on the clock gating flip-flops yourself. Otherwise, these flip-flops might be scan-replaced.

If the ATPG coverage is not acceptable, use latch-based clock gating instead.

TEST-215 (information) No test design rule violation needs to be fixed by Autofix.

DESCRIPTION

The purpose of AutoFix is the following: Each scan flip-flop in a design must be clocked by a signal that can be controlled by a primary input port. Otherwise, clocking of data into the flip-flop cannot be controlled during test. In addition, the asynchronous preset and clear inputs of each flip-flop must be inactive during test. Otherwise, the data in the flip-flop can be set or cleared at any time, leaving unknown data in the flip-flop.

If the clock input and/or the asynchronous signals of a flip-flop are not controllable, the test design rule checker flags that the flip-flop has a test design rule violation that needs to be fixed during AutoFix.

The TEST-215 message indicates that the test design rule checker does not report uncontrollable clock and/or uncontrollable asynchronous signals to allow the activation of the AutoFix feature.

The TEST-215 information message might be followed by the TEST-211 information message if no DFT logic needs to be inserted into the design.

WHAT NEXT

Check the test design rule checker violations and apply the correct DFT technique.

If no AutoFix test point is required, you might want to directly apply the full scan technique.

SEE ALSO

`dft_drc` (2), `preview_dft` (2), `insert_dft` (2).

TEST-217 (information) Starting test protocol inference for existing scan design.

DESCRIPTION

The `infer_test_protocol` command issues this message for existing scan design. An existing scan design is a design where all the sequential elements that you selected as scannable are scan replaced and the scan chains have been routed.

WHAT NEXT

No action is required.

TEST-218 (information) Starting test protocol inference for unrouted scan design.

DESCRIPTION

The `infer_test_protocol` command issues this message when it is dealing with unrouted scan design. An unrouted scan design is a design where all the sequential elements that you selected as scannable are scan replaced, but the scan chains are not routed.

WHAT NEXT

No action is required.

TEST-219 (information) Starting test protocol creation.

DESCRIPTION

You receive this information message when you execute the `create_test_protocol` command. The message indicates the start of the test protocol creation.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`create_test_protocol (2)`.

TEST-220 (information) Starting test design rule checking for existing scan design.

DESCRIPTION

An existing scan design is a design where all the sequential elements that you selected as scannable are scan replaced and the scan chains have been routed. For example, if you issue the commands

```
set_scan_configuration -replace true -route true insert_scan check_test  
check_test classifies your design as an existing scan design.
```

Note that the design has been scan replaced, but not scan routed. Now, you will not see this message, but you will see TEST-221 instead.

If you are reading in a design from a gate-level ASCII format (Verilog, VHDL, or EDIF), which is existing scan, you should issue the command

```
set_scan_configuration -existing_scan true  
before running check_test to indicate that the design has existing scan.
```

WHAT NEXT

No action is required.

TEST-221 (information) Starting test design rule checking for unrouted scan design.

DESCRIPTION

An unrouted scan design is a design where all the sequential elements that you selected as scannable are scan replaced, but the scan chains are not routed. For example, if you issue the commands

```
set_scan_configuration -replace true -route false insert_scan check_test
```

```
check_test classifies your design as an unrouted scan design.
```

Similarly, if you issue the commands

```
compile -scan check_test
```

```
check_test classifies your design as an unrouted scan design.
```

Note that if the design has been both scan replaced and scan routed, you will not see this message, but you will see TEST-220 instead.

If you are reading in a design from a gate-level ASCII format (Verilog, VHDL, or EDIF) which is an unrouted scan design, you should issue the command

```
set_scan_configuration -existing_scan true
```

before running check_test to indicate that the design has unrouted scan.

WHAT NEXT

No action is required.

TEST-222 (information) Starting test design rule checking.

DESCRIPTION

The check_test command issues this message for nonscan designs. A nonscan scan design is a design where the sequential elements are not scan replaced.

For example, if you issue the commands

```
compile check_test
```

```
check_test classifies your design as a nonscan scan design.
```

The check_test command can also classify designs as existing scan (TEST-220) or unrouted scan (TEST-221).

If you are reading in a design from a gate-level ASCII format (Verilog, VHDL, or EDIF), by default, check_test classifies the design as nonscan unless you issue the commands

```
set_scan_configuration -existing_scan true check_test
```

You can also explicitly indicate that a design is nonscan by issuing the command

```
set_scan_configuration -existing_scan false
```

before running check_test.

WHAT NEXT

If you want check_test to classify the design as nonscan, no action is required. However, if you want check_test to classify the design as existing scan or unrouted scan, issue the command

```
set_scan_configuration -existing_scan true  
before running check_test.
```

TEST-223 (warning) Ignoring set_test_hold on test port '%s'.

DESCRIPTION

The **set_test_hold** command is ignored on the TAP port signals because DFT Compiler must control all these signals automatically.

WHAT NEXT

To tell DFT Compiler that BSD logic has been added you can specify the TAP ports and set the BSD attributes as follows: current_design TOP set_signal_type "tdi" my_tdi set_signal_type "tdo" my_tdo set_signal_type "tms" my_tms set_signal_type "tck" my_tck set_signal_type "trst" my_trst set_attribute current_design is_bsd_inserted true -type boolean

Once these attributes are set, **insert_scan** will automatically control the trst pin so that the BSD logic is in bypass mode.

TEST-224 (warning) Target library for design contains no scan-cell models.

DESCRIPTION

Many DFT Compiler capabilities require additional information in the Synopsys library models for scan cells. In this case, the selected target library (or libraries) contain no such extended models.

Depending on the application, the lack of scan cell models may or may not be serious. You will not be able to insert scan cells with the **insert_test** command, and test pattern generation may also be affected.

WHAT NEXT

If you are using an ASIC vendor-supplied library, contact them to confirm whether scan cell models have been included in the library.

If you develop your own Synopsys libraries, refer to the *Library Compiler Reference Manual* in the chapter on modelling scan cells. You can usually supply the additional information very quickly.

TEST-225 (Information) Design has scan chains and unmapped logic.

DESCRIPTION

This message is issued during DFT DRC when the design has unmapped components and also has scan chains. The tool will run PRE DFT DRC in this case.

WHAT NEXT

If the message is issued after `insert_dft`, recheck whether all logic has been mapped during insertion. Also ensure that the target library has all the needed replacements.

TEST-230 (information) No BSR or TAP ports with port_is_pad attribute 'TRUE' encountered. JTAG synthesis will not include pad synthesis.

DESCRIPTION

The JTAG Boundary Scan Register (BSR) associates a register with each I/O pad of a device. These registers can either 'capture' (observe) or 'apply' (control) values at the pads. The registers are serially chained together to form the BSR. Values are set and read serially through the BSR. Typically, all non-TAP (Test Access Port) ports are included in the BSR.

Unless `insert_jtag` is invoked with the `-no_pads` option, Test Compiler will execute pad synthesis along with JTAG synthesis on all ports having the `port_is_pad` attribute set using `set_port_is_pad`. Ports not having this attribute set will be processed for inclusion in the BSR (provided they have not been excluded using `set_jtag_port FALSE {port_list}` command) but will not have pads synthesized for them.

This information message is issued when `insert_jtag` has been invoked without the `-no_pads` option, but no existing JTAG TAP ports or BSR ports have the `port_is_pad` attribute set. In this case, JTAG synthesis will *NOT* include pad synthesis. In other words, JTAG synthesis will proceed as if it had been invoked with `insert_jtag -no_pads`.

WHAT NEXT

If you require pad synthesis as a part of JTAG synthesis, set the **port_is_pad** attribute using the **set_port_is_pad** command on each port you want DFT Compiler to include in the BSR or existing TAP port. Do not assign the **port_is_pad** attribute to internal module ports.

One way to specify ports as pads is to execute **set_port_is_pad find (port,"*")** on the current_design.

If you do not want pad synthesis as a by-product of JTAG synthesis, execute **insert_jtag -no_pads**.

'BACKDOOR' PAD SYNTHESIS WITH JTAG

There is a 'backdoor' method for doing JTAG pad synthesis without using **set_port_is_pad** using **insert_jtag -no_pads**.

Using **set_jtag_implementation <component_type> <implementation> [list_of_ports]** where the **<implementation>** is in fact a pad cell, along with **insert_jtag -no_pads** will synthesize JTAG with pads, provided those pad cells have the satisfactory JTAG BSR logic in them. The following *WILL* synthesize JTAG with pads.

```
set_jtag_implementation BSRINBOTH some_inboth_pad_cell {list_of_input_ports}
set_jtag_implementation BSROUTBOTH some_outboth_pad_cell {list_of_output_ports}

insert_jtag -no_pads
```

TEST-231 (warning) Specified Instruction Register (IR) size (%d) is larger than the minimum (%d) required by the %d JTAG instructions recognized.
(Size specified will be used.)

DESCRIPTION

The IEEE 1149.1 JTAG Standard requires that the JTAG Instruction Register (IR) be at least two bits wide. DFT Compiler supports IRs from 2 to 32 bits wide. You can set the size of the IR in 3 ways:

1. Specify the size using **insert_jtag -ir_size bit_width**.
2. Force the IR size by specifying an instruction code
set_jtag_instruction -code "code".
3. Let DFT Compiler automatically infer the IR size from the set of specified and mandatory instructions you selected.

If you use one of the first two methods for fixing IR size, the IR may end up larger than required by the number of instructions recognized by DFT Compiler. If you use

the third method, DFT Compiler selects the smallest possible IR size (bit-width).

IR size affects test application time, since instructions are loaded serially into the IR from the JTAG TDI port. The smaller the IR, the faster the serial load.

WHAT NEXT

If IR size has been determined by user-specified instruction codes, reduce the size to the minimum shown in this message by shortening these codes.

If IR size has been determined by a call to `insert_jtag -ir_size number_of_cells`, change the `number_of_cells` to the number reported in this warning message.

If you do not specify any instruction codes, DFT Compiler automatically infers the IR size and generates the codes.

TEST-232 (information) %d-bit JTAG Instruction Register (IR) being synthesized.

DESCRIPTION

The IEEE 1149.1 JTAG Standard requires that the JTAG Instruction Register (IR) be at least two bits wide. DFT Compiler supports IRs from 2 to 32 bits wide. You can set the size of the IR in 3 ways:

1. Specify the size using `insert_jtag -ir_size bit_width`.
2. Force the IR size by specifying an instruction code `set_jtag_instruction -code "code"`.
3. Let DFT Compiler automatically infer the IR size from the set of specified and mandatory instructions you selected.

This information message tells you the size of the IR being synthesized.

WHAT NEXT

To change the size of the IR, use one of the three methods described above.

TEST-233 (error) Conflicting routing positions have been assigned to a Boundary Scan

Register cell. The conflict occurs because a BSR cell assigned routing

position %d associated with port '%s' has been merged with

a BSR cell assigned routing position %d associated with port '%s'.

DESCRIPTION

In some cases, several BSR cells can be merged into a single BSR cell. For example, a single BSR control cell can control multiple three-state outputs. Another example is when a design contains a feed-through where an input port drives only an output port. In both of these cases, only a single BSR cell is required. If you assign different routing positions to two or more BSR cells that are merged into a single BSR cell, this conflict occurs.

Since a single JTAG BSR control cell can control the three-state drivers of a number of output or bidirectional ports, routing position conflicts cannot be checked if that BSR cell has been identified with different annotated port names.

For example, suppose ports **X** and **Y** have the same control cell, and you assign **X/ctl** and **Y/ctl**. When you issue the **insert_jtag** command, DFT Compiler determines whether a single control cell can control multiple ports. The **set_jtag_port_routing_order** command does not identify potential conflicts in control cell assignments.

WHAT NEXT

Assign a single routing position to the unique BSR cell formed. Eliminate duplicate specifications of routing position for control cells specified more than once. To identify duplicate specifications, check the routing positions reported in the warning message.

TEST-234 (error) JTAG component library '%s' not found.

DESCRIPTION

DFT Compiler synthesizes JTAG logic from a library of generic JTAG components called **jtag.db**. The generic components include the TAP controller, the BYPASS register, the ID register and I/O pad JTAG logic for the Boundary Scan Register (BSR) input, output and control cells.

WHAT NEXT

Since DFT Compiler must have access to **jtag.db** to synthesize JTAG logic, include **jtag.db** in the search path.

TEST-235 (information) Conflicting JTAG Boundary Scan Register (BSR) membership

specifications encountered. BSR cell optimization has pushed the '%s' BSR cell associated with port '%s' onto a port which has been excluded from the JTAG BSR.

DESCRIPTION

This error occurs when you set conflicting BSR cell requirements by excluding necessary ports from the BSR. In such cases, DFT Compiler issues warning messages TEST-236 and TEST-240, as well as this information message.

You can exclude ports from the BSR with the **set_jtag_port FALSE** *list_of_ports* command. When DFT Compiler optimizes your design, it uses the fewest BSR cells possible, and the port you excluded may be required for the BSR. For example, a single BSR control cell can control the three-state controls of many different output ports. Similarly, in the case of a feed-through line (where an input *only* feeds an output), only a single BSR cell is required.

If you exclude an input port that acts as the three-state control signal for a set of output ports, for example, the BSR will not have any control cells associated with these ports. The IEEE 1149.1 JTAG standard does not allow such a configuration.

WHAT NEXT

The name of the excluded port that caused the conflict is reported by message TEST-240. Use the **set_jtag_port TRUE** command to include the port in the BSR.

TEST-236 (warning) JTAG configuration synthesized is not compliant with the IEEE 1149.1 JTAG Standard.

DESCRIPTION

The IEEE 1149.1 JTAG Standard specifies implementations for JTAG Boundary Scan. Certain user-specified constraints cause **insert_jtag** to synthesize JTAG logic which does not comply with the standard.

WHAT NEXT

This message is always issued in conjunction with an information message that specifies the reason the configuration does not comply. Determine what action is required based on that information message.

TEST-237 (error) Unable to find pin '%s' of JTAG component '%s' in the JTAG component library '%s'.

DESCRIPTION

DFT Compiler synthesizes JTAG logic from a library of generic JTAG components. These components include the TAP controller, the BYPASS register, the ID register and I/O pad JTAG logic for the Boundary Scan Register (BSR) input, output and control cells. All JTAG components must have the I/O pins required by the IEEE 1149.1 standard.

If DFT Compiler cannot access one of the required pins of a JTAG component, this error message is issued.

WHAT NEXT

Verify the specified component to determine whether all its pins are properly named.

TEST-238 (error) JTAG component '%s', associated with option string '%s' not found in the JTAG component library associated with this design.

DESCRIPTION

DFT Compiler selects the various JTAG components (the TAP controller, Bypass, Instruction, and Identification registers, and the various types of Boundary Scan Register cells) from a JTAG component library. You must specify a path to this library. This message is generated if DFT Compiler cannot find the component you requested in this JTAG component library.

WHAT NEXT

If the missing component is a user-specified component, check that it has been correctly identified and that it has been included in the JTAG component library under this name. If the missing component is a default component, rebuild the jtag.db to include all default components contained in the jtag.db library provided with DFT Compiler.

TEST-239 (information) %d core scan chain(s) recognized.

DESCRIPTION

DFT Compiler's JTAG synthesis supports connection of, and access to, internal (core) scan chains via the chip's JTAG Test Access Port (TAP). Core scan chains differ from the JTAG boundary scan chain, in that they are dedicated to the testing of the core design itself. In order to generate the appropriate number of JTAG instructions, DFT Compiler first analyzes the design to determine how many core scan chains exist.

If the designer has selected parallel (not daisy-chained) connection of core scan chains, a unique JTAG instruction will be defined for each core scan chain. Thus the number of core scan chains recognized will effect the size of the JTAG Instruction register (IR).

This information message simply provides information about the number of core scan chains recognized in the design by DFT Compiler.

WHAT NEXT

To recognize core scan chains, DFT Compiler keys off the port attribute and scan index number specifying each scan chain. If the number of scan chains recognized seems to be incorrect, check that each scan chain port has the proper assignment of these attributes.

If you do not want to connect internal scan chains to the TAP, invoke **insert_jtag -no_internal_scan**.

TEST-240 (information) Port '%s' BSR cell '%s' is excluded from the BSR.

DESCRIPTION

It is possible for the user to establish conflicting membership requirements when excluding certain ports from the BSR. If, for instance, using **set_jtag_port FALSE list_of_ports**, s/he excludes an input port which is the three-state control signal for a set of output ports, then no BSR control cells associated with these ports will exist. This is a configuration which is *not* compliant with the IEEE 1149.1 JTAG standard. When such cases are encountered by DFT Compiler, warning messages TEST-235 and TEST-236 are issued as well as this information message.

In most cases, the reported BSR cell name identifies the excluded port causing the reported port's BSR cell to be excluded.

The type (input, output or control) of BSR cell excluded is reported by TEST-235.

WHAT NEXT

To remove the non-compliance, resolve the conflict.

TEST-241 (information) BSR cell ‘%s’ shifted from position %d to position %d.

DESCRIPTION

It is possible for the user to specify erroneous Boundary Scan Register (BSR) routing order criteria if ports have been excluded from the BSR. While some of these cases can be trapped when **set_jtag_port_routing_order** is invoked, other cases can only be trapped after DFT Compiler determines which BSR cells are associated with which ports. If for instance, using **set_jtag_port FALSE list_of_ports**, the user excludes an input port which is the three-state control signal for a set of output ports, then no BSR control cells associated with these ports will exist. Yet if the user has specified a routing order for one or more of these excluded control cells, then the positions s/he specifies for later cells shift ‘forward’ in the BSR.

When DFT Compiler encounters such a case, it automatically shifts the positions of the remaining BSR cells. This information is reported in this error message and is duplicated in the **report_test -port** report.

This is a configuration which is *not* compliant with the IEEE 1149.1 JTAG standard. When such cases are encountered by DFT Compiler, warning messages TEST-235, TEST-236 and TEST-240 are issued as well as this information message.

WHAT NEXT

To remove the non-compliance, resolve the conflict.

TEST-242 (Warning) TAP input signal ‘%s’ shared with a non-JTAG port.

DESCRIPTION

For JTAG TAP input ports (**TDI**, **TMS**, **TCK** and **TRST**), it is possible to synthesize a JTAG implementation where the signal fans out to the JTAG logic and the (non-JTAG) core logic. Such an implementation is not compliant with the IEEE 1149.1 JTAG standard.

WHAT NEXT

Ensure that your TAP input signal is not shared with non-JTAG logic.

TEST-243 (error) Shared output signal ‘%s’ cannot be used as TDO.

DESCRIPTION

For JTAG TAP input ports (**TDI**, **TMS**, **TCK** and **TRST**), it is possible to synthesize a JTAG implementation where the signal fans out to the JTAG logic and the (non-JTAG) core logic. Such an implementation is not compliant with the IEEE 1149.1 JTAG standard. However is not possible to support a dual purpose **TDO** signal since this would require either synthesis of a MUX (with its associated JTAG/non-JTAG control signal) or tolerate a wired AND/wired OR configuration for this output port. Both options compromise the operation of the JTAG TDO.

Therefore in the case of a dual purpose **TDO**, this error message is generated, and JTAG synthesis is aborted.

WHAT NEXT

Remove the **set_signal_type jtag_tdo** attribute from the offending port, or ensure that that port is not connected to a core net.

TEST-244 (Warning) TAP port ‘%s’ is not dedicated to JTAG. Implementation will be non-compliant.

DESCRIPTION

Rule 3.1.1(c) of the IEEE 1149.1 standard specifies that "All TAP inputs and outputs shall be dedicated connections to the component (i.e., the pins used shall not be used for any other purpose)."

Thus it is non compliant with the standard to share TAP ports with other signals (such as core scan ports). If the user executes a

```
set_signal_type jtag_tdi <existing_port>
set_signal_type jtag_tdo <existing_port>,
set_signal_type jtag_tms <existing_port>,
set_signal_type jtag_tck <existing_port>, or
set_signal_type jtag_trst <existing_port>Pf
```

where the existing port is connected to a non-TAP signal, then the synthesized JTAG implementation will be non-compliant with the standard.

One of the reasons that the resulting implementation is non-compliant with the standard is that TAP ports are automatically excluded from the JTAG Boundary Scan Register. (See warning message **UIT-93**).

WHAT NEXT

Remove the **set_signal_type** attribute from the offending port.

TEST-245 (error) Component ‘%s’ of type ‘%s’ is missing signal ‘%s’.

DESCRIPTION

When DFT Compiler executes JTAG synthesis, it uses several JTAG component building blocks that are selected from the JTAG component library. These components include the TAP controller, Bypass Register, ID register, and I/O pad JTAG logic. DFT Compiler recognizes and selects JTAG library components by their names. The following default components are supplied with the JTAG component library:

TYPE	DEFAULT NAME	FUNCTION
- TAP	JTAG_TAP	TAP controller
- BR	JTAG_BR	Bypass register
- ID	JTAG_ID	Device ID register
- IR	JTAG_IR	Instruction register
- BSRINBOTHJTAG_BSRINBOTHBSR		input cell
- BSRINSETJTAG_BSRINSETBSR		input set-only cell
- BSRINOBSJTAG_BSRINBOPBSR		input observe-only cell
- BSROUTBOTHJTAG_BSROUTBOTHBSR		output cell
- BSROUTSETG_BSROUTSETBSR		output set-only cell
- BSROUTOBSJTAG_BSROUTOBSBSR		output observe-only cell
- BSRCTL	JTAG_BSRCTL	BSR control cell
- BSRINCLKBOTHJTAG_BSRINCLKBOTHBSR		clock driver cell
- BSRINCLKSETG_BSRINCLKSETBSR		clock driver set-only cell
- BSRINCLKOBSJTAG_BSRINCLKOBSBSR		clock driver observe-only cell

JTAG synthesis can be invoked using JTAG component implementations that differ from the DFT Compiler default component implementations. When the designer specifies an alternate implementation, DFT Compiler checks to see that the mandatory I/O pins associated with the specified component type exist and have the correct signal direction. These signals are specified by the IEEE 1149.1 JTAG standard.

This error message is generated if DFT Compiler could not find one of these mandatory signals. The signal may be missing or misnamed.

Checking JTAG Instruction Register (IR) implementations poses problems.

DFT Compiler supports IRs of length N , where $2 \leq N \leq 32$ bits wide. Error-checking is executed to ensure that the required signals exist so as to permit successful JTAG synthesis.

Mandatory signals include

- **CLOCKIR**,
- **SHIFTIR**,
- **UPDATEIR**,

- **TDI** and
- **TDO**.

Certain signals must exist for all N bits of the IR:

- **CLEARN**,
- **SETN**,
- **DIN** and
- **DON**

For IRs, this check is potentially executed twice during JTAG synthesis. If the user invokes **set_jtag_implementation IR <custom_implementation>**, the check is executed. It is difficult to identify the desired length of the IR, however, so the check is made only for the two lowest-order bits of the IR. This is a basic sanity check for the **set_jtag_implementation** command.

When **insert_jtag** is invoked, the check is reexecuted. Now, however, DFT Compiler knows the desired size, N , of the IR, so it checks for the N low-order bits. If a problem occurs, **insert_jtag** ends gracefully.

WHAT NEXT

Correct the alternate JTAG component implementation to conform with the IEEE 1149.1 standard and DFT Compiler's JTAG signal naming conventions.

**TEST-246 (error) JTAG component ‘%s’ of type ‘%s’: Erroneous signal ‘%s’ direction ‘%s’.
Must have direction ‘%s’.**

DESCRIPTION

When DFT Compiler executes JTAG synthesis, it uses several JTAG component building blocks that are selected from the JTAG component library. These components include the TAP controller, the Bypass Register, the ID register and I/O pad JTAG logic. DFT Compiler recognizes and selects JTAG library components by their names. The following default components are supplied with the JTAG component library:

TYPE	DEFAULT NAME	FUNCTION
-	TAPJTAG_TAP	TAP controller
-	BRJTAG_BR	Bypass register
-	IDJTAG_ID	Device ID register
-	IRJTAG_IR	Instruction register
-	BSRINBOTHJTAG_BSRINBOTHBSR	input cell
-	BSRINSETJTAG_BSRINSETBSR	input set-only cell
-	BSRINOBSJTAG_BSRINOBSBSR	input observe-only cell
-	BSROUTBOTHJTAG_BSROUTBOTHBSR	output cell
-	BSROUTSETJTAG_BSROUTSETBSR	output set-only cell
-	BSROUTOBSJTAG_BSROUTOBSBSR	output observe-only cell
-	BSRCTLJTAG_BSRCTLBSR	control cell

- **BSRINCLKBOTHJTAG_BSRINCLKBOTH**BSR clock driver cell
- **BSRINCLKSETJTAG_BSRINCLKSET**BSR clock driver set-only cell
- **BSRINCLKOBSSJTAG_BSRINCLKOBSS**BSR clock driver observe-only cell

JTAG synthesis can be invoked using JTAG component implementations that differ from the DFT Compiler default component implementations. When the designer specifies an alternate implementation, DFT Compiler checks to see that the mandatory I/O pins associated with the specified component type exist and have the correct signal direction. These signals are specified by the IEEE 1149.1 JTAG standard.

This error message is generated if one of the mandatory signals has an incorrect sense.

WHAT NEXT

Correct the alternate JTAG component implementation to conform with the IEEE 1149.1 standard and DFT Compiler's JTAG signal naming convention.

TEST-247 (information) Conflicting JTAG Boundary Scan Register (BSR) membership.

BSR cell optimization has pushed the BSR cell associated with port

'%s' onto JTAG Test Access Port (TAP) '%s'
which is excluded from the JTAG BSR.

DESCRIPTION

DFT Compiler optimizes the number of BSR cells required. For example, if the design includes a feed-through line (where an input only drives an output), only a single BSR cell is required. The BSR cell associated with the output port can be merged with the BSR cell associated with the input port.

However, it is an error for one of JTAG Test Access Port (TAP) signals to be included in the BSR.

- TDI: JTAG Test Data In
- TDO: JTAG Test Data Out
- TMS: JTAG Test Mode Select
- TCK: JTAG Test Clock
- TRST: JTAG Test Reset

Thus, if one of these ports acts as a feed-through line, none of the driven logic can be controlled through the BSR, and BSR cell optimization fails. Such a design is not compliant with the IEEE 1149.1 standard. If such a condition is uncovered, this error message is generated and DFT Compiler aborts JTAG synthesis.

WHAT NEXT

A design containing such a conflict probably is incorrect since TAP ports should not effect non-JTAG functionality. Make sure the driven signal is driven by a input port that can be included in the BSR.

TEST-248 (warning) JTAG Test Access Port (TAP) does not include the asynchronous reset signal TRST. A Default protocol placing the JTAG logic in transparent mode cannot be automatically generated.

DESCRIPTION

In order to automatically generate the Test Protocol required to generate test vectors for a design, DFT Compiler *must* first simulate that design. In order to execute test pattern generation on a design containing JTAG logic, the JTAG logic must be placed in transparent mode since in transparent mode, DFT Compiler can recognize and manipulate scan chains in the design. To place the JTAG logic in transparent mode, the JTAG TAP controller must be reset. There are two ways to do this; synchronously and asynchronously. If the JTAG TAP does not include an asynchronous reset signal, the TAP controller must be reset synchronously. Unfortunately, since a simulator cannot infer a known state from an unknown state, only a JTAG TAP controller with an asynchronous reset can be simulated. This error message is generate if the TAP does not include the asynchronous reset.

WHAT NEXT

If you require that DFT Compiler automatically generate the Test Protocol, invoke **insert_jtag** without the **-no_asynchronous_reset** option. If you require a design without the TAP asynchronous reset signal, manually generate the Test Protocol required for test vector generation.

TEST-249 (error) Pad exists on port '%s' to be included in the JTAG Boundary Scan Register. The pad must be removed.

DESCRIPTION

Circuits with existing pads pose a special case for JTAG synthesis. Whether or not

JTAG is invoked in **-no_pads** mode, these existing I/O pads must be removed prior to JTAG synthesis.

If the preexisting I/O pads already contain some functional logic (perhaps complete JTAG logic, perhaps just a MUX, and so on), we are unable to recognize the nature of that functionality and decide what additional JTAG logic must be synthesized for the boundary scan register (BSR). In addition, in the case of complex I/O pads (ranging from bidirectionals and three-states to complex pads containing JTAG), it is not easy to know where the "inside" of the pad is or where it ends and where the core begins. The problem is made more difficult in those technology libraries where a complex pad may be built up of some standard core components and some components that are placed in the pad region of the IC package.

For this reason, JTAG synthesis gracefully terminates in the presence of pads on those ports that are included in the BSR, and this error message is produced.

We encourage the designer to adopt a design flow that completes core design and adds test logic prior to adding pads.

WHAT NEXT

If the designer is sure that the existing I/O pads of his or her design will not conflict functionally with the synthesized JTAG logic, it is sufficient to do a group of all the core logic except the pads, submit the core to TC for **insert_jtag -no_pads**, and then replace the old core with the new core (new core to comprise the old core and the synthesized JTAG logic).

If the designer must use a specific I/O pad containing complete JTAG logic, one acceptable approach is to use

```
set_jtag_implementation <bsr_component_type> <my_I/O_pad_type> [list_of_ports]
```

and invoke **insert_jtag -no_pads**.

The **<bsr_component_type>** is one of the **Types** listed below and results in replacing the associated generic component with the associated **Default Name** by **<my_I/O_pad_type>**.

TypeDefault NameBSR Cell Function

BSRINBOTHJTAG_BSRINBOTHset and observe data input cell
BSRINSETJTAG_BSRINSETset-only data input cell
BSRINOBSJTAG_BSRINOBSSobserve-only data input cell
BSRINCLKBOTHJTAG_BSRINCLKBOTHset and observe clock input cell
BSRINCLKSETJTAG_BSRINCLKSETset-only clock input cell
BSRINCLKOBSJTAG_BSRINCLKOBSobserve-only clock input cell
BSROUTBOTHJTAG_BSROUTBOTHset and observe data output cell
BSROUTSETJTAG_BSROUTSETset-only data output cell
BSROUTOBSJTAG_BSROUTOBSobserve-only data output cell
BSRCTLJTAG_BSRCTLcontrol cell

This will result in instantiating the proper I/O pads with built-in JTAG logic. See

the DFT Compiler reference manual for further details.

TEST-250 (warning) Design has no bidirectional port mode information.

DESCRIPTION

During **check_test**, protocol inference needs to establish whether bidirectionals are turned inwards or outwards during scan shift.

If you used DFT Compiler to insert scan into the design, the information is annotated on the design.

This message is generated if scan is not inserted into the design, or DFT Compiler is not used, and **check_test** has to infer the direction bidirectional ports turn during scan shift.

WHAT NEXT

Study associated information messages and verify that **check_test** has inferred the correct direction.

TEST-251 (information) Test protocol assumes that bidirectional ports are turned %s during scan shift.

DESCRIPTION

During **check_test**, protocol inference needs to establish whether bidirectionals are turned inwards or outwards during scan shift.

If you used DFT Compiler to insert scan into the design, the information is annotated on the design.

If scan is not inserted into the design, or DFT Compiler is not used, **check_test** has to infer the direction bidirectional ports turn during scan shift.

This message tells you that protocol inferencing sees that you used **set_scan_configuration**, and assumes that you are preparing the design for **insert_scan**. It uses either the value you set using the **-bidi_mode** option, or the **insert_scan** default of "inwards".

WHAT NEXT

If **check_test** has not inferred the correct direction, use the **-bidi_mode** option of the **set_scan_configuration** to specify the correct direction, and run **check_test**.

again.

TEST-252 (information) Test protocol assumes that bidirectional ports are turned %s during scan shift.

DESCRIPTION

During **check_test**, protocol inferencing needs to establish whether bidirectionals are turned inwards or outwards during scan shift.

If you used DFT Compiler to insert scan into the design, the information is annotated on the design.

If scan is not inserted into the design, or DFT Compiler is not used, **check_test** has to infer the direction that bidirectional ports are turned during scan shift.

This message tells you that protocol inferencing sees that you did not used the **set_scan_configuration** command, but set the value of environment variable **test_force_bidir_pads_inwards**. It assumes that you are preparing the design for **insert_test** and uses the direction appropriate to the environment variable value.

WHAT NEXT

If **check_test** has not inferred the correct direction, change the value of environment variable **test_force_bidir_pads_inwards** and run **check_test** again.

TEST-253 (information) Test protocol assumes that bidirectional ports are turned %s during scan shift.

DESCRIPTION

During **check_test**, protocol inferencing needs to establish whether bidirectionals are turned inwards or outwards during scan shift.

If you have used DFT Compiler to insert scan into the design, the information is annotated on the design.

If scan is not inserted into the design, or DFT Compiler is not used, **check_test** has to infer the direction that the bidirectional ports are turned during scan shift.

This message tells you that protocol inferencing sees that you did not used the **set_scan_configuration** command, and did not set the value of environment variable **test_force_bidir_pads_inwards**. It assumes that you are going to use the default behavior of **insert_scan** to insert scan into your design, and uses the default direction of "inwards".

WHAT NEXT

If `check_test` has not inferred the correct direction and you do not intend using `insert_test` to put scan into your design, use `set_scan_configuration` to specify the correct direction and run `check_test` again.

If you want to use `insert_test`, change the value of environment variable `test_force_bidir_pads_inwards` and run `check_test` again.

TEST-254 (information) Scan insertion turned bidirectional ports %s during scan shift.

DESCRIPTION

During `check_test`, protocol inferencing needs to establish whether bidirectionals are turned inwards or outwards turned during scan shift.

If you used DFT Compiler to insert scan into the design, the information is annotated on the design.

This information message tells you the direction that DFT Compiler turned bidirectionals.

Note that this direction does not apply to scan ports, or degenerated bidirectional ports.

WHAT NEXT

Check your test protocol.

TEST-255 (error) Can not find pin %s in the design.

DESCRIPTION

This message indicates that an internal pin of the design can not be found during `insert_dft`. This situation generally occur when specific synthesis options that modify the design are applied.

WHAT NEXT

Please review your synthesis options in your script before using "insert_dft" command.

TEST-258 (error) Post-insertion DRC not supported in ScanCompression mode with integration or hybrid flow

DESCRIPTION

You received this message because you are trying to run **dft_drc** post insertion in ScanCompression mode with hybrid or integration enabled, in a hierarchical adaptive scan flow. This is not supported.

WHAT NEXT

You can use TetraMAX to run DRC.

SEE ALSO

dft_drc (2)

TEST-260 (information) Inferred %s clock port %s (%.1f,.1f).

DESCRIPTION

If you do not specify a test protocol for a design, the test design rule checker automatically infers a default protocol. Part of this process involves identifying the various clock ports of the design. The clock ports are identified by type (system, test, system/test or unused), sense (active high or active low), and default timing values (rise time and fall time as shown in this message).

WHAT NEXT

Check that the details of the inferred clock ports are suitable for your design. Use the **set_signal_type** and **create_clock** commands to specify the type and timing of clock ports if the default values are unsuitable.

TEST-261 (information) Inferred active %s asynchronous control port %s.

DESCRIPTION

If you do not specify a test protocol for a design, the test design rule checker automatically infers a default protocol. This involves identifying the ports of the design which control the state of asynchronous preset and clear signals of sequential cells. These ports are held inactive during serial shifting of scan data.

This message indicates when such a port has been inferred, and the sense (active high or active low) determined for the port.

WHAT NEXT

Check that the details of the inferred asynchronous control ports are appropriate for your design.

You can override the default protocol and the asynchronous control ports it identified by using a custom test protocol. See the **read_test_protocol** command for details.

TEST-262 (information) Inferred capture clock group : %s.

DESCRIPTION

During the parallel cycles of the scan-test sequence, the response of the design's combinational logic to applied test patterns is captured into the design's sequential cells. This is usually done by pulsing the system clocks while scan cells are configured in normal operation (parallel) mode.

For designs with multiple system clocks, not all clocks are usually active in one cycle. This is because when data is captured into cells controlled by one clock, the data at the inputs of cells controlled by a second clock may change. If both clocks were active in the same cycle, the data captured would be unpredictable. This situation occurs with two-phase latch-based design.

To ensure that data is reliably captured, test design rule checking analyzes all the clocks used to capture data and organizes them into compatible groups. All the clocks in a group can be active in the same cycle without causing unpredictable data to be captured. In many cases, each group will contain only one clock.

This message lists all the compatible clock ports which form a clock group.

WHAT NEXT

Check that the details of the inferred clock groups are appropriate for your design. The way clocks are grouped for test purposes usually reflects how they are to be used in normal operation.

TEST-263 (warning) Ignoring "test-hold" on port %s.

DESCRIPTION

This message indicates that there is a conflict between a custom test protocol (read in using the **read_test_protocol** command) and values set with the **set_test_hold**

command. The protocol and the **set_test_hold** command identify different values to be held at an input port during the parallel (normal) operation cycles of the scan-test sequence. The value (if any) specified in the protocol file takes precedence over the values set with the **set_test_hold** command.

WHAT NEXT

Edit your protocol file to reflect the values you wish to hold at input ports, or remove the attributes set with the **set_test_hold** command.

TEST-264 (information) This is a(n) %s test protocol

DESCRIPTION

This message informs you of the type of test protocol **check_test** is using in this run. The three possible types are

- inferred
- initialization
- custom

Test design rule check infers the inferred protocol from your design and test constraints. The initialization protocol comes from **read_init_protocol** for the initialization section; then, **check_test** infers the rest of the protocol. Custom test protocols are specified by the user using **read_test_protocol**.

WHAT NEXT

If the type of test protocol displayed is the type that you intended, then no further action is needed. However, if you had intended a type other than the one displayed in this message, then read in the desired type. For more information, refer to the manual pages for **read_test_protocol** and **read_init_protocol**.

TEST-265 (information) Identified %s clock port %s (%.1f,.1f).

DESCRIPTION

You receive this information message identifying the various clock ports of the design when you run the **create_test_protocol** command.

The clock ports are identified by type (system, test, system/test or unused), sense (active high or active low), and default timing values (rise time and fall time, as shown in this message).

WHAT NEXT

Check the details of the identified clock ports and ensure that they are suitable for your design. No action is required if you want to use the default values shown.

If the default values are unsatisfactory, you can specify the clock port type with the `set_signal_type` command and specify the clock port timing with the `create_clock` command.

SEE ALSO

`create_clock` (2), `create_test_protocol` (2), `set_signal_type` (2).

TEST-266 (information) Identified active %s asynchronous control port %s.

DESCRIPTION

You receive this information message because you specified asynchronous signals in your design.

The test design rule checker automatically identifies the ports of the design that control the state of asynchronous preset and clear signals of sequential cells. These ports are held inactive during serial shifting of scan data.

This message indicates that such a port has been identified, and it shows the sense (active high or active low) determined for the port.

WHAT NEXT

Check that the details of the asynchronous control ports are appropriate for your design. No action is required on your part if the details are satisfactory.

However, you can override the default protocol and the asynchronous control ports it identified by using a custom test protocol. See the `read_test_protocol` command for details.

SEE ALSO

`read_test_protocol` (2).

TEST-267 (error) The options -infer_clock or -infer_asynch

cannot be used in the presence of an initialization test protocol.

DESCRIPTION

You receive this error message because DFT Compiler detected that a test protocol has already been loaded. This is due to a `read_test_protocol` -section command issued previously.

You should not infer clocks and asynchronous signals in the presence of a test protocol initialization.

WHAT NEXT

Please, use `set_dft_signal` command to specify clocks and asynchronous signals or do not read a test protocol if you want DFT Compiler to infer clocks and asynchronous.

SEE ALSO

`read_test_protocol` (2). `set_dft_signal` (2).

TEST-268 (warning) The current design contains unmapped components. The output netlist might not be read back into the system.

DESCRIPTION

This warning occurs because `dft_drc` detects that there are references to GTECH components in the current design. When the design is not mapped, the tool might not be able to process a netlist with unmapped components.

TEST-280 (warning) Cell %s (%s) is always asynchronously set/cleared.

DESCRIPTION

When scan data is being shifted in and out of the design under test, the asynchronous preset and clear pins of sequential cells must be held inactive. The reported cell is always asynchronously preset or cleared, so the required condition for shifting scan data cannot be met.

WHAT NEXT

To maximize fault coverage, make all internal asynchronous preset and clear pins externally controllable. You can modify the design to introduce additional logic that disables internal preset and clear signals throughout testing, or just during scan shift.

TEST-281 (information) The network contains: %s.

DESCRIPTION

This message provides additional information in support of other messages. For example, it may report the cell pins that comprise an uncontrollable asynchronous preset/clear network.

WHAT NEXT

The message that appears before this message indicates the actual problem.

TEST-282 (information) The path contains: %s.

DESCRIPTION

This message provides additional information in support of other messages. For example, it can list the pins that form a path through the circuit between two sequential cells.

WHAT NEXT

The message that appears before this one indicates the actual problem.

TEST-283 (information) Cells with this violation : %s.

DESCRIPTION

This message supports other messages that identify specific scan-test design rule violations. If multiple cells have the same rule violation, and you specified the **-verbose** option for rule checking, this message lists all the cells with the same violation.

WHAT NEXT

The message that appears before this one indicates the actual problem.

TEST-284 (information) Pins with this violation : %s.

DESCRIPTION

This message supports other messages that identify specific types of scan-test design rule violations. If there are multiple pins with the same rule violation, and the -verbose option is specified for rule checking, this message lists all the violated pins.

WHAT NEXT

The message preceding this message indicates the actual problem.

TEST-285 (information) Cells with this condition : %s.

DESCRIPTION

This message supports other messages that identify specific types of scan-test design rule conditions. If there are multiple cells with the same rule conditions, and the -verbose option has been specified for rule checking, this message lists all the similar cells.

WHAT NEXT

The message preceding this message indicates the actual condition.

TEST-286 (information) Pins with this condition : %s.

DESCRIPTION

This message supports other messages that identify specific types of scan-test design rule conditions. If there are multiple pins with the same rule condition, and the -verbose option is specified for rule checking, this message lists all of the similar pins.

WHAT NEXT

The message preceding this message indicates the actual condition.

TEST-287 (information) Nets with this violation : %s.

DESCRIPTION

This message supports other messages that identify specific scan-test design rule violations. If multiple nets have the same rule violation, and you specified the **-verbose** option for rule checking, this message lists all the nets with the same violation.

WHAT NEXT

The message that appears before this one indicates the actual problem.

TEST-288 (information) There is 1 other net with the same violation

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first net that violates a rule, followed by the number of additional violations. The **TEST-298** message shows that there is one additional net that violates the same rule.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation).

If you want to see details of both the violations of a rule, run **check_test** in verbose mode (**check_test -verbose**).

TEST-289 (information) There are %d other nets with the same violation.

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first net that violates a rule, followed by the number of additional violations. The **TEST-299** message shows the number of additional nets that violate the same rule.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation).

If you want to see details of all the violations of a rule, run `check_test` in verbose mode (`check_test -verbose`).

TEST-296 (information) There are %d cell%s not scanned because of area constraint.

DESCRIPTION

DFT Compiler could not satisfy the area constraint and scan as many cells as it would have liked in order to meet the fault coverage target range. Since you have specified that the area constraint takes precedence over the fault coverage target (through the `set_min_fault_coverage -area_critical` command), DFT Compiler has left out enough cells from the scan set to meet the area constraint. The set of left-out cells was chosen to have a minimal impact on testability.

WHAT NEXT

It may be that DFT Compiler is still able to meet the fault coverage target. Run the `create_test_patterns` command to find out. If not, and if the fault coverage target cannot be relaxed, then the area constraint will need to be relaxed or otherwise violated.

TEST-297 (information) There are %d cell%s not scanned because of timing constraints: %s.

DESCRIPTION

DFT Compiler could not satisfy the timing constraints and scan as many cells as it would have liked to, in order to meet the fault coverage target range. If you have specified that the timing constraints take precedence over the fault coverage target (through the `set_min_fault_coverage -timing_critical` command), DFT Compiler has left out from the scan set all the cells that would violate the timing constraints if scanned. If you have specified that the fault coverage target takes precedence, DFT Compiler has left out only the cells that would have the largest effect on timing and the smallest effect on fault coverage. In this last case, the timing constraints may be violated.

WHAT NEXT

It may be that DFT Compiler is still able to meet the fault coverage target. Run the **create_test_patterns command** to find out. If it is not able, and if the fault coverage target cannot be relaxed, you may want to resynthesize the partial scan chain forcing some or all of the rejected cells onto the scan chain (using the **set_scan true** command). Then perform a **compile -incremental** to optimize the critical paths.

TEST-298 (information) There is 1 other port with the same violation

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first port that violates a rule, followed by the number of additional violations. The **TEST-298** message shows that there is one additional port that violates the same rule.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation).

If you want to see details of both the violations of a rule, run **check_test** in verbose mode (**check_test -verbose**).

TEST-299 (information) There are %d other ports with the same violation.

DESCRIPTION

When **check_test** runs in ordinary (nonverbose) mode, it lists warnings only for the first port that violates a rule, followed by the number of additional violations. The **TEST-299** message shows the number of additional ports that violate the same rule.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might also be additional information messages that provide more details about the first violation).

If you want to see details of all the violations of a rule, run **check_test** in

```
verbose mode (check_test -verbose).
```

TEST-300 (information) Ports with this violation : %s.

DESCRIPTION

This message supports other messages that identify specific scan-test design rule violations. If multiple ports have the same rule violation, and you specified the **-verbose** option for rule checking, this message lists all the ports with the same violation.

WHAT NEXT

The message that appears before this one indicates the actual problem.

TEST-301 (information) Extending scan in by one cycle because during the first cycle, some scan chains do not shift in data.

DESCRIPTION

The first scan-in cycle has no visible effect on the state of some scan chains.

DFT Compiler automatically adds a clock cycle to the scan pattern in order to get the last bit loaded in the scan chain.

Late-arriving data can cause this problem. The data application time is specified either in the protocol file or through the variables **test_default_delay** for input ports and **test_default_bidir_delay** for bidirectional ports. If, within a cycle, the active edges of the test clocks are before the data application time, the loading of the scan chain would be late by one clock cycle.

Other, more obvious causes of this problem include the absence of scan-in port or the presence of a scan chain break between the scan-in port and the first scan cell, or even the absence of scan chain.

WHAT NEXT

Check the presence of well-defined scan-in ports. Check the connection between the scan-in ports and the first cells of the scan chains. Check the data application time; make sure it is before the active edges of the test clocks.

TEST-302 (warning) Cell %s (%s) is not scan controllable.

DESCRIPTION

The scan-test technique depends on the ability to control (scan) and observe (measure) the state of sequential cells in the design. The state of a sequential cell is controlled by shifting scan data serially through the scan chain that contains that cell.

This technique requires that each sequential cell in a scan chain be externally controllable as well as capable of retaining a value independent of values in the other cells at the end of the scan-in sequence.

A TEST-302 violation indicates that the state of the specified cell cannot be controlled. Cells become not scan controllable due to problems involving either the asynchronous pins, data pins or clock pins. For example, if an asynchronous pin of a cell cannot be controlled (e.g. the asynchronous pin has value 'X') during scan, then the cell will fall into this category. If the clock is uncontrollable or if the clock is not pulsed, then scan-in data will not be clocked into the cell. Data cannot be successfully loaded into the cell if 1) the scan-in pin is unknown or connected to a clock signal, 2) the cell is illegally clocked, or 3) not clocked enough times during the scan-in sequence.

The local cause of the violation is printed as an information message after the TEST-302 warning message. The local cause is the event at an input pin of the cell which caused the violation. There are eight categories which define the local cause of a problem. They are the following:

- (TEST-511) Asynchronous pin is uncontrollable
- (TEST-515) Clock pin is uncontrollable
- (TEST-512) Unknown data is clocked into cell
- (TEST-518) Illegal input combinational applied to cell
- (TEST-519) Clock is used as data
- (TEST-516) Cell did not receive a clock pulse
- (TEST-517) Cell does not contain scan-in data
- (TEST-520) set_scan false applied to cell

If the problem does not fall into one of these eight categories, then no further messages will be printed.

The TEST-517 information message is used in cases where the cell was clocked, but it does not contain scan-in data from an input port at the end of the scan-in sequence. This message is followed by another information message which indicates where the data was located at the start of the scan-in sequence (TEST-525).

If TEST-511, TEST-512, or TEST-515 messages are generated due to the value of the pin being an 'X' or a 'Z', then check_test will attempt to trace back the network to find the source of the problem. Tracing will continue until an 'X' is found that cannot be traced back further in the circuit. At this point, one of six messages will be provided with the cell/pin information or port information of where tracing stopped. These six messages include:

- (TEST-514) Port is unknown

```
(TEST-523) Port is unknown due to a set_test_isolate  
(TEST-524) Port is unknown due to a previous violation  
(TEST-513) Cell/pin is unknown  
(TEST-521) Cell/pin is unknown due to a set_test_isolate  
(TEST-522) Cell/pin is unknown due to a previous violation
```

Additional information about the value of the input pins for the cell where the backtracing stopped will be provided following a TEST-513 warning message. If no backtracing occurred when TEST-511, TEST-512, or TEST-515 was issued, additional information about the value of that pin will be provided. These additional information messages are TEST-541 to TEST-548:

```
(TEST-541) Port is <value>  
(TEST-542) Port is unknown due to a set_test_isolate  
(TEST-543) Port is unknown due to a previous violation  
(TEST-544) Port is a scan-in value  
(TEST-545) Cell/pin is <value>  
(TEST-546) Cell/pin is unknown due to a set_test_isolate  
(TEST-547) Cell/pin is unknown due to a previous violation  
(TEST-548) Cell/pin is a scan-in value
```

PRIMARY AND SECONDARY VIOLATIONS

TEST-302 violations are frequently not independent, and some problems are more severe than others. One cell that is not scan controllable will cause the rest of the scan chain to be not scan controllable. Therefore check_test reports on independent and derived "not scan controllable" violations differently.

TEST-302 warning messages are only issued for cells which contain inherent controllability problems; these are considered "primary" violations. The "secondary" TEST-302 violations are cells that are not controllable as a result of primary TEST-302 violations. The secondary violations are grouped with their corresponding primary violations using the "As a result" information messages (TEST-501 and TEST-502).

Cells with primary TEST-302 violations are also included in the check_test summary section in verbose mode under "identified causes of other reported violations".

VERBOSE AND NON-VERBOSE MODE

When check_test is run in verbose mode (check_test -verbose), all primary TEST-302 violations will be printed. In non-verbose mode, one primary TEST-302 of each category (i.e. TEST-511, TEST-512, TEST-515, TEST-516, TEST-517, TEST-518, TEST-519, TEST-520) will be printed, with a count of other violations of that category. This gives an indication of the different types of scan controllability problems present in a design without listing every cell that is not scan controllable.

The number of cells with secondary TEST-302 violations is given with the corresponding primary TEST-302, and in verbose mode, the names of the cells with secondary TEST-302 violations are also provided.

The following is an example of a TEST-302 violation in verbose and non-verbose mode. The circuit consists of two 3-bit scan chains U1, U2, U3, and U4, U5, U6. In this example, the designer did not add the scan_in attribute to the scan in ports SI1 and SI2, so no scan in values are loaded into the scan chains. The check_test output in

verbose mode is as follows:

```
Warning: Cell U1 (FD1S) is not scan controllable.  
(TEST-302)  
Information: Because it clocks in an unknown value  
from pin TI. (TEST-512)  
Information: Because port SI1 is unknown. (TEST-514)  
Information: As a result, 2 other cells are not scan  
controllable. (TEST-502)  
Information: Cells with this violation : U2, U3.  
(TEST-283)  
Warning: Cell U4 (FD1S) is not scan controllable.  
(TEST-302)  
Information: Because it clocks in an unknown value  
from pin TI. (TEST-512)  
Information: Because port SI2 is unknown. (TEST-514)  
Information: As a result, 2 other cells are not scan  
controllable. (TEST-502)  
Information: Cells with this violation : U5, U6.  
(TEST-283)
```

"Not scan controllable" messages are only printed for cells U1 and U4 although all the cells in the design are not scan controllable. These are the cells with primary TEST-302 violations and need to be investigated. In both cases, the cells clock in an 'X' from the scan-in pin, which is traced back to the values of the ports being unknown. The non-verbose check_test output for the same example is as follows:

```
Warning: Cell U1 (FD1S) is not scan controllable.  
(TEST-302)  
Information: Because it clocks in an unknown value  
from pin TI. (TEST-512)  
Information: Because port SI1 is unknown. (TEST-514)  
Information: There is 1 other cell with the same  
violation. (TEST-173)  
Information: As a result, 4 other cells are not scan  
controllable. (TEST-502)
```

The two primary TEST-302 violations are grouped together in the non-verbose output because they are of the same category (unknown data is clocked into cell). As a result of the two primary TEST-302 violations, another 4 cells are not scan controllable.

WHAT NEXT

If your design has many sequential cells that are not scan-controllable, fault coverage may be significantly affected. Use the diagnostic messages to assist you in addressing the causes of the TEST-302 violations. Note that only cells with "primary" or independent TEST-302 violations need to be investigated. Cells with primary TEST-302 violations are also included in the check_test summary section in verbose mode in the section "identified causes of other reported violations".

You should expect some sequential cells that are not scan controllable, since this is unavoidable. An example is a JTAG boundary scan input register that only supports some of the 1149.1 instructions.

SEE ALSO

check_test

TEST-303 (information) Because asynchronous pin %s is uncontrollable.

DESCRIPTION

This message complements the uncontrollable cell warning (TEST-302) just above it.

WHAT NEXT

Examine the network driving the uncontrollable asynchronous pin to determine the deeper cause of the problem.

TEST-304 (information) Because clock pin %s is uncontrollable.

DESCRIPTION

This message complements the uncontrollable cell warning (TEST-302) just above it.

WHAT NEXT

Examine the network driving the uncontrollable clock pin to determine the deeper cause of the problem.

TEST-305 (information) Because it clocks in an unknown value from pin %s.

DESCRIPTION

This message complements the uncontrollable cell warning (TEST-302) just above it.

WHAT NEXT

Examine the network driving the uncontrollable data pins to determine the deeper cause of the problem.

TEST-306 (information) Because it scans in an unknown value from cell %s.

DESCRIPTION

This message complements the uncontrollable cell warning (TEST-302) just above it. It indicates that the source of the unknown value scanned into the violated cell is the scan cell just prior to it in the scan chain.

Note that the cell referred to in this message need not have a problem of its own: it may scan in an unknown value from its immediate predecessor.

WHAT NEXT

Examine the violations on the upstream scan cell to determine the deeper cause of the problem.

TEST-307 (warning) Segment of cell %s (%s) is not scan controllable.

DESCRIPTION

The TEST-307 warning has exactly the same meaning as TEST-302. The difference is that this message is issued in the SoC DRC context for a segment within a core instance rather than a simple sequential cell.

WHAT NEXT

Refer to the manpage for TEST-302 for more details..

Check the scan controllability of the scan segment within the cell.

SEE ALSO

`check_test`

TEST-308 (warning) Segment %s has sequential length

superior as chain length specified.

DESCRIPTION

You receive this warning message because a segment specified with the **-longest_chain_length** option has a sequential length superior to the chain length requested.

The DFT Compiler permits the use of the **-longest_chain_length** option of the **set_scan_configuration** command to specify the scan length you want in your design.

The DFT Compiler issues this warning message when a **-longest_chain_length** specification cannot be used.

WHAT NEXT

No action is required on your part.

However, you can eliminate the warning message by increasing the **-longest_chain_length**.

SEE ALSO

set_scan_configuration (2).

TEST-310 (warning) Data can not be captured into cell %s (%s).

DESCRIPTION

In the scan-test sequence, after pattern data has been loaded into the design (through serial shifting), the response of the design's combinational logic to the data is *captured* into the sequential cells of the design. Data is captured by pulsing the system clocks while scan cells are configured in normal operation (parallel) mode. This occurs for both full-scan and partial-scan designs, although for partial-scan designs, the cells into which the data is captured may not be scannable.

This message identifies a cell for which data cannot be captured in this manner. This is usually due to the way the cell is clocked. For example, the cell may use an internally-generated clock signal that cannot be controlled.

If data cannot be captured into a cell, faults on the data input pins of that cell and the logic connected to those pins will not be testable.

WHAT NEXT

If your design has many sequential cells into which data cannot be captured, check

the reason. In particular, check the way the cell is clocked. You may need to modify the clocking scheme by selecting an external clock rather than an internal clock for the purposes of testing.

In some cases, sequential cells into which data cannot be captured are to be expected, and are unavoidable. For example a JTAG boundary scan register contains multiple sequential cells, but system data can only be captured into one.

TEST-311 (warning) Data was captured in the master state of cell %s (%s) but scanned out of the slave state.

DESCRIPTION

There is an inconsistency between the capture of system response data and the scan-out operation for this cell. The system response data was captured in the master state of the cell, but the value in the slave state of the cell was scanned out.

There is a corresponding message (TEST-312) for the opposite problem, i.e. data was captured in the slave state of the cell, but scanned out of the master state.

WHAT NEXT

It is necessary to synchronize the captured response with the scan-out operation. In most cases this can be done by either pulsing the slave clock after the capture operation, or changing the sequence of the shift clocks to shift out of the correct state.

If your design has an inferred or initialization test protocol, you can force all slave clocks to pulse after capture by setting the variable `test_infer_slave_clock_pulse_after_capture` to "pulse". Similarly, you can force all the slave clocks to not pulse after capture by setting the variable to "no_pulse". To let `check_test` infer the behavior of the slave clocks, set the variable to "infer".

If your design has a custom test protocol, change the protocol to add a slave clock pulse after capture or modify the sequence of the shift clocks.

SEE ALSO

`check_test`, TEST-312

TEST-312 (warning) Data was captured in the slave state of cell

%s (%s) but scanned out of the master state.

DESCRIPTION

There is an inconsistency between the capture of system response data and the scan-out operation for this cell. The system response data was captured in the slave state of the cell, but the value in the master state of the cell was scanned out.

There is a corresponding message (TEST-311) for the opposite problem, i.e. data was captured in the master state of the cell, but scanned out of the slave state.

WHAT NEXT

It is necessary to synchronize the captured response with the scan-out operation. In most cases this can be done by either not pulsing the slave clock after the capture operation, or changing the sequence of the shift clocks to shift out of the correct state.

If your design has an inferred or initialization test protocol, you can force all slave clocks to not pulse after capture by setting the variable `test_infer_slave_clock_pulse_after_capture` to "no_pulse". Similarly, you can force all the slave clocks to pulse after capture by setting the variable to "pulse". To let `check_test` infer the behavior of the slave clocks, set the variable to "infer".

If your design has a custom test protocol, change the protocol to remove the slave clock pulse after capture or modify the sequence of the shift clocks.

SEE ALSO

`check_test`, TEST-311

TEST-313 (warning) Data was captured in cell %s (%s) but was lost before it was scanned out of the cell.

DESCRIPTION

There is an inconsistency between the capture of system response data and the scan-out operation for this cell.

WHAT NEXT

It is necessary to synchronize the captured response with the scan-out operation.

SEE ALSO

check_test, TEST-311, TEST-312

TEST-314 (warning) Invalid value for variable test_infer_slave_clock_pulse_after_capture, assuming "infer".

DESCRIPTION

For master-slave sequential cells it is necessary to ensure that the capture operation is synchronized with the scan-out operation. Problems include capturing in the master state and scanning out of the slave state (TEST-311), or capturing in the slave state and scanning out of the master state (TEST-312). For inferred protocols, the default behavior is for check_test to determine whether the slave clock needs to be pulsed or not after the capture operation for correct scan-out.

The variable test_infer_slave_clock_pulse_after_capture is used to override the behavior of check_test for inferred protocols. A value of "pulse" (or "true") forces all slave clocks (e.g. clocks with set_signal_type test_scan_clock_b) to pulse after capture, and a value of "no_pulse" (or "false") forces all slave clocks to not pulse after capture. The default value is "infer".

This violation indicates that the value of the variable is not one of the valid values mentioned above. check_test continues as if the value was "infer".

WHAT NEXT

Set the variable test_infer_slave_clock_pulse_after_capture to the value "infer" if you want check_test to determine whether to pulse slave clocks after capture, or set it to either "pulse" or "no_pulse" to force the behavior of slave clocks after capture.

SEE ALSO

check_test, TEST-311, TEST-312

TEST-315 (Error) Multiple clock groups cannot be pulsed in the same capture cycle.

DESCRIPTION

The variable test_force_capture_clocks indicates that all the capture clocks must be active during all capture cycles. However, the current design consists of multiple disjoint clock groups. Simultaneously pulsing clocks from different clock groups will likely result in unusable ATPG vectors. This is an error condition. No ATPG

vectors will be generated.

WHAT NEXT

In order to generate vectors, reset the test_force_capture_clocks to its default value of FALSE.

TEST-320 (warning) No nets identified for tracing by name %s.

DESCRIPTION

To debug complex scan test protocols and scan design rule violations, DFT Compiler traces the values of specified nets during rule-checking simulation. These values are identified with the **trace_nets()** statement within test protocol files.

Individual hierarchical nets or hierarchical cell instances can be named with the **trace_nets()** statement. Hierarchical cell instances indicate that all nets within a cell should be traced.

This message indicates that for a name given in a **trace_nets()** statement, it was not possible to identify any nets or hierarchical cells of that name within the design.

WHAT NEXT

To resolve this problem, edit the appropriate **trace_nets()** statement within the test protocol file currently in use. After correcting the statement, read in the file again using the **read_test_protocol** command.

TEST-321 (information) Trace nets @ %.1f value %s : %s.

DESCRIPTION

To debug complex scan-test protocols and scan design rule violations, DFT Compiler traces the values of specified nets during the rule checking simulation. You can specify these values with the **trace_nets()** statement in the test protocol file.

This message reports the values at traced nets when the scan-test protocol is simulated for the design in question. The message indicates the time (within each test cycle), and value associated with the set of listed nets.

WHAT NEXT

The information in this message can help you pin-point problems in the test protocol or scan design rule violations in the design. If test design rule checking is invoked from within the Synopsys Design Analyzer, the linked report capability can select and highlight the listed nets. This allows you to see a schematic

representation of the values on different nets.

TEST-330 (error) Protocol foreach_pattern missing "parallel" cycles.

DESCRIPTION

The test protocol for a design defines the scan-test sequence by which that design is tested. The sequence must at some point place the design under test in "parallel" (normal) operation, apply patterns values to the inputs of the design, and measure the response at the outputs of the design. This message indicates that the user-specified protocol (read in with the `read_test_protocol` command) does not do what the previous sentence describes.

This failure may occur because the `foreach_pattern` loop is missing, contains no vectors, or does not contain vectors that place the design in parallel operation. Parallel operation is indicated by the presence of the pattern input/response values P_i, P_{io}, P_o in the vector.

WHAT NEXT

You cannot continue with further test commands, such as the generation of test patterns, until the problem is corrected. Modify the protocol file appropriately, and read it in again using the `read_test_protocol` command.

TEST-331 (error) Pullup/pulldown net %s has illegal driver(s).

DESCRIPTION

The `check_test` command issues this message when it finds a pullup or pulldown on a net that is driven by two-state drivers.

WHAT NEXT

Correct the design violation by either a) Replacing the two-state drivers with three-state drivers or b) Removing the pullup or pulldown

TEST-332 (warning) Input pin %s of cell %s (%s) is

unconnected. It is assumed 'X' for the purpose of test.

DESCRIPTION

The specified pin has no driver. This problem was previously reported as warnings LINT-0 or LINT-3, if you have run 'check_design'. Note however that for the purpose of test generation, pins that are not properly driven are unknown. So, contrary to what was reported by check_design, DFT Compiler makes no assumption about the missing connection.

This may cause a loss in fault coverage.

WHAT NEXT

Explicitly connect the pin to an appropriate driver.

TEST-333 (information) Test pin %s of cell %s (%s) is unconnected. It is assumed inactive ('%s') for the purpose of test.

DESCRIPTION

The specified pin has no driver. This problem was previously reported as warnings LINT-0 or LINT-3, if you have run 'check_design'. Note however that since the test circuitry is not fully synthesized, DFT Compiler will assume that the pin is in its inactive state. This assumption may be different from the one stated in the LINT message, but it is consistent with the connection that will be introduced when the circuit is completed with the insert_scan command.

WHAT NEXT

Complete the synthesis of the test circuitry.

TEST-334 (information) Test pin %s of cell %s (%s) is unconnected. It is assumed inactive (0) for the purpose of test.

DESCRIPTION

You receive this information message because the specified pin does not have a driver.

If you ran the **check_design** command, you received warning messages (LINT-0 or LINT-

3) about this problem.

Since the test circuitry is not fully synthesized, the DFT Compiler assumes that the pin is in its inactive state (0). This assumption may be different from the one stated in the LINT warning message, but it is consistent with the connection that will be introduced when the circuit is completed with the **insert_scan** command.

WHAT NEXT

Complete the synthesis of the test circuitry.

SEE ALSO

check_design (2), **insert_scan** (2).

TEST-335 (information) Test pin %s of cell %s (%s) is unconnected. It is assumed inactive (1) for the purpose of test.

DESCRIPTION

You receive this information message because the specified pin does not have a driver.

If you ran the **check_design** command, you received warning messages (LINT-0 or LINT-3) about this problem.

Since the test circuitry is not fully synthesized, the DFT Compiler assumes that the pin is in its inactive state (1). This assumption may be different from the one stated in the LINT message, but it is consistent with the connection that will be introduced when the circuit is completed with the **insert_scan** command.

WHAT NEXT

Complete the synthesis of the test circuitry.

SEE ALSO

check_design (2), **insert_dft** (2).

TEST-337 (warning) Port '%s' cannot be used as a scan port. It

has been previously inferred as an asynchronous signal.

DESCRIPTION

You receive this warning message because the specified scan signal is ignored during test logic previewing or during the test logic insertion of your design. The test design rule checking process, run explicitly by the `check_scan` command or in the background by `scan_preview` or `scan_insertion`, inferred the specified port as an asynchronous port. The same port has been specified as a scan signal using the `set_scan_signal` command. To ensure the correct functioning of your design during test, this port must be dedicated as an asynchronous port.

WHAT NEXT

Remove the scan signal specification for this port and reexecute the command.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `scan_insertion` (2), `scan_preview` (2),
`set_scan_signal` (2).

TEST-340 (error) Partial scan logic cannot be inserted in the presence of generic logic.

DESCRIPTION

To compute the performance and area of the design for meaningful testability trade-off analysis, partial scan designs must not contain generic logic. Generic logic is generated after a functional description of a design is read in, and before the `compile` command synthesizes an implementation of the design from the target technology library.

WHAT NEXT

Use the `compile` command to map the design to the target technology library.

TEST-341 (warning) User specification of chain '%s' has been split.

DESCRIPTION

You receive this message because DFT Compiler has been unable to determine a

functional scan chain that meets the specification, has split the specification into pieces, and has interspersed these with cells that have not been allocated to chains.

You can use the **set_scan_path** command to specify the sequence of scan cells in a chain.

WHAT NEXT

DFT Compiler builds functional chains such that each cell captures before the preceding cell launches. The specification is split to ensure this when unallocated cells are added to the chain.

You can use any of the three following ways to change the behavior:

- To direct DFT Compiler not to add cells to the chain, use the **set_scan_path** command with the **-complete** option.
- To strengthen clock domain constraints, use the **set_scan_configuration** command and do not allow DFT Compiler to mix clocks or clock edges on the same chain.
- To change test clock timing, use the **set_test_clock** command.

SEE ALSO

set_scan_configuration (2), **set_scan_path** (2), **set_test_clock** (2).

TEST-342 (warning) User specification of chain '%s' has been reordered.

DESCRIPTION

You can use the **set_scan_path** command to specify the sequence of scan cells in a chain. This message tells you that DFT Compiler has not been able to come up with a functional scan chain that meets the specification. It has had to reorder the specification.

WHAT NEXT

You see this message because DFT Compiler builds functional chains: each cell captures before its preceding cell launches. DFT Compiler has had to reorder your specification because it would have resulted in a chain that could not shift properly.

To change the behavior, add lockup latches using the **set_scan_configuration** -

`add_lockup true` command or modify test clock timing using the `set_test_clock` command.

TEST-343 (warning) A user-specified wire scan link overrides the insertion of a lock-up latch before cell '%s'.

DESCRIPTION

You receive this message because DFT Compiler cannot automatically insert a lock-up latch because you executed the `set_scan_path` command with a wire scan link that you defined by using the `set_scan_link` command at the lock-up latch position. DFT Compiler does not override this specification.

When you use the `set_scan_path` command to specify the sequence of scan cells in a chain, DFT Compiler analyzes the specification to ensure that it is functional; entailing that each cell must capture before its preceding cell launches. DFT Compiler may encounter cell pairs that violate this condition. It can fix the problem by automatically inserting lock-up latches if you execute the `set_scan_configuration` command with the `-add_lockup` option set to `true`.

WHAT NEXT

Decide whether you want a lock-up latch before the segment. If not, ignore the warning. Otherwise, execute the `set_scan_path` command again, omitting the offending scan link.

Alternately, you can let DFT Compiler automatically order chain elements so that lock-up latches are not needed by using the `set_scan_configuration` command with the `-add_lockup` option set to `false` before you use the `preview_scan` command.

SEE ALSO

`preview_scan` (2), `set_scan_configuration` (2), `set_scan_link` (2), `set_scan_path` (2).

TEST-344 (error) Cannot synchronize scan chain cells '%s' and '%S'. Both edges of clock '%s' occur before clock '%s' triggers.

DESCRIPTION

You can use the `set_scan_path` command to specify the sequence of scan cells in a chain. DFT Compiler analyzes the specification to ensure that it is functional: each cell must capture before its preceding cell launches. DFT Compiler can encounter cell pairs that violate this condition. You can let DFT Compiler resynchronize the

scan chain by automatically inserting lockup latches, by executing the command **set_scan_configuration -add_lockup true** DFT Compiler only implements lockup latch designs that are recognized by test design rule checking. Because of this, there are situations where it cannot resynchronize the scan chain. This message tells you that you have encountered one such situation. DFT Compiler has not been able to resynchronize the scan chain because both edges of the upstream clock arrive before the downstream clock trigger time.

WHAT NEXT

Let DFT Compiler order chain elements automatically so that lockup latches are not needed, by executing **set_scan_configuration -add_lockup false** before you **analyze_scan**. Alternately, study whether you can change your test clock waveforms.

TEST-345 (error) Cannot synchronize scan chain. Connects cell '%s' (triggered by an early transition of clock '%s') to cell '%s' (triggered by a later transition).

DESCRIPTION

You can use the **set_scan_path** command to specify the sequence of scan cells in a chain. DFT Compiler analyzes the specification to ensure that it is functional: each cell must capture before its preceding cell launches. DFT Compiler can encounter cell pairs that violate this condition. You can let DFT Compiler resynchronize the scan chain by automatically inserting lockup latches, by executing the command **set_scan_configuration -add_lockup true** DFT Compiler only implements lockup latch designs that are recognized by test design rule checking. Because of this, there are situations where it cannot resynchronize the scan chain. This message tells you that you have encountered one such situation. DFT Compiler has not been able to resynchronize the scan chain because it connects a cell that is triggered by an early clock transition to a cell that is triggered by a later transition.

WHAT NEXT

Let DFT Compiler order chain elements automatically so that lockup latches are not needed, by executing **set_scan_configuration -add_lockup false** before you **analyze_scan**.

TEST-346 (warning) There are %d specified scan chains. Cannot honor -chain_count specification of %d.

DESCRIPTION

DFT Compiler lets you use the **-chain_count** option of the **set_scan_configuration**

command to specify how many scan chains you want in your design. DFT Compiler also lets you specify scan chains using the **set_scan_path** command. You see this warning when DFT Compiler cannot honor your **-chain_count** specification because there are more specified scan chains than chains requested.

WHAT NEXT

Increase your **-chain_count** to make the warning go away. Alternatively, rework your **set_scan_path** assignments.

TEST-347 (warning) All specified chains are complete but %d %s not been assigned to a scan chain. Cannot honor -chain_count specification of %d.

DESCRIPTION

You receive this message because DFT Compiler cannot honor your chain count specification because it has **-chain_count** complete chains, but you have not assigned any cells to scan chains.

DFT Compiler lets you use the **set_scan_configuration** command with the **-chain_count** option to specify how many scan chains you want in the design. It also lets you use the **set_scan_path** command to specify scan chains. You can direct DFT Compiler to not add cells to chains you specify using the **set_scan_path** command with the **-complete** option.

WHAT NEXT

If you want to reduce the number of scan chains implemented, assign all cells to scan chains or use the **set_scan_path** command without the **-complete** option for specified scan chains. Otherwise, use the **set_scan_configuration** command with the **-chain_count** option to increase the **-chain_count** value to eliminate the warning.

SEE ALSO

set_scan_configuration (2), **set_scan_path** (2).

TEST-348 (warning) Only %d scan chain %s free. Cannot honor -chain_count specification of %d.

DESCRIPTION

DFT Compiler lets you use the **-chain_count** option of the **set_scan_configuration**

command to specify how many scan chains you want in your design. You will see this warning when DFT Compiler cannot honor your **-chain_count** specification because there are not enough free scan chain elements.

WHAT NEXT

If you want to increase the number of scan chains implemented, use the **-rebalance** option of the **set_scan_configuration** command to break up inferred segments. Alternatively, rework **set_scan_path** assignments. Otherwise, reduce your **-chain_count** to make the warning go away.

TEST-349 (error) Scan logic cannot be inserted in the presence of generic logic.

DESCRIPTION

To correctly identify scan equivalents and to compute the performance and area of the design for meaningful testability trade-off analysis, the design must not contain generic logic. Generic logic is generated after a functional description of a design is read in, and before the **compile** command synthesizes an implementation of the design from the target technology library.

WHAT NEXT

Use the **compile** command to map the design to the target technology library.

TEST-350 (warning) Cannot identify the core side pin of complex pad %s.

Connecting test signal to the port side.

DESCRIPTION

There is a pad on the test signal port to which the current test signal must be connected. This pad has multiple pins on its core (i.e., circuit) side. DFT Compiler cannot determine which is the data pin of the pad and what its functional relation to the port is. Therefore, the connection of the test signal is made between the port and the pad. This connection is incorrect and must somehow be modified.

Note that after the connection of test signals, the pads synthesized using the **insert_pads** command may no longer be optimal. To ensure optimal pads, the pad insertion should be done after the routing of test signals.

WHAT NEXT

You may either correct the connection by hand; choose a padless port for test signal connection and rerun **insert_test**; or remove the offending pad on the current port, rerun **insert_test** and reinsert the pad.

TEST-351 (warning) Cannot load object '%s' into chain '%s'.

DESCRIPTION

DFT Compiler recognizes sub-design scan chains, and lets users include them in scan chains using the **set_scan_path** command. This message tells you that DFT Compiler has had a problem loading a sub-design scan chain, and is discarding the specification.

WHAT NEXT

Run **check_test** on the sub-design. Make sure that **check_test** identifies the scan chain, and reports no design rule violations.

TEST-352 (warning) Scan chain '%s' has zero elements.

DESCRIPTION

DFT Compiler can generate zero-length chains when user-specified chains end up with no elements.

For example, suppose instance a of design A has two scannable cells b1 and b2. Scan specification

```
set_scan_path chain-1 a
set_scan_path chain-2 { a/b1, a/b2 }
```

produces zero-length chain chain-1.

We don't want to keep zero length chains because we don't want to synthesize feed-throughs. Instead, we delete the chain and issue this warning.

WHAT NEXT

Check your scan specification to verify that the deleted scan chain is redundant.

TEST-353 (warning) %s '%s' has elements clocked by different

clocks.

DESCRIPTION

You receive this warning message because you used the **set_scan_configuration** command with the **-clock_mixing** option to direct the DFT Compiler not to mix elements that are clocked by different clocks on the same scan chain or wrapper chain and you have violated this directive. This occurs because you can still specify scan segments, scan chains, and wrapper chains or build subdesign chains that violate the directive. The DFT Compiler then generates this warning message.

WHAT NEXT

If you intend for the identified segments or chains to violate your directive, no action is required on your part. Otherwise, respecify the segments or chains as necessary.

SEE ALSO

set_scan_configuration (2).

TEST-354 (warning) %s '%s' has elements clocked by different clock edges.

DESCRIPTION

You receive this message because you used the **set_scan_configuration** command with the **-clock_mixing** option to direct DFT Compiler not to mix elements that are clocked by different clocks or clock edges on the same scan chain and have violated this directive. This occurs because you can still specify scan segments and scan chains or build sub-design chains that violate the directive. DFT Compiler then generates this warning.

WHAT NEXT

If you intend for the identified segments or chains to violate your directive, do nothing. Otherwise, respecify them as necessary.

SEE ALSO

set_scan_configuration (2).

TEST-355 (warning) Cells with %d new incompatible clock %s

have not been assigned to scan chains. Cannot honor -chain_count specification of %d. %s

DESCRIPTION

DFT Compiler lets you say how many scan chains you want in your design. DFT Compiler also lets you specify whether to mix elements clocked using different clocks or clock edges on the same chain. You will see this warning when DFT Compiler cannot honor your **-chain_count** specification because there are more incompatible clock domains than chains requested.

Here are examples of incompatible clock domains in hierarchical scan stitching flows.

1. When the `set_scan_configuration -chain_count` is specified as 1, and there are two CTL segments with the capture edge as falling and the launch edge as rising (with or without latches), with a return-to-zero scan clock. These are incompatible because, if they were serially connected, the same clock pulse would shift the same data into the last scan cell of the first segment and the first scan cell of the second segment. Since these cells could not hold independent data, ATPG fault coverage would be reduced. Hence it is necessary to keep such CTL segments in two separate scan chains. In this case, since the chain count requested is 1, and two scan chains are required to accommodate the CTL segments, TEST-355 will be issued.
2. When the `set_scan_configuration -chain_count` is specified as 1, and all CTL segments with capture edge as falling have a latch at the end of the segment, and segments with capture edge as rising also exist in the design. This makes it impossible to avoid a falling-edge flip-flop followed by a high-enabled lockup latch followed by a rising-edge flip-flop. The high-enabled lockup latch followed by the rising-edge flip-flop creates a race condition. When no compatible falling edge segments are available, such CTL segments will be kept in a separate scan chain, and the chain count will not be respected. Hence TEST-355 will be issued.

WHAT NEXT

If you want to reduce the number of scan chains implemented, use the **-clock_mixing** option of the `set_scan_configuration` command to relax clock domain constraints. Otherwise, increase your **-chain_count** to make the warning go away.

TEST-356 (error) Segment '%s' has no scan-in pin.

DESCRIPTION

DFT Compiler lets you specify scan segments using the `set_scan_segment` command. This message tells you that you have specified a segment that does not have a scan-in pin. DFT Compiler then aborts.

WHAT NEXT

Add a scan-in pin to the scan segment specification using the **-access** option of the **set_scan_segment** command.

TEST-357 (error) Segment '%s' has no scan-out pin.

DESCRIPTION

DFT Compiler lets you specify scan segments using the **set_scan_segment** command. This message tells you that you have specified a segment that does not have a scan-out pin. DFT Compiler then aborts.

WHAT NEXT

Add a scan-out pin to the scan segment specification using the **-access** option of the **set_scan_segment** command.

TEST-358 (warning) Cannot use port '%s' as a '%s'. It's net has a dont_touch attribute.

DESCRIPTION

DFT Compiler lets you identify design scan ports using **set_signal_type** commands. This message tells you that you have specified a port, whose connected net is **dont_touched**. DFT Compiler warns you about this and uses another port.

Note that the **dont_touch** only affects test logic insertion. Test design rule checking will respect port protocol semantics.

WHAT NEXT

If you want DFT Compiler to use the port, remove the **dont_touch** attribute from the net

TEST-359 (warning) %d bidirectional %s degenerated. Please check the test protocol.

DESCRIPTION

The default protocol inferred by DFT Compiler assumes that all bidirectional ports

are turned in the same direction during scan shift. They are turned inwards or turned outwards.

This message tells you that your design has bidirectional ports whose associated pads are degenerated. They do not have bidirectional capabilities, and can only function as inputs or outputs.

WHAT NEXT

Get the test protocol inferred by DFT Compiler using `write_test_protocol`. Study how it treats the degenerated ports. If it does not treat the ports correctly, you need to develop a corrected custom test protocol.

TEST-360 (information) Because independent scan data cannot be shifted into cells %s from cell %s.

DESCRIPTION

This information message always immediately follows a TEST-361 message flagging a scan divergence.

WHAT NEXT

Check the TEST-361 message that precedes this message.

TEST-361 (Warning) Scan chain originating from port '%s' diverges after %s.

DESCRIPTION

DFT Compiler has identified a diverging scan chain. A diverging scan chain occurs when the same bit of scan data is loaded, in parallel, in at least two cells. Such scan topologies are not currently supported since it implies dependencies among the inputs of the ATPG network. DFT Compiler retains one of the diverging branches as the scan chain and marks the other branches as uncontrollable.

This message is followed by two information messages, the first one giving more details on the nature and location of the divergence, and the second one listing the cells that DFT Compiler has made uncontrollable.

WHAT NEXT

This message may be indicative of a faulty scan topology. Modify the design to fix it. If the scan topology is correct, you can suppress the warning message by

performing a **set_scan** FALSE or a **set_test_isolate** on the first diverging cell, which is listed first in the ignored cells list.

TEST-362 (Warning) Scan chain originating from '%s' is not scan observable. The chain terminates at cells %s.

DESCRIPTION

DFT Compiler has identified a scan structure originating from a **scan_in** port but not observable on any **scan_out port**. The cells listed in the message are those that are controllable from the **scan_in** port, but the cells do not propagate the scan data to any other cell. To find the wrong connection of the scan chain, these cells are the prime candidates to examine.

Note that this warning may flag a perfectly acceptable scan topology, one that has been designed *not* to be observable, such as certain forms of user-loadable registers. There is no way for DFT Compiler to guess your intent.

WHAT NEXT

This message may be indicative of a faulty scan topology. If so, fix it by modifying the design.

TEST-363 (Warning) Scan chain terminating at '%s' is not scan controllable. The chain originates from cell %s.

DESCRIPTION

DFT Compiler has identified a scan structure terminating at a **scan_out** port but not controllable from any **scan_in** port. The cell listed in the message is the one that is observable at the **scan_out** port but which does not propagate the scan data from any other cell. It is the prime candidate to look at for wrong connection of the scan chain. If some scan input pin of a scan cell was left unconnected, however, this message would not point to the cell with the floating input. The Design Compiler will issue a message (LINT-0 or LINT-30) and assume that this pin is tied to logic zero. As a result, DFT Compiler will not identify this cell, nor its downstream neighbors, as scan cells, since they will have constant value in scan mode. DFT Compiler will explicitly flag the constant cells as such by issuing the TEST-142 warning.

Note that this warning may flag a perfectly acceptable scan topology, one that has been designed not to be controllable, as, for example, certain forms of user-observable registers. There is no way for DFT Compiler to guess your intent.

WHAT NEXT

This message may be indicative of a faulty scan topology. If such is the case, modify the design to fix it. For more information, see messages LINT-0, LINT-30, and TEST-142.

TEST-364 (warning) Clock pin(s) of cell %s (%s) are not correctly set to their inactive state.

DESCRIPTION

The clock waveform for this clock is incorrect. If this clock waveform was inferred by `check_test`, the problem is an incorrect modeling of the library cell by the semiconductor vendor: the `clocked_on` and `timing_arcs` provide conflicting data.

To determine which pins are asynchronous, the test design rule checker checks to see whether the clocks and asynchronous pins are set to their inactive state. If so, the sequential cell will have no events. If this message occurs, the clocks are not correctly set to their inactive state. The problem is with the polarity of the clock waveforms.

WHAT NEXT

You can fix the incorrect clock waveform by using `create_test_clock`, swapping the rise and fall times to create the correct clock.

If the problem is with the library cell, contact your semiconductor vendor to correct the cell description. However, the above workaround can be used in the meantime.

TEST-365 (information) As a result, the following cells are not scan controllable: %s.

DESCRIPTION

This information message describes the effect of the warning immediately preceding it.

A sequential cell is scan controllable when it can be set to a known state by serially shifting in specific logic values during a scan shift operation. Scan cells that are not scan controllable will cause a loss in the fault coverage that the DFT Compiler ATPG can otherwise achieve.

WHAT NEXT

Study the preceding violation messages to identify the source of the problem and resolve this problem.

TEST-366 (warning) %d conditioned bidirectional %s not being forced %. Please check the test protocol.

DESCRIPTION

The default protocol inferred by DFT Compiler assumes that all bidirectional ports are turned in the same direction during scan shift. They can be turned inwards or outwards.

This message tells you that your design has bidirectional ports that are turned in the opposite direction during scan shift.

WHAT NEXT

Get the test protocol inferred by DFT Compiler using `write_test_protocol`. Study how it treats the conditioned bidirectional ports. If it does not treat them correctly, develop a corrected custom test protocol.

TEST-367 (warning) Scan link '%s' cannot be inserted inside the segment '%s'. It will be inserted at the end of this segment.

DESCRIPTION

DFT Compiler lets you specify the order of the objects in the scan chain using the `set_scan_path` command. This message tells you that you have specified a scan link inside a segment. However, inserting a scan link within a segment will violate the specification of the segment. Instead `insert_scan` will add the link to the scan-out of the last cell in the segment.

WHAT NEXT

To suppress this warning modify the `set_scan_path` specification to place the link at the end of the segment.

TEST-368 (warning) Cannot build functional scan chain for segment '%s', because the user specification violates the clock

domain constraint.

DESCRIPTION

You receive this message if **preview_scan** or **insert_scan** finds a segment in your design that violates the clock domain constraint. A functional scan chain cannot be built for the specified segment unless you correct this violation.

The clock domain constraint states that sequential cells must be serially connected with regard to the clocking scheme, and the sequential cell to be clocked first must be placed at the end of the register chain. When this clock domain constraint is satisfied, each cell captures before its preceding cell launches.

WHAT NEXT

You can correct the clock domain constraint violation in one of two ways:

1. Use the **set_scan_segment** command to define a new segment specification that does not violate the clock domain constraint.
2. Alternatively, you can change the test clock timing using the **set_test_clock** command.

Then, re-execute **preview_scan** or **insert_scan**.

SEE ALSO

insert_scan (2), **preview_scan** (2), **set_scan_segment** (2), **set_test_clock** (2).

TEST-370 (warning) Scan chain %d comprises user-specified cells from different clock domains.

DESCRIPTION

By invoking the **set_scan_chain** command or the **set_test_routing_order** command, you have identified cells from different clock domains to be part of the same scan chain.

In certain instances, this situation can lead to *check_test* problems. Or, in the case of layout-dependent clock skew, it can lead to nonfunctional scan chains. To determine the pairs of consecutive cells that are clocked by different clocks, look at error messages TEST-371 and TEST-372.

WHAT NEXT

If you suspect skew problems in a scan operation, reallocate cells so that each

chain is clocked by a unique clock.

TEST-371 (warning) Consecutive scan cells %s and %s are clocked by different clocks.

DESCRIPTION

The scan chain crosses clock-domain boundaries between the two flagged cells. This situation may be of no consequence if the skew between the two clocks is well controlled. But it can result in a non-functional scan chain if the clock of the second cell is slow. Scan data would then skip this cell.

This message is a result of defining the `-multiple_clocks_chains` option of `insert_test`, or explicitly assigning cells to scan chains using the `set_scan_chain` command or the `set_test_routing_order` command.

WHAT NEXT

If there is a chance that the scan chain will be nonfunctional, undo the offending scan chain assignation command and redo `insert_test` without the `-multiple_clocks_chains`.

TEST-372 (warning) Consecutive scan cells %s and %s are clocked by different edges of the same clock.

DESCRIPTION

The scan chain crosses from a leading-edge clocked cell to a trailing-edge clocked cell. This situation usually results in a nonfunctional scan chain since scan data present at the scan input of the first cell is visible at the scan output of the second cell within one clock cycle.

This message is a result of defining the `-multiple_clocks_chains` option of `insert_test`, or explicitly assigning cells to scan chains using the `set_scan_chain` command or the `set_test_routing_order` command.

WHAT NEXT

Undo the offending scan chain assignation command and redo `insert_test` without the `-multiple_clocks_chains`.

TEST-373 (error) Sequential cell %s (%s) has no clock

information.

It will not be assigned to a scan chain.

DESCRIPTION

DFT Compiler is unable to determine what clock domain this cell belongs to. It is therefore impossible to assign this cell to a scan chain.

One possible cause of this problem is the absence of test-clock information on the library model for this cell. This problem also manifests itself if the scan-clock pin of this cell is unconnected while the rest of the design is scan routed.

WHAT NEXT

Verify the clock attributes on the library model for this cell. Make sure the design is either *fully* scan routed or *not* scan routed.

TEST-374 (warning) Clock information for all sequential cells of design is missing.

DESCRIPTION

DFT Compiler is unable to determine clock domains of any cell of the design. It is therefore impossible to assign cells to scan chains based on clock information. If no assignment is specified manually, all cells will be put in a unique chain.

One possible cause of this problem is the absence of test-clock information on the library models. This problem also manifests itself if the scan-clock pins are unconnected while the rest of the design is scan routed.

WHAT NEXT

Verify the clock attributes on the library models. Make sure the design is either *fully* scan routed or *not* scan routed.

TEST-375 (warning) Cannot add '%s' to chain '%s'. It already belongs to another chain.

DESCRIPTION

DFT Compiler lets users specify scan chains using `set_scan_path` commands. This message tells you that DFT Compiler has been unable to add an element to a scan

chain because it already belongs to another chain. DFT Compiler discards the specification.

WHAT NEXT

Remove the element from the **set_scan_path** argument list to suppress the warning.

If you do want to add the element to the chain, check earlier **set_scan_path** commands to ensure that you have not specified the element inadvertently. Be particularly aware of hierarchical cell specifications. If casual inspection fails, execute the **set_scan_path** that generates the warning first. The conflicting **set_scan_path** command will fail.

TEST-376 (warning) Cannot add '%s' to chain '%s'. The element is not being scanned.

DESCRIPTION

You receive this message because DFT Compiler has been unable to add an element to a scan chain because it is not being scanned.

DFT Compiler enables you to use the **set_scan_path** command to specify scan chains. This message warns you that DFT Compiler has discarded the specification.

WHAT NEXT

Remove the element from the **set_scan_path** argument list to suppress the warning. If you want to add the element to the chain, examine earlier **check_test** commands, **set_scan** commands, and partial scan output to determine why the element is not being scanned.

SEE ALSO

check_test (2), **set_scan** (2), **set_scan_path** (2).

TEST-377 (warning) Cannot add '%s' to chain '%s'. The element already belongs to chain '%s'.

DESCRIPTION

DFT Compiler lets you specify scan chains using **set_scan_path** commands. This message tells you that DFT Compiler is unable to add an element to a scan chain because it already belongs to another chain. DFT Compiler discards the specification.

WHAT NEXT

Remove the element from the `set_scan_path` argument list to suppress the warning.

If you do want to add the element to the chain, use `remove_scan_specification` to delete the conflicting chain specification.

TEST-378 (warning) Cannot add '%s' to chain '%s'. The element already belongs to user segment '%s'.

DESCRIPTION

DFT Compiler lets you specify scan chains using `set_scan_path` commands. This message tells you that DFT Compiler is unable to add an element to a scan chain because it already belongs to a scan segment you defined using the `set_scan_segment` command. DFT Compiler discards the specification.

WHAT NEXT

Remove the element from the `set_scan_path` argument list to suppress the warning.

If you do want to add the element to the chain, use `remove_scan_specification` to delete the conflicting scan segment specification.

TEST-380 (warning) Force simulation of multiple capture clocks.

DESCRIPTION

You have defined multiple capture clocks in your test protocol.

WHAT NEXT

Remove multiple capture clocks from your test protocol.

TEST-381 (warning) Clock net '%s' is dont_touch.

DESCRIPTION

To implement the partial-scan test methodology with the multiplexed flip-flop scan style, non-scan elements that share a clock with scan elements must have their clock gated. This gating requires changes to some clock nets; the designated net has been marked by the user as `dont_touch`, preventing the modification.

WHAT NEXT

Remove the `dont_touch` attribute on the indicated net.

TEST-382 (error) Clock gating for partial scan aborted since nets that will be modified are marked as `dont_touch`.

DESCRIPTION

To implement the partial scan test methodology with the multiplexed flip-flop scan style, non-scan elements that share a clock with scan elements must have their clock gated. This gating requires changes to some clock nets; in this design some of these nets have been made `dont_touch`. As a result, `insert_test` has gracefully aborted.

WHAT NEXT

These nets, identified by warning **TEST-381**, should have the `dont_touch` attribute removed.

TEST-383 (warning) Cell %s (%s) is not supported because it is a sequential cell with tristate outputs. Treating as black box.

DESCRIPTION

This message indicates that the specified cell, a sequential cell with tristate outputs, is not supported by DFT Compiler. DFT Compiler treats this type of cell as a black box, which means that faults on the pins of the cell and the surrounding circuitry are untestable. Depending on the number and location of such cells, the effect on overall fault coverage may or may not be significant.

WHAT NEXT

Replace the offending cell with two separate cells: one tristate and one sequential.

TEST-384 (warning) Can't find clock to gate for non-scan cell '%S'.

DESCRIPTION

DFT Compiler gates the clock of valid non-scan cells to ensure that they hold their

states during scan-shift. This message tells you that DFT Compiler could not find the clock to gate for a non-scan cell.

WHAT NEXT

Examine the circuit to establish why DFT Compiler could not trace back from the cell clock pin. Look for nets that do not have exactly one driver. Expect **check_test** to warn you about the cell, and fault coverage to be reduced.

TEST-385 (warning) Cannot find the core-side hookup pin for port %s.

There are %d %s connected to it that are tristate or on pads.
Connecting test signal to a new, dedicated test signal port.

DESCRIPTION

DFT Compiler finds core-side hookup pins for test signal ports. This message tells you that DFT Compiler has not succeeded because there is not exactly one candidate pin. DFT Compiler creates a new, dedicated test signal port, and connects the test signal to that port.

WHAT NEXT

If you do not want a dedicated test signal port, you can correct the connection by hand.

TEST-386 (warning) Cannot find the core-side hookup pin for port %s.

Connecting test signal to a new, dedicated test signal port.

DESCRIPTION

DFT Compiler finds core-side hookup pins for test signal ports. This message tells you that DFT Compiler has not succeeded because a test signal port has illegal active drivers. DFT Compiler creates a new, dedicated test signal port, and connects the test signal to that port.

WHAT NEXT

If you do not want a dedicated test signal port, you can correct the connection by hand.

TEST-387 (warning) Cannot find the core-side hookup pin for port %s.

Hookup pin design instance %s has a dont_touch attribute. Connecting test signal to a new, dedicated test signal port.

DESCRIPTION

DFT Compiler finds core-side hookup pins for test signal ports. This message tells you that DFT Compiler has not succeeded because the hookup pin it identifies is in a design instance that has a dont_touch attribute. DFT Compiler creates a new, dedicated test signal port, and connects the test signal to that port.

WHAT NEXT

If you do not want a dedicated test signal port, remove the dont_touch attribute from the design instance.

TEST-388 (warning) Cannot identify the core side pin of complex cell %s.

Connecting test signal to a new, dedicated test signal port.

DESCRIPTION

There is a cell on the test signal port to which the current test signal must be connected. This cell has multiple pins on its core (i.e., circuit) side. DFT Compiler cannot determine which is the data pin of the pad and what its functional relation to the port is. Therefore, a new, dedicated test signal port is created, and the connection of the test signal is made to the port.

WHAT NEXT

If you do not want a dedicated test signal port, you may either correct the connection by hand; choose another port for test signal connection and rerun **insert_test**; or remove the offending cell on the current port, rerun **insert_test** and reinsert the cell.

TEST-389 (warning) Cannot identify the core side pin of complex pad %s.

Connecting test signal to a new, dedicated test signal port.

DESCRIPTION

There is a pad on the test signal port to which the current test signal must be connected. This pad has multiple pins on its core (i.e., circuit) side. DFT Compiler cannot determine which is the data pin of the pad and what its functional relation to the port is. Therefore, a new, dedicated test signal port is created, and the connection of the test signal is made to the port.

WHAT NEXT

If you do not want a dedicated test signal port, you may either correct the connection by hand; choose a padless port for test signal connection and rerun **insert_test**; or remove the offending pad on the current port, rerun **insert_test** and reinsert the pad.

TEST-390 (Warning) Multiple pullups and/or pulldowns found for net '%s'.

DESCRIPTION

More than a single pullup and/or pulldown has been found for the same net. Only one is considered in test generation. A pullup and a pulldown for a single net does not make sense.

WHAT NEXT

Use only one pullup or pulldown for a net, but not both.

TEST-391 (Warning) Net '%s' is not three stateable. Removing all pullups and/or pulldowns.

DESCRIPTION

Nets that are not three stateable cannot contain pullups and/or pulldowns. This warning message indicates that the offending pullups and/or pulldowns have been removed; therefore, the ATPG results will not reflect the presence of these pullups/pulldowns.

WHAT NEXT

In the future, use pullups and/or pulldowns only on three stateable nets.

TEST-392 (Warning) Disconnecting pin '%s' to route global signals.

DESCRIPTION

Scan insertion connects global methodology signals, such as test clocks and enables.

The message tells you that scan insertion has encountered a mandatory methodology signal pin that is already functionally connected. DFT Compiler removes the functional connection to route the methodology signal.

WHAT NEXT

Verify that the mission mode functionality of the circuit is not impacted.

To leave the pin functionally connected, omit it from **set_scan_segment -access** specifications.

TEST-393 (Warning) Pin '%s/%s' has a signal_type attribute %s that conflicts with its access pin type %s.

DESCRIPTION

Scan insertion lets you specify scan segments using the **set_scan_segment** command.

Scan insertion also connects up global methodology signals, such as test clocks and enables. From this, scan insertion can encounter methodology signal pins that are also scan segment access pins. The message tells you that a methodology signal pin has a signal_type attribute that conflicts with its access pin type.

The scan segment access specification overrides.

WHAT NEXT

Check the scan segment access pin type. Change it if necessary.

To remove the warning, remove the signal_type attribute from the design port that corresponds to the pin.

TEST-394 (warning) Disconnecting pin '%s' to route scan enable.

DESCRIPTION

This warning message occurs because scan insertion, which routes the scan enable signal, has encountered a scan enable pin that is already functionally connected. DFT Compiler removes the functional connection to route the scan enable.

WHAT NEXT

Verify that the mission mode utility of the circuit is not impacted. To leave the pin functionally connected, omit it from the specification set by the **set_scan_group** command **-access** option.

SEE ALSO

`set_scan_group(2)`

TEST-395 (Warning) Can not unscan cell '%s' of type '%s'. No target library cell has it as its scan equivalent.

DESCRIPTION

The **insert_scan** command can unscan cells that have been scan replaced by DFT Compiler.

You may unscan cells during bottom-up scan insertion. Suppose you include a cell in a scan chain at the module level. If you execute the **check_test** command at the chip level, you may discover that the cell violates a test design rule that was not visible at the module level. You may want **insert_scan** to take the cell off the scan chain and unscan it.

You will also want to unscan violated cells if you are running **insert_scan** after a test-ready compile.

DFT Compiler unscans a scan cell by searching through the target technology library for cells that have it as their scan equivalent. This warning is generated when there are no such cells. The cell is not unscanned.

WHAT NEXT

Ensure that there is at least one cell in the target technology library that has the cell that is being unscanned as its function id-based scan equivalent.

TEST-396 (warning) Cannot find the core-side hookup pin for port %s. Net %s, driven by this port, has illegal active drivers. Connecting test signal to a new, dedicated test signal port.

DESCRIPTION

You receive this message if **insert_scan** cannot find a core-side hookup pin for a test signal port, because the port has illegal active drivers. (A core-side hookup pin is the pin that connects the pad cell (port) to the design core.) This message informs you that **insert_scan** has created a new, dedicated test signal port, and connected the test signal to that port.

WHAT NEXT

If you can accept the dedicated signal port that **insert_scan** created, no action is required on your part. However, if you do not want a dedicated test signal port, you can correct the connection manually.

SEE ALSO

insert_scan (2).

TEST-397 (Warning) The scan out pin on cell '%s' in chain '%s' already drives the scan out port '%s'. No new dedicated scan out ports will be created on subdesigns.

DESCRIPTION

You receive this message if the environment variable **test_dedicated_scan_out_ports** is set to *true* but **insert_scan** cannot create a dedicated scanout port for the scanout pin on the specified cell and chain. The specified cell already drives the specified scanout port.

WHAT NEXT

If this condition is acceptable to you, no action on your part is required. Otherwise, examine the specified cell, chain, and port of your design to verify that they are as you intended. Make any changes necessary, then reexecute **insert_scan**.

SEE ALSO

insert_scan (2); **test_dedicated_scan_out_ports** (3).

TEST-398 (Warning) Can not unscan cell '%s' of type '%s'.

DESCRIPTION

You receive this message if **insert_scan** cannot unscan a test design rule violated cell. The reason the cell is unscannable could be that it has a dedicated scanout pin that drives functional logic.

You can force **insert_scan** to unscan cells that have previously been scan replaced, by executing **set_scan_element -false** and reexecuting **insert_scan**. **insert_scan** unscans a scan cell by searching through the target technology library for cells that have the specified cell as their scan equivalent.

You can unscan cells during bottom-up scan insertion. If, for example, you include a cell in a scan chain at the module level and then execute the **check_test** command at the chip level, you might discover that the cell violates a test design rule that was not visible at the module level. This could be a reason for forcing **insert_scan** to take the cell off the scan chain and unscan it.

You might also want to unscan violated cells if you are running **insert_scan** after a test-ready compile.

WHAT NEXT

If it is acceptable to you that the specified cell was not unscanned, no action on your part is required. However, if you still want the specified cell to be unscanned, first ensure that the dedicated scanout pin on the scan cell does not drive any functional logic. Then reexecute **insert_scan**.

TEST-399 (Warning) Proper hookup-pin missing for port '%s' .

DESCRIPTION

You receive this message if **insert_scan** cannot find a proper pins to the core side of identified signal ports, after jumping pads, and buffers, as needed. Specify a proper hookup-pin for the bidi port.

WHAT NEXT

See **set_scan_signal** to specify hookup pin.

TEST-400 (warning) %s '%s' has elements clocked by different clocks or same clock but different edges. Scan group

specification will be ignored.

DESCRIPTION

You receive this warning message because you used the **set_scan_group** command with elements that are clocked by different clocks or same clock but different edges. A scan group can have elements as part of its -include_elements option, that are clocked by only one clock domain of one edge only. When this message is showed, the scan group specification will be ignored during scan architecting. In other words the scan chains will be constructed without respecting the scan group specification.

If the scan group has a design instance name as part of include_elements which is already scan inserted and has scan chain elements clocked by more than one clock, the scan group specification will be ignored and the model for that instance will not be used for constructing the scan chains. Hence the elements/cells within this design instance will be considered as if it is not scan inserted and new scan chains will be constructed accordingly.

In case if the scan group needs to be respected, please ensure to respecify the **set_scan_group** command with elements that are clocked by only one clock and one edge.

SEE ALSO

[set_scan_group](#)

TEST-401 (warning) Synchronization element %s(%s), clocked by capture clock %s, is in an unsupported configuration.

DESCRIPTION

DFT Compiler's design rule checker (**check_test**) recognizes latches as synchronization elements when they satisfy the following criteria:

1. The enable pin is controlled from a clock port during scan shift.
2. The asynchronous control pins (if any) are held inactive during scan shift.
3. There is no set_scan false or set_scan_transparent attribute on the latch.
4. The latch has a single data port and single enable pin.
5. The latch is transparent at time of scan-in binding. (Essentially this means the enable pin is in its active state when the clock port controlling that pin is in its inactive state).

However, even if **check_test** recognizes a latch as a synchronization element, it still has to check that the particular circuit configuration, including the

synchronization element, is supported by DFT Compiler. Unsupported configurations all introduce sequential complexities that cannot be handled by ATPG or timing hazards. Therefore, if **check_test** finds an unsupported configuration, it issues a TEST-401 message and violates the synchronization element. When **check_test** violates the element, it models it as an X generator so that ATPG will not create bad patterns.

The **check_test** command uses zero-delay simulation to check the timing relationships between sequential elements in both the transitive fanin and the transitive fanout of the synchronization element. (The fanin is the cone of logic that drives the data input pin of the synchronization element. The transitive fanout is the cone of logic driven by the data output pin of the synchronization element.)

The **check_test** command checks for two unsupported configurations:

1. Sequential elements in both the transitive fanin and transitive fanout that are clocked by a different clock port, or clock ports, than the clock port driving the synchronization element's enable

If **check_test** finds this configuration, it also issues a TEST-402, with supporting TEST-403 and TEST-404 information messages to help you identify the problem.

(Note that DFT Compiler supports configurations where registers in the transitive fanin or transitive fanout of the synchronization element are clocked by one or more other clock ports. It is only when these other clock ports drive registers in both the transitive fanin and the transitive fanout that the configuration is unsupported.)

2. A synchronization element driving the data input of another synchronization element

If **check_test** finds this configuration, it also issues a TEST-405 information message, with supporting TEST-406 information messages to help you identify the problem.

WHAT NEXT

To correct the violation, you must change the circuit. Read the information messages (TEST-402 to TEST-406) that follow the TEST-401 message. Identify the circuit configuration that is not supported and correct it.

If you do not want to change the circuit configuration, you will find that the test coverage that DFT Compiler can achieve will be lowered. Try running **create_test_patterns** to see if you can still achieve a test coverage that meets your requirements.

SEE ALSO

TEST-402, **TEST-403**, **TEST-404**, **TEST-405**, **TEST-406**.

TEST-402 (information) Because some sequential cells in its

transitive fan-in and some sequential cells in its transitive fan-out are not clocked by capture clock %s.

DESCRIPTION

The **check_test** command issues this information message in support of a TEST-401 information message. It also issues one or more TEST-403 and one or more TEST-404 messages to give you more details on the unsupported configuration.

The **check_test** command issues this information message when it finds sequential elements in both the transitive fanin and transitive fanout that are clocked by a different clock port, or clock ports, than the clock port driving the synchronization element's enable.

(Note that DFT Compiler supports configurations where registers in the transitive fanin or transitive fanout of the synchronization element are clocked by one or more other clock ports. It is only when these other clock ports drive registers in both the transitive fanin and the transitive fanout that the configuration is unsupported.)

WHAT NEXT

To correct the information, you must change the circuit. Read the information messages (TEST-403 and TEST-404) that follow the TEST-402 information. These messages indicate the elements in the transitive fanin and fanout that are clocked by clocks other than the clock port that drives the synchronization element. You will need to modify your circuit such that the unsupported configuration (as previously described) no longer exists.

If you do not want to change the circuit configuration, you will find that the test coverage that DFT Compiler can achieve will be lowered. Try running **create_test_patterns** to see if you can still achieve a test coverage that meets your requirements.

SEE ALSO

TEST-401, **TEST-403**.

TEST-403 (information) Pin %s of cell %s in the transitive fan-in is clocked by capture clock %s.

DESCRIPTION

The **check_test** command issues this message in support of a preceding TEST-401 violation message and TEST-402 information message. The message identifies a sequential element in the transitive fanin of synchronization element and the

capture clock associated with it. The transitive fanin is the cone of logic that drives the data input pin of the synchronization element.

WHAT NEXT

Note the clock ports and the cells identified by this message and by any other TEST-403 and TEST-404 messages that immediately precede or follow this message.

Use this information and the WHAT NEXT section of the TEST-402 man page to identify the circuit configuration that DFT Compiler cannot support and determine if you want to fix the violation.

SEE ALSO **TEST-401**, **TEST-402**, **TEST-404**.

TEST-404 (information) Pin %s of cell %s in the transitive fanout is clocked by capture clock %s.

DESCRIPTION

The **check_test** command issues this message in support of a preceding TEST-401 violation message and a TEST-402 information message.

The message identifies both a clock port that clocks a sequential element in the transitive fanout of the synchronization element and the sequential element that it captures. The transitive fanout is the cone of logic that the data output pin of the synchronization element drives.

WHAT NEXT

Note the clock ports and the cells identified by this message and by any other TEST-403 and TEST-404 messages that immediately precede or follow this message.

Use this information and the WHAT NEXT section of the TEST-402 man page to identify the circuit configuration that DFT Compiler cannot support and determine if you want to fix the violation.

SEE ALSO

TEST-401, **TEST-402**, **TEST-403**.

TEST-405 (information) Because a synchronization element is

in its transitive fan-in.

DESCRIPTION

The **check_test** command issues this message in support of a TEST-401 violation message. The **check_test** command also issues a TEST-406 message to identify the synchronization element in the transitive fanin.

DFT Compiler does not support two synchronization elements connected in series because this configuration is inherently subject to timing hazards. For example, if two synchronization elements with a common clock signal are in series, only detailed timing simulation can determine the final state of the second element when both latches switch off. DFT Compiler uses zero-delay simulation in ATPG and so cannot safely predict the state of the second element.

DFT Compiler will black box both synchronization elements and **create_test_patterns** will treat both of them as X sources. This will lower the fault coverage that DFT Compiler can achieve.

WHAT NEXT

To correct the violation, you must change the circuit so that you no longer have two synchronization elements connected in series. Use the TEST-401 and TEST-406 messages to identify the two synchronization elements.

If you do not want to change the circuit configuration, you will find that the test coverage that DFT Compiler can achieve will be lowered. Try running **create_test_patterns** to see if you can still achieve a test coverage that meets your requirements.

SEE ALSO

[TEST-401](#), [TEST-406](#).

TEST-406 (information) Pin %s of synchronization element %s(%s) is in the transitive fan-in.

DESCRIPTION

The **check_test** command issues this message in support of the preceding TEST-401 violation and TEST-405 information messages. The message identifies the synchronization element that is in the transitive fanin of the synchronization element identified in the preceding TEST-401 violation. The transitive fanout is the cone of logic that drives the data input pin of the synchronization element.

WHAT NEXT

To correct the violation, you must change the circuit so that you no longer have two synchronization elements connected in series. Use this message and the preceding TEST-401 message to identify the two synchronization elements.

If you do not want to change the circuit configuration, you will find that the test coverage that DFT Compiler can achieve will be lowered. Try running **create_test_patterns** to see if you can still achieve a test coverage that meets your requirements.

SEE ALSO

TEST-401, **TEST-405**.

TEST-407 (error) %s time (%10.2f) must be less than %s (%10.2f).

DESCRIPTION

Data application time/delay must happen before strobe time.

WHAT NEXT

Change strobe time, and/or delay or bidirectional delay time such that data application time happens before strobe time, and rerun **create_test_patterns**

SEE ALSO

create_test_clock (2), **test_default_delay** (3), **test_default_bidir_delay** (3),
test_default_strobe (3)

TEST-421 (information) ‘SAMPLE’ instruction renamed ‘SAMPLE/PRELOAD’.

DESCRIPTION

This information message indicates that DFT Compiler considers both ‘SAMPLE/PRELOAD’ and ‘SAMPLE’ as two names for the same instruction. This instruction is called ‘SAMPLE/PRELOAD’.

WHAT NEXT

Since renaming the instruction as SAMPLE/PRELOAD does not affect the instruction codes associated with this command, there is no need to make any additional changes to the db design.

TEST-422 (warning) Mandatory instruction opcodes are not specified when using custom tap controller.

DESCRIPTION

You receive this warning message when you are using a custom tap controller during boundary scan insertion and have not specified the opcodes for the mandatory BYPASS, EXTEST and SAMPLE instructions (unless specified otherwise, SAMPLE and PRELOAD instructions are merged and share their opcodes for IEEE1149.1-2001 std. insertion).

Instruction opcodes might be implemented (fully or partially) within the tap custom controller. You must specify such opcodes (else the tool will proceed with default opcode assignments which might be inconsistent). Not doing so for mandatory instructions can potentially result in an incompliant boundary scan design.

WHAT NEXT

Examine the boundary scan preview report carefully to make sure that the opcode assignments are correct. If the automatic opcode assignment is not correct, specify the correct opcodes using `set_bsd_instruction` command and rerun.

SEE ALSO

`insert_bsd` (2), `preview_bsd` (2), `set_bsd_instruction` (2).

TEST-424 (information) TCK clock frequency ‘%e’, calculated from clock period ‘%f’, and technology library ‘%s’ time scale ‘%d’ in units of ‘%s’.

DESCRIPTION

The 1149.1 Boundary Scan Test Access Port (TAP) clock signal TCK drives the boundary scan test logic. The speed at which TCK will be operated is a function of the maximum speed of the tester and the board component in the chain of boundary scan components with the slowest TCK clock. Typically, TCK is operated at between 10 and 25 MHz. In the absense of any specification by the designer, DFT Compiler will synthesize a TCK clock which operates at 20MHz.

BSDL descriptions of 1149.1 boundary scan logic require explicit specification of TCK clock frequency.

Synthesis tasks associated with design clocks are executed using unitless specification of clock period (e.g. 'create_clock myTCK -period 31').

In order to calculate clock frequency, determination of the period units is required. This is done by querying the technology library into which the target design has been mapped. Two global attributes of the technology library are the time_unit_name (e.g. ns, ps) and the time_scale (e.g. 1, 10, 100) which acts as a multiplier of the period in the specified time units. For example a clock period specified as 31 in time units of ps (picoseconds) and a time_scale of 10 has a frequency = $1 / (31 * (10 * (1 / 1.0e12)))$.

WHAT NEXT

If this appears to be an incorrect TCK frequency, verify that the correct technology library is associated with the db design. If necessary, manually edit the generated BSDL file to provide the required frequency information.

You can specify a custom TCK clock frequency by executing boundary scan synthesis using 'insert_jtag -tck_period <custom_period>'.

TEST-425 (warning) Unable to calculate TCK frequency for technology library '%s'.

DESCRIPTION

Synthesis tasks associated with design clocks are executed using unitless specification of clock period (e.g. 'create_clock myTCK -period 31').

BSDL files require explicit specification of TCK clock frequency. In order to calculate clock frequency, determination of the period units is required. This is done by querying the technology library into which the target design has been mapped. Two global attributes of the technology library are the time_unit_name (e.g. ns, ps) and the time_scale (e.g. 1, 10, 100) which acts as a multiplier of the period in the specified time units. For example a clock period specified as 31 in time units of ps (picoseconds) and a time_scale of 10 has a frequency = $1 / (31 * (10 * (1 / 1.0e12)))$.

This warning message is produced if either the time_scale or time_unit_name were unavailable for the specified library.

WHAT NEXT

First verify that the correct library is be targetted for the calculation of frequency. If not, associate the correct library with the db design. If the correct library has been identified, but one or both of the time_scale and time_unit_name attributes do not exist, work with your technology vendor to provide this

information. Then reextract the BSDL file using the `write_jtag_bsdl` command.

Alternately, manually edit the generated BSDL file to provide the required TCK frequency information.

TEST-427 (information) TCK clock frequency ‘%e’, calculated from default clock period ‘%f’, and technology library ‘%s’ time scale ‘%d’ in units of ‘%s’.

DESCRIPTION

The 1149.1 Boundary Scan Test Access Port (TAP) clock signal TCK drives the boundary scan test logic. The speed at which TCK will be operated is a function of the maximum speed of the tester and the board component in the chain of boundary scan components with the slowest TCK clock. Typically, TCK is operated at between 10 and 25 MHz. In the absence of any specification by the designer, DFT Compiler will synthesize a TCK clock which operates at 20MHz.

BSDL descriptions of 1149.1 boundary scan logic require explicit specification of TCK clock frequency.

Synthesis tasks associated with design clocks are executed using unitless specification of clock period (e.g. ‘`create_clock myTCK -period 31`’).

In order to calculate clock frequency, determination of the period units is required. This is done by querying the technology library into which the target design has been mapped. Two global attributes of the technology library are the `time_unit_name` (e.g. ns, ps) and the `time_scale` (e.g. 1, 10, 100) which acts as a multiplier of the period in the specified time units. For example a clock period specified as 31 in time units of ps (picoseconds) and a `time_scale` of 10 has a $\text{frequency} = 1 / (31 * (10 * (1 / 1.0e12)))$.

WHAT NEXT

If this appears to be an incorrect TCK frequency, verify that the correct technology library is associated with the db design. If necessary, manually edit the generated BSDL file to provide the required frequency information.

If you are not satisfied with the default TCK clock frequency chosen by DFT Compiler, execute boundary scan synthesis by invoking ‘`insert_jtag -tck_period <custom_period>`’.

TEST-428 (warning) The length of the RUNBIST signature (%d) does not equal the length of the ‘%s’ register selected by the

RUNBIST instruction.

DESCRIPTION

This error message indicates that there is a mismatch in between the length of the Test Data Register selected by the RUNBIST instruction and the length of the signature that you have specified using the **set_bsd_rumbist** command.

WHAT NEXT

Re-issue the **set_bsd_rumbist** command with the correct signature length.

TEST-429 (warning) The parameters for the '%s' instruction have been defined but the instruction could not be found in the design '%s'.

DESCRIPTION

This error message indicates that you have defined the parameters for the INTEST/RUNBIST instruction using the **set_bsd_intest** or **set_bsd_rumbist** commands but the ANSI/IEEE Std.1149.1 Compliance Checker could not find the corresponding instruction in the Boundary Scan Design.

WHAT NEXT

Make sure that the RUNBIST/INTEST instructions have been implemented for the Boundary Scan Design and that the implementation is compliant with ANSI/IEEE Std.1149.1.

TEST-430 (warning) The subdesign scan chain '%s' is assumed to be non-inverting.

DESCRIPTION

You have asked scan synthesis to create non-inverting scan chains. Scan synthesis assumes that all subdesign scan chains are non-inverting. If this assumption is not true, you may end up with a scan chain that has inversions in it, even when you have asked scan synthesis to create non-inverting scan chains.

WHAT NEXT

Make sure that the specified subdesign scan chain does not have any inversions in it.

TEST-431 (warning) The scan segment '%s' is assumed to be non-inverting.

DESCRIPTION

You have asked scan synthesis to create non-inverting scan chains. Scan synthesis assumes that all scan segments that you have specified using the **set_scan_segment** are non-inverting. If this assumption is not true, you may end up with a scan chain that has inversions in it, even when you have asked scan synthesis to create non-inverting scan chains.

WHAT NEXT

Make sure that the specified scan segment does not have any inversions in it.

TEST-432 (warning) Enable pin(s) attached to the tristate port "%s" always drive the port to a high impedance value. The control port is ignored for boundary-scan insertion.

DESCRIPTION

You receive this warning message because the output port specified in your design is constantly driven to a high impedance value. If the specified port is a bidirectional port, this warning holds for the output side of the port and a BSR cell is still inserted for the input side of the port.

WHAT NEXT

Check the design and verify that you intended to always drive the output port to high impedance. Check all the enable pins on the specified port to verify that each enable pin is driven appropriately.

SEE ALSO

insert_bsd (2), **preview_bsd** (2).

TEST-433 (warning) Enable pin(s) attached to the tristate port "%s" always enable the port. The port functionality is reduced to a simple two-state output port, and no control BSR cell is attached.

DESCRIPTION

You receive this warning message when the specified output port in your design is constantly enabled. If the specified port is a bidirectional port, this warning holds for the output side of the port.

WHAT NEXT

Check the design and verify that you intended to use the tristate output port as a simple output port.

SEE ALSO

`insert_bsd` (2), `preview_bsd` (2).

TEST-434a (warning) Boundary-cell type BC_4 specified for the input port %s cannot be implemented. Ignoring the specification and using BC_1 type instead.

DESCRIPTION

You receive this warning message in DB mode when INTEST is implemented and you use the `set_bsd_data_cell` command to specify BC_4 to be used at a nonclock input port.

You receive this warning message in XG mode when INTEST is implemented and you use the `set_boundary_cell` command to specify BC_4 to be used at a nonclock input port.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_bsd` (2), `insert_dft` (2), `preview_bsd` (2), `preview_dft` (2),
`set_bsd_data_cell`(2), `set_boundary_cell`(2), `set_bsd_instruction`(2).

TEST-434 (warning) Boundary-cell type BC_2 specified for the output port %s cannot be implemented. Ignoring the specification and using BC_1 type instead.

DESCRIPTION

You receive this warning message in DB mode when INTEST is implemented and you use the **set_bsd_data_cell** command to specify BC_2 to be used at an output port.

You receive this warning message in XG mode when INTEST is implemented and you use the **set_boundary_cell** command to specify BC_2 to be used at an output port.

WHAT NEXT

No action is required on your part.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2),
set_bsd_data_cell(2), **set_boundary_cell**(2), **set_bsd_instruction**(2).

TEST-435 (warning) Pad design %s cannot be validated as it's access list does not specify the signal type 'port'.

DESCRIPTION

You receive this warning message in DB mode when you specify the pad design to get validated (by the **-check_pad_designs** argument of the **set_bsd_configuration** command), and the **-access_list** of **set_bsd_pad_design** command does not specify the signal type **port**.

You receive this warning message in XG mode when you specify the pad design to get validated (by the **-check_pad_designs** argument of the **set_bsd_configuration** command), and the **-interface** of **define_dft_design** command does not specify the signal type **port**.

Signal type **port** specifies the pin in the pad design instance that is connected to the design port.

WHAT NEXT

Specify signal type **port** in the **-access_list** for the pad design in the **set_bsd_pad_design** command.

SEE ALSO

`set_bsd_configuration` (2), `set_bsd_pad_design` (2), `define_dft_design` (2).

TEST-436 (warning) Pin %s of pad design instance %s is not a valid a enable pin.

DESCRIPTION

You receive this warning message when you specify the pad design to be validated (using the `-check_pad_designs` argument of the `set_bsd_configuration` command), and an active low value at the specified enable pin does not make the pad output inactive (high impedance). The enable pin functionality is validated for tristate and bidirectional pad designs.

WHAT NEXT

Specify the correct pin for the `enable` or `enable_inverted` signal type in the `-access_list` of the pad design in DB mode. If applicable, use the `set_bsd_compliance` command to specify a compliance enable pattern at the compliance enable ports of the design.

Specify the correct polarity for the `enable` signal type in the `-interface` of the pad design in XG mode. If applicable, use the `set_bsd_compliance` command to specify a compliance enable pattern at the compliance enable ports of the design.

SEE ALSO

`set_bsd_compliance` (2), `set_bsd_configuration` (2), `set_bsd_pad_design` (2),
`define_dft_design` (2).

TEST-437 (warning) Data cannot propagate correctly from pin %s to pin %s of pad design instance %s.

DESCRIPTION

You receive this warning message when you specify the pad design to be validated (using the `-check_pad_designs` argument of the `set_bsd_configuration` command), and the functionality of the data pin could not be established during validation.

WHAT NEXT

Verify that the following information is correct:

- Specify the correct pin in the **-access_list** for the pad design for the **data_in**, **data_in_inverted**, **data_out**, and **data_out_inverted** signal types in DB mode.
- Specify the correct pin polarity in the **-interface** for the pad design for the **data_in**, **data_out** signal types in XG mode.
- Check that the signal types polarities are correct.
- Specify the correct **enable** or **enable_inverted** pin for tristate and bidirectional pads in DB mode.
- Specify the correct polarity of **enable** pin for tristate and bidirectional pads in XG mode.
- Specify the correct **port** pin.
- If applicable, use the **set_bsd_compliance** command to specify a compliance enable pattern at compliance enable ports of the design.

SEE ALSO

set_bsd_compliance (2), **set_bsd_configuration** (2), **set_bsd_pad_design** (2),
define_dft_design (2).

TEST-438 (error) TDO port(%s) pad does not have an enable pin.

DESCRIPTION

You receive this error message because the enable pin was not found for the TDO (test data out) port pad. The TDO port must have a 3-state pad and an enable pin.

WHAT NEXT

Correct the design, ensuring that the following information is accurate:

- Specify the correct pin in the **-access_list** for the pad design for the **data_in**, **data_in_inverted**, **data_out**, and **data_out_inverted** signal types in DB mode.
- Specify the correct pin polarity in the **-interface** for the pad design for the **data_in**, **data_out** signal types in XG mode.
- Specify the signal types with the correct polarities.
- Specify the correct **port** pin for tristate and bidirectional pads.

- Specify the correct **enable** or **enable_inverted** pin in DB mode.
- Specify the correct polarity of **enable** pin in XG mode.
- If required, use the **set_bsd_compliance** command to specify the values to put on other pins.

SEE ALSO

set_bsd_compliance (2), **set_bsd_configuration** (2), **set_bsd_pad_design** (2),
define_dft_design (2).

TEST-439 (error) %s port(%s) is not a valid TAP port.

DESCRIPTION

You get this error when a bidirection port is used as a TAP port and the port pad is not of the correct type. The port pad for TCK, TMS, TDI or TRST should be either an input pad or a bidirectional pad reduced to an input pad by disabling the output side. The port pad used for the TDO port should be either a tristate pad or a bidirectional pad whose input side is not used. According to section 3.1.1(c) IEEE std. 1149.1, all TAP inputs and outputs should be dedicated connections to the component and should not be used for any other purpose.

WHAT NEXT

Correct the design by providing correct pad configuration at the specified TAP port. Make sure that the TAP port is not used for any other purpose.

SEE ALSO

check_bsd (2), **insert_bsd** (2), **insert_dft** (2), **define_dft_design** (2).

TEST-440 (information) Combinational feedback loop is disabled at pin %s of cell %s (%s) by constant values.

DESCRIPTION

Test design rule checking has identified a combinational feedback loop in the design which was disabled by logic 0 in the circuit, logic 1 in the circuit, **set_test Assumes**, or **set_test_holds**. The command **set_test_hold** does not have any effect on custom test protocols. However, for custom test protocols, constants are those values which are the same through the **foreach pattern** section of the test protocol.

check_test has broken the combinational feedback loop at the point where it was logically disabled so no additional coverage was lost because of the break point. **create_test_patterns** requires all feedback loops to be disabled because in the faulty state of the circuit, the feedback loop may no longer be disabled.

WHAT NEXT

If you don't agree with the break point, change the constant values in the circuit.

TEST-441 (information) Combinational feedback loop is disabled at pin %s of cell %s (%s) by logical values present during initialization.

DESCRIPTION

Test design rule checking has identified a combinational feedback loop in the design which was disabled by logic values present in the circuit after simulating the foreach program section of the test protocol.

The logic values present at this point may not be present for the rest of the protocol.

WHAT NEXT

If this is a bad place to break the combinational feedback loop, use `set_test_isolate` to break it in a particular place. You can also use `set_test_hold` to create constants in the circuit which break the feedback loop.

TEST-442 (error) Length not specified for the test data register %s.

DESCRIPTION

You get this error message during "insert_bsd" or "preview_bsd" in the debug flow (i.e. when the value of the "-flow" option of "set_bsd_configuration" is set to debug and the length is not specified for the user test data register).

WHAT NEXT

Specify the length of the test data register and rerun insert_bsd/preview_bsd.

SEE ALSO

`set_bsd_configuration (2)`. `set_bsd_register (2)`.

TEST-443 (error) Undefined BSR %s cell %s specified for port %S.

DESCRIPTION

You get this error message in DB mode during "insert_bsd" or "preview_bsd" when the set_bsd_data_cell or set_bsd_control_cell specification provided for a port refers to a bsr element that has not been defined. This may happen either due to incorrect BSR element name used in the set_bsd_data_cell or set_bsd_control_cell specification or due to a missing definition of the intended BSR element.

You get this error message in XG mode during "insert_dft" or "preview_dft" when the set_boundary_cell specification provided for a port refers to a bsr element that has not been defined. This may happen either due to incorrect BSR element name used in the set_boundary_cell specification or due to a missing definition of the intended BSR element.

WHAT NEXT

Correct the BSR element name in the set_bsd_data_cell or set_bsd_control_cell command OR provide a set_bsd_bsr_element definition for the named BSR and rerun insert_bsd/preview_bsd in DB mode.

Correct the BSR element name in the set_boundary_cell OR provide a define_dft_design definition for the named BSR and rerun insert_dft/preview_dft in XG mode.

SEE ALSO

`set_bsd_bsr_element (2)`, `define_dft_design (2)`, `set_bsd_data_cell (2)`,
`set_bsd_control_cell (2)`, `set_boundary_cell (2)`.

TEST-444 (error) Invalid type %s of BSR data cell %s specified for the direction %s of port %s.

DESCRIPTION

You get this error message in DB mode during "insert_bsd" or "preview_bsd" when the set_bsd_data_cell specification provided for a port is found to be invalid, due to the invalid bsr cell type for the port direction.

You get this error message in XG mode during "insert_dft" or "preview_dft" when the

`set_boundary_cell` specification provided for a port is found to be invalid, due to the invalid bsr cell type for the port direction.

The allowed BSR cell types are as follows:

Input (or input side of an Inout port) - BC_1, BC_2, BC_4
Output (or output side of an Inout port) - BC_1, BC_2
Inout - BC_7

WHAT NEXT

Specify a correct type of BSR element at the port and rerun `insert_bsd/preview_bsd` in DB mode.

Specify a correct type of BSR element at the port and rerun `insert_dft/preview_dft` in XG mode.

SEE ALSO

`set_bsd_bsr_element (2)`, `define_dft_design (2)`, `set_bsd_data_cell (2)`,
`set_boundary_cell (2)`.

TEST-445 (error) BSR element %s type %s does not match with the type %s in control cell specification.

DESCRIPTION

You get this error message in DB mode during "`insert_bsd`" or "`preview_bsd`" when the `set_bsd_control_cell` specification provided for a port refers to a bsr element whose type that does not match with the control cell type specified in the command. Note that the allowed types for control bsr cells are BC_1 and BC_2.

You get this error message in XG mode during "`insert_dft`" or "`preview_dft`" when the `set_boundary_cell` specification provided for a port refers to a bsr element whose type that does not match with the control cell type specified in the command. Note that the allowed types for control bsr cells are BC_1 and BC_2.

WHAT NEXT

Specify a control bsr cell with correct type and rerun `insert_bsd/preview_bsd` in DB mode.

Specify a control bsr cell with correct type and rerun `insert_dft/preview_dft` in XG mode.

SEE ALSO

`set_bsd_bsr_element (2)`, `define_dft_design (2)`, `set_bsd_control_cell (2)`,

```
set_boundary_cell (2) .
```

TEST-446 (error) %s is not a valid compliance enable port.

DESCRIPTION

You get this error when a bidirection port is used as a compliance enable port and the port pad is not of the correct type. The port pad for a compliance enable port should be either an input pad or a bidirectional pad reduced to an input pad.

WHAT NEXT

Correct the design by providing correct pad configuration at the specified compliance enable port. Make sure that the compliance enable port is not used for any other purpose.

SEE ALSO

```
check_bsd (2) insert_bsd (2) set_bsd_pad_design(2)
```

TEST-447 (error) Non-compliant Boundary Scan logic will be synthesized.

Inverting three-state output drivers encountered.

DESCRIPTION

The IEEE 1149.1 Boundary Scan Standard requires that the output of a Boundary Scan Register (BSR) cell not be inverted before it exits the chip through the chip's io pad. Rules 10.4.1e and 10.6.11 of IEEE Std 1149.1a-1993 require that the polarity of the system output equal the polarity of the TDO output of the BSR cell.

This error message is generated because one or more output ports have three-state drivers that invert their data signals. As a result, the BSR cells associated with these output ports will also have their data signals inverted, in violation of the Boundary Scan Standard.

This error invalidates some of the fundamental assumptions about data accessed through the chip's TAP port by downstream test tools. In particular, by violating rule 10.4.1e, it violates rule 10.6.11 of the standard. As a result, Boundary Scan Description Language (BSDL) file descriptions of these ports by downstream tools will be misleading.

WHAT NEXT

Modify your design so that the boundary-scan configuration complies with the standard; otherwise, there will be significant problems with downstream testing. You can make the boundary-scan configuration compliant in one of two ways.

First, if your library contains non-inverting three-state output cells, for each output port in the boundary scan register, replace each inverting three-state output cell in your original design by a non-inverting three-state output cell, preceded by an inverter. (If necessary, use the `set_dont_use` command to ensure selection of the correct library cells.) Then, reinvoke `insert_jtag`.

Second, as an alternative, modify the configuration synthesized by DFT Compiler by inserting an inverter on each side of the BSR cell associated with the data signal of each offending port. Insert one inverter directly in front of the DI port of the BSR cell. Insert the other inverter directly after the DO port of the BSR cell. While Rule 10.4.1 (e) of IEEE Std 1149.1-1990 states that there shall be no logic between any boundary-scan register cell and the system pin to which that cell is connected, transparent devices such as buffers and I/O buffers are not considered to be "logic" and may exist outside the boundary-scan register. Inverters may also exist outside the boundary-scan register subject to conformance to rules 10.5.1h, 10.5.1i, 10.6.1i, 10.6.1k, 10.6.11, 10.6.1m, and 10.6.1n. (Gates, flip-flops, latches, and other devices that perform logical operations are considered to be logic devices and must not be placed outside the boundary-scan register.)

For example, consider this illegal configuration:

```
CORE----->inverting_buffer
```

To achieve a legal boundary scan configuration while maintaining the desired logical behavior, place the serial string inverter->BSR_Cell->inverter between the CORE and the inverting buffer, as follows:

```
CORE---->inverter---->BSR_Cell---->inverter---->inverting_buffer
```

Notice that, although the inverted output still occurs before the BSR cell, the net output of the BSR cell itself is not inverted. The inverters meet the requirements of rules 10.6.1l and 10.6.1m.

TEST-448 (warning) %s instruction cannot be implemented as the user data register %s specified for the instruction is not found. Removing the instruction.

DESCRIPTION

You get this warning when the test data register specified for a user instruction does not exist. This may happen either due to a missing specification for the test data register or due to incorrect test data register name used in the `set_bsd_instruction` command.

WHAT NEXT

Check the test data register specified for the instruction. Either correct the test data register name or provide a definition for the test data register using `set_bsd_register` command in DB mode.

Check the test data register specified for the instruction. Either correct the test data register name or provide a definition for the test data register using `set_scan_path` and `set_dft_signal` commands in XG mode.

SEE ALSO

`insert_bsd(2)`, `insert_dft(2)`, `set_bsd_instruction(2)`, `set_bsd_register(2)`,
`set_scan_path(2)`, `set_dft_signal(2)`.

TEST-449 (error) Wired logic driving output port '%s' encountered.

DESCRIPTION

Currently DFT Compiler's boundary scan synthesis capability does not support designs containing output ports driven by wired logic.

WHAT NEXT

It is possible that the wired logic is the result of a user error. Run `check_design` on your design and make sure that all warning messages can be ignored.

TEST-451 (warning) Cell %s (%s) is unknown (black box) because functionality for output pin %s is bad or incomplete.

DESCRIPTION

Test design rule checking has identified that this output or three-state pin does not have a function described in the library. Test design rule checking requires that all outputs/three-states have functions defined in order to recognize the functionality of the cell. If any output/three-state does not have a function specified, the entire cell will be black-boxed as is the case here.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

TEST-452 (warning) Cell %s (%s) is unknown (black box) because output pin %s is always an X.

DESCRIPTION

Test design rule checking has identified that this output or three-state pin's function specifies that this output is always an X. Test design rule checking requires that all outputs/three-states have functions other than an X in order to recognize the functionality of the cell. If any output/three-state can only be an X, the entire cell will be black-boxed as is the case here.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

TEST-453 (warning) Cell %s (%s) is unknown (black box) because output pin %s is three-state but does not have a three-state function specified.

DESCRIPTION

Test design rule checking has identified that this pin is a three-state through attributes on the library cell. However, the `three_state` function is not specified in the library for this particular cell. In other words, there is no function specified for the tree-state enable. Test design rule checking requires that all three-state outputs have functions specified for their enable pins. If this is not the case, the entire cell will be black-boxed as is the case here.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

TEST-454 (information) Because the information in the library db is incomplete or inconsistent. For this cell, the current version of Library Compiler issues the following message(s): "%S"

DESCRIPTION

DFT Compiler requires that the functionality of all sequential cell be unique and explicit. The information about this particular cell is either incomplete or inconsistent, preventing the construction of a DFT Compiler usable model. Please refer to the reported LIBG message(s) to understand the exact nature of the problem.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

TEST-455 (Error) Protocol cannot be generated for %s instruction as the instruction is not implemented."

DESCRIPTION

You get this error when you try to generate the protocol for an instruction which is not implemented. Check the preview_bsd report to make sure that the instruction exists there.

WHAT NEXT

Implement the instruction first by providing a specification for the instruction. Then rerun insert_bsd and the write_bsd_protocol command.

SEE ALSO

`set_bsd_instruction insert_bsd preview_bsd`

TEST-456 (Warning) OBSERVE_ONLY BSR cell %s specified for port % is not of the type BC_4. Using the default BC_4 BSR

cell.

DESCRIPTION

You get this warning in DB mode during insert_bsd/preview_bsd when you specified BSR cell with '-function OBSERVE', but the type of the BSR cell is not BC_4.

You get this warning in XG mode during insert_dft/preview_dft when you specified BSR cell with '-function OBSERVE', but the type of the BSR cell is not BC_4.

WHAT NEXT

Specify a BSR cell of type BC_4 and rerun insert_bsd/preview_bsd in DB mode.

Specify a BSR cell of type BC_4 and rerun insert_dft/preview_dft in XG mode.

SEE ALSO

set_bsd_data_cell (2) **set_boundary_cell** (2) **insert_bsd** (2), **insert_dft** (2),
preview_bsd (2), **preview_dft** (2).

TEST-457 (warning) Pin '%s' is not found in design, the UDR '%s' is ignored.

DESCRIPTION

This warning message occurs when the user test data register (UDR) specified has a pin that is not found in the design. The **insert_dft** command ignores the user test data register after displaying this error message. The hookup pins specified in the scan path of user data registers with the **set_scan_path** command, or hookup pins specified with the **set_dft_signal** command must be present in the design.

WHAT NEXT

Check the user test data register specified for the instruction. When using the **set_dft_signal** or **set_scan_path** command, use only the pins in the hookup pins list that are present in the design.

SEE ALSO

insert_dft(2)
set_bsd_instruction(2)
set_dft_signal(2)
set_scan_path(2)

TEST-461 (warning) Generic sequential cell %s (%s) is not supported because both clocks are used. This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this cell is not supported because this cell is using a generic sequential cell with both `clocked_on` and `enable` hooked up to the circuit. A supported sequential element cannot have more than one non-test clock. If both the edge sensitive, `clocked_on`, and level sensitive, `enable`, clocks are hooked up for generic sequential cells, the cell will be black boxed by test design rule checking.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should not use both an edge sensitive and level sensitive clock for a single sequential cell.

TEST-462 (warning) Cell %s (%s) is not supported because it has too many states (%s states). This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this cell is not supported because the corresponding library cell is not a supported single bit device. A supported single bit device cannot have more than 4 states. The only supported single bit device with four states is a master-slave latch pair with set/reset pins on each state. If the cell has more than 4 states, it is black-boxed. The warning message specifies how many states were found for this library cell.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

Library cell developers should use `report_lib -table` to determine the number of states in a library cell.

TEST-463 (warning) Master-slave cell %s (%s) is not supported because state pin %s is neither a master nor a slave. This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this master-slave cell is not really a master-slave cell. The only cells that we support are single bit flip flops and master-slave latch pairs. Although this cell has more than one state, this cell is not a master-slave latch pair. A master-slave latch pair must have level-sensitive latches where the master latch feeds the slave latch. The slave latch must only get its data from the master latch. If the cell is not a recognized flip-flop or master-slave latch pair, then it is black-boxed.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

Library cell developers should use `report_lib -table` to look at the library description of the cell.

TEST-464 (warning) Master-slave cell %s (%s) is not supported because there are two or more master states. This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this master-slave cell is not really a master-slave cell. The only cells that we support are single bit flip flops and master-slave latch pairs. Although this cell has more than one state, this cell is not a master-slave latch pair. A master-slave latch pair must have level-sensitive latches where the master latch feeds the slave latch. The slave latch must only get its data from the master latch. In this case, test design rule checking determined that two distinct states fed slave state(s). However, test design rule checking only allows one master latch to feed a slave latch. If the cell has more than one master-state, then it is black-boxed.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

Library cell developers should use report_lib -table to look at the library description of the cell.

TEST-465 (warning) Master-slave cell %s (%s) is not supported because there are two or more slave states. This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this master-slave cell is not really a master-slave cell. The only cells that we support are single bit flip flops and master-slave latch pairs. Although this cell has more than one state, this cell is not a master-slave latch pair. A master-slave latch pair must have level-sensitive latches where the master latch feeds the slave latch. The slave latch must only get its data from the master latch. In this case, test design rule checking determined that two distinct states are fed from a master latch. However, test design rule checking only allows one slave latch. If the cell has more than one slave state, then it is black-boxed.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

Library cell developers should use report_lib -table to look at the library description of the cell.

TEST-466 (warning) Cell %s (%s) is not supported because the state pin %s has no clocks. This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this cell is not supported because all sequential cells must have clocks. Test design rule checking has determined that this state of this cell does not have any clocks, therefore it is black-boxed.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black

box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

Library cell developers should use report_lib -table using libgen_debug_ebst=87 to determine the clocks of each state.

TEST-467 (warning) Cell %s (%s) is not supported because the state pin %s is multi-port. This cell is being black-boxed.

DESCRIPTION

Test design rule checking has identified that this cell is not supported because it requires that all states of sequential cells can only have one non-test clock and one data input. Test design rule checking has determined that this state of this cell has too many data or non-test clocks. Therefore it is black-boxed.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

You should either use a different library cell or contact your vendor/library developer to fix this cell.

Library cell developers should use report_lib -table using libgen_debug_ebst=87 to determine the clocks of each state.

TEST-468 (warning) Cell %s (%s) is not supported because it is a sequential cell with three-state outputs. This cell is being black-boxed.

DESCRIPTION

This message identifies sequential cells with three-state outputs. This type of cell is treated as a *black-box*, which means that faults on the pins of the cell and the surrounding circuitry are untestable. Depending on the number and location of such cells, the effect on overall fault coverage may or may not be significant.

`check_test`, `create_test_patterns`, and `write_test` will treat this cell as a black box.

WHAT NEXT

This message appears when you are using a sequential cell with tristate outputs. This cell is not supported. This cell will be treated as a black-box cell.

The only way to get around this problem is to replace this cell with two distinct cells, separate tristate and sequential cells.

TEST-469 (Information) Test protocol inference terminated with errors.

DESCRIPTION

This message tells you that `infer_test_protocol` terminated because of errors. The user must fix these errors before continuing. The error(s) are usually associated with user specifications.

WHAT NEXT

Provide the specifications requested.

TEST-470 (Information) Test design rule checking terminated with errors.

DESCRIPTION

This message tells you that `check_test` terminated because of errors. The user must fix these errors before continuing. The error(s) are associated with the timing specified by the user.

WHAT NEXT

Fix the timing by using `create_test_clock`, `test_default_period`, `test_default_delay`, `test_default_bidir_delay`, `test_default_strobe`, or `test_default_strobe_width`.

TEST-471 (warning) Asynchronous control pin %s of cell %s (%s) can change in the capture cycle. This can cause the cell to

capture unreliable.

DESCRIPTION

You receive this warning message if **check_test** detects a condition where an asynchronous control pin might not remain stable while response data is being captured. This condition causes a capture violation, so that ATPG cannot predict the captured state, regardless of the input pattern applied. Warning messages indicate a test design rule violation and warn you of the possibility of reduced fault coverage. If you want this cell to be testable, you must correct the situation that causes the unreliable capture.

During the parallel cycle of the scan-test sequence, the response of internal combinational logic to the applied test pattern is captured into the sequential cells in the design. This is usually done by applying a system (normal operation) clock pulse.

To ensure that data is reliably captured, the values being captured into a cell must depend on the scanned-in state of sequential cells in the fan-in cone of that cell. In general, the captured data value must depend only on scanned-in state, valid non-scan state (for partial scan), and primary input values. In addition, asynchronous control pins of the cell must remain inactive when response data is being captured by the data pins of a sequential cell.

Unreliable capture can occur when the response value captured in a register can asynchronously affect the response value captured in another register. This condition can occur if there is a combinational path between the output of one sequential cell and the asynchronous control pin of another sequential cell, the source and destination registers are clocked by the same clock port, and the combinational path between the two registers is not disabled by constants present in the design.

Examples of unreliable capture conditions caused by an asynchronous path between source register and destination register include the following:

- A combinational path between the output of a negative edge-triggered flip-flop and the asynchronous control pin of a positive edge-triggered flip-flop, clocked by the same clock port.
- A combinational path between the output of a latch and the asynchronous control pin of another register, both clocked by the same clock port.

When DFT Compiler detects an unreliable capture condition of this type, it marks the asynchronous control pin of the destination register with a violation, and ATPG does not use the cell for observing fault effects.

Following this message, DFT Compiler issues diagnostic messages describing the conditions at the source and destination registers that cause this violation.

WHAT NEXT

If you receive this message, proceed as follows:

1. Locate and identify the cause of the unreliable capture, by doing any or all of the following:
 - Read the diagnostic messages that follow this warning message, and the messages following **check_test** execution.
 - Use **Design Analyzer** to view the violation. For more information, see the *Design Analyzer Reference Manual*.
 - Read the related extended error messages TEST-472, TEST-476, TEST-479, and TEST-559.
2. Modify your design to correct the violating condition. For more information, see Chapter 6 of the *DFT Compiler Test Design Rule Checking User Guide*.
3. Re-execute **check_test** to verify that the violation has been corrected.

TEST-472 (information) Cell %s launches response data from pin %s at %s edge of clock port %s (pin %s) at time %s.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture warning messages (TEST-471 and TEST-478) to help you identify and correct the cause of the unreliable capture problem.

This message is a companion message to TEST-473 or TEST-476, and describes the cause of the unreliable capture problem as it relates to the source register when response data is launched from that register at a clock transition in the capture cycle. The message is to be interpreted as follows:

- Cell %s is the source register from which response data launches.
- pin %s is the output pin of the source register.

- %s edge is the transition (rising or falling) of the clock when response data launches.
- clock port %s is the name of the clock port that is the source of the clock signal.
- (pin %s) is the launching register's clock pin that is affected by the transition at the clock port.
- time %s is the time that the clock transition occurs in the capture cycle, assuming zero delay.

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-471 or TEST-478 extended warning messages, using the information in this diagnostic message to help find the cause of the problem.

SEE ALSO

check_test (2); **TEST-471** (n), **TEST-473** (n), **TEST-476** (n), **TEST-477** (n), **TEST-478** (n), **TEST-479** (n), **TEST-559** (n); *Design Analyzer Reference Manual, DFT Compiler Test Design Rule Checking User Guide*.

TEST-473 (information) Cell %s captures data on pin %s at %s edge of clock port %s (pin %s) at time %s.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture warning message TEST-478 to help you identify and correct the cause of the unreliable capture problem.

This message is a companion message to TEST-472, and describes the cause of the unreliable capture problem as it relates to the destination register. The message is to be interpreted as follows:

- Cell %s is the destination register where response data is to be captured.
- pin %s is the synchronous input pin of the destination register.
- %s edge is the transition (rising or falling) of the clock when response data is to be captured in the destination register.

- clock port %s is the source of the clock signal.
- (pin %s) is the target register's clock pin that is affected by the transition at the clock port.
- time %s is the time that clock transition occurs in the capture cycle, assuming zero delay.

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-478 extended warning message, using the information in this diagnostic message to help find the cause of the problem.

SEE ALSO

check_test (2); **TEST-472** (n), **TEST-476** (n), **TEST-477** (n), **TEST-478** (n), **TEST-479** (n), **TEST-559** (n); *Design Analyzer Reference Manual, DFT Compiler Test Design Rule Checking User Guide*.

TEST-474 (information) There is a path from %s to %s.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture warning messages (TEST-478 and TEST-471) to help you identify and correct the cause of the unreliable capture problem.

This message tells you that there is a path from the source (identified by the preceding TEST-472, TEST-479 or TEST-559 violation) to the destination register (identified by the preceding TEST-473, TEST-476 or TEST-477 violation).

Details of the path are shown in the companion TEST-282 violation that immediately follows this violation message.

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-471 or TEST-478 extended warning message, using the information in this, and the accompanying diagnostic messages to help find the cause of the problem.

SEE ALSO

TEST-476 (information) Response data launched from the source register can cause a change on asynchronous control pin %s of cell %s.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture warning message TEST-471 to help you identify and correct the cause of the unreliable capture problem.

Unreliable capture can occur when the response value captured in a register can asynchronously affect the response value captured in another register. This condition can occur if there is a combinational path between the output of one sequential cell and the asynchronous control pin of another sequential cell, the source and destination registers are clocked by the same clock port, and the combinational path between the two registers is not disabled by constants present in the design. When DFT Compiler detects this condition, it issues the TEST-471 warning.

This message describes the cause of the unreliable capture problem as it relates to the destination register. The message is to be interpreted as follows:

- pin %s is the asynchronous control pin of the destination register affected by the launch of captured response data from the source register.
- cell %s is the destination register.

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-471 extended warning message, using the information in this diagnostic message to help find the cause of the problem.

SEE ALSO

`check_test (2); TEST-471 (n), TEST-472 (n), TEST-479 (n).`

TEST-477 (information) Enable pin %s of cell %s becomes

active at %s edge of clock port %s at time %s.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture warning message TEST-478 to help you identify and correct the cause of the unreliable capture problem.

This message describes the cause of the unreliable capture problem as it relates to the destination register when that register is level-sensitive and becomes transparent at the resting value of the clock. The message is to be interpreted as follows:

- Enable pin %s is the destination register enable pin that is affected by the transition at the clock port.
- Cell %s is the destination register where response data is to be captured.
- %s edge is the transition (rising or falling) of the clock when the clock returns to its resting value. The enable pin of the destination register becomes active at this edge.
- clock port %s is the source of the clock signal.
- time %s is the time that clock transition occurs in the capture cycle, assuming zero delay.

This diagnostic message is displayed, for example, when there is a Q-to-D path between a negative edge-triggered flip-flop and an enabled low latch, clocked by the same return-to-zero clock source. In this case, the destination latch captures response data at the rising edge (first edge) of the clock. The source flip-flop launches captured (or response) data at the falling edge (second edge) of the clock. However, the destination latch becomes transparent at the falling edge of the clock and the initial captured value of that cell is overwritten by the newly-launched response data from the source register.

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-478 extended warning message, using the information in this diagnostic message to help find the cause of the problem.

SEE ALSO

check_test (2); **TEST-472** (n), **TEST-473** (n), **TEST-478** (n), **TEST-479** (n), **TEST-559** (n); *Design Analyzer Reference Manual, DFT Compiler Test Design Rule Checking User Guide*.

TEST-478 (warning) Pin %s of cell %s (%s) cannot capture reliably.

DESCRIPTION

You receive this warning message if **check_test** detects a condition that causes a capture violation, so that ATPG cannot predict the captured state, regardless of the input pattern applied. Warning messages indicate a test design rule violation and warn you of the possibility of reduced fault coverage. If you want this cell to be testable, you must correct the situation that causes the unreliable capture.

During the parallel cycle of the scan-test sequence, the response of internal combinational logic to the applied test pattern is captured into the sequential cells in the design. This is usually done by applying a system (normal operation) clock pulse.

To ensure that data is reliably captured, the values being captured into a cell must depend on the scanned-in state of sequential cells in the fan-in cone of that cell. In general, captured data value must depend only on scanned-in state, valid non-scan state (for partial scan), and primary input values.

Unreliable capture occurs if a combinational path exists between two sequential elements that are clocked by the same clock source, and the signals at the clock pins of these two elements are not properly aligned. The captured value of the destination element depends on the response value of the source element instead of the scanned-in value.

This message indicates that a particular pin of the sequential cell cannot perform the capture operation reliably because one or more of the sequential cells in the fan-in cone of that pin launches response (captured) data before response data is captured by that pin.

For example, for a combinational path between two enabled-high latches clocked by the same return-to-zero clock, both devices are transparent while the clock is active. When the clock becomes inactive (falling edge of the clock), the destination latch can capture the value originally on its data pin or the response (capture) value launched from the source latch at the rising edge of the clock. This depends on the relationship between the clock width and the delay on the data path, and causes the destination latch to capture unreliably.

Other examples of unreliable capture conditions caused by source register launch before destination register capture include the following:

- A Q-to-D path between a positive edge-triggered flip-flop and a negative edge-triggered flip-flop, clocked by the same return-to-zero clock source. In this case, the response data launched from the source flip-flop at the rising edge of the clock can arrive at the synchronous input of the destination register before the falling edge of the clock.
- Q-to-D path between a negative edge-triggered flip-flop and an enabled low latch, clocked by the same return-to-zero clock source. In this case, the destination latch captures response data at the rising edge (first edge) of the clock. The source flip-flop launches captured (or response) data at the falling edge (second edge) of

the clock. However, the destination latch becomes transparent at the falling edge of the clock and the initial captured value of that cell is overwritten by the newly-launched response data from the source register.

When DFT Compiler detects an unreliable capture condition of this type, the pin of the destination register, indicated in the TEST-477 message, is marked with a violation; ATPG does not use this pin for observing fault effects in the register. Note that ATPG uses other data pins of the cell (if any) for observing fault effects as long as those pins are not violated.

Following this message, DFT Compiler issues diagnostic messages describing the conditions at the source and destination registers that cause this violation.

WHAT NEXT

If you receive this message, proceed as follows:

1. Locate and identify the cause of the unreliable capture, by doing any or all of the following:

- Read the diagnostic messages that follow this warning message, and the messages following **check_test** execution.
- Use **Design Analyzer** to view the violation. For more information, see the *Design Analyzer Reference Manual*.
- Read the related extended error messages TEST-472, TEST-473, TEST-477, TEST-479, and TEST-559.

2. Modify your design to correct the violating condition. For more information, see Chapter 6 of the *DFT Compiler Test Design Rule Checking User Guide*.

3. Re-execute **check_test** to verify that the violation has been corrected.

SEE ALSO

check_test (2); **TEST-472** (n), **TEST-473** (n), **TEST-477** (n), **TEST-479** (n), **TEST-559** (n); *Design Analyzer Reference Manual*, *DFT Compiler Test Design Rule Checking User Guide*.

TEST-479 (information) Cell %s launches response data from pin %s prior to the start of the capture cycle.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture

warning messages (TEST-478 and TEST-471) to help you identify and correct the cause of the unreliable capture problem.

This message describes the cause of the unreliable capture problem as it relates to the source register when response data is launched from that register before the start of the capture cycle. The message is to be interpreted as follows:

- Cell %s is the source register where response data is launched.
- pin %s is the output pin of the register that launches response data.

This diagnostic message is displayed, for example, if the source register is an enabled-low latch clocked by a return-to-zero clock. In this case, the latch is transparent at the start of the capture cycle, and response data is launched from that register before the start of the capture cycle (at the one-to-zero transition of the clock in the last scan shift cycle).

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-478 extended warning message, using the information in this diagnostic message to help find the cause of the problem.

SEE ALSO

TEST-480 (error) The following compliance enable port is a TAP port: '%S'.

DESCRIPTION

The **set_bsd_compliance** command lets you specify a compliance enable pattern for a Boundary Scan design. Each compliance enable pattern consists of a set of port_name-value pairs. No compliance enable pattern may include a TAP port.

WHAT NEXT

Remove the TAP ports from the compliance pattern specification.

TEST-481 (error) The following compliance enable ports are

TAP ports:

DESCRIPTION

The **set_bsd_compliance** command lets you specify a compliance enable pattern for a Boundary Scan design. Each compliance enable pattern consists of a set of port_name-value pairs. No compliance enable pattern may include a TAP port.

WHAT NEXT

Remove the TAP ports from the compliance pattern specification.

TEST-482 (error) The '%s' port in the port-to-pin map for the package '%s' is not a port of the design '%s'.

DESCRIPTION

You receive this message if **read_pin_map** finds a port in the port-to-pin mapping file that is not found in the design db file. The signal ports in each port-to-pin mapping file must match those in the design db file.

WHAT NEXT

If you receive this message, proceed as follows:

1. Check the port-to-pin mapping file and the design db file for syntax errors and any spelling errors or typos that would cause the port names to not match.
2. If no such errors are found, either remove the port from the port-to-pin mapping file or add it to the design db file.

SEE ALSO

create_bsd_patterns (2), **read_pin_map** (2), **write_bsdl** (2).

TEST-484 (warning) The '%s' port of the design '%s' is missing from the port-to-pin map for the package '%s'.

DESCRIPTION

You receive this message if **read_pin_map** finds a port in the design db file that is not found in the port-to-pin mapping file. The signal ports in each port-to-pin

mapping file must match those in the design db file.

WHAT NEXT

If you receive this message, proceed as follows:

1. If this port is a no-connect port, nothing needs to be done.
2. Otherwise, check the port-to-pin mapping file and the design db file for syntax errors and any spelling errors or typos that would cause the port names to not match.
3. If no such errors are found, either remove the port from the design db file or add it to the port-to-pin mapping file.

SEE ALSO

`create_bsd_patterns` (2), `read_pin_map` (2), `write_bsdl` (2).

TEST-485 (warning) The following ports of the design '%s' are missing from the port-to-pin map for the package '%s'.

DESCRIPTION

You receive this warning message when the `read_pin_map` command finds ports in the design db file that are not found in the port-to-pin mapping file. The signal ports in each port-to-pin mapping file must match those in the design db file.

WHAT NEXT

No action is required if the ports are no-connect ports.

Otherwise, check the port-to-pin mapping file and the design db file for syntax errors, spelling errors, or typos that might cause differences between the port names.

If no such errors are found, either remove the port from the design db file or add it to the port-to-pin mapping file.

After your changes are complete, rerun the `read_pin_map` command.

SEE ALSO

`create_bsd_patterns` (2), `read_pin_map` (2), `write_bsdl` (2).

TEST-486 (warning) The maximum line length specified must be at least %d. Using a value of %d as the maximum line length.

DESCRIPTION

You receive this message if the environment variable `test_bsdl_max_line_length` has a value less than 50 characters. The maximum line length must be at least as many characters as 50; if it is not, `write_bsdl` uses 50 as the line length.

WHAT NEXT

If it is acceptable for `write_bsdl` to use a maximum line length of 50 characters, you do not need to do anything. However, if you want the maximum line length to be greater than 50 characters, set the value of the `test_bsdl_max_line_length` to the value you want, and re-execute `write_bsdl`.

SEE ALSO

`write_bsdl` (2); `test_bsdl_max_line_length` (3).

TEST-486b (warning) The maximum line length specified must be at most %d. Using a value of %d as the maximum line length.

DESCRIPTION

You receive this message if the environment variable `test_bsdl_max_line_length` has a value greater than 132 characters. The maximum line length must be at most 132 characters; if it is not, `write_bsdl` uses 132 as the line length.

WHAT NEXT

If it is acceptable for `write_bsdl` to use a maximum line length of 132 characters, you do not need to do anything. However, if you want the maximum line length to be less than 132 characters, set the value of the `test_bsdl_max_line_length` to the value you want, and re-execute `write_bsdl`.

SEE ALSO

`write_bsdl` (2); `test_bsdl_max_line_length` (3).

TEST-487 (Information) Opened BSDL file '%s' for writing.

DESCRIPTION

This message informs you that the BSDL generation subsystem has successfully opened the specified output file for writing.

WHAT NEXT

This is an informational message only. No action is required on your part.

TEST-488 (error) No valid packages were found for the design '%s'.

DESCRIPTION

This error message indicates that either no packages were found for the Boundary Scan Design, or that the pin map files read in for the Boundary Scan Design have errors.

WHAT NEXT

Check the pin map files and ensure that there is at least one valid package read in for the design. Correct any typos or spelling errors that might prevent packages from being read in. Then re-execute `read_pin_map`.

TEST-489 (warning) No default device package has been specified for the design '%s'.

DESCRIPTION

You receive this warning message if `insert_bsd` detects that you have multiple packages in your pin map file but have not selected a default package for the Boundary Scan Design.

WHAT NEXT

Use `set_bsd_configuration -default_package` to specify which of the packages in your pin map file you want to use as the default. Or, modify your pin map file so that it contains only the package you want to use.

TEST-490 (error) No signal ports were found for the design '%s'.

DESCRIPTION

This error message indicates that no signal ports were found for the design.

WHAT NEXT

Make sure that the design has at least one port.

TEST-491 (warning) No linkage ports were found for the design '%s'.

DESCRIPTION

This warning message indicates that no linkage ports were found for the design.

WHAT NEXT

Any design typically has at least one VDD and at least one GND port. Add these ports to the port-to-pin map files for the design.

TEST-492 (warning) BSDL atom '%s' is longer than the maximum number of characters allowed in a line.

DESCRIPTION

The BSDL generation subsystem fits as many BSDL atoms on a line as possible without exceeding the maximum line length permissible. If an atom is longer than the maximum permissible line length, the BSDL generation subsystem generates this warning and prints the atom by itself on a new line.

WHAT NEXT

Make sure that the atom length is smaller than maximum permissible line length.

TEST-493 (warning) The following %s name %sis an illegal

BSDL identifier: '%s'.

DESCRIPTION

Valid BSDL identifiers can only have letters, digits, underscores, or periods. Valid BSDL identifiers must start with a letter. They cannot end with an underscore or have adjacent underscores. The BSDL generation subsystem produces this warning if an identifier in the design does not obey the previous rules.

WHAT NEXT

Make sure that the identifier obeys the BSDL naming rules.

TEST-494 (warning) The following %s names %sare illegal BSDL identifiers:

DESCRIPTION

Valid BSDL identifiers can only have letters, digits, underscores, or periods. Valid BSDL identifiers must start with a letter. They cannot end with an underscore or have adjacent underscores. The BSDL generation subsystem produces this warning if an identifier in the design does not obey the previous rules.

WHAT NEXT

Make sure that the identifier obeys the BSDL naming rules.

TEST-495 (warning) The following %s name %sis a %s reserved word: '%s'.

DESCRIPTION

This warning message indicates that an identifier in the design is a BSDL or VHDL reserved word.

WHAT NEXT

Make sure that the identifier is not a BSDL or VHDL reserved word.

TEST-496 (warning) The following %s names %sare %s

keywords:

DESCRIPTION

This warning message indicates that some identifiers in the design are BSDL or VHDL reserved words.

WHAT NEXT

Make sure that the identifiers are not BSDL or VHDL reserved words.

TEST-497 (warning) The TCK frequency has not been specified.
Using a default value of 10.0 MHz as the TCK frequency.

DESCRIPTION

This warning message is produced if the Boundary Scan Test Clock frequency has not been specified.

WHAT NEXT

Use the `create_clock` command to specify the Boundary Scan Test Clock frequency.

TEST-498 (information) Successfully generated BSDL file '%s'.

DESCRIPTION

This information message indicates that the BSDL generation subsystem has successfully generated the BSDL file for the Boundary Scan Design.

WHAT NEXT

No further action is needed.

TEST-499 (warning) Violations occurred during IEEE 1149.1

compliance checking.

DESCRIPTION

This warning message indicates that the boundary scan design has certain features that are not compliant with ANSI/IEEE Std. 1149.1. Therefore, BSDL generation cannot proceed.

WHAT NEXT

Run the `check_bsd` command and fix the compliance problems.

TEST-500 (warning) Physical design information is not available. The `preview_scan` command is running in -command `insert_scan` mode.

DESCRIPTION

This warning message indicates that the physical design information is not present so that the command `preview_scan` can be used in the `reoptimize_design` context.

The `preview_scan` is then run in default mode, the `insert_scan` mode.

WHAT NEXT

You need to run the `read_clusters` command in order to read in the physical design information. Please see the `reoptimize_design` documentation for more details.

TEST-501 (information) As a result, 1 other cell is not scan controllable.

DESCRIPTION

This message is used in conjunction with the TEST-302 violation message just above it.

Cells which contain inherent controllability problems are reported as TEST-302 violation messages. The number of cells which are uncontrollable as a result of the TEST-302 violation is provided in this message, which in this case is one.

This message is issued in both the verbose and non-verbose modes of check-test. In verbose mode this message is followed by a list of the cell names.

WHAT NEXT

Investigate the reason why the cell given in the TEST-302 message is uncontrollable, and re-run check_test when this problem is fixed.

SEE ALSO

check_test, TEST-302

TEST-502 (information) As a result, %d other cells are not scan controllable.

DESCRIPTION

This message is used in conjunction with the TEST-302 violation message just above it.

Cells which contain inherent controllability problems are reported as TEST-302 violation messages. The number of cells which are uncontrollable as a result of the TEST-302 violation is provided in this message.

This message is issued in both the verbose and non-verbose modes of check-test. In verbose mode this message is followed by a list of the cell names.

WHAT NEXT

Investigate the reason why the cell given in the TEST-302 message is uncontrollable, and re-run check_test when this problem is fixed.

SEE ALSO

check_test, TEST-302

TEST-503 (information) As a result, 1 other cell is not scan controllable : %s.

DESCRIPTION

This message is generated as a result of an earlier rule violation.

WHAT NEXT

Check other error violation messages preceding this one.

TEST-504 (warning) Cell %s has constant 0 value.

DESCRIPTION

This message is issued by dft_drc if it finds a cell that has a constant 0 value at its output. This means that the cell is violated and will not be included in a scan chain.

WHAT NEXT

Validate the condition that results in the output of the cell being constant. If this is intentional, the violation can be ignored. If not fix the condition. Cells with constant outputs will not be autofixed.

TEST-505 (warning) Cell %s has constant 1 value.

DESCRIPTION

This message is issued by dft_drc if it finds a cell that has a constant 1 value at its output. This means that the cell is violated and will not be included in a scan chain.

WHAT NEXT

Validate the condition that results in the output of the cell being constant. If this is intentional, the violation can be ignored. If not fix the condition. Cells with constant outputs will not be autofixed.

TEST-511 (information) Because asynchronous pin %s is uncontrollable.

DESCRIPTION

This message is used in conjunction with the TEST-302 warning message. This message states that the cause of the uncontrollable cell provided in the previous TEST-302 message is due to the specified asynchronous pin being uncontrollable.

WHAT NEXT

Check to see if there are any subsequent information messages associated with the TEST-302 message. If the asynchronous pin is either an 'X' or 'Z', then check_test will attempt to trace back the network to find the source of the problem. Tracing will continue until an 'X' is found that cannot be traced back further in the

circuit. Note that backtracing will terminate when 1) an input port has been reached, 2) there is more than one 'X' on the sensitized paths to the asynchronous pin, or 3) a scan value is found (the output of a scan cell is an input to the asynchronous pin).

Then, examine the network which drives the asynchronous pin to determine why the pin is uncontrollable. For example, verify that there is not a misplaced 'X' in the custom test protocol or there is no uninitialized cell feeding into an asynchronous pin.

EXAMPLE

Warning: Cell X2 (FD2S) is not scan controllable. (TEST-302)

Information: Because asynchronous pin CD is uncontrollable. (TEST-511)

Information: Because port RESET is unknown. (TEST-514)

SEE ALSO

check_test, TEST-302

TEST-512 (information) Because it clocks in an unknown value from pin %s.

DESCRIPTION

This message is used in conjunction with the TEST-302 warning message. This message states that the cause of the uncontrollable cell provided in the previous TEST-302 message is due to an unknown value on the data pin specified.

WHAT NEXT

Check to see if there are any subsequent information messages associated with the TEST-302 message. If the data pin is either an 'X' or 'Z', then check_test will attempt to trace back the network to find the source of the problem. Tracing will continue until an 'X' is found that cannot be traced back further in the circuit. Note that backtracing will terminate when 1) an input port has been reached, 2) the output of a scan cell has been reached or 3) there is more than one 'X' or scan value (i.e. outputs from two distinct scan cells) on sensitized paths to the data pin.

Check to see if there are any additional information messages associated with the TEST-302 message which traces back the network for the cause of this unknown data pin, and then examine the network which drives the data pin to determine why the data pin is unknown.

For example, verify that there are no missing or incorrect test_holds or test_isolates in the design, or that there is not a misplaced 'X' in the custom test protocol.

EXAMPLE

Warning: Cell U1 (FD1S) is not scan controllable. (TEST-302)

Information: Because it clocks in an unknown value from
pin TI. (TEST-512)

Information: Because port SCAN_IN is unknown. (TEST-514)

SEE ALSO

check_test, TEST-302

TEST-513 (information) Because pin %s of cell %s (%s) is unknown.

DESCRIPTION

This message is used in conjunction with other TEST-xxx warning or error messages just above it. It provides additional information regarding an unknown value (X) in network which may have caused the previous warning/error message to be generated.

If this message has been issued in connection with a "not scan controllable" (TEST-302) violation, then it will be followed by additional information messages (e.g. indicating all the input values of a cell, if the output of the cell is unknown).

WHAT NEXT

Use any additional information messaged to determine why the indicated pin is unknown.

If this pin is expected to be unknown, then verify that this is the correct path to be sensitized from the pin given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-514 (information) Because port %s is unknown.

DESCRIPTION

This message is used in conjunction with other TEST-xxx warning or error messages just above it. It provides additional information regarding an unknown value (X) at a port which may have caused the previous warning/error message to be generated.

WHAT NEXT

Verify that the port has the necessary test attributes. Possible problems include missing test_holds on "Test Mode" ports, or missing test attributes such as scan_in or scan_enable on test ports.

If this port is expected to be unknown, then verify that this is the correct path to be sensitized from the port given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-515 (information) Because clock pin %s is uncontrollable.

DESCRIPTION

This message is used in conjunction with the TEST-302 warning message. This message states that the cause of the uncontrollable cell provided in the previous TEST-302 message is due to the clock pin being uncontrollable.

WHAT NEXT

Check to see if there are any subsequent information messages associated with the TEST-302 message. If the clock pin is either an 'X' or 'Z', then check_test will attempt to trace back the network to find the source of the problem. Tracing will continue until an 'X' is found that cannot be traced back further in the circuit. Note that backtracing will terminate when 1) an input port has been reached, 2) there is more than one 'X' on the sensitized paths to the clock pin, or 3) a scan value is found (the output of a scan cell is an input to the clock pin).

Then, examine the network which drives the clock pin to determine why the pin is uncontrollable. For example, verify that there is no clock reconvergence or unintended clock gating feeding into the clock pin, or a misplaced 'X' in the custom test protocol.

If the clock pin is uncontrollable due to a clock reconvergence at a net (e.g. when using parallel clock buffers), this reconvergence can be allowed by setting the variable test_allow_clock_reconvergence to true.

EXAMPLE

Warning: Cell U5 (FD1S) is not scan controllable. (TEST-302)

Information: Because clock pin CP is uncontrollable. (TEST-515)

Information: Because pin A of cell X3 (IV) is unknown. (TEST-513)

SEE ALSO

`check_test`, TEST-302, `test_allow_clock_reconvergence`

TEST-516 (information) Because cell did not receive a clock pulse.

DESCRIPTION

This message is used in conjunction with the TEST-302 warning message. This message states that the cause of the uncontrollable cell provided in the previous TEST-302 message is because there is no clock pulse on the clock pins of this cell during the scan-in sequence.

The causes for such violations fall into two general classes:

- 1) There is a clock pulse on a top-level port that should drive the clock pin of the uncontrollable cell, but for some reason the clock pulse does not reach the clock pin.

Possible causes include:

- A missing connection between the top-level clock port and the clock pin
- A `set_test_hold` in the wrong state, which blocks the clock pulse from reaching the clock pin
- A missing `set_test_hold` resulting in an X reaching the clock pin instead of a clock pulse
- Reconvergent clocks

- 2) There is no clock pulse on the top-level port that drives the clock pin during the scan-shift sequence.

Possible causes include:

- A missing clock character from a Custom Test Protocol
- The `check_test` command fails to infer a clock pulse on the top-level port

The most common cause for `check_test` failing to infer a clock pulse during the scan-shift sequence is that the test attributes on the design are in an inconsistent state. In general, if you inserted scan using `insert_scan` and stored the design in db format, you do not need to set any test attributes from the command line. However, if you read in a scan inserted design from a Verilog, VHDL, or EDIF, you need to set test attributes from the command line.

WHAT NEXT

You must first try to determine if there is a missing clock in the scan-shift section of the test protocol. You can write the test protocol out (simply enter **write_test_protocol** after you run **check_test**) or examine the diagnostic messages from **check_test**.

Verify that the clock feeding into the non-scan controllable cell has been inferred (TEST-260) or defined (**create_test_clock**) as a test clock, or that there is a clock pulse on the corresponding clock port in the custom test protocol during scan.

If no clock pulse has been inferred, determine and correct the cause of the missing clock pulse. Review your script carefully.

Possible causes include:

- A missing **create_test_clock** in the script
- A missing clock character in a Custom Test Protocol
- Missing "test_scan_in" and "test_scan_out" attributes on the scan ports of existing scan designs that are scan routed. (If there are no such attributes, the default test protocol will not pulse the shift clock during the scan-in sequence, which results in this message.)
- Issuing a **set_scan_configuration -existing_scan true** for a test-ready design (compile -scan) when you have not run **insert_scan** to route the scan design. (Setting **existing_scan** true on such a design confuses **check_test** and causes it to not infer a clock pulse on the clock ports.)

If the correct clock pulses are inferred on the top-level ports during the scan-shift sequence, you need to determine why the clock pulse does not reach the clock pin of the element.

Examine the network driving the clock pins, looking particularly for

- A signal that must be held in a particular state for the clock pulse to propagate
- Bad logic that prevents the propagation of a clock pulse
- Reconvergent clock signals that cause the output of a gate to go to X

EXAMPLE Warning: Cell U4 (FD1S) is not scan controllable. (TEST-302) Information: Because cell did not receive a clock pulse. (TEST-516)

SEE ALSO

check_test (2), **write_test_protocol** (2), **TEST-302**.

TEST-517 (information) Because cell did not receive scan-in

data from an input port.

DESCRIPTION

This message is used in conjunction with the "not scan controllable" warning (TEST-302) just above it and the information message (TEST-525) just below it.

This message states that the cell was clocked, but it does not contain scan-in data from an input port at the end of the scan-in sequence.

The data which originated from the "TEST-525" cell at the beginning of the scan sequence, has reached the "TEST-302" cell at the end of the scan-in sequence.

WHAT NEXT

Use this message in conjunction with the corresponding TEST-525 message and other scan messages (e.g. "scan chain terminating at <cell> is not scan controllable" (TEST-363)) to determine if the cause of the problem is either 1) a scan-in sequence that is shorter than the length of the scan chain, or 2) a circular scan chain in the design.

EXAMPLE

Warning: Cell X3 (FD1S) is not scan controllable. (TEST-302)

Information: Because cell did not receive scan-in data from
an input port. (TEST-517)

Information: Because cell contains data that was in cell X2 (FD1S)
at the start of scan shift. (TEST-525)

SEE ALSO

check_test, TEST-302, TEST-525

**TEST-518 (information) Because an illegal input combination
was applied: Pin %s was %s.**

DESCRIPTION

This message is used in conjunction with the TEST-302 warning message. It indicates that an input combination was applied to the cell that is not allowed, so the output is unknown.

There is a separate TEST-518 information message for each pin of the cell that contributed to the illegal input combination.

A common situation which results in this message is if multiple clock pins of a cell are active at the same time.

WHAT NEXT

Examine the network driving the mentioned pins to see why there is an illegal input combination. If any of the pins are clocks, also verify the clock waveforms.

EXAMPLE

```
Warning: Cell U2 (C_SCAN_FF) is not scan controllable. (TEST-302)
Information: Because an illegal input combination was applied:
Pin C was rising. (TEST-518)
Information: Because an illegal input combination was applied:
Pin SC was rising. (TEST-518)
```

SEE ALSO

`check_test`, TEST-302

TEST-519 (information) Because clock is used as data on pin %S.

DESCRIPTION

This message is used in conjunction with the TEST-302 warning message. This message states that the cause of the uncontrollable cell provided in the previous TEST-302 message is due to the fact that there is a clock on a data pin of this cell.

WHAT NEXT

Examine why a transition has occurred at the data input of the cell being clocked.

EXAMPLE

```
Warning: Cell U3 (FD1S) is not scan controllable. (TEST-302)
Information: Because clock is used as data on pin TI. (TEST-519)
```

SEE ALSO

`check_test`, TEST-302

TEST-520 (information) Because cell is set_scan or

set_scan_element false.

DESCRIPTION

This message is used in conjunction with the TEST-302 violation message previously given. This cell is not scanned since a set_scan or set_scan_element false command was issued by you on the cell.

WHAT NEXT

Verify that a set_scan or set_scan_element false command is desirable for this cell.

If this cell is correctly marked with this attribute, this message is for informational purposes only.

EXAMPLE

Warning: Cell U3 (FD1) is not scan controllable. (TEST-302)

Information: Because cell is set_scan or set_scan_element false. (TEST-520)

SEE ALSO

check_test

TEST-521 (information) Because pin %s of cell %s (%s) is unknown due to a set_test_isolate command.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message just above it. The value of the pin is unknown (X) due to a set_test_isolate command issued by the user on either the pin or the cell.

WHAT NEXT

Verify that a set_test_isolate command is desirable for this cell or pin. The command "report_test -assertions" will list all the test_isolate attributes in a design.

If this cell/pin is correctly marked with this attribute, then verify that this is the correct path to be sensitized from the pin given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-522 (information) Because pin %s of cell %s (%s) is unknown due to a previously reported violation.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message just above it. The value at the pin is unknown (X) due to another violation that was found by check_test.

WHAT NEXT

Fix the preceding violations in the check_test output which appear above this message that are on or near this pin.

Also verify that this is the correct path to be sensitized from the pin given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-523 (information) Because port %s is unknown due to a set_test_isolate command.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message just above it. The value at the port is unknown (X) due to a set_test_isolate command issued by the user on the port.

WHAT NEXT

Verify that a set_test_isolate command is desirable for this port. The command "report_test -assertions" will list all the test_isolate attributes in a design.

If this port is correctly marked with this attribute, then verify that this is the correct path to be sensitized from the port given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-524 (information) Because port %s is unknown due to a previously reported violation.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message just above it. The value at the port is unknown (X) due to another violation that was found by check_test.

WHAT NEXT

Fix the preceding violations in the check_test output which appear above this message that are on or near this port.

Also verify that this is the correct path to be sensitized from the port given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-525 (information) Because cell contains data that was in cell %s (%s) at the start of scan shift.

DESCRIPTION

This message is used in conjunction with the "not scan controllable" warning (TEST-302) and "no scan-in data" information message (TEST-517) just above it.

There are two scan cells involved; one is the cell referenced in the TEST-302 message and the other is the scan cell referenced in this TEST-525 message. The data which originated from the "TEST-525" cell at the beginning of the scan sequence, has reached the "TEST-302" cell at the end of the scan-in sequence. If the scan chain was operating properly, the data in the "TEST-525" cell should have been shifted out of the scan-out pin.

WHAT NEXT

Use this message in conjunction with other scan messages (e.g. "scan chain terminating at <cell> is not scan controllable" (TEST-363)) to determine if the

cause of the problem is either 1) a scan-in sequence that is shorter than the length of the scan chain, or 2) a circular scan chain in the design.

SEE ALSO

check_test, TEST-302, TEST-517

TEST-526 (information) Because input pin %s of cell %s (%s) is unconnected.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message just above it. The value at the pin is unknown (X) due to the absence of driver. The unconnected input was previously reported as a violation (TEST-332).

WHAT NEXT

Explicitly connect the pin to the appropriate driver.

Also verify that this is the correct path to be sensitized from the pin given in this message to the pin/cell given in the violation message just above it.

SEE ALSO

check_test

TEST-540 (information) The drivers of the cone of logic ending at pin %s of cell %s (%s) are listed below.

DESCRIPTION

This message indicates that the following information messages list the drivers of the cone of logic ending at the indicated pin. The drivers of the cone of logic include ports, outputs of sequential cells, and pins that are unknown due to previous violations found by check_test or set_test_isolate commands.

WHAT NEXT

The following messages contain the pins driving the cone of logic, as well as their values. Possible problems include missing test_holds on "Test Mode" ports, or missing test attributes such as scan_in or scan_enable on test ports.

TEST-541 (information) Port %s is %s.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. It provides the logic value of the port at the currently simulated protocol vector.

WHAT NEXT

Check if the logic value of the port provided in this message contributes to the violation message which precedes this message.

SEE ALSO

`check_test`

TEST-542 (information) Port %s is %s due to a set_test_isolate command.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. Since a set_test_isolate command is applied to the port, the value of the port is unknown (X).

WHAT NEXT

Check if the set_test_isolate attribute on the port provided in this message contributes to the violation message which precedes this message. The command "report_test -assertions" lists the test_isolate attributes in a design.

SEE ALSO

`check_test`

TEST-543 (information) Port %s is %s due to a previously

reported violation.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. It provides the logic value of the port at the currently simulated protocol vector. Another violation that has been reported by check_test is the reason that the value of the port is unknown (X).

WHAT NEXT

Examine the violations in the check_test output which appear prior to this message that are on or near this port. An example is a "Three-state net %s has non three-state driver(s). (TEST-115)" violation on the net connected to the port.

SEE ALSO

check_test

TEST-544 (information) Port %s is a scan-in value.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. It indicates that the port has a valid scan-in value at the currently simulated protocol vector.

WHAT NEXT

Check if the logic value of the port provided in this message contributes to the violation message which precedes this message.

SEE ALSO

check_test

TEST-545 (information) Pin %s of cell %s (%s) is %s.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. It provides the logic value of the pin at the currently simulated protocol vector.

WHAT NEXT

Check if the logic value of the pin provided in this message contributes to the violation message which precedes this message.

SEE ALSO

check_test

TEST-546 (information) Pin %s of cell %s (%s) is %s due to a set_test_isolate command.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. Since a set_test_isolate command is applied to either the cell or the pin, the value of the pin is unknown (X).

WHAT NEXT

Check if the test_isolate attribute on the pin provided in this message contributes to the the violation message which precedes this message. The command "report_test - assertions" lists the test_isolate attributes in a design.

SEE ALSO

check_test

TEST-547 (information) Pin %s of cell %s (%s) is %s due to a previously reported violation.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. It provides the logic value of the pin at the currently simulated protocol vector. Another violation reported by check_test is the reason that the value of the pin is unknown (X).

WHAT NEXT

Examine the violations in the check_test output which appear above this message that are on or near this pin. A simple example is a cell that is a "black box" because it has no function associated with it.

SEE ALSO

check_test

TEST-548 (information) Pin %s of cell %s (%s) is a scan-in value.

DESCRIPTION

This message is used in conjunction with the TEST-xxx violation message previously given. It indicates that the pin has a valid scan-in value at the currently simulated protocol vector.

WHAT NEXT

Check if the logic value of the pin provided in this message contributes to the violation message which precedes this message.

SEE ALSO

check_test

TEST-549 (information) Pin %s of cell %s (%s) is the value of pin %s of sequential cell %s (%s).

DESCRIPTION

This message complements the previous information message, and informs you that the specified pin has the same value as the specified pin of the specified sequential cell in the design.

WHAT NEXT

This is an informational message only. No action is required on your part.

TEST-550 (error) %s condition detected on bidirectional port

%S.

DESCRIPTION

This message indicates that there is a contention or float condition on a bidirectional port when the DFT Compiler's test design rule checker, `check_test`, simulates in a particular vector in the test protocol.

A contention condition will occur, for example, when the three-state driver associated with a bidirectional port is enabled, and the test protocol specifies an input value (e.g. '0', '1', 'X', 'Pi') for the bidirectional port in a particular vector. Another example of a contention condition is when the net connected to the bidirectional port has multiple three-state drivers, and two or more of these drivers are enabled. Note that DFT Compiler will flag a contention condition even if the values driven by the enabled three-states are the same.

A float condition will occur, for example, if all three-state drivers associated with a bidirectional port are disabled, the test protocol specifies an output value (e.g. 'Po', 'M') for the bidirectional port, and there are no pull-ups, pull-downs, or bus-holds on the net connected to the bidirectional port.

Currently, `check_test` checks for contention or float conditions on bidirectional ports only in the parallel measure vector of the test protocol.

A contention or float violation does not stop `check_test` from continuing its check of other test design rules. However, DFT Compiler commands which run `check_test` as a preprocessor (e.g. `create_test_patterns`, `insert_scan`, `preview_scan`, and `insert_test`) will not proceed if a contention or float condition is detected by `check_test`.

WHAT NEXT

If a contention condition is due to the three-state drivers associated with a bidirectional port, then examine the enable cone of logic associated with the three-state driver(s) of the port, and the protocol values which enable the driver(s). If a contention condition is due to a protocol value associated with the bidirectional port, then either modify the protocol value of the port, or examine the enable cone of logic associated with the three-state drivers of the port.

In case of a float condition, either follow one of the steps described above, or consider adding a pull-up or pull-down to the net connected to the bidirectional port.

Note that contention and float checking in `check_test` can be turned off by the "`-check_contention`" and "`-check_float`" options of the command. For example, if you would like `check_test` not to check for float conditions on bidirectional ports, then issue the following `check_test` command:

```
dc_shell> check_test -check_float false;
```

The corresponding command for bypassing contention checking in `check_test` is

```
dc_shell> check_test -check_contention false
```

If `check_test` is being run as a preprocessor to another DFT Compiler command, and you would like to allow for contention or float on bidirectional ports, then run `check_test` with the `"-check_contention"` and/or `"-check_float"` option immediately before issuing the desired DFT Compiler command. Note that depending on the DFT Compiler command being issued, you may have to turn off contention and/or float checking in that command as well.

Consider an example where you would like to generate test patterns using the `create_test_patterns` command, and `create_test_patterns` has stopped after the test design rule checker (`check_test`) has detected a float condition. You must use the following command sequence in order to turn off float checking and generate patterns.

```
dc_shell> check_test -check_float false;  
dc_shell> create_test_patterns -check_float false;
```

SEE ALSO

`check_test`, `TEST-551.n`, `TEST-552.n`, `read_test_protocol`

TEST-551 (information) Because the value of port %s in the protocol is %s.

DESCRIPTION

You receive this message because it reports the protocol value of a port for a particular protocol vector simulated by the `check_test` command and a brief description of that value. This message supports other messages issued by DFT Compiler.

Symbolic protocol values and their descriptions are as follows:

0 - Applied logic zero
1 - Applied logic one
X - Input does not care
value Z - High impedance
C - Applied clock pulse
Cp - Applied Capture clock pulse
Si - Applied scan data
So - Measured scan data
Pi - Applied parallel data
Po - Measured parallel data
U - Value not changed
M - Output does not care
value Pio - Either applied parallel input data or measured output data, depending on the state of the circuit (bidirectional pin only)

WHAT NEXT

Check your test protocol.

SEE ALSO

`check_test` (2), `read_test_protocol` (2), `TEST-550` (n), `TEST-557` (n), `TEST-558` (n).

TEST-552 (information) The three-state cell %s is %s because of the following input pin values: %s.

DESCRIPTION

This message supports other messages issued by **check_test**, and informs you of the state (active or inactive) of the specified three-state cell instance during simulation of a particular protocol vector by **check_test**. This message also provides the names and values of input pins that have values of logic 1 or logic 0 for this particular vector and are in the three-state support of the cell.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

check_test (2), **TEST-550** (n), **TEST-557** (n), **TEST-558** (n).

TEST-554 (warning) Three-state net %s has both pull-up and pull-down resistor cells.

DESCRIPTION

You receive this message if **check_test** detects the existence of both pull-up and pull-down cells on the same net. The pull-up (pull-down) cell could be embedded in an existing three-state cell, or could be an independent library cell driving the net.

After **check_test** issues this message, it continues to check the design, assuming that there are no pull-up or pull-down cells present on the net. If all drivers of a three-state net of this type are inactive, **check_test** flags a float condition on the net. Similarly, **create_test_patterns** assumes that there are no pull-up or pull-down cells on the net, and does not generate patterns where all drivers of the net are inactive. Thus this condition (a net having both pull-up and pull-down cells) could lead to a loss of coverage.

This message is followed by informational messages that list the pull-up and pull-down cells on the net.

WHAT NEXT

To prevent a possible loss of test coverage, proceed as follows:

1. Read the informational messages to identify the pull-up and pull-down cells on the net.

2. Modify the design so that the specified net does not have both pull-up and pull-down cells.
3. Re-execute **check_test**.

SEE ALSO

check_test (2), **create_test_patterns** (2), **TEST-555** (n), **TEST-556** (n).

TEST-555 (information) Pull-up cell%*s*: %*s*.

DESCRIPTION

This message supports other messages issued by **check_test**, and indicates the list of pull-up cells on a net in the design.

WHAT NEXT

Use the information in this message to correct the condition flagged by **TEST-554**, following the instructions in that extended error message.

SEE ALSO

check_test (2), **TEST-554** (n).

TEST-556 (information) Pull-down cell%*s*: %*s*.

DESCRIPTION

This message supports other messages issued by **check_test**, and indicates the list of pull-down cells on a net in the design.

WHAT NEXT

Use the information in this message to correct the condition flagged by **TEST-554**, following the instructions in that extended error message.

SEE ALSO

check_test (2), **TEST-554** (n).

TEST-557 (warning) Bidirectional port %s with test_isolate attribute has inconsistent protocol value %. Protocol value is ignored.

DESCRIPTION

This message indicates that DFT Compiler's test design rule checker, `check_test`, has detected an inconsistency while simulating the current protocol vector. The inconsistency is between the protocol value of a bidirectional port and the `test_isolate` attribute on that port.

This condition can occur if the protocol value of a bidirectional port in a particular vector is '1' or '0', and the port has a `test_isolate` attribute.

The `test_isolate` attribute can be placed on a port by the `set_test_isolate` command. The presence of this attribute on a port forces test pattern generation to not use that port. Test pattern generation (`create_test_patterns`), and test design rule checking (`check_test`) assume that the value of the port is unknown. A protocol value of '1' or '0' on a bidirectional port, however, indicates to `check_test` and `create_test_patterns` that the port is to be used as input, and that the value driven by that port is '1' or '0'. This is inconsistent with the `test_isolate` attribute on the port.

When `check_test` detects such a condition, it honors the `test_isolate` attribute and ignores the '1' or '0' value in the test protocol.

WHAT NEXT

Either remove the `test_isolate` attribute from the port, or change the protocol value of the port to 'X', 'Pi', 'Pio', 'Po', or 'M' as appropriate.

SEE ALSO

`check_test`, `set_test_isolate`, `read_test_protocol`

TEST-558 (error) The variable atpg_bidirect_output_only is set to "true", but the bidirectional port %s cannot be forced into output mode. No vectors can be generated.

DESCRIPTION

You receive this message if `check_test` detects an inconsistency between the setting of the variable `atpg_bidirect_output_only`, and the mode of the identified bidirectional port.

When the variable **atpg_bidirect_output_only** is set to *true*, **create_test_patterns** generates patterns that force all bidirectionals in the design into output mode. However, if the state of the three-state driver(s) associated with a bidirectional port is inactive because of constant values present in the design; or if the bidirectional port has an input protocol value, then DFT Compiler cannot force the bidirectional port into output mode in all patterns. This condition prevents **create_test_patterns** from generating test vectors.

This condition does not prevent **check_test** from checking other test design rules, but it does prevent execution of DFT Compiler commands that run **check_test** as a preprocessor (for example, **create_test_patterns**, **insert_scan**, **preview_scan**, and **insert_test**).

WHAT NEXT

If you receive this message, do one or more of the following:

1. Set **atpg_bidirect_output_only** to *false*.
2. Modify the test constraints (**set_test_hold**, **set_test_assume**, **set_test_require**) or modify the test protocol to allow DFT Compiler to force the bidirectional ports into output mode.
3. As a last resort, you might need to modify your design.

Then re-execute **check_test**.

SEE ALSO

check_test (2); **atpg_bidirect_output_only** (3); **TEST-551** (n), **TEST-552** (n).

TEST-559 (information) Bidirectional port %s changes value to %s at time %s.

DESCRIPTION

This is one of the diagnostic messages, issued following the unreliable capture warning messages (TEST-478 and TEST-471) to help you identify and correct the cause of the unreliable capture problem.

This message describes the cause of an unreliable capture problem when the value applied to a bidirectional port in the parallel measure cycle changes before response data is captured into sequential cells driven by that port. The message is to be interpreted as follows:

- port %s is the name of the bidirectional port whose change causes the unreliable capture.

- %s is the new protocol value of the bidirectional port after the change occurs. Possible protocol values include the following:

0	Applied logic zero value
1	Applied logic one value
X	Input don't care value
Si	Applied scan data
M	Output don't care value

- time %s is the time (within a cycle) when the change occurs.

DFT Compiler's automatic test pattern generation (ATPG), invoked by the **create_test_patterns** command, assumes that values applied to primary inputs in the parallel measure cycle are stable while response data is measured at primary output ports and captured in scan (or valid non-scan) sequential cells. This assumption is also true for a bidirectional port when that port is used as input. Therefore, if the value applied to a port in the parallel measure cycle changes before response data is captured into sequential cells, this would invalidate the patterns generated by **create_test_patterns**.

The default test protocol inferred by **check_test** ensures that during the parallel measure cycle the values applied to primary inputs (and bidirectionals when used as input) do not change until response data is measured at primary outputs and captured into sequential cells. However, a change to the default test timing can cause **check_test** to infer a protocol that changes the value applied to bidirectional ports before response data is captured into sequential cells.

For example, if the bidirectional delay is set to a value smaller than the active (capture) edge of the clocks, the protocol value of a bidirectional port is 'M' (output don't care) in the capture cycle, and the port can be used as input by ATPG. This condition can cause a mismatch between the actual values captured into sequential cells driven by this port and the expected values of these sequential cells in the generated patterns. An input value is applied to the bidirectional port at the bidirectional delay time in the parallel measure cycle. However, the bidirectional port is released (changes to 'M') in the capture cycle at the bidirectional delay time. This is before the capture edge of the clock(s).

While simulating the test protocol, **check_test** detects any change in the value applied to a bidirectional port in the parallel measure cycle that can cause an unreliable capture in the sequential cells driven by that port. All sequential cell pins reached by the change are marked as violated. **create_test_patterns** does not use the violated pins for observing fault effects, and considers them as unknown when expecting response values.

If the variable **test_check_port_changes_in_capture** is set to *false*, **check_test** does not perform the previously-mentioned checks.

WHAT NEXT

Follow the instructions in the WHAT NEXT section of the TEST-471 or TEST-478 extended warning messages, using the information in this diagnostic message to help find the cause of the problem.

SEE ALSO

`check_test` (2), `create_test_patterns` (2); `test_check_port_changes_in_capture` (3);
TEST-471 (n), **TEST-478** (n), *Design Analyzer Reference Manual, DFT Compiler Test Design Rule Checking User Guide*.

TEST-560 (information) `check_test` will not check for port changes that cause unreliable capture, because the variable `test_check_port_changes_in_capture` is set to "false".

DESCRIPTION

`check_test` issues this message if the variable `test_check_port_changes_in_capture` is set to *false*. By default, when `check_test` simulates the test protocol, it checks for any change to the value applied to a bidirectional port in the parallel measure cycle that can cause an unreliable capture in the sequential cells driven by that port. Setting the variable `test_check_port_changes_in_capture` to *false* disables this check.

WHAT NEXT

If you want `check_test` to check for port changes that cause unreliable capture, set `test_check_port_changes_in_capture` to *true*, and re-execute `check_test`.

SEE ALSO

`check_test` (2); `test_check_port_changes_in_capture` (3); **TEST-471** (n), **TEST-478** (n), **TEST-559** (n).

TEST-561 (information) Because bidirectional port driver %s is active.

DESCRIPTION

This message provides additional information in support of the TEST-115 (Three-state net %s is not properly driven) warning message. You receive this message when more than two bidirectional ports are driving the three-state net.

WHAT NEXT

Eliminate the problem by only enabling one bidirectional port driver at a time. Then re-run `check_test`.

TEST-562 (error) %s condition detected on bidirectional port %s during scan shift.

DESCRIPTION

This message is generated by the DFT Compiler design rule checker, check_test, when a net is connected to more than one bidirectional port and two or more ports have input values during scan shift. For example, if a net is connected to two bidirectional ports and the two ports are attributed as scan-in (test_scan_in signal_type attributes), contention can occur when scan-in values are applied to both ports during scan shift.

When inferring the test protocol, check_test checks the condition of all bidirectional ports to make sure that contention and float conditions are avoided during scan shift. Check_test establishes the simulation state of the design in scan shift by simulating any initialization sequence, the active value of all ports being held constant throughout testing, any assumed values, and the active value of the scan enable. It then checks for contention and float conditions on the nets connected to bidirectional ports. This is done by checking the mode of the three-state driver(s) associated with the port as well as port attributes. Port attributes (for example signal_type or test_hold attributes) indicate whether a value is applied to the port during scan shift. If a net is connected to multiple bidirectional ports, and values are applied to two or more of these ports during scan shift, check_test flags the contention condition.

This violation stops test pattern generation (create_test_patterns command) and scan insertion (insert_scan command).

WHAT NEXT

Check_test identifies the bidirectional ports that cause the contention condition as well as the attributes that indicate that values are to be applied to these ports in scan shift. This information is printed in the information messages (TEST-564) following this message. Remove the extra attributes from all but one of the ports.

If you do not want to remove any port attributes and want to proceed with test pattern generation or scan insertion despite the contention condition, run check_test with the check_contention option set to the value "none" or "capture_only" prior to the create_test_patterns or insert_scan command. For example:

```
dc_shell> check_test -check_contention capture_only; dc_shell> create_test_patterns;
```

SEE ALSO

check_test, TEST-564

TEST-563 (warning) Net %s, connected to bidirectional port %s,

has three-state driver(s) with unknown mode during scan shift.

DESCRIPTION

You receive this message because a bidirectional port's three-state driver (buffer or pad) is not forced to be active or inactive throughout the scan shift operation. This message is generated by the DFT Compiler design rule checker, the **check_test** command.

During scan shift, bidirectional ports must be forced into either input or output mode to avoid contention or float conditions on these ports during scan shift. If the enable of the three-state driver associated with a bidirectional port is not held constant during scan shift, the mode of the bidirectional can change, thus causing a contention or float condition. Note that the bidirectional port enable does not have to be held constant in parallel measure and capture cycles because the port's state is controlled by the scanned-in state of the circuit.

A bidirectional port's three-state driver enable can be held constant during scan shift by gating the enable with a scan enable or test mode signal. DFT Compiler scan synthesis (the **insert_scan** command) automatically adds conditioning logic to force bidirectionals into input or output mode throughout scan shift. This gating uses the scan enable signal.

This message is followed by several diagnostic messages. The first diagnostic message (TEST-552) gives information about the bidirectional port's three-state driver(s) and logic values on its enable during scan shift. The second diagnostic message (TEST-565) indicates the protocol value that is inferred for the bidirectional port during scan shift.

WHAT NEXT

If logic exists for forcing bidirectional ports into input or output mode throughout scan shift and you still receive this message, the design is missing protocol information or port attributes. Ensure that the following are attributed:

- All test-related ports, such as scan enable.
- Test bidirectional control (for LSI Logic vector formats only).
- Ports that are held constant throughout scan testing (test-hold). If an initialization sequence is required to condition the bidirectional ports to input or output, ensure that the corresponding initialization protocol is read in.

If conditioning logic does not exist and the design is pre-scan, add conditioning logic to the bidirectional ports' three-state enables during the scan insertion process. The **insert_scan** command performs this by default. If the design is scan replaced only or scan routed, you can still use the **insert_scan** command to add conditioning logic to the bidirectional ports' three-state drivers. See the **set_scan_configuration** command man page for appropriate scan configuration specification that adds only three-state conditioning logic to the design (no scan replacement or routing).

NOTES

If the design is scan routed and bidirectional ports are not conditioned into input or output mode throughout scan shift, the DFT Compiler automatic test pattern generator (**create_test_patterns** command) does not generate test patterns. This is because the generated patterns would cause contention or float during scan shift. If you would like DFT Compiler to proceed with pattern generation even when bidirectionals are not conditioned throughout scan shift, you must run **check_test** with the **-check_contention** and **-check_float** options set to *false* or *capture_only* prior to using the **create_test_patterns** command. For example:

```
dc_shell> check_test -check_contention capture_only\  
      -check_float capture_only;  
dc_shell> create_test_patterns;
```

SPECIAL NOTE

Note the following information on conditioning bidirectionals into input mode during scan shift.

By default, the **insert_scan** command conditions bidirectional ports into input mode during scan shift. The inferred test protocol for the design then places an X (value is unimportant to input) on the bidirectional ports for all scan shift vectors. The formatted test vectors therefore indicate that the tester must apply a value to the bidirectional ports during scan shift.

In the default inferred test protocol, the scan shift vectors are followed by the parallel measure vector. In this vector, primary inputs are applied at a time corresponding to the input delay, and primary outputs are strobed at the specified strobe time. Similarly, bidirectional ports used as inputs are applied at the time corresponding to the bidirectional delay, and bidirectional ports that are used as output are strobed at strobe time.

A contention condition may occur on bidirectional ports in the parallel measure cycle when both of the following situations are true:

- Bidirectionals are conditioned as inputs during scan shift by using the scan enable signal (the **insert_scan** command default).
- Input delay (the time at which primary inputs such as scan enable change in each cycle) is less than the bidirectional delay (time at which bidirectional ports change in each cycle).

The contention occurs between the input delay and bidirectional delay times.

For example, if the input delay (specified by the **test_default_input_delay** variable) has a default value of 5ns and the bidirectional delay (specified by the **test_default_bidir_delay** variable) has a default value of 55ns, a 50ns contention can occur for patterns in which automatic test-pattern generation (ATPG) uses a bidirectional as output. In these patterns, the bidirectional's three-state becomes active at time 5 in the parallel measure cycle when scan enable changes to its inactive value. This is because the scanned-in state of circuit conditions the port

into output mode. However, since the bidirectionals change at bidirectional delay time, the value applied to the bidirectional throughout scan shift is not released until time 55ns in the parallel measure cycle.

In order to avoid this type of contention you can use a scan configuration that specifies bidirectionals to be in output mode during scan shift. Thus, the **insert_scan** command adds the appropriate conditioning logic, which forces the three-state driver of each bidirectional port to be active during scan shift.

SEE ALSO

check_test (2), **create_test_patterns** (2), **insert_scan** (2), **set_scan_configuration** (2), **test_default_bidir_delay** (3), **TEST-552** (n), **TEST-564** (n), **TEST-565** (n).

TEST-564 (information) Port %s is attributed as %s.

DESCRIPTION

This is one of the diagnostic messages issued by **check_test** in addition to messages related to conflict (contention or float) on bidirectional ports during scan shift (TEST-566 and TEST-562). This message indicates which port attribute causes the conflict in scan shift as well as the effect of that attribute on protocol inference.

When inferring the test protocol, **check_test** checks the condition of all bidirectional ports to ensure that contention and float conditions are avoided during scan shift. **check_test** establishes the simulation state of the design in scan shift by first simulating any initialization sequence, and then by simulating the design. During the simulation of the design, the following values are applied to the appropriate ports:

- 1) The active value is applied to all ports that are held constant throughout testing.
- 2) The **test_hold** values specified with the **set_test_hold** command are applied to input ports in the design.
- 3) The **test_assume** values specified with the **set_test_assume** command are applied to output pins of black box cells.
- 4) The active value of the scan enable is applied to the scan enable port.

check_test then checks for contention or float conditions on the nets connected to bidirectional ports, by checking the mode of the three-state driver(s) associated with the port as well as port attributes. Port attributes (for example, **signal_type** or **test_hold** attributes) indicate whether a value is applied to the port during scan shift.

WHAT NEXT

Check the specified port attribute, and its value, and determine whether it is in conflict with the mode of the port. If so, remove or correct the attribute by using `remove_attribute`, `set_test_hold`, or `set_signal_type` as appropriate. Then re-execute `check_test`.

SEE ALSO

`check_test TEST-562 (n), TEST-566 (n).`

TEST-565 (information) Bidirectional port %s is inferred as %s.

DESCRIPTION

You receive this message because a bidirectional port's three-state driver (buffer or pad) is not forced active or inactive throughout the scan shift operation. You receive this message following the **TEST-563** warning message. This message informs you that `check_test` is inferring the specified bidirectional port as having the specified protocol value *M* (value is unimportant to output) or *X* (the value is unimportant to input).

If the inferred protocol value is *M*, the test vectors do not apply any value to the bidirectional port during scan shift. If the inferred protocol value is *X*, the test vectors apply a value to the bidirectional port during scan shift, either 1, 0, or *X*, as determined by the `write_test_input_dont_care_value` variable (the default is *X*).

If you continue with `create_test_patterns` without fixing the **TEST-563** violation, you will lose test coverage because the scan chain is not observable. If the scan chain contains a high percentage of the scan cells in your design, the loss in test coverage will be severe.

WHAT NEXT

Use the information in this message to help fix the **TEST-563** violation. Read the **TEST-563** extended warning message, then do one or more of the following:

1. Change the value of the `write_test_input_dont_care_value` variable.
2. Modify the test constraints (`set_test_hold`, `set_test_assume`, `set_test_require`) or modify the test protocol to allow DFT Compiler to force the bidirectional port either active or inactive during scan shift.
3. As a last resort, you may have to modify your design.
4. Execute the `check_test` command again.

SEE ALSO

```
check_test (2), set_test_assume (2), set_test_hold (2), set_test_require (2),
write_test_input_dont_care_value (3), TEST-552 (n), TEST-563 (n).
```

TEST-566 (warning) %s condition detected on bidirectional port %s during scan shift.

DESCRIPTION

This message is generated by the DFT Compiler design rule checker, check_test, when a net connected to a bidirectional port does not have one and only one driver active during scan shift. Contention can occur, for example, if the three-state driver associated with the bidirectional is active during scan shift and the bidirectional port is attributed as scan-in (test_scan_in signal_type attribute). For example, float can occur if the three-state driver associated with the bidirectional is inactive during scan shift and the bidirectional port is attributed as scan-out (test_scan_out signal_type attribute).

When inferring the test protocol, check_test checks the condition of all bidirectional ports to make sure that contention and float conditions are avoided during scan shift. Check_test establishes the simulation state of the design in scan shift by simulating any initialization sequence, the active value of all ports being held constant throughout testing, any assumed values, and the active value of the scan enable. Check_test then checks for contention or float conditions on the nets connected to bidirectional ports. This is done by checking the mode of the three-state driver(s) associated with the port as well as port attributes. Port attributes (for example signal_type or test_hold attributes) indicate whether a value is applied to the port during scan shift.

If more than one of the drivers associated with the bidirectional is active, check_test flags the contention. This can occur if the net connected to the bidirectional port has more than one active three-state driver. It can also occur if the net's three-state driver is active and a value is being applied to the bidirectional port during scan shift.

If all of the drivers associated with the bidirectional are inactive, and there is no pull-up, pull-down, or bus-holder on the net, check_test flags a float condition. This can occur if all of the net's three-state drivers are inactive, and the bidirectional port has been attributed as an output (for example scan-out).

This violation stops test pattern generation (create_test_patterns command) if the design is scan routed. It does not stop scan insertion (insert_scan command).

WHAT NEXT

Check_test identifies the bidirectional port or three-state driver(s) which cause the contention or float condition. This is printed in the information messages (TEST-564 and TEST-552) following this message.

Make sure that all test related ports such as scan enable, test bidirectional control (for LSI Logic vector formats only) and ports which are held constant throughout testing (test-hold) are attributed with their correct sense. For example, if the scan enable signal is inverted, make sure that the scan enable port is attributed with the `test_scan_enable_inverted` signal_type. If an initialization sequence is required to condition the bidirectional ports to input or output, make sure that the correct initialization sequence is used.

If the design is attributed correctly, you can use the `insert_scan` command to fix the contention or float condition identified by `check_test`. DFT Compiler scan insertion (`insert_scan` command) automatically adds conditioning logic to the enable of the three-state drivers to insure that one and only one net driver (including the bidirectional port) is active during scan shift. You can use this command to fix conflict conditions identified by this message even if the design is scan routed.

For example, if the contention condition is due to multiple active three-state drivers, `insert_scan` adds disabling logic to one of the three-state drivers so that only one is active during scan shift.

As another example, consider a float condition in a pre-scan design. If the float is due to the bidirectional port being attributed as scan-out and the three-state driver associated with the port is inactive during scan shift, `insert_scan` adds enabling logic to the three-state driver's enable and uses the port as a scan-out.

For more information refer to the `insert_scan`, `set_scan_configuration`, and `set_scan_signal` man pages.

If the design is scan routed and you do not want to take any actions to fix the conflict violation prior to test pattern generation, you must run `check_test` with the `check_contention` (or `check_float`) option set to the value "none" or "capture_only" prior to the `create_test_patterns` command. For example if `check_test` has identified a float condition in your scan routed design and you want to proceed with test pattern generation despite the identified float, use the following command sequence:

```
dc_shell> check_test -check_float capture_only; dc_shell> create_test_patterns;
```

SEE ALSO

`check_test`, TEST-564, TEST-552, `insert_scan`, `set_scan_configuration`, `set_scan_signal`

TEST-567 (information) The preceding violation will prevent test pattern generation.

DESCRIPTION

This message indicates that the preceding warning message issued by `check_test` is a severe rule violation that prevents test pattern generation. The `create_test_patterns` command will not proceed with pattern generation because of the rule violation identified by the preceding warning message.

WHAT NEXT

Read the preceding warning message and correct the rule violation. Then re-execute **check_test** before proceeding with test pattern generation.

SEE ALSO

check_test (2), **create_test_patterns** (2); **TEST-566** (n), **TEST-563** (n).

TEST-568 (error) Some test design rule checking violations prevent test vector generation.

DESCRIPTION

You receive this message because DFT Compiler identifies a severe design rule violation that prevents test pattern generation. It is issued by the **create_test_patterns** command when the DFT Compiler design rule **check_test** command identifies a violation such as contention on bidirectional ports during scan shift. The **create_test_patterns** command does not proceed with pattern generation if the rule checker identifies severe violations.

WHAT NEXT

You can run the **check_test** command, which issues a **TEST-567** message after warning messages (rule violations) that prevent test pattern generation. You must address these rule violations before proceeding with test pattern generation. The **check_test** violation summary also indicates the number of rule violations (warnings) that stop test pattern generation.

SEE ALSO

check_test (2), **create_test_patterns** (2), **TEST-563** (n), **TEST-566** (n), **TEST-567** (n).

TEST-569 (information) The open-drain or open-source port %s cannot be used as a scan output.

DESCRIPTION

This message follows the warning message **TEST-362**, and informs you that the specified port cannot be used as a scan output because it does not have a pullup or pulldown resistor cell attached to it.

An open-drain (or open-source) output can have only two values: logic 0 and High-Z. Such an output cannot be used as a scan output unless a pullup (or pulldown)

resistor cell is attached to it. When the pullup/pulldown cell is missing, **check_test** considers the scan chain reaching this output as not observable and issues first **TEST-362** and then this informational message.

WHAT NEXT

If you continue with **create_test_patterns** without correcting the **TEST-362** violation, you will lose test coverage because the scan chain is not observable. If the scan chain contains a high percentage of the scan cells in your design, the loss in test coverage will be severe.

Correct the situation by attaching a pullup or pulldown resistor cell to the specified port. Then re-execute **check_test**.

SEE ALSO

check_test (2); **TEST-362** (n).

TEST-570 (error): Invalidate clock offstate (Offstate of clock %s is incompatible with clock gating optimization).

DESCRIPTION

You receive this message because the clock offstate is not consistent with the clock gating optimizations. This message is generated by the DFT Compiler test design rule checker, the **dft_drc** command. This message tells you that DFT Compiler could not recover from processing errors that occurred during test design rule checking. Others test design rule checker violations might exist.

When the variable **test_dft_drc_ungate_clocks** is set to true, the test design rule checker performs clock gating optimizations. A count is maintained to establish which transformation will affect the least number of flip-flops. The clock gating optimizations are then performed and the test design rule checker checks if the clock offstate is consistent with the clock gating optimizations. Both methods of defining clock through the **create_test_clock** command or through the STIL procedure file (with the **read_test_protocol** command) are checked.

WHAT NEXT

Change the clock offstate by using the **create_test_clock** command or by modifying the STIL procedure file. Then, rerun the test design rule checker, the **dft_drc** command.

SEE ALSO

dft_drc (2), **create_test_clock** (2), **read_test_protocol** (2),
test_dft_drc_ungate_clocks (3).

TEST-580 (Warning) All cells in multibit '%s' will not be scanned due to an explicit specification on cell '%s'.

DESCRIPTION

Some cells in the specified multibit are candidates for scan replacement, while at least one cell is explicitly marked as a non scan cell. In order to preserve the homogeneity of function in the multibit, DFT Compiler chooses to extent the dont_scan specification to all the cells of the multibit.

WHAT NEXT

If the whole bag is not to be scan replaced, perform a 'set_scan_element FALSE' on the complete multibit, otherwise remove the 'scan' and 'scan_element' attributes from all the cells in the multibit.

TEST-582 (Warning) All the cells in multibit '%s' are violated.

DESCRIPTION

Since a multibit structure must be homogeneous, any violation on a cell of a multibit which prevents scan replacement must also prevent scan replacement of all other cells in the multibit. This message notifies you that such a violation occurred. The next message, TEST-583, points to the cell with the original violation.

WHAT NEXT

Look for the following information message to determine which cell of the multibit is previously violated. Study the previous messages to understand the original violation.

TEST-583 (Information) Because multibit member cell '%s' is previously violated.

DESCRIPTION

This message always follows a TEST-582 message. It makes explicit the violated cell that caused the whole multibit to become violated.

WHAT NEXT

Search for the original violation on the cell reported in the message and fix it.

TEST-584 (Information) The multibit contains: %s.

DESCRIPTION

This message lists the newly violated cells in the multibit referred to in the previous message.

WHAT NEXT

No action required.

TEST-585 (information) There are %d other multibits with the same condition.

DESCRIPTION

The preceding set of messages flag a problem about a multibit. This message informs you that other multibits have the same condition.

WHAT NEXT

Use the verbose option of `check_test` to get individual messages for each multibit. Refer to the description of the previous set of messages.

TEST-586 (information) There is 1 other multibit with the same condition.

DESCRIPTION

The preceding set of messages flag a problem about a multibit. This message informs you that exactly one multibit that has the same condition.

WHAT NEXT

Use the verbose option of `check_test` to get individual messages for each multibit. Refer to the description of the previous set of messages.

TEST-587 (warning) Multibits are ignored for partial scan

selection.

DESCRIPTION

Partial scan synthesis will not honor multibit specifications. This means that some cells in a multibit bag may get scan replaced while some may not. This non-uniform scan replacement may make multibit bag invalid as they contain cells of different functionality.

WHAT NEXT

To suppress this message, either remove the multibits from your design, or use a full scan methodology.

TEST-588 (warning) Cannot model multibit cell %s; treating it as a black box.

DESCRIPTION

The multibit cell cannot be modeled for one of the following reasons:

1. The target_library or target_libraries (as specified by the **dc_shell target_library** variable) do not contain a cell that is the single-bit degenerate of the multibit cell.
2. The target_library/libraries do not contain the multibit library cell. You must specify the library that contains the multibit with the **dc_shell target_library** variable.
3. Local optimization is disabled. This can be controlled using **set_compile_directives**.

WHAT NEXT

Check the possible causes listed above, and fix the problem.

TEST-590 (Warning) Multibit specification on multibit component '%s' ignored.

DESCRIPTION

This message indicates that scan synthesis cannot perform multibit optimization on the specified multibit component; the multibit specification is being ignored. As a

consequence of ignoring the multibit specification, scan synthesis will treat each bit of the the multibit component as an independent cell and might assign those individual cells to different scan chains.

The reason why the multibit specification is being ignored could be one of the following:

1. The component might contain a **dont_touch** attribute.
2. Local optimization might be disabled. This can be controlled using **set_compile_directives**.
3. The multibit component might not be wide enough, as specified by **set_multibit_options**.
4. The multibit component might contain cells with different functionalities.

WHAT NEXT

If it is acceptable for the multibit specification to be ignored for the specified design object, no action is required. Otherwise, check the specified multibit component or cell for conditions 1-4.

1. If the component contains **dont_touch** attributes, remove them with **set_dont_touch false** or **remove_attribute**.
2. If local optimization is disabled, enable it with **set_compile_directives -local_optimization true**.
3. If the multibit component is not wide enough, adjust the minimum width using **set_multibit_options -minimum_width**, or make the component wider.
4. Ensure that the multibit component contains cells with the same functionalities.

Use the **create_multibit** or **remove_multibit** commands to manipulate multibit components, then re-execute the **check_test** command.

TEST-591 (Warning) There exists a cell %s on the bus which is not controllable. So the tristate disabling logic on this bus is not synthesized.

DESCRIPTION

This happens when a cell driving a bus has a tristate pin but no way of controlling it. This wil prevent addition of any disabling logic to this tristate-bus.

WHAT NEXT

Update the cell and rerun the command.

TEST-592 (Warning) There is a contention while controlling cell %s on the bus. So the tristate disabling logic on this bus is not synthesized.

DESCRIPTION

This happens when a cell driving a bus has a tristate pin and the logic to control it contradict another driver of the same bus. This will prevent addition of any disabling logic to this tristate-bus.

WHAT NEXT

Update the cell and rerun the command.

TEST-593 (Information) All cells in multibit component '%s' are violated.

DESCRIPTION

This message informs you that all the cells in the given multibit are violated. This is necessary in order to ensure that all the cells in the multibit are either scan replaced together, or not at all.

WHAT NEXT

Refer to the previous message to understand why some cell in the multibit component was violated.

TEST-594 (warning) Clock pin %s of cell %s (%s) has active or unknown value at off state of clock %s.

DESCRIPTION

You receive this warning message because clock pins controlled by a system clock have active or unknown values at the beginning of the system clock cycle.

This warning message is issued by the **check_dft**, **check_scan**, and **check_test** commands for a level-sensitive scan design (LSSD) pre-scan.

The result is that scan chains are improperly constructed with some scan cells having the system clock and the test clock active at the same time.

WHAT NEXT

Correct the design by ensuring that all of the clock pins driven by a system clock are at their inactive values when the system clock is at its off state.

SEE ALSO

check_dft (2), **check_scan** (2), **check_test** (2).

TEST-595 (information) There are %d other such violation(s).

DESCRIPTION

When **dft_drc** runs in ordinary (nonverbose) mode, it only lists the first instance of certain violations. This message shows the number of additional such violations.

WHAT NEXT

The warning message that appears before this one indicates the design rule violation. (There might be additional information messages that provide more details about the first violation.)

If you want to see details of all the violations of a rule, run **dft_drc** in verbose mode. For example, **check_test** might produce the following messages:

```
Warning: Warning: Chains 1 and 15 always have the same load value. (R9-1)
Information: There are 1 other such violation(s). (TEST-595)
```

However, if you run **fbdft_drc -verbose**, you see details of all the violations:

TEST-600 (Warning) All cells in multibit %s are violated because multibit cell %s is previously violated.

DESCRIPTION

You receive this warning message when all of the cells in the specified multibit are violated because of a prior violation on one of the cells of the multibit. This action is necessary to ensure that all cells in the multibit are either scan replaced together, or not at all.

WHAT NEXT

Search for and fix the original violation on the cell reported in the message.

TEST-601 (warning) Inferring default device package '%s'.

DESCRIPTION

This warning message indicates that you have not selected any default package for the Boundary Scan Design using the **set_bsd_configuration** command. However, as only one port-to-pin map file was read in, this package is assumed to be the default device package.

WHAT NEXT

Nothing

TEST-602 (error) '%s' is not an RTL file. The following modules cannot be modified: %s.

DESCRIPTION

The specified modules have been identified as part of the named file. This file is apparently not an RTL source file, so the modification of the source cannot be performed. File names are stored at the time of the reading of the RTL if the variable 'hdlin_enable_rtldrc_info' is set to true. Otherwise the source is assumed to be a non-editable db file.

Be aware that when the 'hdlin_enable_rtldrc_info' is set to true, the internally represented RTL enables the tracing of the circuit topology back to the source, at the expense of synthesizability. You should not assert this variable if the RTL is meant to be synthesized without modification, least you accept significant degradation in QoR.

WHAT NEXT

Ensure that the variable 'hdlin_enable_rtldrc_info' is set to true.

TEST-603 (information) The following RTL modules, from file

'%s', are edited: %s.

DESCRIPTION

This is a simple information message that lists the modules of a file that require modification at the RTL source. The actual modification is performed immediately after the issuing of this message.

WHAT NEXT

Continue reading.

TEST-604 (information) Uniquifying '%s' into %d new modules.

DESCRIPTION

This is a simple information message stating that the named module has multiple instances requiring different modifications. The module itself is uniquified into as many copies as required to satisfy all the modification requirements. The copies are stored in the same file as the original, immediately before it. The references, from other modules, are adjusted in consequence.

WHAT NEXT

Continue reading.

TEST-605 (error) The RTL Editor executable '%s' is not found.

DESCRIPTION

The RTL Editor executable is not found. No modification of RTL can be performed. Typically, the executable is obtained from the root. The cause of this message is either an unsupported platform, an incorrect specification of the root, or faulty installation.

WHAT NEXT

Check the availability of the RTL editing feature for the current platform in the Release Notes. Check the specification of the Synopsys root. Contact your systems administrator.

TEST-606 (error) Cannot start the RTL Editor.

DESCRIPTION

The RTL Editor executable cannot be started. No modification of RTL can be performed. This is most likely due to a runtime configuration issue.

WHAT NEXT

Check execute permissions on the RTL Editor.

TEST-610 (warning) Static X cell analysis may be inaccurate on design containing cells with CTL models.

DESCRIPTION

This warning message indicates that the current design has cells with CTL models therefore static X cell analysis may be inaccurate.

TEST-700 (warning) %s '%s' %s '%s' does not exist and hence will be ignored. The remaining valid non empty scan group specification will be accepted.

DESCRIPTION

You receive this warning message because the **set_scan_group** command was issued with non-existing elements or invalid elements. A scan group can have elements as part of its -include_elements option, that could be a valid sequential cell name, or a core segment name, or a design instance name. Scan groups cannot have nested scan groups has part of its specification. Also Scan groups cannot have elements that belong to different clock domains or different clock edges. In other words, scan group can accept only elements from same clock and edge. When this message is showed, the element will be ignored from the scan group specification during scan architecting.

If the scan group has a design instance name as part of include_elements which is already scan inserted and has scan chain elements clocked by more than one clock, the scan group specification will be ignored and the model for that instance will not be used for constructing the scan chains. Hence the elements/cells within this design instance will be considered as if it is not scan inserted and new scan chains will be constructed accordingly.

SEE ALSO

`set_scan_group`

TEST-801 (information) There is 1 such other violation.

DESCRIPTION

This message is issued by the `check_bsd` command in conjunction with the violation message just above it.

This message is issued in both the verbose and non-verbose modes of `check_bsd`. In verbose mode this message is followed by the name of the object with the same violation.

WHAT NEXT

Investigate the reason for the previous violation, and re-run `check_bsd` when this problem is fixed.

SEE ALSO

`check_bsd`.

TEST-802 (information) There are %d such other violations.

DESCRIPTION

This message is issued by the `check_bsd` command in conjunction with the violation message just above it.

This message is issued in both the verbose and non-verbose modes of `check_bsd`. In verbose mode this message is followed by the name of the objects with the same violation.

WHAT NEXT

Investigate the reason for the previous violation, and re-run `check_bsd` when this problem is fixed.

SEE ALSO

`check_bsd`.

TEST-811 (error) Mandatory IEEE 1149.1 test port %s missing.

DESCRIPTION

The mandatory 1149.1 boundary scan Test Access Port is missing. You are suppose to specify at least the four mandatory Test Access Ports.

WHAT NEXT

Use the command `set_bsd_port <tdi | tdo | tms | tck | trst> <port_name>` to specify the four or five Test Access Ports in DB mode.

Use the command `set_dft_signal -type <tdi | tdo | tms | tck | trst> -port <port_name> -view existing_dft` to specify the four or five Test Access Ports in XG mode.

TEST-812 (error) NO IEEE 1149.1 test ports have been identified.

DESCRIPTION

None of the Test Access Ports have been defined. You are suppose to specify at least the four mandatory Test Access Ports.

WHAT NEXT

Use the command `set_bsd_port <tdi | tdo | tms | tck | trst> <port_name>` to specify the four or five Test Access Ports in DB mode.

Use the command `set_dft_signal -type <tdi | tdo | tms | tck | trst> -port <port_name> -view existing_dft` to specify the four or five Test Access Ports in XG mode.

TEST-813 (error) %s TAP Controller state flops have been found, which is an insufficient number of state flops. There must be at least four.

DESCRIPTION

The tool is unable to find the minimum number of TAP Controller states. The 1149.1 TAP Controller has 16 states which can be realize by at least 4 state elements. Hence this TAP controller is either not compliant to the standards or there is some

design problem. If it is a design problem then the diagnostic will be able to specify it. If the problem is of not setting of compliance ports, then these ports should be specified.

WHAT NEXT

1. Use `set_tap_elements` to specify the TAP state elements as follows :

```
set_tap_elements -state_cells <list of TAP state elements>
2. Specify the compliance enable ports as follows if not specified and diagnostic finds it to be a problem.
set_bsd_compliance {<port_name> <pattern>}
3. If there is some design problem then it should be rectified before running check_bsd again.
```

TEST-814 (error) TAP controller makes an illegal transition from state %s to state %s with TMS at logic value %s. The TAP controller should make transition to state %s.

DESCRIPTION

The 1149.1 TAP Controller has 16 states and a well defined state transition diagram is defined in chapter 5 of IEEE Std 1149.1. The TAP Controller has made an illegal transition to a state. This can occur a. If the synchronizing sequence of "11111" doesn't take the TAP Controller to Test-Logic-Reset state. b. If the TAP Controller state machine is malfunctioning. Diagnostic will not help in this case.

WHAT NEXT

You should correct the functioning of synchronizing sequence or the TAP Controller state machine before re-running `check_bsd`.

TEST-815 (error) Low halt state for TCK does not exist.

DESCRIPTION

As defined in chapter 3 of IEEE Std 1149.1, the dedicated TCK input is provided to permit shifting of test data concurrently with system operation of the component. This require TCK to be stopped for a period to do other support functions during test, for example an ATE needs to fetch test data from backup memory. Hence, the standard requires that TCK can be stopped at 0 indefinitely without causing any change to state of test logic. Therefore, while TCK is stopped at 0, state devices are required to retain their state so that the test logic can continue its operation when the clock operation restarts. The tool was able to find the TAP Controller state devices are not able to retain their state, when TCK is stopped at 0.

WHAT NEXT

You should rectify this problem by making the state devices of TAP Controller to retain their state, when TCK is stopped at 0.

TEST-816 (error) TRST does not reset TAP controller asynchronously. TRST specification ignored.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 that the TAP controller shall be asynchronously reset to the Test-Logic-Reset controller state when a logic 0 is applied to TRST port. The design port which has been specified as TRST doesn't reset the TAP controller asynchronously, hence the specification is being removed. The cause might be the problem with the TAP controller reset operation or the specification of a wrong design port have been done as TRST.

WHAT NEXT

You can do the following : 1. use set_tap_elements to specify all the TAP state elements or 2. correct the reset problem of TAP controller or 3. assign attribute to correct the design port as TRST.

TEST-816a (warning) TRST reset TAP controller synchronously but not asynchronously. TRST specification ignored.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 that the TAP controller shall be asynchronously reset to the Test-Logic-Reset controller state when a logic 0 is applied to TRST port. The design port which have been specified as TRST reset the TAP controller synchronously. This is not correct and hence the specification is being removed. The cause might be the problem with the TAP controller reset operation.

WHAT NEXT

You should correct the reset problem of TAP controller before re-running check_bsd.

TEST-816b (warning) TAP controller is not reset at power up.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 5 that TAP controller should either be initialized by TRST port or at power-up by operation of circuitry built into the test logic. Because the design doesn't specify any TRST port and power-up initialization is not correct. Hence, it is not possible to externally control the TAP controller.

WHAT NEXT

Check the power-up circuitry if it exists; otherwise, assign the TRST port to the design if you forgot to.

SEE ALSO

`set_bsd_power_up_reset (2)`

TEST-817 (warning) TDO driver can not be active in the TAP controller state %s.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 and 5 that the TDO driver shall be set to inactive state except when the scanning of data is in progress.

WHAT NEXT

Check the TDO logic to put the TDO driver into inactive state during this TAP controller state.

TEST-818 (error) TDO driver must be active in TAP Controller state %s.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 and 5 that the TDO driver shall be set to active state when the scanning of data is in progress.

WHAT NEXT

Check the TDO logic to put the TDO driver into active state during this TAP controller state.

TEST-819 (warning) Undriven input port %s is floating. When undriven, this port should behave as though it was driven by logic one.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 that the design of circuitry fed from the Test Access Ports TMS, TDI and TRST shall be such that an undriven input produces a response identical to the application of a logic 1.

WHAT NEXT

You should correct the problem with the specified Test Access Port before re-running check_bsd.

TEST-820 (error) EXTEST opcode is not specified.

DESCRIPTION

You get this error message during check_bsd when you are using the 2001 revision(default) of the IEEE1149.1 standard for the compliance check and have not specified the opcode for the EXTEST instruction.

In the 2001 revision of the IEEE1149.1 standard, all-0's is no longer the default opcode for the EXTEST instruction, so user needs to explicitly specify the EXTEST opcode for the check_bsd using the set_bsd_instruction command.

WHAT NEXT

CaseI: If you are checking the conformance against the 2001 revision(default) of the IEEE1149.1 standard, then specify the EXTEST opcode using the set_bsd_instruction command and rerun check_bsd.

Example: `set_bsd_instruction EXTEST -code {0010}`

CaseII: If you are not upgraded to the 2001 revision of the IEEE1149.1 standard, and still following the 1993 version, you can switch back to the older version (non default mode) using the set_bsd_configuration command and rerun check_bsd. In this mode check_bsd assumes all-0's opcode for the EXTEST instruction and user does not need to specify the EXTEST opcode.

Example: set_bsd_configuration -ieee1149.1_1993

SEE ALSO

`set_bsd_instruction` `set_bsd_configuration` `check_bsd`

TEST-821 (warning) TDO should not change on the rising edge of TCK in the TAP controller state %s.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 that to ensure a race-free operation, changes in the state of the signal driven through TDO shall occur only on the falling edge of TCK.

WHAT NEXT

You should correct the behavior of test logic at TDO to change on the falling edge of TCK.

TEST-822 (warning) TAP Controller should not be reset by the functional input %s. A dedicated reset port or power-up sequence is required.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 5 that TAP controller shall not be initialized by operation of any system input, such as system reset.

WHAT NEXT

You should fix the design by removing initialization by any system input of the TAP controller.

TEST-823 (error) TAP controller can not be initialized by the

synchronizing sequence of 11111 on TMS.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 5 that no matter what the original state of TAP controller, it should enter Test-Logic-Reset when TMS is held high for at least five rising edges of TCK.

WHAT NEXT

Check the TAP controller logic and rectify the synchronizing sequence problem.

TEST-824 (warning) Data is inverted during shift from TDI to TDO.

DESCRIPTION

The IEEE Std 1149.1 stated in Chapter 6 and 8 that there can be no inversion of data between the serial input and serial output of IR (instruction register) or any TDRs (test data register).

WHAT NEXT

Rectify the logic at the cell of the shift register.

TEST-824a (information) Data is inverted during shift from TDI to TDO at the TDO port cell %s.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 6 and 8 that there can be no inversion of data between the serial input and serial output of IR (instruction register) or any TDRs (test data register).

WHAT NEXT

Rectify the TDO logic.

TEST-824b (warning) Data is inverted during shift from TDI to

TDO at cell %s of the shift register.

DESCRIPTION

The IEEE Std 1149.1 stated in Chapter 6 and 8 that there can be no inversion of data between the serial input and serial output of IR (instruction register) or any TDRs (test data register).

WHAT NEXT

Rectify the logic at the cell of the shift register.

TEST-825 (error) Cannot access Instruction Register during the shift-IR TAP controller state.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 6 that a shift register of length at least 2 should be put between TDI and TDO in the TAP controller Shift-IR state. As no shift register is inferred the tool can not progress. It is a non-tolerable violation and should be fixed.

WHAT NEXT

Fix the IR (instruction Register) problem. If the diagnostic provides a port controlling the inference, then this port should be set as compliance enable port using the command.

TEST-826 (error) Illegal Instruction Register Length %s.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 6, section 6.1.1.8 that the instruction register (IR) shall include at least TWO shift-register-based cells capable of holding instruction data.

WHAT NEXT

Correct your design to include, at a minimum, two IR cells for the instruction register length.

TEST-827 (error) TAP controller state flops make state transitions at the falling edge of TCK instead of on the rising edge of TCK.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 6, section 6.1.1(b) that the transitions of the TAP controller shall occur based upon the value of TMS at the rising edge of TCK.

WHAT NEXT

Examine and correct the TAP controller FSM architecture to conform with the rule 6.1.1(b).

TEST-828 (error) The capture value of the least significant bits in the instruction register is %s%s. It must be the fixed pattern "01".

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 6 that the two least significant instruction register (IR) cells (that is those nearest the serial output) must load a fixed binary "01" pattern (the 1 into the least significant bit location) in the Capture-DR controller state.

WHAT NEXT

Correct the IR design.

TEST-829 (warning) The length of Device Identification Register is %s. It should be 32.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 11 that the component shall contain a vendor-defined identification code, containing four fields (32 bits) [Version (4 bits), Part Number(16 bits), Manufacturer identity (11 bits), 1]. Hence the Device Identification Register should be of length 32 bits.

WHAT NEXT

You should correct the design of Device Identification Register.

TEST-830a (warning) Unable to access any Register to be serially connected between TDI and TDO in the Test-Logic-Reset state.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 5 that IR initialize to either IDCODE or, if the optional DIR (device identification register) is not provided, BYPASS instruction. No register is found during the Capture-DR state after the TAP Controller has been taken through the Test-Logic-Reset state. This indicate a problem with either a. DIR to be serially connected between TDI and TDO b. Not a proper instruction is loaded during the Test-Logic-Reset state

WHAT NEXT

Correct the design of IR to load either BYPASS or IDCODE instruction or correct the design of DIR.

TEST-831 (error) Mandatory BYPASS instruction is not implemented with all-ones opcode.

DESCRIPTION

You get this error message when **-infer_instructions** option of the **check_bsd** command is set to false(default) and **check_bsd** finds that all-ones opcode does not implement the mandatory **BYPASS** instruction .

The IEEE Std 1149.1 state in chapter 7 that each component shall provide a BYPASS instruction with all-ones opcode.

WHAT NEXT

Correct the design to implement the BYPASS instruction with all-ones opcode.

TEST-832 (error) Cannot access BYPASS Register during the shift-DR TAP controller state with the "all ones" instruction

opcode.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 7 that a binary code for BYPASS instruction shall be {111...1} (i.e., a logic 1 entered into every instruction register cell).

WHAT NEXT

You should correct the design of BYPASS instruction to include an "all ones" opcode.

TEST-834 (error) Cannot access Boundary Scan Register during the shift-DR TAP controller state with the "%s" instruction opcode.

DESCRIPTION

The IEEE Std 1149.1-1993 state in chapter 7 that a binary code for the EXTEST instruction shall be {000...0} (i.e., a logic 0 is loaded into every IR cell).

Later versions of IEEE 1149.1 allow any opcode for EXTEST instruction.

The above error message is issued when Boundary Scan Register is not selected to connect between TDI and TDO during the EXTEST instruction opcode in Shift-DR Tap state.

WHAT NEXT

If EXTEST instruction doesn't use "all zeros" opcode for IEEE Std 1149.1-1993 implementation, you should correct the EXTEST instruction to include an "all zeros" opcode.

If EXTEST instruction uses the correct opcode, check if there is a breakage in the Boundary Scan Register accessed by the EXTEST instruction in Shift-DR Tap state.

TEST-835 (error) The capture value of the least significant bit in the Device Identification Register is logic zero. It must be logic

one.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 11 that a DIR (device identification register) should load a constant logic 1 into its LSB in the Test-Logic-Reset TAP Controller state.

WHAT NEXT

You should correct the design of DIR.

TEST-836 (Error) Illegal manufacturing code %s has been captured in the Device Identification Register.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 11 that the manufacturer code 0000111111 shall not be used in components that are otherwise compatible with this standard.

WHAT NEXT

You should correct the design of device identification register.

TEST-837 (Warning) No Register is selected to connect between TDI and TDO during instruction opcode %s.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 7 that each instruction shall completely define the set of TDRs (test data register) that may operate while the instruction is current.

WHAT NEXT

You should either map this opcode to select BYPASS if unused otherwise correct the design of instruction opcode to select a TDR(s).

TEST-838 (warning) An INPUT boundary scan register cell is

missing on design port %s.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 10 that one or more boundary scan register cells must be provided at each system input of the on-chip system logic.

WHAT NEXT

Provide the missing boundary scan register cell on this port.

TEST-838a (warning) An OUTPUT boundary scan register cell is missing on design port %s.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 10 that one or more boundary scan register cells must be provided at each system output of the on-chip system logic.

WHAT NEXT

Provide the missing boundary scan register cell on this port.

TEST-839 (error) A boundary scan register cell %s cannot be placed on TAP port %s.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 10 state that boundary-scan register cells shall not be provided at: TAP pins (TCK, TDI, TDO, TMS, and TRST*).

WHAT NEXT

Remove the boundary-scan register cell from the TAP port.

TEST-840 (warning) A boundary scan register cell %s cannot be

placed on compliance port %s.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 10 that boundary-scan register cells shall not be provided at pins that enable compliance to this standard.

WHAT NEXT

Remove the boundary-scan register cell from this port.

TEST-841 (error) Not able to infer the mandatory SAMPLE/PRELOAD instruction.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 7 that each component shall provide a SAMPLE/PRELOAD instruction. The SAMPLE/PRELOAD instruction is inferred by analyzing the capturing of input ports by the boundary-scan register cells on the design input ports and the conditioning of design output ports.

WHAT NEXT

Correct the design to provide a SAMPLE/PRELOAD instruction or correct the capturing of boundary-scan register cells on the design input ports or conditioning of design output ports as defined.

TEST-842 (error) Mandatory SAMPLE/PRELOAD instruction is not implemented (or not specified).

DESCRIPTION

You get this error message when **-infer_instructions** option of the **fBset_bsd_configuration** command is set to false(default) and **check_bsd** does not find the mandatory **SAMPLE/PRELOAD** instruction.

The IEEE Std 1149.1 state in chapter 7 that each component shall provide a SAMPLE/PRELOAD instruction. The SAMPLE/PRELOAD instruction is inferred by analyzing the capturing of input ports by the boundary-scan register cells on the design input ports and the conditioning of design output ports.

If you are running **check_bsd** on a design for which boundary-scan synthesis is done by BSD compiler then **check_bsd** analyzes the opcode(s) for SAMPLE/PRELOAD passed by

`insert_bsd` else `check_bsd` looks for the opcodes for SAMPLE/PRELOAD specified by the `set_bsd_instruction` command.

WHAT NEXT

If you are running `check_bsd` on a design for which boundary-scan synthesis is not done by BSD compiler then make sure that you specify correct opcode(s) for the implemented SAMPLE/PRELOAD instruction and make sure that the design implements the SAMPLE/PRELOAD instruction correctly. If you do not know the SAMPLE/PRELOAD instruction opcode(s), set the `-infer_instructions` option of the `set_bsd_configuration` command to true and rerun `check_bsd`. This will let `check_bsd` examine all opcodes for SAMPLE/PRELOAD.

TEST-843 (error) Logic cannot exist between boundary scan cell %s and design port %s.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 10 that there cannot be logic between any boundary scan register cell and the system pin to which that cell is connected.

WHAT NEXT

Correct the design by removing the logic between the boundary scan register cell and the design port.

TEST-844 (error) The Instruction Register Update flops update on the rising edge of TCK instead of falling edge of TCK.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 5 and 6 that the instruction shifted into the instruction register is latched onto parallel output from the shift-register path on the falling edge of TCK. This error shows that the output is not latched on the falling edge but on the next rising edge.

WHAT NEXT

Correct the design by making the update stage latch on the falling edge of TCK.

TEST-845 (warning) The compliance-enable pattern %s do not

cause the component to be fully compliant with this standard. This pattern is being removed from the set of patterns.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 3 that any one of the compliance-enable patterns, when applied to the compliance-enable inputs without regard to preceding patterns on these inputs, shall cause the component to be fully compliant with this standard.

WHAT NEXT

Correct the design to meet this requirement or remove the pattern from the compliance enable list.

TEST-846 (error) The Boundary Scan Register Update flops update on the rising edge of TCK instead of falling edge of TCK.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 5 and 7 that the data shifted into the BS register is latched onto parallel output from the shift-register path on the falling edge of TCK. This error shows that the output is not latched on the falling edge but on the next rising edge.

WHAT NEXT

Correct the design by making the update stage latch on the falling edge of TCK.

TEST-847 (warning) The BSR Update flops illegally update during Update-DR under CLAMP instruction.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 10 that all latched output of BSR should retain their states until 1. The Test-Logic-Reset controller state is entered as a result of application of a logic '0' at TRST* or 2. The first falling edge of TCK occurs in Test-Logic-Reset controller state when that state is entered as a result of signals applied at TCK and TMS and the instruction selects the BSR between TDI and TDO.

This error shows that the output is latched on the falling edge of TCK in Update-DR

while CLAMP is selected. CLAMP selects the BYPASS register between TDI and TDO (not the BSR), so the BSR Update flops should not update during Update-DR under CLAMP instruction.

WHAT NEXT

Correct the design by making the update stage unchanged during CLAMP.

Case1: If you are using synchronous implementation then you can correct the design by driving the BSR cell's update_en from Tap controller's sync_update_dr signal gated with the decoded instruction opcodes which select the BSR between TDI and TDO, instead of driving it directly from the Tap controller's sync_update_dr signal.

Case2: If you are using asynchronous implementation then you can correct the design by driving the BSR cell's update_clk from Tap controller's update_dr signal gated with the decoded instruction opcodes which select the BSR between TDI and TDO, instead of driving it directly from the Tap controller's update_dr signal.

Example: ----- Suppose Tap/I[3..0] is the instruction bus, and you have the following opcode assignments in your boundary-scan design:

EXTEST Instruction(Selcting BSR between TDI and TDO) = 0000 0010 SAMPLE
Instruction(Selcting BSR between TDI and TDO) = 0111 1000 CLAMP Instruction(Selcting BYPASS between TDI and TDO) = 1001 1010 HIGHZ Instruction(Selcting BSR between TDI and TDO) = 1011 1110 BYPASS Instruction(Selcting BYPASS between TDI and TDO) = 1111 & the remaining opcodes

Opcodes selecting the BSR = 0000 0010 0111 1000 1011 1110

Depending upon whether you have a synchronous or asynchronous design, you will fix this violation as follows.

Case1: If you are using a synchronous implementation then you can derive the BSR cell's update_en signal as follows:

update_en = (Tap Controller's sync_update_dr) & (!I3&!I2&!I1&!I0 | !I3&I2&I1&!I0 | !I3&I2&I1&I0 | I3&!I2&!I1&!I0 | I3&I2&I1&I0 | I3&I2&I1&!I0) (Most probably what you were generating update_en = (Tap Controller's sync_update_dr))

Case2: If you are using a asynchronous implementation then you can derive the BSR cell's update_clk signal as follows:

update_clk = (Tap Controller's update_dr) & (!I3&!I2&!I1&!I0 | !I3&I2&I1&!I0 | !I3&I2&I1&I0 | I3&!I2&!I1&!I0 | I3&I2&I1&I0 | I3&I2&I1&!I0) (Most probably what you were generating update_clk = (Tap Controller's update_dr))

TEST-848 (warning) The BSR Update flops illegally update during Update-DR under RUNBIST instruction, while selecting

another TDR as shift register.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 10 that all latched output of BSR should retain their states until 1. The Test-Logic-Reset controller state is entered as a result of application of a logic '0' at TRST* or 2. The first falling edge of TCK occurs in Test-Logic-Reset controller state when that state is entered as a result of signals applied at TCK and TMS.

This error shows that the output is latched on the falling edge of TCK in Update-DR while RUNBIST is selected.

WHAT NEXT

Correct the design by making the update stage unchanged during RUNBIST.

TEST-849 (warning) The tristate pin %s on the cell %s has multiple Boundary-Scan Register controlling cells.

DESCRIPTION

A pad cell was found with controlling input being driven by multiple BSR cell, which is a violation of IEEE Std 1149.1 rule 10.6.1c.

WHAT NEXT

Correct the logic so that one boundary-scan register cell drives the control input.

TEST-850 (Warning) Initialization using TMS synchronizing sequence "11111" does not match the initialization using the TRST port or power-up sequence. This process will continue by using the TMS synchronizing sequence.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 5 that the TAP controller can be initialized into the Test-Logic-Reset state by one of the following: a. At power-up either by either using the TRST* signal or as a result of circuitry built into the test logic.

b. By holding TMS high for at least five rising edges of TCK. On this design the two initialized states are not same.

WHAT NEXT

Check the design of TAP controller and verify the initialization by both of the aforementioned methods to be Test-Logic-Reset state.

TEST-850a (warning) No external method to reset the TAP controller (such as TRST port or power-up) has been provided. This process will continue by forcing logic values on the TAP controller state elements.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 5 that the TAP controller can be initialized into the Test-Logic-Reset state at power-up either by using the TRST* signal or as a result of circuitry built into the test logic. Because neither of these have been provided to initialize that TAP controller, there isn't an external way to control the TAP controller.

WHAT NEXT

You should correct the TAP controller design and provide, at least, one of the specified initialization mechanism.

SEE ALSO

`set_bsd_power_up_reset` (2)

TEST-851 (Error) The shift flops of Instruction Register are not clocking on the positive edge of TCK during the Capture-IR TAP Controller state.

DESCRIPTION

While checking for capture value in the Instruction Register during Capture-IR, it is found that the shift flops of the Instruction Register are not clocked on the positive edge of the TCK. IEEE Std. 1149.1 in rule 6.2.1(c) states that all operations of shift-register stages shall occur on the rising edge of TCK following entry into a controller state.

WHAT NEXT

Correct the design to clock the IR shift flops on the positive edge of TCK during the Capture-IR state and rerun `check_bsd`.

TEST-852 (Warning) Opcode %s specified for %s instruction does not select the specified/implied %s register. Removing the opcode.

DESCRIPTION

You get this warning message when `check_bsd` finds that the opcode you specified by `set_bsd_instruction` command for the instruction does not select the correct test data register for the instruction. When `-infer_instructions` option of the `fBset_bsd_configuration` command is set to false(default) and `check_bsd` uses the implemented instructions information provided by the `set_bsd_instruction` command.

WHAT NEXT

Make sure that you specify the correct opcode and check the design for implemented behavior of the opcode.

TEST-853 (Warning) Opcode %s specified for %s instruction does not cause valid conditioning. Removing the opcode.

DESCRIPTION

You get this warning message when `check_bsd` finds that the opcode you specified by `set_bsd_instruction` command for the instruction does not comply to the input/output conditioning for the instruction. When `-infer_instructions` option of the `fBset_bsd_configuration` command is set to false(default) and `check_bsd` uses the implemented instructions information provided by the `set_bsd_instruction` command.

WHAT NEXT

Make sure that you specify the correct opcode and check the design for implemented behavior of the opcode.

TEST-854 (information) There is a break in the shift register

chain at flop %s.

DESCRIPTION

During the inference of the shift-register stage between the TDI and TDO, a break at the cell was found. The break is because the cell driving is not active. Diagnostic will find a cause of unknown in full.

WHAT NEXT

Correct the design by removing the cause and rerun `check_bsd`.

TEST-855 (information) There is a break in the shift register chain due to test data out (TDO) port not being driven by the shift register chain.

DESCRIPTION

During the inference of the shift-register stage between the TDI and TDO, a break at TDO was found. This shows the TDO logic is not enabled. Diagnostic will find an actual cause of this.

WHAT NEXT

Check your design for proper the shift enable connection, missing clocks, or broken internal nets. Correct the design by removing the cause and rerun `check_bsd`.

TEST-856 (warning) The design TDO port %s is not enabled.

DESCRIPTION

During the inferences, the design TDO port was found not to be enabled. Hence, no simulation token can propagate to the TDO port. This can cause problems at both the traversing of TAP states, as well as the inference of shift register stage. Diagnostics can help to pin-point the cause.

WHAT NEXT

Run the software in verbose mode to find the actual cause of the break. Correct the design by removing the cause and rerun.

TEST-857 (warning) Synchronous mode for the shift register was not inferred. There seems to be break in the shift register.

DESCRIPTION

During the inference of shift-register stage between the TDI and TDO, a break at the cell has been found. The break is due to the fact that the cell driving is not active. Diagnostic will find a cause of unknown in full.

WHAT NEXT

Run the software in diagnostic mode to know the actual cause of the break. Correct the design by removing the cause and re-run check_bsd.

TEST-858 (warning) The update elements of the instruction register should not be reset on the rising edge of test clock TCK.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 6, section 6.2.1(d) that the data present at the parallel output of the instruction register shall be latched from the shift-register state on the falling edge of TCK in the Update-IR controller state.

WHAT NEXT

Correct the design to latch the data from the shift-register flip-flops into the parallel hold latches on the falling edge of TCK during the Update-IR controller state.

TEST-859 (error) Unable to find the Boundary Scan Register Update flops on falling edge of TCK.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 5 and 7 that the data shifted into the boundary-scan register is latched onto parallel output from the shift-register path on the falling edge of TCK. This error shows that the output is not latched on the falling edge of TCK. The boundary scan register update flops are either missing or not designed according to the IEEE 1149.1 Standard (10.3.1.b).

WHAT NEXT

Correct the design for one of the following three possible causes: 1. No update flip flop exists in the update register. 2. There are multiple flip flops in the update register. 3. The update register is not being clocked by the negative edge of TCK.

TEST-859a (warning) Boundary Scan Register Update Flops change state during BYPASS Update-DR operation.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 10 (10.3.1c) that when the boundary scan register is NOT selected between TDI and TDO, all latched parallel outputs should retain their last state until the Test-Logic-Reset controller state is entered asynchronously (Logic 0 at TRST) or the first falling edge of TCK occurs when the Test-Logic-Reset controller state is entered synchronously (as a result of signals applied at TCK and TMS).

WHAT NEXT

Correct the design. Make sure that all the boundary scan register update flops are clocked in the Update-DR state only when either of the instructions selecting BSR is active and not otherwise.

Case1: If you are using synchronous implementation then you can correct the design by driving the BSR cell's update_en from Tap controller's sync_update_dr signal gated with the decoded instruction opcodes which select the BSR between TDI and TDO, instead of driving it directly from the Tap controller's sync_update_dr signal.

Case2: If you are using asynchronous implementation then you can correct the design by driving the BSR cell's update_clk from Tap controller's update_dr signal gated with the decoded instruction opcodes which select the BSR between TDI and TDO, instead of driving it directly from the Tap controller's update_dr signal.

Example: ----- Suppose Tap/I[3..0] is the instruction bus, and you have the following opcode assignments in your boundary-scan design:

EXTEST Instruction(Selcting BSR between TDI and TDO) = 0000 0010 SAMPLE
Instruction(Selcting BSR between TDI and TDO) = 0111 1000 CLAMP Instruction(Selcting BYPASS between TDI and TDO) = 1001 1010 HIGHZ Instruction(Selcting BSR between TDI and TDO) = 1011 1110 BYPASS Instruction(Selcting BYPASS between TDI and TDO) = 1111 & the remaining opcodes

Opcodes selecting the BSR = 0000 0010 0111 1000 1011 1110

Depending upon whether you have a synchronous or asynchronous design, you will fix this violation as follows.

Case1: If you are using a synchronous implementation then you can derive the BSR cell's update_en signal as follows:

```
update_en = (Tap Controller's sync_update_dr) & (!I3&!I2&!I1&!I0 | !I3&!I2&I1&!I0 | !I3&I2&I1&I0 | I3&!I2&!I1&!I0 | I3&!I2&I1&I0 | I3&I2&I1&!I0 ) (Most probably you were generating update_en = (Tap Controller's sync_update_dr))
```

Case2: If you are using a asynchronous implementation then you can derive the BSR cell's update_clk signal as follows:

```
update_clk = (Tap Controller's update_dr) & (!I3&!I2&!I1&!I0 | !I3&!I2&I1&!I0 | !I3&I2&I1&I0 | I3&!I2&!I1&!I0 | I3&!I2&I1&I0 | I3&I2&I1&!I0 ) (Most probably what you were generating update_clk = (Tap Controller's update_dr))
```

TEST-859b (warning) Boundary Scan Register shifts data during BYPASS Shift-DR operation.

DESCRIPTION

You get this warning when the the boundary scan register shifts data during the Shift-DR state of the BYPASS instruction. The IEEE Std 1149.1 states in Chapter 8 (8.3.1g) that when no operation of a selected test data register is required in a given controller state, the register shall retain its last state unchanged.

WHAT NEXT

Correct the design. Make sure that all the boundary scan register shift flops are clocked in the Shift-DR state only when either of the instructions selecting BSR is active and not otherwise.

Case1: If you are using synchronous implementation then you can correct the design by driving the BSR cell's update_en from Tap controller's sync_update_dr signal gated with the decoded instruction opcodes which select the BSR between TDI and TDO, instead of driving it directly from the Tap controller's sync_update_dr signal.

Case2: If you are using asynchronous implementation then you can correct the design by driving the BSR cell's update_clk from Tap controller's update_dr signal gated with the decoded instruction opcodes which select the BSR between TDI and TDO, instead of driving it directly from the Tap controller's update_dr signal.

Example: ----- Suppose Tap/I[3..0] is the instruction bus, and you have the following opcode assignments in your boundary-scan design:

```
EXTEST Instruction(Selcting BSR between TDI and TDO) = 0000 0010 SAMPLE  
Instruction(Selcting BSR between TDI and TDO) = 0111 1000 CLAMP Instruction(Selcting BYPASS between TDI and TDO) = 1001 1010 HIGHZ Instruction(Selcting BSR between TDI and TDO) = 1011 1110 BYPASS Instruction(Selcting BYPASS between TDI and TDO) = 1111 & the remaining opcodes
```

Opcodes selecting the BSR = 0000 0010 0111 1000 1011 1110

Depending upon whether you have a synchronous or asynchronous design, you will fix this violation as follows.

Case1: If you are using a synchronous implementation then you can derive the BSR cell's capture_en signal as follows:

```
capture_en = (Tap Controller's sync_capture_en) & (!I3&!I2&!I1&!IO | !I3&!I2&I1&!IO  
| !I3&I2&I1&IO | I3&!I2&!I1&!IO | I3&!I2&I1&IO | I3&I2&I1&!IO ) (Most probably you  
were generating capture_en = (Tap Controller's sync_capture_en))
```

Case2: If you are using a asynchronous implementation then you can derive the BSR cell's capture_clk signal as follows:

```
capture_clk = (Tap Controller's clock_dr) & (!I3&!I2&!I1&!IO | !I3&!I2&I1&!IO |  
!I3&I2&I1&IO | I3&!I2&!I1&!IO | I3&!I2&I1&IO | I3&I2&I1&!IO ) (Most probably what  
you were generating capture_clk = (Tap Controller's clock_dr))
```

TEST-860 (warning) Boundary scan register cell %s is illegally merged. Only an input function can be merged with an output or control function.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 10, section 10.9, that in a case in which a system input is used solely as a source of control or solely as a source of data for a system output pin, a single cell can be provided that meets the rules of 10.5.1 for the input pin and 10.6.1 for the output pin.

WHAT NEXT

Correct the design of the boundary-scan register cell to either A. Include two separate boundary-scan cells. B. Combine both the input pin and the control cell of the output pin into a single cell.

For more information, see the *Boundary Scan Reference Manual*.

TEST-860a (warning) Boundary scan register cell %s is illegally merged. The merged cell contains more than two functions.

DESCRIPTION

A merged cell can, at most, contain two functions. Here, the cell was found to either control more than one output ports or have more than two functions.

WHAT NEXT

You should correct the design of the boundary-scan register cell to drive only one

output port or have only at most two functions.

TEST-861 (warning) The boundary scan register cells are not able to update the update flops, when the TAP Controller changes state from Capture-DR to Update-DR through Exit-DR only. These cells do update the update flops, when the TAP Controller changes state from Capture-DR to Update-Dr through Shift-DR.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 5 that whatever may be the path to Update-DR, the update-flops should be updated by the latest values from the boundary-scan shift-register stage.

WHAT NEXT

You should correct the design of boundary-scan register cell.

TEST-862 (error) Mandatory BYPASS instruction is not implemented.

DESCRIPTION

You get this error message when `check_bsd` finds that either 1. all-ones opcode does not implement the mandatory **BYPASS** instruction or 2. the output of some boundary scan register cell is not being driven by the input pin during the **BYPASS** instruction with the specified opcode (i.e TEST-877 has occurred).

The IEEE Std 1149.1 state in chapter 7 that each component shall provide a BYPASS instruction with all-ones opcode.

WHAT NEXT

Correct the design to implement the BYPASS instruction with all-ones opcode.

TEST-863 (error) Mandatory EXTEST instruction is not

implemented with all-zeros opcode.

DESCRIPTION

You get this error message when `-infer_instructions` option of the `check_bsd` command is set to false(default) and `check_bsd` finds that all-zeros opcode does not implement the mandatory EXTEST instruction .

The IEEE Std 1149.1 state in chapter 7 that each component shall provide a EXTEST instruction with all-zeros opcode.

WHAT NEXT

Correct the design to implement the EXTEST instruction with all-zeros opcode.

TEST-864 (information) This problem occurred because TDO port %s is driven by a constant source.

DESCRIPTION

Diagnostics found a constant source driving the TDO port. If it comes through any sequential elements, those elements become non-active for shift-register inference. Hence, it becomes impossible to find the shift-register.

WHAT NEXT

Correct the design so as not to drive the TDO during shifting by a constant source.

TEST-865 (information) The TDO port %s is not enabled during the shift-DR TAP controller state.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 5 that the test data out (TDO) port must be active during Shift-DR TAP controller state to facilitate the serial shifting of data. Diagnostic can pin-point the cause.

WHAT NEXT

Correct the enabling logic of TDO. You can run the `check_bsd` in diagnostic mode to

find the real cause of the problem. Rectify the design and rerun **check_bsd**.

TEST-866 (warning) Ignoring instruction %s, as opcode(s) is not specified for the instruction.

DESCRIPTION

You get this warning message when **-infer_instructions** option of the **check_bsd** command is set to false(default) and **check_bsd** looks for the implemented instructions information provided by the **set_bsd_instruction** command, for the designs in the verification flow for which there is no implemented instructions information passed by **insert_bsd** command is found. If opcode is not specified for an instruction (besides BYPASS and EXTEST instructions, which have reserved and mandatory opcodes), the instruction will be ignored by **check_bsd**.

WHAT NEXT

Specify the opcode of the instruction by the **set_bsd_instruction** command and rerun **check_bsd**. If complete and accurate information about the implemented instructions is not known, turn on the **-infer_instructions** option of the **check_bsd** command and rerun **check_bsd**.

TEST-867 (warning) Opcode %s specified for instruction %s is not implemented because the instruction register width %d is insufficient.

DESCRIPTION

You get this warning message when you are using a custom TAP controller and the opcode you specified for an instruction is not implemented because the instruction register does not have sufficient number of bits.

WHAT NEXT

Use another opcode that fit into the instruction register or use another TAP controller with sufficient instruction register width. If you use a DW TAP then instruction register width is automatically selected to accommodate all the opcodes.

TEST-868 (warning) Opcode %s of instruction %s has a different signature than opcode %s. A new instruction will be

inferred for the opcode %s.

DESCRIPTION

When the -infer_instructions switch in the command **set_bsd_configuration** is set to the value false, then **check_bsd** does not infer the instructions of the current boundary-scan inserted design, but it looks for the implemented instructions information already stored with the design by the **insert_bsd** command during boundary-scan synthesis.

This error message appears when you have set the -infer_instructions switch in the command **set_bsd_configuration** to a value false and **check_bsd** finds that two opcodes for the same instruction have different signatures. In such a case **check_bsd** infers a new instruction for the opcode whose signature is different.

WHAT NEXT

Insure that the functionality of the IEEE 1149.1 boundary-scan logic is enabled in the design. You may be required to use **set_bsd_compliance** to specify the compliance enable ports and patterns that enable the IEEE 1149.1 boundary-scan functionality for a design.

TEST-869 (error) Could not find implemented instructions information for the design.

DESCRIPTION

DB Mode When the -infer_instructions switch in the command **set_bsd_configuration** is set to the value false, then **check_bsd** does not infer the instructions of the current boundary-scan inserted design, but it looks for the implemented instructions information already stored with the design by the **insert_bsd** command during boundary-scan synthesis.

This error message appears when you have set the -infer_instructions switch in the command **set_bsd_configuration** to a value false and **check_bsd** is not able to find the implemented instructions information in the current boundary-scan inserted design.

XG Mode When the -infer_instructions switch in the command **check_bsd** is set to the value false, then **check_bsd** does not infer the instructions of the current boundary-scan inserted design, but it looks for the implemented instructions information already stored with the design by the **insert_dft** command during boundary-scan synthesis.

This error message appears when you have set the -infer_instructions switch in the command **check_bsd** to a value false and **check_bsd** is not able to find the implemented instructions information in the current boundary-scan inserted design.

WHAT NEXT

DB Mode Insure that boundary-scan synthesis has been done with a version which supports the feature of passing the implemented instructions information from **insert_bsd** to **check_bsd**. If the boundary-scan synthesis has been done with an older version, then set the -infer_instructions switch to the value true in the command **set_bsd_configuration** before invoking the **check_bsd** command.

XG Mode Insure that boundary-scan synthesis has been done with a version which supports the feature of passing the implemented instructions information from **insert_dft** to **check_bsd**. If the boundary-scan synthesis has been done with an older version, then set the -infer_instructions switch to the value true in the command **check_bsd** before invoking the **check_bsd** command.

TEST-870 (warning) Design port %s is not forced to inactive state during the instruction opcode %s.

DESCRIPTION

During the inference of the HIGHZ instruction, it was found that there are some design ports that are put into inactive state during this instruction, but there are still some design ports left that are not put into inactive state. This instruction might not be HIGHZ, but half conditioning of a design port is not proper for any instruction except for a private instruction.

WHAT NEXT

Ignore the warning if this instruction is private and the output conditioning of design ports is to be like this. Otherwise, correct the design of the instruction to have a proper output conditioning of design ports.

TEST-871 (error) Illegal capture descriptor on the bsr cell %s for the instruction opcode %s for instruction %s. The capture source is %s.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 10 that the signal loaded into the shift-register stage of each cell on the rising edge of TCK in the Capture-DR controller state is listed in table 10-1 for boundary-scan register cells at system logic inputs and in table 10-4 for cells at system logic outputs. The software finds a different capture source than what is listed in the tables for that instruction. The reason can be a. The instruction is not the one it has been inferred as. b. The design of boundary-scan register cell used is not correct.

WHAT NEXT

Fix the design to capture the correct source if the instruction inferred is correct; otherwise, check the conditions that makes the instruction being inferred as public instruction.

TEST-872 (warning) Illegal Capture source descriptor for the EXTEST instruction on the input bsr cell %s. It should be primary input ports.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 7 and 10 that the signal loaded into the shift-register stage of each cell on design input ports on the rising edge of TCK in the Capture-DR controller state is the following:

The signal driven to the system logic input from the external source.

WHAT NEXT

Correct the design of boundary-scan register cell on the design input.

TEST-873 (error) Illegal output conditioning during the EXTEST instruction on the output bsr cells. It should be conditioned by BSR cells.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 7 and 10 that the signal driven from the parallel output of each control-and-observe cell when EXTEST is selected should be: The latched parallel output of shift-register stage.

WHAT NEXT

You should correct the design of EXTEST or boundary-scan register cell at system output ports.

TEST-874 (warning) The logic state of design port %s is not driven by the boundary scan register BSR cell %s during the

instruction opcode %s.

DESCRIPTION

During the inference of the CLAMP instruction it was found that for this instruction opcode there are some design output ports that are driven by the boundary-scan register cell, but there exists some other design ports that are not driven by their boundary-scan register cells. This might be due to a. The instruction is not CLAMP but a private instruction. b. The design of CLAMP instruction is not proper.

WHAT NEXT

If the instruction opcode belongs to a private instruction, ignore the warning. Otherwise, correct the design of CLAMP to make signals from the boundary-scan register cells drive all the design ports.

TEST-875 (warning) The boundary scan register cell %s is not able to capture the logic state of design input port during the instruction opcode %s.

DESCRIPTION

While inferring an instruction to be SAMPLE/PRELOAD, it was found that for this instruction there exists some boundary scan cells on design input ports that capture the value at these ports. However, there are some other cells that cannot capture the value at the design input ports that they observe. This might be due to the following:

- a. The instruction might not be SAMPLE/PRELOAD but a private instruction.
- b. The design of SAMPLE/PRELOAD is not correct.
- c. The design of boundary scan register cell is not correct.

WHAT NEXT

Ignore this warning if this is a private instruction; otherwise, correct the design of the problems. Some suggestions are to try tracing the shift_dr or the capture_clk of the BSR shift register when inferring the SAMPLE/PRELOAD instruction. Also, try tracing the connection of the input or output port to the BSR shift register.

TEST-876 (error) The output pin of the boundary scan register cell %s is not being driven by the update flop during EXTEST

instruction with opcode %s.

DESCRIPTION

The IEEE Std 1149.1 states in Chapter 7 that when EXTEST is selected, the state of all signals driven from system output pins shall be completely defined by the data held in the boundary-scan register and change only on the falling edge of TCK in the Update-DR controller state.

WHAT NEXT

You should correct the design of EXTEST in the circuit. Some suggestions are to verify that the mode signal is getting the correct value and that the data is latched on the negative edge of TCK for the update register.

TEST-877 (error) The output pin of the boundary scan register cell %s is not being driven by the input pin during the instruction %s with opcode %s.

DESCRIPTION

This message occurs with BSR cells having both PI and PO. The IEEE Std 1149.1 states in Chapter 7 that when SAMPLE/PRELOAD, BYPASS, IDCODE, and USERCODE is selected, the operation of test logic has no affect on the operation of the on-chip system logic or on the flow of signals between the system pins and the on-chip system logic. This shows that either the design of the boundary scan register cell doesn't allow the primary input to drive the primary output or the design of the instruction with this opcode is not correct.

WHAT NEXT

Correct the design for the problem outlined. A suggestion is to review the BSR design to verify it functions properly.

TEST-878 (warning) The capture value of the boundary scan register cell %s is not from the input pin %s during instruction with opcode %s.

DESCRIPTION

The IEEE Std 1149.1 state in Chapter 7 and 10 that the signal loaded into the shift-

register stage of each cell on design input ports on the rising edge of TCK in the Capture-DR controller state is the signal driven to the system logic input from the external source.

WHAT NEXT

You should correct the design of boundary-scan register cell on the design input ports to capture the correct input value.

TEST-879 (error) Not able to locate a parallel output for the input boundary scan register cell %s.

DESCRIPTION

It was not possible to find the primary input to an input boundary-scan cell and hence will not be able to process any further. Diagnostic should be able to outline the cause of this problem.

WHAT NEXT

You should run with diagnostics on. Correct the cause of the problem before rerunning check_bsd.

TEST-880 (warning) A shift register of length %s has been selected for the BYPASS instruction with "all-ones" instruction opcode. The register should be of length one.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 7 that a binary code for the BYPASS instruction shall be {111...1} (i.e., a logic 1 entered into every instruction register cell). Here the "all-ones" instruction opcode doesn't select a single bit BYPASS register or BYPASS register contains more than one cell.

WHAT NEXT

You should either correct the all-ones instruction to map to BYPASS instruction or correct the BYPASS register design to make it single stage.

TEST-881 (error) Illegal capture value of BYPASS register.

DESCRIPTION

The IEEE Std 1149.1 state in Chapter 9 that the shift-register stage of BYPASS register shall be set to a logic zero on the rising edge of TCK following entry into the Capture-DR controller state.

WHAT NEXT

You should correct the design of the BYPASS register to capture logic zero on the rising edge of TCK.

TEST-882 (warning) Illegal number of capture descriptors for the boundary scan register cell %s.

DESCRIPTION

In order to assign a type to boundary-scan register cell between BC_0 to BC_7, the capture descriptor for each cell under the instructions EXTEST, INTEST, and SAMPLE/PRELOAD is captured. For this cell the number of such capture descriptor is less than the required. This shows a problem in analyzing the mandatory instructions of EXTEST and SAMPLE/PRELOAD.

WHAT NEXT

Check the descriptor of the BSR as suggested by the IEEE Std 1149.1 when implementing the EXTEST and SAMPLE/PRELOAD instruction. All BSR cells with illegal capture descriptors default to BC_0.

EXAMPLE In the following example, the cell is used as an input cell while EXTEST is in effect, and the capture flip-flop loads the parallel input data at the capture_dr state.

NOTE: INTEST is not supported for BC_2 cells on output2, because it will result in an illegal descriptor BSR.

TEST-883 (warning) The TAP controller makes an illegal state transition from state %s to state %s with test clock TCK at the

low halt state.

DESCRIPTION

The TAP controller transition has taken place at TCK low halt state. It is mandatory by the standard to provide at least the TCK low halt state.

WHAT NEXT

You should correct the TCK halt state if it has one or introduce at least the LOW halt state.

TEST-884 (error) Illegal change in the TAP Controller state %s to state %s at TCK high halt state.

DESCRIPTION

The TAP controller transition has taken place at TCK high halt state. Hence the TCK will have only the LOW halt state if implemented.

WHAT NEXT

You should correct the TCK halt state if it has none, to introduce at least the LOW halt state.

TEST-885 (error) Illegal test clock TCK halt state.

DESCRIPTION

As defined in chapter 3 of IEEE Std 1149.1, the dedicated TCK input is provided to permits shifting of test data concurrently with system operation of the component. This require TCK to be stopped for a period to do other support functions during test, e.g. an ATE needs to fetch test data from backup memory. Hence the standard requires that TCK can be stopped at 0 indefinitely without causing any change to state of test logic. Hence while TCK is stopped at 0, state devices are required to retain their state so that the test logic may continue its operation when the clock operation restarts. The tool was able to find the TAP Controller state devices are not able to retain their state, when TCK is stopped at 0.

WHAT NEXT

You should rectify this problem by making the state devices of TAP Controller to retain their state, when TCK is stopped at 0.

TEST-886 (warning) The parallel output of the boundary scan register cell %s is not driven by the update flop using opcode %s, which is the INTEST instruction.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 7 and 10 that the signal driven from the parallel output of each control-and-observe cell while INTEST is selected is either a. The latched parallel output of shift-register stage b. The value that disables connected output.

As in these cases many output boundary-scan register cells have been found to be driven by latched parallel output of their shift-register stage. There seems to be design problems with INTEST implementation on the cell in question.

WHAT NEXT

You should correct the design of INTEST instruction to route the boundary-scan register cell properly.

TEST-887 (warning) The parallel output of a clock boundary scan register cell %s is not driven according to rule 10.5.1g during %s with opcode %s.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 10 that for clock inputs, when the INTEST instruction is selected, the signal driven to the on-chip system logic shall be one of the following: 1. The signal received at the connected system pin 2. The TCK signal, controlled such that the on-chip system logic changes state only in the Run-Test/idle controller state 3. The parallel output of the shift-register stage

WHAT NEXT

Correct the INTEST routing for the boundary-scan register cell on the clock system pins.

TEST-888 (error) The parallel output of an input boundary scan register cell %s is not driven by the parallel input with opcode

%s, which is the SAMPLE instruction.

DESCRIPTION

The IEEE Std 1149.1 state in chapter 7 and 10 that when the SAMPLE/PRELOAD instruction is selected, the states of all signals flowing through system pins shall be loaded into the boundary-scan register on the rising edge of TCK in the Capture-DR controller state.

WHAT NEXT

You should correct the routing of the BSR cell during SAMPLE/PRELOAD instruction.

TEST-889 (warning) Boundary scan register cell %s is not standard(BC_0 to BC_7). This will be defaulted to BC_0 in the output BSDL.

DESCRIPTION

In order to associate a cell type from BC_0 to BC_7, the BSR cells on system inputs and outputs are analyzed under the influence of EXTEST, SAMPLE/PRELOAD, and INTEST (if implemented) to find the captured source. The BSR cells are structurally analyzed to find other characteristics. Based on the information gathered, the BSR cell is assigned the type BC_0 to BC_7. The BSR cell in question was found to have characteristics that are different either in functional respect or structural from the standard BSR cell type BC_0 to BC_7.

WHAT NEXT

Check the analysis of the instructions EXTEST, SAMPLE/PRELOAD, and INTEST to know more about functional problems, if problems exist.

TEST-890 (warning) Not able to locate the parallel input for the boundary scan register cell %s.

DESCRIPTION

In order to analyze the instructions in detail and to analyze the characteristics of boundary scan register (BSR) cell, the Primary Input (PIs) and Primary Output (POs) of the cells are inferred. The reason for not finding a PI of observable and controllable BSR cell can be as follows:

- a. BSR cell is not compliant to the IEEE 1149.1, the reason being the PI is not driving the set of POs during SAMPLE/PRELOAD instruction.
- b. The PI is not being captured into the shift_flop properly.

WHAT NEXT

Correct the BSR cell implementation if you want to check further compliance. The BSDL output cannot be generated.

TEST-891 (error) Not able to locate the parallel output for the %s boundary scan register cell %s.

DESCRIPTION

In order to analyze the instructions in detail and to analyze the characteristics of boundary scan register (BSR) cell, the Primary Inputs (PI) and Primary Outputs (PO) of the cells are inferred. The reason for not finding a PO of observable and controllable BSR cell can be because of the following:

BSR cell is not compliant to the IEEE 1149.1, the reason being the PO is not driven by the PI during SAMPLE/PRELOAD instruction.

WHAT NEXT

Correct the BSR cell implementation if you want to check further compliance. The BSDL output cannot be generated.

TEST-892 (error) Not able to locate the parallel output for the control boundary scan register cell %s.

DESCRIPTION

In order to analyze the instructions in detail and to analyze the characteristics of BSR cell, the PIs (Primary Input) and POs (Primary Output) of the cells are inferred. The reason for not finding a PO of observable and controllable BSR cell can be as follows: a. BSR cell is not compliant to the IEEE 1149.1, the reason being the PO is not driven by the PI during SAMPLE/PRELOAD instruction.

WHAT NEXT

You need to correct the BSR cell implementation if you want to check further compliance. The BSDL output cannot be generated.

TEST-893 (error) Not able to locate the parallel input for the CONTROL boundary scan register cell %s.

DESCRIPTION

In order to analyze the instructions in detail and to analyze the characteristics of BSR cell, the PIs (Primary Input) and POs (Primary Output) of the cells are inferred. The reason for not finding a PI of any BSR cell can be as follows: a. BSR cell is not compliant to the IEEE 1149.1, the reason being either the PI is not captured by the BSR cell shift-register stage or the PO is not driven by the PI during SAMPLE/PRELOAD instruction.

WHAT NEXT

You need to correct the BSR cell implementation if you want to check further compliance. The BSDL output cannot be generated.

TEST-894 (error) Not able to locate the parallel input for the OUTPUT boundary scan register cell %s.

DESCRIPTION

In order to analyze the instructions in detail and to analyze the characteristics of BSR cell, the PIs (Primary Input) and POs (Primary Output) of the cells are inferred. The reason for not finding a PI of any BSR cell can be as follows: a. BSR cell is not compliant to the IEEE 1149.1, the reason being either the PI is not captured by the BSR cell shift-register stage or the PO is not driven by the PI during SAMPLE/PRELOAD instruction.

WHAT NEXT

You need to correct the BSR cell implementation if you want to check further compliance. The BSDL output cannot be generated.

TEST-895 (error) Not able to locate the parallel output for the input boundary scan register cell %s.

DESCRIPTION

In order to analyze the instructions in detail and to analyze the characteristics of BSR cell, the PIs (Primary Input) and POs (Primary Output) of the cells are inferred. The reason for not finding a PO of observable and controllable BSR cell

can be as follows: a. BSR cell is not compliant to the IEEE 1149.1, the reason being the PO is not driven by the PI during SAMPLE/PRELOAD instruction.

WHAT NEXT

You need to correct the BSR cell implementation if you want to check further compliance. The BSDL output cannot be generated.

TEST-896 (error) Mandatory SAMPLE instruction is not implemented (or not specified).

DESCRIPTION

You get this error message during **check_bsd** when the mandatory SAMPLE instruction is not found to be implemented in the design. The IEEE Std 1149.1(2001) states in chapter 8 that each component shall provide a SAMPLE instruction. The SAMPLE instruction is inferred by analyzing the capturing of input ports by the boundary-scan register cells on the design input ports.

WHAT NEXT

Case I: If you are running **check_bsd** on a design for which boundary-scan synthesis is not done by BSD compiler then make sure that you specify correct opcode(s) for the implemented SAMPLE instruction and make sure that the design implements the SAMPLE instruction correctly. Example: `set_bsd_instruction SAMPLE -code {101}`

CaseII: If you do not know the SAMPLE instruction opcode(s), set the **-infer_instructions** option of the **set_bsd_configuration** command to true and rerun **check_bsd**. This will let **check_bsd** examine all opcodes for SAMPLE. Example: `set_bsd_configuration -infer_instructions true`

CaseIII: If you are not upgraded to the 2001 revision of the IEEE1149.1 standard, and still following the 1993 version, you can switch back to the older version (non default mode) using the **set_bsd_configuration** command and rerun **check_bsd**. In this mode **check_bsd** looks for the merged SAMPLE/PRELOAD instruction instead of separate SAMPLE and PRELOAD instructions. Example: `set_bsd_configuration -ieee1149.1_1993`

SEE ALSO

`set_bsd_instruction` `set_bsd_configuration` `check_bsd`

TEST-897 (error) Mandatory PRELOAD instruction is not

implemented (or not specified).

DESCRIPTION

You get this error message during **check_bsd** when the mandatory PRELOAD instruction is not found to be implemented in the design. The IEEE Std 1149.1(2001) states in chapter 8 that each component shall provide a PRELOAD instruction. The PRELOAD instruction is inferred by analyzing the update behavior of the boundary-scan register. The output update flops should load the data held in the associated shift register cells on the falling edge of TCK in the UPDATE-DR state.

WHAT NEXT

Case I: If you are running **check_bsd** on a design for which boundary-scan synthesis is not done by BSD compiler then make sure that you specify correct opcode(s) for the implemented PRELOAD instruction and make sure that the design implements the PRELOAD instruction correctly.

Example: `set_bsd_instruction PRELOAD -code {101}`

CaseII: DB Mode If you are running **check_bsd** on a design for which boundary-scan synthesis is not done by BSD compiler and you do not know the PRELOAD instruction opcode(s), set the **-infer_instructions** option of the **set_bsd_configuration** command to true and rerun **check_bsd**. This will let **check_bsd** examine all opcodes for PRELOAD.

XG Mode If you are running **check_bsd** on a design for which boundary-scan synthesis is not done by BSD compiler and you do not know the PRELOAD instruction opcode(s), set the **-infer_instructions** option of the **check_bsd** command to true and rerun **check_bsd**. This will let **check_bsd** examine all opcodes for PRELOAD.

CaseIII: If you are not upgraded to the 2001 revision of the IEEE1149.1 standard, and still following the 1993 version, you can switch back to the older version (non default mode) using the **set_bsd_configuration** command and rerun **check_bsd**. In this mode **check_bsd** looks for the merged SAMPLE/PRELOAD instruction instead of separate SAMPLE and PRELOAD instructions.

Example: `set_bsd_configuration -ieee1149.1_1993`

SEE ALSO

set_bsd_instruction **set_bsd_configuration** **check_bsd**

TEST-898 (error) The boundary scan register cell %s is not a

valid cell type.

DESCRIPTION

The BSR cell's primary type as per IEEE Std 1149.1b-1994, can be one of the following only: a. INPUT b. OUTPUT2 c. CLOCK d. OUTPUT3 e. CONTROL f. CONTROLR g. INTERNAL h. BIDIR i. OBSERVE_ONLY

WHAT NEXT

You need to correct the design and functionality of the BSR cells to proceed further.

TEST-899 (Information) Scan routing is not complete. Signals '%s' need to be routed.

DESCRIPTION

The scan is not complete because some route signals have been not routed yet.

WHAT NEXT

Set the signals to be routed by `set_scan_configuration`, and run `insert_scanFP again`.

SEE ALSO

`set_scan_configuration` and `insert_scan`

TEST-900 (information) This problem occurred because tristate output (or output side of bidirectional) port %s is disabled and is driven to high impedance value.

DESCRIPTION

This may happen when the enable pin of the pad is tied to a constant value and is constantly driving the tristate output (or output side of bidirectional) port to HIGHZ value. This might be the case when a bidirectional port is intended to be used as reduced input port.

WHAT NEXT

Check if you that you intend to disable the tristate output (or output side of bidirectional) port, else check the connection(s) of the enable pin(s) of the port pad.

TEST-900a (information) This problem occurred because tristate output (or output side of bidirectional) port %s is enabled and is reduced to a two state port.

DESCRIPTION

This may happen when the the enable pin of the pad is tied to a constant value and is constantly enabling the tristate output (or output side of bidirectional) port to HIGHZ value. This might be the case when a bidirectional port is intended to be used as reduced output port or a tristate output port is intended to be used as a two-state port.

WHAT NEXT

Check if you that you intend to enable the tristate output (or output side of bidirectional) port, else check the connection(s) of the enable pin(s) of the port pad.

TEST-901 (information) This problem occurred because design input port %s controls the logic.

DESCRIPTION

A design input port was found to be controlling the logic during diagnostic.

WHAT NEXT

Either correct the logic or set the design port as a compliance enable port with a relevant value.

TEST-902 (information) This problem occurred because %s has an unknown value 'X' due to being driven by multiple drivers:

%s.

DESCRIPTION

A multiple driver net was found. This might be due to unresolved reference making the input port as I/O.

WHAT NEXT

Resolve all the references or correct the design.

TEST-903 (information) This problem occurred because %s has an unknown value 'X', due to black box cell %s driving it.

DESCRIPTION

A design cell was found to be black boxed (reference not found) during diagnostic. All pins of a black-boxed cell are considered to be bidirectional pins. This in turn results in an unknown value at a pin actually intended to be driving a pin of the black-boxed cell.

WHAT NEXT

Either correct the logic or set the design cell reference properly.

TEST-904 (information) This problem occurred because pin %s of the cell %s is driven by a constant source.

DESCRIPTION

A design pin of a cell was found to be driven by a constant source.

WHAT NEXT

Correct the logic.

TEST-905 (information) This problem occurred because %s has

an unknown value 'X', due to pin %s being in a high impedance state.

DESCRIPTION

A design cell input pin of was found to be in an inactive drive state value, causing an unknown value at another design pin.

WHAT NEXT

Correct the logic.

TEST-906 (information) This problem occurred because cell %s has multiple inputs with indexed scan tokens.

DESCRIPTION

A design cell is found with multiple indexed scan token which has resulted in 'x' on its output.

WHAT NEXT

Correct the logic.

TEST-907 (information) This problem occurred because x-bdd of pin %s of cell %s is one.

DESCRIPTION

A design cell was found with x-bdd of its pin as one.

WHAT NEXT

Correct the logic.

TEST-908 (information) This problem occurred because the asynchronous input to cell %s is unknown.

DESCRIPTION

A design cell was found with an unknown asynchronous input.

WHAT NEXT

Correct the logic.

TEST-909 (information) Because the clock input to cell %s is unknown.

DESCRIPTION

A design cell is found with unknown clock input.

WHAT NEXT

Correct the logic.

TEST-910 (information) This problem occurred because the TMS port is controlled by design input port %s.

DESCRIPTION

A design input port was found to be controlling the TMS port logic during diagnostic.

WHAT NEXT

Either correct the logic or set the design port as a compliance enable port with a relevant value.

TEST-911 (information) This problem occurred because TRST port is controlled by design input port %s.

DESCRIPTION

A design input port was found to be controlling the logic on the TRST TAP port during diagnostic.

WHAT NEXT

Either correct the logic or set the design port as a compliance enable port with a relevant value.

TEST-912 (information) This problem occurred because TCK port is controlled by design input port %s.

DESCRIPTION

A design input port was found to be controlling the logic on the TCK TAP port during diagnostic.

WHAT NEXT

Either correct the logic or set the design port as a compliance enable port with a relevant value.

TEST-913 (information) The sequential cell %s is driven by constant source.

DESCRIPTION

A sequential cell is found to be driven by a constant source during diagnostic.

WHAT NEXT

Correct the logic.

TEST-914 (information) This problem occurred because %s has an unknown value 'X', due to pin %s left unconnected.

DESCRIPTION

A design cell input pin of was found unconnected, causing an unknown value at another design pin.

WHAT NEXT

Correct the logic.

TEST-915 (information) This problem occurred because pin %s on the cell %s has controlling value.

DESCRIPTION

A cell was found with controlling input forced on the pin, and hence, the signal from PI cannot be captured.

WHAT NEXT

Correct the logic.

TEST-916 (information) This problem occurred because port %s is unconnected.

DESCRIPTION

A port was found unconnected.

WHAT NEXT

Correct the logic.

TEST-917 (information) This problem occurred because the

tristate pin %s on
the cell %s has multiple controlling cells.

DESCRIPTION

A pad cell was found with controlling input being driven by multiple BSR cell, which is a violation of rule 10.6.1c.

WHAT NEXT

Correct the logic.

TEST-918 (information) This problem occurred because the pin %s on
the cell %s is driven by multiple BSR cells.

DESCRIPTION

A cell was found with multiple input being driven by BSR cells.

WHAT NEXT

Correct the logic.

TEST-920 (Error) No pad type found for the pad design %s.

DESCRIPTION

You did not specify a pad type with the `set_bsd_pad_design -pad_type` command. As a result, when you execute the `insert_bsd` or the `preview_bsd` command, you receive this error message in DB mode.

You did not specify a pad type with the `define_dft_design -param { pad_type` command. As a result, when you execute the `insert_dft` or the `preview_dft` command, you receive this error message in XG mode.

WHAT NEXT

Reexecute the `set_bsd_pad_design` command with the `-pad_type` option, and specify a valid pad type. Then, rerun the `insert_bsd` or `preview_bsd` command in DB mode.

Reexecute the **define_dft_design** command with the **-param {\$pad_type\$}** option, and specify a valid pad type. Then, rerun the **insert_dft** or **preview_dft** command in XG mode.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2), **set_bsd_pad_design** (2), **define_dft_design** (2).

TEST-921 (Error) Data output pin not found in the input pad design %s.

DESCRIPTION

DB Mode You receive this error message because you have not specified a data_out or data_out_inverted signal type pin in the access list for the **set_bsd_pad_design** command, or the specified pin does not exist in the pad design. For the input pad type data_out or data_out_inverted, a pin is expected. This message is generated by the **preview_bsd** command and the **insert_bsd** command.

XG Mode You receive this error message because you have not specified a data_out signal type pin in the access list for the **define_dft_design** command, or the specified pin does not exist in the pad design. For the input pad type data_out pin is expected. This message is generated by the **preview_dft** command and the **insert_dft** command.

WHAT NEXT

Provide a valid pad design pin name for the data_out or data_out_inverted signal type in the access list of the **set_bsd_pad_design** command, and rerun the **insert_bsd** or **preview_bsd** command in DB mode.

Provide a valid pad design pin name for the data_out signal type in the interface list of the **define_dft_design** command, and rerun the **insert_dft** or **preview_dft** command in XG mode.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2), **set_bsd_pad_design** (2), **define_dft_design** (2).

TEST-922 (Error) Data input pin not found in the output pad

design %s.

DESCRIPTION

DB Mode You receive this error message because you have not specified a data_in or a data_in_inverted signal type pin in the access list of the **set_bsd_pad_design** command, or the specified pin does not exist in the pad design. For an output pad type, a data_in or data_in_inverted output pin is expected. This message is generated by the **preview_bsd** or **insert_bsd** command.

XG Mode You receive this error message because you have not specified a data_in signal type pin in the access list of the **define_dft_design** command, or the specified pin does not exist in the pad design. For an output pad type, a data_in pin is expected. This message is generated by the **preview_dft** or **insert_dft** command.

WHAT NEXT

Specify a valid pad design pin name for the data_in or data_in_inverted signal type in the access list of **set_bsd_pad_design** command, and rerun the **insert_bsd** or **preview_bsd** command in DB mode.

Specify a valid pad design pin name for the data_in signal type in the interface list of **define_dft_design** command, and rerun the **insert_dft** or **preview_dft** command in XG mode.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2), **set_bsd_pad_design** (2), **define_dft_design** (2).

TEST-923 (Error) Enable pin not found in the tristate output or open drain pad design %s.

DESCRIPTION

DB Mode You receive this error message because you have not specified an enable or enable_inverted signal type pin in the access list of the **set_bsd_pad_design** command. For pad types of tristate_output, open_drain_output or open_drain_bidirectional, an enable or enable_inverted signal type pin is expected. This message tells you that you have either not specified an enable or enable_inverted signal type pin in the access list with the **set_bsd_pad_design** command, or the specified pin does not exist in the pad design. This message is generated by the **preview_bsd** or **insert_bsd** command.

XG Mode You receive this error message because you have not specified an enable signal type pin in the interface list of the **define_dft_design** command. For pad types of tristate_output, open_drain_output or open_drain_bidirectional, an enable

signal type pin is expected. This message tells you that you have either not specified an enable signal type pin in the interface list with the **define_dft_design** command, or the specified pin does not exist in the pad design. This message is generated by the **preview_dft** or **insert_dft** command.

WHAT NEXT

DB Mode Specify valid pad design pin name for the enable or enable_inverted signal type in the access list of the **set_bsd_pad_design** command and rerun the **insert_bsd** or **preview_bsd** command.

XG Mode Specify valid pad design pin name for the enable signal type in the interface list of the **define_dft_design** command and rerun the **insert_dft** or **preview_dft** command.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2), **set_bsd_pad_design** (2), **define_dft_design** (2).

TEST-924 (Error) Cannot generate protocol for unimplemented instruction "%s".

DESCRIPTION

DB Mode You receive this error message during the **write_bsd_protocol** command, when you ask the protocol to be generated for an instruction which is not implemented. STIL protocol can be generated only for instructions which are implemented by the **insert_bsd** command.

For instance, suppose that you specified the HIGHZ instruction, which could not be implemented the **insert_bsd** command (due to the reason that not all the port-pads are tristate - you will get TEST-943 warning during **preview_bsd** and **insert_bsd**). If you try to generate bsd protocol after **insert_bsd** for HIGHZ instruction, you will get the current error message.

XG Mode You receive this error message during the **write_bsd_protocol** command, when you ask the protocol to be generated for an instruction which is not implemented. STIL protocol can be generated only for instructions which are implemented by the **insert_dft** command.

For instance, suppose that you specified the HIGHZ instruction, which could not be implemented the **insert_dft** command (due to the reason that not all the port-pads are tristate - you will get TEST-943 warning during **preview_dft** and **insert_dft**). If you try to generate bsd protocol after **insert_dft** for HIGHZ instruction, you will get the current error message.

WHAT NEXT

Specify a correct instruction name to generate the protocol for and rerun the command. Look at the **preview_bsd** report in DB mode for a list of the implemented instructions.

Specify a correct instruction name to generate the protocol for and rerun the command. Look at the **preview_dft** report in XG mode for a list of the implemented instructions.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2), **write_bsd_protocol** (2), **set_bsd_instruction**

TEST-925 (Error) Differential pad design %s is not connected to two ports of the same type.

DESCRIPTION

You receive this error message because you have executed the **insert_bsd** or the **preview_bsd** command and specified a pad design that is not connected to two ports of the same type.

WHAT NEXT

Modify the design so that the differential pad design is connected to two ports of the same type and reexecute the **insert_bsd** or **preview_bsd** command.

SEE ALSO

insert_bsd (2), **preview_bsd** (2).

TEST-926 (Warning) Ignoring the unnecessary signal type pin(s) specified for the pad design %s.

DESCRIPTION

DB Mode You received this warning message because some of the signal type pins specified in the access list of the **set_bsd_pad_design** command are not required for the pad type you specified and will be ignored.

XG Mode You received this warning message because some of the signal type pins specified in the access list of the **define_dft_design** command are not required for

the pad type you specified and will be ignored.

WHAT NEXT

Because the extra pins specified are not used in BSD synthesis, no action is required on your part.

SEE ALSO

`set_bsd_pad_design` (2), `define_dft_design` (2).

TEST-927 (Error) Internal development error related to the pad design %s.

DESCRIPTION

You receive this error message because an internal error occurred while performing BSD synthesis in the presence of pad designs.

WHAT NEXT

For more information, contact Synopsys.

TEST-928 (Warning) Output disable result value not specified for the tristate pad design %s.

DESCRIPTION

DB Mode You receive this warning message because you have not specified a value for the `-disable_res` option of the `set_bsd_pad_design` command. This message is generated by the `insert_bsd` or `preview_bsd` command.

XG Mode You receive this warning message because you have not specified a value for the `-param {$disable_res$}` option of the `define_dft_design` command. This message is generated by the `insert_dft` or `preview_dft` command.

WHAT NEXT

Specify a valid disable result value for the `-disable_res` option with the `set_bsd_pad_design` command and reexecute the `insert_bsd` or `preview_bsd` command in DB mode.

Specify a valid disable result value for the `-param {$disable_res$}` option with the

define_dft_design command and reexecute the **insert_dft** or **preview_dft** command in XG mode.

SEE ALSO

insert_bsd (2), **insert_dft** (2), **preview_bsd** (2), **preview_dft** (2), **set_bsd_pad_design** (2), **define_dft_design** (2).

TEST-929 (Warning) Enable pin not found or not specified for the bidirectional pad design %. The pad design will be treated as an open drain bidirectional pad.

DESCRIPTION

DB Mode You receive this warning message because you have not specified an enable or an enable_inverted signal type in the access list of the **set_bsd_pad_design** command, or the specified pin is not found. The pad design will be treated as an open drain bidirectional pad.

XG Mode You receive this warning message because you have not specified an enable signal type in the access list of the **define_dft_design** command, or the specified pin is not found. The pad design will be treated as an open drain bidirectional pad.

WHAT NEXT

If the specified bidirectional pad design is used in BSD synthesis, specify the enable pin for correct BSD synthesis. The synthesized BSD design might not be correct if the enable pin is not specified.

SEE ALSO

set_bsd_pad_design (2), **define_dft_design** (2).

TEST-930 (Error) NO Pad cell have been found on the design port %s.

DESCRIPTION

There is no PAD cell present on the design port. It is a neccesary condition to have Pad cells on the design.

WHAT NEXT

Correct the design or give the top level design and not the core. You may also use the set_bsd_linkage_port command to exclude the port from boundary-scan logic insertion.

TEST-931 (Error) Multiple Pad cells have been found on the design port %s.

DESCRIPTION

More than the required Pad cells have been found on the design port.

WHAT NEXT

Correct the design.

TEST-931b (warning) Shift Register Flop '%s' captures data on negative edge of TCK.

DESCRIPTION

Rule 9.3.1b of IEEE Std. 1149.1-2001 states that Test Data Register connected between TDI and TDO shall shift data one stage towards TDO following each rising edge of TCK in Shift-Dr state.

This warning is issued by the tool when it detects a shift register flop of the Test Data Register that shifts data on negative edge of TCK.

WHAT NEXT

Rectify the logic at the cell of the shift register to be in full compliance with the Std.

TEST-932 (Error) Pad cell %s attached to design port %s is a black box.

DESCRIPTION

The attached Pad cell to the design port is not modelled correctly.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-932b (warning) Pad design %s has black box attributes.

DESCRIPTION

The attached pad design is not modelled correctly. Pad design is observed to have black box attributes. TAP ports should not be connected to black box pad designs, otherwise check_bsd will fail.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-933 (Error) The Bi-directional Pad cell %s attached to design port %s has no core logic output pin.

DESCRIPTION

The attached Bi-directional Pad cell to the design port is not modelled correctly. The pad cell doesnot have any core logic output pin.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-934 (Error) The Input Pad cell %s attached to design port %s has no core logic output pin.

DESCRIPTION

The attached Input Pad cell to the design port is not modelled correctly. The pad cell doesnot have any core logic output pin.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-935 (Error) The 3-State Output Pad cell %s attached to design port %s has no core logic input pin.

DESCRIPTION

The attached Output Pad cell to the design port is not modelled correctly. The pad cell doesnot have any core logic input pin.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-936 (Error) The 2-State Output Pad cell %s attached to design port %s has no core logic input pin.

DESCRIPTION

The attached Output Pad cell to the design port is not modelled correctly. The pad cell doesnot have any core logic input pin.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-937 (Error) The 3-State Output Pad cell %s attached to design port %s has no enable pin.

DESCRIPTION

The attached 3-State Pad cell to the design port is not modelled correctly. The pad cell doesnot have any 3-state enable pin.

WHAT NEXT

Check the library model for the PAD cell and correct it.

TEST-938 (warning) Design '%s' must be scan-replaced or

scan-routed.

DESCRIPTION

This message tells you that your design must be either scan-replaced or scan-routed before you invoke one of the 'reoptimize_design -reorder_scan_chains' or the 'preview_scan -command reoptimize_design' commands.

WHAT NEXT

At least get sequential cells replaced by scan cells from your technology library or simply run **insert_scan** command on your design in either replace-only or replace_and_route mode.

TEST-939 (information) Scan chain reordering was not successful. There were unrecoverable processing errors.

DESCRIPTION

This message tells you that DFT Compiler could not recover from processing errors that occurred during scan chain reordering. Scan chain reordering has exited, without modifying your design.

WHAT NEXT

Study accompanying error messages and fix the problems reported.

TEST-940 (information) Cumulated distance before and after scan reordering could not be computed because XY information for scan cells is partial or unexistent.

DESCRIPTION

This information message tells you that the XY information for scan cells is partial or unexistent. You get this message when you are using PDEF 1.0 which does not support XY coordinates for cells and clusters. In this case, XY information is unexistent. You may also get this message while working with PDEF 2.0 early in the optimization process. At that level, the physical information coming from a floorplanner may be incomplete as the placement of some cells can be still fluid.

WHAT NEXT

If you are working with PDEF 2.0, you can wait till the XY coordinates for scan cells become available before invoking scan chain reordering.

TEST-941 (information) Scan chain is user specified with '-complete true'.

The initial ordering of segments is not disturbed.

DESCRIPTION

This information message tells you that scan chain reordering does not modify scan segment positions when those positions are specified by the designer through the **set_scan_path** command with '-complete' option set to 'true'. The only case in which user specification is modified by scan chain reordering is when it violates clock domain constraint.

WHAT NEXT

If you want your scan chain to get reordered you need to change your scan path specification before invoking scan chain reordering.

TEST-942 (information) Scan chain is user specified with '-complete false'

or split/reordered to meet clock domain constraints.

The reordering is done respecting user-segment positions.

DESCRIPTION

Scan chain reordering does not modify user-specified scan segment positions unless the specification violates clock domain constraints. This information message is issued when you are in this case or simply when your specification is incomplete (use of the **set_scan_path** command with '-complete' option set to 'false').

WHAT NEXT

If you don't want your scan chain to get disturbed you need to change your scan path specification before invoking scan chain reordering.

TEST-943 (Warning) HIGHZ instruction cannot be implemented

as the following design output port(s) are not driven by 3-state pad pin: %s. Removing the HIGHZ specification.

DESCRIPTION

A necessary requirement to implement the HIGHZ instruction is that all the output ports should have 3-state pads and the pad pin driving the design port should also be a s-state pin. Because HIGHZ is specified and not all the output design ports have three-state pads in order to synthesize logic for the HIGHZ instruction, the specification will be removed.

WHAT NEXT

Check the design and insert three-state pads on all the output ports causing the problem. Make sure that the pad pins driving all the output ports are also 3-state.

TEST-944 (Warning) The IDCODE instruction has been specified, but an appropriate environment variable has not been set to specify a valid, nonzero manufacturer identity.

DESCRIPTION

You receive this message because you have specified the IDCODE instruction but have not assigned a valid value to the **test_bsd_manufacturer_id** environment variable. To synthesize a Device Identification register, BSD Compiler requires a valid, nonzero value for this parameter. By default, this variable is set to 0.

WHAT NEXT

Do the following:

1. Assign an appropriate integer value to the **test_bsd_manufacturer_id** environment variable.
2. Execute the **set_bsd_instruction** command again.

SEE ALSO

insert_bsd (2), **preview_bsd** (2), **set_bsd_instruction**(2), **test_bsd_manufacturer_id** (3), **test_bsd_part_number** (3), **test_bsd_version_number** (3).

TEST-945 (Warning) Illegal value for manufacturer_id. It can not be 0000111111 (127 decimal).

DESCRIPTION

The IEEE Std 1149.1 state in chapter 11 that the manufacturer code 0000111111 shall not be used in components that are otherwise compatible with this standard.

WHAT NEXT

You can assign another id and rerun the command.

TEST-946 (Warning) Overflow in the value assigned to manufacturer_id, part_number or version_number.

DESCRIPTION

The IEEE Std 1149.1 states in chapter 11 that the manufacturer code should have the following fields with specific width: Version 4bits Part Number 16 bits Manufacturer Id 11 bits 1 in LSB

There seems to be overflow in the values assigned to the aforementioned fields.

WHAT NEXT

Reassign values to these fields and re-run the command.

TEST-947 (Error) Boundary-Scan has already been inserted using 'insert_bsd' command..

DESCRIPTION

The **insert_bsd** can be invoked only once. If the Boundary-Scan circuitry is already synthesized, it can be re-synthesized but it can be optimized using **optimized_bsd**.

WHAT NEXT

Run **optimize_bsd** if you want to optimize the synthesized boundary scan.

TEST-948 (error) LSI 4-pattern STIL protocol could not be generated because no primary input bidirectional control signal has been specified.

DESCRIPTION

This design contains at least one bidirectional signal, but it contains no primary input signal for controlling the direction of the bidirectional signals. LSI scan rules require such signals. The error is specific to writing LSI STIL protocol file.

WHAT NEXT

Before invoking the `check_test` command, use the `set_signal_type`, `test_bidir_control`, or `test_bidir_control_inverted` command to define all primary inputs controlling bidirectional signals. Then, reinvoke the `check_test` command in order to generate the LSI 4-pattern STIL protocol file.

TEST-949 (Error) Protocol could not be generated as the design is not boundary-scan inserted.

DESCRIPTION

You get this error when "write_bsd_protocol" is used to generate protocol on a design which does not have boundary-scan circuitry inserted by the "insert_bsd" command.

WHAT NEXT

Insert boundary-scan circuitry using the "insert_bsd" command and rerun "write_bsd_protocol".

SEE ALSO

`insert_bsd(2)`, `write_bsd_protocol(2)`

TEST-950 (warning) Enable pin '%s' of pad '%s' is selected for BSR cell (or TAP controller) connection, from the multiple enable

pins found for the pad: %s.

DESCRIPTION

DB Mode You receive this warning message during **preview_bsd** or **insert_bsd** if there exist multiple enable pins for the specified pad. In this case the first eligible enable pin is selected by the BSD Compiler for connection to the BSR cell (or TAP controller connection in case of TAP ports). This warning informs about the enable pin selected and the displays the list of all enable pins found.

XG Mode You receive this warning message during **preview_dft** or **insert_dft** if there exist multiple enable pins for the specified pad. In this case the first eligible enable pin is selected by the BSD Compiler for connection to the BSR cell (or TAP controller connection in case of TAP ports). This warning informs about the enable pin selected and the displays the list of all enable pins found.

WHAT NEXT

DB Mode Check what enable pin is selected for the connection. If required, drive the other enable pins to constant logic 0 or logic 1 through compliance ports and use the command **set_bsd_compliance** to spececiy the compliance pattern. If you want to specify any other enable pin, use the command **set_bsd_pad_design** with option - **lib_cell** set to true.

XG Mode Check what enable pin is selected for the connection. If required, drive the other enable pins to constant logic 0 or logic 1 through compliance ports and use the command **set_bsd_compliance** to spececiy the compliance pattern. If you want to specify any other enable pin, use the command **define_dft_design**.

SEE ALSO

set_bsd_pad_design (2), **define_dft_design** (2), **set_bsd_compliance** (2), **check_bsd** (2).

TEST-951 (Error) Protocol could not be generated as the test_access_port %s port is not specified.

DESCRIPTION

You get this error when "write_bsd_protocol" is used to generate protocol for a boundary-scan design and the test access port is not specified.

WHAT NEXT

Use the command **set_bsd_signal <tdi | tdo | tms | tck | trst> <port_name>** to specify the test access ports in DB mode.

Use the command `set_dft_signal -type <tdi | tdo | tms | tck | trst> -port <port_name>` to specify the test access ports in XG mode.

SEE ALSO

`write_bsd_protocol(2)`

TEST-952 (Warning) USERCODE instruction cannot be implemented as the IDCODE instruction is not implemented. Ignoring the USERCODE specification.

DESCRIPTION

You get this warning during `preview_bsd` or `insert_bsd` when you have specified the USERCODE instruction and a valid IDCODE specification is not found. IDCODE instruction must be implemented in order for the USERCODE instruction to be implemented.

One case You get this warning is, when you have specified the USERCODE instruction and have not specified the IDCODE instruction.

Another case you might get this warning is, when you have specified both the IDCODE and USERCODE instructions but IDCODE cannot be implemented due to appropriate environment variables not set to specify valid version number, part number and manufacturer identity.

WHAT NEXT

Provide a valid specification for the IDCODE instruction including the appropriate environment variables to specify valid version number, part number and manufacturer identity

SEE ALSO

`set_bsd_instruction`

TEST-953 (warning) Signal %s(%s, %s) drives clock inputs of %d flip-flops but is not reached by any test clock.

DESCRIPTION

You receive this warning message if your design contains a flip-flop clock signal that is uncontrollable. All flip-flops and latches must be controlled by clocks in

order for ATPG to generate patterns to test the surrounding logic.

The most basic check is whether a clock I/O signal controls the state of the flip-flop's clock or the state of the latch's enable at the beginning of the cycle, where they are at the clock off state.

This violation can be caused by clocks not being defined or conditioned before **rtldrc** is run. **rtldrc** does not infer clocks, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the clocks and condition them to reach their destinations. If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

If left uncorrected, unless DFT Compiler can infer the clock, this condition will result in a TEST-169 (normal mode clock pin is uncontrollable) violation from **check_scan**, and the flip-flop will be declared a black box. This will cause it to be excluded from the scan chain.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See **insert_dft(2)** for details. Otherwise, proceed as follows:

1. Ensure that you have defined the test clocks using **create_test_clock**, and conditioned them using **set_signal_type** and **set_test_hold**.
2. Examine the specified flip-flops to determine why they have uncontrollable clock signals, and fix the violations.
3. Reexecute **rtldrc**.

SEE ALSO

check_scan(2), **create_test_clock(2)**, **insert_dft(2)**, **preview_dft(2)**, **rtldrc(2)**, **set_test_hold(2)**, **set_signal_type (2)**.

TEST-954 (warning) Signal %s(%s, %s) drives clock inputs of %d latches but is not reached by any test clock.

DESCRIPTION

You receive this warning message if your design contains a latch clock signal that is uncontrollable. All flip-flops and latches must be controlled by clocks in order for ATPG to generate patterns to test the surrounding logic.

The most basic check is whether a clock I/O signal controls the state of the flip-flop's clock or the state of the latch's enable at the beginning of the cycle, where

they are at the clock off state.

This violation can be caused by clocks not being defined or conditioned before **rtldrc** is run. **rtldrc** does not infer clocks, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the clocks and condition them to reach their destinations. If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

If left uncorrected, unless DFT Compiler can infer the clock, this condition will result in a TEST-169 (normal mode clock pin is uncontrollable) violation from **check_scan**, and the latch will be declared a black box. This will cause it to be excluded from the scan chain.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See **insert_dft(2)** for details. Otherwise, proceed as follows:

1. Ensure that you have defined the test clocks using **create_test_clock**, and conditioned them using **set_signal_type** and **set_test_hold**.
2. Examine the specified latches to determine why they have uncontrollable clock signals, and fix the violations.
3. Reexecute **rtldrc**.

SEE ALSO

check_scan(2), **create_test_clock(2)**, **insert_dft(2)**, **preview_dft(2)**, **rtldrc(2)**, **set_test_hold(2)**, **set_signal_type (2)**.

TEST-955 (Warning) Tap controller %s does not have the required access to implement the

DESCRIPTION

You this message when the tap controller does not have the required access signal types, to implement the instruction.

Following access types are required to implement the USERCODE instruction. You must provide the required interface in order to implement the USERCODE instruction:
device_id_sel (scalar) user_code_sel (scalar) user_code_val (bus [31:0])

Following access types are required to implement the IDCODE instruction:
device_id_sel (scalar) ver (bus [3:0]) ver_sel (scalar) part_num (bus [15:0])
part_num_sel (scalar) mnfr_id (bus [10:0]) mnfr_id_sel (scalar)

WHAT NEXT

Case 1: If you are using not using a custom tap controller: In this case the default DesignWare tap controller is used. The default DW tap controller has the required access signals for USERCODE and IDCODE instruction support. Make sure that you have NOT set the variable bsd_use_old_tap(default false) to true. Setting bsd_use_old_tap to true will use an older version of theDesignWare tap controller, which does not support USERCODE and IDCODE instruction implementation.

case 2: If you are using custom tap controller: Make sure that your tap implementation has the required interface signals for USERCODE and IDCODE instruction support. For the bus interfaces check that the required range of bits exist.

SEE ALSO

set_bsd_tap_element set_bsd_instruction insert_bsd preview_bsd

TEST-956 (Information) Following access pins are missing from the %s tap controller interface: %s.

DESCRIPTION

You this information message showing which of the access pins are missing from the tap controller interface.

Following access types are required to implement the USERCODE instruction. You must provide the required interface in order to implement the USERCODE instruction:
device_id_sel (scalar) user_code_sel (scalar) user_code_val (bus [31:0])

Following access types are required to implement the IDCODE instruction:
device_id_sel (scalar) ver (bus [3:0]) ver_sel (scalar) part_num (bus [15:0])
part_num_sel (scalar) mnfr_id (bus [10:0]) mnfr_id_sel (scalar)

WHAT NEXT

Case 1: If you are using not using a custom tap controller: In this case the default DesignWare tap controller is used. The default DW tap controller has the required access signals for USERCODE and IDCODE instruction support. Make sure that you have NOT set the variable bsd_use_old_tap(default false) to true. Setting bsd_use_old_tap to true will use an older version of theDesignWare tap controller, which does not support USERCODE and IDCODE instruction implementation.

case 2: If you are using custom tap controller: Make sure that your tap implementation has the required interface signals for USERCODE and IDCODE instruction support. For the bus interfaces check that the required range of bits exist.

TEST-957 (information) There are %d asyncs in the design.

DESCRIPTION

You receive this message to inform you that **rtldrc** has identified the specified number of asynchronous control ports (asyncs) in your design. This message also lists all asyncs in the design, along with their back-annotated file names and line numbers. Back-annotated information for asyncs in other violation messages can be found here.

WHAT NEXT

If the specified number of asyncs is what you intended, no action is required on your part. Otherwise, redefine the asyncs using **set_signal_type**.

SEE ALSO

`rtldrc` (2), `set_signal_type` (2).

TEST-958 (information) There are %d test clocks in the design.

DESCRIPTION

You receive this message to inform you that **rtldrc** has identified the specified number of test clocks in your design. This message also lists all test clocks in the design, along with their back-annotated file names and line numbers. Back-annotated information for test clocks in other violation messages can be found here.

WHAT NEXT

If the specified number of test clocks is what you intended, no action is required on your part. Otherwise, redefine the test clocks using **create_test_clock**.

SEE ALSO

`create_test_clock(2)`, `rtldrc` (2).

TEST-959 (information) There are %d blackboxes in the design.

DESCRIPTION

You receive this message to inform you that **rtldrc** has identified the specified number of objects in your design as black boxes. This message also lists the black boxes, along with their back-annotated file names and line numbers. Back-annotated information for black boxes in other violation messages can be found here.

WHAT NEXT

Examine your design for the objects that were reported as black boxes, and ensure that these black boxes are as you intended. If necessary, modify the design to eliminate some or all of the black boxes.

SEE ALSO

rtldrc (2),

TEST-960 (warning) Sensitizable feedback loop detected at %s(%s, %s).

DESCRIPTION

You receive this message to warn you that **rtldrc** found a sensitizable (active) feedback loop at the specified location. Such feedback loops can decrease fault coverage by ATPG, because paths are difficult to control if they are part of feedback loops.

If left uncorrected, this condition will result in a B23 (Feedback path) violation from TetraMAX, and often also an X1 (Feedback path is sensitizable) violation. This condition does not result in a violation from check_scan, but check_test will give a TEST-117 (combinational feedback loop) violation. All of these violations result in reduced fault coverage from ATPG.

WHAT NEXT

If you are using the loop as a latch, convert the combinational elements that make up this feedback loop into a latch from your ASIC vendor library. Otherwise, use **set_test_hold** to place known values on the loop's inputs.

SEE ALSO

check_scan (2), **check_test** (2), **set_test_hold** (2), **rtldrc** (2).

TEST-961 (warning) Clock pins of %d flip-flops are floating.

DESCRIPTION

You receive this message to warn you that **rtldrc** has found floating clock pins on the specified flip-flops. All flip-flops and latches must be controlled by clocks in order for ATPG to generate patterns to test the surrounding logic.

The most basic check is whether a clock I/O signal controls the state of the flip-flop's clock or the state of the latch's enable at the beginning of the cycle, where they are at the clock off state.

This violation can be caused by clocks not being defined or conditioned before **rtldrc** is run. **rtldrc** does not infer clocks, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the clocks and condition them to reach their destinations. If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. Proceed as follows:

1. Ensure that you have defined the test clocks using **create_test_clock**, and conditioned them using **set_signal_type** and **set_test_hold**.
2. Examine the specified flip-flops to determine why they have floating clock pins, and fix the violations.
3. Reexecute **rtldrc**.

SEE ALSO

TEST-964 (warning) Clock %s reaches %d latches but does not control them at beginning of cycle.

DESCRIPTION

You receive this message to warn you that **rtldrc** has found latches that are not controlled by the specified clock signal. All flip-flops and latches must be controlled by clocks in order for ATPG to generate patterns to test the surrounding logic.

The most basic check is whether a clock I/O signal controls the state of the flip-flop's clock or the state of the latch's enable at the beginning of the cycle, where they are at the clock off state.

This violation can be caused by clocks not being conditioned before **rtldrc** is run. **rtldrc** does not infer clocks, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the clocks and condition them to reach their destinations. If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

If left uncorrected this condition will result in a TEST-169 (normal mode clock pin is uncontrollable) violation from check_scan, and the latch will be declared a black box. This will cause it to be excluded from the scan chain.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See `insert_dft(2)` for details. Otherwise, proceed as follows:

1. Ensure that you have conditioned the test clocks using `set_signal_type` and `set_test_hold`.
2. Examine the specified latches to determine why they are not controlled by the clock signal, and fix the violations.
3. Reexecute `rtldrc`.

SEE ALSO

`check_scan(2)`, `create_test_clock(2)`, `insert_dft (2)`, `preview_dft (2)`, `rtldrc (2)`, `set_test_hold(2)`, `set_signal_type (2)`.

TEST-965 (warning) Clock %s reaches %d latches but does not hold data in them at beginning of cycle.

DESCRIPTION

You receive this message to warn you that `rtldrc` has found that the clock does not hold data in the specified latches at the beginning of the cycle. This check is to ensure that a latch can be made scannable. For scannable latches, the latch must be forced to hold its value at the beginning of the cycle, where it is at the clock off state.

This violation is checked with the assumption that the latches should be scanned. This violation is not checked when the scan style is set to multiplexed flip-flop, unless the `test_rtldrc_latch_check_style` variable is set to `scan`.

This violation can be caused by clocks not being defined or conditioned before `rtldrc` is run. `rtldrc` does not infer clocks, but depends on the commands `create_test_clock`, `set_signal_type`, and `set_test_hold` to define the clocks and condition them to reach their destinations. If all signal definitions have been made correctly before `rtldrc` is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See `insert_dft(2)` for details. Otherwise, proceed as follows:

1. Ensure that you have defined the test clocks using `create_test_clock`, and

conditioned them using **set_signal_type** and **set_test_hold**.

2. Examine the specified latches to determine why the clock does not hold data in them, and fix the violations.

3. As an alternative, enable latch transparency checks in place of latch scanability checks.

4. Reexecute **rtldrc**.

SEE ALSO

create_test_clock(2), **insert_dft(2)**, **preview_dft(2)**, **rtldrc (2)**, **set_test_hold(2)**, **set_signal_type (2)**, **test_rtldrc_latch_check_style (4)**.

TEST-966 (warning) No asynch reaches %d flip-flops with asynch control.

DESCRIPTION

You receive this message to warn you that **rtldrc** has found flip-flops whose asynchronous pins are not controlled by an asynchronous control signal. All flip-flops and latches with asynchronous controls must be able to have these controls held inactive in order to be made scannable.

This violation can be caused by asynchronous controls (asynchs) not being defined or conditioned before **rtldrc** is run. **rtldrc** does not infer asynchs, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the asynchs and condition them to reach their destinations. (A signal defined as a **test_asynch** has a disabled value of 0, and one defined as a **test_asynch_inverted** has a disabled value of 1.)

If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

If left uncorrected this condition will result in a TEST-116 (asynchronous pins are uncontrollable) violation from **check_scan**, and the flip-flop will be declared a black box. This will cause it to be excluded from the scan chain.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See **insert_dft(2)** for details. Otherwise, proceed as follows:

1. Ensure that you have defined the test clocks using **create_test_clock**, and defined asynchronous control signals using **set_signal_type**.

2. Examine the design, locate the flip-flops whose asynchronous pins are not being controlled by an asynchronous control signal, and fix the violations.
3. Reexecute **rtldrc**.

SEE ALSO

```

TEST-968 (warning) Asynch %s reaches %d flip-flops but can not disable their asynch controls.

DESCRIPTION

You receive this message to warn you that **rtldrc** has found flip-flops whose asynchronous control signal ("Asynch") reaches a register but cannot disable the asynchronous pin. All flip-flops and latches with asynchronous controls must be able to have these controls held inactive in order to be made scannable.

This violation can be caused by asynchronous controls (asynchs) not being defined or conditioned before **rtldrc** is run. **rtldrc** does not infer asynchs, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the asynchs and condition them to reach their destinations. (A signal defined as a **test_asynch** has a disabled value of 0, and one defined as a **test_asynch_inverted** has a disabled value of 1.)

If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

If left uncorrected this condition will result in a TEST-116 (asynchronous pins are uncontrollable) violation from **check_scan**, and the flip-flop will be declared a black box. This will cause it to be excluded from the scan chain.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See **insert_dft(2)** for details. Otherwise, proceed as follows:

1. Ensure that you have defined the test clocks using **create_test_clock**, and defined asynchronous control signals using **set_signal_type**.
2. Examine the design, locate the flip-flops whose asynchronous pins are not being controlled by an asynchronous control signal, and fix the violations.
3. Reexecute **rtldrc**.

```

TEST-969 (warning) Asynch %s reaches %d latches but can not disable their asynch controls.

DESCRIPTION

You receive this message to warn you that **rtldrc** has found latches whose asynchronous control signal ("Asynch") reaches a register but cannot disable the asynchronous pin. All flip-flops and latches with asynchronous controls must be able to have these controls held inactive in order to be made scannable.

This violation can be caused by asynchronous controls (asynchs) not being defined or conditioned before **rtldrc** is run. **rtldrc** does not infer asynchs, but depends on the commands **create_test_clock**, **set_signal_type**, and **set_test_hold** to define the asynchs and condition them to reach their destinations. (A signal defined as a **test_asynch** has a disabled value of 0, and one defined as a **test_asynch_inverted** has a disabled value of 1.)

If all signal definitions have been made correctly before **rtldrc** is run, this violation indicates that there are registers that cannot be controlled by ATPG. If the violation is not corrected, these registers will be unscannable and fault coverage will be reduced.

If left uncorrected this condition will result in a TEST-116 (asynchronous pins are uncontrollable) violation from **check_scan**, and the latch will be declared a black box. This will cause it to be excluded from the scan chain.

WHAT NEXT

You must correct this violation to make the violated registers scannable and to increase fault coverage. This violation can be corrected using Autofix. See **insert_dft(2)** for details. Otherwise, proceed as follows:

1. Ensure that you have defined the test clocks using **create_test_clock**, and defined asynchronous control signals using **set_signal_type**.
2. Examine the design, locate the latches whose asynchronous pins are not being controlled by an asynchronous control signal, and fix the violations.
3. Reexecute **rtldrc**.

TEST-970 (warning) Clock %s affects data inputs of %d flip-

flops.

DESCRIPTION

You receive this warning message if **rtldrc** finds flip-flops whose data inputs are driven by the specified clock signal. ATPG pulses only one clock at a time, keeping all other clocks in their off state. Thus, a clock driving the data inputs of flip-flops or latches reduces the fault coverage because ATPG cannot determine the captured input value when that clock is in its off state. Overcoming this behavior to test this logic within ATPG is not recommended, because multiple ATPG iterations and possibly special scan chain redesign would be required.

If left uncorrected this condition will result in a TEST-131 (data pin is driven by a clock/enable signal) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C26 (clock used as data is different from capture clock) violation.

WHAT NEXT

Modify your design so that the logic feeding the data inputs of all flip-flops is independent of clocks.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-971 (warning) Clock %s affects data inputs of %d latches.

DESCRIPTION

You receive this warning message if **rtldrc** finds latches whose data inputs are driven by the specified clock signal. ATPG pulses only one clock at a time, keeping all other clocks in their off state. Thus, a clock driving the data inputs of flip-flops or latches reduces the fault coverage because ATPG cannot determine the captured input value. Overcoming this behavior to test this logic within ATPG is not recommended, because multiple ATPG iterations and possibly special scan chain redesign would be required.

If left uncorrected this condition will result in a TEST-131 (data pin is driven by a clock/enable signal) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C26 (clock used as data is different from capture clock) violation.

WHAT NEXT

Modify your design so that the logic feeding the data inputs of all latches is independent of clocks.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-972 (warning) Clock %s affects both clock and data of %d flip-flops.

DESCRIPTION

You receive this warning message if `rtldrc` finds flip-flops for which the specified clock signal affects both the clock and the data input pin. A clock affecting both clock and data of a flip-flop or latch sets up a race condition. ATPG does not consider timing, so it can generate vectors that will fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-131 (data pin is driven by a clock/enable signal) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C12 (LE port captured data affected by clock) violation.

WHAT NEXT

Modify the logic leading to the data paths to eliminate dependency on the clock.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-973 (warning) Clock %s affects both clock and data of %d latches.

DESCRIPTION

You receive this warning message if `rtldrc` finds latches for which the specified clock signal affects both the clock and the data input pin. A clock affecting both clock and data of a flip-flop or latch sets up a race condition. ATPG does not consider timing, so it can generate vectors that will fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-131 (data pin is driven by a clock/enable signal) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C15 (LS port captured data affected by clock) violation.

WHAT NEXT

Modify your design so that the logic leading to the data paths is independent of the clock.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-974 (warning) Latch enabled by clock %s affects data inputs of %d latches on the same clock.

DESCRIPTION

You receive this warning message if `rtldrc` finds latches that are enabled by the same clock, but have a combinational data path between them. Thus, data is propagated through both latches in a single clock cycle, which reduces the ability of ATPG to observe logic along this path. In some cases, ATPG could generate vectors that fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-478 (pin cannot capture reliably) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C5 (LS port captured data affected by new capture) violation.

WHAT NEXT

Modify your design so that the logic leading to the affected latches does not contain paths affected by latches enabled by the same clock.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-975 (warning) Latch enabled by clock %s affects data inputs of %d flip-flops clocked by the trailing edge of the same clock.

DESCRIPTION

You receive this warning message if `rtldrc` finds flip-flops that receive data from latches enabled by the same clock, such that the clock's trailing edge both clocks the flip-flops and disables the latches so that their data is held. In this case,

race conditions could result.

If left uncorrected this condition will result in a TEST-478 (pin cannot capture reliably) violation from check_test. No violation will be given by check_scan because it is not related to scan shifting. TetraMAX will give a C6 (TE port captured data affected by new capture) violation. This is a relatively minor violation for TetraMAX, since it can generate good vectors in this situation without loss of fault coverage.

WHAT NEXT

Consider modifying your design so that the logic feeding the data inputs of the flip-flops does not go through the latches.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-976 (warning) Clocks %s and %s cannot capture on %d latches with the other off.

DESCRIPTION

You receive this warning if `rtldrc` finds latches that capture as a result of more than one clock, but cannot capture with one clock active and all others off. ATPG pulses only one clock at a given time, keeping all other clocks in their off states. Thus, if multiple clocks must be active, the latches cannot capture and fault coverage is reduced.

If left uncorrected this condition will result in a TEST-310 (data cannot be captured into cell) violation from check_test. No violation will be given by check_scan because it is not related to scan shifting. TetraMAX will give a C15 (scan cell port unable to capture) violation.

WHAT NEXT

Modify your design so that the the clock gating logic for latches is as follows:

Clock and Data are ANDed
The two clocks are ORed

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-977 (warning) Clocks %s and %s both capture on %d flip-flops.

DESCRIPTION

You receive this warning message if **rtldrc** finds flip-flops that can capture as a result of two different clocks. This situation allows a write-over write operation without an intermediate read, so that one of the values is not observable.

If left uncorrected this condition will result in a TEST-310 (data cannot be captured into cell) violation from **check_test**. No violation will be given by **check_scan** because it is not related to scan shifting. TetraMAX will give a C15 (scan cell port unable to capture) violation.

WHAT NEXT

Modify your design so that the flip-flops capture as a result of only one clock.

SEE ALSO

check_scan (2), **check_test** (2), **rtldrc** (2).

TEST-978 (warning) Signal %s(%s, %s) illegally combines clock %s and latch data to clock %d flip-flops.

DESCRIPTION

You receive this warning message if **rtldrc** finds a clock gated with the output of a latch clocked by it. This is an illegal combination, and results in timing hazards, including clock glitches and delayed clocks. In some cases, ATPG can generate vectors that will fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-140 (clock signal is illegally gated) violation from **check_test**. No violation will be given by **check_scan** because it is not related to scan shifting. TetraMAX will give a C8 (LS port clock path affected by new capture) violation.

WHAT NEXT

Modify your design so that the clock gating logic leading to the affected registers do not contain paths affected by latches enabled by the same clock.

SEE ALSO

check_scan (2), **check_test** (2), **rtldrc** (2).

TEST-979 (warning) Signal %s(%s, %s) illegally combines clock %s and latch data to clock %d latches.

DESCRIPTION

You receive this warning message if **rtldrc** finds a clock gated with the output of a latch clocked by it. This is an illegal combination, and results in timing hazards including clock glitches and delayed clocks. In some cases, ATPG can generate vectors that will fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-140 (clock signal is illegally gated) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C8 (LS port clock path affected by new capture) violation.

WHAT NEXT

Modify your design so that the clock gating logic leading to the affected registers do not contain paths affected by latches enabled by the same clock.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-980 (warning) Signal %s(%s, %s) illegally combines clock %s and flip-flop data to clock %d flip-flops.

DESCRIPTION

You receive this warning message if **rtldrc** finds a clock gated with the output of a flip-flop clocked by it. This is an illegal combination, and results in timing hazards including clock glitches and delayed clocks. In some cases, ATPG can generate vectors that will fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-140 (clock signal is illegally gated) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C8 (LS port clock path affected by new capture) violation.

WHAT NEXT

Modify your design so that the clock gating logic leading to the affected registers do not contain paths affected by flip-flops enabled by the same clock.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-981 (warning) Signal %s(%s, %s) illegally combines clock %s and flip-flop data to clock %d latches.

DESCRIPTION

You receive this warning message if `rtldrc` finds a clock gated with the output of a latch clocked by it. This is an illegal combination, and results in timing hazards including clock glitches and delayed clocks. In some cases, ATPG can generate vectors that will fail functional simulation or fail on the tester.

If left uncorrected this condition will result in a TEST-140 (clock signal is illegally gated) violation from `check_test`. No violation will be given by `check_scan` because it is not related to scan shifting. TetraMAX will give a C8 (LS port clock path affected by new capture) violation.

WHAT NEXT

Modify your design so that the clock gating logic leading to the affected registers do not contain paths affected by latches enabled by the same clock.

DESCRIPTION

You receive this warning message if **rtldrc** finds output ports driven by the specified black box instance. Logic that drives or is driven by black boxes cannot be tested, because it is unobservable or uncontrollable. Usually this condition has a minor effect on fault coverage, unless the logic driven by black boxes feeds clock or asynchronous control inputs of registers. In that case, the registers can become unscannable and have a large effect on coverage.

WHAT NEXT

Modify your design to eliminate the specified black box instance.

SEE ALSO

`create_test_patterns` (2), `rtldrc` (2).

TEST-991 (warning) Black box instance %s(%s, %s)

receives data from %d input ports.

DESCRIPTION

You receive this warning message if **rtldrc** finds input ports that drive the specified black box instance. Logic that drives or is driven by black boxes cannot be tested, because it is unobservable or uncontrollable. Usually this condition has a minor effect on fault coverage, unless the logic driven by black boxes feeds clock or asynchronous control inputs of registers. In that case, the registers can become unscannable and have a large effect on coverage.

WHAT NEXT

Modify your design to eliminate the specified black box instance.

SEE ALSO

`create_test_patterns` (2), `rtldrc` (2).

TEST-992 (warning) The argument to `set_scan_register_type -type`

does not contain a valid scan equivalent for cell or design %.
Ignoring the `-type` specification and replacing it with the best match.

DESCRIPTION

You receive this message if none of the scan cells you supplied as arguments to `set_scan_register_type -type` are valid scan equivalents of the specified nonscan cell or design. In this case, `insert_scan` and `compile -scan` disregard the `-type` specification, search the target library for a scan cell that is the best possible match, and replace the nonscan cell with that best match.

WHAT NEXT

If you can accept the scan replacement implemented by `insert_scan` or `compile -scan`, no action is required on your part. However, if you still want to specify a scan replacement for the nonscan cell, first, ensure that you did not make any typing or spelling errors when you issued the `set_scan_register_type` command. Then proceed as follows:

1. Look for a closer match for the nonscan cell within the target library.

Alternatively, if the specification is set on the RTL netlist, use the **set_register_type** command to match the nonscan cell more closely to the scan cell.

2. Reissue **set_scan_register_type** with the appropriate arguments.

3. Reissue **insert_scan** or **compile -scan**.

SEE ALSO

compile (2), **insert_scan** (2), **set_scan_register_type** (2).

TEST-993 (error) Design has more than 6 TEST CLOCKS and TEST ASYNCS.

DESCRIPTION

You receive this message if **rtldrc** finds more than 6 test-related clocks and asynchronous signals in your design. The current implementation of RTL DRC can accept only six or fewer.

WHAT NEXT

Modify your design so that the total number of test clocks and asynchronous signals is six or fewer.

SEE ALSO

rtldrc (2).

TEST-994 (warning) Clock %s affects multiple clock or asynch ports of %d registers.

DESCRIPTION

You receive this message if **rtldrc** finds a clock that affects more than one clock port or asynchronous control port of flip-flops or latches. This situation prevents ATPG from capturing data with the registers, and reduces fault coverage.

If left uncorrected this condition will result in a TEST-131 (data pin is driven by a clock/enable signal) violation from **check_test**. No violation will be given by **check_scan** because it is not related to scan shifting.

WHAT NEXT

Modify your design so that the specified clock affects only one port on each flip-flop or latch. The specific data that is captured should be determined at the data input of the register.

SEE ALSO

`check_scan` (2), `check_test` (2), `rtldrc` (2).

TEST-995 (information) %s (%s, %s)

DESCRIPTION

The register is affected by the RTLDRC violation.

WHAT NEXT

Correct the logic.

TEST-996 (Error) Can not optimize the Boundary-Scan logic. Boundary-Scan logic is not inserted using 'insert_bsd' command.

DESCRIPTION

The `insert_bsd` command should be invoked before invoking the `optimize_bsd` command. If the Boundary-Scan circuitry is not inserted using `insert_bsd` command, the `optimize_bsd` command cannot be used to optimize the boundary-scan logic. Make sure to run `insert_bsd` before running `optimize_bsd`.

WHAT NEXT

Run `insert_bsd` if you want to add boundary-scan logic to the design.

TEST-997 (information) Design has %d transparent latches.

DESCRIPTION

You receive this message to inform you that `rtldrc` has found in your design the

specified list of transparent latches in the off state.

WHAT NEXT

This is an informational message only. No action is required on your part.

SEE ALSO

`rtldrc` (2).

TEST-998 (error) Design has %d ports defined as both TEST CLOCKS and TEST ASYNCS.

DESCRIPTION

You receive this message if `rtldrc` finds ports that are defined both as test clocks and test asynchronous signals (asyncs). You cannot define a port as both a test clock and an async.

WHAT NEXT

Reexecute `create_test_clock` or `set_signal_type -test_asynch` to ensure that you define each of the specified ports as either a test clock or a test async, but not both.

SEE ALSO

`create_test_clock` (2), `rtldrc` (2), `set_signal_type` (2).

TEST-999 (warning) Removing the 'set_scan_register_type' on the bit %s of multibit.

DESCRIPTION

You receive this warning message if the `scan_register_type` attribute is set on some, but not all, of the bits of a multibit register. You must set this attribute either on all or on none of the bits of a multibit register. This message informs you that the `scan_register_type` attribute is being removed from the specified bit.

WHAT NEXT

If removing the `scan_register_type` attribute from the specified bit is acceptable to you, no action is required on your part. Otherwise, use the `set_scan_register_type`

command to set the attribute on all bits of the multibit register, and reexecute.

SEE ALSO

`set_scan_register_type` (2).

TEST-1000b (warning) Mismatch in the value of variable %s. Its current value is %s and its value during last check_bsd run was %s. Current value is used.

DESCRIPTION

You receive this warning message because the current value of the environment variable is different from its value during the previous `check_bsd` command run. This difference triggers an invisible run of `check_bsd` using the current value of the variable.

The warning message appears while executing either the `write_bsdl` command or the `create_bsd_patterns` command.

The result of `write_bsdl` or `create_bsd_patterns` reflects the results of the invisible `check_bsd` run instead of the previous `check_bsd` run.

WHAT NEXT

No action is required on your part.

However, if you want to suppress the invisible `check_bsd` rerun, ensure that the environment variable during the previous `check_bsd` run is the same environment variable that was used during the `write_bsdl` or `create_bsd_patterns`.

SEE ALSO

`check_bsd` (2), `create_bsd_patterns` (2), `write_bsdl` (2).

TEST-1000a (warning) Mismatch in the value of variable %s. Its current value is %d and its value during last check_bsd run was %d. Current value is used.

DESCRIPTION

You receive this warning message because the current value of the environment

variable is different from its value during the previous `check_bsd` command run. This difference triggers an invisible run of `check_bsd` using the current value of the variable.

The warning message occurs while executing either the `write_bsdl` command or the `create_bsd_patterns` command.

The result of `write_bsdl` or `create_bsd_patterns` reflects the results of the invisible `check_bsd` run, instead of the previous `check_bsd` run.

WHAT NEXT

No action is required on your part.

However, if you want to suppress the invisible `check_bsd` rerun, ensure that the environment variable during the previous `check_bsd` run is the same environment variable that was used during `write_bsdl` or `create_bsd_patterns`.

SEE ALSO

`check_bsd` (2), `create_bsd_patterns` (2), `write_bsdl` (2).

TEST-1001 (error) Cannot open file %s in read or write mode.

DESCRIPTION

You receive this message if `preview_scan` or `insert_scan` cannot open the place and route report file for reading, or if `write_layout_scan` cannot open the scan chain information output file (`design.def` or a user-specified filename) for writing.

By default, `write_layout_scan` writes scan chain information required for third party place and route tools into a file `design.def`. You can override the default filename and specify another filename by executing `write_layout_scan` with the `-output` option. If you receive this message from `write_layout_scan`, you might not have permission to write a file to that directory, or the file might already exist and be write-protected.

When `preview_scan` and `insert_scan` route scan chains, they use information in the place and route report file previously specified by `set_scan_configuration -pfile`. If you receive this message from `preview_scan` or `insert_scan`, the specified place and route report file might not exist or might be read-protected.

WHAT NEXT

If the file specified in this error message is the scan chain information file to be generated by `write_layout_scan`, proceed as follows:

1. Check whether the file already exists and is write-protected. If so, change the permissions so that you can overwrite the file.

2. If the file does not already exist, determine whether you have write permission for the directory, and if not, change the permissions so that you can write a file to the directory. If you cannot change the permissions on that directory, change your working directory to one in which you have write permission.

3. Re-execute **write_layout_scan**.

If the file specified in this error message is the place and route report file to be read by **preview_scan** or **insert_scan**, proceed as follows:

1. Verify that the place and route report file exists. If it does not, execute the place and route tool to generate the report file using as input the *design.def* file generated by **write_layout_scan**. For more information, see the **write_layout_scan** manual page.

2. Examine the filename and verify that you entered it correctly, without typos or spelling errors.

3. Verify that you have read permission for the file. If not, change the permissions accordingly.

4. Re-execute **preview_scan** or **insert_scan**.

SEE ALSO

insert_scan (2), **preview_scan** (2), **set_scan_configuration** (2), **write_layout_scan** (2).

TEST-1002 (error) Error %s near %s at line number %d.

DESCRIPTION

You received this message because **preview_scan** or **insert_scan** found a syntax error at the specified line number of the place and route report file specified through **set_scan_configuration -profile**.

This error could occur for one of the following reasons:

- The wrong filename was specified for the **-profile** option.
- The file has been corrupted.
- The place and route tool has introduced syntax unknown to **preview_scan** or **insert_scan**.

WHAT NEXT

If you receive this message, proceed as follows:

1. Verify whether the correct filename was specified. If not, re-execute **set_scan_configuration -pfile** with the correct filename, then re-execute **preview_scan** or **insert_scan**.
2. Examine the line where the error occurred and try to determine whether the file is corrupted. If it is, re-execute the place and route tool to regenerate the file, then re-execute **preview_scan** or **insert_scan**.
3. If the error persists, contact Synopsys Technical Support.

SEE ALSO

insert_scan (2), **preview_scan** (2), **set_scan_configuration** (2), **write_layout_scan** (2).

TEST-1003 (error) Syntax errors found while parsing file %s.

DESCRIPTION

You receive this message if the **insert_scan** or **preview_scan** command encounters syntax errors while parsing the place and route report file you specified through **set_scan_configuration -pfile**. If the file has syntax errors, the tool cannot parse it.

WHAT NEXT

Examine the report file for syntax errors, and correct them. For assistance in locating the errors, contact Synopsys Technical Support.

SEE ALSO

insert_scan (2), **preview_scan** (2), **set_scan_configuration** (2).

TEST-1004 (error) Scan flip-flop %s, specified in the place and route report file, was not found in scan chain %s of design.

DESCRIPTION

You receive this message if a scan flip-flop in a particular scan chain, specified in the place and route report file, cannot be found by **insert_scan** or **preview_scan**. The place and route report file was specified through **set_scan_configuration -pfile**.

This error message could have been caused by a spelling error or a typo in the name of the scan flip-flop. Or, you might have changed test constraints after using

write_layout_scan to generate the place and route scan information file (*design.def*), which the place and route tool uses to generate the place and route report file.

WHAT NEXT

First, check for and correct spelling errors and typos.

Next, if you want the specified scan flip-flop to be in the scan chain, proceed as follows:

1. Examine the place and route report file, and verify that it contains the flip-flop.
2. Execute **set_scan_configuration** with options such that **check_test** can extract the flip-flop along with the scan chain information.
3. Execute **check_test** and correct any violations.
4. Re-execute **preview_scan** or **insert_scan**.

Alternatively, if you have changed your test constraints and no longer want the scan flip-flop to be in the scan chain, proceed as follows:

1. Execute **check_test** to extract the updated scan chain information.
2. Execute **write_layout_scan** to generate an updated *design.def* file.
3. Execute the place and route tool to generate an updated place and route report file.
4. Execute **set_scan_configuration** with appropriate options.
5. Re-execute **check_test**.
6. Re-execute **preview_scan** or **insert_scan**.

SEE ALSO

check_test (2), **insert_scan** (2), **preview_scan** (2), **set_scan_configuration** (2).

TEST-1005 (error) You must specify a target place and route tool using **set_scan_configuration -prtool**.

DESCRIPTION

You receive this message if you issue the **write_layout_scan** command without having specified the target place and route tool to be used for scan chain reordering. Before issuing **write_layout_scan**, you must use **set_scan_configuration -prtool** to

specify the required place and route tool.

WHAT NEXT

Execute `set-scan_configuration -prtool` and specify the target place and route tool to be used. Then re-execute `write_layout_scan`.

SEE ALSO

`set_scan_configuration` (2), `write_layout_scan` (2).

TEST-1006 (error) Combinational logic found between %s and %s; you cannot use combinational logic other than buffers and inverters in the scan path between scan flip-flops

DESCRIPTION

You receive this message if your design contains combinational logic other than buffers and inverters in a scan path between scan flip-flops. The scan chain reordering using third party place and route tools does not support combinational logic between scan paths.

Please note that you may get TEST-1006 message while writing out the scan def, if you are using extraction flow with the input netlist, which was originally written in multi-mode scan insertion flow or Adaptive Scan flow. The support for scan def is not available in this type of extraction flows.

WHAT NEXT

Modify your design so that it does not contain combinational logic between scan states.

TEST-1007 (error) Cannot create a net between two pins.

DESCRIPTION

While restitching the netlist using placement order, the tool could not create nets between two pins.

WHAT NEXT

This is an internal error. Contact Synopsys Technical Support.

TEST-1008 (error) Cannot find a scan-in pin for cell %s.

DESCRIPTION

You receive this message if `insert_scan`, `preview_scan`, or `write_layout_scan` could not find a scan-in pin for the specified cell; this scan-in pin should have been extracted by `check_test` while extracting scan chain information. The placement-based scan chain ordering requires a scan-in pin for each cell.

This error would occur if you did not execute `check_test`, or if `check_test` did not extract the scan chain information correctly.

WHAT NEXT

Try to extract the missing scan-in pin by re-executing `check_test`. Then re-execute `insert_scan`, `preview_scan`, or `write_layout_scan`. If the scan-in pin is still missing, contact Synopsys Technical Support for assistance.

SEE ALSO

`check_test` (2), `insert_scan` (2), `preview_scan` (2), `write_layout_scan` (2).

TEST-1009 (error) Cannot find a scan-out pin for cell %s.

DESCRIPTION

You receive this message if `insert_scan`, `preview_scan`, or `write_layout_scan` could not find a scan-out pin for the specified cell; this scan-out pin should have been extracted by `check_test` while extracting scan chain information. The placement-based scan chain ordering requires a scan-out pin for each cell.

This error would occur if you did not execute `check_test`, or if `check_test` did not extract the scan chain information correctly.

WHAT NEXT

Try to extract the missing scan-out pin by re-executing `check_test`. Then re-execute `insert_scan`, `preview_scan`, or `write_layout_scan`. If the scan-out pin is still missing, contact Synopsys Technical Support for assistance.

SEE ALSO

`check_test` (2), `insert_scan` (2), `preview_scan` (2), `write_layout_scan` (2).

TEST-1010 (error) Scan chain name %s in place and route report file differs from original name.

DESCRIPTION

You receive this message if **preview_scan** or **insert_scan** finds that the name of the specified scan chain in the place and route report file differs from the name of the same scan chain in the file originally generated by **write_layout_scan**. The scan chain names specified in the report file must match the scan chain names originally exported to the place and route tools.

This error could have been caused by a spelling error or typo; by entering the wrong filename when you specified the **-prfile** option; or by manually changing the scan chain name while in the place and route tool.

WHAT NEXT

If you receive this message, first check for and correct spelling errors or typos, and examine the place and route report file to verify that it is the correct one for this design.

If you still need to correct the error, decide which of the conflicting names you want to use. Then do one of the following:

1. If you want to change the name of the scan chain in the design, do so using **set_scan_path**. Then execute **set_scan_configuration**, **check_test**, **write_layout_scan**, and the place and route tool; then re-execute **preview_scan** or **insert_scan**.
2. Alternatively, if you want to keep the name of the scan chain in the design, first try using the existing *design.def* file to regenerate the report file using the place and route tool, then re-execute **preview_scan** or **insert_scan**. If the problem persists, execute **set_scan_configuration**, **check_test**, **write_layout_scan**, and the place and route tool; then re-execute **preview_scan** and **insert_scan**.

SEE ALSO

check_test (2), **insert_scan** (2), **preview_scan** (2), **set_scan_configuration** (2), **set_scan_path** (2).

TEST-1011 (error) Scan cell pins are not loaded properly for scan def generation.

DESCRIPTION

You receive this message if **write_scan_def** could not load scan cell input and output pins properly while generating scan def ASCII file for the place and route tool to

perform scan reordering and repartitioning. Please make sure after scan insertion, **dft_drc** command successfully traced all the scan chains without any scan chain violations. Please also make sure that the CTL ASCII file generated after scan insertion using **write_test_model** command represents all the scan chain information correctly.

This error would occur if the CTL model is not correctly updated with the scan chain information or if **dft_drc** did not extract the scan chains post scan insertion.

This error can also happen in a Hierarchical Scan Synthesis flow, where the CTL models for the blocks are corrupted or not read correctly. Please make sure that such occurrences, if any, are addressed.

WHAT NEXT

If you did not execute **dft_drc**, do so now; then re-execute **write_scan_def** command. Otherwise, re-execute **set_scan_configuration** and ensure that you do not use any options that might prevent **dft_drc** from extracting the scan chain information. Re-execute **dft_drc**, correct any violations, and then re-execute **write_scan_def**. If still the message is displayed, re-execute **write_test_model** command and analyze the scan chain structures for correctness.

SEE ALSO

dft_drc (2), **insert_dft** (2), **preview_dft**(2), **write_scan_def**(2), **write_test_model**(2), **set_scan_configuration** (2).

TEST-1012 (error) Invalid scan configuration. The number of scan chains, %d, specified by **set_scan_configuration -chain_count**, does not agree with the number of scan chains, %d, in the place and route report file.

DESCRIPTION

You receive this message from **preview_scan** or **insert_scan** if the number of scan chains specified with **set_scan_configuration -chain_count** does not agree with the number of scan chains in the place and route report file. This condition invalidates the scan configuration specified while restitching scan chains using the place and route report file.

WHAT NEXT

Examine the place and route report file to find the number of scan chains specified. Re-execute **set_scan_configuration -chain_count** and specify the same number, then re-execute **check_test** and **preview_scan** or **insert_scan**.

SEE ALSO

`check_test` (2), `insert_scan` (2), `preview_scan` (2), `set_scan_configuration` (2).

TEST-1013 (error) Invalid scan configuration. The `set_scan_configuration -add_lockup` is set to *false*, but there are lockup latches in the place and route report file.

DESCRIPTION

You receive this message from `preview_scan` or `insert_scan` if `set_scan_configuration -add_lockup false` is specified but there are lockup latches in the place and route report file. This condition invalidates the scan configuration specified while restitching scan chains using the place and route report file.

WHAT NEXT

Verify that there are lockup latches in the place and route report file. Then execute `set_scan_configuration -add_lockup true` and re-execute `check_test` and `preview_scan` or `insert_scan`.

SEE ALSO

`check_test` (2), `insert_scan` (2), `preview_scan` (2), `set_scan_configuration` (2).

TEST-1014 (error) Invalid scan configuration. The clock mixing specification is inconsistent between the place and route report file and the scan configuration.

DESCRIPTION

You receive this message from `preview_scan` or `insert_scan` if you execute the `set_scan_configuration` command with no clock mixing, but the place and route report file contains scan chains that have clock mixing. This condition invalidates the scan configuration specified while restitching scan chains using the place and route report file.

WHAT NEXT

Examine the place and route report file to find out the type of clocking specified. Then re-execute `set_scan_configuration -clock_mixing` and specify the appropriate argument for `-clock_mixing`. Re-execute `check_test`, `preview_scan`, and `insert_scan`.

SEE ALSO

`check_test` (2), `insert_scan` (2), `preview_scan` (2), `set_scan_configuration` (2).

TEST-1015 (error) Physical design information is not available for scan cells.

DESCRIPTION

You receive this error message because you executed the `preview_scan` or the `insert_scan` command with the `-physical` option and the physical design information is not present.

WHAT NEXT

Run the `physopt` or the `compile_physical` command with the `-scan` option to read in physical design information.

SEE ALSO

`compile_physical` (2), `insert_scan` (2), `physopt` (2), `preview_scan` (2).

TEST-1016 (Warning) XY locations are missing for %s scan cell or scan port.

DESCRIPTION

You receive this error message because the x and y locations of certain scan cells or ports are not present to run the commands `preview_scan -physical` or `insert_scan -physical`.

WHAT NEXT

Run the `physopt` command or the `compile_physical -scan` command to place the scan cells and the ports.

SEE ALSO

`compile_physical` (2), `insert_scan` (2), `physopt` (2), `preview_scan` (2).

TEST-1017 (Warning) Serial port %s of scan chain %s does not exist in floorplan.

DESCRIPTION

You receive this error message because you executed the **preview_scan -physical** or the **insert_scan -physical** command, but the scan-in or scan-out ports are not present in the floorplan. Serial ports such as scan-in and scan-out must have a valid floorplan before **preview_scan -physical** or **insert_scan -physical** are used.

WHAT NEXT

Create scan-in and scan-out ports and include them in your design floorplan. Then, reexecute the command.

SEE ALSO

insert_scan (2), **preview_scan** (2).

TEST-1018 (error) Cells (%s, %s) have locations overlapping.

DESCRIPTION

You receive this error message because you specified cells having the same location when you executed the **preview_scan -physical** or **insert_scan -physical** command.

All scan cells in the design must have valid locations before you can run the **preview_scan -physical** or **insert_scan -physical** command.

WHAT NEXT

Reexecute the **preview_scan -physical** or **insert_scan -physical** command and specify a valid placement using the proper **physopt** commands.

SEE ALSO

insert_scan (2), **preview_scan** (2).

TEST-1019 (warning) Scan cells reordering can not be applied

on the scan chain (%s).

DESCRIPTION

You receive this warning message because all of the cells have a user-specified position in the current scan chain. This position is defined first by using the `set_scan_path` command.

WHAT NEXT

No action is required on your part.

However, you can use the `remove_scan_specification` command on the current scan chain and reexecute the `preview_scan -physical` or `insert_scan -physical` command to apply physical ordering.

SEE ALSO

`insert_scan (2)`, `preview_scan (2)`, `remove_scan_specification (2)`,
`set_scan_configuration (2)`, `set_scan_path (2)`.

TEST-1020 (warning) Chain length requirements can not be honored on scan chain '%s'. Scan architect will ignore this specification.

DESCRIPTION

You receive this warning message when scan architect is unable to build a scan chain with the sequential length required.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_scan (2)`, `preview_scan (2)`, `set_scan_configuration (2)`, `set_scan_path (2)`.

TEST-1021 (warning) Chain clock requirements is only considered with no mixing clock configuration. Scan architect

will ignore this specification.

DESCRIPTION

You receive this warning message because the global scan clock specification is not equal to no mixing clock, and the clock specification is required for a scan chain.

WHAT NEXT

No action is required on your part.

However, if you want the scan architect to use the scan chain, set the global scan clock specification to no mixing clock.

SEE ALSO

`insert_scan` (2), `preview_scan` (2), `set_scan_configuration` (2), `set_scan_path` (2).

TEST-1022 (error) Cannot find the lockup latch clock for the segment '%s'.

DESCRIPTION

You receive this error message because the `insert_dft` or `preview_dft` command cannot not find a clock for the lockup latch associated with the segment while designing scan chains.

WHAT NEXT

Verify that the segment defined with the `set_scan_segment` command is correct. If necessary, correct the definition and run the `insert_dft` or `preview_dft` command again.

If the lockup clock is still missing, contact Synopsys Technical Support for assistance.

SEE ALSO

`insert_dft` (2), `preview_dft` (2), `set_scan_segment` (2).

TEST-1023 (warning) Core scan segment '%s' has a lockup

latch on the output.

DESCRIPTION

You receive this warning message when any of the following are true:

- You specified to mix edges or mix clocks in your scan configuration.
- The reported core scan segment has a lockup latch placed at the end of the segment.
- You have other core scan segments triggered by the same clock on a different edge in your design.

The scan architecture is prevented from putting that segment in a chain with segments triggered by a different edge of the same clock and causing scan shift violations.

WHAT NEXT

No action is required on your part.

However, to avoid this warning message, specify no edge mixing or no clock mixing in your scan configuration.

SEE ALSO

`check_dft` (2), `insert_dft` (2), `preview_dft` (2), `set_scan_configuration` (2).

TEST-1024 (warning) Flop '%s' specified in `set_scan_replacement` is not valid for the corresponding methodology.

DESCRIPTION

You receive this warning message, when the flop you specified thru `set_scan_replacement` for a given methodology is not valid for the methodology. This won't stop the scan replacement and the tool tries to find a valid scan replacement by other methods.

WHAT NEXT

Specify a valid scan flop for the options of `set_scan_replacement`.

SEE ALSO

`set_scan_replacement(2).`

TEST-1025 (warning) No vectors are allowed between the forcePI and measurePO cycles in the %s procedure.

DESCRIPTION

You receive this warning message because vectors in the CTL model and/or the test protocol are between the forcePI and measurePO cycles. This will not stop or invalidate the post insert_dft DRC. This warning can be ignored in case of PLL flows when the reference clocks are expected to pulse during the capture procedures.

WHAT NEXT

Analyze the CTL model or the test protocol to check what vectors are between forcePI and measurePO cycles. In PLL flow, the reference clocks are pulsed during the F cycle of the capture procedure.

SEE ALSO

`set_dft_clock_controller(2).`

TEST-1026 (warning) elements are supplied by different voltages.

DESCRIPTION

You receive this warning message because you used the `set_scan_configuration` command with the `-voltage_mixing` option to direct the DFT Compiler not to mix elements that are supplied by different voltages on the same scan chain or wrapper chain and you have violated this directive. This occurs because you can still specify scan segments, scan chains, and wrapper chains or build subdesign chains that violate the directive. The DFT Compiler then generates this warning message.

WHAT NEXT

If you intend for the identified segments or chains to violate your directive, no action is required on your part. Otherwise, respecify the segments or chains as necessary.

SEE ALSO

`set_scan_configuration` (2).

TEST-1027 (Error) Scan compression requires serial signals to be routed

DESCRIPTION

You cannot insert scan compression logic without routing serial signals

WHAT NEXT

Set the signals to be routed by `set_scan_configuration` or `set_dft_insertion_configuration` (dcxg mode), and run `insert_dftFP again`.

SEE ALSO

`set_scan_configuration` and `insert_dft`

TEST-1028 (error) Scan output of chain %s could not be traced.

DESCRIPTION

You receive this message if your design contains combinational logic other than buffers and inverters in a scan path between the last scan flip-flop and the scan output port. The scan chain reordering using third party place and route tools does not support combinational logic between scan paths.

WHAT NEXT

Modify your design so that it does not contain combinational logic between the last flop and the scan output port.

TEST-1029 (warning) scan elements are supplied in different power domains.

DESCRIPTION

You receive this warning message because you instructed DFT Compiler not to mix scan

cells across different power domains, and at the same time you are trying to violate that specification.

This situation occurs when you specify scan groups, scan paths, and wrapper chains or build subdesign scan chains that have scan cells already mixed across different power domains.

WHAT NEXT

To avoid getting this message, you need to change your specifications or allow power domain mixing by setting the **-power_domain_mixing** option of the **set_scan_configuration** command to true.

SEE ALSO

set_scan_configuration (2).

TEST-1030 (error) Parameter value for reserved parameter '%s' is not specified.

DESCRIPTION

You receive this error message when dft architect tries to create a reserved parameter for a test component without specifying the parameter value. Reserved parameters can't be created if the parameter values are not specified.

WHAT NEXT

No action is required on your part.

SEE ALSO

insert_dft (2), **preview_dft** (2)

TEST-1031 (error) Parameter type '%s' is not a valid type for reserved parameter '%s', expected parameter type '%s'.

DESCRIPTION

You receive this error message when dft architect tries to create a reserved parameter of incorrect parameter type. Reserved parameters have predetermined parameter types. If the parameter type is incorrect, the parameter is not created.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1032 (error) Invalid value '%s' specified for reserved parameter '%s', valid values are : '%s'.

DESCRIPTION

You receive this error message when dft architect tries to create a reserved parameter with invalid parameter values. Reserved parameters are not created when incorrect parameter values are specified.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1033 (error) No such %s - %d exists.

DESCRIPTION

You receive this error message when dft architect tries to access an unexisting test object with the specified identifier.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1034 (warning) Parameter by name '%s' already exists in the specified params, ignoring the passed parameter.

DESCRIPTION

You receive this warning message when dft architect tries to add a parameter to a set of parameters that already include the specified parameter.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1035 (warning) Duplicate pin type '%s' found, not adding it to the component type.

DESCRIPTION

You receive this warning message when dft architect tries to create a component type with a set of pin types that has a duplicate pin type.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1036 (error) Component type '%s' already exists.

DESCRIPTION

You receive this error message when dft architect tries to create a component type which already exists.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1037 (warning) Duplicate pin name '%s' found, not adding it to the pin map.

DESCRIPTION

You receive this warning message when dft architect tries to create a pin map with duplicate pin names.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1038 (error) No such component type '%s' exists.

DESCRIPTION

You receive this error message when dft architect tries to access an unexisting component type.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1039 (warning) Specified pin map %d is incompatible with

comp type '%s'.

DESCRIPTION

You receive this error message when dft architect tries to create a component with incompatible pin map and component type. If the pin names used in a pin map are not described in a component type, they become incompatible.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1040 (error) Component of type '%s' already exists in library '%s'.

DESCRIPTION

You receive this error message when dft architect tries to create a component which already exists in the specified library.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1041 (warning) Parameter '%s' doesn't exists on the component %d.

DESCRIPTION

You receive this warning message when dft architect tries to create a component instance with parameters that doesn't exist on the instance's component.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1042 (error) Parameter '%s' type '%s' doesn't match the component parameter type '%s'.

DESCRIPTION

You receive this error message when dft architect tries to add a parameter to a component instance with incompatible parameter type. The type of the component instance's parameter doesn't match that of the component's parameter.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1043 (error) Value of parameter '%s' is unspecified.

DESCRIPTION

You receive this error message when dft architect tries to create a component instance with incomplete parameters.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1044 (error) Legality check for the component instance '%s' of library '%s' failed.

DESCRIPTION

You receive this error message when dft architect tries to create a component instance that has incorrect parameter values. All components used in insert_dft has legal formulas that specify the allowed parameter values for the components. When a component instance is created, the parameter values of the instance are checked to see if they violate the legal values allowed for the component. component instance is not created if the legality check is failed for the component instance.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1045 (error) Component instance '%s' already exists in library '%s'.

DESCRIPTION

You receive this error message when dft architect tries to create a component instance that already exists in then specified library.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2), preview_dft (2)`

TEST-1046 (error) Library with name '%s' already exists.

DESCRIPTION

You receive this error message when dft architect tries to create a library that

already exists.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1047 (error) Mapping lib cell '%s' of component instance '%s' failed.

DESCRIPTION

You receive this error message when dft insertion tries to create a mapped lib cell for the specified component instance. Please look at prior messages for information on the reasons for the failure to create a lib cell and map it.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1048 (error) Couldn't find the test model template for component instance '%s'.

DESCRIPTION

You receive this error message when dft architect tries to create a test model for the specified component instance. Test model template may not be found either there is no template available for the specified component instance or due to incomplete DW installation.

WHAT NEXT

No action is required on your part.

SEE ALSO

`insert_dft (2)`, `preview_dft (2)`

TEST-1049 (error) Command `estimate_test_coverage` is not supported in the current (HSS) flow.

DESCRIPTION

You receive this error message because you are running `estimate_test_coverage` command in hierarchical scan synthesis (HSS) DFT flow. The HSS flow uses test models which are used only for scan synthesis purposes and are insufficient to estimate test coverage. If test coverage estimation is necessary, use regular scan insertion flow.

WHAT NEXT

If test coverage estimation is necessary, use regular scan insertion flow.

SEE ALSO

`test_use_test_models (3)`

TEST-1050 (warning) IO bound register '%s' is used in a user %s, register is not reused in core wrapping.

DESCRIPTION

DFT Compiler does not allow an IO bound register to be reused in core wrapping if the register is already part of a user segment or user scan chain specification. This warning tells you that the IO register is already used in an earlier `set_scan_path` or `set_scan_segment` command. Core wrapping will add a dedicated wrapper cell for the IO associated with the register.

WHAT NEXT

If the IO bound register should be reused in core wrapping, remove the register from user segment or user scan chain specifications.

TEST-1051 (warning) Shared wrapper cell can't be used for the

port '%s', using a dedicated wrapper cell.

DESCRIPTION

DFT Compiler does not allow a shared wrapper cell to be used for wrapping an IO that is not connected to a register. This warning tells you that there is no register connected to the port and user specified a shared wrapper cell to be used for wrapping the port. A dedicated wrapper cell will be used to wrap the port.

WHAT NEXT

If the register for the port is missing, add the register and rerun the tool again.

TEST-1052 (warning) Pin '%s' of IO register '%s' is of unknown type, not reusing the IO register in wrapper chains.

DESCRIPTION

DFT Compiler does not allow an IO bound register to be reused in core wrapping if the type of a pin of the register is unknown. This warning tells you that the type of the pin is unknown. A dedicated wrapper cell will be used to wrap the associated port of the design.

WHAT NEXT

Add any missing pin attributes that are making the tool not understand the pin functionality.

TEST-1053 (warning) %s pin missing for IO register '%s', not reusing the IO register in wrapper chains.

DESCRIPTION

DFT Compiler does not allow an IO bound register to be reused in core wrapping if the required pins are missing from the register. This warning tells you that the specified type of pin is missing on the register. A dedicated wrapper cell will be used to wrap the associated port of the design.

WHAT NEXT

Check if the specified type of pin is missing for the register.

TEST-1054 (warning) IO register '%s' is shared between %s %s%s, using dedicated wrapper cell to wrap the output port%s.

DESCRIPTION

DFT Compiler does not allow a shared wrapper cell to be shared between multiple ports. This warning tells you that there is a valid IO register that is connected to multiple ports. A dedicated wrapper cell will be used to wrap the port.

WHAT NEXT

If the IO register is connected to multiple ports, specify the register to be reused for only one port to avoid the warning message.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1055 (warning) IO register '%s' associated with port '%s' can't be swapped with a shared wrapper cell, adding a dedicated wrapper cell to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be swapped with a shared wrapper cell, if the register is constrained with test hold constraints. This warning tells you that the IO register is not valid for swapping with a shared wrapper cell. A dedicated wrapper cell will be used to wrap the port.

WHAT NEXT

Check if the IO register has test hold constraints. If dedicated wrapper cell is not desirable, specify that in place implementation of shared wrapper cell is needed for the port with the IO register.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1056 (warning) Scan Enable pin of IO register '%s' is functionally connected, not reusing the register in wrapping the

port '%s'

DESCRIPTION

DFT Compiler does not allow an IO register with functional connections to be used in wrapping a port. This warning tells you that the IO register is functionally used in the design. The IO register is not reused in wrapping the associated port.

WHAT NEXT

Check if the scan enable pin of IO register is connected to functional logic. If so, specify that a dedicated wrapper cell to be added for the associated port if there is only one IO register connected to the port to avoid the warning.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1057 (warning) More than one data_in pins found for IO bound register '%s', not reusing the register for wrapping the port '%s'

DESCRIPTION

DFT Compiler does not allow an IO register with multiple data in pins to be used for wrapping a port. This warning tells you that the IO register has multiple data in pins. The IO register is not reused in wrapping the associated port.

WHAT NEXT

Check if there are multiple data in pins to the specified IO register. If there are multiple data in pins, see if the pins can be constrained such that only one pin is active and is connected an IO for DFT Compiler to reuse the IO register in wrapping the associated port.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1058 (warning) No data_in pin found for IO bound register

'%s', not reusing the register for wrapping the port '%s'

DESCRIPTION

DFT Compiler does not allow an IO register that doesn't have an active data in pin to be used for wrapping a port. This warning tells you that the IO register data in pin(s) are tied to constant drivers or constrained to constant signals. The IO register is not reused in wrapping the associated port.

WHAT NEXT

Check if the data in pins of the specified IO register are tied off to constant signals or constrained to constant signals. If so, check if constraints can be relaxed so that there is an active data in pin of the register connected to an IO of the design so that DFT Compiler can reuse the register in wrapping the associated port.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1059 (warning) More than %s (%d) %s pins found on IO register '%s', not reusing the register for wrapping the port '%s'

DESCRIPTION

DFT Compiler does not allow an IO register with more than the normal number of allowed pins to be reused in wrapping a port. This warning tells you that there are more pins than required on the IO register. The IO register is not reused in wrapping the associated port.

WHAT NEXT

To avoid the warning specify that a dedicated wrapper cell to be used to wrap the associated port.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1060 (warning) Port '%s' is connected to %d input

register%s%s%, IO register%s not used to wrap the port.

DESCRIPTION

DFT Compiler does not allow an IO register to be used in wrapping the associated input port, if the port is connected to multiple IO registers or connected to other logic in addition to IO register. This warning tells you that the specified IO is connected to an IO register and also fans out other registers or other logic. A dedicated wrapper cell will be used to wrap the port.

WHAT NEXT

To avoid the warning, specify that a dedicated wrapper cell need to be used to wrap the port.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1061 (warning) Creating a shared wrapper cell for port '%s' is not successful, using a dedicated wrapper cell to wrap the port.

DESCRIPTION

DFT Compiler is not able to create a shared wrapper cell successfully for the specified port. This warning tells you that the tool is not able to create a shared wrapper cell. A dedicated wrapper cell will be added to wrap the associated port.

WHAT NEXT

Check if the IO register connected to the port is a complex register.

SEE ALSO

`set_core_wrapper_configuration (2)`, `set_core_wrapper_cell (2)`

TEST-1062 (warning) Reduced %s port to %s : %s.

DESCRIPTION

This warning message informs you that the core wrapper architect detected that the bidirectional/tri-state port is reduced. If a bidirectional port is reduced to two-state output, only output wrapper cell is added to the port. If a bidirectional port is reduced to input, only input wrapper cell is added to the port. If a tri-state port is reduced to two-state output, only output wrapper cell is added to the port.

WHAT NEXT

Check if any test hold constraints or constant logic is causing the reduction of bidirectional/tri-state ports. If this is the intended behavior, no action is required from the user.

SEE ALSO

`set_dft_configuration (2)`, `set_core_wrapper_cell (2)`, `set_core_wrapper_configuration (2)`.

TEST-1063 (warning) Can't use WC_S1_S cell for the port '%s', using a WC_S1 cell instead, safe logic will be implemented outside the wrapper cell.

"

DESCRIPTION

This warning message informs you that the core wrapper architect detected an IO register attached to an output port which also fans out to other functional logic. Allowing a shared wrapper cell with builtin safe logic will affect the test coverage as the safe values driven out of the cell affect functional logic during Internal test of the core. Core wrapper uses a shared wrapper cell without builtin safe logic to wrap such ports. The safe logic will be implemented outside the wrapper cell and placed just before the port so that functional logic is not affected by the safe values driven out of the safe logic.

WHAT NEXT

No action is required from the user.
